About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

IEC Catalogue - webstore.iec.ch/catalogue

The stand-alone application for consulting the entire bibliographical information on IEC International Standards, Technical Specifications, Technical Reports and other documents. Available for PC, Mac OS, Android Tablets and iPad.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and also once a month by email.

Electropedia - www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing 21 000 terms and definitions in English and French, with equivalent terms in 16 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

67 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**TEXT-TO-SPEECH FOR TELEVISION –
GENERAL REQUIREMENTS****FOREWORD**

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62731 has been prepared by IEC technical committee 100: Audio, video and multimedia systems and equipment.

This second edition cancels and replaces the first edition published in 2013. This edition constitutes a technical revision.

This edition includes the following significant technical changes with respect to the previous edition:

- a) in 6.2, the levels of announcement quality were revised as well as considerations for ways in which device users can provide service providers with feedback on incorrectly announced terms.
- b) in 6.3, the following TV functionality was added: the TV can receive updated words, associated conversions and updated conversion rules for the TTS engine via a network connection.

The text of this standard is based on the following documents:

FDIS	Report on voting
100/2989/FDIS	100/3013/RVD

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

TEXT-TO-SPEECH FOR TELEVISION – GENERAL REQUIREMENTS

1 Scope

This International Standard specifies the text-to-speech functionality for a (broadcast) receiver with a text-to-speech system. Such a system may be one device, i.e. a receiver with an integrated text-to-speech generator, or may be two devices, i.e. a receiver interfacing with an external text-to-speech device. This document applies only to completely functional stationary (or semi-stationary) digital TV receivers such as set top boxes, integrated digital TVs, recorders and other products whose primary function is to receive TV content. Where this document refers to TV, this will be shorthand for all such receivers.

This document does not apply to products that are capable of receiving TV as a secondary function (e.g. PCs or game consoles with digital television receivers). It also does not apply to sub-assemblies (e.g. PC tuner cards).

2 Normative references

There are no normative references in this document.

3 Terms, definitions and abbreviated terms

3.1 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1.1

context

one specific function of a TV

EXAMPLE: Watching TV, EPG.

3.1.2

DTV broadcast event classification

general category of programme/event content, or its classification

EXAMPLES: Movie (drama), news/current affairs, talk show, sports (football).

3.1.3

EPG filter

filter that organises or reduces the list of displayed EPG items according to certain criteria

EXAMPLES Of criteria are to show only:

- programmes with a certain content type;
- favourites;
- programmes that are audio described;
- programmes for a given time period (for instance "today", "tomorrow", "next 7 days").

3.1.4

event

trigger to start an action

3.1.5

list

collection of items

3.1.6

menu

subsequent order of items

3.1.7

receiver

device capable of receiving or handling digital television signals

3.1.8

service

sequence of programmes under the control of a broadcaster which can be broadcast as part of a schedule

3.1.9

subtitle

textual representation of the dialogue (and frequently additional auditory information), typically shown at the bottom of the screen

Note 1 to entry: Subtitles can be a textual rendering in the same language as the spoken dialogue, or can provide a written translation in a different language.

Note 2 to entry: In some parts of the world, subtitles are called "(closed) captions", and subtitling is referred to as "(closed) captioning".

Note 3 to entry: This document uses the term subtitles throughout.

3.1.10

TTS audio

audio generated by the TTS engine based on the TTS data

Note 1 to entry: If the TV uses an external TTS converter, TTS audio is interpreted as TTS data.

3.1.11

priority audio information

audio information for immediate output typically related to emergency information

3.1.12

TTS data

(text) data converted into TTS audio information by the text-to-speech engine

3.2 Abbreviated terms

DTV	digital television
EPG	electronic programme guide
STB	set top box
TTS	text-to-speech
TV	television
UI	user interface

4 Guiding principles and conventions

This document describes the required basic behaviour for a TV text-to-speech combination in a basic profile, but also provides for enhanced profiles. It also gives a short introduction into the basic problems of visually impaired people: i.e. what are the problems visually impaired people experience when using and watching TV?

Providing text-to-speech functionality for a broadcast receiver, for example a TV or an STB, can be of great help to (visually) disabled people. Such speech functionality may be integrated in the receiver or may be external to the receiver in a separate device.

In general as the guiding principle, when building a TTS interface in the context of this document, implementers should aspire to achieve functional equivalence of the user experience. This means that a person operating the device using the speech interface should have access to similar information and be able to accomplish tasks similar to those they would with a graphical UI.

The main features of this document are:

- basic functional description for a TV-TTS device combination or TV with integrated TTS;
- profiles for different levels of TV-TTS functionality;
- targeted towards the digital TV application.

In this document, mandatory requirements are specified, optional and informative features are also included.

A claim of conformity with this document requires conformity with all mandatory requirements. A TV-TTS device combination or a TV with a TTS that is integrated may provide options for a user to enable or disable each feature of a product. While options for user configurations may be provided, the product shall meet the mandatory requirements.

5 User requirements of visually impaired people

5.1 Users' needs

This subclause explains the needs of visually impaired people as the primary target users for a TV with TTS. Unless these needs are met, the system is not accessible to this user group. Visually impaired people experience access barriers in the course of the following activities when watching TV:

- a) following TV programming, e.g. the TV series;
- b) using a remote control;
- c) not being able to see subtitles;
- d) navigating channels;
- e) navigating TV inputs;
- f) using additional data (text) services provided by the broadcaster, e.g. an EPG;
- g) daily operation of the TV and initial setup of the TV for use.

Items a), b) and c) are outside the scope of this document. Item c) further relates to the fact that, in some countries, foreign language programmes are translated via subtitles. For users who cannot see the subtitles, supplementary audio services are sometimes used to deliver an audio version of the subtitles. This document elaborates on the remaining four items, i.e. d), e), f) and g), in 5.2 to 5.6.

NOTE 1 For DVB systems, item a) is already solved by audio description. Also, the use case of providing supplementary audio services to deliver an audio version of the subtitles is covered in the DVB-SI specification ETSI EN 300 468.

NOTE 2 For ATSC systems, the audio system includes a visually impaired (VI) associate service, which allows a complete programme mix containing music, effects, dialogue, and additionally a narrative description of the picture content, see ATSC A/53 part 5 and part 6.

5.2 Navigating channels

The problem is that a user does not know which channel the TV displays, i.e. the user gets "lost during navigation". The TV is displaying navigation data on the screen but the user is unable to see it. Such data are, for example:

- channel number,
- service name,
- (DTV broadcast) event name.

5.3 Navigating TV inputs

The problem is that a user is unable to select the required input to the TV, e.g. the user wishes to select DTV or a specific external input linked to a recording or other device. The choice is shown on the screen but the user is unable to see it.

5.4 Additional data services

With digital TV, a broadcaster may transmit additional data (text) services to augment TV programming, provide additional information on programming, or provide news. Such additional data are:

- information about whether audio description, subtitling is available,
- (next) (DTV broadcast) event name,
- (DVB-) event information (enhanced description of the (DTV broadcast) event),
- EPG data.

The items above are listed in order of importance with the most important item appearing first. It is noted that this data provides additional convenience in using the TV, but that is non-essential for the primary function of watching TV, and selecting channels.

5.5 Operating the TV

User settings are another needed function besides navigation. This can be done through buttons on the remote control (out of scope of this specification), but also via on-screen menus. For visually impaired people, on-screen menus are typically of little use.

A distinction exists between initial setup and daily operation of the TV. Initial setup is typically a one-time operation during the lifetime of a TV. Daily operation is more frequent and more important. Consequently, a distinction among menu items for daily operation exists, those addressing specific accessibility functions, and TV setup menu items. However, the most frequently used keys are "volume", "channel up/down", and number keys.

5.6 TV use

Use characterization of a TV helps in determining implementation profiles. Navigating channels, for example, is done most often when watching TV, as well as commands such as volume up and down. This may be supported by additional data services, but does not affect the primary functions of the TV. Changing the TV's system settings is not done very often, except perhaps for changing sound or video settings or switching audio description on and off. Such settings may have an easy access mode through a special menu. TV installation is typically performed only once during the lifetime of the TV. Often, visually impaired people

can benefit from specialized support for installing the TV, i.e. it is part of the service when buying a new TV. Understanding this life- and usage cycle of a TV helps with defining the most effective and efficient solutions and is reflected in the profiles. In the following paragraphs, we refer to "basic", "main" and "enhanced" profiles, which are further defined and detailed in Clause 8.

Key operations for a minimum TTS implementation on a receiver for TV use are as set out in the basic profile defined in this document. This basic profile shall include:

- a) channel number, name and event information – key for a user to identify which service has been selected;
- b) availability of audio description – key for a user to know about the availability of this service feature;
- c) availability of subtitles – key for a user to know about the availability of this service feature;
- d) basic EPG – allow the user to navigate through the EPG, if such data is present in the broadcast, to identify which future events are available to them;
- e) context changes – key for a user to understand if the TV went to another state or when a pop-up message appears.

Additional operations that shall be included in the main profile, in addition to all those in the basic profile are:

- f) receiver menu functions allows the user to navigate receiver operations and functions.

Additional operations that shall be included in the enhanced profile, in addition to all those from the basic and main profiles, are:

- g) event information – provide the event synopsis;
- h) additional EPG data – allows the user to get more info on the service or event;
- i) operations of a recording device – allows the user to record future events, possibly selected via the EPG; play/pause a recorded event.

6 Functional requirements

6.1 Functionality for TV, TTS device combination

The TV-TTS device system diagram is illustrated in Figure 1. As shown in the figure, the TTS device is a separate function from the TV, which can be implemented on a device connected with a TV-TTS device interface, or may also be integrated in the TV.

Figure 1 – TV – TTS device system diagram

The functionality requirements for a TV with TTS combination are:

- the TV, in principle, only outputs text strings towards the TTS device;
- the delay between an event and the resulting TTS audio related to that event shall be such that they are perceived as belonging tied together;

- the user should be able to move to the next operation even in the middle of currently playing TTS audio;
- the user should be able to stop currently playing TTS audio;
- the user shall be able to repeat the current or previous TTS audio;
- the user shall be able to mute the TTS audio;
- the user shall be able to switch on/off the TTS function;
- the language of the TTS audio shall be the same as set for the TV's UI, except when signalled differently; the TTS device/engine may choose to pronounce the text or to indicate failure in case it does not support the signalled language;
- TTS audio may not need to literally represent the related visual information on the screen as long as the meaning of the visual information stays intact;
- priority audio information shall overrule currently playing TTS audio information.

NOTE For example, EAS (Emergency Alert System) [USA] or EWS (Emergency Warning System) [JPN] are higher priority than TTS audio information.

6.2 Functionality: TTS device/engine

The functionality requirements for the TTS device/engine are:

- an external TTS device should be designed to be fully accessible to visually impaired users without being dependent on the TV;
- the volume level of the TTS device/engine shall be changeable by the user: the TTS device shall announce the new volume level; it should be possible to do this independently of the TV volume;
- the user should be able to adjust speech characteristics like speed, pitch, voice type, when applicable;
- the TTS engine should announce abbreviations in a manner suited to the context, for example: "IEC" should be announced "I E C"; and "IEEE" should be announced "I triple E". The TTS engine may also pronounce common acronyms in full, e.g. "sub" could be spoken as "subtitles" where appropriate;
- the TTS engine should announce numbers in a manner suited to the context, e.g. as a natural number, digit-by-digit, etc.;
- the TTS engine should announce proper nouns (e.g. names, place names) correctly;
- levels of announcement quality are at the discretion of the implementers; the following are examples of the implementation in order to achieve good levels of quality:
 - consider ways to update the vocabulary database and conversion rules of the TTS engine;
 - consider provision of additional information (= metadata) to help the TTS engine for pronunciations or readings;
 - consider ways in which device users can provide service providers with feedback on incorrectly announced terms.

6.3 Functionality: TV

The TV determines the user interface, i.e. what is displayed on the screen, and how the TV interacts with the user. The TV therefore also determines which text is sent to the TTS engine.

The TV can receive updated words, associated conversions and updated conversion rules for the TTS engine via a network connection.

The user should be able to control, via the TV TTS, settings such as volume, speed, pitch, voice type.

NOTE In Europe, to fulfil basic accessibility needs, the TV is expected to comply with SELFC.

6.4 Setting up: TV, TTS device combination

TTS audio guidance may be given during the installation of a receiver. TTS audio guidance for receiver installation should adhere to the following requirements when implemented:

- the requirements of 6.1 should apply;
- the user should be able to easily switch on the TTS audio at the beginning of the installation;
- all essential information to complete the installation procedure should be available as TTS audio; special attention should be given to inform the user about the progress of slow processes such as channel searches.

Additional suggestions for TTS audio guidance during receiver installation may be found in DTG-UG024.

7 TV events and TTS data

7.1 TV context and events

The TV can output data in response to events and events can take place in different contexts. The following TV contexts can exist (this list is not necessarily exhaustive):

- watching TV: the user watches TV;
- list: the user browses a (channel) list;
- (acc-)menu: the user browses through the (accessibility) menu structure of the TV. If the menu contains accessibility services, it is called an accessibility menu, or acc-menu. An example of an accessibility service is audio description;
- EPG: the user browses the EPG;
- standby: the TV is on stand-by;
- timeshift: the user may start a timeshift recording or play a timeshift recording.

The following contexts are currently outside the scope of this specification and are to be considered for future versions of this specification:

- interactive TV;
- pay-TV.

Within said contexts, the following events may occur:

- channel change: the TV changes channels after the user initiated a change channel event, e.g. by pressing a button on the remote control;
- additional information: the TV presents additional information on the item shown. This item may be the event shown on the display, but may also be a highlighted menu item, etc. Additional information may be presented, for example after the user has pressed the "info" button on the remote control;
- navigation and selection: the TV highlights another item in, for example, a list or menu. The user selects an item;
- context switch: the TV switches to another context, for example from watching TV to showing a menu;
- pop-up message: the TV puts a message on the screen for some purpose, for example PIN required, or gives status information.

The TV is expected to output data after an event to the TTS device using the TV-TTS interface. These data contain an indication of the event and the TTS data to be announced.

The different TV contexts and the events that may occur in a certain context are graphically shown in Figure 2. Figure 2 lists the events in a certain context and shows the possible transitions between the different contexts. It also shows that in the menu context it is possible to switch to (sub) menus.

Figure 2 – Context event state diagram

7.2 TTS data per event

7.2.1 Details

Subclauses 7.2.2 to 7.2.6 specify which TTS data the TV shall output to the TTS device/engine given a specified event.

7.2.2 Channel change

7.2.2.1 General

A channel change event outputs data on the newly selected channel. Channel change typically only occurs in the watch TV context.

7.2.2.2 Watch TV context

A channel change event in the watch TV context shall at least output the following TTS data for the newly selected channel if present:

- <channel number>;
- <service name>;
- <present (DTV broadcast) event name>;
- <audio description y/n>.

A channel change event in the watch TV context may also output the following other recommended TTS data if present:

- <present (DTV broadcast) event start time>;

- f) <present (DTV broadcast) event end time or duration>;
- g) <next (DTV broadcast) event name>;
- h) <next (DTV Broadcast) event start time>;
- i) <next (DTV Broadcast) event end time or duration>;
- j) <audio description yes/no next (DTV broadcast) event>.

7.2.3 Additional information

7.2.3.1 General

An additional information event shall output the additional available information on the selected/highlighted item as shown on the TV screen as TTS data.

NOTE The TV channel shown on the TV is a "selected item", i.e. it is the selected channel.

Additional information typically occurs in the watch TV, EPG, and timeshift contexts.

7.2.3.2 Watch TV context

An additional information event in watch TV context may also output the following other recommended information as TTS data:

- a) <(DTV broadcast) event synopsis>;
- b) <parental rating>;
- c) <next (DTV broadcast) event synopsis>;
- d) <presence of subtitles y/n>;
- e) <next (DTV broadcast) event parental rating>;
- f) <encrypted y/n>;
- g) <DTV broadcast event classification>.

7.2.3.3 EPG context

An additional information event in the EPG context may also output the following other recommended TTS data:

- a) <(DTV broadcast) event synopsis>;
- b) <parental rating>;
- c) <subtitle availability>;
- d) <languages available>.

7.2.3.4 Timeshift context

An additional information event in the timeshift context may output the following data on an event or service to be recorded or to be played back:

- a) <(DTV broadcast) event synopsis>;
- b) <parental rating>;
- c) <subtitle availability>.

7.2.4 Navigation and selection

7.2.4.1 General

A navigation and selection event shall output as TTS data/audio the (new) highlighted item. The TV shall output as TTS data/audio a selected and/or changed item.

The highlighted item may only be fully understandable in context with other items on the screen. In this case, these other items should also be output as TTS data. For example: in a matrix type of EPG, the x,y position of the highlighted item also represents information. In this case, the contents of the x -axis and y -axis at the position of the highlighted item should also be output as TTS data.

7.2.4.2 List context

The generic requirements for navigation and selection in 7.2.4.1 apply.

7.2.4.3 (Acc-)Menu context

The generic requirements for navigation and selection in 7.2.4.1 apply.

7.2.4.4 EPG context

The generic requirements for navigation and selection in 7.2.4.1 apply. The TV shall output as TTS data the individual elements listed below if also displayed on screen:

- a) channel number,
- b) service name,
- c) audio description (if available),
- d) event name,
- e) event start time,
- f) event end time or duration.

The TV should output as TTS data:

- g) subtitles (if available) (broadcast icon).

For usability reasons, when moving within a service in the EPG, it is recommended that the TV does not repeat the <channel number> and <service name>.

This list does not mandate a specific order of enunciation of these items.

7.2.4.5 Timeshift context

The generic requirements for navigation and selection in 7.2.4.1 apply. Typically it may be expected that, in this context, the commands play, pause, rewind, forward, stop, and record are covered.

7.2.5 Context switch

7.2.5.1 General

A context switch event shall output as TTS data the context name and may output guidance on how to operate in the selected context. Guidance data may be on what type of buttons can be used and what actions they trigger.

Guidance data on how to operate in a certain context is up to the manufacturer. Examples of guidance data:

- "You are in the EPG context. Use navigation buttons. Up/down navigation will run you through all channels. Left/right navigation will run you through the time schedule."
- "You are in the TV menu. Use up/down and OK to operate the menu."

7.2.5.2 Watching TV context

The same TTS audio for a channel change event in the watching TV context shall be output as TTS audio when entering the watching TV context from the standby context.

7.2.5.3 List context

When entering the list context, the TV shall output as TTS data:

- <list title>.
- <number of list items>.

7.2.5.4 (Acc-) Menu context

When entering the (acc-) menu context, the TV shall output as TTS data:

- <menu title>.
- <number of menu items>.

7.2.5.5 EPG Context

When entering the EPG context, the TV shall output as TTS data:

- <highlighted item>.

The TV may also output as TTS data:

- <EPG overview>: shortly describe EPG,
- <EPG filter setting applied>.

The TV shall output as TTS data if the <highlighted item> is an (DTV Broadcast) event and is shown on screen:

- a) <channel number>.
- b) <service name>.
- c) <audio description y/n>, <present (DTV broadcast) event name>.
- d) <present (DTV broadcast) event start time>.
- e) <present (DTV broadcast) event end time or duration>.

The TV should output as TTS data:

- f) <subtitles (if available) >.

7.2.5.6 Standby context

When entering standby, the user should be notified that the receiver is switching to standby.

7.2.5.7 Timeshift context

When entering timeshift, the user should be notified that the receiver is switching to a context for timeshifting.

7.2.5.8 Currently not supported contexts

The contexts for interactive TV and pay-TV are currently outside the scope of this specification. It is recommended to inform the user when entering an unsupported context and to inform the user on how to leave the said context again.

7.2.6 Pop-up message

For a visually impaired user, pop-up messages often constitute an insurmountable access barrier, unless fully supported by the TTS device. The visually impaired user shall be made aware of the occurrence of the pop-up, its contents in full and what action is required from the user in order to proceed. Pop-up messages are often modal, thus preventing the user from exercising normal control and navigation until the pop-up has been dismissed.

The user shall be informed of any warnings and notifications, such as tuning issues or PIN control. When a pop-up message appears on the screen, it should output as TTS data:

- <notification of pop-up>,
- <description of pop-up>.

TTS audio on changing status information shall be provided regularly and after completion. It is not required to provide for TTS audio at every update.

8 TTS profiles

8.1 Basic profile

A TV with integrated TTS or a TV-TTS device combination shall at least support the basic profile. The basic profile shall support TTS audio as specified in the event and context clauses for the following events and contexts:

- channel change event:
 - watch TV context;
- navigation and selection event:
 - list context,
 - acc-menu context,
 - EPG context;
- additional information event:
 - watch TV context;
- context switch event:
 - list context,
 - standby context,
 - acc-menu context,
 - EPG context;
- pop-up message event.

NOTE A channel change event can be seen as a special case of a navigation event.

8.2 Main profile

The main profile shall support TTS audio as specified in the event and context clauses for the following events and contexts:

- channel change event:
 - watch TV context;
- navigation and selection event:
 - list context,
 - acc-menu context,
 - menu context,

- EPG context;
- additional information event:
 - watch TV context;
- context switch event:
 - list context,
 - standby context,
 - acc-menu context,
 - menu context,
 - EPG context;
- pop-up message event.

8.3 Enhanced profile

The enhanced profile shall support TTS audio as specified in the event and context clauses for the following events and contexts:

- channel change event:
 - watch TV context;
- navigation and selection event:
 - list context,
 - acc-menu context,
 - menu context,
 - EPG context,
 - timeshift context;
- additional information event;
 - watch TV context,
 - EPG context,
 - timeshift context;
- context switch event:
 - list context,
 - standby context,
 - acc-menu context,
 - menu context,
 - EPG context,
 - timeshift context;
- pop-up message event.
