Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Part 2: Spatial Audio Object Coding (SAOC)

AMENDMENT 4: SAOC Conformance

Add Clause 10, Conformance testing:

10 Conformance testing

10.1 Introduction

This clause specifies conformance criteria for both bitstreams and decoders compliant with the SAOC standard as defined in Clauses 1 to 9 and Annexes A to G. This is done to assist implementers and to ensure interoperability.

10.2 Terms and definitions

The terms and definitions as stated in Clause 3 apply. Furthermore, the following terms and definitions will be used throughout this clause.

bitstream data encoded according to the SAOC standard

conformance test bitstream bitstream used for testing the conformance of an SAOC decoder.

10.3 SAOC conformance testing

5.5 defines the SAOC profiles and levels. Some conformance criteria apply to SAOC in general, while others are specific to the specific SAOC profile and its levels. Conformance shall be tested for the level of the profile with which a given bitstream or decoder/transcoder claims to comply.

10.4 Bitstreams

An SAOC bitstream shall have the syntax and semantics as specified in Clauses 1 to 9 and Annexes A to G. The present subclause defines the conformance criteria that shall be fulfilled by a compliant bitstream. These criteria are specified for the syntactic elements of the bitstream and for some parameters decoded from the SAOC bitstream payload.

10.5 SAOC decoder/transcoder

10.5.1 Characteristics

10.5.1.2 General

The SAOC decoder/transcoder can be implemented in two different versions:

- High Quality (HQ) SAOC
- Low Power (LP) SAOC

10.5.2 Test procedure

10.5.2.1 Downmix decoders

An SAOC decoder/transcoder can be used in combination with a downmix decoder. In this case, the downmix decoder shall fulfill the conformance criteria that are applicable to it. Nevertheless, for the conformance test procedure, the PCM coding shall be applied to a downmix signal.

10.5.2.2 SAOC decoder/transcoder test procedure

With regard to the definition and further details of the conformance criterion RMS/LSB being used to test SAOC decoders/transcoders, reference is made to ISO/IEC 14496.

The conformance test procedure for SAOC decoders/transcoders internally creates a reference for comparison, given the conformance test sequence and the output from the decoder under test as outlined in Figure AMD1.3.

Figure — AMD1.3 — Block diagram of the SAOC decoding/transcoding conformance test procedure

The relevant signals and data are:

- Data from the conformance test sequence:
 - bs: SAOC bitstream from the conformance test sequence;
 - rend: rendering information from the conformance test sequence;
 - dmx: SAOC downmix signal from the conformance test sequence.
- Outputs for comparison from the SAOC decoder/transcoder implementation instances:
 - $upmix^{REF}/dmx_bs^{REF}$: output from the reference SAOC decoder/transcoder;
 - $upmix^{TEST}/dmx_bs^{TEST}$: output from the SAOC decoder/transcoder under test;
 - $Param./mps_bs^{REF}$: Parametric or/and MPS data from the reference SAOC decoder/transcoder;
 - $Param./mps_bs^{TEST}$: Parametric or/and MPS data from the SAOC decoder/transcoder under test.
- Conformance test modes:
 - SAOC test (RMS/LSB comparison): This module calculates the difference signals between the output from the SAOC decoder/transcoder under test and the internal reference. The maximum amplitude of the difference signal (Diff max) as well as the RMS of the difference signal are calculated. The conformance criteria are specified with respect to PCM-sample in the range $-32768 \dots 32767$.
 - Param test (ASCII comparison): This module calculates the difference between the obtained output parameters (e.g. MPS data) from the SAOC decoder/transcoder under test and the internal reference.

10.5.3 Test sequences

To test SAOC decoder/transcoder, ISO/IEC JTC 1/SC 29 supplies a number of test sequences. The naming convention of these bitstreams is as follows: The first part of the name (the part preceding the first underscore) specifies the downmix format. The second part of the name (between the first and the last underscore) specifies the properties of the test sequence in question according to Table AMD1.4. For

each test sequence, the SAOC test (RMS/LSB comparison) and/or Param test (ASCII comparison) are applied according to Table AMD1.5.
