C.3 Application management - application data structure construction error conditions

This appendix provides the test data and expected results, as described in Annex A.1.3, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.3.

C.4 Application management - second application data structure construction

This appendix provides the test data and expected results, as described in Annex A.1.4, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.4.

       <invocationType>RETURN</invocationType>
       <description>Return of previous SAL Proxy call: Create the management
     external certificate DID. The management
          external certificate DID is used to provide an external party with full
     privileges. First create the DIDs then
          restrict the DID modification permissions. The modification access
     rules refer to the Internal and External DIDs.
          This DID is actually a Simple Assertion DID, not an Client Application
     External Authenticate with Certificates DID.
          This simplifies the test case.</description>

C.5 Data manipulation - card application path

This appendix provides the test data and expected results, as described in Annex A.1.5, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.5.

  <layerName>SAL</layerName>
  <method>cardApplicationConnect</method>
  <invocationType>CALL</invocationType>
  <description>Pre-condition: Ensure the A00000041000010001 card application
exist. This shall automatically invoke Open
      on the TC layer and then EstablishContext on the IFDProxy as
connectivity to the smartcard host has not yet been
      established. Then it shall invoke connect on the IFDProxy. In turn
connect shall be invoked on the IFD layer on the
      client side. After connect has completed, transmit on the IFDProxy
shall be invoked to transmit the
      CardApplicationConnect APDU to the Alpha card application. If the
sessionIdentifier field in the ChannelHandle is
      null then the SAL Proxy shall create a new TC connection. If the
sessionIdentifier field is not null then the TC
      connection must exist at this point. In this case sessionIdentifier is
null. Ensure that the card application exists
      at the following location: Host: http://smartcard-host.net; IFD Name:
Blue IFD Reader SN2432A4; Slot: 1. The
      smartcard path shall be replaced when comparing the results to those
from an ISO247272 stack.</description>

      <description>Return of previous SAL Proxy call: Pre-condition: Ensure the
    A00000041000010001 card application exist.
        This shall automatically invoke Open on the TC layer and then
    EstablishContext on the IFDProxy as connectivity to the
        smartcard host has not yet been established. Then it shall invoke
    connect on the IFDProxy. In turn connect shall be
        invoked on the IFD layer on the client side. After connect has
    completed, transmit on the IFDProxy shall be invoked
        to transmit the CardApplicationConnect APDU to the Alpha card
    application. If the sessionIdentifier field in the
        ChannelHandle is null then the SAL Proxy shall create a new TC
    connection. If the sessionIdentifier field is not null
        then the TC connection must exist at this point. In this case
    sessionIdentifier is null. Ensure that the card
        application exists at the following location: Host: http://smartcard-
    host.net; IFD Name: Blue IFD Reader SN2432A4;
        Slot: 1. The smartcard path shall be replaced when comparing the
    results to those from an ISO247272 stack.</description>

  <invocationType>RETURN</invocationType>
  <description>Return of previous SAL Proxy call: Retrieve all slots that
contain an ISO24727 smartcard that contain a
     card application named A00000041000010001. First invoke
IFD.EstablishContext as it has not yet been invoked. Then
     invoke IFD.GetStatus to return all available slots that contain a
smartcard. A SAL.CardApplicationConnect action
     shall be invoked for each IFD slot that contains a smartcard. Each
successful SAL.CardApplicationConnect action shall
     also have a corresponding SAL.CardApplicationDisconnect
action.</description>

C.6 Data manipulation – general

This appendix provides the test data and expected results, as described in Annex A.1.6, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.6.

        <invocationType>RETURN</invocationType>
        <description>Return of previous SAL Proxy call: Pre-condition: Connect to
      the A00000041000010001 card application.
        This shall automatically invoke Open on the TC layer and then
      EstablishContext on the IFDProxy as connectivity to the
        smartcard host has not yet been established. Then it shall invoke
      connect on the IFDProxy. In turn connect shall be
        invoked on the IFD layer on the client side. After connect has
      completed, transmit on the IFDProxy shall be invoked
        to transmit the CardApplicationConnect APDU to the Alpha card
      application. If the sessionIdentifier field in the
        ChannelHandle is null then the SAL Proxy shall create a new TC
      connection. If the sessionIdentifier field is not null
```

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011
