  <method>didCreate</method>
  <invocationType>CALL</invocationType>
  <description>Create the internal certificate DID. The internal certificate
DID is used to verify that this is a valid
      smartcard. First create the DIDs then restrict the DID modification
permissions. The modification access rules refer
      to the Internal and External DIDs. One of these may not have yet been
created. This DID is actually a Simple
      Assertion DID, not an Client Application Asymmetric Internal
Authentication DID. This simplifies the test case.
      Ensure that multiple DIDs with the same name can exist in multiple card
applications.</description>

 <description>Transmit the command APDU from the SAL Proxy to the IFD layer.
Extended APDUs are used between the IFD
     Proxy and the IFD. The APDU contains the DER encoded SAL call object
from the previous SAL Proxy call.</description>

B.5 Data manipulation - card application path

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements the ENVELOPE APDU) as described in Annex A.1.5, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.5.

  <invocationType>CALL</invocationType>
  <description>Pre-condition: Ensure the A00000041000010001 card application
exist. This shall automatically invoke Open
     on the TC layer and then EstablishContext on the IFDProxy as
connectivity to the smartcard host has not yet been
     established. Then it shall invoke connect on the IFDProxy. In turn
connect shall be invoked on the IFD layer on the
     client side. After connect has completed, transmit on the IFDProxy
shall be invoked to transmit the
     CardApplicationConnect APDU to the Alpha card application. If the
sessionIdentifier field in the ChannelHandle is
     null then the SAL Proxy shall create a new TC connection. If the
sessionIdentifier field is not null then the TC
     connection must exist at this point. In this case sessionIdentifier is
null. Ensure that the card application exists
     at the following location: Host: http://smartcard-host.net; IFD Name:
Blue IFD Reader SN2432A4; Slot: 1. The
     smartcard path shall be replaced when comparing the results to those
from an ISO247272 stack.</description>

  <method>cardApplicationConnect</method>
  <invocationType>RETURN</invocationType>
  <description>Return of previous SAL Proxy call: Pre-condition: Ensure the
A00000041000010001 card application exist.
      This shall automatically invoke Open on the TC layer and then
EstablishContext on the IFDProxy as connectivity to the
      smartcard host has not yet been established. Then it shall invoke
connect on the IFDProxy. In turn connect shall be
      invoked on the IFD layer on the client side. After connect has
completed, transmit on the IFDProxy shall be invoked
      to transmit the CardApplicationConnect APDU to the Alpha card
application. If the sessionIdentifier field in the
      ChannelHandle is null then the SAL Proxy shall create a new TC
connection. If the sessionIdentifier field is not null
      then the TC connection must exist at this point. In this case
sessionIdentifier is null. Ensure that the card
      application exists at the following location: Host: http://smartcard-
host.net; IFD Name: Blue IFD Reader SN2432A4;
      Slot: 1. The smartcard path shall be replaced when comparing the
results to those from an ISO247272 stack.</description>

B.6 Data manipulation – general

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements the ENVELOPE APDU) as described in Annex A.1.6, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual

  <description>Pre-condition: Connect to the A00000041000010001 card
application. This shall automatically invoke Open
     on the TC layer and then EstablishContext on the IFDProxy as
connectivity to the smartcard host has not yet been
     established. Then it shall invoke connect on the IFDProxy. In turn
connect shall be invoked on the IFD layer on the
     client side. After connect has completed, transmit on the IFDProxy
shall be invoked to transmit the
     CardApplicationConnect APDU to the Alpha card application. If the
sessionIdentifier field in the ChannelHandle is
     null then the SAL Proxy shall create a new TC connection. If the
sessionIdentifier field is not null then the TC
     connection must exist at this point. In this case sessionIdentifier is
null. Ensure that the card application exists
     at the following location: Host: http://smartcard-host.net; IFD Name:
Blue IFD Reader SN2432A4; Slot: 1. The
     smartcard path shall be replaced when comparing the results to those
from an ISO247272 stack.</description>

  <invocationType>RETURN</invocationType>
  <description>Return of previous SAL Proxy call: Pre-condition: Connect to
the A00000041000010001 card application.
     This shall automatically invoke Open on the TC layer and then
EstablishContext on the IFDProxy as connectivity to the
     smartcard host has not yet been established. Then it shall invoke
connect on the IFDProxy. In turn connect shall be
     invoked on the IFD layer on the client side. After connect has
completed, transmit on the IFDProxy shall be invoked
     to transmit the CardApplicationConnect APDU to the Alpha card
application. If the sessionIdentifier field in the
     ChannelHandle is null then the SAL Proxy shall create a new TC
connection. If the sessionIdentifier field is not null
     then the TC connection must exist at this point. In this case
sessionIdentifier is null. Ensure that the card
     application exists at the following location: Host: http://smartcard-
host.net; IFD Name: Blue IFD Reader SN2432A4;
     Slot: 1. The smartcard path shall be replaced when comparing the
results to those from an ISO247272 stack.</description>

B.7 Data manipulation - global authentication

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements the ENVELOPE APDU) as described in Annex A.1.7, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.7.
