C.7 Data manipulation - global authentication

This appendix provides the test data and expected results, as described in Annex A.1.7, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.7.

C.8 Application management - data structure destruction

This appendix provides the test data and expected results, as described in Annex A.1.8, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.8.

Annex D
(informative)

TLS implementation ICC-Resident stack expected component test inputs and outputs

All ASN.1 TLV encoded data enforces Destinguished Encoding Rules (DER).

The default pathsecurity shall be TLS 1.0.

D.1 Application management - alpha card-application data structure construction

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements TLS) as described in Annex A.1.1, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.1.

D.2 Application management - first application data structure construction

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements TLS) as described in Annex A.1.2, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.2.

D.3 Application management - application data structure construction error conditions

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements TLS) as described in Annex A.1.3, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.3.
