Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

ISO/IEC 24727-5 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 17, *Cards and personal identification*.

ISO/IEC 24727 consists of the following parts, under the general title *Identification cards — Integrated circuit card programming interfaces*:

— *Part 1: Architecture*

— *Part 2: Generic card interface*

— *Part 3: Application interface*

— *Part 4: Application programming interface (API) administration*

— *Part 5: Testing procedures*

— *Part 6: Registration authority procedures for the authentication protocols for interoperability*

Introduction

ISO/IEC 24727 is a set of programming interfaces for interactions between integrated circuit cards (ICCs) and external applications to include generic services for multi-sector use. The organization and the operation of the ICCs conform to ISO/IEC 7816-4.

ISO/IEC 24727 is relevant to ICC applications desiring interoperability among diverse application domains.

ISO/IEC 7498-1:1994, *Information technology — Open Systems Interconnection — Basic Reference Model: The Basic Model*, is used as the layered architecture of the client-application to card-application connectivity. That is, the client-application, through the Application Interface, assumes that there is a protocol stack through which it will exchange information and transactions among card-applications using commands conveyed through the message structures defined in ISO/IEC 7816. The semantics of action requests through the interface defined in ISO/IEC 24727-3 refers to application protocol data units (APDUs) as characterized through the interface defined in ISO/IEC 24727-2 and in the following International Standards:

— ISO/IEC 7816-4:2005, *Identification cards — Integrated circuit cards — Part 4: Organization, security and commands for interchange*

— ISO/IEC 7816-8:2004, *Identification cards — Integrated circuit cards — Part 8: Commands for security operations*

— ISO/IEC 7816-9:2004, *Identification cards — Integrated circuit cards — Part 9: Commands for card management*

The goal of ISO/IEC 24727 is to maximize the applicability and solution space of software tools that provide application interface support to card-aware client-applications. This effort includes supporting the evolution of card systems as the cards become more powerful, peer-level partners with existing and future applications while minimizing the impact to existing solutions conforming to this part of ISO/IEC 24727.

This part of ISO/IEC 24727 specifies an application-independent and implementation-independent testing regimen through which conformance of specific implementations to the relevant part of ISO/IEC 24727 can be confirmed. It is assumed that such testing will be performed through test environments and procedures developed in accordance with this part of ISO/IEC 24727.

Identification cards — Integrated circuit card programming interfaces —

Part 5: Testing procedures

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

1 Scope

ISO/IEC 24727 is a set of programming interfaces for interactions between integrated circuit cards and external applications to include generic services for multi-sector use.

This part of ISO/IEC 24727 specifies conformance testing procedures designed to determine if interfaces developed with the ISO/IEC 24727 series meet the requirement of ISO/IEC 24727. By conforming to this part of ISO/IEC 24727, interoperable implementations of ISO/IEC 24727 can be realized.

Test procedures for ISO/IEC 24727-2, ISO/IEC 24727-3 and ISO/IEC 24727-4 are described with sufficient detailing in support of ISO/IEC 24727 interoperability requirements, i.e. the connectivity, ISO/IEC 24727 security mechanisms and discovery mechanisms between the client-application and the card-application. This part of ISO/IEC 24727 defines calls on ISO/IEC 24727-3 in an ordered sequence. It also defines the confirmation of integrity of transmitted data by an implementation under test, as well as the syntax of that data received from the implementation under test for the marshalling procedures defined in ISO/IEC 24727-3 and ISO/IEC 24727-4.

For each test procedure, the conditions required for its execution are defined, along with the conditions under which it has to be executed and the expected results. Structures and entities used for the tests, as well as a common set of recurring sequences used for the various procedures, are identified and documented in this part of ISO/IEC 24727.

2 Normative references

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1
certification
formal confirmation of successful conformance testing by a certified party

3.2
component
executable code comprising a processing layer accessed with ISO/IEC 24727 defined application programming interfaces

[ISO/IEC 24727-4:2008]

3.3
component-under-test
ISO/IEC 24727 component being tested

3.4
conformance-testing
formal demonstration that a component complies with specified critera established by a standard

3.5
conformance-vector
concatenation of the tuple element values

3.6
dimension-of-conformance
tuple element of a conformance-vector

3.7
native-implementation
on-card implementation connected to ISO/IEC 24727-2 layer either directly or via a procedural element

3.8
card-application emulator
processing component accessed through the interface device application programming interface (IFD-API) that simulates the behaviour of a smart card-application

3.9
card emulator
processing component accessed through the interface device application programming interface (IFD-API) that simulates the behaviour of a card

3.10
stack-configuration
series of processing components connected by communication channels that connect a client-application to a card-application as specified by the ISO/IEC 24727-4 protocol stacks

3.11
test-component
ISO/IEC 24727 trusted component that is provided and used by the testee

3.12
test-environment
systems, personnel and standard procedures to perform conformance-testing

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

© ISO/IEC 2011 – All rights reserved

3.13
test-implementation
ISO/IEC 24727 stack including the component(s) under test and testing components

3.14
testing-body
organization providing a test-environment, test-implementation and means to perform conformance-testing

4 Symbols and abbreviated terms

ACA	alpha card application
ACD	application capability description
ACL	access control list
AK	asymmetric key
APDU	application protocol data unit
API	application programming interface
AR	access rule
CA	card application
CCD	card capability description
CIA	cryptographic information application
CUT	component under test
DER-TLV	distinguished encoding rules – tag length value
DF	dedicated file
DID	differential identity
DS	data set
DSI	data structure for interoperability
EF	elementary file
GCI	generic card interface
IFD	interface device
MF	master file
PC/SC	personal computer / smart card consortium
RMI	reference model implementation
RFU	reserved for future use
SAL	service access layer

TLS transport layer security

5 Testing methodology

ISO/IEC 24727 establishes the facilities for interoperability through the specification of a number of interfaces. Independent implementations of each interface shall be interchangeable and thus provide for interoperability at each interface. Consequently, ISO/IEC 24727 enables a wide variety of interoperability. This part of ISO/IEC 24727 shall provide a methodology for conformance-testing such that distinct interface implementations can be affirmed as being interchangeable with other independent implementations.

The testing methodology assumes a test-environment that presents standard characteristics that include:

1) Equipment configuration interfaces

2) Test-implementations

3) Test-specifications

Given these standard characteristics a testing-body can make use of this test-environment to confirm the behaviour of the various interfaces through which interoperability is enabled.

This part of ISO/IEC 24727 does not test the following:

1) Tests for quality, performance, robustness

2) Testing of standards and protocols that are referenced within

3) Testing of proprietary card application services, their creation and execution

4) Error conditions that cannot be produced by a correctly functioning implementation

5.1 Terms of testing

5.1.1 Purpose of testing

The purpose of ISO/IEC 24727-5 is to provide testing specifications at a level that allow independent testing bodies to conduct testing with the assurance of independent equivalent results.

5.1.2 Testing objective

The objective of ISO/IEC 24727-5 is to specify a testing regimen that enables independent, equivalent implementations. Independent testing bodies can thereby evaluate conformance to ISO/IEC 24727 with equivalent results. Levels of certification can then indicate which component or set of components is ISO/IEC 24727 conformant.

5.1.3 Testing Principles

The testing principles are derived from the ISO/IEC 24727 objective of interoperability. Interoperability is achieved by specifying interfaces and behaviour through which a component is accessed. Since each component is tested independently there will be varying levels of conformance and a distinct set of certification levels will be defined that address single components as well as a concatenation of components that form ISO/IEC 24727 component-configurations.

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

 © ISO/IEC 2011 – All rights reserved

ISO/IEC 24727-5 defines test configurations and unique parameters to be applied uniformly to each component for different implementations to assure conformance.

It is assumed that automated testing tools can be used for:

- the generation of test data that is used as input and output during testing to ensure that all user data is differs for each test execution;
- consistent definition;
- performance of tests; and
- result reporting.

ISO/IEC 24727 certification is enabled through ISO/IEC 24727-5 tests that can be administered by testing bodies.

Table 1 —Testing Principles

	Principle
1.	To attain conformance, all aspects of the ISO/IEC 24727 interfaces for the Component-under-test shall comply with ISO/IEC 24727.
2.	ISO/IEC 24727-5 testing shall only include behavioural testing at the component interfaces.
3.	Testing shall encompass one or more of the following ISO/IEC 24727 components: i. ASN.1 DER-TLV defined APIs; ii. communication interfaces; iii. C language bindings for API marshalling and binding of the APIs; iv. stack configurations; v. authentication protocols.
4.	A test facility shall provide a reference test implementation that permits a component under test to be tested in a complete stack test configuration.
5.	The use of automated testing tools is assumed for generating tests and to aid the certification process.
6.	ISO/IEC 24727-5 should enable the development of conformance and certification testing abilities to be derived in a consistent manner.
7.	Every component under test shall be subject to tests defined at the ISO/IEC 24727-3 API.
8.	Only services and actions as defined by ISO/IEC 24727-3 shall be tested. The testing of proprietary services, actions and the associated creation and loading of these is out of scope.
9.	Test inputs and results shall vary each time a test is performed in order to ascertain that tests are not predictable.
10.	ISO/IEC 24727-3 testing verifies the request and response of the interface and the APDUs it generates.
11.	ISO/IEC 24727-3 proxy testing verifies the request and response of the interface plus the DER-TLV that it generates.
12.	ISO/IEC 24727-3 (including proxy) tests shall be run against blank and populated (partially provisioned) smart cards.
13.	Interoperability is only fully tested in the C language implementation (until other language binding is provided)
14.	Any other languages shall use an agent to translate the messages (e.g. DER-TLV) into language

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

© ISO/IEC 2011 – All rights reserved

	Principle
	specific bindings.
15.	Data transfer over communication channels is intercepted by a "man in the middle" and compared to the test data (protocol analysers).
16.	The only testable interface at the card application is the ISO/IEC 24727-3 on-card implementation.
17.	Only IFD API syntax (i.e. the structure and not the containing data) shall be tested. The testing of data contained within the IFD API syntax is out of scope.
18.	Only TC API syntax shall be tested. The testing of data contained within the TC API syntax is out of scope.
19.	Testing of procedural element low-level coding and functions is out of scope
20.	Testing of other standards that are referenced within ISO/IEC 24727 is out of scope
21.	Testing of other protocols (i.e. not ISO/IEC 24727 authentication protocols) that are referenced within ISO/IEC 24727 is out of scope
22.	Testing of error conditions that cannot be produced by a correctly functioning implementation is out of scope
23.	Testing of proprietary services, actions and the associated creation and loading of these is out of scope.
24.	The standard shall not test application specific software module.
25.	Checking of CIA updates is out of scope.

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

5.1.4 GCI under test:

The GCI under test shall be submitted to test that shall confirm the following minimum set features:

- Whenever procedural elements are present, all the incoming APDUs that are part of the GCI shall be submitted to these procedural elements. Therefore, the GCI under test capability to handle the request and response APDUs shall be tested. The GCI under test shall pass on the request APDU from SAL to Procedural Elements, and the response APDU from the ICC to procedural elements. The procedural elements testing component shall require a “probe” to prove such APDU processing.

- GCI under test shall be capable to parse CCD and to ensure availability of interoperability data to the SAL. The CCD content shall be retrieved according to the bootstrap mechanism. Some CCD data object values may be loaded from remote location specified in the CCD.

- GCI under test capability to deliver upon request the CCD content to the SAL.

- ISO/IEC 24727-2 interface (request and response) (only for C language binding).

- GCI under test capability to handle request APDUs with CLA=’FF’ (packageA) intended for GCI internal/resources management

- GCI under test capability to forward any APDU that is neither part of ISO/IEC 24727-2 Table 2 nor Table 3 directly to ICC without any processing.

- GCI under test capability to call IFD-API functions.

5.1.5 SAL under test:

The SAL under test shall be submitted to test that shall confirm the following minimum set features:

© ISO/IEC 2011 – All rights reserved

- SAL shall be able to recover the whole data mapping between off-card data representation an on-card data representation using the CIA containing within the ACD.
- SAL shall be enabled to parse the CIA values and to generate all the discovery data and to encode it according to ISO/IEC 24727-3, Annex C ASN.1 normative definitions.
- Upon or prior to the call to CardApplicationEndSession action, any change impacting the CIA entries (as per ISO/IEC 24727-2) that occurred during the transaction shall be updated in the CIA that is either stored or referenced in the ACD.
- The retrieved (by ISO/IEC 24727-3) CIA must reflect the card implementation and any changes that have been applied.
- ISO/IEC 24727-3 interface (request and response) (only for C language binding), generated APDUs and ASN.1 DER-TLV (for proxies)
- The off-card SAL shall be enabled to act on client-application requests according to the related ACL (e.g denied actions shall not be translated into APDUs)
- SAL claiming compatibility with a given Authentication Protocol shall prove capability to translate generic requests into specific set of request APDUs according to the Protocol OID description and the rest of information provided in the DID bearing this Protocol.
- Authentication protocols that are internal to ISO/IEC 24727-3 are tested using a trusted test implementation below the ISO/IEC 24727-3 layer.
- Authentication protocols that are internal to ISO/IEC 24727-3 are tested using a trusted test ISO/IEC 24727-3 implementation.
- Specified authentication protocol algorithms and their use are verified by the trusted test components.
- DIDCreate and DIDUpdate requests shall uniquely be executed by the SAL according to existing specification of these requests parameters in ISO/IEC 24727-3, Annex A.
- SAL shall be enabled to translate ExecuteAction requests into IFD-API calls without resorting to GCI under test layer. The SAL shall be able to extract the parameter “request” from within ExecuteAction call and to deliver it unchanged as InputAPDU parameter to the Transmit command from IFD-API.
- SAL shall be enabled to process post-issuance personalization data as a separate package of requests. This package is comprised of the following SAL-API calls:
    i) DIDCreate
    ii) DIDUpdate
    iii) DataSetCreate
    iv) DSICreate

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

5.1.6 Conformance attainment

For a component-under-test to attain conformance all its mandatory features, as defined in all other parts of ISO/IEC 24727, shall be implemented.

All tests contained within ISO/IEC 24727-5 shall be mandatory for each relevant component-under-test.

Distinct tests shall identify the component-under-test interface behaviour.

© ISO/IEC 2011 – All rights reserved

A test report shall be generated stating what aspects of the component-under-test interface do and do not conform to ISO/IEC 24727.

Testing shall be performed on a single component or on component-configurations comprising one or more of the stack models specified in ISO/IEC 24727-4.

The following clause identifies a conformance-vector comprised of a tuple of dimension-of-conformance. The dimensions of this conformance-vector are defined by ISO/IEC 24727 component, ISO/IEC 24727-3 authentication protocol, ISO/IEC 24727-4 stack, ISO/IEC 24727-4 marshalling and cryptographic algorithms.

5.2 Conformance vector

Four distinct criteria can be identified for each testable implementation. These criteria are entitled dimension-of-conformance.

1) ISO/IEC 24727 component

2) ISO/IEC 24727-3 authentication protocol

3) ISO/IEC 24727-4 stack configuration

4) ISO/IEC 24727-4 marshalling

5) ISO/IEC 24727 cryptographic algorithms

A bit-mask is applied to the possible values of these dimensions-of-conformance and by concatenating these bit-masks to form a five-tuple, a conformance-vector is established that will provide a quantitative indicator of the level of conformance of a particular testable-interface. Table 2 provides values for the dimension-of-conformance.

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

Conformance indicator bit set from 26 to 32 shall be Reserved for Future Use (RFU).

5.3 Structure of tests

Specification of conformance tests shall address three distinct testing domains:

1) Basic (atomic) tests across the allowed range of status responses

2) Processing tests

3) Discoverability tests

4) Operational tests

© ISO/IEC 2011 – All rights reserved

Considering that an application programming interface is comprised of distinct requests or functions. For each request or function, a series of tests shall be defined to exercise the request and elicit the complete range of status responses that a specific request can support. These are the basic or "atomic" tests.

Figure 1 — Testable data in transfer between CUTs depicts the CUT and the data transered between each component. When testing components in the ICC-Resident stack the protocol structure as well as the data encapsulated within that protocol shall be tested. Data transferred between non ICC-Resident stack model components can vary to a large degree, therefore only the protocol structure shall be tested and not the data contained within.

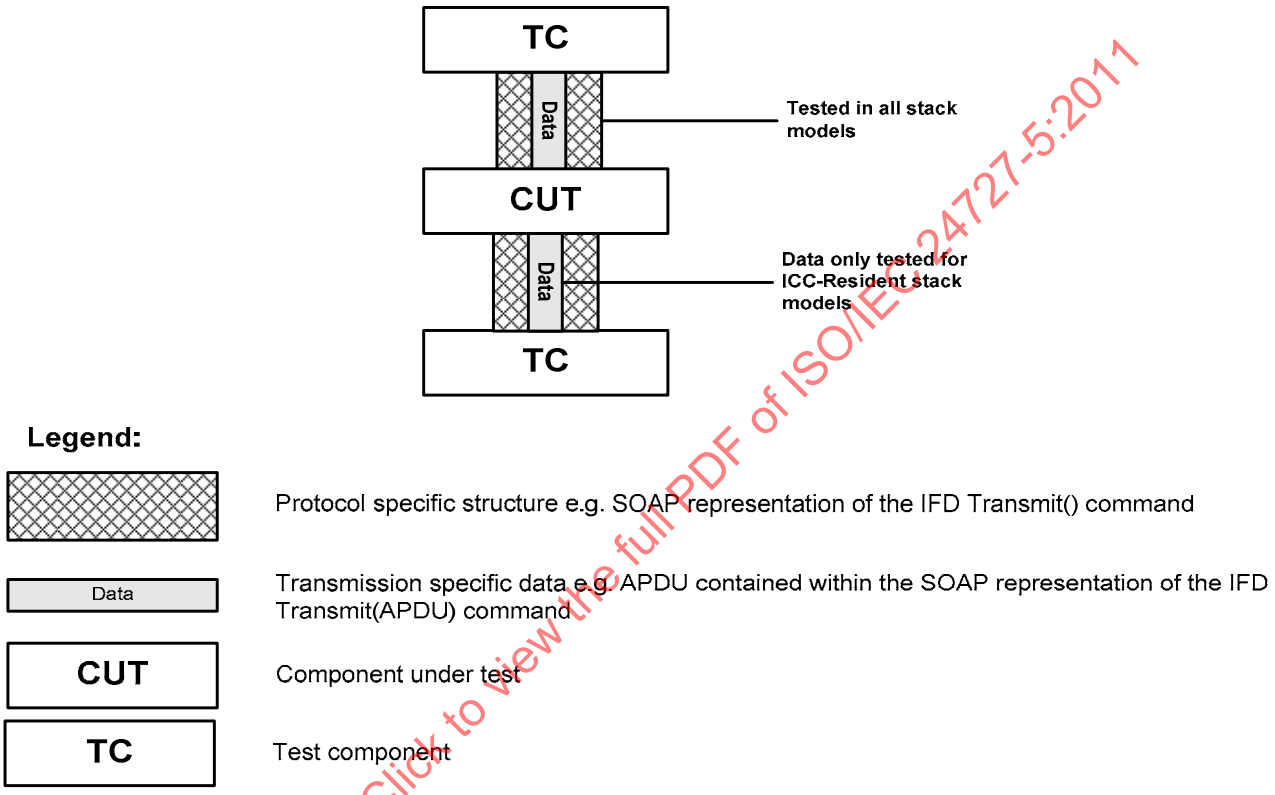

Figure 1 — Testable data in transfer between CUTs

A more comprehensive set of tests shall be defined to completely exercise all of the requests that the specific interface encompasses. Such tests shall comprise inter-related tests; that is, testing sequences of requests that may be related through their individual impact on the target(s) of the interface. These sets of tests are refered to as processing tests.

An alternative yet still comprehensive set of tests shall be defined to fully exercise the complete life-cycle of the targets of interfaces. These sets of tests are aimed at exercising application level utilization of an interface. These sets of tests are termed operational tests.

In the following clauses, sets of tests in these three domains shall be specified.

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

© ISO/IEC 2011 – All rights reserved

5.4 Test environment

5.4.1 Stack configurations

The components that will facilitate the testing shall be implemented as a full network stack, that both provide a programming language agnostic API as well as the program language specific binding interface. Each test component must be interchangeable with a given component-under-test. No ISO/IEC 24727 implementation shall be tested remotely i.e. all elements to be tested shall be tested in the given test environment. Two possible constraints apply to the components under test.

If the component under test is intended to reside on the same machine as the stack used for testing, it shall provide a program specific language binding for the interfaces through which it communicates.

If the component under test is intended to be accessed through a network, it shall provide network connectivity by supporting at least one standard marshalling and at least one secure transmission protocol for the interfaces it supports.

5.4.2 Card-application emulators

Within the stack used for testing, a card emulator or card-application emulator (depending on what is to be tested) may be used instead of an actual smart card.

5.4.3 Verification and logging capability of components

Each test component shall have the capability to verify that all action performed upon it and commands received by it are valid. A log shall be kept of all actions and input and output parameters for a given component. This log may be generated through an internal debugging system or a man in the middle interception between components. The generated log shall contribute to the final conformance test report.

5.4.4 Procedural element

A test procedural element shall exist and be used during ISO/IEC 24727-2 conformance testing. The test procedural element shall take the test APDU as an input argument and forward that APDU to the GCI this process is described in detail in clause 6.2. The purpose of the test procecdural element is not to test the functionality of a given procedural element, but rather the ISO/IEC 24727-2 implementation under test conformance to integrate procedural elements.

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

6 Components

6.1 Service access layer API

6.1.1 Basic tests

All service actions defined in ISO/IEC 24727-3 shall be tested according to clauses 6 through to and including clause 12 of ISO/IEC 24727-3 and the returned values shall be checked to be compliant to ISO/IEC 24727-3, clauses 6 through to and including clause 12.

6.1.2 Discoverability tests

Figure 2 — Discoverability testing ISO/IEC 24727-3 implementation shows the structure of the component under test for an ISO/IEC 24727-3 implementation.

© ISO/IEC 2011 – All rights reserved

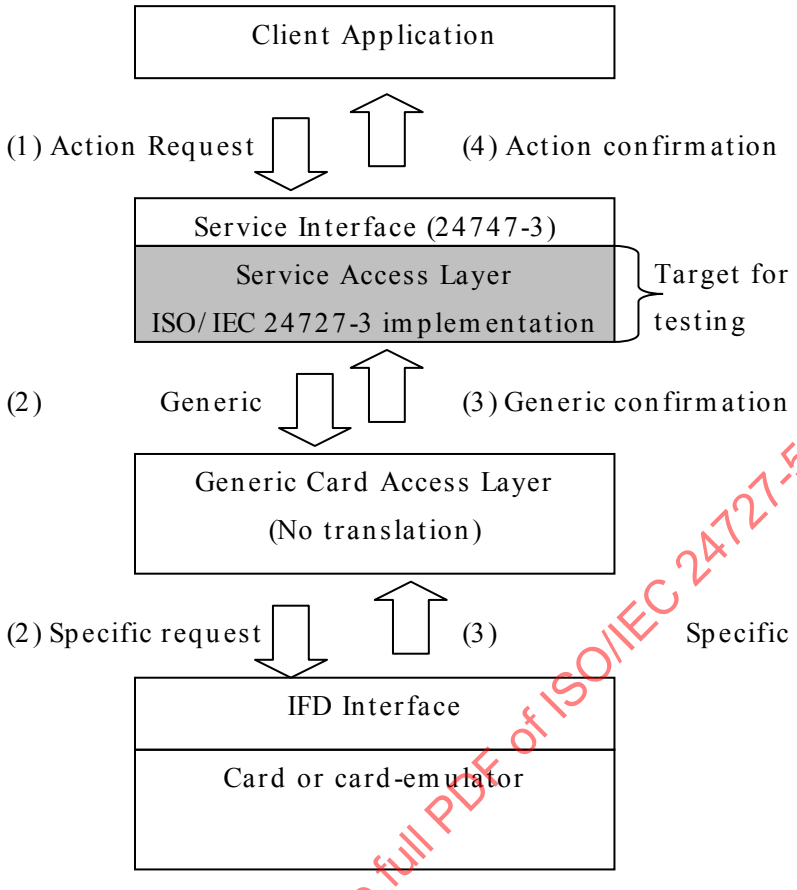

Figure 2 — Discoverability testing ISO/IEC 24727-3 implementation

The purpose of the test is to evaluate that the CUT i.e. the SAL shall be capable to bootstrap the CIA component retrieved from the CCD or from a location as defined within the CCD.

Figure 3 — Discoverability test for ISO/IEC 24727-3 with TC ICC depicts how a test-component (TC) shall be used to test ISO/IEC 24727-3 discoverability via consumption of a trusted procedural element that has been discovered from the TC components.

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

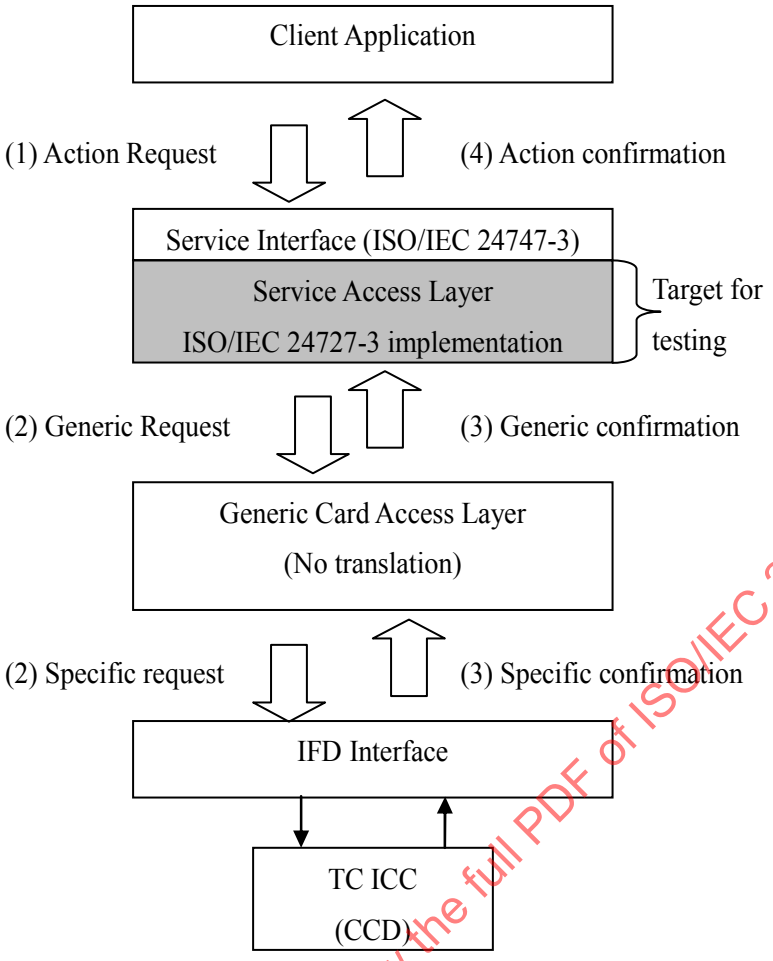

Figure 3 — Discoverability test for ISO/IEC 24727-3 with TC ICC

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

These tests shall use a trusted TC ICC or equivalent software module (e.g. card-application-emulator) that contains a CCD that will perform specific mapping between the off-card data representation and the on-card data representation as defined below.

The test shall use a TC ICC or card-application-emulator to bootstrap a Cryptographic Information Application (CIA) component that shall perform:

— An action that takes a DSIName as a parameter. The mapping between the DSIName (i.e. off-card data representation) and the file identifier (i.e. on-card data representation) is contained with in the CIA of the trusted TC ICC. The test shall confirm that the SAL has correctly performed the mapping between the off-card DSIName and the on-card file identifier. If a non ICC-Residential stack model is under test that does not cater for Package "A" commands as specified in ISO/IEC 24727-2 clause 5.1.3 Table 2 then these tests shall not be performed.

— The required actions in order to create a DSI (e.g. DSIName = DSI1). The session with the TC ICC shall be ended and the connection terminated. A new connection to the TC ICC shall be established and the CIA shall be bootstrapped during the Initialize action. An action shall be performed that takes a DSIName (i.e. DSI1) as a parameter. The mapping between the DSIName (i.e. off-card data representation) and the file identifier (i.e. on-card data representation) has been created during the previous sequence and shall be contained with in the CIA of the trusted TC ICC. The test shall confirm that the SAL has correctly performed the mapping between the off-card DSIName (i.e. DSI1) and the on-card file identifier that was created during the previous sequence. If a non ICC-Residential stack model is under test that does not cater for Package "B" commands as specified in ISO/IEC 24727-2 clause 5.1.3 Table 2 then these tests shall not be performed.

© ISO/IEC 2011 – All rights reserved

6.2 Generic card interface

6.2.1 Basic test

All commands defined in ISO/IEC clause 5.1.3, package A shall be tested according to the limitations given in Table 2 of ISO/IEC 24727-2 and the status returned shall be checked to be compliant to ISO/IEC 24727-2, clause 5.3. Commands defined in ISO/IEC 24727-2, clause 5.3 package B, may be subject to the same procedure

6.2.2 Processing tests

All GCI APDUs defined in ISO/IEC 24727-2 clause 5.1.3 Table 2 shall trigger the *"Transmit"* function of the IFD API, with the input of that *"Transmit"* function being the APDUs generated by the procedural element.

The ENVELOPE command defined in ISO/IEC 24727-4 clause 5.5 shall be the input and trigger the *"Transmit"* function of the IFD API without being passed into the procedural element.

The following GCI APDUs defined in ISO/IEC 24727-2 clause 5.1.3 Table 3 shall not trigger a request of the IFD API but shall be processed within the GCI itself i.e. these are not passed into the procedural element:

- SELECT PROCEDURAL ELEMENT (CLA = 'FF')
- GET DATA (CLA = 'FF')
- PUT DATA (CLA = 'FF')

Table 3 — GCI commands to IFD API mapping shall map the GCI APDUs defined in ISO/IEC 24727-2 clause 5.1.3 Table 3 to the relevant IFD API functions.

6.2.3 Discoverability tests

Figure 4 — Discoverability testing ISO/IEC 24727-2 implementation shows the structure of the component under test for an ISO/IEC 24727-2 implementation.

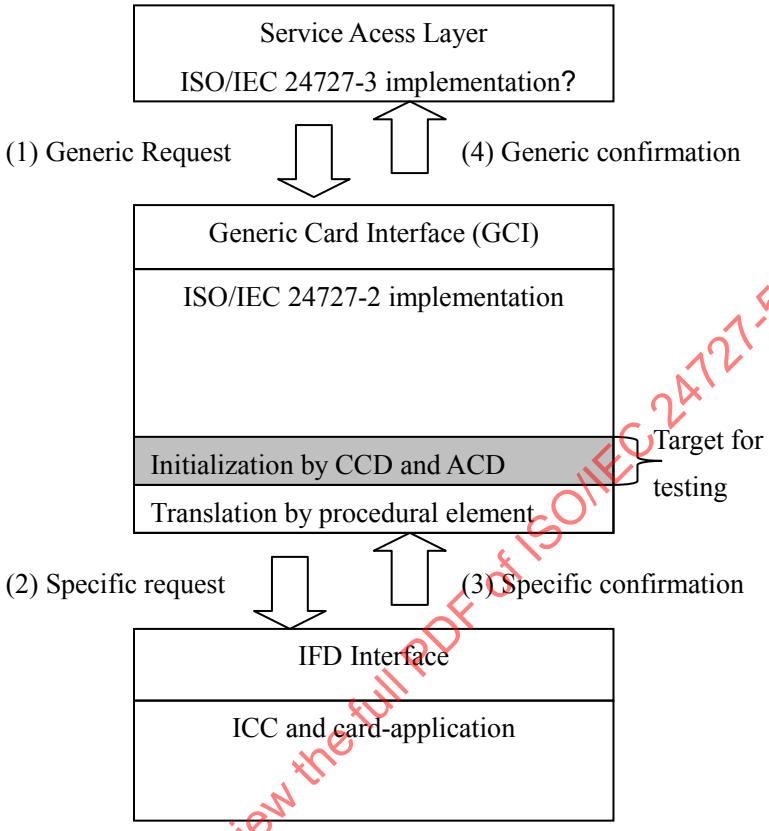

Figure 4 — Discoverability testing ISO/IEC 24727-2 implementation

The purpose of the test is to evaluate that the software module under test has the interoperable functions, especially following three functions specific to ISO/IEC 24727-2.

APDU request/response defined in clause 5.1.3 Table 2 of ISO/IEC 24727-2 shall not be independently tested.

The translation of ISO/IEC 24727-2 defined APDUs to any commands by the procedural element shall not be tested.

6.2.3.1 Discovery Mechanism

Testing shall evaluate that the software module under evaluation supports all CCD and ACD retrieval procedures defined in ISO/IEC 24727-2 and returns the expected return codes. The return code may differ within the content of retrieved CCD and ACD information, especially with and without signature on the procedural element.

6.2.3.2 Testing Mechanism

Figure 5 — Discoverability test for ISO/IEC 24727-2 with TC ICC depicts how a test-component (TC) shall be used to test ISO/IEC 24727-2 discoverability via consumption of a trusted procedural element that has been discovered from the TC components.

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

© ISO/IEC 2011 – All rights reserved

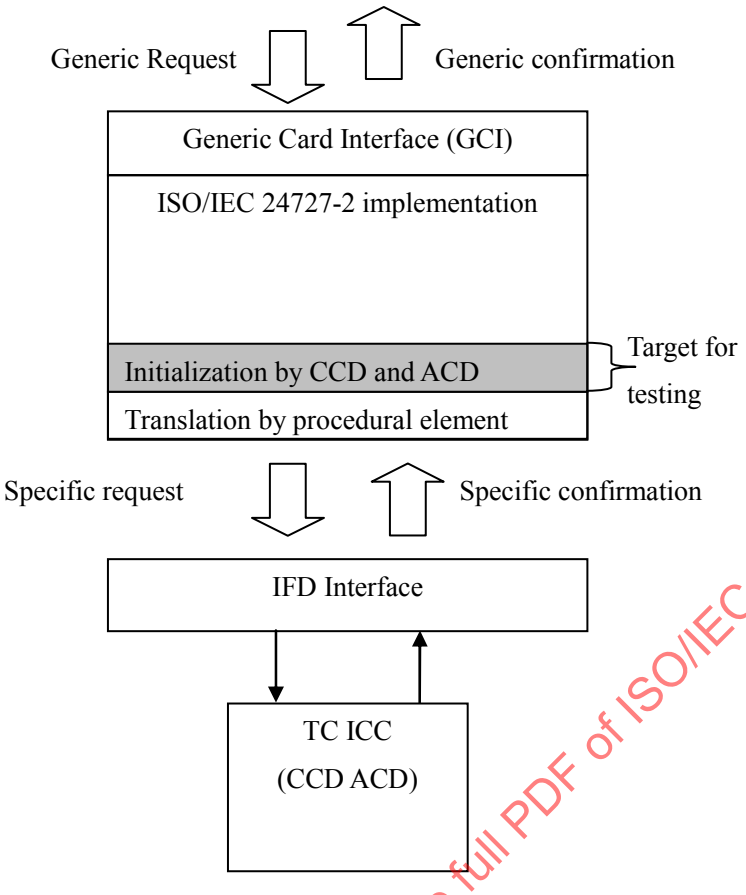

Figure 5 — Discoverability test for ISO/IEC 24727-2 with TC ICC

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

These tests shall use a trusted TC ICC or equivalent software component (e.g. card-application-emulator) that contains a CCD and ACD that will perform specific APDU translationas defined below.

The test shall use a TC ICC or card-application-emulator to bootstrap a procedural element that shall:

— Receive a request APDU as defined in ISO/IEC 24727-2 clause 5.1.3 Table 2 and transform the class byte from '00' to '01' i.e. the request APDU passed into the procedural element shall contain a CLA = '00' and the output (i.e. the request APDU) from the procedural element request APDU shall contain a CLA '01'.

— Receive a response APDU with a status word of '9000' and transform the status word to '9001' i.e. the response APDU passed into the procedural element shall have a SW1 = '90' and SW2 = '00' the output from the procedural element shall contain a response APDU that shall have a SW1 = '90' and SW2 = '01'.

6.2.4 Generic card interface acted on ISO/IEC 24727-2 implementation (i.e. CLA = "FF")

6.2.4.1 Basic test

The support of commands with CLA=FF defined in ISO/IEC 24727-2 clause 5.1.3, Table 3 are not necessarily supported at the GCI.

If the implementation is expected to support them, they shall be tested according to the limitations given in Table 3 of ISO/IEC 24727-2 and the status returned shall be checked to be compliant to ISO/IEC 24727-2, clause 5.3

© ISO/IEC 2011 – All rights reserved

6.2.4.2 Application oriented tests

The purpose of those tests is to verify that the GCAL implementation translates correctly the APDUs received at the GCI into the proper command at the IFD API

6.3 Interface device API

The IFD API shall be tested by intercepting the data communication flow between the CUT during operational testing as defined in clause 10. The format of the IFD data encapsulation mechanism shall be verified; the actual transmitted data shall only be verified for data sent between ICC-Resident stack components (i.e. Appendix A) as this is the only stack model for which the transfer data shall not vary.

Refere to Annex E for example data structures.

6.4 Trusted channel API

The trusted channel API is implementation specific and therefore cannot be tested in a generic way. In order for an ISO/IEC 24727 implementation to claim trusted channel compliance the API shall be tested using a approved ISO/IEC 24727 binding.

The trusted channel consists of two remote components and each transmission of data shall be tested by comparing the input into the TC_API_Write function with the corresponding output of the TC_API_Read function.

6.4.1 TC_API_Open

This function shall be invoked during the ISO/IEC 24727-3 Initialize action if the TC channel is not already open.

Tests shall confirm that a channelHandle is returned by this function upon processing valid input parameters as defined by ISO/IEC 24727-4 clause 7.3.1.

6.4.2 TC_API_Close

This function shall be invoked during the ISO/IEC 24727-3 Terminate action if the TC channel was opened using the ISO/IEC 24727-3 Initialize action.

Tests shall confirm that the tursted channel is closed by this function upon processing the channelHandle input parameter of a valid established trusted channel as defined by ISO/IEC 24727-4 clause 7.3.2.

6.4.3 TC_API Write

This function shall be invoked during all ISO/IEC 24727-3 actions.

Tests shall confirm that a message can be written to the trusted channel as defined by ISO/IEC 24727-4 clause 7.3.4.

6.4.4 TC_API Read

This function shall be invoked during all ISO/IEC 24727-3 actions.

Tests shall confirm that a message can be read from the trusted channel as defined by ISO/IEC 24727-4 clause 7.3.3.

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

© ISO/IEC 2011 – All rights reserved

6.5 SAL on-card implementation component testing

The SAL on-card implementation is the only on-card implementation that shall be tested. The test cases for this CUT shall be identical to those of the SAL off-card component, that is the actions and their associated parameters shall be DER/TLV encoded and wrapped in either the APDU or TCP/IP web server based interface as defined in ISO/IEC 24727-4.

7 Authentication protocols

7.1 General

An authentication protocol consists of two components, the on-card implementation and the off-card implementation. The off-card implementation of the authentication protocol may either be implemented in the SAL layer or by the client application.

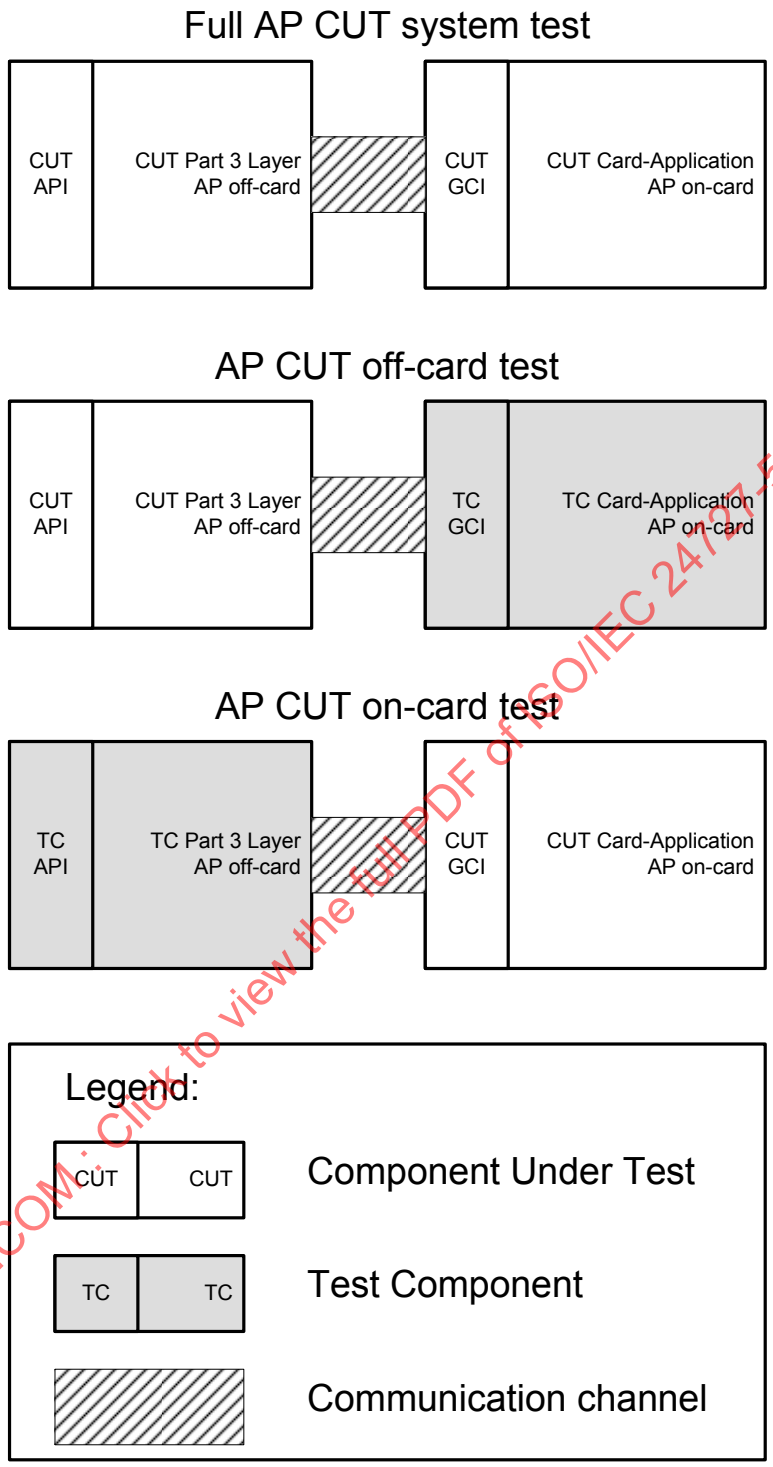
The whole authentication protocol details are handled by the SAL unless the DIDAuthenticate() or CardApplicationStartSession() request conveys authenticationProtocolData that can be processed by both the client-application and the SAL.

For an authentication protocol to achieve conformance, two types of tests shall be performed:

1) The off-card CUT shall be tested independently by using a card-application emulator that shall provide the required on-card functionality of the authentication protocol under test.

2) The on-card CUT shall be tested in conjunction with the off-card CUT.

All authentication protocols shall be actioned as described in ISO/IEC 24727-3 and all necessary authenticationProtocolData parameters shall be constructed as defined in ISO/IEC 24727-2, Annex A.



Authentication protocols shall be tested by the implementor providing the on-card and off-card CUT. The testing facility shall provide the equivelant trusted on-card and off-card TC. The CUT shall be verified by passing the test scenarios defined in clauses below that shall be executed using the following combinations of CUT and TC:

- Full authentication protocol components under test system testing
- Authentication protocol components under test off-card testing, where the on-card CUT is replaced with the on-card TC.
- Authentication protocol components under test on-card testing, where the off-card CUT is replaced with the off-card TC.

This concept is described in Figure 6 — Authentication protocol testing strategy.

Figure 6 — Authentication protocol testing strategy

7.2 SAL security test sequences

The SAL test sequences for authentication protocols shall not test any functionality of the qualifier that is contained within the DID for a specific authentication protocol.

© ISO/IEC 2011 – All rights reserved

7.2.1 Cryptographic operations

All authentication protocols shall be tested for the cryptographic actions that they support as well as for the correct error condition i.e. return codes, when a specific cryptographic action is not supported by the authentication protocol under test.

7.2.1.1 Test sequences for supported cryptographic functionality

Table 4 through Table 10 define the tests for cryptographic actions if these are supported by the authentication protocol under test.

7.2.1.1.1 Encipher

Table 4 — Encipher – Action supported

Row number	*Action*	*Parameters*	*Return data*	*Description*
1	Encipher	As defined in ISO/IEC 24727-3 clause 10.2	return code = API_OK cipherText = the cipher of the plain text passed into this action	Test for correct execution of the Encipher action

7.2.1.1.2 Decipher

Table 5 — Decipher – Action supported

Row number	*Action*	*Parameters*	*Return data*	*Description*
1	Decipher	As defined in ISO/IEC 24727-3 clause 10.3	return code = API_OK plainText = plain text that is the deciphered cipher text passed into this action	Test for correct execution of the Decipher action

7.2.1.1.3 GetRandom

Table 6 — GetRandom – Action supported

Row number	*Action*	*Parameters*	*Return data*	*Description*
1	GetRandom	As defined in ISO/IEC 24727-3 clause 10.4	return code = API_OK random = random value	Test for correct execution of the GetRandom action

8 Secure messaging

Secure messaging shall be tested by securing a specific APDU with the symmetric keys as defined below. All expected results shall be met in order to comply with ISO/IEC 24727-4 secure messaging.

The session encryption key shall be:

```
E0:E1:E2:E3:E4:E5:E6:E7:E8:E9:EA:EB:EC:ED:EE:EF
```

The session MAC key shall be:

```
F0:F1:F2:F3:F4:F5:F6:F7:F8:F9:FA:FB:FC:FD:FE:FF
```

The encryption and MAC algorithms to be used for secure messaging are defined in ISO/IEC 24727-4 Annex A.

The request APDU payload data shall be:

```
A1:A2:A3:A4:A5:A6:A7:A8:A9:AA:AB:AC:AD:AE:AF
```

The original request APDU shall be (the envelope command is to be used for this test):

```
00:C2:00:00:0F:A1:A2:A3:A4:A5:A6:A7:A8:A9:AA:AB:AC:AD:AE:AF:00
```

The send sequence counter (SSC) for the encryption of the request APDU shall be:

```
D0:D1:D2:D3:D4:D5:D6:D7:D8:D9:DA:DB:DC:DD:00:03
```

The MAC input data shall be:

```
0C:C3:00:00:80:00:00:00:00:00:00:00:00:00:00:00:85:20:12:4F:F4:BA:0E:EF:2D:7B:2E:
95:99:29:D2:BC:F2:D2:80:08:81:6B:11:17:AE:E7:E4:90:01:F4:56:AC:4B:D0:97:02:00:00
```

The constructed and encrypted request APDU shall be:

```
0C:C3:00:00:00:00:38:85:20:12:4F:F4:BA:0E:EF:2D:7B:2E:95:99:29:D2:BC:F2:D2:80:08:
81:6B:11:17:AE:E7:E4:90:01:F4:56:AC:4B:D0:97:02:00:00:8E:10:32:D2:55:3A:53:6D:6F:
95:1D:78:A1:D8:F0:26:33:8C:00:00
```

IECNORM.COM : Click to view the full PDF of ISO/IEC 24727-5:2011

© ISO/IEC 2011 – All rights reserved

The response APDU payload data shall be:

```
C0:C1:C2:C3:C4:C5:C6:C7:C8:C9:CA:CB:CC:CD:CE:CF:90:00
```

The send sequence counter (SSC) for the encryption of the response APDU shall be:

```
D0:D1:D2:D3:D4:D5:D6:D7:D8:D9:DA:DB:DC:DD:00:04
```

The constructed and encrypted response APDU shall be:

```
85:20:33:8E:F1:C6:3E:6B:15:C2:DD:52:05:FE:24:7F:49:3B:C7:36:26:E8:13:30:EA:ED:CC:
65:7A:57:51:E7:08:C6:99:02:90:00:8E:10:AF:D0:65:92:AC:B1:0E:12:D9:19:4C:8B:01:3C:
46:A9:90:00
```

9 Marshalling

9.1 ASN.1 representation

All ASN.1 representations defined in ISO/IEC 24727-3, Annex C shall be DER/TLV encoded in accordance with *"ISO/IEC 8825-1, Information technology — ASN.1 encoding rules: Specification of Basic Encoding Rules (BER), Canonical Encoding Rules (CER) and Distinguished Encoding Rules (DER)".*

The DER/TLV encoded ISO/IEC 24727-3 actions and/or the APDUs that are sent between the SAL Proxy API and the SAL Agent API are specified in Annex A of this part of ISO/IEC 24727.

9.2 Web-services representation

All WSDL representations defined in ISO/IEC 24727-4, Annex B shall be adhered to for IFD communications between the IFD Agent and IFD Proxy using SOAP services. If communication occures that does not use SOAP services than the IFD XML representation does not have to be SOAP wrapped, in this case the the IFD XML shall comply to the ISO/IEC 24727-4 Annex B ISOIFD.XSD definition.

The WSDL structures of the IFD interface are defined in clause 6.3 of this part of ISO/IEC 24727.

10 Stack configuration testing

All stack models defined in ISO/IEC 24727-4 shall be implemented using one or more components defined in ISO/IEC 24727-2, 3 and 4. In order to test these stack models the data transferred between the components shall be verified during test execution. This clause is based on the stack configurations as defined in ISO/IEC 24727-4 clause 5 Architecture specialization and identifies the testable interfaces for each component.

10.1 Testable interface definitions

Table 40 identifies the ISO/IEC 24727 component APIs (Interface B), the calling components (Interface A) and the data format that is transmitted between these components. Each possible combination of communication channel between components is assigned an Interface ID. The Interface ID is referenced in the appropriate stack model configurations in Figures 7 to 12.

11 Operational testing

Operational testing is performed by applying a predefined sequence of actions on the ISO/IEC 24727-3 layer. The ISO/IEC 24727-3 layer is the only component that is static across all stack model implementations. Data transfer packets shall be intercepted between each layer and verified against expected results.

The system under test shall implement the simple assertion protocol in order to test ACL, DID and AR creation and functionality.

Operational testing shall include successful tests and failure tests.

© ISO/IEC 2011 – All rights reserved

11.1 SAL test sequences

The following test sequences:

- Application management - alpha card-application data structure construction
- Application management - first application data structure construction
- Application management - application data structure construction error conditions
- Application management - second application data structure construction
- Data manipulation - card application path
- Data manipulation - general
- Data manipulation - global authentication
- Application management - data structure destruction

shall be run repediatly to ascertain that the data structure destruction deletes all constructs created during data structure construction.

Test descriptions are defined in Annex A.

12 Operational test reporting

Upon completion of conformance testing a test report shall be generated that will detail the dimension-of-conformance of the ISO/IEC 24727 implementation under test. Failure to achieve a specified dimension-of-conformance shall result in a report that details why a specific component-under-test did not achieve the targeted dimension-of-conformance.

Test reports shall be generated automatically taking into account verification and logging data as well as test specific results, based on expected inputs and output of the various components under test.

13 ISO/IEC 24727-6 authentication protocol testing

ISO/IEC 24727-6 authentication protocols shall follow the same guidelines of conformance testing as the ISO/IEC 24727-3 authentication protocols as defined in clause 7.

For an authentication protocol to achieve conformance, two types of tests need to be performed:

1) The off-card CUT shall be tested independently by using a card-application emulator that shall provide the required on-card functionality of the authentication protocol under test.

2) The on-card CUT shall be teste in conjunction with the off-card CUT.

All authentication protocols shall be actioned as described in ISO/IEC 24727-3 and all necessary authenticationProtocolData parameters shall be constructed as defined in ISO/IEC 24727-6.

13.1 SAL test sequences

13.1.1 ISO/IEC 24727-6 defined authentication protocol

Table 41 shall be used as a template to define the tests required to ascertain that a specific implementation of this authentication protocol conforms to the specifications.

Table 41 — Protocol Sequence – ISO/IEC 24727-6 defined authentication protocol

ID	*Action*	*Possible ISO/IEC 24727-2 command translation*	*Description*

13.2 Reference model implementations

It is the responsibility of an authentication protocol submission to provide the required application oriented tests as well as a reference model implementation that may be used to verify the functionality of any test components constructed by the test laboratory. The RMI submission may be accompanied by its source code, which may aid in the implementation of the test components.

13.2.1 Off card-application

The off card-application RMI shall be encapsulated in a functional ISO/IEC 24727 component that is to be deployed off-card (e.g. client application, SAL proxy, or SAL). The provided implementation shall be a fully functional, stand alone, ISO/IEC 24727 off card component that can substitute a component under test. The RMI component may not be ISO/IEC 24727 verified.

13.2.2 Card-application emulator or test card use

The on card-application RMI may be provided as either a card-application emulator or a test card itself. The emulator or test card must be fully ISO/IEC 24727 functional but may not be ISO/IEC 24727 verified.

The ISO/IEC 24727-2 test emulator or card shall conform to ISO/IEC 24727-2 and the ISO/IEC 24727-3 emulator or card shall conform to ISO/IEC 24727-3.

Annex A
(normative)

SAL operational test sequence descriptions

This annex provides a description of the tests and parameters defined in Annex B and Annex C. Annex A.1.1 to Annex A.1.8 represent defined scenarios that shall test the functionality of the components under test.

The following tests contain some environment and context specific parameters that may not be applicable to all test environments. All parameters shall be varied as defined in ISO/IEC 24727-5 clause 5.1.3 Testing Principles, principle number nine (9), which states:

"Test inputs and results shall vary each time a test is performed in order to ascertain that tests are not predictable."

The following tests define the expected inputs and outputs if the parameters are as defined within these tests. Expected inputs and outputs shall be adjusted, in accordance with the standard, when these parameters vary.

A.1 Application management – alpha card-application data structure construction

This scenario shall test the alpha card-application by constructing defined data structures and their security features. All tests shall pass i.e. not failure testing.

Detailed test data for each CUT is defined in Annex B.1, Annex C.1 and Annex D.1.

A.2 Application management – first application data structure construction

This scenario shall test the creation of a card-application other than the alpha card-application as well as data structures and their associated security features. All tests shall pass i.e. not failure testing.

Detailed test data for each CUT is defined in Annex B.2, Annex C.2 and Annex D.2

Table A.2 —SAL Sequence – Application management – first application data structure construction

A.3 Application management – application data structure construction error conditions

This scenario shall test error conditions that are associated with data construction and their associated security conditions.

Detailed test data for each CUT is defined in Annex B.3, Annex C.3 and Annex D.3

Table A.3 —SAL Sequence – Application management – application data structure construction error conditions

A.4 Application management – second application data structure construction

This scenario shall test the creation of an additional card-application other than the alpha card-application as well as data structures and their associated security features. All tests shall pass i.e. not failure testing.

Detailed test data for each CUT is defined in Annex B.4, Annex C.4 and Annex D.4

Table A.4 —SAL Sequence – Application management – second application data structure construction

ID	Action	Arguments	Description
1	*initialize*	*InitializeCall transactionIdentifier: null*	*Initialise the SAL Proxy.*
1	*initialize*	*InitializeReturn transactionIdentifier: null returnCode: API_OK*	*Return of previous SAL Proxy call: Initialise the SAL Proxy.*

A.8 Application management - data structure destruction

This scenario shall test the destruction of a card-applications as well as data structures and their associated security features. This scenario shall return the smart card to its original state.

Detailed test data for each CUT is defined in Annex B.8, Annex C.8 and Annex D.7

Table A.8 —SAL Sequence – Application management - data structure destruction

Annex B
(informative)

Envelope APDU implementation ICC-Resident stack expected component test inputs and outputs

All ASN.1 TLV encoded data enforces Destinguished Encoding Rules (DER).

The transactionIdetifier is OPTIONAL and if it does not exist it may not be returned. If an empty transactionIdentifier is returned then it shall be encoded as “05 00” i.e. NULL.

The default pathsecurity shall be TLS 1.0

B.1 Application management - alpha card-application data structure construction

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements the ENVELOPE APDU) as described in Annex A.1.1, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.1.

  <invocationType>CALL</invocationType>
  <description>Pre-condition: Connect to the Alpha card application. This
shall automatically invoke Open on the TC
      layer and then EstablishContext on the IFDProxy as connectivity to the
smartcard host has not yet been established.
      Then it shall invoke connect on the IFDProxy. In turn connect shall be
invoked on the IFD layer on the client side.
      After connect has completed, transmit on the IFDProxy shall be invoked
to transmit the CardApplicationConnect APDU to
      the Alpha card application. If the sessionIdentifier field in the
ChannelHandle is null then the SAL Proxy shall
      create a new TC connection. If the sessionIdentifier field is not null
then the TC connection must exist at this
      point. In this case sessionIdentifier is null. The smartcard path shall
be replaced when comparing the results to
      those from an ISO247272 stack.</description>

  <method>cardApplicationConnect</method>
  <invocationType>RETURN</invocationType>
  <description>Return of previous SAL Proxy call: Pre-condition: Connect to
the Alpha card application. This shall
     automatically invoke Open on the TC layer and then EstablishContext on
the IFDProxy as connectivity to the smartcard
     host has not yet been established. Then it shall invoke connect on the
IFDProxy. In turn connect shall be invoked on
     the IFD layer on the client side. After connect has completed, transmit
on the IFDProxy shall be invoked to transmit
     the CardApplicationConnect APDU to the Alpha card application. If the
sessionIdentifier field in the ChannelHandle is
     null then the SAL Proxy shall create a new TC connection. If the
sessionIdentifier field is not null then the TC
     connection must exist at this point. In this case sessionIdentifier is
null. The smartcard path shall be replaced
     when comparing the results to those from an ISO247272
stack.</description>

B.2 Application management - first application data structure construction

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements the ENVELOPE APDU) as described in Annex A.1.2, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.2.

  <method>didCreate</method>
  <invocationType>CALL</invocationType>
  <description>Create the internal certificate DID. The internal certificate
DID is used to verify that this is a valid
     smartcard. First create the DIDs then restrict the DID modification
permissions. The modification access rules refer
     to the Internal and External DIDs. One of these may not have yet been
created. This DID is actually a Simple
     Assertion DID, not an Client Application Asymmetric Internal
Authentication DID. This simplifies the test case.
     Ensure that multiple DIDs with the same name can exist in multiple card
applications.</description>

  <description>Return of previous SAL Proxy call: Create the management
external certificate DID. The management
     external certificate DID is used to provide an external party with full
privileges. First create the DIDs then
     restrict the DID modification permissions. The modification access
rules refer to the Internal and External DIDs.
     This DID is actually a Simple Assertion DID, not an Client Application
External Authenticate with Certificates DID.
     This simplifies the test case.</description>

B.3 Application management - application data structure construction error conditions

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements the ENVELOPE APDU) as described in Annex A.1.3, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.3.

B.4 Application management - second application data structure construction

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements the ENVELOPE APDU) as described in Annex A.1.4, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.4.
