Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

ISO and IEC draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO and IEC take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC have not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and <https://patents.iec.ch>. This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 32, *Data management and interchange*.

This fifth edition cancels and replaces the fourth edition (ISO/IEC 9075-11:2016), which has been technically revised. It also incorporates the Technical Corrigenda ISO/IEC 9075-9:2016/Cor.1:2019 and ISO/IEC 9075-9:2016/Cor.2:2022.

The main changes are as follows:

- improve the presentation and accuracy of the summaries of implementation-defined and implementation-dependent aspects of this document;
- introduction of several digital artifacts;
- alignment with updated ISO house style and other guidelines for creating standards.

This fifth edition of ISO/IEC 9075-11 is designed to be used in conjunction with the following editions of other parts of the ISO/IEC 9075 series, all published in 2023:

4 Concepts

This Clause modifies Clause 4, “Concepts”, in ISO/IEC 9075-2.

4.1 Notations and conventions

This Subclause modifies Subclause 4.1, “Notations and conventions”, in ISO/IEC 9075-2.

4.1.1 Notations

This Subclause modifies Subclause 4.1.1, “Notations”, in ISO/IEC 9075-2.

The notations used in this document are defined in ISO/IEC 9075-1.

4.1.2 Values in Descriptions

The Descriptions in Clause 7, “Definition Schema”, sometimes specify values that are to appear in rows of base tables. When such a value is given as a sequence of capital letters enclosed in <double quote>s, it denotes the same value as would be denoted by the <character string literal> obtained by replacing the enclosing <double quote>s by <quote>s. The need for such notation arises when the column in question sometimes, in other rows, contains character strings denoting SQL expressions, possibly even <character string literal>s.

4.2 Introduction to the Definition Schema

The Definition Schema base tables are defined as being in a schema named DEFINITION_SCHEMA. The table definitions are as complete as the definitional power of SQL allows. The table definitions are supplemented with assertions where appropriate.

The only purpose of the Definition Schema is to provide a data model to support the Information Schema and to assist understanding. An SQL-implementation need do no more than simulate the existence of the Definition Schema, as viewed through the Information Schema views. The specification does not imply that an SQL-implementation shall provide the functionality in the manner described in the Definition Schema.

A Definition Schema *DS* completely describes all contents of every schema, excluding itself, but including the Information Schema, contained in the catalog *C* that contains *DS*. When some object, such as a constraint or a view, references an object contained in a schema contained in a catalog *OC*, $OC \neq C$, the reference to that object cannot be confirmed, because the information about objects contained in *OC* is not necessarily available to *DS*. The constraints defined in *DS* can thus guarantee consistency only within *C*.

Because the DEFINITION_SCHEMA references objects that are only defined in the INFORMATION_SCHEMA, it would not normally be possible to create these two schemata using the CREATE SCHEMA statements as written. It is assumed that an INFORMATION_SCHEMA and its underlying DEFINITION_SCHEMA are created in some implementation-dependent (UW003) way at the time that a catalog is created.

In addition to the descriptors created by the effective execution of the CREATE INFORMATION_SCHEMA statement, the DEFINITION_SCHEMA must also contain descriptions of other object defined by the standard, e.g., the character repertoire SQL_IDENTIFIER.

The way in which certain constraints are expressed caters for the possibility that an object is being referenced that exists in a catalog that is outside the purview of the Definition Schema containing the reference in question. For example, the definition of the VIEW_TABLE_USAGE base table in Subclause 7.71, “VIEW_TABLE_USAGE base table”, includes the following constraint:

```
CONSTRAINT VIEW_TABLE_USAGE_CHECK_REFERENCES_TABLES
CHECK ( TABLE_CATALOG NOT IN
      ( SELECT CATALOG_NAME
        FROM SCHEMATA )
OR
      ( TABLE_CATALOG, TABLE_SCHEMA, TABLE_NAME ) IN
      ( SELECT TABLE_CATALOG, TABLE_SCHEMA, TABLE_NAME
        FROM TABLES ) )
```

Either the table being used by the view exists in a catalog within this Definition Schema's purview, in which case its existence is guaranteed, or it is assumed but not guaranteed to exist in some catalog that is outside this Definition Schema's purview.

Because <unqualified schema name>s are prohibited by [SR 10](#)) of [Subclause 5.4, "Names and identifiers"](#), in [ISO/IEC 9075-2](#), from specifying DEFINITION_SCHEMA, the Definition Schema cannot normally be accessed in an SQL-statement. However, view definitions in the Information Schema assume the existence of the Definition Schema and reference base tables whose <schema name> is DEFINITION_SCHEMA. They use the Definition Schema to define the content of the Information Schema. Regardless of [SR 14](#)) of [Subclause 5.4, "Names and identifiers"](#), in [ISO/IEC 9075-2](#), the <schema name> DEFINITION_SCHEMA is never qualified by a <catalog name>. It is implementation-defined ([IA027](#)) whether the DEFINITION_SCHEMA referenced by an INFORMATION_SCHEMA describes schemas in catalogs other than the catalog in which the INFORMATION_SCHEMA is located.

A base table in the Definition Schema is specified by:

- a Function, which summarizes the purpose and contents of the table;
- a Definition, giving the SQL statement(s) needed to define the table;
- a Description of the column values comprising a row of the table;
- an Initial Table Population detailing the initial contents of the table. An Initial Table Population entry of "None" implies that the table contents should be fully apparent from the Function, Definition, and Description; it does not necessarily imply that the table has no rows.

4.3 Introduction to the Information Schema

The views of the Information Schema are viewed tables defined in terms of the base tables of the Definition Schema.

The Information Schema views are defined as being in a schema named INFORMATION_SCHEMA, enabling these views to be accessed in the same way as other tables in other schemas. SELECT on most of these views is granted to PUBLIC WITH GRANT OPTION, so that they can be queried by all users and so that SELECT privilege can be further granted on views that reference these Information Schema views. No other privilege is granted on them, so they cannot be updated.

In order to provide access to the same information that is available via the INFORMATION_SCHEMA to an SQL-Agent in an SQL-environment where the SQL-implementation does not support Feature F391, "Long identifiers", alternative views are provided that use only short identifiers. The Information Schema also contains a small number of domains on which the columns of the Definition Schema are based. USAGE on all these domains is granted to PUBLIC WITH GRANT OPTION, so that they can be used by all users.

An SQL-implementation may define objects that are associated with INFORMATION_SCHEMA that are not defined in this Clause. SQL-implementations and future versions of the ISO/IEC 9075 series may also add columns to tables that are defined in this Clause.

NOTE 1 — The Information Schema tables are supposed to be represented in the Definition Schema in the same way as other tables, and are hence self-describing.

NOTE 2 — The Information Schema is a definition of the SQL data model, specified as an SQL-schema, in terms of <SQL schema statement>s as defined in the ISO/IEC 9075 series. Constraints defined in this Clause are not actual SQL constraints.

The representation of an <identifier> in the base tables and views of the Information Schema is by a character string corresponding to its <identifier body> (in the case of a <regular identifier>) or its <delimited identifier body> (in the case of a <delimited identifier>). Within this character string, every lower-case letter appearing in a <regular identifier> is replaced by the equivalent upper-case letter, and every <double quote symbol> appearing in a <delimited identifier body> is replaced by a <double quote>. Where an <actual identifier> has multiple forms that are equal according to the rules of [Subclause 8.2](#), “<comparison predicate>”, in ISO/IEC 9075-2, the form stored is that encountered at definition time.

7.2 DEFINITION_SCHEMA Schema

Function

Create the schema that is to contain the base tables that underlie the Information Schema

Definition

```
CREATE SCHEMA DEFINITION_SCHEMA
AUTHORIZATION DEFINITION_SCHEMA;
```

Description

None.

7.3 EQUAL_KEY_DEGREES assertion

Function

The assertion EQUAL_KEY_DEGREES ensures that every foreign key is of the same degree as the corresponding unique constraint.

Definition

```
CREATE ASSERTION EQUAL_KEY_DEGREES
CHECK
( NOT EXISTS
  ( SELECT *
    FROM ( SELECT COUNT ( DISTINCT FK.COLUMN_NAME ),
                  COUNT ( DISTINCT PK.COLUMN_NAME )
          FROM KEY_COLUMN_USAGE AS FK,
               REFERENTIAL_CONSTRAINTS AS RF,
               KEY_COLUMN_USAGE AS PK
          WHERE ( FK.CONSTRAINT_CATALOG, FK.CONSTRAINT_SCHEMA,
                  FK.CONSTRAINT_NAME ) =
                ( RF.CONSTRAINT_CATALOG, RF.CONSTRAINT_SCHEMA,
                  RF.CONSTRAINT_NAME )
            AND
              ( PK.CONSTRAINT_CATALOG, PK.CONSTRAINT_SCHEMA,
                PK.CONSTRAINT_NAME ) =
                ( RF.UNIQUE_CONSTRAINT_CATALOG, RF.UNIQUE_CONSTRAINT_SCHEMA,

          GROUP BY
            RF.CONSTRAINT_CATALOG, RF.CONSTRAINT_SCHEMA, RF.CONSTRAINT_NAME )
        AS R ( FK_DEGREE, PK_DEGREE )
    WHERE FK_DEGREE <> PK_DEGREE ) );
```

7.4 KEY_DEGREE_GREATER_THAN_OR_EQUAL_TO_1 assertion

Function

The assertion KEY_DEGREE_GREATER_THAN_OR_EQUAL_TO_1 ensures that every unique or primary key constraint has at least one unique column and that every referential constraint has at least one referencing column.

Definition

```
CREATE ASSERTION KEY_DEGREE_GREATER_THAN_OR_EQUAL_TO_1
CHECK
( NOT EXISTS
  ( SELECT *
    FROM TABLE_CONSTRAINTS
      FULL OUTER JOIN
        KEY_COLUMN_USAGE
      USING ( CONSTRAINT_CATALOG, CONSTRAINT_SCHEMA, CONSTRAINT_NAME )
    WHERE COLUMN_NAME IS NULL
      AND
        CONSTRAINT_TYPE IN
          ( 'UNIQUE', 'PRIMARY KEY', 'FOREIGN KEY' ) ) ) );
```

7.5 UNIQUE_CONSTRAINT_NAME assertion

Function

The UNIQUE_CONSTRAINT_NAME assertion ensures that the same combination of <schema name> and <constraint name> is not used by more than one constraint.

NOTE 7 — The UNIQUE_CONSTRAINT_NAME assertion avoids the need for separate checks on DOMAINS, TABLE_CONSTRAINTS, and ASSERTIONS.

Definition

```
CREATE ASSERTION UNIQUE_CONSTRAINT_NAME
CHECK ( 1 =
  ( SELECT MAX ( OCCURRENCES )
    FROM ( SELECT COUNT ( * ) AS OCCURRENCES
      FROM ( SELECT CONSTRAINT_CATALOG, CONSTRAINT_SCHEMA, CONSTRAINT_NAME
        FROM DOMAIN_CONSTRAINTS
        UNION ALL
        SELECT CONSTRAINT_CATALOG, CONSTRAINT_SCHEMA, CONSTRAINT_NAME
        FROM TABLE_CONSTRAINTS
        UNION ALL
        SELECT CONSTRAINT_CATALOG, CONSTRAINT_SCHEMA, CONSTRAINT_NAME
        FROM ASSERTIONS )
      GROUP BY
        CONSTRAINT_CATALOG, CONSTRAINT_SCHEMA, CONSTRAINT_NAME ) ) );
```

              WHERE USER_DEFINED_TYPE_CATEGORY = 'STRUCTURED' ) )
);
```

Description

- 1) The values of UDT_CATALOG, UDT_SCHEMA, and UDT_NAME are the catalog name, unqualified schema name, and qualified identifier, respectively, of the user-defined type containing the attribute being described.
- 2) The value of ATTRIBUTE_NAME is the name of the attribute being described.

- 3) The values of UDT_CATALOG, UDT_SCHEMA, UDT_NAME, and DTD_IDENTIFIER are the values of OBJECT_CATALOG, OBJECT_SCHEMA, OBJECT_NAME, and DTD_IDENTIFIER, respectively, of the row in DATA_TYPE_DESCRIPTOR that describes the data type of the attribute.
- 4) The value of ORDINAL_POSITION is the ordinal position of the attribute in the user-defined type.
- 5) The value of ATTRIBUTE_DEFAULT is null if the attribute being described has no explicit default value. If the character representation of the default value cannot be represented without truncation, then the value of ATTRIBUTE_DEFAULT is 'TRUNCATED'. Otherwise, the value of ATTRIBUTE_DEFAULT is a character representation of the default value for the column that obeys the rules specified for <default option> in [Subclause 11.5, “<default clause>”](#).

NOTE 8 — 'TRUNCATED' is different from other values like CURRENT_USER or CURRENT_TIMESTAMP in that it is not an SQL <key word> and does not correspond to a defined value in SQL.

- 6) The values of IS_DERIVED_REFERENCE_ATTRIBUTE have the following meanings:

YES	The attribute is used in the definition of a derived representation for the reference type corresponding to the structured type to which the attribute belongs.
NO	The attribute is not used in the definition of a derived representation for the reference type corresponding to the structured type to which the attribute belongs.

Initial Table Population

None.

7.8 AUTHORIZATIONS base table

Description

- 1) 16 The values of OBJECT_CATALOG, OBJECT_SCHEMA, and OBJECT_NAME are the fully qualified name of the object (table, domain, SQL-invoked routine, user-defined type, or sequence generator) whose descriptor includes the data type descriptor, and OBJECT_TYPE is 'TABLE', 'DOMAIN', 'ROUTINE', 'USER-DEFINED TYPE', or 'SEQUENCE', as the case may be.

- 2) The value of DTD_IDENTIFIER is the implementation-dependent (UV006) value that uniquely identifies the data type descriptor among all data type descriptors of the schema object identified by OBJECT_CATALOG, OBJECT_SCHEMA, OBJECT_NAME, and OBJECT_TYPE.
- 3) Let *DTN* be the data type name specified in the declaration of the data type being described. The value of DATA_TYPE is
Case:
 - a) If the data type being described is an exact numeric type or an approximate numeric type, then the name of the normal form of *DTN*.
 - b) Otherwise, *DTN*.

NOTE 10 — The normal form of an exact numeric data type or an approximate numeric data type is defined in Subclause 6.1, “<data type>” of ISO/IEC 9075-2.
- 4) The value of DECLARED_DATA_TYPE is
Case:
 - a) If the SQL-Implementation knows the data type name specified in the declaration of the data type being described, then *DTN*.
 - b) Otherwise, the null value.

NOTE 11 — The declared data type of a numeric item can be unknown if, for example, the SQL-Implementation has been upgraded to support Feature T322, “Declared data type attributes” but manages schema items declared before the upgrade was installed.
- 5) Case:
 - a) If the data type being described is a character string type, then the values of CHARACTER_MAXIMUM_LENGTH and CHARACTER_OCTET_LENGTH are, respectively, the length or maximum length in characters and the length or maximum length in octets of the data type being described.
 - b) If the data type being described is a binary string type, then the values of CHARACTER_MAXIMUM_LENGTH and CHARACTER_OCTET_LENGTH are the length or maximum length in octets of the data type being described.
 - c) If the data type being described is a reference type, then the values of CHARACTER_MAXIMUM_LENGTH and CHARACTER_OCTET_LENGTH are the length in octets of the data type being described.
 - d) Otherwise, the values of CHARACTER_MAXIMUM_LENGTH and CHARACTER_OCTET_LENGTH are the null value.
- 6) Case:
 - a) If the data type being described is a character string type, then the values of CHARACTER_SET_CATALOG, CHARACTER_SET_SCHEMA, CHARACTER_SET_NAME, COLLATION_CATALOG, COLLATION_SCHEMA and COLLATION_NAME are, respectively, the qualified name of the character set and applicable collation, if any.
 - b) Otherwise, CHARACTER_SET_CATALOG, CHARACTER_SET_SCHEMA, CHARACTER_SET_NAME, COLLATION_CATALOG, COLLATION_SCHEMA and COLLATION_NAME are the null value.
- 7) For a numeric type, the values of NUMERIC_PRECISION, NUMERIC_PRECISION_RADIX, and NUMERIC_SCALE are, respectively, the implemented precision, the radix of the precision and the scale of the data type being described.

- 8) For a numeric type, the values of DECLARED_NUMERIC_PRECISION, and DECLARED_NUMERIC_SCALE are, respectively,

Case:

- a) If they are known to the SQL-Implementation, the declared precision and declared scale of the data type being described.
- b) Otherwise, the null value.

NOTE 12 — The declared precision or scale of a numeric item can be unknown if, for example, the SQL-Implementation has been upgraded to support Feature T322, “Declared data type attributes” but manages schema items declared before the upgrade was installed, or if it was not specified in the declaration of the item.

- 9) For a datetime or interval type, the value of DATETIME_PRECISION is the fractional seconds precision of the data type being described.
- 10) If DATA_TYPE is 'INTERVAL', then the values of INTERVAL_TYPE are the value for <interval qualifier> (as specified in Table 32, “Codes used for <interval qualifier>s in Dynamic SQL”, in ISO/IEC 9075-2) for the data type being described; otherwise, INTERVAL_TYPE is the null value.
- 11) If DATA_TYPE is 'INTERVAL', then the values of INTERVAL_PRECISION are the interval leading field precision of the data type being described; otherwise, INTERVAL_PRECISION is the null value.
- 12) Case:
 - a) If DATA_TYPE is 'USER-DEFINED', then the values of USER_DEFINED_TYPE_CATALOG, USER_DEFINED_TYPE_SCHEMA, and USER_DEFINED_TYPE_NAME are the qualified name of the user-defined type being described.
 - b) If the DATA_TYPE is 'REF', then the values of USER_DEFINED_TYPE_CATALOG, USER_DEFINED_TYPE_SCHEMA, and USER_DEFINED_TYPE_NAME are the qualified name of the referenced structured type of the reference type being described.
 - c) Otherwise, the values of USER_DEFINED_TYPE_CATALOG, USER_DEFINED_TYPE_SCHEMA, and USER_DEFINED_TYPE_NAME are the null value.
- 13) If DATA_TYPE is 'REF', then the values of SCOPE_CATALOG, SCOPE_SCHEMA, and SCOPE_NAME are the fully qualified name of the referenceable table, if any; otherwise, the values of SCOPE_CATALOG, SCOPE_SCHEMA, and SCOPE_NAME are the null value.
- 14) If DATA_TYPE is the name of some character string type and OBJECT_SCHEMA is 'INFORMATION_SCHEMA', then the values for CHARACTER_MAXIMUM_LENGTH, CHARACTER_OCTET_LENGTH, CHARACTER_SET_CATALOG, CHARACTER_SET_SCHEMA, CHARACTER_SET_NAME, COLLATION_CATALOG, COLLATION_SCHEMA, and COLLATION_NAME are implementation-defined (IV106).
- 15) If DATA_TYPE is 'ARRAY', then the value of MAXIMUM_CARDINALITY is the maximum cardinality of the array type being described. Otherwise, the value of MAXIMUM_CARDINALITY is the null value.
- 16) If DATA_TYPE is 'ROW', then the data type being described is a row type.
- 17) Case:
 - a) If the data type being described is a generic table parameter type of a polymorphic table function, then
 - i) DATA_TYPE is 'TABLE'.
 - ii) If the generic table parameter has row semantics, then TABLE_SEMANTICS is 'ROW'; otherwise, it is 'SET'.
 - iii) If the generic table parameter has set semantics and PRUNE WHEN EMPTY is specified, then IS_PRUNABLE is 'YES'; otherwise, it is 'NO'.

- iv) If the generic table parameter has pass-through columns, then HAS_PASS_THROUGH_COLUMNS is 'YES'; otherwise, it is 'NO'.
 - b) If the data type being described is the return type of a polymorphic table function, then DATA_TYPE is 'TABLE', and TABLE_SEMANTICS, IS_PRUNABLE and HAS_PASS_THROUGH_COLUMNS are the null value.
 - c) Otherwise, TABLE_SEMANTICS, IS_PRUNABLE, and HAS_PASS_THROUGH_COLUMNS are the null value.
- 18) 09 15 If DATA_TYPE is 'DESCRIPTOR', then the data type being described is the parameter type of a descriptor parameter of a polymorphic table function.

7.50 SQL_IMPLEMENTATION_INFO base table

Function

The SQL_IMPLEMENTATION_INFO base table has one row for each SQL-implementation information item defined by the ISO/IEC 9075 series. An SQL-implementation information item describes some characteristic of the implementation, such as the name of the implementation software and various implementation default settings.

NOTE 17 — Implementation characteristics which describe sizes or limits are found in the SQL_SIZING base table.

Definition

```
CREATE TABLE SQL_IMPLEMENTATION_INFO (
  IMPLEMENTATION_INFO_ID          INFORMATION_SCHEMA.CARDINAL_NUMBER,
  IMPLEMENTATION_INFO_NAME        INFORMATION_SCHEMA.CHARACTER_DATA
    CONSTRAINT SQL_IMPLEMENTATION_INFO_NAME_NOT_NULL
      NOT NULL,
  INTEGER_VALUE                   INFORMATION_SCHEMA.CARDINAL_NUMBER,
  CHARACTER_VALUE                 INFORMATION_SCHEMA.CHARACTER_DATA,
  COMMENTS                       INFORMATION_SCHEMA.CHARACTER_DATA,

  CONSTRAINT SQL_IMPLEMENTATION_INFO_PRIMARY_KEY
    PRIMARY KEY ( IMPLEMENTATION_INFO_ID ),

  CONSTRAINT SQL_IMPLEMENTATION_INFO_CHECK_INTEGER_EXCLUDES_CHARACTER
    CHECK ( INTEGER_VALUE IS NULL
      OR
      CHARACTER_VALUE IS NULL )
);
```

Description

- 1) The SQL_IMPLEMENTATION_INFO table consists of exactly one row for each SQL-implementation information item defined in the ISO/IEC 9075 series.
- 2) The IMPLEMENTATION_INFO_ID and IMPLEMENTATION_INFO_NAME columns identify the SQL-implementation information item by the integer and name assigned to it.
- 3) Some IMPLEMENTATION_INFO_ID values assigned by the ISO/IEC 9075 series have been assigned for backwards compatibility with ISO/IEC 9075-3:1995. All other values assigned by ISO/IEC 9075 are in the range 21000 through 24999, inclusive.
- 4) Implementation-defined (IV055) items that are represented in this table shall have an IMPLEMENTATION_INFO_ID value that is in the range 11000 through 14999, inclusive.
- 5) Depending on the type of information, the value is present in either INTEGER_VALUE or CHARACTER_VALUE; the other column is the null value.
- 6) The COMMENTS column is intended for implementor comments pertinent to the identified item.

Initial Table Population

- 1) Without Feature F869, “SQL Implementation info population”, the SQL_IMPLEMENTATION_INFO Initial Table Population is None, and the remaining Initial Table Population items in this subclause do not apply.

- 2) The SQL-implementation shall effectively populate the SQL_IMPLEMENTATION_INFO base table with an <insert statement> that is equivalent to the <insert statement> shown below; the <insert statement> shown below provides values only for certain columns and implicitly assigns the null value to other columns of the table.
- 3) The SQL-implementation effectively populates the table so that, for each row containing information about some facility that the SQL-implementation supports, either the INTEGER_VALUE column or the CHARACTER_VALUE column is set to a value that specifies the requisite information about that supported facility. For all information items that the SQL-implementation does not support, both the INTEGER_VALUE and the CHARACTER_VALUE column have the null value. The COMMENTS column may be set to any value deemed appropriate by the SQL-implementation, or it may be set to the null value. The following INSERT statement specifies values for the COMMENTS column that may be used by an SQL-implementation if it so chooses.
 - a) Let *CAT* be 'Y' if the SQL-implementation supports catalog names and 'N' otherwise.
 - b) Let *COLL* be the default collation name for the SQL-implementation.
 - c) Let *CCB* be an integer representing the default cursor commit behavior of the SQL-implementation: 0 (zero) if the SQL-implementation closes cursors and deleted prepared statements, 1 (one) if it closes cursors and retains prepared statements, and 2 if it leaves cursors open and retains prepared statements.
 - d) Let *DSN* be the connection name used in a CONNECT statement when connecting to the SQL-implementation.
 - e) Let *DBMS* be the name of the SQL-implementation software (e.g., the product name).
 - f) Let *VER* be a character representation of the version of the implementation software comprising two digits, a period, two more digits, another period, four more digits, and optionally a sequence of characters.
 - g) Let *DTI* be a number indicating the default transaction isolation level of the SQL-implementation: 1 (one) for READ UNCOMMITTED, 2 for READ COMMITTED, 3 for REPEATABLE READ, and 4 for SERIALIZABLE.
 - h) Let *IDC* be a number indicating the treatment of identifiers when stored in the SQL-implementation's metadata: 1 (one) indicates they are stored in all upper-case characters, 2 that they are stored in all lower-case characters, 3 that they are stored in mixed case and that they are case sensitive, and 4 that they are stored in mixed case but are case insensitive.
 - i) Let *NCOL* be a number indicating how nulls are collated: 0 (zero) indicates that nulls are collated higher than non-null values, and 1 (one) indicates that they are collated lower than non-null values.
 - j) Let *SERV* be the SQL server name used by a CONNECT statement when connecting to the SQL-implementation.
 - k) Let *SPEC* be a character string containing all special characters that are allowed in non-delimited identifiers.
 - l) Let *TXC* be a number indicating the transaction capabilities of the SQL-implementation: 0 (zero) indicates that transactions are not supported, 1 (one) indicates that they are supported only for DML statements, 2 indicates that they are supported for both DML and DDL statements, 3 indicates that they are supported only for DML statements and that an implicit COMMIT occurs before any DDL statements are executed, and 4 indicates that they are supported only for DML statements and that DDL statements are ignored for the purposes of transactions.
- 4) The <insert statement> that effectively populates the SQL_IMPLEMENTATION_INFO base table is:

```

NOTE 18 — Implementation characteristics which are not sizes or limits are found in the SQL_IMPLEMENTATION_ITEMS base table.

Definition

```

0	The SQL-implementation either places no limit on this sizing item or the SQL-implementation cannot determine the limit.
the null value	The SQL-implementation does not support any features for which this sizing item is applicable.
any other value	The maximum size supported by the SQL-implementation for this sizing item.
- 6) The COMMENTS column is intended for implementor comments pertinent to the identified SQL sizing item.

Initial Table Population

- 1) Without Feature F869, “SQL Implementation info population”, the SQL_SIZING Initial Table Population is None, and the remaining Initial Table Population items in this subclause do not apply.

Description

- 1) The values of CONSTRAINT_CATALOG, CONSTRAINT_SCHEMA, and CONSTRAINT_NAME are the catalog name, unqualified schema name, and qualified identifier, respectively, of the constraint being described. If the <table constraint definition> or <add table constraint definition> that defined the constraint did not specify a <constraint name>, then the values of CONSTRAINT_CATALOG, CONSTRAINT_SCHEMA, and CONSTRAINT_NAME are implementation-defined (ID017).
- 2) The values of CONSTRAINT_TYPE have the following meanings:

FOREIGN KEY	The constraint being described is a foreign key constraint.
UNIQUE	The constraint being described is a unique constraint.
PRIMARY KEY	The constraint being described is a primary key constraint.
CHECK	The constraint being described is a check constraint.
- 3) The values of TABLE_CATALOG, TABLE_SCHEMA, and TABLE_NAME are the catalog name, the unqualified schema name, and the qualified identifier of the name of the table to which the table constraint being described applies.
- 4) The values of IS_DEFERRABLE have the following meanings:

YES	The table constraint is deferrable.
NO	The table constraint is not deferrable.
- 5) The values of INITIALLY_DEFERRED have the following meanings:

YES	The table constraint is initially deferred.
NO	The table constraint is initially immediate.
- 6) The values of ENFORCED have the following meanings:

YES	The table constraint is enforced.
NO	The table constraint is not enforced.
- 7) The values of NULLS_DISTINCT have the following meanings:

YES	The constraint is a UNIQUE constraint and the unique with nulls distinct definition is applied for this constraint.
NO	The constraint is a UNIQUE constraint and the unique with nulls not distinct definition is applied for this constraint.
the null value	The constraint is not a UNIQUE constraint.
