Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 3.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75% of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this part of ISO 10303 may be subject of patent rights. ISO shall not be held responsible for any or all such patent rights.

International Standard ISO 10303–214 was prepared by Technical Committee ISO/TC 184/SC4, *Industrial automation systems and integration*, Subcommittee SC4, *Industrial data*.

This International Standard is organized as a series of parts, each published separately. The parts of ISO 10303 fall into one of the following series: description methods, integrated resources, application interpreted constructs, application protocols, abstract test suites, implementation methods, and conformance testing. The series are described in ISO 10303-1.

A complete list of parts of ISO 10303 is available from the internet:

<http://www.nist.gov/sc4/editing/step/titles>

The structure of this International Standard is described in ISO 10303-1. The numbering of the parts of this International Standard reflects its structure:

— Parts 11 to 14 specify the description methods,

— Parts 21 to 29 specify the implementation methods,

— Parts 31 to 35 specify the conformance testing methodology and framework,

— Parts 41 to 50 specify the integrated generic resources,

— Parts 101 to 108 specify the integrated application resources,

— Parts 201 to 236 specify the application protocols,

— Parts 301 to 336 specify the abstract test suites,

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— Parts 501 to 520 specify the application interpreted constructs, and

— Parts 1001 to 1009 specify the application modules.

Should further parts of ISO 10303 be published, they will follow the same numbering pattern.

Annexes A, B, C, D, and E form a normative part of this part of ISO 10303. Annexes F, G, H, J, and K are for information only.

Introduction

ISO 10303 is an International Standard for the computer-interpretable representation and exchange of product data. The objective is to provide a neutral mechanism capable of describing product data throughout the life cycle of a product independent from any particular system. The nature of this description makes it suitable not only for neutral file exchange, but also as a basis for implementing and sharing product databases and archiving.

This International Standard is organized as a series of parts, each published separately. The parts of ISO 10303 fall into one of the following series: description methods, integrated resources, application interpreted constructs, application protocols, abstract test suites, implementation methods, and conformance testing. The series are described in ISO 10303–1. This part of ISO 10303 is a member of the application protocol series.

This part of ISO 10303 specifies an application protocol (AP) for automotive mechanical design processes. This application protocol defines the context, scope, and information requirements for various development stages during the design of a vehicle and specifies the integrated resources necessary to satisfy these requirements. This application protocol addresses the requirements of the automotive industry covering cars, trucks, busses, and motorcycles. It may also be applicable to other forms of vehicles, such as rail, agricultural, and construction vehicles.

A typical vehicle consists of the body, power train, chassis, and interior parts.

The body describes the body shell and the body in white (see 3.11.1).

EXAMPLE 1 Typical constituents of the body are the frame, doors, roof, engine hood, windshield, and bumpers.

The power train includes the engine, transmission, and driveline.

EXAMPLE 2 Typical constituents of the power train are gearbox, pistons, and exhaust pipe.

The chassis includes all parts that are involved with the vehicle's handling.

EXAMPLE 3 Typical constituents of the chassis are the front axle, rear axle, steering gear, suspension components, wheels, shock absorbers, and brakes.

Interior parts include parts that are built into the interior of the vehicle and not related to the power train.

EXAMPLE 4 Typical interior parts are seats, instrument panel, power windows, air conditioning system, and stereo equipment.

Only the mechanical aspects of a vehicle and its components are covered by this AP; the electrical, electronic, hydraulic, and pneumatic aspects are not covered.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXAMPLE 5 For a battery or a switch, product characteristics such as shape, material, or mass are covered but the electrical functionality is not covered.

Finite element analysis (FEA) is not supported by this AP.

Figure 1 shows the processes included in the development of a vehicle. The illustrations are taken from car body development. The application activity model (AAM) given in annex F provides a further detailed graphical representation of the processes and information flows.

These processes include:

— product definition;

— styling;

— design;

— evaluation;

— production planning;

— tool design;

— tool manufacturing;

— quality control.

Figure 2 shows the planning model for this AP. It provides a high level overview of the information supported by the AP on the basis of the units of functionality as defined in 4.1. UoF abbreviations can be found in the upper right corner of the boxes.

Application protocols provide the basis for developing implementations of ISO 10303 and abstract test suites for the conformance testing of AP implementations.

Clause 1 defines the scope of the application protocol and summarizes the functionality and data covered by the AP. Clause 3 lists the words defined in this part of ISO 10303 and gives pointers to words defined elsewhere. An application activity model that is the basis for the definition of the scope is provided in annex F. The information requirements of the application are specified in clause 4 using terminology appropriate to the application. A graphical representation of the information requirements, referred to as the application reference model, is given in annex G.

Resource constructs are interpreted to meet the information requirements. This interpretation produces the application interpreted model (AIM). This interpretation, given in 5.1, shows the correspondence between the information requirements and the AIM. The short listing of the AIM specifies the interface to the integrated resources and is given in 5.2. Note that the definitions and EXPRESS provided in the integrated resources for constructs used in the AIM may include select list items and subtypes which are

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

not imported into the AIM. The expanded listing given in annex A contains the complete EXPRESS for the AIM without annotation. A graphical representation of the AIM is given in annex H. Additional requirements for specific implementation methods are given in annex C.

Industrial automation systems and integration — Product data representation and exchange — Part 214: Application protocol: Core data for automotive mechanical design processes

1 Scope

This part of ISO 10303 specifies the use of the integrated resources necessary for the scope and information requirements for the exchange of information between the applications that support the development process of the mechanical aspects of automotive vehicles.

NOTE - The application activity model in annex F provides a graphical representation of the processes and information flows that are the basis for the definition of the scope of this part of ISO 10303.

The following are within the scope of this part of ISO 10303:

— products of automotive manufacturers and of their suppliers. These products include parts, assemblies of parts, tools, assemblies of tools, and raw materials. The considered parts include the constituents of the car body, of the power train, of the chassis, and of the interior. The tools include those specific to the products produced and used by various manufacturing technologies.

EXAMPLE 1 Typical manufacturing technologies are:

a) for primary shaping: moulding or casting;

b) for transforming: bending or stamping;

c) for separating: milling or turning;

d) for coating: painting or surface coating;

e) for fitting: welding or riveting.

The raw materials include those used to produce the parts or the tools;

— process plan information describing the relationships between parts and the tools used to manufacture them and to manage the relationships between intermediate stages of part or tool development;

— product definition data and configuration control data for managing large numbers of variants of automotive products during the design phase;

— data describing the changes that have occurred during the design phase, including tracking of the versions of a product and of the data related to the documentation of the change process;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— identification of physically realized parts or of tools, e.g., for prototype building;

— identification of standard parts, based on international, national, or industrial standards;

— release and approval data for product data;

— data that identify the supplier of a product and related contract information;

— the following eight types of representation of the shape of a part or of tool:

  a) 2D – wireframe representation;

  b) 3D – wireframe representation;

  c) geometrically bounded surface representation;

  d) topologically bounded surface representation;

  e) faceted – boundary representation;

  f) boundary representation;

  g) compound shape representation;

  h) constructive solid geometry representation.

— representation of the shape of parts or tools that is a combination of two or more of these eight types of shape representation;

— data that pertains to the presentation of the shape of the product;

— representation of portions of the shape of a part or a tool by form features;

— product documentation represented on drawings;

— references to product documentation represented in a format other than those specified by ISO 10303;

EXAMPLE 2 Other formats include physical clay models, digital data in other standard formats such as NC – data encoded according to ISO 6983 [18], or text data encoded according to ISO/IEC 8879 (SGML) [20].

— simulation data for the description of kinematic structures;

EXAMPLE 3 The simulation data for a windshield wiper may include the geometry of the windshield as well as the kinematic structure of the wiper including all necessary links and joints.

— properties of parts or of tools;

— data defining surface conditions;

— dimensional data and geometrical tolerance data.

The following are outside the scope of this part of ISO 10303:

— product definition data pertaining to any life cycle phase of a product not related to the design phase;

— business or financial data for the management of a design project;

— a general parametric representation of the shape of a part or of a tool;

— data describing the pneumatic, hydraulic, electric, or electronic functions of a product;

— continuous kinematics simulations over time;

— data describing the input or the results of finite element analysis.

2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this part of ISO 10303. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this part of ISO 10303 are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

3 Terms, definitions, abbreviations, and symbols

3.1 Terms defined in ISO 10303 – 1

For the purpose of this part of ISO 10303, the following terms defined in ISO 10303 – 1 apply.

— application;

— application activity model (AAM);

— application context;

— application interpreted model (AIM);

— application object;

— application protocol (AP);

— application reference model (ARM);

— application resource;

— assembly;

— component;

— conformance class;

— conformance requirement;

— data;

— data exchange;

— generic resource;

— implementation method ;

— information;

— information model;

— integrated resource;

— interpretation;

— PICS proforma;

— presentation;

— product;

— product data;

— product information;

— resource construct;

— structure;

— unit of functionality (UoF).

3.2 Terms defined in ISO 10303 – 31

For the purpose of this part of ISO 10303, the following terms defined in ISO 10303 – 31 apply.

— preprocessor;

— postprocessor.

3.3 Terms defined in ISO 10303 – 42

For the purpose of this part of ISO 10303, the following terms defined in ISO 10303 – 42 apply.

— arcwise connected;

— bounds;

— boundary;

— boundary representation solid model (B-Rep);

— closed curve;

— closed surface;

— connected;

— constructive solid geometry (CSG);

— coordinate space;

— curve;

3.4 Terms defined in ISO 10303 – 44

For the purpose of this part of ISO 10303, the following terms defined in ISO 10303 – 44 apply.

— bill-of-material structure (BOM);

— constituent;

— form, fit and function of a product;

— lot.

3.5 Terms defined in ISO 10303 – 45

For the purpose of this part of ISO 10303, the following terms defined in ISO 10303 – 45 apply.

— material;

— material property.

3.6 Terms defined in ISO 10303 – 46

For the purpose of this part of ISO 10303, the following terms defined in ISO 10303 – 46 apply.

— annotation;

— layer;

— picture;

— planar;

— presentation information;

— symbol;

— visualization.

3.7 Terms defined in ISO 10303 – 47

For the purpose of this part of ISO 10303, the following terms defined in ISO 10303 – 47 apply.

— form tolerance;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— profile tolerance;

— toleranced feature.

3.8 Terms defined in ISO 10303 – 105

For the purpose of this part of ISO 10303, the following terms defined in ISO 10303 – 105 apply.

— base;

— frame;

— joint;

— link;

— mechanism;

— motion;

— pair;

— placement;

— world coordinate system.

3.9 Terms defined in ISO 10303 – 202

For the purpose of this part of ISO 10303, the following terms defined in ISO 10303 – 202 apply.

— application interpreted construct (AIC);

— externally defined;

— predefined.

3.10 Terms defined in ISO 13584 – 42

For the purpose of this part of ISO 10303, the following terms defined in ISO 13584 – 42 apply.

— basic semantic unit (BSU)

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

3.11 Other terms and definitions

For the purpose of this part of ISO 10303, the following definitions apply.

3.11.1
body in white
Parts of the vehicle body that form the body shell and ensure its stability

3.11.2
vehicle
Land conveyance for the transportation of goods or passengers

EXAMPLE A cart, a lorry, a motor-car, and a bus are examples of a vehicle.

3.12 Symbols and abbreviations

For the purpose of this part of ISO 10303, the following symbols and abbreviations apply:

C1	surface_condition UoF
CAD	Computer Aided Design
CAM	Computer Aided Manufacturing
CSG	Constructive Solid Geometry
D1	explicit_draughting UoF
D2	associative_annotation UoF
E1	external_reference_mechanism UoF

4 Information requirements

This clause specifies the information required for core data for automotive mechanical design processes.

The information requirements are specified as a set of units of functionality, application objects, and application assertions. These assertions pertain to individual application objects and to relationships between application objects. The information requirements are defined using the terminology of the subject area of this application protocol.

NOTE 1 - A graphical representation of the information requirements is given in annex G.

NOTE 2 - The information requirements correspond to those of the activities identified as being within the scope of this application protocol in annex F.

NOTE 3 - The mapping table specified in 5.1 shows how the integrated resources and application interpreted constructs are used to meet the information requirements of this application protocol.

4.1 Units of functionality

This subclause specifies the units of functionality for the Core Data for Automotive Mechanical Design Processes application protocol.

NOTE 1 - One or more UoFs, grouped together, provide a solution to identified data flows derived from the AAM (see annex F). The grouping of the UoFs is documented in clause 6.

This part of ISO 10303 specifies the following units of functionality:

NOTE 2 - Following the name of each UoF, its abbreviation is shown in brackets. The abbreviations consist of one or two letters and a number. The letters indicate a logical group to which the UoF belongs. The logical groups identified are shown in table 1.

Figure 5 gives an overview for the UoFs, their logical groups, and the interdependencies among the UoFs and the logical groups.

The units of functionality and a description of the functions that each UoF supports are given below. The application objects included in the UoFs are defined in 4.2.

4.1.1 surface_condition (C1)

This unit of functionality provides the capability to represent surface properties and surface treatments of a material. It covers surface characteristics which may be defined by a designer to achieve the required functionality of a part or to satisfy aesthetic requirements.

The definition of the presentation of the surface characteristics information is dealt with in the associative_annotation UoF (D2).

The following application objects are used by the surface_condition UoF:

— Coating_layer (see 4.2.75);

— Contact_ratio (see 4.2.102);

— Default_setting_association (see 4.2.132);

— Default_surface_texture (see 4.2.133);

— Hardness (see 4.2.254);

— Measurement_path (see 4.2.314);

— Surface_condition (see 4.2.492);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— Surface_condition_association (see 4.2.493);

— Surface_texture (see 4.2.500);

— Surface_texture_parameter (see 4.2.501);

— Tactile_appearance (see 4.2.504);

— Treatment_result (see 4.2.538);

— Visual_appearance (see 4.2.560).

4.1.2 explicit_draughting (D1)

This unit of functionality specifies the representation of annotation elements in an explicit form used in technical drawings. Additionally, it defines the organizational structure and management data for technical drawings.

This UoF is based on ISO 10303 – 201 and establishes the information requirements for the exchange of part definition data in the form of CAD drawings with explicit annotation. Annotation elements are either defined in a two-dimensional coordinate system, related to the area or view, or in the same coordinate system as the geometry which may be two- or three-dimensional. The annotation elements themselves are always planar.

This UoF also provides the objects needed for the management of drawing sheets, drawing views, symbols, and dimensioning.

The following application objects are used by the explicit_draughting UoF:

— Annotation_curve (see 4.2.16);

— Datum_feature_callout (see 4.2.124);

— Datum_target_callout (see 4.2.126);

— Dimension (see 4.2.149);

— Dimension_callout (see 4.2.150);

— Dimension_curve (see 4.2.151);

— Dimension_sequence_pair (see 4.2.152);

— Drawing (see 4.2.170);

— Drawing_assignment (see 4.2.171);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— Drawing_sequence (see 4.2.172);

— Drawing_sheet (see 4.2.173);

— Geometric_tolerance_callout (see 4.2.244);

— Projection_curve (see 4.2.407);

— Surface_condition_callout (see 4.2.494).

4.1.3 associative_annotation (D2)

This unit of functionality specifies the representation of annotation elements in an associative form, i.e., with an association to the annotated geometry.

This unit of functionality is based on ISO 10303 – 202 and allows the exchange of drawings that maintain an association between the annotation and the geometric shape of a part. Associated annotation elements are either defined in a two-dimensional coordinate system related to the area or view, or in the same coordinate system as the geometry which may be two- or three-dimensional. The annotation elements themselves are always planar. In the case dimensions that are associated with geometry or other annotation, the associativity is maintained between the calculated value of the size or distance, the presentation of the value, and the elements from which this value is calculated.

This UoF also allows a reference to tolerance information within geometric dimensions (see UoF T1).

The following application objects are used by the associative_annotation UoF:

— Associated_draughting_callout (see 4.2.29);

— Associated_fill_area (see 4.2.30);

— Associated_leader (see 4.2.31);

— Associated_projection_curve (see 4.2.32).

4.1.4 external_reference_mechanism (E1)

This unit of functionality provides a reference mechanism to specify external documents that are associated with objects defined in this part of ISO 10303. These documents may contain data that are not in scope of this part of ISO 10303. This includes conventional non-digital data and digital data in other computer interpretable formats.

NOTE - See clause 5.2.1.11 for a discussion of how the information requirements of this unit of functionality are satisfied.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXAMPLE 1 Technical drawings on paper, standards documents, or hand-written documents, are examples of non-digital data referenced by the external reference mechanism.

EXAMPLE 2 CAD data in a system's native format, text documents in SGML [20], or NC-data in ISO 6983 [18] are examples of digital data referenced by the external reference mechanism.

The following application objects are used by the external_reference_mechanism UoF:

— Accuracy (see 4.2.1);

— Axis_placement (see 4.2.33);

— Cartesian_coordinate_space (see 4.2.44);

— Cartesian_coordinate_space_2d (see 4.2.45);

— Transformation_3d (see 4.2.535).

4.1.5 user_defined_feature (FF1)

This unit of functionality provides the capability to categorize an area of interest in a shape as a feature and to associate parameters as additional information – not intended for shape generation – with this area in the shape. Using this mechanism, multiple aspects of the shape that are identified as features, may be combined into a compound general feature. The type of the feature and of the associated parameters are individually specified by the user.

The following application objects are used by the user_defined_feature UoF:

— Feature_occurrence (see 4.2.200);

— General_compound_feature (see 4.2.219);

— General_feature (see 4.2.221);

— Included_feature (see 4.2.261);

— Path_parameter (see 4.2.344);

— Profile_parameter (see 4.2.402).

4.1.6 included_feature (FF2)

This unit of functionality provides the capability to identify areas of interest on an already designed shape as a particular kind of feature whose type and defining parameters are specified in this part of ISO 10303.

NOTE 1 - Usually, these features have a certain meaning to the user, such as a correspondence to a manufacturing process operation managed or manageable by the user.

This part of ISO 10303 distinguishes between form features for sheet-type parts or tools and form features for solid-type parts or tools. Among these features are hole, pocket, boss, slot, rib, thread, bead and joggle as well as transition features such as fillet, edge round, and chamfer. Mechanisms for the replication of features and to build up compounds of features are also included. Figure **??** shows the features for solid-type parts covered by this UoF. Figure 4 shows the features for sheet-type parts covered by this UoF.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Within this UoF, a variation of the feature parameters does not result in a change of the shape of the part where the features are applied, i.e., the shape, which is defined explicitly, is not dependent on the feature parameters.

NOTE 2 - The parameters may be used to specify the areas of interest in a more appropriate way, e.g., to support manufacturing planning.

This UoF is based on the user_defined_feature UoF.

The following application objects are used by the included_feature UoF:

— Angle_specification (see 4.2.11);

— Angle_taper (see 4.2.12);

— Bead_end_type (see 4.2.38);

— Bead_feature (see 4.2.39);

— Boss_feature (see 4.2.42);

— Boss_top_condition (see 4.2.43);

— Catalogue_thread (see 4.2.48);

— Chamfer (see 4.2.51);

— Chamfer_angle (see 4.2.52);

— Chamfer_definition (see 4.2.53);

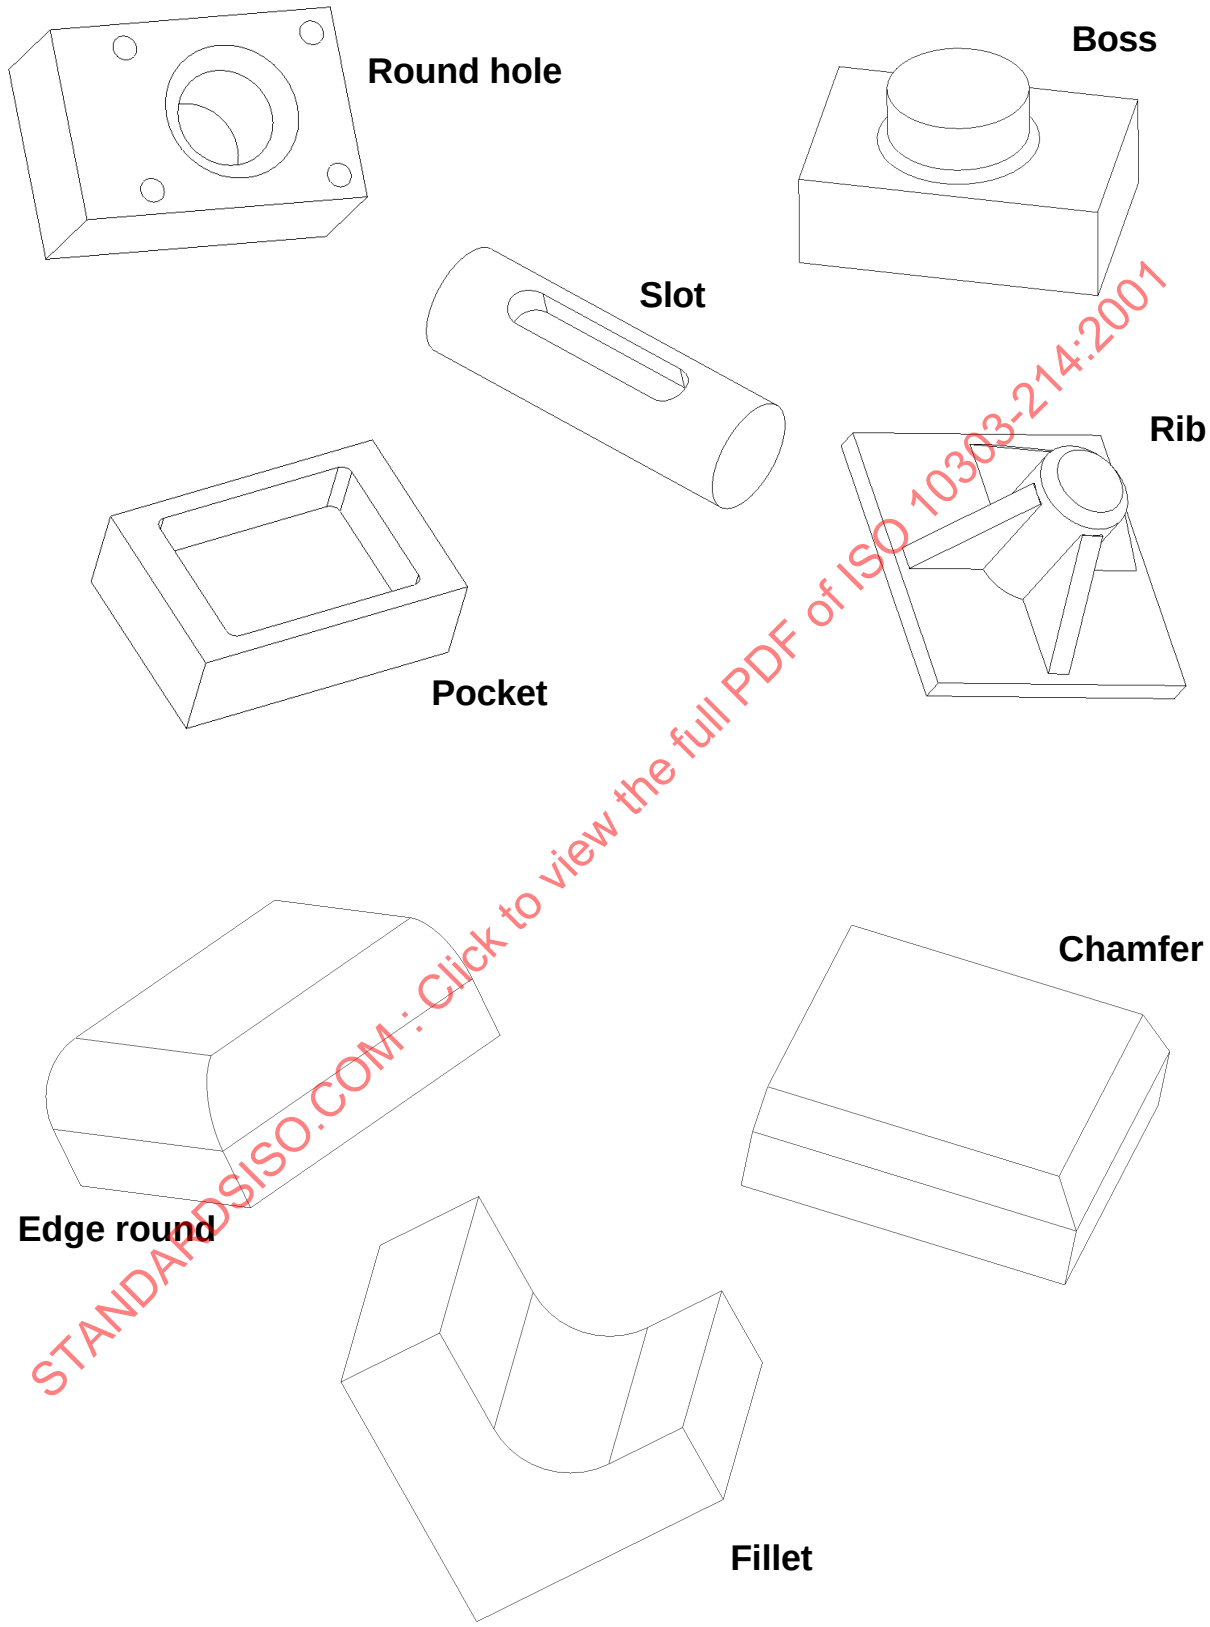
— Chamfer_offset (see 4.2.54);

— Circular_boss (see 4.2.57);

— Circular_closed_profile (see 4.2.58);

— Circular_offset_pattern (see 4.2.59);

— Circular_omit_pattern (see 4.2.60);



— Circular_path (see 4.2.61);

— Circular_pattern (see 4.2.62);

— Closed_profile (see 4.2.72);

4.1.7 generative_featured_shape (FF3)

This unit of functionality provides the capability to use a subset of those features specified within the included_feature UoF, in a way that the application of the features on a base shape results in a modified shape. Within this UoF, the identification of feature parameters is related to the intent to study the consequences of a variation of these parameters on the resulting shape.

Additionally, this UoF supports the definition of sequences of 'operations', i.e., the application of one or more features to a base shape with the possibility to represent the resulting shapes at the various intermediate stages.

This UoF is based on the included_feature UoF.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The following application objects are used by the generative_featured_shape UoF:

— Feature_placement (see 4.2.202);

— Featured_shape (see 4.2.203);

— Placed_feature (see 4.2.356).

4.1.8 wireframe_model_2d (G1)

This unit of functionality provides the capability to represent geometry as a two-dimensional wireframe model, i.e., of two-dimensional points and curves.

NOTE - The difference between 3D and 2D geometric elements is specified by the presence or absence of a third coordinate value.

Composite curves for the geometric representation of paths and loops are included in this UoF. The types of points and curves excluded from this UoF are point_on_surface and curve_on_surface. All unbounded curves in this UoF are explicitly trimmed unless they are closed in order to facilitate the data exchange, the visualization on the screen, and to limit calculation time.

Surface data and all topological information are outside the scope of this UoF.

The following application objects are used by the wireframe_model_2d UoF:

— B_spline_curve (see 4.2.36);

— Cartesian_point (see 4.2.47);

— Circle (see 4.2.56);

— Composite_curve (see 4.2.83);

— Curve (see 4.2.108);

— Curve_set_2d (see 4.2.111);

— Detailed_element (see 4.2.143);

— Detailed_geometric_model_element (see 4.2.144);

— Detailed_model_element (see 4.2.145);

— Ellipse (see 4.2.183);

— Hyperbola (see 4.2.260);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

— Line (see 4.2.296);

— Offset_curve (see 4.2.325);

— Parabola (see 4.2.337);

— Point (see 4.2.367);

— Point_on_curve (see 4.2.373);

— Polyline (see 4.2.377);

— Trimmed_curve (see 4.2.539);

— Wireframe_model_2d (see 4.2.561).

4.1.9 wireframe_model_3d (G2)

This unit of functionality provides the capability to represent geometry as a three-dimensional geometrically bounded wireframe model.

NOTE - The difference between 3D and 2D geometric elements is specified by the presence or absence of a third coordinate value, respectively.

All application objects of the wireframe_model_2d UoF (G1) are included for the 3D case in the wireframe_model_3d UoF (G2).

Composite curves for the geometric representation of paths and loops are included in this UoF. The types of points and curves excluded from this UoF are point_on_surface and curve_on_surface. All unbounded curves in this UoF are explicitly trimmed unless they are closed.

Surface data and all topological information are outside the scope of this UoF.

The following application objects are used by the wireframe_model_3d UoF:

— B_spline_curve (see 4.2.36);

— Cartesian_point (see 4.2.47);

— Circle (see 4.2.56);

— Composite_curve (see 4.2.83);

— Curve (see 4.2.108);

— Curve_set_3d (see 4.2.112);

— Trimmed_curve (see 4.2.539);

— Wireframe_model_3d (see 4.2.562).

4.1.10 connected_surface_model (G3)

This unit of functionality provides the capability to represent geometry as a surface model that is topologically bounded.

Topological relationships are modelled explicitly by using objects, i.e., face, loop, edge, and vertex. The bounded surfaces in this UoF are connected. A model shall be manifold. A facility to associate transition information with a pair of adjacent faces or with a pair of adjacent edges is provided. Trimming and composition of curves and surfaces are represented by applying topological objects, i.e., vertex, edge, loop, and face.

This UoF contains the same geometric representations of points, unbounded curves, and unbounded surfaces as in UoF G2 and in UoF G8 but, unlike these UoFs, does not support geometric constructs for bounding and connecting geometric objects. The connected_surface_model UoF has the additional functionality of representing points and curves in the parameter space of curves and surfaces, respectively.

EXAMPLE Examples for curves represented in the parameter space of surfaces are intersection curves or seam curves.

— Vertex_loop (see 4.2.552);

— Vertex_point (see 4.2.553).

4.1.11 faceted_b_rep_model (G4)

This unit of functionality provides the capability to represent geometry as a B-rep model with planar faces and implicit topology.

The faceted B-rep model is represented by an outer shell and an arbitrary number of internal voids, each represented by a closed shell. A requirement, included to provide internal consistency checks, is that each face shall be associated with a plane surface. All the face boundaries are implicitly defined by poly loops. One of these poly loops is defined as the outer boundary. The edges are all straight lines but are not explicitly defined. The edge information can be deduced from the poly loop definitions.

This UoF shares the basic geometric definitions of point, line, and plane with the UoFs G3 and G5. It also shares the definition of a manifold solid B-rep and the topological concepts of closed shell and face with the UoF G5.

NOTE - A faceted B-rep model, as defined in this UoF, would not be considered to be a valid example of a B-rep model in the UoF G5; it could however be converted to such a model by explicitly creating lines, edges and vertices and converting the face bounding poly loops in UoF G4 to edge loops as required by the UoF G5.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following application objects are used by the faceted_b_rep_model UoF:

— Cartesian_point (see 4.2.47);

— Detailed_element (see 4.2.143);

— Detailed_geometric_model_element (see 4.2.144);

— Detailed_model_element (see 4.2.145);

— Faceted_b_rep (see 4.2.195);

— Faceted_b_rep_model (see 4.2.196);

— Faceted_face (see 4.2.198);

— Plane (see 4.2.360);

— Point (see 4.2.367);

— Poly_loop (see 4.2.376).

4.1.12 b_rep_model (G5)

This unit of functionality provides the capability to represent geometry as B-rep model with a consistent topological structure and explicitly defined geometry for faces and edges.

The B-rep model is represented by one or more B-rep solids. Each B-rep solid consists of a single closed shell, which represents its exterior, and an arbitrary number of closed shells corresponding to internal voids. Each shell consists of a collection of faces. Each face is defined by a surface and by loops of edges bounding the surface. The edges meet at vertices and have their geometry defined by curves. The geometry of the curves and surfaces can be complex but is required to be directly defined.

The definitions of geometric objects in this UoF as well as the definitions of the topological objects vertex, edge, path, loop, and face are identical to those in the UoF G3.

NOTE - Any B-rep model, defined in UoF G5, could be represented in UoF G3 as a collection of faces with no loss of geometric precision but losing the information of a solid model, e.g., inner and outer domain of the B-rep solid.

The following application objects are used by the b_rep_model UoF:

— B_rep (see 4.2.34);

— B_rep_model (see 4.2.35);

— Vertex_point (see 4.2.553).

4.1.13 compound_model (G6)

This unit of functionality provides the capability to represent geometry as a topologically connected geometric model consisting of solid, surface, or wireframe data. This geometric model deals with mixed dimensionality (solids, surfaces, and wireframes) and non-manifold topology.

Only shape models with complete topological description, i.e., in boundary representation are supported. Since the topology is not restricted to be manifold, the models can have more than two faces sharing one edge, and faces shared by two adjacent shells. A compound representation collects several geometric items of the same or of different type and joins them into one topologically connected model.

NOTE - This UoF should be used wherever portions of the shape have to be distinguished.

EXAMPLE Examples for distinguishing portions of the shape are material zones with different heat treatment, structures welded together, meshing macros for finite element analysis, and shape representation of varying dimensionality, e.g., surfaces and solids.

This UoF includes all application objects of UoF b_rep_model (G5) and connected_surface_model (G3).

The following application objects are used by the compound_model UoF:

— B_spline_curve (see 4.2.36);

— B_spline_surface (see 4.2.37);

— Cartesian_point (see 4.2.47);

— Circle (see 4.2.56);

— Compound_model (see 4.2.92);

4.1.14 csg_model (G7)

This unit of functionality provides the capability to represent geometry as a solid model using Constructive Solid Geometry (CSG).

A CSG shape is the evaluation of a CSG tree which has solid objects at the leaves and Boolean operations at the nodes. This model provides geometric functionality for building solids using Boolean operations on predefined simple parameterized solid shapes, manifold solid B-rep shapes in faceted or exact form, half space solids, or swept face solids.

The following application objects are used by the csg_model UoF:

— B_rep (see 4.2.34);

— B_rep_model (see 4.2.35);

— B_spline_curve (see 4.2.36);

— B_spline_surface (see 4.2.37);

— Block (see 4.2.40);

— Boolean_result (see 4.2.41);

— Cartesian_point (see 4.2.47);

— Circle (see 4.2.56);

— Closed_shell (see 4.2.74);

— Conical_surface (see 4.2.96);

4.1.15 geometrically_bounded_surface_model (G8)

This unit of functionality provides the capability to represent geometry as a surface model that is geometrically bounded.

This UoF provides basic geometric constructs, such as three-dimensional points, curves, and surfaces. It includes elementary and sculptured surfaces as well as composite surfaces. Points and curves can be represented in the parameter space of curves or surfaces, respectively, by objects such as point on curve and parametric curve. The replication of the geometric objects is not included in this UoF.

© ISO 2001 – All rights reserved

The basic geometric constructs are used for the definition of complex geometric objects, i.e., geometrically bounded surfaces without connectivity. They are also used within the connected_surface_model UoF (G3) and b_rep_model UoF (G5) for the definition of topologically bounded surfaces with topological connections.

NOTE - This UoF does not contain any topological information. Therefore, the geometrically bounded surfaces cannot be connected by topology.

The following application objects are used by the geometrically_bounded_surface_model UoF:

— B_spline_curve (see 4.2.36);

— B_spline_surface (see 4.2.37);

— Cartesian_point (see 4.2.47);

— Circle (see 4.2.56);

— Composite_curve (see 4.2.83);

— Conical_surface (see 4.2.96);

— Curve (see 4.2.108);

— Curve_on_surface (see 4.2.110);

— Cylindrical_surface (see 4.2.114);

— Ellipse (see 4.2.183);

— Geometric_set_3d (see 4.2.242);

— Geometrically_bounded_surface_model (see 4.2.248);

— Hyperbola (see 4.2.260);

— Line (see 4.2.296);

— Offset_curve (see 4.2.325);

— Offset_surface (see 4.2.326);

— Parabola (see 4.2.337);

— Plane (see 4.2.360);

— Point (see 4.2.367);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— Point_on_curve (see 4.2.373);

— Point_on_surface (see 4.2.374);

— Polyline (see 4.2.377);

— Spherical_surface (see 4.2.475);

— Surface (see 4.2.489);

— Toroidal_surface (see 4.2.530);

— Trimmed_curve (see 4.2.539);

— Trimmed_surface (see 4.2.540).

4.1.16 kinematics (K1)

This unit of functionality provides the capability to represent kinematic aspects of a mechanical product as required for the communication between CAD systems and kinematic analysis systems, including robotic simulation systems, as well as between dissimilar kinematic analysis systems.

A mechanism as described using this UoF is regarded as being composed of rigid links mating in the following types of joints:

— cylindrical pair;

— gear pair;

— homokinetic pair;

— planar pair;

— point on surface pair;

— prismatic pair;

— rack and pinion pair;

— revolute pair;

— rolling curve pair;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— rolling surface pair;

— screw pair;

— sliding curve pair;

— sliding surface pair;

— spherical pair;

— universal pair.

The mechanism may contain open or closed kinematic chains. This information is implicitly defined by the topology of the kinematic structure. A mechanism may be connected to another mechanism. Both planar and 3D mechanisms can be defined. The rigid links may be described by a 3D geometric shape description. A link may have additional frames attached to it, to allow application specific kinematic forward analysis to be performed.

The following application objects are used by the kinematics UoF:

— Actuator (see 4.2.7);

— Ground_representation (see 4.2.249);

— Initial_configuration (see 4.2.263);

— Interpolated_configuration_sequence (see 4.2.265);

— Kinematic_configuration_definition (see 4.2.279);

— Kinematic_configuration_interpolation (see 4.2.280);

— Kinematic_control (see 4.2.281);

— Kinematic_element (see 4.2.282);

— Kinematic_joint (see 4.2.283);

— Kinematic_link (see 4.2.284);

— Kinematic_link_representation (see 4.2.285);

— Kinematic_mechanism (see 4.2.286);

— Kinematic_pair (see 4.2.287);

— Kinematic_simulation_information (see 4.2.288);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— Kinematic_structure (see 4.2.289);

— Kinematic_transformation_result (see 4.2.290);

— Pair_value (see 4.2.335);

— Path_approximation (see 4.2.343);

— Simple_pair_range (see 4.2.453);

— Tool_attachment_point_frame (see 4.2.526);

— Tool_centre_point_frame (see 4.2.527);

— Transformation_to_reference_frame (see 4.2.536).

4.1.17 measured_data (MD1)

This unit of functionality specifies the representation of scanned data resulting from a measurement process of a physical part. These data are represented by a sequence of measured points, potentially with associated vector information for the measured surface normal direction.

NOTE - This data representation may also be used for manufacturing processes, e.g., to represent tool paths for NC programming with vector information indicating the tool direction.

The following application objects are used by the measured_data UoF:

— Point_direction (see 4.2.369);

— Point_direction_model (see 4.2.370);

— Point_direction_sequence (see 4.2.371);

— Point_sequence (see 4.2.375).

4.1.18 item_property (PR1)

This unit of functionality specifies various properties for a part, such as material, recyclability, mass, and general properties.

The information about recyclability is required to describe whether and how material or component parts may be reused. The costs, as planned or calculated for a part, as well as a quality measure property to keep track of the results of some processes, e.g., prototype building, may be specified. The mass is required to express the weight of a part. Shape related properties that are rotation and translation invariant such as the centre of mass and the moments of inertia may also be specified.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The general properties are required to define property data which are not covered by one of the other UoFs, and, due to their variety, cannot be specified all by explicit application objects.

EXAMPLE Noise development of an engine, maintenance intervals of parts, and heat or noise absorption of insulating parts between the engine and passenger compartment are examples for general properties.

The following application objects are used by the item_property UoF:

— Centre_of_mass (see 4.2.49);

— Change (see 4.2.55);

— Cost_property (see 4.2.105);

— Data_environment (see 4.2.116);

— Duration_property (see 4.2.175);

— General_property (see 4.2.230);

— General_shape_dependent_property (see 4.2.231);

— Item_property_association (see 4.2.273);

— Mass_property (see 4.2.306);

— Material (see 4.2.309);

— Material_property (see 4.2.310);

— Material_property_association (see 4.2.311);

— Material_property_value_representation (see 4.2.312);

— Model_property_association (see 4.2.317);

— Model_property_value (see 4.2.318);

— Moments_of_inertia (see 4.2.319);

— Process_property_association (see 4.2.390);

— Property (see 4.2.409);

— Property_change (see 4.2.410);

— Property_relationship (see 4.2.411);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— Property_value_association (see 4.2.413);

— Property_value_representation (see 4.2.414);

— Property_value_representation_relationship (see 4.2.415);

— Quality_property (see 4.2.416);

— Recyclability_property (see 4.2.428);

— Shape_dependent_property (see 4.2.447).

4.1.19 geometric_presentation (P1)

This unit of functionality specifies the presentation of point, vector, curve, and surface geometry with attributes, such as colour, line thickness, or line font. The association of these attributes to geometric elements is defined either directly or through a context.

EXAMPLE The following are examples for a context: drawing sheet, layer, group, model view, template, view, or view area.

The curve appearance is restricted to unscaled curve fonts only. A viewing mechanism for the presentation of a geometric model in one or more views is also provided.

The following application objects are used by the geometric_presentation UoF:

— Appearance_assignment (see 4.2.20);

— Context_dependent_appearance_assignment (see 4.2.103);

— Curve_appearance (see 4.2.109);

— Hidden_element_handling (see 4.2.256);

— Model_image (see 4.2.316);

— Point_appearance (see 4.2.368);

— Point_marker_symbol (see 4.2.372);

— Styled_element (see 4.2.482);

— Styled_geometric_model (see 4.2.483);

— Styled_model (see 4.2.484);

— Styled_model_element (see 4.2.485);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— Styled_model_relationship (see 4.2.486);

— Styled_model_version (see 4.2.487);

— Surface_appearance (see 4.2.490);

— Surface_appearance_element (see 4.2.491);

— Terminator_symbol (see 4.2.513);

— Vector_appearance (see 4.2.550);

— View (see 4.2.554);

— View_area (see 4.2.555);

— View_area_assignment (see 4.2.556).

4.1.20 annotated_presentation (P2)

This unit of functionality specifies the presentation of annotations and a view layout with multiple views, including annotations. The curve appearance is unrestricted in this UoF.

EXAMPLE Sketches can be represented with this UoF.

The organizational definition of technical drawings is not included in this UoF but in the Explicit_draughting UoF.

The following application objects are used by the annotated_presentation UoF:

— Annotation_curve (see 4.2.16);

— Annotation_element (see 4.2.17);

— Annotation_subfigure (see 4.2.18);

— Annotation_symbol (see 4.2.19);

— Area_placed_annotation (see 4.2.25);

— Detailed_element (see 4.2.143);

— Dimension_symbol (see 4.2.153);

— Draughting_callout (see 4.2.169);

— Fill_area (see 4.2.204);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— General_symbol (see 4.2.233);

— Geometric_tolerance_symbol (see 4.2.246);

— Hatching (see 4.2.255);

— Leader (see 4.2.293);

— Point_marker_symbol (see 4.2.372);

— Solid_fill_area (see 4.2.459);

— Styled_annotation_model (see 4.2.481);

— Surface_condition_symbol (see 4.2.495);

— Terminator_symbol (see 4.2.513);

— Text (see 4.2.514);

— Text_appearance (see 4.2.515);

— Tiling (see 4.2.521);

— View_area_relationship (see 4.2.557);

— View_placed_annotation (see 4.2.558);

— View_relationship (see 4.2.559).

4.1.21 shaded_presentation (P3)

This unit of functionality specifies advanced presentation capabilities for three-dimensional geometry. This includes hidden line and hidden surface presentation. It also includes definitions which enable the creation of shaded images, such as light source definitions. Enhanced surface appearance definitions are also included.

EXAMPLE Examples of enhanced surface appearance definitions are transparency and reflection rates of surfaces.

The following application objects are used by the shaded_presentation UoF:

— Hidden_element_handling (see 4.2.256);

— Light_source (see 4.2.294).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.1.22 product_management_data (S1)

This unit of functionality provides the capability to represent product management information. It includes information about items that are either raw materials, parts, or tools, about versions and views of items, about persons and dates, and about information resulting from release and approval processes.

Additionally, this unit of functionality provides the capability to represent descriptive information about objects in different languages and to assign alias identifiers to objects.

The following application objects are used by the product_management_data UoF:

— Alias_identification (see 4.2.8);

— Application_context (see 4.2.21);

— Approval (see 4.2.22);

— Approval_relationship (see 4.2.23);

— Approval_status (see 4.2.24);

— Certification (see 4.2.50);

— Contract (see 4.2.104);

— Date_and_person_assignment (see 4.2.117);

— Date_and_person_organization (see 4.2.118);

— Date_time (see 4.2.119);

— Date_time_assignment (see 4.2.120);

— Date_time_interval_assignment (see 4.2.121);

— Design_discipline_item_definition (see 4.2.142);

— Feature_parameter (see 4.2.201);

— General_parameter (see 4.2.226);

— Interval_of_time (see 4.2.266);

— Item (see 4.2.267);

— Item_version (see 4.2.275);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.1.23 element_structure (S2)

This unit of functionality provides the capability to associate items with shape or to identify aspects of the shape.

Additionally, this UoF contains elements that are needed to build up structures of data elements. The data elements that can be structured, are geometric elements, annotation elements, and kinematic elements. The supported structures are groups, layers, and templates for multiple instances of the same definition.

This UoF allows also to distinguish between geometric elements used as auxiliary elements and geometric elements that describe product data.

Additionally this UoF contains the capability of an empty geometric model with only a geometric element for placement purposes and an unconstrained three-dimensional geometric model that may contain any geometric data elements of other geometric UoFs in the same conformance class.

NOTE - This UoF is always available if other geometric UoFs are participating in a given conformance class, see Figure 5

The following application objects are used by the element_structure UoF:

— Accuracy (see 4.2.1);

— Axis_placement (see 4.2.33);

— Cartesian_coordinate_space (see 4.2.44);

— Cartesian_coordinate_space_2d (see 4.2.45);

— Cartesian_coordinate_space_3d (see 4.2.46);

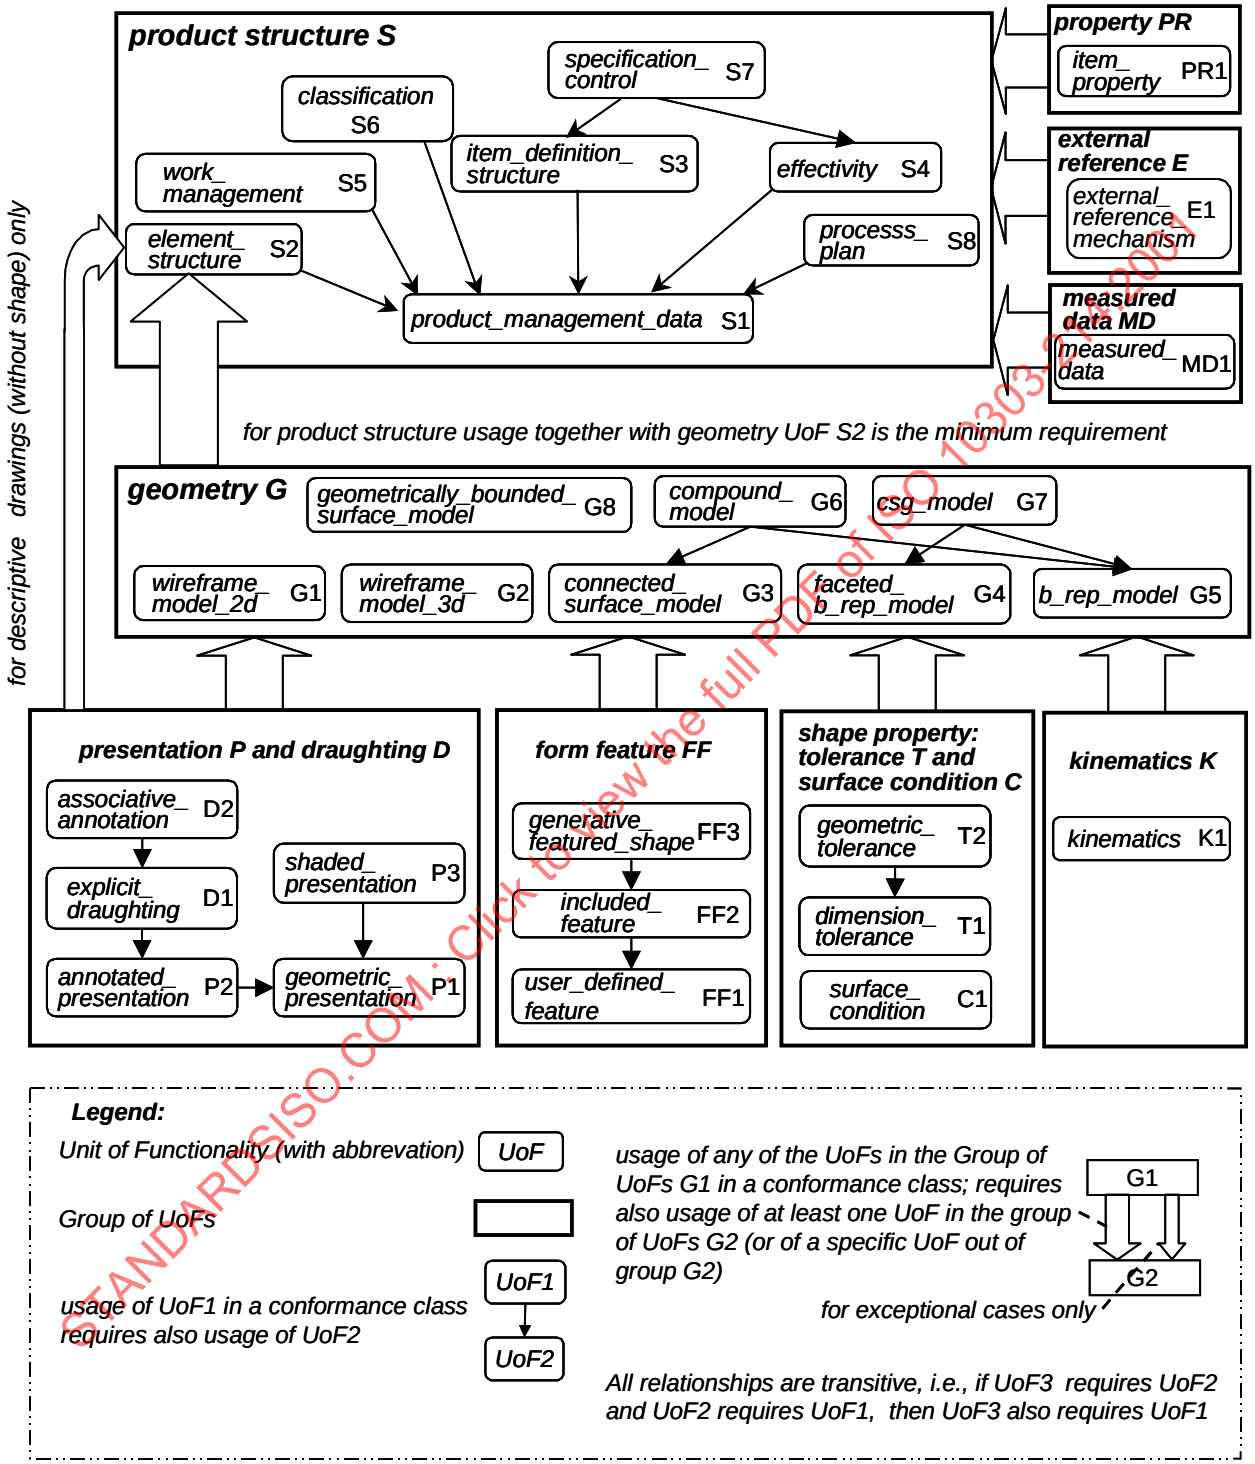
— Change (see 4.2.55);

— Constructive_geometric_element (see 4.2.99);

— Constructive_geometry (see 4.2.100);

— Constructive_geometry_association (see 4.2.101);

— Full_model_change (see 4.2.213);



— General_shape_dependent_property (see 4.2.231);

— Geometric_model (see 4.2.238);

— Geometric_model_relationship (see 4.2.239);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

— Transformation_3d (see 4.2.535).

4.1.24 item_definition_structure (S3)

This unit of functionality provides the capability to represent relationships between items to build up various kinds of structures.

The structures are defined for item definitions, for item instances that are particular occurrences of item definitions or between item definitions and item instances.

Among these structures is a hierarchical assembly structure to represent the relationships between constituents and the assembly.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following application objects are used by the item_definition_structure UoF:

— Alternate_item_relationship (see 4.2.9);

— Assembly_component_relationship (see 4.2.26);

— Assembly_definition (see 4.2.27);

— Assembly_substitute_relationship (see 4.2.28);

— General_item_definition_relationship (see 4.2.223);

— Geometrical_relationship (see 4.2.247);

— Item_definition_instance_relationship (see 4.2.268);

— Item_definition_relationship (see 4.2.269);

— Replaced_definition_relationship (see 4.2.430);

— Selected_instance (see 4.2.445);

— Single_instance (see 4.2.455);

— Specified_instance (see 4.2.472).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.1.25 effectivity (S4)

This unit of functionality provides the capability to represent information concerning the validity of data. Implicit propagation of data specifying validity is not available.

The validity of data can be expressed by effectivities that specify time ranges within which data may be used and by retention periods that specify how long data have to be kept and when they may or have to be deleted.

© ISO 2001 – All rights reserved

Both concepts can make use of explicit dates or of dates expressed by events in order to represent the relevant points in time.

The following application objects are used by the effectivity UoF:

— Dated_configuration (see 4.2.122);

— Duration (see 4.2.174);

— Effectivity (see 4.2.179);

— Effectivity_assignment (see 4.2.180);

— Effectivity_relationship (see 4.2.181);

— Event_reference (see 4.2.184);

— Lot_configuration (see 4.2.303);

— Manufacturing_configuration (see 4.2.305);

— Product_class (see 4.2.392);

— Product_design (see 4.2.396);

— Product_identification (see 4.2.398);

— Retention_period (see 4.2.434);

— Serial_configuration (see 4.2.446).

4.1.26 work_management (S5)

This unit of functionality provides the capability to represent activity, project, and contract related information.

Activities may be initiated by work requests and may be authorized by work orders. Activities may result in changes of models or of properties; such changes can also be represented in this UoF.

The following application objects are used by the work_management UoF:

— Activity (see 4.2.2);

— Activity_element (see 4.2.3);

— Activity_method (see 4.2.4);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— Activity_method_assignment (see 4.2.5);

— Activity_relationship (see 4.2.6);

— Change (see 4.2.55);

— Element_delivery (see 4.2.182);

— Organization_relationship (see 4.2.333);

— Project (see 4.2.404);

— Project_relationship (see 4.2.405);

— Work_order (see 4.2.564);

— Work_request (see 4.2.565).

4.1.27 classification (S6)

This unit of functionality provides the capability to classify items into specific categories.

EXAMPLE 1 Examples are the classification as raw materials, parts, or tools, or as safety or in-process items.

Additionally items may be classified by their attributes.

EXAMPLE 2 Examples for categories of attribute based classification are screws, bolts, nuts, shafts, or brackets.

The following application objects are used by the classification UoF:

— Classification_association (see 4.2.69);

— Classification_attribute (see 4.2.70);

— Classification_system (see 4.2.71);

— External_library_reference (see 4.2.188);

— General_classification (see 4.2.216);

— General_classification_hierarchy (see 4.2.217);

— Plib_class_reference (see 4.2.361);

— Plib_property_reference (see 4.2.362);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— Specific_item_classification (see 4.2.465);

— Specific_item_classification_hierarchy (see 4.2.466).

4.1.28 specification_control (S7)

This unit of functionality provides the capability to describe products with a large number of variants.

EXAMPLE Examples for automotive products are passenger cars, trucks, busses, or engines or components of these products.

Because of the large number of variants there is no unique identification for each of the variants that could be produced. The main concepts that are used to handle this large number of variants are the following:

— product classes are used to identify sets of similar products to be offered to the market;

— specifications are used to describe characteristics of the products;

— specification categories are used to group similar characteristics of the products;

— specification expressions are used to control the usage of a part within a product and to represent conditions for product classes;

— product functions are used to describe the functional requirements for products and components of products;

— product components are used to describe the common decomposition structure of all products of a product class or of various alternative solutions;

— alternative solutions are used to describe the variants for a product component or for a product function;

— item instances are used to identify an occurrence of a component in an assembly structure, e.g., to identify the elements of an alternative solution;

— configurations are used to link the parts (item instances), alternative solutions, product components, or product functions with their usage cases, i.e., the conditions under which they are used;

— product specifications are used to identify a manufacturable product out of a product class by its specific characteristics (specifications), e.g., a customer order for a car;

— physical instances are used to identify actually manufactured physical parts or products by their lot id or serial number.

Figure 6 illustrates the relationships among these concepts.

The following application objects are used by the specification_control UoF:

— Alternative_solution (see 4.2.10);

— Class_category_association (see 4.2.64);

— Class_condition_association (see 4.2.65);

— Class_inclusion_association (see 4.2.66);

— Class_specification_association (see 4.2.67);

— Class_structure_relationship (see 4.2.68);

— Collected_item_association (see 4.2.77);

— Collection_definition (see 4.2.78);

— Complex_product (see 4.2.80);

— Complex_product_relationship (see 4.2.81);

— Component_placement (see 4.2.82);

— Configuration (see 4.2.94);

— Descriptive_specification (see 4.2.137);

— Design_constraint (see 4.2.138);

— Design_constraint_association (see 4.2.139);

— Design_constraint_relationship (see 4.2.140);

— Design_constraint_version (see 4.2.141);

— Final_solution (see 4.2.206);

— General_item_definition_instance_relationship (see 4.2.222);

— General_item_instance_relationship (see 4.2.224);

— Instance_placement (see 4.2.264);

— Item_function_association (see 4.2.270);

— Item_instance_relationship (see 4.2.272);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— Physical_assembly_relationship (see 4.2.350);

— Physical_instance (see 4.2.352);

— Physical_instance_test_result (see 4.2.353);

— Product_class (see 4.2.392);

— Product_class_relationship (see 4.2.393);

— Product_component (see 4.2.394);

— Product_function (see 4.2.397);

— Product_identification (see 4.2.398);

— Product_specification (see 4.2.399);

— Product_structure_relationship (see 4.2.400);

— Replaced_usage_relationship (see 4.2.431);

— Specification (see 4.2.467);

— Specification_category (see 4.2.468);

— Specification_category_hierarchy (see 4.2.469);

— Specification_expression (see 4.2.470);

— Specification_inclusion (see 4.2.471);

— Supplier_solution (see 4.2.488);

— Technical_solution (see 4.2.510).

4.1.29 process_plan (S8)

This unit of functionality provides the capability to represent process related data. This includes process plans, versions of process plans with version tracking, process operations and properties of processes.

A process plan is decomposed into one or more occurrences of process operations. Process plans and process operations establish relationships among raw materials, in-process items, and final items, as well as the relationship between the items and the tools used to manufacture them.

Additionally, the representation of the connection of parts in various kinds of mating is part of this UoF.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The following application objects are used by the process_plan UoF:

— Descriptive_specification (see 4.2.137);

— Make_from_relationship (see 4.2.304);

— Mated_item_association (see 4.2.307);

— Mated_item_relationship (see 4.2.308);

— Mating_definition (see 4.2.313);

— Process_operation_definition (see 4.2.381);

— Process_operation_definition_relationship (see 4.2.382);

— Process_operation_input_or_output (see 4.2.383);

— Process_operation_occurrence (see 4.2.384);

— Process_operation_occurrence_relationship (see 4.2.385);

— Process_operation_resource_assignment (see 4.2.386);

— Process_plan (see 4.2.387);

— Process_plan_relationship (see 4.2.388);

— Process_plan_version (see 4.2.389);

— Process_state (see 4.2.391);

— Same_time_machining_relationship (see 4.2.442);

— Tool_part_relationship (see 4.2.528).

4.1.30 dimension_tolerance (T1)

This unit of functionality specifies the representation of geometric dimensions and of tolerances limiting geometric dimensions. Tolerances for geometric dimensions are characterized by plus-minus-tolerances, limits and fits, dimension ranges, or dimension limits and describe the allowable deviation range.

The definition of the presentation of the Tolerance information is dealt with in the associative_annotation UoF (D2).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following application objects are used by the dimension_tolerance UoF:

— Angular_location_dimension (see 4.2.13);

— Angular_size_dimension (see 4.2.14);

— Curved_distance_dimension (see 4.2.113);

— Default_setting_association (see 4.2.132);

— Default_thickness (see 4.2.134);

— Derived_geometry (see 4.2.136);

— General_size_dimension (see 4.2.232);

— General_tolerance_table (see 4.2.234);

— General_tolerances (see 4.2.235);

— Geometric_dimension (see 4.2.237);

— Limits_and_fits (see 4.2.295);

— Linear_distance_dimension (see 4.2.299);

— Location_dimension (see 4.2.301);

— Measurement_path (see 4.2.314);

— Plus_minus_bounds (see 4.2.363);

— Plus_minus_toleranced_datum (see 4.2.364);

— Significant_number_of_digits (see 4.2.452);

— Size_dimension (see 4.2.456);

— Thickness_dimension (see 4.2.516);

— Tolerance_table_cell (see 4.2.523);

— Upper_lower_limit (see 4.2.542);

— Upper_lower_toleranced_datum (see 4.2.543);

— Value_limitation (see 4.2.545).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.1.31 geometric_tolerance (T2)

This unit of functionality specifies the representation of geometric tolerances with a datum reference, such as parallelism or perpendicularity, and also geometric tolerances without a datum reference, such as straightness or flatness.

The tolerances are defined relative to the ideal shape of the toleranced object.

This UoF allows the definition of up to three datum references that are either single datum references, compound datum references, or datum targets and additionally the specification of tolerance zones.

The definition of the presentation of the Tolerance information is dealt with in the associative_annotation UoF (D2).

The following application objects are used by the geometric_tolerance UoF:

— Angularity_tolerance (see 4.2.15);

— Circular_runout_tolerance (see 4.2.63);

— Coaxiality_tolerance (see 4.2.76);

— Compound_datum (see 4.2.84);

— Concentricity_tolerance (see 4.2.93);

— Cylindricity_tolerance (see 4.2.115);

— Datum (see 4.2.123);

— Datum_target (see 4.2.125);

— Datum_target_set (see 4.2.127);

— Derived_geometry (see 4.2.136);

— Flatness_tolerance (see 4.2.211);

— Geometric_tolerance (see 4.2.243);

— Geometric_tolerance_relationship (see 4.2.245);

— Line_profile_tolerance (see 4.2.297);

— Parallelism_tolerance (see 4.2.338);

— Perpendicularity_tolerance (see 4.2.345);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— Placed_target (see 4.2.357);

— Position_tolerance (see 4.2.378);

— Projection (see 4.2.406);

— Reference_plane (see 4.2.429);

— Roundness_tolerance (see 4.2.441);

— Single_datum (see 4.2.454);

— Straightness_tolerance (see 4.2.477);

— Surface_profile_tolerance (see 4.2.499);

— Symmetry_tolerance (see 4.2.503);

— Target_area (see 4.2.505);

— Target_circle (see 4.2.506);

— Target_line (see 4.2.507);

— Target_point (see 4.2.508);

— Target_rectangle (see 4.2.509);

— Tolerance_condition (see 4.2.522);

— Tolerance_zone (see 4.2.524);

— Tolerance_zone_definition (see 4.2.525);

— Total_runout_tolerance (see 4.2.532).

4.2 Application objects

This subclause specifies the application objects for the Core data for automotive mechanical design processes application protocol. Each application object is an atomic element that embodies a unique application concept and contains attributes specifying the data elements of the object. The application objects and their definitions are given below.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE 1 - The following conventions apply for the definition text:

— lower case terms refer to the concept known in the application environment, e.g., 'circle' refers to the concept of a round planar figure whose circumference is everywhere equidistant from its centre;

— terms with a first upper case character refer to the application objects as defined in this part of ISO 10303, e.g., 'Circle' refers to the application object as defined in the geometric UoFs.

The attribute names 'id', 'name', and 'description' imply the following meanings:

— id: a computer interpretable identifier;

— name: human readable information;

— description: descriptive text.

NOTE 2 - The id is not a system generated identifier used by an implementation to distinguish between the various objects but it is an identifier that has a certain meaning in an application and that may be meaningful to a human being as well.

NOTE 3 - In cases where unique identifiers are required, identifiers with a format according to ISO 6523 [17] may be used.

In this clause, a permissive list approach for attributes with suffix '_type' or with name 'role' is used consistently, i.e., there is a list of standardized values with the specific semantics defined. However, the usage of other non-standardized values is also allowed.

NOTE 4 - Especially many relationship objects are defined in a general way where the attribute 'relation_-type' defines the standardized usages with a definition of the meaning of the other attributes, like 'relating' and 'related'.

4.2.1 Accuracy

An Accuracy is the information about the geometrical accuracy of the product data contained in a model.

The data associated with an Accuracy are the following:

— accuracy_type;

— accuracy_value;

— description;

— is_defined_for.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.1.1 accuracy_type

The accuracy_type specifies the kind of accuracy that is applied. Where applicable, the following values shall be used:

— 'angular accuracy': A kind of accuracy that specifies the maximum value for the absolute angle between two curve tangents or two surface normals for which the creating system assumes curve tangents or surface normals being identical;

NOTE 1 - The angular accuracy value can be used to determine the accuracy range for tangent continuous curve or surface connections.

— 'curvature accuracy': A kind of accuracy that specifies the value for the term

$$\frac{2 \parallel R_1 - R_2 \parallel}{\parallel R_1 \parallel + \parallel R_2 \parallel}$$

under which a system can assume that the two radii of curvature R_1 and R_2 are identical. The curvature accuracy value is used to determine the accuracy range for curvature continuous curve or surface connections;

NOTE 2 - Terms surrounded by the $\parallel$ symbols represent the absolute values of these terms.

— 'distance accuracy': A kind of accuracy that specifies the distance under which two points can be considered as having the same location. The distance accuracy value defined for a Geometric_model (see 4.2.238) is valid for all geometric elements of the Geometric_model.

4.2.1.2 accuracy_value

The accuracy_value specifies a numerical value defining the Accuracy.

4.2.1.3 description

The description specifies additional information about the Accuracy.

See 4.3.4 for the application assertion.

The description need not be specified for a particular Accuracy (see 4.2.1).

If present, there shall be exactly one object that defines the description for an Accuracy.

4.2.1.4 is_defined_for

The is_defined_for specifies the geometry to which the Accuracy is assigned.

See 4.3.1, 4.3.2, 4.3.3, 4.3.5, and 4.3.6 for the application assertions.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

There shall be at least one object that the Accuracy (see 4.2.1) is_defined_for.

4.2.2 Activity

An Activity is the fact of achieving or accomplishing an action.

The data associated with an Activity are the following:

— activity_type;

— actual_end_date;

— actual_start_date;

— chosen_method;

— concerned_organization;

— description;

— id;

— internal;

— planned_end_date;

— planned_start_date;

— requestor;

— resolved_request;

— status;

— supplying_organization.

4.2.2.1 activity_type

The activity_type specifies the purpose of the Activity. Where applicable, the following values shall be used:

— 'amendment': An Activity to add information to product data;

— 'analysis': An Activity to determine the behaviour of an element under certain physical circumstances;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— ’cancellation’: An Activity to delete an element from the bill of material or to cancel the whole bill of material;

— ’delivery change’: An Activity to change the delivery schedule of an element;

— ’design change’: An Activity to change the design of an item or an assembly; this might include changes to the geometry or to properties of the object;

— ’design’: An Activity concerning the development of a design of an item;

— ’mock-up creation’: An Activity to create an experimental model or replica of an item;

— ’prototype building’: An Activity to manufacture a preliminary version of an item;

— ’rectification’: An Activity to correct the data, documentation or structure associated with an item;

— ’restructuring’: An Activity to create a new structure or position within a bill of material without changing the data associated with the items in the bill of material;

— ’spare part creation’: An Activity to design a spare part or to classify an item as a spare part;

— ’stop notice’: An Activity to stop the manufacturing process of an item;

— ’testing’: An Activity to test an item;

— ’work definition’: An Activity to manage several sub-activities related to this Activity by an Activity_relationship (see 4.2.6) with a ’relation_type’ of value ’decomposition’.

4.2.2.2 actual_end_date

The actual_end_date specifies the date when the Activity actually finished.

See 4.3.9 for the application assertion.

The actual_end_date need not be specified for a particular Activity (see 4.2.2).

4.2.2.3 actual_start_date

The actual_start_date specifies the date when the Activity actually started.

See 4.3.9 for the application assertion.

The actual_start_date need not be specified for a particular Activity (see 4.2.2).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.2.4 chosen_method

The chosen_method specifies the Activity_method (see 4.2.4) used to carry out the Activity.

See 4.3.7 for the application assertion.

The chosen_method need not be specified for a particular Activity (see 4.2.2).

4.2.2.5 concerned_organization

The concerned_organization specifies the set of Organization (see 4.2.331) objects that are affected by the result of the Activity.

EXAMPLE The production site that has to change a manufacturing process due to a design change activity is an example for concerned_organization.

See 4.3.13 for the application assertion.

4.2.2.6 description

The description specifies additional information about the Activity.

See 4.3.12 for the application assertion.

The description need not be specified for a particular Activity (see 4.2.2).

If present, there shall be exactly one object that defines the description for an Activity.

4.2.2.7 id

The id specifies the identifier of the Activity.

4.2.2.8 internal

The internal specifies whether the activity is carried out within the organization that initiated the activity. A value of 'true' indicates that the activity is carried out within this particular organization.

The internal need not be specified for a particular Activity (see 4.2.2).

4.2.2.9 planned_end_date

The planned_end_date specifies the date when the Activity is or was supposed to be finished.

See 4.3.9, 4.3.10, and 4.3.11 for the application assertions.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The planned_end_date need not be specified for a particular Activity (see 4.2.2).

If present, there shall be exactly one object that defines the planned_end_date for an Activity.

4.2.2.10 planned_start_date

The planned_start_date specifies the date when the Activity is or was supposed to be started.

See 4.3.9 and 4.3.11 for the application assertions.

The planned_start_date need not be specified for a particular Activity (see 4.2.2).

If present, there shall be exactly one object that defines the planned_start_date for an Activity.

4.2.2.11 requestor

The requestor specifies the Person (see 4.2.346) or Organization (see 4.2.331) that requested the Activity and the date the request was submitted.

See 4.3.8 for the application assertion.

The requestor need not be specified for a particular Activity (see 4.2.2).

4.2.2.12 resolved_request

The resolved_request specifies the set of Work_request (see 4.2.565) objects that are resolved by the Activity.

See 4.3.14 for the application assertion.

4.2.2.13 status

The status specifies the level of completion of the Activity.

EXAMPLE The value 'open' is an example for status.

NOTE - The values and sequence of status are company specific.

The status need not be specified for a particular Activity (see 4.2.2).

4.2.2.14 supplying_organization

The supplying_organization specifies the set of Organization (see 4.2.331) objects that carry out the work.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

See 4.3.13 for the application assertion.

4.2.3 Activity_element

An Activity_element is an item of work that is part of an Activity (see 4.2.2).

The data associated with an Activity_element are the following:

— associated_activity;

— element;

— role.

4.2.3.1 associated_activity

The associated_activity specifies the Activity (see 4.2.2) the Activity_element belongs to.

See 4.3.15 for the application assertion.

4.2.3.2 element

The element specifies the piece of product data that is under work.

See 4.3.16, 4.3.17, 4.3.18, 4.3.19, 4.3.20, 4.3.21, 4.3.22, 4.3.23, 4.3.24, 4.3.25, 4.3.26, 4.3.27, 4.3.28, 4.3.29, 4.3.30, 4.3.31, 4.3.32, 4.3.33, 4.3.34, 4.3.35, 4.3.36, 4.3.37, 4.3.38, 4.3.39, 4.3.40, 4.3.41, 4.3.42, 4.3.43, 4.3.44, 4.3.45, 4.3.46, 4.3.47, 4.3.48, 4.3.49, 4.3.50, 4.3.51, 4.3.52, 4.3.53, 4.3.54, 4.3.55, 4.3.56, 4.3.57, 4.3.58, and 4.3.59 for the application assertions.

There shall be exactly one object that defines the element for an Activity_element (see 4.2.3).

4.2.3.3 role

The role specifies the function that is performed by the Activity_element in the context of the concerned Activity (see 4.2.2). Where applicable, the following values shall be used:

— 'control': The referenced element is an object that has immediate influence on the Activity performed;

> EXAMPLE Design lots used in the design of a component that fulfils a given product function may be identified as Activity_element objects that refer to this Product_function (see 4.2.397) in the role of 'control'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— ’input’: The referenced element serves as initial data for the Activity;

— ’output’: The referenced element is a result of the Activity.

4.2.4 Activity_method

An Activity_method is a procedure that may be used to solve a request.

The data associated with an Activity_method are the following:

— consequence;

— description;

— name.

4.2.4.1 consequence

The consequence specifies the expected positive or negative effects of the application of a particular Activity_method.

The consequence need not be specified for a particular Activity_method (see 4.2.4).

4.2.4.2 description

The description specifies additional information that defines the Activity_method in terms of either the nature of the Activity_method or in terms of the specific procedure steps required to implement it.

See 4.3.60 for the application assertion.

There shall be exactly one object that defines the description for an Activity_method (see 4.2.4).

4.2.4.3 name

The name specifies the word or group of words by which the Activity_method is referred to.

See 4.3.60 for the application assertion.

There shall be exactly one object that defines the name for an Activity_method (see 4.2.4).

4.2.5 Activity_method_assignment

An Activity_method_assignment is an object that associates an Activity_method (see 4.2.4) with a Work_request (see 4.2.565). The associated Activity_method serves as a recommended or non-recommended method to resolve the tasks specified in the Work_request.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with an Activity_method_assignment are the following:

— assigned_method;

— associated_request;

— relation_type.

4.2.5.1 assigned_method

The assigned_method identifies the Activity_method (see 4.2.4) that is recommended or that shall not be chosen.

See 4.3.61 for the application assertion.

4.2.5.2 associated_request

The associated_request identifies the Work_request (see 4.2.565) that the recommended or non – recommended method applies to.

See 4.3.62 for the application assertion.

4.2.5.3 relation_type

The relation_type specifies whether the specified Activity_method (see 4.2.4) may be used or not. Where applicable, the following values shall be used:

— 'non recommended method': The specified Activity_method shall not be used in order to accomplish the specified Work_request (see 4.2.565);

— 'recommended method': The specified Activity_method may be used in order to accomplish the specified Work_request.

NOTE – Several alternative recommended methods may exist.

4.2.6 Activity_relationship

An Activity_relationship is a relationship between two Activity (see 4.2.2) objects.

The data associated with an Activity_relationship are the following:

— description;

— related;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— relating;

— relation_type.

4.2.6.1 description

The description specifies additional information about the Activity_relationship.

See 4.3.64 for the application assertion.

The description need not be specified for a particular Activity_relationship (see 4.2.6).

If present, there shall be exactly one object that defines the description for an Activity_relationship.

4.2.6.2 related

The related specifies the second of the two Activity (see 4.2.2) objects related by an Activity_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.63 for the application assertion.

4.2.6.3 relating

The relating specifies the first of the two Activity (see 4.2.2) objects related by an Activity_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.63 for the application assertion.

4.2.6.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'alternative': The application object defines a relationship where the related Activity (see 4.2.2) may be used alternatively instead of the relating Activity;

— 'decomposition': The application object defines a relationship where the related Activity is one of potentially more sub-activities into which the relating Activity is broken down;

— 'derivation': The application object defines a relationship where the related Activity is derived from the relating Activity;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXAMPLE An Activity that is controlled by a Work_order (see 4.2.564) with work order type 'manufacturing release' may be derived from (is based on) another Activity controlled by another Work_order with 'work_order_type' 'design release'.

— 'exclusiveness': The application object defines a relationship where the relating and the related Activity shall not have any overlap in time of execution;

— 'precedence': The application object defines a relationship where the related Activity has higher priority than the relating Activity;

— 'sequence': The application object defines a relationship where the relating Activity shall be completed before the related Activity starts;

— 'simultaneity': The application object defines a relationship that establishes that both the relating and related Activity are considered as occurring during the same time period or shall be performed together in order to ensure consistency and enhance efficiency.

NOTE - The criteria for 'simultaneity' and in particular the allowed delay between two Activity objects declared simultaneous, are user-dependent.

4.2.7 Actuator

An Actuator is a mechanism that applies forces or moments to a Kinematic_pair (see 4.2.287) in such a way that a defined motion results.

The data associated with an Actuator are the following:

— is_applied_to;

— name.

4.2.7.1 is_applied_to

The is_applied_to specifies the Kinematic_pair (see 4.2.287) that the Actuator is actuating.

See 4.3.65 for the application assertion.

4.2.7.2 name

The name specifies the word or group of words by which the Actuator is referred to.

EXAMPLE 'cylinder' is an example for a name.

See 4.3.66 for the application assertion.

There shall be exactly one object that defines the name for an Actuator (see 4.2.7).

4.2.8 Alias_identification

An Alias_identification is a mechanism to associate an object with an additional identifier that is used to identify the object of interest in a different context, either in another Organization (see 4.2.331), or in some other context. The scope of the Alias_identification shall be specified either by the attribute 'alias_scope' or by the attribute 'description'.

EXAMPLE A document (e.g., a book) may have a unique document id (ISBN) and an Alias_identification as inventory number in the context of the inventory of a company.

The data associated with an Alias_identification are the following:

— alias_id;

— alias_scope;

— alias_version_id;

— description;

— is_applied_to.

4.2.8.1 alias_id

The alias_id specifies the identifier used in the context specified by the alias_scope, or by the description.

4.2.8.2 alias_scope

The alias_scope specifies the Organization (see 4.2.331) in which the Alias_identification is valid.

See 4.3.82 for the application assertion.

The alias_scope need not be specified for a particular Alias_identification (see 4.2.8).

4.2.8.3 alias_version_id

The alias_version_id specifies the version of the object as known in the context of the Alias_identification.

NOTE - An alias_version_id may be applied even if the object of interest does not have versions.

The alias_version_id need not be specified for a particular Alias_identification (see 4.2.8).

4.2.8.4 description

The description specifies the type of the Alias_identification.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXAMPLE The description may be, e.g., 'inventory number'.

See 4.3.81 for the application assertion.

The description need not be specified for a particular Alias_identification (see 4.2.8).

If present, there shall be exactly one object that defines the description for an Alias_identification.

4.2.8.5 is_applied_to

The is_applied_to specifies the object that has an Alias_identification.

NOTE - If applied to an Approval_status (see 4.2.24), a Document_type_property (see 4.2.166), or a Security_level (see 4.2.444), it is not the id but the name that is being aliased.

See 4.3.67, 4.3.68, 4.3.69, 4.3.70, 4.3.71, 4.3.72, 4.3.73, 4.3.74, 4.3.75, 4.3.76, 4.3.77, 4.3.78, 4.3.79, 4.3.80, 4.3.82, 4.3.83, 4.3.84, 4.3.85, 4.3.86, 4.3.87, 4.3.88, and 4.3.89 for the application assertions.

There shall be exactly one object that the Alias_identification (see 4.2.8) is_applied_to.

4.2.9 Alternate_item_relationship

An Alternate_item_relationship is the relationship between two Item (see 4.2.267) objects specifying that all versions of the alternate Item may be used in place of the base Item, regardless of its usages and of its versions.

NOTE - This concept usually refers to form, fit, function, and quality. Additional properties such as performance, noise, endurance, or reliability may also be considered as a prerequisite for the replacement.

The data associated with an Alternate_item_relationship are the following:

— alternate;

— base;

— fulfilled_requirements.

4.2.9.1 alternate

The alternate specifies the Item (see 4.2.267) that may be used in place of the base Item.

See 4.3.90 for the application assertion.

4.2.9.2 base

The base specifies the Item (see 4.2.267) for which another Item may be used as a replacement.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.90 for the application assertion.

4.2.9.3 fulfilled_requirements

The fulfilled_requirements specifies the word or group of words describing the requirements that are covered by both the base and the alternate and therefore are the basis for the statement regarding the capability of replacement.

See 4.3.91 for the application assertion.

There shall be exactly one object that defines the fulfilled_requirements for an Alternate_item_relationship (see 4.2.9).

4.2.10 Alternative_solution

An Alternative_solution is the identification of one of potentially many mutually exclusive implementations of a Product_function (see 4.2.397) or of a Product_component (see 4.2.394).

An Alternative_solution may refer directly to the object to be implemented or to another Alternative_solution object. In the latter case it serves as a refinement of the referenced Alternative_solution.

An Alternative_solution shall be instantiated only, if it is decomposed further into Product_component or Product_function objects.

NOTE 1 - An Alternative_solution may specify (through Product_structure_relationship (see 4.2.400) with 'relation_type' 'functionality' or 'realization') a set of objects that jointly form this implementation.

NOTE 2 - Each Alternative_solution may be any combination of Final_solution (see 4.2.206), Supplier_solution (see 4.2.488), and Technical_solution (see 4.2.510).

An Alternative_solution is a type of Complex_product (see 4.2.80).

Each Alternative_solution may be a Technical_solution (see 4.2.510), a Supplier_solution (see 4.2.488), or a Final_solution (see 4.2.206).

The data associated with an Alternative_solution are the following:

— base_element

The base_element specifies the object, for which the Alternative_solution provides a design alternative. All Alternative_solution objects for the same base_element are mutually exclusive.

See 4.3.92, 4.3.93, and 4.3.94 for the application assertions.

There shall be exactly one object that defines the base_element for an Alternative_solution.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.11 Angle_specification

An Angle_specification is an angle value and the specification of the element from which the angle is measured.

EXAMPLE Figure **??** shows two examples of the use of an Angle_specification for the definition of a Form_feature_in_panel (see 4.2.212).

The data associated with an Angle_specification are the following:

— angle;

— angle_reference.

4.2.11.1 angle

The angle specifies the Feature_parameter (see 4.2.201) that represents the angle.

NOTE - Depending on the direction of the vector that serves as the reference for the angle measurement positive or negative values may be used.

See 4.3.95 for the application assertion.

4.2.11.2 angle_reference

The angle_reference specifies the element the angle is measured from. The following values shall be used:

— 'profile normal': The angle is measured from a direction normal to the profile plane;

— 'punch direction': The angle is measured from the punch direction that is specified for the Process_-feature_in_panel (see 4.2.379);

— 'surface normal': The angle is measured from the actual surface normal.

4.2.12 Angle_taper

An Angle_taper is an angular deviation from a linear path. The Angle_taper is measured from the Linear_path (see 4.2.300) that is the sweep path of the feature to which the Angle_taper is applied. The start of the Linear_path is the start of the taper.

Tapers shall be applied after general end conditions are applied.

EXAMPLE Figure 8 illustrates the application of an Angle_taper.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

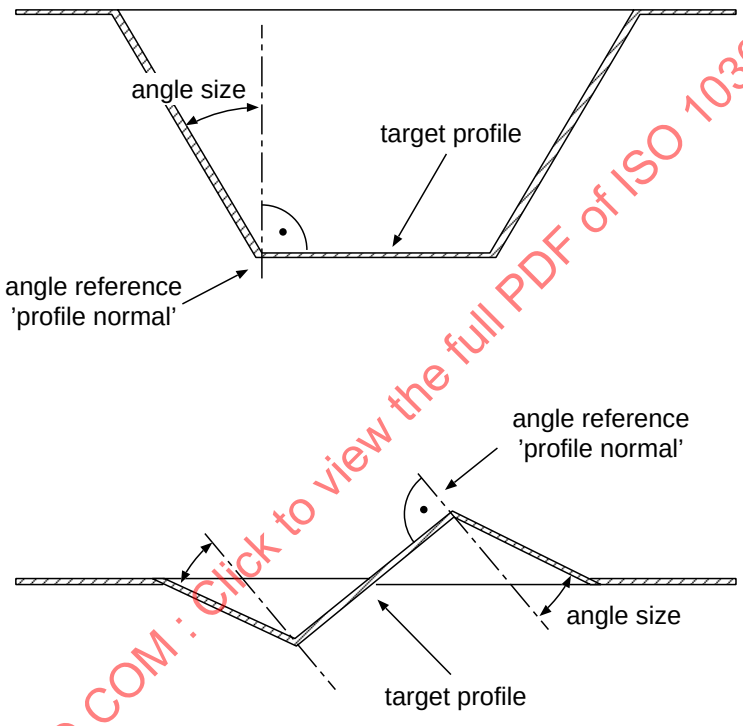

Figure 7 – Form features in panel defined by target boundaries and wall angles

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with an Angle_taper are the following:

— angle

The angle specifies the amount of angular deviation. An angle between 0 and 90 degrees or between -90 and -180 degrees indicates that the profile grows larger along the sweep path. An angle between 0 and -90 degrees or between 90 and 180 degrees indicates that the profile grows smaller along the sweep path.

See 4.3.96 for the application assertion.

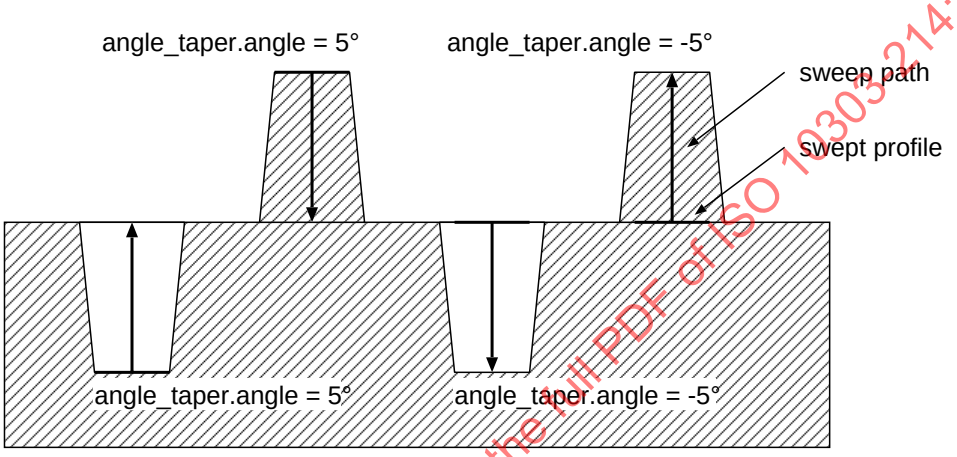

Figure 8 – Parameters defining an Angle_taper

4.2.13 Angular_location_dimension

An Angular_location_dimension is the representation of a geometrical angular constraint concerning the position of two elements.

NOTE - In the following, the first referenced element (plane or line) of the angular constraint is called origin and the second referenced element (plane or line) is called target.

EXAMPLE Figure 9 illustrates the application of the attributes of an Angular_location_dimension.

An Angular_location_dimension is a type of Location_dimension (see 4.2.301).

The data associated with an Angular_location_dimension are the following:

— major_angle;

— mirror_target;

— origin_determination.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.13.1 major_angle

The major_angle specifies a Boolean value that indicates the way the dimension is defined. A value of 'true' specifies the angle to be the larger of the two angles formed by the two elements that are referred to by the Angular_location_dimension.

NOTE - This attribute is used in combination with the other attributes to determine the angle that is constrained.

4.2.13.2 mirror_target

The mirror_target specifies a Boolean value that indicates whether the element that defines the target of the limitation is to be mirrored in order to define the angle whose dimension is specified. A value of 'true' indicates that the target object is mirrored about a plane orthogonal to it through the intersection point of the origin and the target.

4.2.13.3 origin_determination

The origin_determination specifies the method used to identify the first of the two elements that form the angle. The following values shall be used:

— 'unchanged': The Angular_location_dimension is measured from the origin as identified;

— 'mirror': The Angular_location_dimension is measured from the origin that is mirrored about a plane orthogonal to it through the intersection point of the origin and the target;

— 'positive normal': The Angular_location_dimension is measured from a line or plane that is positive normal to the identified origin through the intersection point of the origin and the target. Positive normal means into that half space where the target is located;

— 'negative normal': The Angular_location_dimension is measured from a line or plane that is negative normal to the identified origin through the intersection point of the origin and the target. Negative normal means into that half space where the target is not located.

4.2.14 Angular_size_dimension

An Angular_size_dimension is a dimension representing an angular size of an aspect of a part.

EXAMPLE Figure 10 shows the difference between an Angular_size_dimension and an Angular_location_dimension (see 4.2.13).

NOTE - For each combination of values of the attribute 'full' and 'major_angle' the value of the Angular_size_dimension remains positive.

An Angular_size_dimension is a type of Size_dimension (see 4.2.456).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

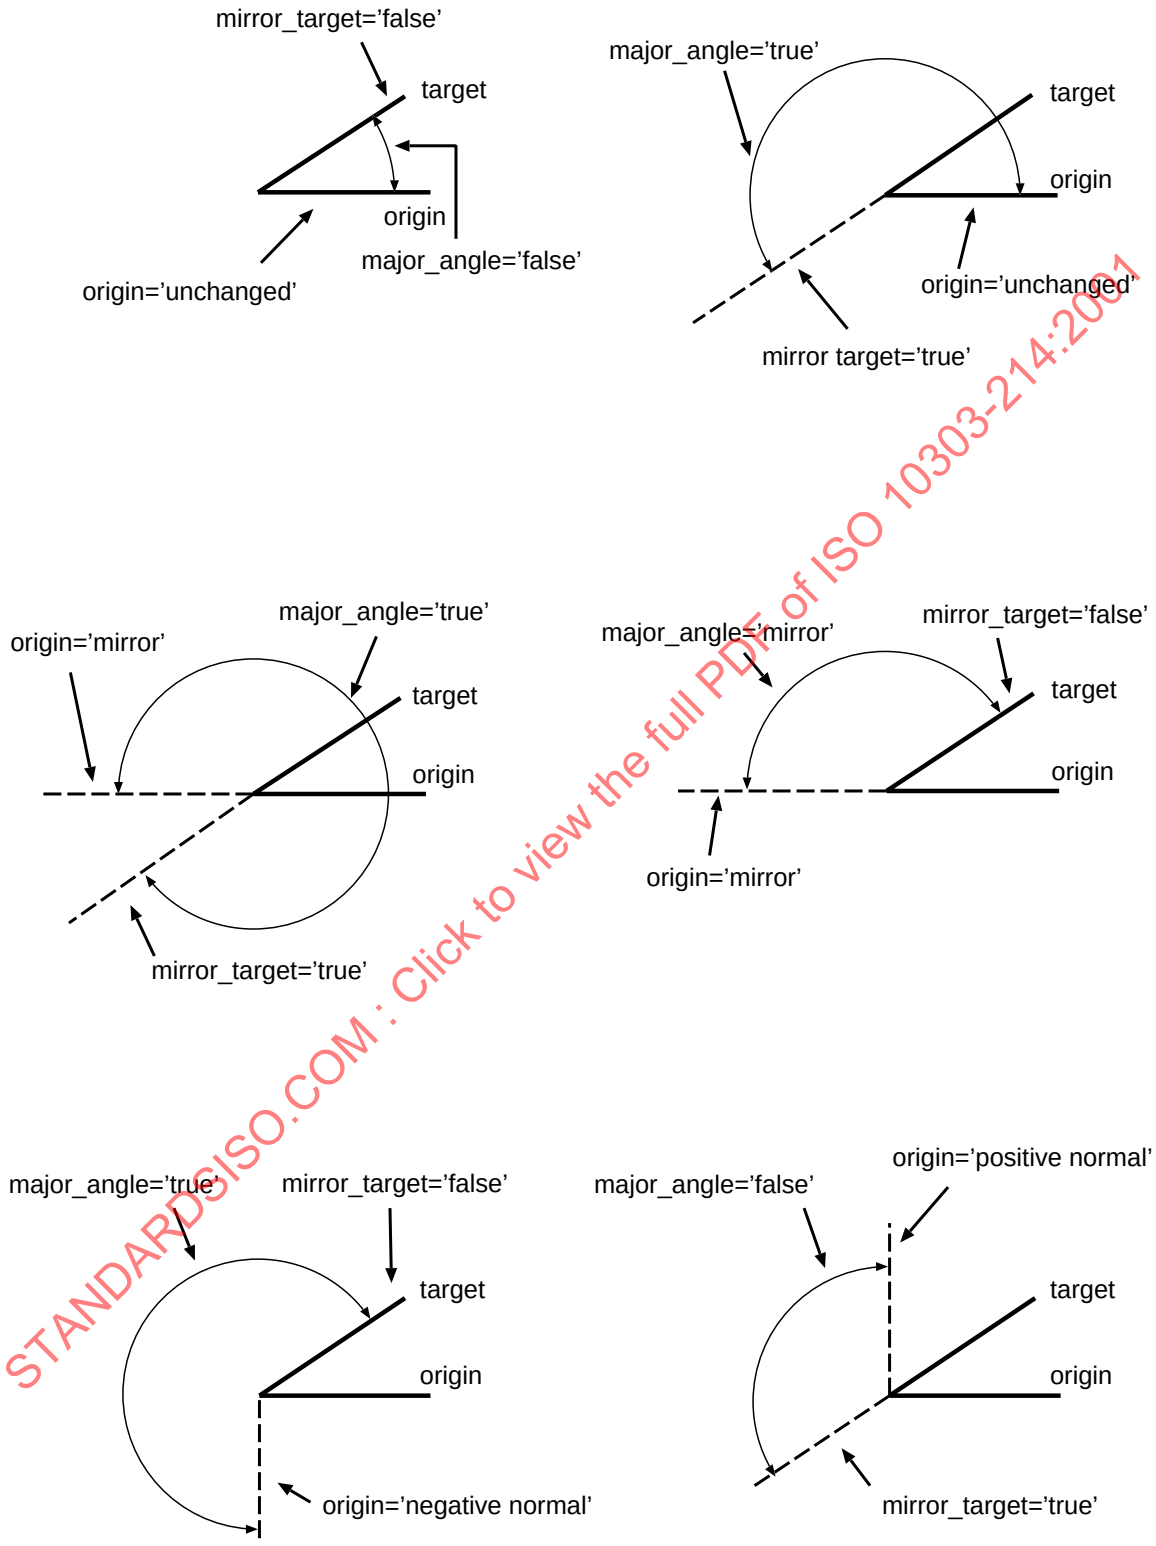

Figure 9 – Parameters defining an Angular_location_dimension

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with an Angular_size_dimension are the following:

— full;

— major_angle.

4.2.14.1 full

The full specifies the method used to establish the Angular_size_dimension. A value of 'true' specifies the angle is established between the two sides of the angular element. A value of 'false' specifies the angle is established between the bisector line and the angular element.

4.2.14.2 major_angle

The major_angle specifies which one of the two possible angles is meant. A value of 'true' specifies the angle to be the larger of the two angles formed by the angular element.

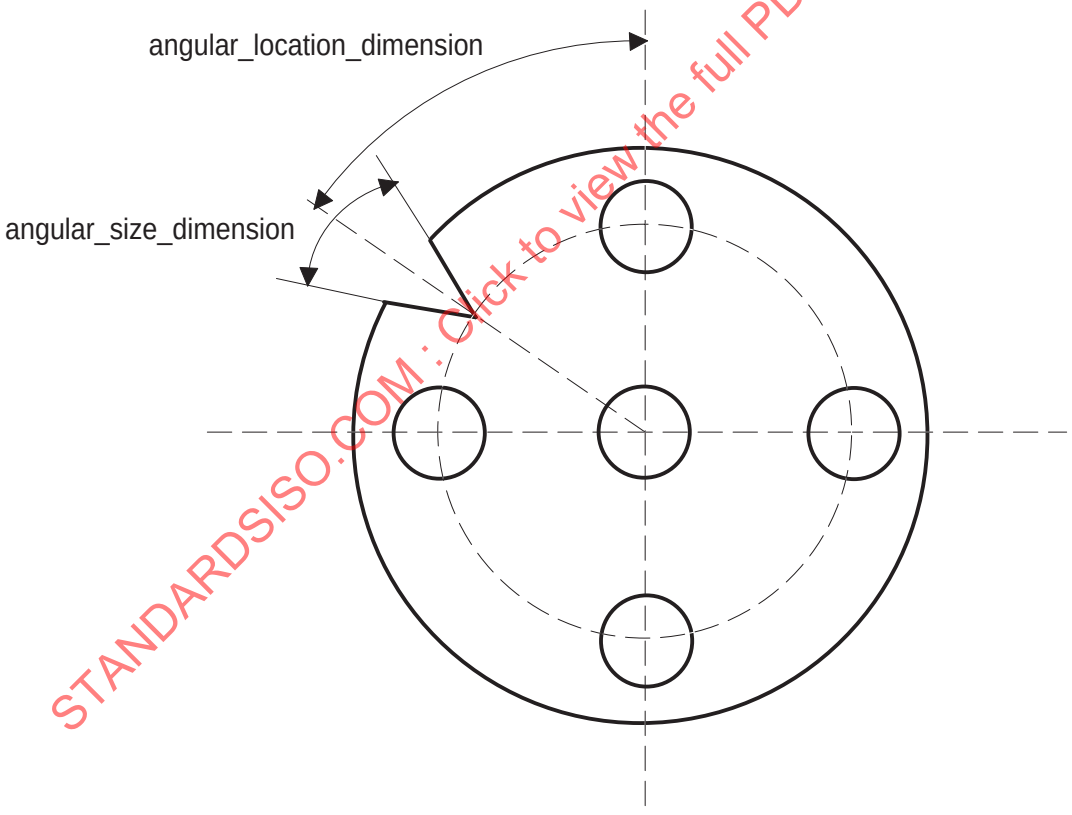

Figure 10 – Angular_location_dimension versus Angular_size_dimension

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.15 Angularity_tolerance

An Angularity_tolerance is a constraint on the location of a surface, of a centre plane, of an edge, or of an axis that lies theoretically at a specified angle (other than 90 degrees) from a datum plane or from a datum axis. An Angularity_tolerance specifies one of the following:

— a tolerance zone defined by two parallel planes at the specified basic angle from a datum plane or axis within which the considered element must lie;

— a tolerance zone defined by a cylinder at the specified basic angle from a datum plane or axis within which the considered element must lie.

An Angularity_tolerance is a type of Geometric_tolerance (see 4.2.243).

The data associated with an Angularity_tolerance are the following:

— reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) objects that define the reference for this type of geometric tolerance.

See 4.3.97 for the application assertion.

4.2.16 Annotation_curve

An Annotation_curve is a two-dimensional trimmed curve that is used to annotate a drawing or a geometric model.

An Annotation_curve is a type of Annotation_element (see 4.2.17).

Each Annotation_curve may be a Projection_curve (see 4.2.407), a Dimension_curve (see 4.2.151), or a Leader (see 4.2.293).

The data associated with an Annotation_curve are the following:

— annotation_curve_type

The annotation_curve_type specifies the kind of annotation curve. This information is provided with respect to the intended usage of the annotated object.

EXAMPLE 'centre line' is an example for annotation_curve_type.

The annotation_curve_type need not be specified for a particular Annotation_curve.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.17 Annotation_element

An Annotation_element is a representation of an annotation.

An Annotation_element is a type of Styled_element (see 4.2.482).

Each Annotation_element is a Text (see 4.2.514), an Annotation_subfigure (see 4.2.18), an Annotation_curve (see 4.2.16), an Annotation_symbol (see 4.2.19), or a Fill_area (see 4.2.204).

4.2.18 Annotation_subfigure

An Annotation_subfigure is the occurrence of a template that contains annotation elements. An Annotation_subfigure is located within the coordinate system of a Drawing_sheet (see 4.2.173), a Styled_model (see 4.2.484), or a View (see 4.2.554).

EXAMPLE Figure 11 depicts an Annotation_subfigure.

An Annotation_subfigure is a type of Annotation_element (see 4.2.17).

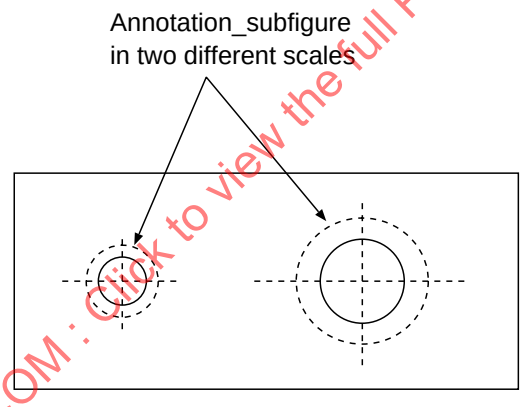

Figure 11 – Annotation_subfigure for a hole on a technical drawing

4.2.19 Annotation_symbol

An Annotation_symbol is an annotation presenting a symbol.

An Annotation_symbol is either user-defined, externally defined, or pre-defined. The set of pre-defined symbols comprises the following:

— Geometrical tolerance symbols;

— Surface condition symbols;

— Dimension symbols;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

— Terminator symbols;

— Point marker symbols.

An Annotation_symbol is a type of Annotation_element (see 4.2.17).

The data associated with an Annotation_symbol are the following:

— symbol_definition

The symbol_definition specifies the symbol that defines this annotation.

See 4.3.98, 4.3.99, 4.3.100, 4.3.101, 4.3.102, and 4.3.103 for the application assertions.

There shall be exactly one object that defines the symbol_definition for an Annotation_symbol.

4.2.20 Appearance_assignment

An Appearance_assignment is the assignment of visual appearance characteristics to geometric elements and to annotation.

The appearance can be defined explicitly for each represented element or for a context in which the elements are represented. Several appearance components for the representation of the different kinds of elements can be associated with the Appearance_assignment.

Each Appearance_assignment may be a Context_dependent_appearance_assignment (see 4.2.103).

The data associated with an Appearance_assignment are the following:

— component

The component specifies the various appearance objects that define the appearance of geometric and annotation objects.

See 4.3.104, 4.3.105, 4.3.106, 4.3.107, 4.3.108, 4.3.109, and 4.3.110 for the application assertions.

There shall be at least one object that defines the component for an Appearance_assignment.

4.2.21 Application_context

An Application_context is a shared universe of discourse.

The data associated with an Application_context are the following:

— application_domain;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— description;

— life_cycle_stage.

4.2.21.1 application_domain

The application_domain is the identification of the applications for which an object may be relevant. Where applicable, the following values shall be used:

— 'assembly study': The object may be relevant for an assembly study;

— 'digital mock-up': The object may be relevant for digital mock-up;

— 'electrical design': The object may be relevant for the electrical design;

— 'mechanical design': The object may be relevant for the mechanical design;

— 'preliminary design': The object may be relevant for the preliminary design;

— 'process planning': The object may be relevant for the process planning.

4.2.21.2 description

The description specifies additional information about the Application_context.

See 4.3.111 for the application assertion.

The description need not be specified for a particular Application_context (see 4.2.21).

If present, there shall be exactly one object that defines the description for an Application_context.

4.2.21.3 life_cycle_stage

The life_cycle_stage is the specification of the general stage in the product life cycle to which the concerned items belong. Where applicable, the following values shall be used:

— 'design': The concerned item belongs to the design phase of the life cycle;

— 'manufacturing': The concerned item belongs to the manufacturing phase of the life cycle;

— 'recycling': The concerned item belongs to the recycling phase of the life cycle.

4.2.22 Approval

An Approval is a judgement concerning the quality of those product data that are subject of the Approval. An Approval represents a statement made by technical personnel or management personnel whether

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

certain requirements are met. The absence of approval information does not imply any approval status by default.

The data associated with an Approval are the following:

— actual_date;

— is_applied_to;

— is_approved_by;

— level;

— planned_date;

— scope;

— status.

4.2.22.1 actual_date

The actual_date specifies the date when the Approval actually became valid. If this attribute is absent, the approval has not yet occurred, i.e., it is pending.

See 4.3.130 for the application assertion.

The actual_date need not be specified for a particular Approval (see 4.2.22).

4.2.22.2 is_applied_to

The is_applied_to specifies the objects to which the Approval is assigned.

See 4.3.112, 4.3.113, 4.3.114, 4.3.115, 4.3.117, 4.3.118, 4.3.119, 4.3.120, 4.3.121, 4.3.122, 4.3.123, 4.3.124, 4.3.125, 4.3.126, 4.3.127, 4.3.128, 4.3.131, 4.3.132, 4.3.133, 4.3.134, 4.3.135, 4.3.136, 4.3.137, 4.3.138, 4.3.139, 4.3.140, 4.3.141, 4.3.142, 4.3.143, 4.3.144, 4.3.145, 4.3.146, 4.3.147, 4.3.148, 4.3.150, 4.3.151, 4.3.152, 4.3.153, 4.3.154, 4.3.155, 4.3.156, 4.3.157, 4.3.158, 4.3.159, 4.3.160, 4.3.161, 4.3.162, 4.3.163, 4.3.164, 4.3.165, and 4.3.166 for the application assertions.

There shall be at least one object that the Approval (see 4.2.22) is_applied_to.

4.2.22.3 is_approved_by

The is_approved_by specifies personnel responsible for the Approval and the dates of the Approval.

NOTE - In cases, where more than one person or organization has to sign off on the Approval, usually the last sign-off date corresponds to the date specified as the 'actual date'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.129 for the application assertion.

4.2.22.4 level

The level represents the aspect for which the object subject to approval, by reference as 'is_applied_to', is endorsed. Where applicable, the following values shall be used:

— 'disposition': The referenced object is approved for series production;

— 'equipment order': The referenced object has reached a status in which changes are subject to a defined change process and tools and other equipment required for production may be ordered;

— 'planning': The referenced object is technically complete and has reached a status sufficiently stable so that other designs may be based on it.

The level need not be specified for a particular Approval (see 4.2.22).

4.2.22.5 planned_date

The planned_date specifies the date when the Approval is or was supposed to be performed.

See 4.3.130 for the application assertion.

The planned_date need not be specified for a particular Approval (see 4.2.22).

4.2.22.6 scope

The scope specifies the set of Organization (see 4.2.331) objects for which the Approval is valid.

See 4.3.149 for the application assertion.

4.2.22.7 status

The status indicates the level of acceptance of the object, the Approval is applied to, for the specified 'level'.

NOTE - The approval levels are defined within a given life cycle stage view and are typically dependent upon the approval cycles within an individual business process. For each defined level, generally there is a defined sequence of values for the status, usually leading towards the status 'approved' indicating achievement of the particular level.

See 4.3.116 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.23 Approval_relationship

An Approval_relationship is a relationship between two Approval (see 4.2.22) objects.

The data associated with an Approval_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.23.1 description

The description specifies additional information about the Approval_relationship.

See 4.3.168 for the application assertion.

The description need not be specified for a particular Approval_relationship (see 4.2.23).

If present, there shall be exactly one object that defines the description for an Approval_relationship.

4.2.23.2 related

The related specifies the second of the two Approval (see 4.2.22) objects related by the Approval_-relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.167 for the application assertion.

4.2.23.3 relating

The relating specifies the first of the two Approval (see 4.2.22) objects related by the Approval_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.167 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.23.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'decomposition': The Approval_relationship defines a relationship where the related Approval (see 4.2.22) is one of the components into which the relating Approval is broken down with no implication of 'sequence' or 'dependency';

— 'dependency': The Approval_relationship defines a relationship where the issuing of the related Approval is dependent on the issuing of the relating Approval;

NOTE - The value 'dependency does not imply the semantics of the the values 'decomposition' or 'sequence'.

EXAMPLE 1 The Approval of an assembly is dependent on the Approval of all of the constituents of the assembly.

EXAMPLE 2 In two parallel sequences of approvals for two assemblies a certain approval of one assembly may be dependent on a certain approval of the second assembly.

— 'precedence': the Approval_relationship defines a relationship where the related Approval has higher priority than the relating Approval;

— 'sequence': The Approval_relationship defines a relationship where the relating Approval shall be completed before the related Approval is given.

4.2.24 Approval_status

An Approval_status is the state of acceptance of some product data.

The data associated with an Approval_status are the following:

— status_name;

— used_classification_system.

4.2.24.1 status_name

The status_name specifies the terms characterizing the Approval_status. Where applicable, the following values shall be used:

— 'approved': The required authorizations have been obtained for a particular role of approval for a piece of product data;

— 'disapproved': The required authorizations have been denied for a particular role of approval for a piece of product data;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— 'withdrawn': The required authorizations have been revoked for a particular role of approval for a piece of product data.

4.2.24.2 used_classification_system

The used_classification_system specifies the Classification_system (see 4.2.71) that contains the information about how to interpret the Approval_status.

See 4.3.169 for the application assertion.

The used_classification_system need not be specified for a particular Approval_status (see 4.2.24).

4.2.25 Area_placed_annotation

An Area_placed_annotation is a two-dimensional annotation element that is defined in the two-dimensional coordinate space of a View_area (see 4.2.555) or of a Drawing_sheet (see 4.2.173).

EXAMPLE The drawing title box and drawing frame are examples for Area_placed_annotation objects on a drawing sheet.

The data associated with an Area_placed_annotation are the following:

— element;

— reference_area.

4.2.25.1 element

The element specifies the presented Annotation_element (see 4.2.17).

See 4.3.170 and 4.3.171 for the application assertions.

There shall be exactly one object that defines the element for an Area_placed_annotation (see 4.2.25).

4.2.25.2 reference_area

The reference_area specifies the View_area (see 4.2.555) or Drawing_sheet (see 4.2.173) where the Annotation_element (see 4.2.17) is located.

See 4.3.172 and 4.3.173 for the application assertions.

There shall be exactly one object that defines the reference_area for an Area_placed_annotation (see 4.2.25).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.26 Assembly_component_relationship

An Assembly_component_relationship is the relation between an Assembly_definition (see 4.2.27) and an Item_instance (see 4.2.271) representing a constituent of the assembly. The Assembly_definition and the Design_discipline_item_definition (see 4.2.142) that serves as 'definition' of the Item_instance shall share at least one Application_context (see 4.2.21).

NOTE - The constituent may also be an assembly.

An Assembly_component_relationship is a type of Item_definition_instance_relationship (see 4.2.268).

Each Assembly_component_relationship may be a Next_higher_assembly (see 4.2.322) or a Promissory_usage (see 4.2.408).

The data associated with an Assembly_component_relationship are the following:

— placement;

— relating.

4.2.26.1 placement

The placement specifies the Geometric_model_relationship_with_transformation (see 4.2.240) or the Template_instance (see 4.2.512) that specify the transformation information which is used to locate and orient the constituent in the coordinate space of the Assembly_definition (see 4.2.27). In the case of a Template_instance, the scale factor shall be omitted or set to 1.0.

See 4.3.175 and 4.3.176 for the application assertions.

The placement need not be specified for a particular Assembly_component_relationship (see 4.2.26).

If present, there shall be exactly one object that defines the placement for an Assembly_component_relationship.

4.2.26.2 relating

The relating specifies the Assembly_definition (see 4.2.27) that has subordinate constituents.

See 4.3.174 for the application assertion.

4.2.27 Assembly_definition

An Assembly_definition is a definition of an Item_version (see 4.2.275) that contains other subordinate objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

An Assembly_definition is a type of Design_discipline_item_definition (see 4.2.142).

The data associated with an Assembly_definition are the following:

— assembly_type

The assembly_type specifies the kind of the Assembly_definition.

EXAMPLE 'functional assembly', 'manufacturing assembly', and 'design assembly' are examples of an assembly_type.

The assembly_type need not be specified for a particular Assembly_definition.

4.2.28 Assembly_substitute_relationship

An Assembly_substitute_relationship is a relationship that indicates that one Assembly_component_relationship (see 4.2.26) may be substituted for another Assembly_component_relationship. The subjects of the substitution are the related Item_instance (see 4.2.271) objects of both Assembly_component_relationship objects. The relating Assembly_definition (see 4.2.27) shall be the same in both Assembly_component_relationship objects.

The data associated with an Assembly_substitute_relationship are the following:

— base;

— description;

— substitute.

4.2.28.1 base

The base specifies the Assembly_component_relationship (see 4.2.26) that is replaceable.

See 4.3.177 for the application assertion.

4.2.28.2 description

The description specifies additional information about the Assembly_substitute_relationship.

See 4.3.178 for the application assertion.

The description need not be specified for a particular Assembly_substitute_relationship (see 4.2.28).

If present, there shall be exactly one object that defines the description for an Assembly_substitute_relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.28.3 substitute

The substitute specifies the Assembly_component_relationship (see 4.2.26) that may be used instead of the base Assembly_component_relationship.

See 4.3.177 for the application assertion.

4.2.29 Associated_draughting_callout

An Associated_draughting_callout is a combination of annotation elements that represents a recognized annotation concept and that is associated with other pieces of geometry or annotation.

An Associated_draughting_callout is a type of Draughting_callout (see 4.2.169).

The data associated with an Associated_draughting_callout are the following:

— is_associated_to

The is_associated_to specifies the piece of annotation or geometry with which the Associated_draughting_callout is associated.

See 4.3.179 and 4.3.180 for the application assertions.

There shall be at least one object that the Associated_draughting_callout is_associated_to.

4.2.30 Associated_fill_area

An Associated_fill_area is a bounded area containing colouring, hatching, or tiling. The boundary of the Associated_fill_area is defined by closed annotation curves. The annotation curves defining the boundary of the Associated_fill_area are derived from geometric elements of the shape model or from other annotation curves.

An Associated_fill_area is a type of Fill_area (see 4.2.204).

The data associated with an Associated_fill_area are the following:

— is_derived_from

The is_derived_from specifies the geometric elements or the annotation curves from which the boundary curves of the Associated_fill_area are derived.

See 4.3.181 and 4.3.182 for the application assertions.

There shall be at least one object that the Associated_fill_area is_derived_from.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.31 Associated_leader

An Associated_leader is a leader that is associated with the referenced object.

This association implies that a change in the definition of the 'target' affects the Associated_leader in a way the Associated_leader may also need to be changed in order to keep up consistency.

> EXAMPLE If the 'target' is a 3D curve and if the location of the curve changes, then the leader will have to move in a way consistent with the movement of the curve.

An Associated_leader is a type of Leader (see 4.2.293).

The data associated with an Associated_leader are the following:

— target

The target specifies the associated element.

See 4.3.183 and 4.3.184 for the application assertions.

There shall be exactly one object that defines the target for an Associated_leader.

4.2.32 Associated_projection_curve

An Associated_projection_curve is a projection curve that is associated with a Detailed_geometric_model_element (see 4.2.144) or with another Annotation_element (see 4.2.17).

An Associated_projection_curve is a type of Projection_curve (see 4.2.407).

The data associated with an Associated_projection_curve are the following:

— is_projected_to

The is_projected_to specifies the associated element.

See 4.3.185 and 4.3.186 for the application assertions.

There shall be exactly one object that the Associated_projection_curve is_projected_to.

4.2.33 Axis_placement

An Axis_placement is the representation of three orthogonal axes defined in a three-dimensional reference coordinate system, which intersect at a unique point. This point defines the origin of the Axis_placement.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.34 B_rep

A B_rep is a geometric element that is defined by exactly one outer Closed_shell (see 4.2.74) and by zero or more inner Closed_shell objects.

A B_rep is a type of Detailed_geometric_model_element (see 4.2.144).

The data associated with a B_rep are the following:

— outer;

— void.

4.2.34.1 outer

The outer specifies a Closed_shell (see 4.2.74) defining the exterior boundary of the B_rep.

NOTE - This shell has a normal pointing into the empty outside space.

See 4.3.187 for the application assertion.

4.2.34.2 void

The void specifies a Closed_shell (see 4.2.74) that represents an internal cavity of the B_rep.

NOTE - This shell has a normal pointing into the empty inside space.

See 4.3.187 for the application assertion.

4.2.35 B_rep_model

A B_rep_model is a collection of B_rep (see 4.2.34) objects.

A B_rep_model is a type of Geometric_model (see 4.2.238).

The data associated with a B_rep_model are the following:

— element

The element specifies a set of B_rep objects that form the B_rep_model.

See 4.3.188 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.36 B_spline_curve

A B_spline_curve is a general polynomial or a rational parametric sculptured curve of various degrees and segments, defined in terms of control points, associated basic functions, weights, and knots.

NOTE - A polynomial uniform B_spline_curve is defined by a list of control points and by the associated basis functions. The knot values can be derived and the weights are equal. A rational non-uniform B_spline_-curve is defined by a list of control points, by the associated basis functions, by weights and by multiplicities of knots.

EXAMPLE A circular arc can be represented by a rational parametric curve.

A B_spline_curve is a type of Curve (see 4.2.108).

4.2.37 B_spline_surface

A B_spline_surface is a bounded surface that is used to represent a wide variety of sculptured surfaces. With appropriate attribute values it enables to represent single span or spline surfaces of explicit polynomial, rational Bézier, or B-spline types, such as NURBS. A B_spline_surface is defined in terms of control points, associated basis functions, weights, and knots.

A B_spline_surface is a type of Surface (see 4.2.489).

4.2.38 Bead_end_type

A Bead_end_type is the definition of a kind of end that characterizes a Bead_feature (see 4.2.39).

Each Bead_end_type is a Linear_bead_end_type (see 4.2.298), an Open_bead_end_type (see 4.2.327), or a Radiused_bead_end_type (see 4.2.418).

The data associated with a Bead_end_type are the following:

— is_applied_to

The is_applied_to specifies to which extremity of the path the Bead_end_type applies. The following values shall be used:

— 'end': The Bead_end_type is applied to the extremity of the Bead_feature that corresponds to the end of the defining Path (see 4.2.342);

— 'start': The Bead_end_type is applied to the extremity of the Bead_feature that corresponds to the start of the defining Path.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.39 Bead_feature

A Bead_feature is a feature that is applied to panel parts to increase the stiffness of the part and for forming to control metal flow.

EXAMPLE Figure 12 shows a Bead_feature and illustrates the results of the application of various Bead_-end_type (see 4.2.38) conditions.

A Bead_feature is a type of Process_feature_in_panel (see 4.2.379).

The data associated with a Bead_feature are the following:

— base_radius;

— bead_profile;

— end_condition;

— sweep_path.

4.2.39.1 base_radius

The base_radius specifies the blend radius where the Bead_feature meets the panel surface.

See 4.3.190 for the application assertion.

The base_radius need not be specified for a particular Bead_feature (see 4.2.39).

4.2.39.2 bead_profile

The bead_profile specifies the usage of a profile that determines the cross section of the Bead_feature.

See 4.3.191 for the application assertion.

4.2.39.3 end_condition

The end_condition specifies the Bead_end_type (see 4.2.38) objects that define the types of the bead's ends.

See 4.3.189 for the application assertion.

4.2.39.4 sweep_path

The sweep_path specifies the course along which the bead_profile is swept.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

See 4.3.192 for the application assertion.

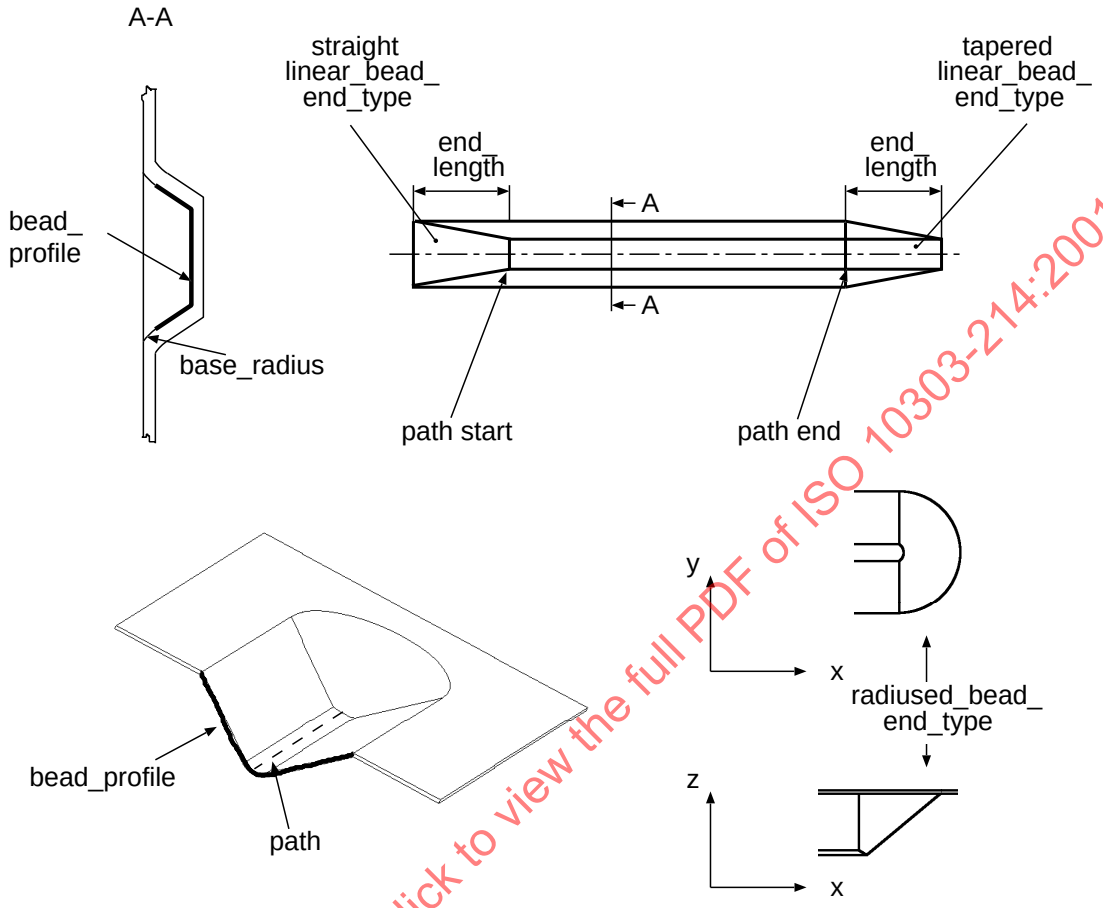

Figure 12 – Parameters defining a Bead_feature

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.40 Block

A Block is a solid rectangular parallelepiped defined by a location and placement coordinate system. The Block is specified by the positive lengths x, y, and z along the axes of the placement coordinate system, and has one vertex at the origin of the placement coordinate system.

A Block is a type of Csg_primitive (see 4.2.107).

4.2.41 Boolean_result

A Boolean_result is the result of a regularised operation on two solids to create a new shape.

NOTE - A Boolean_result may create a new solid with more than one solid bodies.

A Boolean_result is a type of Detailed_geometric_model_element (see 4.2.144).

 © ISO 2001 – All rights reserved

The data associated with a Boolean_result are the following:

— boolean_operation;

— first_operand;

— second_operand.

4.2.41.1 boolean_operation

The boolean_operation specifies the type of operation that is applied on the two solids. The following values shall be used:

— 'difference': creates a new solid that is the regularisation of the set of all points, which are in the first operand but not in the second operand;

— 'intersection': creates a new solid that is the regularisation of the set of all points that are in both the first operand and the second operand;

— 'union': creates a new solid that contains all the points that are either in the first operand or in the second operand or both.

4.2.41.2 first_operand

The first_operand specifies the first solid for the Boolean operation.

See 4.3.193, 4.3.194, 4.3.195, 4.3.196, 4.3.197, 4.3.198, and 4.3.199 for the application assertions.

There shall be exactly one object that defines the first_operand for a Boolean_result (see 4.2.41).

4.2.41.3 second_operand

The second_operand specifies the second solid for the Boolean operation.

See 4.3.193, 4.3.194, 4.3.195, 4.3.196, 4.3.197, 4.3.198, and 4.3.199 for the application assertions.

There shall be exactly one object that defines the second_operand for a Boolean_result (see 4.2.41).

4.2.42 Boss_feature

A Boss_feature is an enclosed shape that protrudes from a surface in the direction of the sweep path. The intersection of the Boss_feature and the surface may, but need not, have radius shaped blend between them.

A Boss_feature is a type of Process_feature_in_solid (see 4.2.380).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Each Boss_feature is a Circular_boss (see 4.2.57), a Rectangular_boss (see 4.2.420), or a General_boss (see 4.2.214).

The data associated with a Boss_feature are the following:

— base_radius;

— boss_height;

— boundary;

— taper;

— top_condition.

4.2.42.1 base_radius

The base_radius specifies a radius shape blend between a Boss_feature and the surrounding surface at its base. The fillet is applied after the placement of the Boss_feature (see 4.2.42) on the part and after a potential application of a taper.

For the creation of a fillet, the following rules apply:

If R_f is the fillet radius to be created at the bottom of the boss and C the path along which the centre of a sphere S defining the fillet is moving then

— the fillet is created by rolling the sphere S with radius R_f along the boss with a constant contact on the surface on which the boss is placed;

— C shall be such that in any point of C the area of contact between S and the boss is either a point or an arc wise connected set of points.

See 4.3.205 for the application assertion.

The base_radius need not be specified for a particular Boss_feature.

4.2.42.2 boss_height

The boss_height specifies the Linear_path (see 4.2.300) that is used to sweep the Closed_profile (see 4.2.72).

See 4.3.206 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.42.3 boundary

The boundary specifies the Closed_profile_usage (see 4.2.73) that references the Closed_profile (see 4.2.72), which defines the cross section of the Boss_feature.

NOTE - The different types of Boss_feature constrain the usage of the boundary further.

See 4.3.202 for the application assertion.

4.2.42.4 taper

The taper specifies a variation of the size of the Boss_feature. If present, the variation shall be specified either by an Angle_taper (see 4.2.12) or by a Directed_taper (see 4.2.154) or, in the case of a Circular_-boss (see 4.2.57), by a Diameter_taper (see 4.2.146), or an Angle_taper. If no taper is specified, the cross section at the start of the sweep path and at the end of the sweep path shall be of identical shape.

See 4.3.200, 4.3.203, and 4.3.204 for the application assertions.

The taper need not be specified for a particular Boss_feature (see 4.2.42).

If present, there shall be exactly one object that defines the taper for a Boss_feature.

4.2.42.5 top_condition

The top_condition specifies the shape at the top of the Boss_feature (see 4.2.42).

See 4.3.201 for the application assertion.

4.2.43 Boss_top_condition

A Boss_top_condition is the definition of a kind of top that characterizes a Boss_feature (see 4.2.42).

Each Boss_top_condition is a Planar_top_condition (see 4.2.359) or a General_top_condition (see 4.2.236).

The data associated with a Boss_top_condition are the following:

— is_applied_to;

— top_radius.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.43.1 is_applied_to

The is_applied_to specifies to which end of the path the Boss_top_condition applies. The following values shall be used:

— 'end': The Boss_top_condition is applied to that extremity of the Boss_feature (see 4.2.42) that corresponds to the end of the defining Linear_path (see 4.2.300);

— 'start': The Boss_top_condition is applied to that extremity of the Boss_feature that corresponds to the start of the defining Linear_path.

4.2.43.2 top_radius

The top_radius specifies a radius shape blend between the wall of a Boss_feature (see 4.2.42) object and its top surface.

See 4.3.207 for the application assertion.

The top_radius need not be specified for a particular Boss_top_condition (see 4.2.43).

4.2.44 Cartesian_coordinate_space

A Cartesian_coordinate_space is a coordinate space in which geometric and annotation elements may be defined. It is either two-dimensional or three-dimensional. An origin for coordinate values is implicitly defined. The units applicable to the coordinate values of elements defined in the Cartesian_coordinate_space are specified.

NOTE 1 - Cartesian Transformation (see 4.2.533) objects are used to specify the relationships between coordinate spaces.

Each Cartesian_coordinate_space is a Cartesian_coordinate_space_3d (see 4.2.46) or a Cartesian_coordinate_space_2d (see 4.2.45).

The data associated with a Cartesian_coordinate_space are the following:

— unit_of_values

The unit_of_values specifies the various units in which any values are expressed. In the case where geometric elements are defined in the Cartesian_coordinate_space, there shall be at least two units specified, the length unit and the plane angle unit. The same length unit is applied to each coordinate direction. Only one unit of a kind shall be specified.

The unit_of_values need not be specified only if the Cartesian_coordinate_space belongs to an External_model (see 4.2.189).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE 2 - If elements with different units are required, they have to be separated into different models with their own Cartesian_coordinate_space.

EXAMPLE A length measure unit measured in inches and an angle measure unit measured in degrees are examples for two members of the attribute unit_of_values assigned to the same Cartesian_coordinate_space.

See 4.3.208 for the application assertion.

The unit_of_values need not be specified for a particular Cartesian_coordinate_space.

4.2.45 Cartesian_coordinate_space_2d

A Cartesian_coordinate_space_2d is a two-dimensional coordinate space. Any two-dimensional geometric and annotation element shall be defined in a Cartesian_coordinate_space_2d.

EXAMPLE The annotation elements associated in a View_area (see 4.2.555) are defined in a Cartesian_coordinate_space_2d.

A Cartesian_coordinate_space_2d is a type of Cartesian_coordinate_space (see 4.2.44).

4.2.46 Cartesian_coordinate_space_3d

A Cartesian_coordinate_space_3d is a three-dimensional coordinate space. Any three-dimensional geometric data shall be defined in a Cartesian_coordinate_space_3d.

A Cartesian_coordinate_space_3d is a type of Cartesian_coordinate_space (see 4.2.44).

4.2.47 Cartesian_point

A Cartesian_point is a point that is defined by its coordinates in a rectangular Cartesian coordinate system.

A Cartesian_point is a type of Point (see 4.2.367).

4.2.48 Catalogue_thread

A Catalogue_thread is a thread that is specified by a document or by a library containing the specification of the thread. Each Catalogue_thread shall be referenced by either a Document_assignment (see 4.2.156) or a Classification_association (see 4.2.69).

A Catalogue_thread is a type of Thread_specification (see 4.2.518).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.49 Centre_of_mass

A Centre_of_mass is the centre of the mass of a body. The relative position of the Centre_of_mass within the body is an invariant datum relative to rotation and translation. The Centre_of_mass is a characteristic of an item, not its shape.

NOTE 1 - If a shape representation is present, the Centre_of_mass is usually derivable from the shape representation. However, as a characteristic of an item, it may be pre-defined in order to reflect a requirement.

NOTE 2 - In order to convey the information about the actual centre of mass of a geometric model, the use of General_shape_dependent_property (see 4.2.231) with value 'centroid' for its attribute 'property_type' is appropriate.

A Centre_of_mass is a type of Shape_dependent_property (see 4.2.447).

The data associated with a Centre_of_mass are the following:

— centre_point;

— is_defined_in.

4.2.49.1 centre_point

The centre_point specifies a point in three-dimensional space that defines the location of a Centre_of_-mass in the Cartesian_coordinate_space (see 4.2.44).

4.2.49.2 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) in which the property is applicable.

NOTE - The values of geometry related properties are specified relative to a Cartesian_coordinate_space.

EXAMPLE A Centre_of_mass (see 4.2.49) may be specified in different coordinate spaces for different dimensioning applications.

See 4.3.209 for the application assertion.

4.2.50 Certification

A Certification is a certificate for an object.

The data associated with a Certification are the following:

— certification_type;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— is_applied_to;

— name;

— purpose.

4.2.50.1 certification_type

The certification_type specifies the kind of certification.

EXAMPLE ’supplier certificate’ is an example for the certification_type.

4.2.50.2 is_applied_to

The is_applied_to specifies the set of objects that the certificate is applied to.

See 4.3.210, 4.3.211, 4.3.212, and 4.3.214 for the application assertions.

There shall be at least one object that the Certification (see 4.2.50) is_applied_to.

4.2.50.3 name

The name specifies the word or group of words by which the Certification is referred to.

See 4.3.213 for the application assertion.

There shall be exactly one object that defines the name for a Certification (see 4.2.50).

4.2.50.4 purpose

The purpose specifies the objective of the Certification.

See 4.3.213 for the application assertion.

The purpose need not be specified for a particular Certification (see 4.2.50).

If present, there shall be exactly one object that defines the purpose for a Certification.

4.2.51 Chamfer

A Chamfer is a transition between two joining non-coplanar faces, having a linear cross section perpendicular to the intersection of the two faces or, if this intersection does not exist, the intersection of the surfaces obtained by extrapolating linearly the faces until an intersection exists.

EXAMPLE Figure 13 illustrates a Chamfer.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

A Chamfer is a type of Transition_feature (see 4.2.537).

The data associated with a Chamfer are the following:

— chamfer_face;

— is_defined_by.

4.2.51.1 chamfer_face

The chamfer_face specifies the Face (see 4.2.191) that results from the chamfering operation.

See 4.3.216 for the application assertion.

4.2.51.2 is_defined_by

The is_defined_by specifies the Chamfer_definition (see 4.2.53) that has the information defining the Chamfer.

See 4.3.215 for the application assertion.

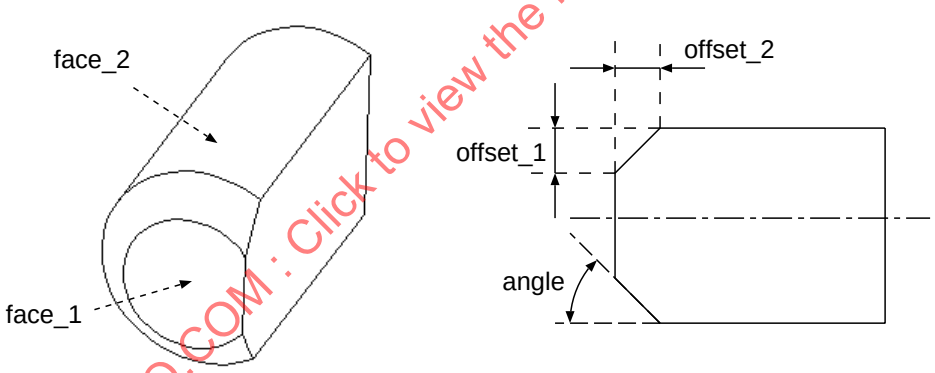

Figure 13 – Parameters defining a Chamfer

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.52 Chamfer_angle

A Chamfer_angle is the definition of an angle used to specify a Chamfer (see 4.2.51).

The data associated with a Chamfer_angle are the following:

— angle

The angle specifies the value of the angle between the resulting face and the base shape. It is measured between a tangent of the concerned surface and the face resulting from the application of the chamfer as shown in figure 13.

 © ISO 2001 – All rights reserved

See 4.3.217 for the application assertion.

4.2.53 Chamfer_definition

A Chamfer_definition is the set of parameters specifying a Chamfer (see 4.2.51).

The data associated with a Chamfer_definition are the following:

— offset_1;

— value_2.

4.2.53.1 offset_1

The offset_1 specifies the amount of offset measured from the intersection of the two faces along the first face. In the case where there is no intersection between the faces, the offset is measured from the intersection curve obtained by extrapolating the faces until they intersect.

See 4.3.219 for the application assertion.

4.2.53.2 value_2

The value_2 specifies the second value that is necessary to define a Chamfer (see 4.2.51). In the case where the value_2 is a Chamfer_angle (see 4.2.52) the angle is measured from the second face. In the case where the value_2 is a Chamfer_offset (see 4.2.54), the offset is measured from the intersection of the two faces along the second face as shown in figure 13.

See 4.3.218 and 4.3.219 for the application assertions.

There shall be exactly one object that defines the value_2 for a Chamfer_definition (see 4.2.53).

4.2.54 Chamfer_offset

A Chamfer_offset is the definition of an offset used to specify a Chamfer (see 4.2.51). The offset is measured as an arc length perpendicularly from the intersection curve of the two faces on the concerned face. The curve along which the arc length is measured is the intersection of a plane that is the cross-section of the concerned face along the intersection curve.

The data associated with a Chamfer_offset are the following:

— offset

The offset specifies the value of the Chamfer_offset.

See 4.3.220 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.55 Change

A Change is a mechanism to collect the Model_change (see 4.2.315) objects and the Property_change (see 4.2.410) objects that describe the differences between the two objects referenced by the specified relationship object.

The data associated with a Change are the following:

— described_change;

— description.

4.2.55.1 described_change

The described_change specifies the relationship object that references a modified object and the corresponding original object.

See 4.3.221, 4.3.222, 4.3.223, 4.3.225, 4.3.226, 4.3.227, 4.3.228, and 4.3.229 for the application assertions.

There shall be exactly one object that defines the described_change for a Change (see 4.2.55).

4.2.55.2 description

The description specifies additional information about the Change.

See 4.3.224 for the application assertion.

The description need not be specified for a particular Change (see 4.2.55).

If present, there shall be exactly one object that defines the description for a Change.

4.2.56 Circle

A Circle is a planar unbounded curve where all points are equidistant from one point.

A Circle is a type of Curve (see 4.2.108).

4.2.57 Circular_boss

A Circular_boss is a protrusion feature that is made up by an enclosed volume bounded by a cylinder. The boundary shall be defined using a Circular_closed_profile (see 4.2.58).

EXAMPLE Figure 14 illustrates a Circular_boss.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

A Circular_boss is a type of Boss_feature (see 4.2.42).

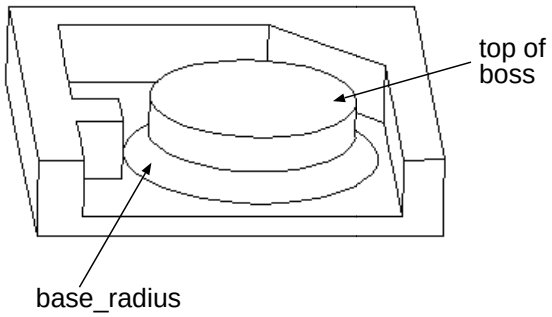

Figure 14 – Parameters defining a Circular_boss

4.2.58 Circular_closed_profile

A Circular_closed_profile is made up by a circle that bounds an enclosed area.

EXAMPLE Figure 15 illustrates a Circular_closed_profile.

The x-y-plane of the inherited Axis_placement (see 4.2.33) lies in the plane of the circle that outlines the profile. It is located in the centre of that circle.

A Circular_closed_profile is a type of Closed_profile (see 4.2.72).

The data associated with a Circular_closed_profile are the following:

— diameter

The diameter specifies the diameter of the circle that defines the Circular_closed_profile.

See 4.3.230 for the application assertion.

4.2.59 Circular_offset_pattern

A Circular_offset_pattern is a modification of the placement of a particular occurrence of the base feature in a Circular_pattern (see 4.2.62) relative to the expected placement of the occurrence.

EXAMPLE Figure 16 depicts a Circular_offset_pattern.

The data associated with a Circular_offset_pattern are the following:

— angular_offset;

— index.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

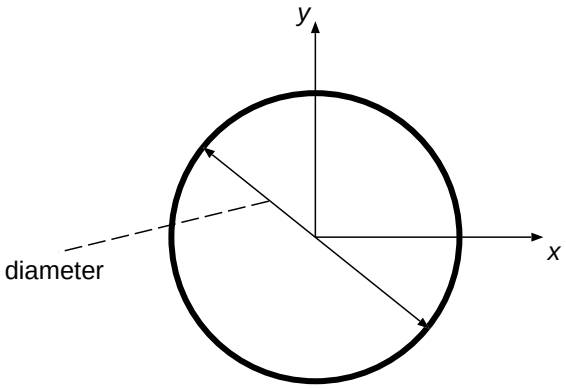

Figure 15 – Definition of a Circular_closed_profile

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.59.1 angular_offset

The angular_offset specifies the amount of rotation from the expected feature location to the actual feature location of the Circular_pattern (see 4.2.62) as an angular measurement.

4.2.59.2 index

The index specifies the number of the feature that has an offset.

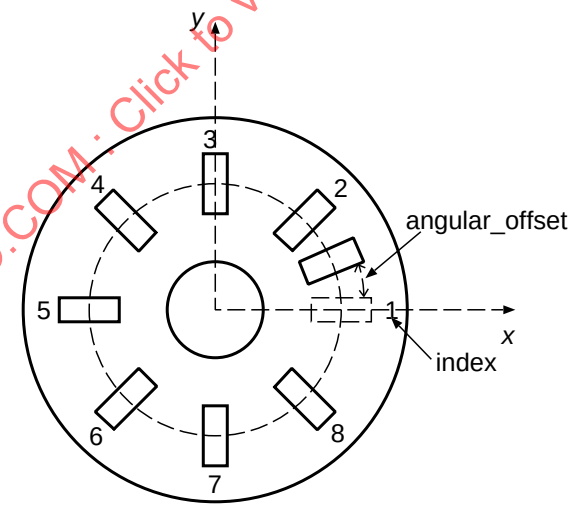

Figure 16 – Parameters defining an offset in a circular pattern

4.2.60 Circular_omit_pattern

A Circular_omit_pattern is an omission of a particular occurrence of the base feature in a Circular_-pattern (see 4.2.62).

 © ISO 2001 – All rights reserved

EXAMPLE Figure 17 depicts a Circular_omit_pattern.

The data associated with a Circular_omit_pattern are the following:

— index

The index specifies the number of the feature that is omitted.

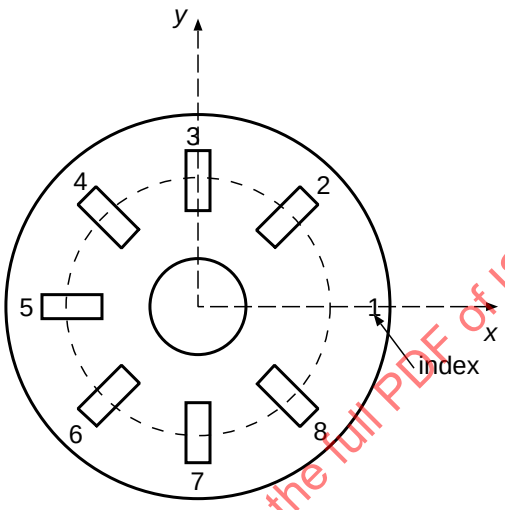

Figure 17 – Parameters defining an omission in a circular pattern

4.2.61 Circular_path

A Circular_path is specified by a direction of travel along an arc of constant radius around an axis.

A Circular_path is a type of Path (see 4.2.342).

Each Circular_path is a Complete_circular_path (see 4.2.79) or a Partial_circular_path (see 4.2.339).

The data associated with a Circular_path are the following:

— radius

The radius specifies the radius of the Circular_path.

See 4.3.231 for the application assertion.

4.2.62 Circular_pattern

A Circular_pattern is the replication of a base feature about a rotation axis.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The inherited attribute 'location_and_orientation' shall be located in the centre point of the pattern. The z-axis of this attribute shall specify the rotation axis, and the base feature shall be located at a y co-ordinate of zero.

The origin of the base feature or of the transformed base feature is located at a distance from the local z-axis that equals half the diameter of the Circular_pattern.

NOTE - The base feature or the transformed base feature is the first instance of the Circular_pattern.

A Circular_pattern is a type of Replicate_feature (see 4.2.433).

The data associated with a Circular_pattern are the following:

— angular_spacing;

— diameter;

— missing_feature;

— number_of_features;

— relocated_feature;

— rotation.

4.2.62.1 angular_spacing

The angular_spacing specifies the angle between two instances in the Circular_pattern.

See 4.3.234 for the application assertion.

4.2.62.2 diameter

The diameter specifies twice the distance between the centre of the Circular_pattern and the location of the base feature.

NOTE - Usually, the diameter can be determined from the location of the Circular_pattern and the location of the base feature. The attribute diameter may be instantiated to support process planning which may require the diameter value explicitly.

See 4.3.234 for the application assertion.

The diameter need not be specified for a particular Circular_pattern (see 4.2.62).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.62.3 missing_feature

The missing_feature specifies those instances that are omitted in the Circular_pattern.

See 4.3.233 for the application assertion.

4.2.62.4 number_of_features

The number_of_features specifies the number of features used in the Circular_pattern.

NOTE - The number_of_features includes any constituents that are in a later step subject to omission.

4.2.62.5 relocated_feature

The relocated_feature specifies those instances that are relocated in the Circular_pattern.

See 4.3.232 for the application assertion.

4.2.62.6 rotation

The rotation specifies the angle of the rotation that shall be applied to each replicate, after its positioning along the circle, with respect to the position of the previous replicate in the Circular_pattern. The default value is zero.

EXAMPLE Figure 18 depicts a Circular_pattern with a rotation specified that equals the negative angular_-spacing of the Circular_pattern.

See 4.3.234 for the application assertion.

The rotation need not be specified for a particular Circular_pattern (see 4.2.62).

4.2.63 Circular_runout_tolerance

A Circular_runout_tolerance is a geometric constraint on the circularity of curves pertaining to a surface described by the rotation of a part about an axis.

The tolerance is applied independently at any circular measuring position as the part is rotated 360 degrees.

NOTE - Where applied to surfaces constructed around a datum axis, Circular_runout_tolerance may be used to control the cumulative variations of circularity and coaxiality. Where applied to surfaces constructed at right angles to the datum axis, Circular_runout_tolerance controls circular elements of a plane surface.

A Circular_runout_tolerance is a type of Geometric_tolerance (see 4.2.243).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

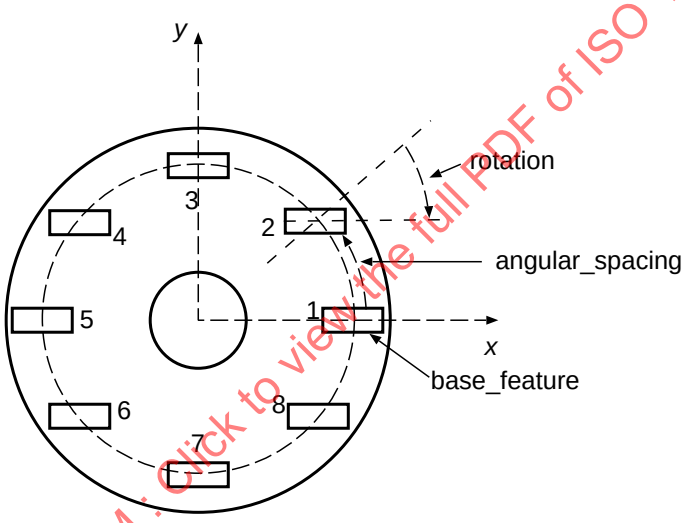

Figure 18 – Circular_pattern with rotation of base feature

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Circular_runout_tolerance are the following:

— angle;

— reference_datum.

4.2.63.1 angle

The angle specifies the direction in which the runout tolerance is controlled.

If the angle is specified, the runout tolerance applies in this angle which is fixed with respect to the datum axis. If the angle is not specified, the runout tolerance applies normal to the surface generated by the rotation.

The angle need not be specified for a particular Circular_runout_tolerance (see 4.2.63).

4.2.63.2 reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) objects that defines the reference for this type of geometric tolerance. The reference_datum shall contain an axis.

See 4.3.235 for the application assertion.

4.2.64 Class_category_association

A Class_category_association is the association of a Specification_category (see 4.2.468) with a Product_class (see 4.2.392). Additionally, this assignment specifies if the usage of one or more Specification (see 4.2.467) objects belonging to this Specification_category, is mandatory or optional for all products of that Product_class.

NOTE - The assignment of a Specification_category to a Product_class does not replace the association of single members of the Specification_category to the Product_class.

The data associated with a Class_category_association are the following:

— associated_category;

— associated_product_class;

— mandatory.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.64.1 associated_category

The associated_category specifies the Specification_category (see 4.2.468) that is associated with the Product_class (see 4.2.392).

See 4.3.237 for the application assertion.

4.2.64.2 associated_product_class

The associated_product_class specifies the Product_class (see 4.2.392) for which the Specification_-category (see 4.2.468) is valid.

See 4.3.236 for the application assertion.

4.2.64.3 mandatory

The mandatory specifies whether the Specification (see 4.2.467) objects referring to the associated Specification_category (see 4.2.468) have to be used or may be used (optional) for products within the referenced Product_class (see 4.2.392). A value of 'true' indicates that the usage is mandatory.

EXAMPLE The specification category 'radio' may be associated 'optional' to the product class of a car; the specification category 'engine' is an example for a 'mandatory' association.

4.2.65 Class_condition_association

A Class_condition_association is the association of a Specification_expression (see 4.2.470) with a Product_class (see 4.2.392).

The meaning of this association is specified further by the attribute condition_type.

The data associated with a Class_condition_association are the following:

— associated_condition;

— associated_product_class;

— condition_type;

— description.

4.2.65.1 associated_condition

The associated_condition specifies the Specification_expression (see 4.2.470) that is assigned to the Product_class (see 4.2.392).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.240 for the application assertion.

4.2.65.2 associated_product_class

The associated_product_class specifies the Product_class (see 4.2.392) for which the Specification_-expression (see 4.2.470) is valid.

See 4.3.239 for the application assertion.

4.2.65.3 condition_type

The condition_type specifies the meaning of the association. Where applicable, the following values shall be used:

— 'design case': The Specification_expression (see 4.2.470) specifies a condition when a given object has to be designed and verified. This value of the condition_type is for information only and shall not be interpreted when querying design cases or usage cases. For such a query, the value of the attribute 'configuration_type' of Configuration (see 4.2.94) shall be evaluated;

> NOTE - This value may be used to precise when a given Product_function (see 4.2.397) or a given Product_component (see 4.2.394) has to be studied by the design department so that it provides solutions appropriate for the case specified by 'associated_condition' and 'associated_product_class'.

— 'identification': The Specification_expression specifies a condition that enables to distinguish the associated Product_class (see 4.2.392) from other Product_class objects. This value is not applicable for a top level node in a hierarchy of Product_class objects. This identification is part of the identification of all sub classes of this Product_class;

— 'part usage': The Specification_expression specifies a condition for the usage of the components of an Alternative_solution (see 4.2.10), the usage of an Item_instance (see 4.2.271) or for the application of a Process_plan (see 4.2.387) or a Process_operation_occurrence (see 4.2.384) in the products of the associated Product_class. In this case, the Class_condition_association shall be referenced by at least one Configuration object;

— 'validity': The Specification_expression specifies a condition that is used to verify a Product_-specification (see 4.2.399) for the associated Product_class. That means that the Specification_-expression evaluates to 'true' if the set of Specification (see 4.2.467) objects is valid; otherwise it evaluates to 'false' with the meaning that the specified object is invalid for the Product_class.

It is valid for all products belonging to the 'associated_product_class' in case of the condition types 'identification' and 'validity'.

4.2.65.4 description

The description specifies additional information about the Class_condition_association.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

See 4.3.238 for the application assertion.

The description need not be specified for a particular Class_condition_association (see 4.2.65).

If present, there shall be exactly one object that defines the description for a Class_condition_association.

4.2.66 Class_inclusion_association

A Class_inclusion_association is the assignment of a Specification_inclusion (see 4.2.471) to a Product_-class (see 4.2.392). This assignment contains the information that a particular Specification_inclusion applies for all products of that Product_class.

The data associated with a Class_inclusion_association are the following:

— associated_inclusion;

— associated_product_class;

— description.

4.2.66.1 associated_inclusion

The associated_inclusion specifies the Specification_inclusion (see 4.2.471) that is associated with the Product_class (see 4.2.392).

See 4.3.243 for the application assertion.

4.2.66.2 associated_product_class

The associated_product_class specifies the Product_class (see 4.2.392) for which the Specification_-inclusion (see 4.2.471) is valid.

See 4.3.242 for the application assertion.

4.2.66.3 description

The description specifies additional information about the Class_inclusion_association.

See 4.3.241 for the application assertion.

The description need not be specified for a particular Class_inclusion_association (see 4.2.66).

If present, there shall be exactly one object that defines the description for a Class_inclusion_association.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.67 Class_specification_association

A Class_specification_association is an association of a Specification (see 4.2.467) with a Product_class (see 4.2.392). This Specification serves as a potential characteristic of all products belonging to the Product_class.

The meaning of this association is specified further by the attribute association_type.

The data associated with a Class_specification_association are the following:

— associated_product_class;

— associated_specification;

— association_type.

4.2.67.1 associated_product_class

The associated_product_class specifies the Product_class (see 4.2.392) for which the Specification (see 4.2.467) is valid.

See 4.3.244 for the application assertion.

4.2.67.2 associated_specification

The associated_specification specifies the Specification (see 4.2.467) that is associated with the Product_class (see 4.2.392).

See 4.3.245 for the application assertion.

4.2.67.3 association_type

The association_type specifies the kind of availability of a particular Specification (see 4.2.467) in a Product_class (see 4.2.392). Where applicable, the following values shall be used:

— 'availability': The Specification is a potential characteristic of any product belonging to a high level Product_class. It is not specified if this is an option or a standard;

EXAMPLE 1 'front wheel drive' or 'four wheel drive' are available for a product class 'Voyager'.

— 'identification': The Specification is a characteristic that enables to distinguish the associated Product_class from other Product_class objects. This is a kind of 'non replaceable standard'. This value is not applicable for a top level node in a hierarchy of Product_class objects. This identification is part of the identification of all sub classes of this Product_class;

EXAMPLE 2 The car body type 'limousine' is identifying for product class 'S40'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— ’non replaceable standard’: The Specification is a characteristic of all products belonging to the Product_class;

EXAMPLE 3 ’South East Asia climate zone’ is a ’non replaceable standard’ for a car that is produced for use in that particular geographic area.

— ’option’: The Specification is a characteristic of a product if explicitly chosen. The Specification replaces another Specification of the same specification category if the replaced Specification is associated with the Product_class as ’replaceable standard’;

EXAMPLE 4 ’sun roof’ or ’radio with CD’ are common options proposed to the customer.

— ’part usage’: The Specification is a characteristic for the usage of the components of an Alternative_solution (see 4.2.10), the usage of an Item_instance (see 4.2.271), or for the application of a Process_plan (see 4.2.387) or a Process_operation_occurrence (see 4.2.384) in the products of the associated Product_class;

— ’replaceable standard’: The Specification is a default characteristic of the products belonging to the Product_class as long as no other specification of the same Specification_category (see 4.2.468) is chosen.

EXAMPLE 5 ’power brake’ is a ’replaceable standard’ for product class ’Golf’; it can be replaced by ’ABS’ which is another specification of the same specification category ’brake system’.

4.2.68 Class_structure_relationship

A Class_structure_relationship is an association between a Product_class (see 4.2.392) object and either a Product_component (see 4.2.394) or a Product_function (see 4.2.397) object.

The data associated with a Class_structure_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.68.1 description

The description specifies additional information about the Class_structure_relationship.

See 4.3.246 for the application assertion.

The description need not be specified for a particular Class_structure_relationship (see 4.2.68).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

If present, there shall be exactly one object that defines the description for a Class_structure_relationship.

4.2.68.2 related

The related specifies the Product_component (see 4.2.394) or Product_function (see 4.2.397) object related by the Class_structure_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.248 and 4.3.249 for the application assertions.

There shall be exactly one object that the Class_structure_relationship (see 4.2.68) is related to.

4.2.68.3 relating

The relating specifies the Product_class (see 4.2.392) object related by the Class_structure_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.247 for the application assertion.

4.2.68.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'functionality': The related Product_function (see 4.2.397) is an element of the functional structure of the relating Product_class (see 4.2.392). This relation type shall only be used if the related object is a Product_function;

— 'realization': The related Product_component (see 4.2.394) fulfils, partially or fully, the requirements identified with the relating Product_class. This relation type shall only be used if the related object is a Product_component.

4.2.69 Classification_association

A Classification_association associates a General_classification (see 4.2.216) with an object.

The data associated with a Classification_association are the following:

— associated_classification;

— classified_element;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— definitional;

— role.

4.2.69.1 associated_classification

The associated_classification specifies the General_classification (see 4.2.216) object that provides classification information.

See 4.3.263 for the application assertion.

4.2.69.2 classified_element

The classified_element specifies the object that is classified.

See 4.3.250, 4.3.251, 4.3.252, 4.3.253, 4.3.254, 4.3.255, 4.3.256, 4.3.257, 4.3.258, 4.3.259, 4.3.260, 4.3.261, 4.3.262, 4.3.264, 4.3.265, 4.3.266, 4.3.267, 4.3.268, 4.3.269, 4.3.270, 4.3.271, 4.3.272, 4.3.273, 4.3.274, 4.3.275, 4.3.276, 4.3.277, 4.3.278, 4.3.279, 4.3.280, 4.3.281, 4.3.282, and 4.3.283 for the application assertions.

There shall be exactly one object that defines the classified_element for a Classification_association (see 4.2.69).

4.2.69.3 definitional

The definitional specifies whether a General_classification (see 4.2.216) serves as definition. A value of 'true' indicates that the General_classification is definitional. The 'associated_classification' does not take precedence over the descriptions of the 'classified_element' made using Property_value (see 4.2.412) or Geometric_model (see 4.2.238) objects.

The attribute definitional shall only be used, if the classified_element is of one of the types Material (see 4.2.309), Item (see 4.2.267), Item_version (see 4.2.275), Design_discipline_item_definition (see 4.2.142), or Catalogue_thread (see 4.2.48).

The definitional need not be specified for a particular Classification_association (see 4.2.69).

4.2.69.4 role

The role specifies the relationship between the General_classification (see 4.2.216) and the associated object. Where applicable, the following values shall be used:

— 'electromagnetic compatibility': The associated object is the classification that categorizes the classified element in respect of its ability to comply with requirements concerning electromagnetic interference;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— ’environmental conditions’: The associated object is the classification that categorizes the classified element with respect to its ability to comply with environmental impact requirements.

The role need not be specified for a particular Classification_association (see 4.2.69).

4.2.70 Classification_attribute

A Classification_attribute is a characteristic used to classify an object associated with the corresponding General_classification (see 4.2.216). The definition attribute of each ’allowed_value’ shall refer to the property identified within ’attribute_definition’.

The data associated with a Classification_attribute are the following:

— allowed_value;

— associated_classification;

— attribute_definition;

— description;

— id;

— name.

4.2.70.1 allowed_value

The allowed_value specifies the set of Property_value_representation (see 4.2.414) objects that represent characteristic values of the Classification_attribute.

See 4.3.287 for the application assertion.

4.2.70.2 associated_classification

The associated_classification specifies the General_classification (see 4.2.216) the Classification_attribute is a characteristic of.

See 4.3.284 for the application assertion.

4.2.70.3 attribute_definition

The attribute_definition specifies the Property (see 4.2.409) that characterizes the allowed values.

NOTE - The specification of compound characteristics can be realized by using Property_relationship (see 4.2.411) with ’relation_type ’peer’ or ’decomposition’.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

See 4.3.286 for the application assertion.

4.2.70.4 description

The description specifies additional information about the Classification_attribute.

See 4.3.285 for the application assertion.

The description need not be specified for a particular Classification_attribute (see 4.2.70).

If present, there shall be exactly one object that defines the description for a Classification_attribute.

4.2.70.5 id

The id specifies the identifier of the Classification_attribute that shall be unique within the scope of the associated General_classification (see 4.2.216).

EXAMPLE 'a' or 'b' for length or width attributes or 'r' for radius attributes are examples for identifiers of Classification_attribute objects. The meaning of such ids is usually specified in external sources.

4.2.70.6 name

The name specifies the word or group of words by which the Classification_attribute is referred to.

EXAMPLE 'length', 'width', or 'radius' are examples for the name of a Classification_attribute.

See 4.3.285 for the application assertion.

The name need not be specified for a particular Classification_attribute (see 4.2.70).

If present, there shall be exactly one object that defines the name for a Classification_attribute.

4.2.71 Classification_system

A Classification_system is the scheme used to define the categorization of an item.

EXAMPLE A dictionary collecting the conventional definitions of technical properties is an example of Classification_system.

The data associated with a Classification_system are the following:

— description;

— id.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.71.1 description

The description specifies additional information about the Classification_system.

See 4.3.288 for the application assertion.

The description need not be specified for a particular Classification_system (see 4.2.71).

If present, there shall be exactly one object that defines the description for a Classification_system.

4.2.71.2 id

The id specifies the identifier of the Classification_system.

4.2.72 Closed_profile

A Closed_profile is specified by an outline that bounds an enclosed area with no opening.

A Closed_profile is a type of Profile (see 4.2.401).

Each Closed_profile is a Ngon_profile (see 4.2.323), a Rectangular_closed_profile (see 4.2.422), a General_closed_profile (see 4.2.218), or a Circular_closed_profile (see 4.2.58).

4.2.73 Closed_profile_usage

A Closed_profile_usage is the identification of a Closed_profile (see 4.2.72) and possibly of a geometric Transformation (see 4.2.533) used to place the Closed_profile in a reference coordinate space.

A Closed_profile_usage is a type of Profile_usage (see 4.2.403).

The data associated with a Closed_profile_usage are the following:

— used_profile

The used_profile specifies the Closed_profile that is used.

See 4.3.289 for the application assertion.

4.2.74 Closed_shell

A Closed_shell is a collection of at least one Face (see 4.2.191) object that bounds a region in a three-dimensional space. The topological normal of the shell is defined as being directed from the finite to the infinite region. A Closed_shell shall not self-intersect.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Closed_shell are the following:

— shell_boundary

The shell_boundary specifies the Face that represents the boundary of a Closed_shell.

See 4.3.290 for the application assertion.

4.2.75 Coating_layer

A Coating_layer is one layer of covering applied to a surface. For a Coating_layer the inherited attribute 'element_name' is not available.

NOTE 1 - Each Coating_layer is one particular aspect of a part's shape.

NOTE 2 - Sequences of Coating_layer objects can be defined using Shape_element_relationship (see 4.2.450) with relation_type 'coating layer sequence'.

EXAMPLE A layer of paint, applied to a part, is an example of Coating_layer.

A Coating_layer is a type of Shape_element (see 4.2.449).

The data associated with a Coating_layer are the following:

— thickness;

— used_material.

4.2.75.1 thickness

The thickness specifies the thickness of the Coating_layer.

NOTE - This reference to Thickness_dimension (see 4.2.516) is identical with the reference from Thickness_dimension to Shape_element (see 4.2.449) as Shape_element is a supertype of Coating_layer.

See 4.3.292 for the application assertion.

The thickness need not be specified for a particular Coating_layer (see 4.2.75).

4.2.75.2 used_material

The used_material specifies the material that is used for the Coating_layer.

NOTE - This reference to Material (see 4.2.309) is identical with the reference from Material to Shape_element (see 4.2.449) as Shape_element is a supertype of Coating_layer.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.291 for the application assertion.

4.2.76 Coaxiality_tolerance

A Coaxiality_tolerance is a constraint where the tolerance zone is limited by a cylinder, the diameter of which is the tolerance value. The cylinder axis is defined by the datums that are referenced.

A Coaxiality_tolerance is a type of Geometric_tolerance (see 4.2.243).

The data associated with a Coaxiality_tolerance are the following:

— reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) objects that define the reference for this type of geometric tolerance.

See 4.3.293 for the application assertion.

4.2.77 Collected_item_association

A Collected_item_association is a mechanism to associate Item_instance (see 4.2.271) objects with a Collection_definition (see 4.2.78).

A Collected_item_association is a type of Item_definition_instance_relationship (see 4.2.268).

The data associated with a Collected_item_association are the following:

— relating

The relating specifies the Collection_definition that collects the Item_instance objects.

See 4.3.294 for the application assertion.

4.2.78 Collection_definition

A Collection_definition is the definition of an Item_version (see 4.2.275) that serves as a collector for Item_instance (see 4.2.271) objects that are mounted in the same vehicle but may not be assembled together.

> EXAMPLE Brake pads on the left and right front brake from same supplier, locks and keys of the car all from one supplier, wooden panels in the interior from the same supplier (to ensure common structure of the wood) are examples for collections.

A Collection_definition is a type of Design_discipline_item_definition (see 4.2.142).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Collection_definition are the following:

— purpose

The purpose specifies the rationale behind the Collection_definition.

See 4.3.295 for the application assertion.

The purpose need not be specified for a particular Collection_definition.

If present, there shall be exactly one object that defines the purpose for a Collection_definition.

4.2.79 Complete_circular_path

A Complete_circular_path is a path that defines a revolution of 360 degrees along a circle. The x-axis of the inherited Axis_placement (see 4.2.33) is coaxial to the rotation axis, and the z-axis is tangent to the curve n its start point. The y-axis is oriented such that the actual rotation axis has a y co-ordinate equal to the value of the 'radius' inherited from Circular_path (see 4.2.61). The Axis_placement lies on the curve described by the path.

EXAMPLE Figure 19 illustrates a Complete_circular_path.

A Complete_circular_path is a type of Circular_path (see 4.2.61).

4.2.80 Complex_product

A Complex_product is an object with the capability that it can be realized by, decomposed into or specialized as Product_constituent (see 4.2.395) objects in a functional, logical, or physical way.

Each Complex_product is a Product_function (see 4.2.397), a Product_component (see 4.2.394), or an Alternative_solution (see 4.2.10).

The data associated with a Complex_product are the following:

— id;

— version_id.

4.2.80.1 id

The id specifies the identifier of the Complex_product.

4.2.80.2 version_id

The version_id identifies a version of the concept represented by a Complex_product.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

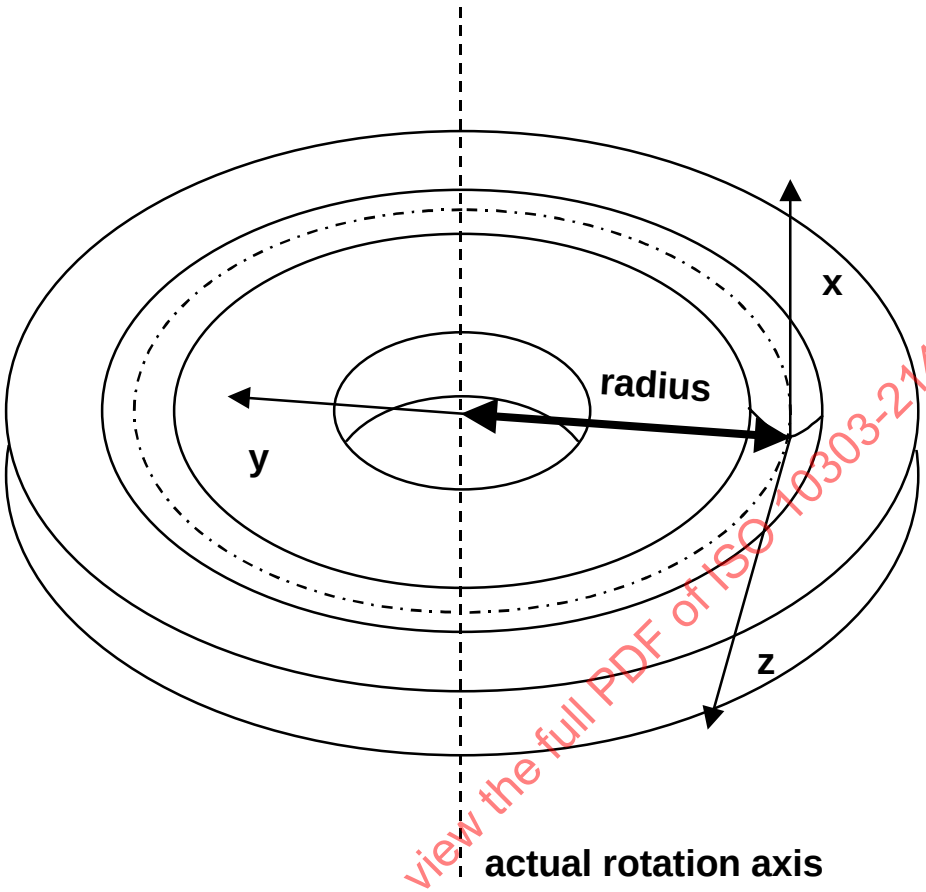

Figure 19 – Definition of a Complete_circular_path

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

NOTE - The version_id does not identify a version of its characterization in one or more application contexts.

The version_id need not be specified for a particular Complex_product (see 4.2.80).

4.2.81 Complex_product_relationship

A Complex_product_relationship is a relationship between two Complex_product (see 4.2.80) objects.

The Complex_product_relationship shall only be used to relate Complex_product objects that are of the same kind.

The data associated with a Complex_product_relationship are the following:

— description;

— related;

© ISO 2001 – All rights reserved

— relating;

— relation_type.

4.2.81.1 description

The description specifies additional information about the Complex_product_relationship.

See 4.3.297 for the application assertion.

The description need not be specified for a particular Complex_product_relationship (see 4.2.81).

If present, there shall be exactly one object that defines the description for a Complex_product_relationship.

4.2.81.2 related

The related specifies the second of the two objects related by the Complex_product_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.296 for the application assertion.

4.2.81.3 relating

The relating specifies the first of the two objects related by the Complex_product_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.296 for the application assertion.

4.2.81.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'derivation': the Complex_product_relationship defines a relationship where the related Complex_product (see 4.2.80) is derived from the relating Complex_product;

NOTE 1 - The relationship does not imply inheritance of any kind between the application objects that are related.

— 'replacement': The Complex_product_relationship defines a relationship where the related Complex_product is used in place of the relating Complex_product;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— 'version hierarchy': the Complex_product_relationship defines a relationship where the related Complex_product is a sub version of the relating Complex_product;

EXAMPLE 1 'version hierarchy' is used, whenever a revision of one particular version is prepared, e.g., 'version 1.1'.

— 'version sequence': the Complex_product_relationship defines a relationship where the relating Complex_product is the preceding version and the related Complex_product is the following version.

NOTE 2 - The relationship does not imply inheritance of any kind between the application objects that are related.

EXAMPLE 2 'version sequence' is used, whenever a new version is prepared, e.g., 'version 1.0' is the preceding version for the following 'version 2.0'.

4.2.82 Component_placement

A Component_placement is the information pertaining to the placement of a Product_component (see 4.2.394), which is defined in its own Cartesian_coordinate_space (see 4.2.44), in the coordinate space of a reference Product_component.

EXAMPLE An example for the use of of a Component_placement is the placement of the Product_component 'steering wheel' dependent on left hand versus right hand steering in different countries.

The data associated with a Component_placement are the following:

— placed_component;

— placement;

— reference_product_component.

4.2.82.1 placed_component

The placed_component specifies the Product_component (see 4.2.394) that is positioned with respect to the 'reference_product_component'.

NOTE 1 - The Component_placement does not define a placement for all variants of the placed_component in the context of 'reference_product_component'.

The coordinate system that serves as a reference for the placement shall be specified by a Model_property_association (see 4.2.317). the 'definition' of the Model_property_value (see 4.2.318) shall be a General_property (see 4.2.230) with a 'property_type' of 'positioning'. The placement is only applicable for the placed_component and Product_component or Item_instance (see 4.2.271) objects that are explicitly placed in its coordinate space by Component_placement or Instance_placement (see 4.2.264).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

NOTE 2 - The placement does not apply to variants of the placed_component, i.e., Alternative_solution (see 4.2.10) objects that refer to the placed_component as 'base_element'.

See 4.3.299 for the application assertion.

4.2.82.2 placement

The placement specifies the Geometric_model_relationship_with_transformation (see 4.2.240) or the Template_instance (see 4.2.512) that defines the position of the 'placed_component' relatively to the 'reference_product_component'. In the case of Template_instance, the scale shall be omitted or set to 1.0.

See 4.3.298 and 4.3.300 for the application assertions.

There shall be exactly one object that defines the placement for a Component_placement (see 4.2.82).

4.2.82.3 reference_product_component

The reference_product_component specifies the high level Product_component (see 4.2.394) that is defined in the reference coordinate space. A Model_property_association (see 4.2.317) shall be assigned to the reference_product_component to define this reference coordinate space.

See 4.3.299 for the application assertion.

4.2.83 Composite_curve

A Composite_curve is a curve that is composed of a number of curves which join end to end.

NOTE - A Composite_curve may be closed and self-intersecting.

A Composite_curve is a type of Curve (see 4.2.108).

4.2.84 Compound_datum

A Compound_datum is a set of two Single_datum (see 4.2.454) objects of equal importance which are used to establish a single datum plane or axis.

EXAMPLE Figure 20 shows the usage of compound datum objects for tolerancing.

A Compound_datum is a type of Datum (see 4.2.123).

The data associated with a Compound_datum are the following:

— is_made_up_by

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The is_made_up_by specifies the set of Single_datum objects that form the Compound_datum.

See 4.3.301 for the application assertion.

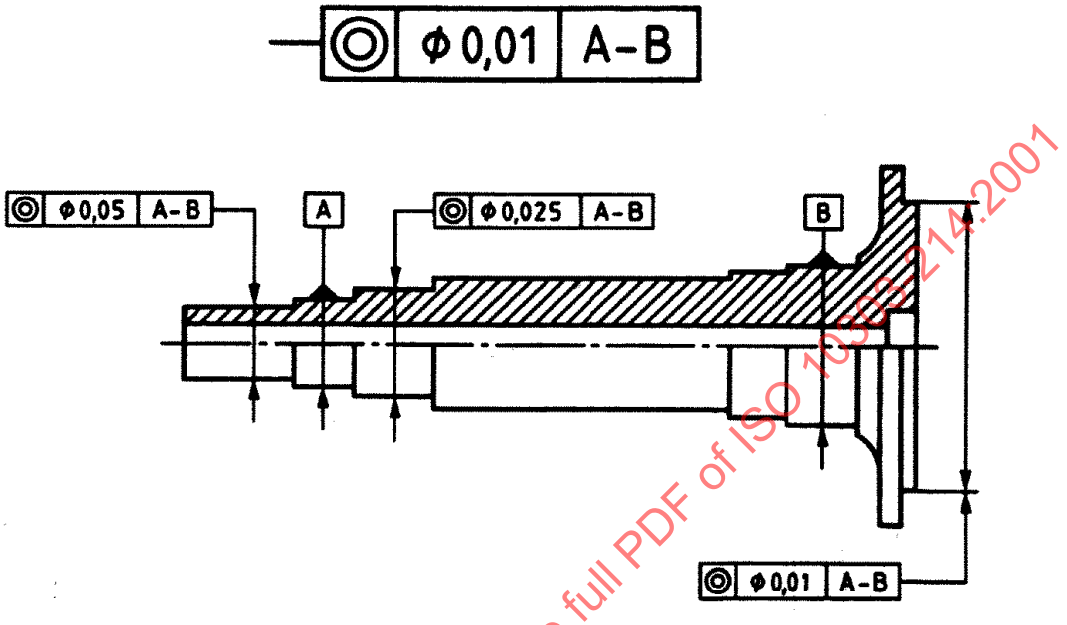

Figure 20 – Usage of compound datums

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.85 Compound_feature_in_panel

A Compound_feature_in_panel is a union of Process_feature_in_panel (see 4.2.379) objects.

In the case where the Compound_feature_in_panel is applied as a Placed_feature (see 4.2.356), all of its elements, except for Transition_feature (see 4.2.537) objects, shall be defined in their own local coordinate spaces, and then transformed into the coordinate space of the Compound_feature_in_panel. In the case where the Compound_feature_in_panel is applied as an Included_feature (see 4.2.261), the Compound_feature_in_panel as well as all of its elements shall be defined in the coordinate space of the shape where it is applied.

NOTE - A Compound_feature_in_panel enables the definition of complex features based on existing Process_feature_in_panel definitions.

A Compound_feature_in_panel is a type of Process_feature_in_panel (see 4.2.379).

The data associated with a Compound_feature_in_panel are the following:

— feature_type

The feature_type specifies the kind of Compound_feature_in_panel.

© ISO 2001 – All rights reserved

4.2.86 Compound_feature_in_panel_element

A Compound_feature_in_panel_element is the identification and, if necessary, the positioning of an element of a Compound_feature_in_panel (see 4.2.85).

The data associated with a Compound_feature_in_panel_element are the following:

— element_placement;

— feature;

— is_element_for.

4.2.86.1 element_placement

The element_placement specifies the geometric Transformation (see 4.2.533) that defines the position and the orientation of the Compound_feature_in_panel_element in the coordinate space of the Compound_feature_in_panel (see 4.2.85) in the case where the Compound_feature_in_panel is applied as a Placed_feature (see 4.2.356). In the case where the Compound_feature_in_panel is applied as an Included_feature (see 4.2.261) the element_placement shall not be instantiated.

See 4.3.304 for the application assertion.

The element_placement need not be specified for a particular Compound_feature_in_panel_element (see 4.2.86).

4.2.86.2 feature

The feature specifies the Process_feature_in_panel (see 4.2.379) or Transition_feature (see 4.2.537) that is the feature definition of the Compound_feature_in_panel_element.

See 4.3.303 and 4.3.305 for the application assertions.

There shall be exactly one object that defines the feature for a Compound_feature_in_panel_element (see 4.2.86).

4.2.86.3 is_element_for

The is_element_for specifies the Compound_feature_in_panel (see 4.2.85) of which the Compound_feature_in_panel_element is a component.

See 4.3.302 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.87 Compound_feature_in_panel_element_relationship

A Compound_feature_in_panel_element_relationship is a relationship between two Compound_feature_-in_panel_element (see 4.2.86) objects that shall be applied consecutively when forming a Compound_-feature_in_panel (see 4.2.85).

The data associated with a Compound_feature_in_panel_element_relationship are the following:

— predecessor;

— successor.

4.2.87.1 predecessor

The predecessor specifies the Compound_feature_in_panel_element (see 4.2.86) that is preceding the other feature in the Compound_feature_in_panel_element_relationship.

See 4.3.306 for the application assertion.

4.2.87.2 successor

The successor specifies the Compound_feature_in_panel_element (see 4.2.86) that is succeeding the other feature in the Compound_feature_in_panel_element_relationship.

See 4.3.306 for the application assertion.

4.2.88 Compound_feature_in_solid

A Compound_feature_in_solid is a union of Process_feature_in_solid (see 4.2.380) objects.

In the case where the Compound_feature_in_solid is applied as a Placed_feature (see 4.2.356), all of its elements, Transition_feature (see 4.2.537) or Thread_feature (see 4.2.517) objects excepted, shall be defined in their own local coordinate spaces and then transformed into the coordinate space of the Compound_feature_in_solid. In the case where the Compound_feature_in_solid is applied as an Included_-feature (see 4.2.261), the Compound_feature_in_solid as well as all of its elements shall be defined in the coordinate space of the shape where the Compound_feature_in_solid is applied.

NOTE - A Compound_feature_in_solid allows the definition of complex features based on existing Process_feature_in_solid definitions.

A Compound_feature_in_solid is a type of Process_feature_in_solid (see 4.2.380).

Each Compound_feature_in_solid is a Compound_hole (see 4.2.91) or a General_compound_feature_-in_solid (see 4.2.220).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Compound_feature_in_solid are the following:

— feature_type

The feature_type specifies a user defined name for the kind of Compound_feature_in_solid.

The feature_type need not be specified for a particular Compound_feature_in_solid.

4.2.89 Compound_feature_in_solid_element

A Compound_feature_in_solid_element is the identification and, if necessary, the positioning of an element of a Compound_feature_in_solid (see 4.2.88).

If the Compound_feature_in_solid_element is a Thread_feature (see 4.2.517), there shall be a Compound_feature_in_solid_element_relationship (see 4.2.90) that references the Compound_feature_in_solid_element representing the Thread_feature as successor and a Compound_feature_in_solid_element referring to either a Circular_boss (see 4.2.57) or a Round_hole (see 4.2.439) as predecessor.

The data associated with a Compound_feature_in_solid_element are the following:

— element_placement;

— feature;

— is_element_for.

4.2.89.1 element_placement

The element_placement specifies the geometric Transformation (see 4.2.533) that defines the position and the orientation of the Compound_feature_in_solid_element in the coordinate space of the Compound_feature_in_solid (see 4.2.88), in the case where the Compound_feature_in_solid is applied as a Placed_feature (see 4.2.356). The element_placement shall not be used if the Compound_feature_in_solid_element is a Thread_feature (see 4.2.517) or a Transition_feature (see 4.2.537). In the case where the Compound_feature_in_solid is applied as an Included_feature (see 4.2.261), the element_placement shall not be instantiated.

See 4.3.310 for the application assertion.

The element_placement need not be specified for a particular Compound_feature_in_solid_element (see 4.2.89).

4.2.89.2 feature

The feature specifies the Process_feature_in_solid (see 4.2.380) that is the feature definition of the Compound_feature_in_solid_element.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.308, 4.3.309, and 4.3.311 for the application assertions.

There shall be exactly one object that defines the feature for a Compound_feature_in_solid_element (see 4.2.89).

4.2.89.3 is_element_for

The is_element_for specifies the Compound_feature_in_solid_element (see 4.2.89) of which the Compound_feature_in_solid_element is a component.

See 4.3.307 for the application assertion.

4.2.90 Compound_feature_in_solid_element_relationship

A Compound_feature_in_solid_element_relationship is a relationship between two Compound_feature_in_solid_element (see 4.2.89) objects that shall be applied consecutively when forming a Compound_feature_in_solid (see 4.2.88).

NOTE - The sequence defined by the Compound_feature_in_solid_element_relationship need not be the same as the manufacturing sequence of the Compound_feature_in_solid.

The data associated with a Compound_feature_in_solid_element_relationship are the following:

— predecessor;

— successor.

4.2.90.1 predecessor

The predecessor specifies the Compound_feature_in_solid_element (see 4.2.89) that is preceding the other feature in the Compound_feature_in_solid_element_relationship.

See 4.3.312 for the application assertion.

4.2.90.2 successor

The successor specifies the Compound_feature_in_solid_element (see 4.2.89) that is succeeding the other feature in the Compound_feature_in_solid_element_relationship.

See 4.3.312 for the application assertion.

4.2.91 Compound_hole

A Compound_hole made of two Round_hole (see 4.2.439) objects. The top of the first Round_hole shall mate with the bottom of the second Round_hole. The Compound_hole orientation shall be the

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

same as the orientation of the first Round_hole. Both Round_hole objects shall be co-axial. The Axis_placement (see 4.2.33) referenced by the inherited attribute 'location_and_orientation' shall coincide with the Axis_placement referenced by the first Round_hole.

A Compound_hole is a type of Compound_feature_in_solid (see 4.2.88).

The data associated with a Compound_hole are the following:

— compound_hole_type

The compound_hole_type specifies the type of combination of the two Round_hole objects. The following values shall be used:

— 'counterbore': The first Round_hole shall have any kind of Hole_bottom_condition (see 4.2.257), the second shall not have a Through_pocket_bottom_condition (see 4.2.520), and a larger diameter than the first Round_hole;

— 'countersunk': The first Round_hole shall have any kind of Hole_bottom_condition, the second shall not have a Through_pocket_bottom_condition, and shall have a taper.

4.2.92 Compound_model

A Compound_model is a geometry model where elements of different dimensionality, such as wireframe models or surface models, are topologically connected. The topology of a Compound_model may be non-manifold.

NOTE - A Compound_model may include non-manifold surface models as well as topologically bounded three-dimensional wireframe models.

A Compound_model is a type of Geometric_model (see 4.2.238).

The data associated with a Compound_model are the following:

— element

The element specifies the topologically connected elements that form the Compound_model.

See 4.3.313 for the application assertion.

4.2.93 Concentricity_tolerance

A Concentricity_tolerance is a constraint defining one of the following two conditions:

— a condition where the axes of all cross-sectional elements of a surface of revolution perpendicular to the axis of a datum feature are common to this axis. In this case, it implies a cylindrical tolerance

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

zone whose axis coincides with the datum axis and within which all cross-sectional axes of the feature being controlled must lie;

— a condition where the centre point of one sphere is common to the centre point of another sphere. In this case, it implies a spherical tolerance zone within which the centre point of the first sphere must lie.

A Concentricity_tolerance is a type of Geometric_tolerance (see 4.2.243).

The data associated with a Concentricity_tolerance are the following:

— reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) that defines the reference for this type of geometric tolerance.

See 4.3.314 for the application assertion.

4.2.94 Configuration

A Configuration is the association of a Class_condition_association (see 4.2.65) or a Class_specification_association (see 4.2.67) object with a design or with a process in order to define a valid usage of it in the context of a certain Product_class (see 4.2.392).

NOTE 1 - The validity of the association may be limited by a time period through assigning an Effectivity (see 4.2.179) object to it.

NOTE 2 - The semantics of the kind of association is defined by the attributes 'configuration_type' and 'inheritance_type'.

The data associated with a Configuration are the following:

— configuration_type;

— configured_element;

— inheritance_type;

— is_solution_for.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.94.1 configuration_type

The configuration_type specifies the valid usage of a Configuration object that is applied to the application object as configured_element. The following values shall be used:

— 'design': The object referenced as 'configured_element' has to be designed and verified before it can actually be used in a given context. This context is specified by the Class_condition_association (see 4.2.65) and Class_specification_association (see 4.2.67) objects referenced as the 'is_solution_for'.

  This type of Configuration is applicable for Alternative_solution (see 4.2.10), Product_component (see 4.2.394), Product_function (see 4.2.397), Process_plan (see 4.2.387), or Process_operation_occurrence (see 4.2.384) objects;

— 'usage': The object referenced as the 'configured_element' is controlled by a Configuration. The Class_condition_association and Class_specification_association objects specify the usage cases and are referenced as the 'is_solution_for'.

  This type of Configuration is applicable for Alternative_solution, Item_instance (see 4.2.271), Process_plan, Process_operation_occurrence, or Product_component objects.

  EXAMPLE 1 The presence of an optional third rear axle of a truck is controlled by specifications on the level of Product_component.

  EXAMPLE 2 A 'sun-roof' has to be provided, i.e., designed for a class of vehicles that has an optional 'sun-roof' as part of its specification.

4.2.94.2 configured_element

The configured_element specifies the application object that is controlled for its valid usage by the Configuration.

See 4.3.315, 4.3.318, 4.3.319, 4.3.320, 4.3.321, and 4.3.322 for the application assertions.

There shall be exactly one object that defines the configured_element for a Configuration (see 4.2.94).

4.2.94.3 inheritance_type

The inheritance_type specifies whether or not an inheritance scheme for the configuration information in a hierarchical structure is applied to the application object referenced as the configured_element. The levels within such a hierarchy are defined through Product_structure_relationship (see 4.2.400) objects or the attribute 'base_element' of Alternative_solution (see 4.2.10). The following values shall be used:

— 'exception': No inheritance scheme is applicable and all required configuration information must be attached locally at the application object. The value indicates that the configuration information may be inconsistent to the structural levels above it or that it is, on purpose, contradictory to it. Such

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

a condition implies that an inheritance scheme shall not continue beyond this point in the product structure tree;

EXAMPLE 1 A situation where the inheritance_type 'exception' is applicable is a technical solution released for an one particular customer without support in higher structure levels.

— 'inherited': A scheme for inheritance of configuration information applies. The complete configuration information shall be collected from the different levels in the structure by evaluation of results. The results shall be evaluated using the logical AND to combine configuration information starting at the referenced configured_element and using the logical OR to combine alternatives. In addition, this evaluation shall consider related effectivity information. 'inherited' only applies for objects for which the same value of 'configuration_type' is defined;

EXAMPLE 2 Figure 21 shows how inheritance is applied along the tree of a product structure: The complete configuration information of an Item_instance (see 4.2.271) can be obtained by adding any such information to Alternative_solution objects which are linked through Product_structure_relationship objects and 'base_element' attributes respectively. Whenever more than one higher level instance is present, the current information available is branched in as many branches as instances are present. For example, the total configuration information for the Item_instance given in Figure 21 could be expressed as follows: (C0.0 AND C1.0 AND C2.0) OR (C0.0 AND C1.1 AND C2.1) OR (C0.0 AND C1.1 AND C2.2).

— 'local': No inheritance scheme is applicable and all required configuration information must be attached locally at the application object. Nevertheless, any potentially inherited configuration information of a higher level shall be consistent, i.e., be a subset of the locally defined configuration information.

4.2.94.4 is_solution_for

The is_solution_for specifies the characteristic or combination of characteristics for which the object referenced as the configured_element provides a solution or which is needed to control a process operation. These characteristics are defined by a Class_specification_association (see 4.2.67) and combinations of characteristics are defined by a Class_condition_association (see 4.2.65) where the attribute 'condition type' is 'part usage'.

See 4.3.316 and 4.3.317 for the application assertions.

There shall be exactly one object that the Configuration (see 4.2.94) is_solution_for.

4.2.95 Conical_bottom

A Conical_bottom is a hole bottom that is shaped like a cone. A Conical_bottom is characterized by a constant decrease in the hole diameter until the diameter is zero or until the surface becomes tangent to a specified tip_radius.

A Conical_bottom is a type of Hole_bottom_condition (see 4.2.257).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

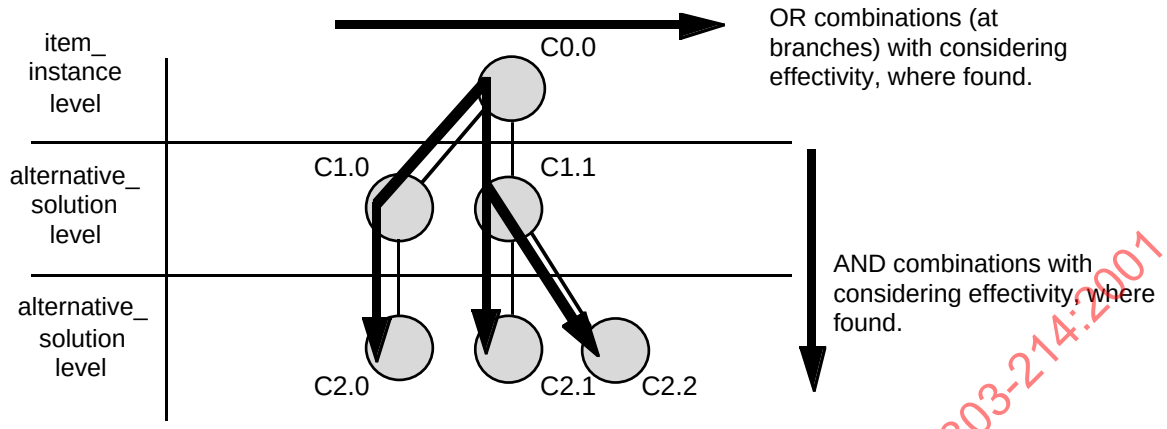

Figure 21 – Configuration inheritance scheme

The data associated with a Conical_bottom are the following:

— tip_angle;

— tip_radius.

4.2.95.1 tip_angle

The tip_angle specifies the opening angle of the cone. The tip_angle shall have a value greater than 0 degrees and smaller than 180 degrees.

See 4.3.323 for the application assertion.

4.2.95.2 tip_radius

The tip_radius specifies the radius at the tip of the cone.

See 4.3.323 for the application assertion.

The tip_radius need not be specified for a particular Conical_bottom (see 4.2.95).

4.2.96 Conical_surface

A Conical_surface is a surface that can be produced by revolving a line in three-dimensional geometric space about any intersecting line as rotation axis. The angle between the axis and the revolved line shall be between and not equal to 0 and 90 degrees. A Conical_surface shall be trimmed to a finite extension if used in a Surface_model (see 4.2.496) or a Geometrically_bounded_surface_model (see 4.2.248).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

A Conical_surface is a type of Surface (see 4.2.489).

4.2.97 Constant_radius_edge_round

A Constant_radius_edge_round is an Edge_round (see 4.2.177) with a constant radius.

A Constant_radius_edge_round is a type of Edge_round (see 4.2.177).

The data associated with a Constant_radius_edge_round are the following:

— first_offset;

— radius;

— second_offset.

4.2.97.1 first_offset

The first_offset specifies the amount of offset from the first Face (see 4.2.191) that defines the location of tangency.

EXAMPLE Figure 22 illustrates the use of offsets with a Constant_radius_edge_round.

NOTE - The use of offsets causes the location of tangency to be 'outside the material' on an imaginary offset surface and not on the part's surface.

See 4.3.324 for the application assertion.

The first_offset need not be specified for a particular Constant_radius_edge_round (see 4.2.97).

4.2.97.2 radius

The radius specifies the amount of curvature for a convex transition representing a Constant_radius_-edge_round.

See 4.3.324 for the application assertion.

4.2.97.3 second_offset

The second_offset specifies the amount of offset from the second Face (see 4.2.191) that defines the location of tangency.

See 4.3.324 for the application assertion.

The second_offset need not be specified for a particular Constant_radius_edge_round (see 4.2.97).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

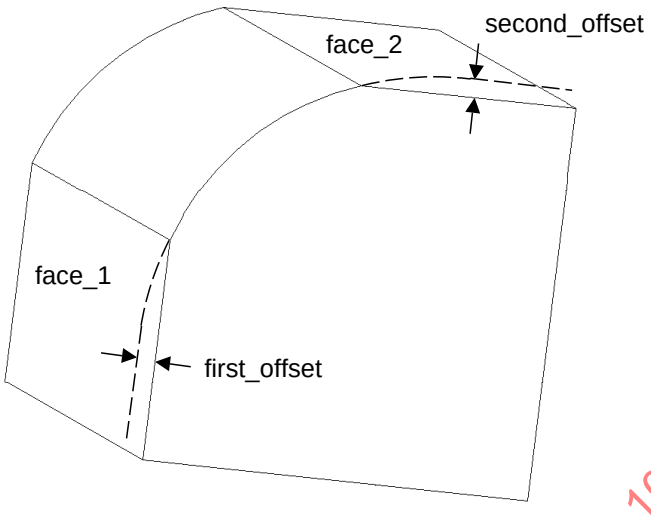

Figure 22 – Parameters defining an edge round with constant radius by offsets

4.2.98 Constant_radius_fillet

A Constant_radius_fillet is a Fillet (see 4.2.205) with a constant radius.

A Constant_radius_fillet is a type of Fillet (see 4.2.205).

The data associated with a Constant_radius_fillet are the following:

— first_offset;

— radius;

— second_offset.

4.2.98.1 first_offset

The first_offset specifies the amount of offset from the first Face (see 4.2.191) that defines the location of tangency.

EXAMPLE Figure 23 illustrates the use of offsets with a Constant_radius_fillet.

NOTE - The use of offsets causes the location of tangency to be 'inside the material' on an imaginary offset surface and not on the part's surface.

See 4.3.325 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The first_offset need not be specified for a particular Constant_radius_fillet (see 4.2.98).

4.2.98.2 radius

The radius specifies the amount of curvature for a concave transition representing a Constant_radius_-fillet.

See 4.3.325 for the application assertion.

4.2.98.3 second_offset

The second_offset specifies the amount of offset from the second Face (see 4.2.191) that defines the location of tangency.

See 4.3.325 for the application assertion.

The second_offset need not be specified for a particular Constant_radius_fillet (see 4.2.98).

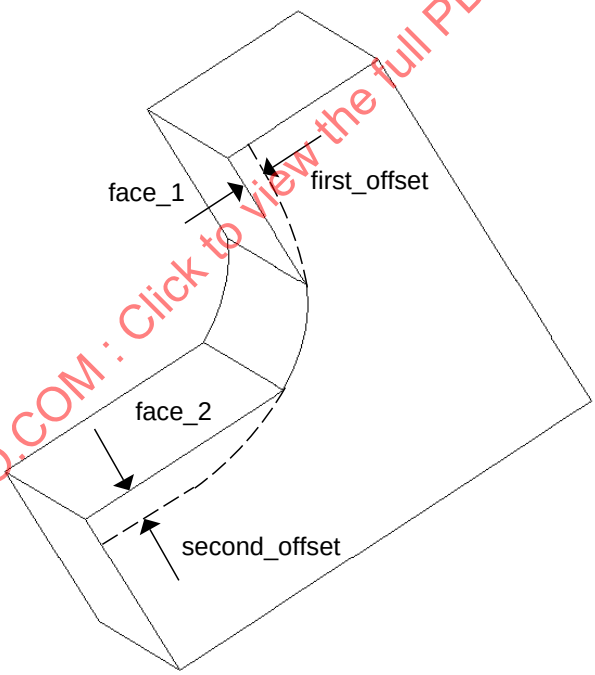

Figure 23 – Parameters defining a fillet with a constant radius by offsets

4.2.99 Constructive_geometric_element

A Constructive_geometric_element is an element of a Constructive_geometry (see 4.2.100).

© ISO 2001 – All rights reserved

The data associated with a Constructive_geometric_element are the following:

— description;

— element.

4.2.99.1 description

The description specifies the meaning of the Constructive_geometric_element.

EXAMPLE The description may be, e.g., 'rotation axis' or 'mirroring plane'.

See 4.3.329 for the application assertion.

The description need not be specified for a particular Constructive_geometric_element (see 4.2.99).

If present, there shall be exactly one object that defines the description for a Constructive_geometric_-element.

4.2.99.2 element

The element specifies the geometric element that serves as a Constructive_geometric_element.

See 4.3.326, 4.3.327, 4.3.328, 4.3.330, 4.3.331, 4.3.332, and 4.3.333 for the application assertions.

There shall be exactly one object that defines the element for a Constructive_geometric_element (see 4.2.99).

4.2.100 Constructive_geometry

A Constructive_geometry is a collection of non-shape geometry that is used to support the definition of a Geometric_model (see 4.2.238). Each Constructive_geometry shall refer directly or indirectly, via intermediate Constructive_geometry objects, to a Geometric_model through Constructive_geometry_-association (see 4.2.101) objects.

The data associated with a Constructive_geometry are the following:

— element;

— name.

4.2.100.1 element

The element specifies the Constructive_geometric_element (see 4.2.99) objects the Constructive_geom-etry consists of.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.334 for the application assertion.

4.2.100.2 name

The name specifies the word or group of words by which the Constructive_geometry is referred to.

See 4.3.335 for the application assertion.

The name need not be specified for a particular Constructive_geometry (see 4.2.100).

If present, there shall be exactly one object that defines the name for a Constructive_geometry.

4.2.101 Constructive_geometry_association

A Constructive_geometry_association is a the association of an auxiliary Constructive_geometry (see 4.2.100) with a Geometric_model (see 4.2.238) or another Constructive_geometry. This association specifies that the auxiliary Constructive_geometry contains elements that have been used to build the elements of the Geometric_model or of the Constructive_geometry.

The data associated with a Constructive_geometry_association are the following:

— auxiliary_geometry;

— base_geometry;

— description.

4.2.101.1 auxiliary_geometry

The auxiliary_geometry specifies the Constructive_geometry (see 4.2.100) that supports the definition of the 'base_geometry'.

See 4.3.336 for the application assertion.

4.2.101.2 base_geometry

The base_geometry specifies the Geometric_model (see 4.2.238) in which the 'auxiliary geometry' is used.

See 4.3.336 and 4.3.337 for the application assertions.

There shall be exactly one object that defines the base_geometry for a Constructive_geometry_association (see 4.2.101).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.101.3 description

The description specifies additional information about the Constructive_geometry_association.

See 4.3.338 for the application assertion.

The description need not be specified for a particular Constructive_geometry_association (see 4.2.101).

If present, there shall be exactly one object that defines the description for a Constructive_geometry_association.

4.2.102 Contact_ratio

A Contact_ratio is the measure of the quality of contact of a shape on a reference surface. It is expressed as the ratio between the measure of the area of contact and the measure of the area of the reference surface.

A Contact_ratio is a type of Surface_condition (see 4.2.492).

The data associated with a Contact_ratio are the following:

— measuring_gauge;

— ratio_value.

4.2.102.1 measuring_gauge

The measuring_gauge specifies a Physical_model (see 4.2.354) that serves as the reference for the determination of a Contact_ratio.

See 4.3.339 for the application assertion.

4.2.102.2 ratio_value

The ratio_value specifies a value between 0.0 and 1.0 that is the ratio between the measure of the area of contact and the measure of the area of the reference surface.

See 4.3.340 for the application assertion.

4.2.103 Context_dependent_appearance_assignment

A Context_dependent_appearance_assignment is the assignment of appearance characteristics to geometric elements and to annotations which are presented in a particular context. The assignment is made to this context. The Context_dependent_appearance_assignment is overridden by appearances associated with elements by an Appearance_assignment (see 4.2.20).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

A Context_dependent_appearance_assignment is a type of Appearance_assignment (see 4.2.20).

The data associated with a Context_dependent_appearance_assignment are the following:

— appearance_context

The appearance_context specifies the context where the appearance components are valid.

See 4.3.341, 4.3.342, 4.3.343, 4.3.344, 4.3.345, and 4.3.346 for the application assertions.

There shall be exactly one object that defines the appearance_context for a Context_dependent_appearance_assignment.

4.2.104 Contract

A Contract is a binding agreement concerning the design of Item_version (see 4.2.275) objects, the delivery of Drawing (see 4.2.170) objects, or the execution of other Activity (see 4.2.2) objects.

The data associated with a Contract are the following:

— contracted_element;

— description;

— id.

4.2.104.1 contracted_element

The contracted_element specifies the object that is subject of the Contract.

See 4.3.347, 4.3.348, and 4.3.349 for the application assertions.

4.2.104.2 description

The description specifies additional information for an Item_version (see 4.2.275), a Drawing (see 4.2.170), or an Activity (see 4.2.2) object according to the underlying Contract.

EXAMPLE The description of the Contract may be the ordered price.

See 4.3.350 for the application assertion.

The description need not be specified for a particular Contract (see 4.2.104).

If present, there shall be exactly one object that defines the description for a Contract.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.104.3 id

The id specifies the identifier of the Contract that shall be unique within the scope of an organization.

4.2.105 Cost_property

A Cost_property is a property that specifies costs.

A Cost_property is a type of Property (see 4.2.409).

4.2.106 Csg_model

A Csg_model is a collection of solids combined using regularized Boolean operations according to a tree (directed acyclic graph) with CSG primitives and non primitive solid models at the leaves and Boolean operations (and their associated Boolean results) at the nodes. A Csg_model is the root of the tree.

A Csg_model is a type of Geometric_model (see 4.2.238).

The data associated with a Csg_model are the following:

— tree_root_expression

The tree_root_expression specifies the root of the CSG tree.

See 4.3.351, 4.3.352, 4.3.353, 4.3.354, 4.3.355, and 4.3.356 for the application assertions.

4.2.107 Csg_primitive

A Csg_primitive is a basic solid object that may be combined with other solid objects, using regularized Boolean operations, in order to create more complex solid geometric elements.

A Csg_primitive is a type of Detailed_geometric_model_element (see 4.2.144).

Each Csg_primitive is a Right_circular_cylinder (see 4.2.438), a Right_angular_wedge (see 4.2.436), a Right_circular_cone (see 4.2.437), a Torus (see 4.2.531), a Block (see 4.2.40), or a Sphere (see 4.2.473).

4.2.108 Curve

A Curve is a path of a point moving in a coordinate space.

A Curve is a type of Detailed_geometric_model_element (see 4.2.144).

Each Curve is a Hyperbola (see 4.2.260), a Parabola (see 4.2.337), a Trimmed_curve (see 4.2.539), an Offset_curve (see 4.2.325), an Ellipse (see 4.2.183), a Composite_curve (see 4.2.83), a Circle (see

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.56), a Line (see 4.2.296), a B_spline_curve (see 4.2.36), a Curve_on_surface (see 4.2.110), or a Polyline (see 4.2.377).

4.2.109 Curve_appearance

A Curve_appearance governs the visual appearance of geometric curves and of annotation curves.

Each Curve_appearance may be a Vector_appearance (see 4.2.550).

The data associated with a Curve_appearance are the following:

— colour;

— font;

— width.

4.2.109.1 colour

The colour specifies the colour of the visible segments of a curve. The colour is either user-defined or pre-defined. Figure 24 shows the pre-defined colours.

4.2.109.2 font

The font specifies the line font of a curve. The font determines the visible and invisible segments of a curve. Figure 25 shows the pre-defined curve fonts.

4.2.109.3 width

The width specifies the thickness of the visible segments of a curve measured perpendicular to the direction of the curve. The width is invariant to the scale of a Model_image (see 4.2.316).

Colour name	Red	Green	Blue
Black	0	0	0
Red	1.0	0	0
Green	0	1.0	0
Blue	0	0	1.0
Yellow	1.0	1.0	0
Magenta	1.0	0	1.0
Cyan	0	1.0	1.0
White	1.0	1.0	1.0

Chain double dash	7.0	1.0	1.0	1.0	1.0	1.0	6

Figure 25 – Predefined curve fonts

4.2.110 Curve_on_surface

A Curve_on_surface is a curve that lies on a parametric surface. This includes the cases of a 3D curve representation together with the basis surface, a 2D curve representation within the parameter space of the surface, and a combination of both.

A Curve_on_surface is a type of Curve (see 4.2.108).

4.2.111 Curve_set_2d

A Curve_set_2d is a collection of a two-dimensional Curve (see 4.2.108) or Point (see 4.2.367) objects that establish a Wireframe_model_2d (see 4.2.561).

A Curve_set_2d is a type of Detailed_geometric_model_element (see 4.2.144).

The data associated with a Curve_set_2d are the following:

— element

The element specifies the set of Curve or Point objects that form a Curve_set_2d.

See 4.3.357 and 4.3.358 for the application assertions.

There shall be at least one object that defines the element for a Curve_set_2d.

4.2.112 Curve_set_3d

A Curve_set_3d is a collection of three-dimensional Curve (see 4.2.108) or Point (see 4.2.367) objects that establish a Wireframe_model_3d (see 4.2.562).

A Curve_set_3d is a type of Detailed_geometric_model_element (see 4.2.144).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Curve_set_3d are the following:

— element

The element specifies the set of Curve or Point objects that form a Curve_set_3d.

See 4.3.359 and 4.3.360 for the application assertions.

There shall be at least one object that defines the element for a Curve_set_3d.

4.2.113 Curved_distance_dimension

A Curved_distance_dimension is the chordal dimension or the arc length along a curve.

A Curved_distance_dimension is a type of Location_dimension (see 4.2.301).

The data associated with a Curved_distance_dimension are the following:

— used_path;

— with_curve_direction.

4.2.113.1 used_path

The used_path specifies the Measurement_path (see 4.2.314) representing the curve.

See 4.3.361 for the application assertion.

4.2.113.2 with_curve_direction

The with_curve_direction specifies a Boolean value that indicates whether the direction along the element is of interest or not. The value 'true' indicates that the dimension is applied from the start point of the curve to the end point of the curve. The value 'false' indicates that the direction does not matter.

4.2.114 Cylindrical_surface

A Cylindrical_surface is a surface at a constant distance from an axis. A Cylindrical_surface shall be trimmed to a finite extension if used in a Surface_model (see 4.2.496) or a Geometrically_bounded_surface_model (see 4.2.248).

A Cylindrical_surface is a type of Surface (see 4.2.489).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.115 Cylindricity_tolerance

A Cylindricity_tolerance is the limitation of the allowable tolerance a surface may deviate from being nominally cylindrical. The tolerance zone is limited by two coaxial cylinders, with a difference in radii of the tolerance value.

A Cylindricity_tolerance is a type of Geometric_tolerance (see 4.2.243).

4.2.116 Data_environment

A Data_environment is the specification of the conditions under which a Material_property_value_representation (see 4.2.312) is valid.

EXAMPLE A Data_environment may have the name 'standard' and the description '20 degrees Celsius, 75% humidity'.

The data associated with a Data_environment are the following:

— description;

— environment_name.

4.2.116.1 description

The description specifies additional information about the Data_environment.

See 4.3.362 for the application assertion.

The description need not be specified for a particular Data_environment (see 4.2.116).

If present, there shall be exactly one object that defines the description for a Data_environment.

4.2.116.2 environment_name

The environment_name specifies the word or group of words by which the Data_environment is referred to.

4.2.117 Date_and_person_assignment

A Date_and_person_assignment is an object that associates a Date_and_person_organization (see 4.2.118) with product data. This assignment provides additional information for the associated object. The provision of such data through this assignment has an organizational character whereas some objects require the same kind of data mandatorily in order to be semantically complete. This assignment shall not be used to associate the corresponding organizational data with an object whose attributes are referencing the organizational data directly.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE 1 An example for the requirement stated is that there shall not exist a Date_and_person_-assignment with a role of 'requestor' that refers to a Work_request (see 4.2.565), since this object refers directly to Date_and_person_organization in that role.

NOTE - In the context of the object Date_and_person_assignment, the expression 'referenced object' means 'a concept that is conveyed within one of the instances referred to by the attribute 'is_applied_to' and not one of the instances referred to by this attribute.

EXAMPLE 2 If applied to an instance of Item (see 4.2.267) with role 'creation', the Date_and_person_-assignment specifies the creation date of the part, tool, or raw material as a new object in the activity domain of the organization, and not the creation date of the instance of Item in the product management system of the organization.

The data associated with a Date_and_person_assignment are the following:

— assigned_date_and_person;

— description;

— is_applied_to;

— role.

4.2.117.1 assigned_date_and_person

The assigned_date_and_person specifies the Date_and_person_organization (see 4.2.118).

See 4.3.381 for the application assertion.

4.2.117.2 description

The description specifies additional information about the Date_and_person_assignment.

See 4.3.403 for the application assertion.

The description need not be specified for a particular Date_and_person_assignment (see 4.2.117).

If present, there shall be exactly one object that defines the description for a Date_and_person_assignment.

4.2.117.3 is_applied_to

The is_applied_to specifies the set of objects with which the Date_and_person_assignment is associated.

See 4.3.363, 4.3.364, 4.3.365, 4.3.366, 4.3.367, 4.3.368, 4.3.369, 4.3.370, 4.3.371, 4.3.372, 4.3.373, 4.3.374, 4.3.375, 4.3.376, 4.3.377, 4.3.378, 4.3.379, 4.3.380, 4.3.382, 4.3.383, 4.3.384, 4.3.385, 4.3.386,

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.387, 4.3.388, 4.3.389, 4.3.390, 4.3.391, 4.3.392, 4.3.393, 4.3.394, 4.3.395, 4.3.396, 4.3.397, 4.3.398, 4.3.399, 4.3.400, 4.3.401, 4.3.402, 4.3.404, 4.3.405, 4.3.406, 4.3.407, 4.3.408, 4.3.409, 4.3.410, 4.3.411, 4.3.412, 4.3.413, 4.3.414, 4.3.415, 4.3.416, 4.3.417, 4.3.418, 4.3.419, 4.3.420, 4.3.421, 4.3.422, 4.3.423, 4.3.424, 4.3.425, 4.3.426, 4.3.427, 4.3.428, and 4.3.429 for the application assertions.

There shall be at least one object that the Date_and_person_assignment (see 4.2.117) is_applied_to.

4.2.117.4 role

The role specifies the relationship between the date or time and the person or organization in the Date_-and_person_assignment. Where applicable, the following values shall be used:

— 'creation': The assignment specifies that the referenced object has been created by the given person or organization at the given date and time;

— 'update': The assignment specifies that the referenced object has been altered by the given person or organization at the given date and time.

4.2.118 Date_and_person_organization

A Date_and_person_organization is a Person_in_organization (see 4.2.347) or an Organization (see 4.2.331) associated with a Date_time (see 4.2.119) or an Event_reference (see 4.2.184).

The data associated with a Date_and_person_organization are the following:

— actual_date;

— person_or_organization.

4.2.118.1 actual_date

The actual_date specifies the date and an optional time of day component of a Date_and_person_organization, or alternatively a discrete point in time as an Event_reference (see 4.2.184).

See 4.3.430 for the application assertion.

4.2.118.2 person_or_organization

The person_or_organization specifies the Organization (see 4.2.331) or the Person_in_organization (see 4.2.347) that is part of the Date_and_person_organization.

See 4.3.431 and 4.3.432 for the application assertions.

There shall be exactly one object that defines the person_or_organization for a Date_and_person_organization (see 4.2.118).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.119 Date_time

A Date_time is the specification of a date and an optional time of day.

The data associated with a Date_time are the following:

— date;

— time.

4.2.119.1 date

The date specifies the calendar time, defined according to the Gregorian calendar, conveying information about the year, the month, and the day in no specific order. The representation of a date shall be complete, i.e., millenium, century, and year-within-century data shall be included.

4.2.119.2 time

The time specifies a moment of occurrence measured by hour, minute, and second.

The time need not be specified for a particular Date_time (see 4.2.119).

4.2.120 Date_time_assignment

A Date_time_assignment is an association of point in time specified as a Date_time (see 4.2.119) or an Event_reference (see 4.2.184) with product data.

This assignment provides additional information for the associated object. The provision of such data through this assignment has an organizational character whereas some objects require the same kind of data mandatorily in order to be semantically complete. This assignment shall not be used to associate the corresponding organizational data with an object whose attributes are referencing the organizational data directly.

EXAMPLE 1 An example for the requirement stated is that there shall not exist a Date_time_assignment with a role of 'actual start date' that refers to an Activity (see 4.2.2), since this object refers directly to Date_time in that role.

NOTE - In the context of the object Date_time_assignment, the expression 'referenced object' means 'a concept that is conveyed within one of the instances referred to by the attribute 'is_applied_to' and not one of the instances referred to by this attribute.

EXAMPLE 2 If applied to an instance of Item (see 4.2.267) with role 'creation', the Date_time_assignment specifies the creation date of the part, tool, or raw material as a new object in the activity domain, and not the creation date of the instance of Item in a product management system.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Date_time_assignment are the following:

— assigned_date_time;

— description;

— is_applied_to;

— role.

4.2.120.1 assigned_date_time

The assigned_date_time specifies the Date_time (see 4.2.119), or alternatively a discrete point in time as an Event_reference (see 4.2.184) that is associated with the product data.

See 4.3.451 for the application assertion.

4.2.120.2 description

The description specifies additional information about the Date_time_assignment.

See 4.3.473 for the application assertion.

The description need not be specified for a particular Date_time_assignment (see 4.2.120).

If present, there shall be exactly one object that defines the description for a Date_time_assignment.

4.2.120.3 is_applied_to

The is_applied_to specifies the set of objects of product data with which the Date_time_assignment is associated.

See 4.3.433, 4.3.434, 4.3.435, 4.3.436, 4.3.437, 4.3.438, 4.3.439, 4.3.440, 4.3.441, 4.3.442, 4.3.443, 4.3.444, 4.3.445, 4.3.446, 4.3.447, 4.3.448, 4.3.449, 4.3.450, 4.3.452, 4.3.453, 4.3.454, 4.3.455, 4.3.456, 4.3.457, 4.3.458, 4.3.459, 4.3.460, 4.3.461, 4.3.462, 4.3.463, 4.3.464, 4.3.465, 4.3.466, 4.3.467, 4.3.468, 4.3.469, 4.3.470, 4.3.471, 4.3.472, 4.3.474, 4.3.475, 4.3.476, 4.3.477, 4.3.478, 4.3.479, 4.3.480, 4.3.481, 4.3.482, 4.3.483, 4.3.484, 4.3.485, 4.3.486, 4.3.487, 4.3.488, 4.3.489, 4.3.490, 4.3.491, 4.3.492, 4.3.493, 4.3.494, 4.3.495, 4.3.496, 4.3.497, 4.3.498, and 4.3.499 for the application assertions.

There shall be at least one object that the Date_time_assignment (see 4.2.120) is_applied_to.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.120.4 role

The role specifies the action associated with the Date_time_assignment. Where applicable, the following values shall be used:

— 'classification date': The assignment specifies that the specified object is classified at the given date and time. This value shall only be used, if the Date_time_assignment refers to instances of Classification_association (see 4.2.69) as 'is_applied_to';

— 'creation': The assignment specifies that the referenced object was created at the given date and time;

— 'installation': The assignment specifies that the referenced object was mounted in a product at the given date and time;

EXAMPLE 1 This role is applicable, e.g., when referring to a Physical_instance (see 4.2.352).

— 'production': The assignment specifies that the referenced object was produced at the given date and time;

EXAMPLE 2 This role is applicable, e.g., when referring to a Physical_instance.

— 'registration': The assignment specifies that the referenced object was determined at the given date and time;

EXAMPLE 3 This role is applicable, e.g., when referring to a Property (see 4.2.409).

— 'update': The assignment specifies that the referenced object was altered at the given date and time.

4.2.121 Date_time_interval_assignment

A Date_time_interval_assignment is an association of an Interval_of_time (see 4.2.266) with some product data. The Date_time_interval_assignment shall neither be used to convey effectivity information, i.e., information concerning valid use of product data, nor to convey retention information, nor duration information.

NOTE - Such information is conveyed using Effectivity (see 4.2.179), Retention_period (see 4.2.434), and Duration (see 4.2.174) respectively.

The data associated with a Date_time_interval_assignment are the following:

— assigned_time_interval;

— description;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— is_applied_to;

— role.

4.2.121.1 assigned_time_interval

The assigned_time_interval specifies the Interval_of_time (see 4.2.266) that is associated with the product data.

See 4.3.528 for the application assertion.

4.2.121.2 description

The description specifies additional information about the Date_time_interval_assignment.

See 4.3.539 for the application assertion.

The description need not be specified for a particular Date_time_interval_assignment (see 4.2.121).

If present, there shall be exactly one object that defines the description for a Date_time_interval_assignment.

4.2.121.3 is_applied_to

The is_applied_to specifies the set of objects of product data with which the Date_time_interval_assignment is associated.

See 4.3.500, 4.3.501, 4.3.502, 4.3.503, 4.3.504, 4.3.505, 4.3.506, 4.3.507, 4.3.508, 4.3.509, 4.3.510, 4.3.511, 4.3.512, 4.3.513, 4.3.514, 4.3.515, 4.3.516, 4.3.517, 4.3.518, 4.3.519, 4.3.520, 4.3.521, 4.3.522, 4.3.523, 4.3.524, 4.3.525, 4.3.526, 4.3.527, 4.3.529, 4.3.530, 4.3.531, 4.3.532, 4.3.533, 4.3.534, 4.3.535, 4.3.536, 4.3.537, 4.3.538, 4.3.540, 4.3.541, 4.3.542, 4.3.543, 4.3.544, 4.3.545, 4.3.546, 4.3.547, 4.3.548, 4.3.549, 4.3.550, 4.3.551, 4.3.552, 4.3.553, 4.3.554, 4.3.555, 4.3.556, 4.3.557, 4.3.558, 4.3.559, 4.3.560, 4.3.561, 4.3.562, 4.3.563, 4.3.564, and 4.3.565 for the application assertions.

There shall be at least one object that the Date_time_interval_assignment (see 4.2.121) is_applied_to.

4.2.121.4 role

The role specifies the action associated with the Date_time_interval_assignment. Where applicable, the following values shall be used:

— 'installation': The assignment specifies that the object referenced as 'is_applied_to' was mounted in a product during the given interval of time

4.2.122 Dated_configuration

A Dated_configuration is a Manufacturing_configuration (see 4.2.305) that applies onwards from a given date, or between a start and an end date.

A Dated_configuration is a type of Manufacturing_configuration (see 4.2.305).

The data associated with a Dated_configuration are the following:

— end_date;

— start_date.

4.2.122.1 end_date

The end_date specifies the date and time when the validity of the 'configured_element' is not defined any longer.

If the end_date is not specified, the Dated_configuration is considered as valid forever from the start_-date.

The end_date need not be specified for a particular Dated_configuration (see 4.2.122).

4.2.122.2 start_date

The start_date specifies the first date when the Dated_configuration is valid.

4.2.123 Datum

A Datum is a reference point, line, axis, or plane.

NOTE - The concept of datum for tolerancing is defined in ISO 5459 [15].

Each Datum is a Single_datum (see 4.2.454) or a Compound_datum (see 4.2.84).

The data associated with a Datum are the following:

— precedence

The precedence specifies the position of the Datum in a sequence of Datum objects.

4.2.124 Datum_feature_callout

A Datum_feature_callout is a callout that is used to denote a point, line, or plane as a datum and that specifies the designation to be used as identification of that datum.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXAMPLE The top view in figure 26 shows some Datum_feature_callout objects for datums labeled 'E' and 'F'.

A Datum_feature_callout is a type of Draughting_callout (see 4.2.169).

4.2.125 Datum_target

A Datum_target is a designated geometric element on the surface of a part used to locate the part in a datum reference frame.

NOTE - The concept of datum for tolerancing is defined in ISO 5459 [15].

EXAMPLE Figure 27 shows how datum targets are presented on a drawing.

Each Datum_target is a Target_area (see 4.2.505) or a Placed_target (see 4.2.357).

The data associated with a Datum_target are the following:

— id

The id specifies the identifier of the Datum_target in a Datum_target_set (see 4.2.127).

4.2.126 Datum_target_callout

A Datum_target_callout is a type of callout that is used to denote points, lines, and surfaces of contact, on a part, which are used in establishing a reference datum. The callout contains an alphanumeric designation and, where applicable, a specification of the diametrical size of the target area.

EXAMPLE The bottom view in figure 26 shows three datum target points and their associated datum target symbols.

A Datum_target_callout is a type of Draughting_callout (see 4.2.169).

4.2.127 Datum_target_set

A Datum_target_set is a set of Datum_target (see 4.2.125) objects used to define a datum reference frame for a part.

The data associated with a Datum_target_set are the following:

— rule_description;

— target.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

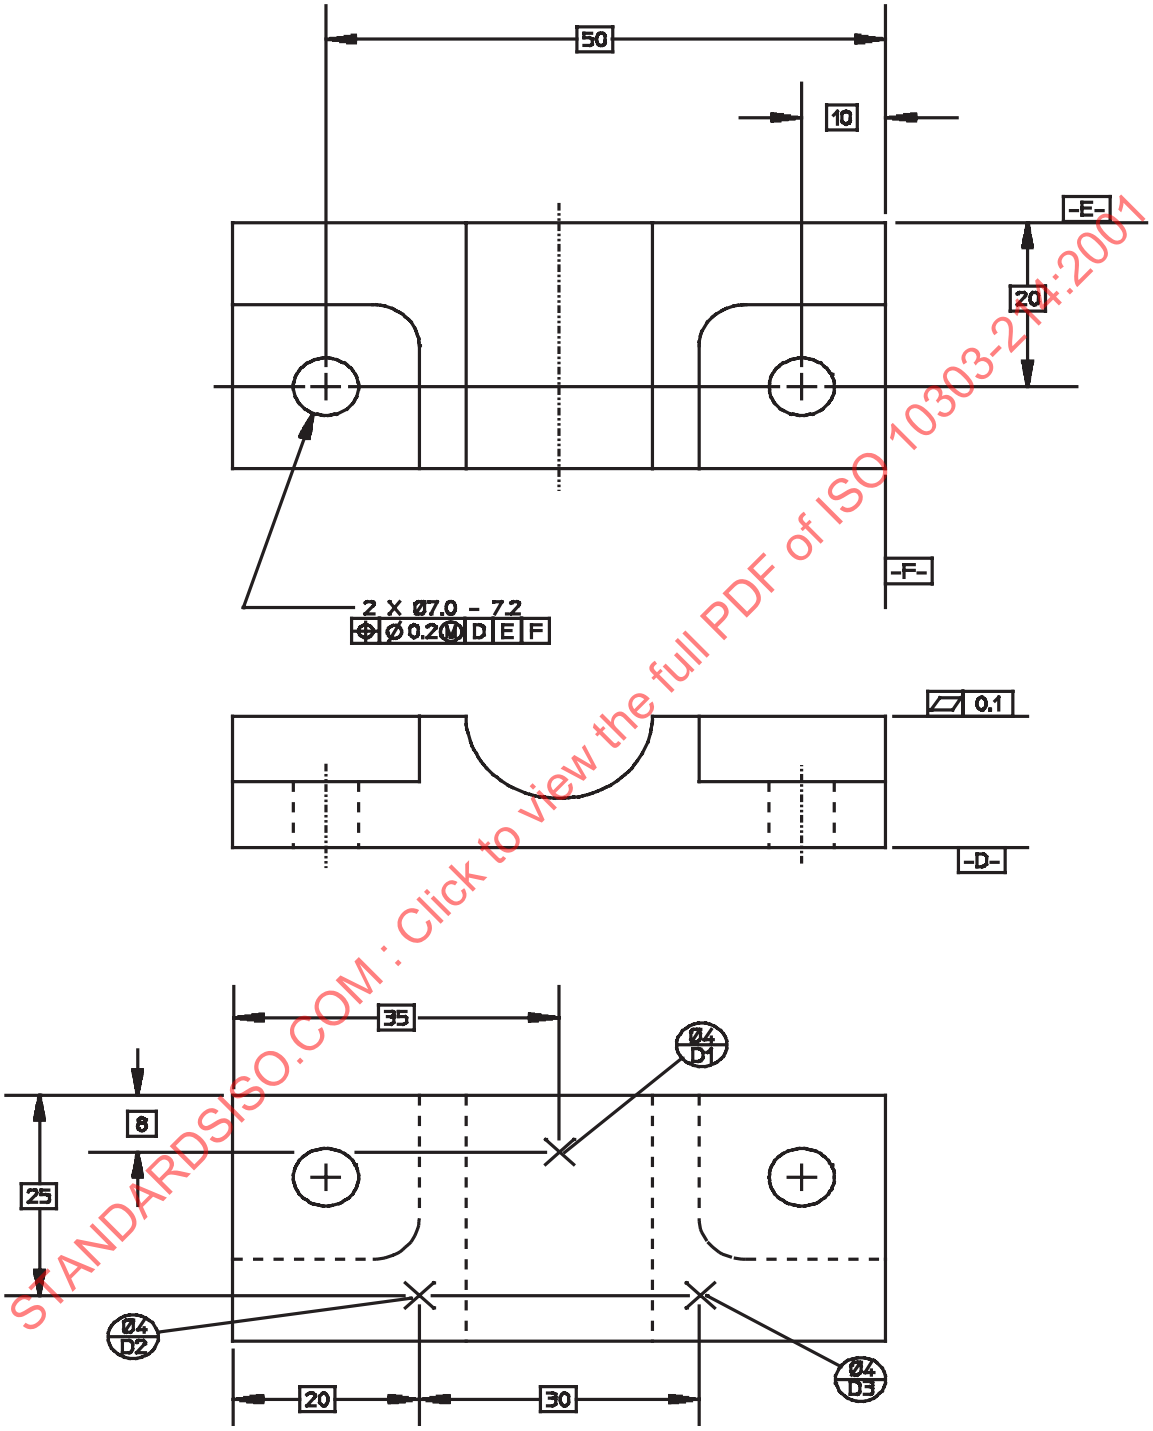

Figure 26 – Draughting callouts on a drawing

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

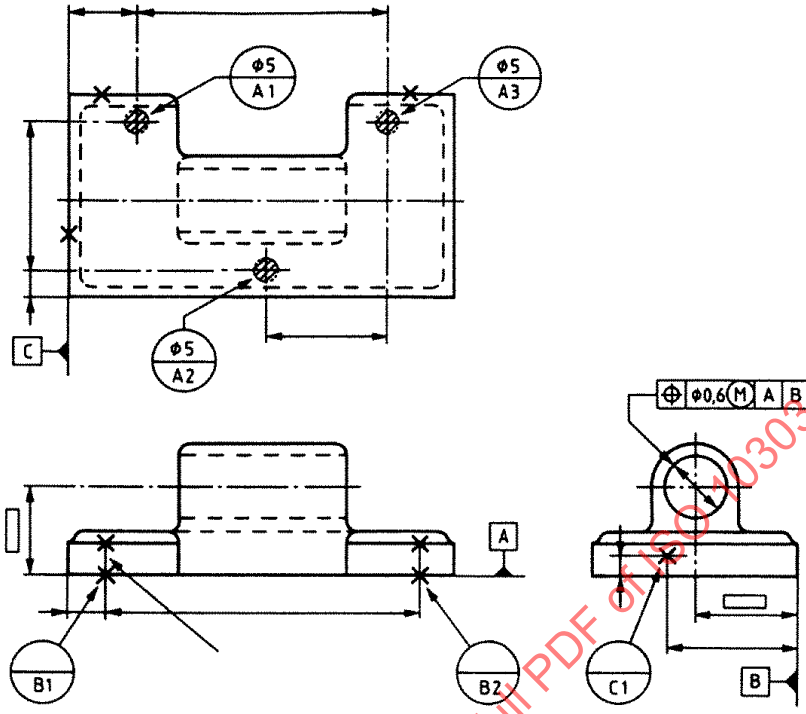

Figure 27 – Datum targets on a drawing

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.127.1 rule_description

The rule_description specifies the type of datum that is formed by the Datum_target_set.

EXAMPLE The rule_description 'V-block' indicates that two Datum_target (see 4.2.125) objects on a cylindrical element are supposed to form the areas of contact in a V-shaped fixture.

See 4.3.567 for the application assertion.

The rule_description need not be specified for a particular Datum_target_set (see 4.2.127).

If present, there shall be exactly one object that defines the rule_description for a Datum_target_set.

4.2.127.2 target

The target specifies the set of Datum_target (see 4.2.125) objects that form the Datum_target_set.

See 4.3.566 for the application assertion.

 © ISO 2001 – All rights reserved

4.2.128 Default_chamfer

A Default_chamfer is the definition of a chamfer that shall be applied to each non-tangent continuous, convex edge of a shape where no other chamfer or edge round is specified. For a given context only one of Default_chamfer and Default_edge_round (see 4.2.130) shall be specified at a time. A Default_chamfer is applicable only to edges that do not change from convex to concave.

EXAMPLE During the creation of a 3D CAD model, the explicit modelling of chamfers is often omitted to save on time and model size.

The data associated with a Default_chamfer are the following:

— description;

— offset_value.

4.2.128.1 description

The description specifies additional information about the Default_chamfer.

See 4.3.569 for the application assertion.

The description need not be specified for a particular Default_chamfer (see 4.2.128).

If present, there shall be exactly one object that defines the description for a Default_chamfer.

4.2.128.2 offset_value

The offset_value specifies the width of the chamfer with respect to the two faces where it is applied to.

See 4.3.568 for the application assertion.

4.2.129 Default_draft_angle

A Default_draft_angle is the definition of an angle that is applied to each planar face of the part that is oriented in this draft direction.

NOTE 1 - For parts manufactured by casting, the draft angle is necessary to facilitate the extraction of the part out of the form after the casting.

NOTE 2 - There may be various draft directions depending on the actual shape of the part. The Default_-draft_angle is, therefore, not necessarily meant to enable a system to create a resulting shape out of the application of the angle; in most cases this is additional information that has to be interpreted by human beings.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Default_draft_angle are the following:

— description;

— draft_angle_value.

4.2.129.1 description

The description specifies additional information about the Default_draft_angle.

See 4.3.571 for the application assertion.

The description need not be specified for a particular Default_draft_angle (see 4.2.129).

If present, there shall be exactly one object that defines the description for a Default_draft_angle.

4.2.129.2 draft_angle_value

The draft_angle_value specifies the value of the Default_draft_angle.

See 4.3.570 for the application assertion.

4.2.130 Default_edge_round

A Default_edge_round is the definition of an edge round that shall be applied to any non-tangent continuous, convex edge of a shape where no other edge round or chamfer is specified. For a given context only one of Default_edge_round and Default_chamfer (see 4.2.128) shall be specified at a time. A Default_edge_round is applicable only to edges that do not change from convex to concave.

> EXAMPLE During the creation of a 3D CAD model, the explicit modelling of edge rounds is often omitted to save on time and model size.

The data associated with a Default_edge_round are the following:

— description;

— radius_value.

4.2.130.1 description

The description specifies additional information about the Default_edge_round.

See 4.3.573 for the application assertion.

The description need not be specified for a particular Default_edge_round (see 4.2.130).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

If present, there shall be exactly one object that defines the description for a Default_edge_round.

4.2.130.2 radius_value

The radius_value specifies the amount of curvature for a convex transition between two faces.

See 4.3.572 for the application assertion.

4.2.131 Default_fillet

A Default_fillet is the definition of a fillet that shall be applied to each non-tangent continuous, concave edge of a shape model where no other fillet is specified and where its nature does not change from concave to convex.

EXAMPLE During the creation of a 3D CAD model, the explicit modelling of fillets is often omitted to save on time and model size.

The data associated with a Default_fillet are the following:

— description;

— radius_value.

4.2.131.1 description

The description specifies additional information about the Default_fillet.

See 4.3.575 for the application assertion.

The description need not be specified for a particular Default_fillet (see 4.2.131).

If present, there shall be exactly one object that defines the description for a Default_fillet.

4.2.131.2 radius_value

The radius_value specifies the amount of curvature for a concave transition between two faces.

See 4.3.574 for the application assertion.

4.2.132 Default_setting_association

A Default_setting_association is the setting of default values for one context.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Default_setting_association are the following:

— default_context;

— default_value.

4.2.132.1 default_context

The default_context specifies the object in which the default settings apply.

See 4.3.582, 4.3.583, 4.3.584, 4.3.586, and 4.3.587 for the application assertions.

There shall be exactly one object that defines the default_context for a Default_setting_association (see 4.2.132).

4.2.132.2 default_value

The default_value specifies various defaults.

See 4.3.576, 4.3.577, 4.3.578, 4.3.579, 4.3.580, 4.3.581, and 4.3.585 for the application assertions.

There shall be at least one object that defines the default_value for a Default_setting_association (see 4.2.132).

4.2.133 Default_surface_texture

A Default_surface_texture is the definition of a surface texture that applies to each surface of a part in the given context that has no other surface texture explicitly specified.

The data associated with a Default_surface_texture are the following:

— measuring_method

The measuring_method specifies the method or the standard that defines the meaning of the parameters describing a surface texture. Where applicable, the following values shall be used:

— 'ISO 4287': The surface texture parameters are defined in ISO 4287;

— 'ISO 12085': The surface texture parameters are defined in ISO 12085;

— 'ISO 13565': The surface texture parameters are defined in ISO 13565.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.134 Default_thickness

A Default_thickness is the thickness value that is valid for all sheet-like objects in the context defined by the Default_setting_association (see 4.2.132) when a thickness value is not explicitly assigned.

The data associated with a Default_thickness are the following:

— description;

— parameter_name;

— thickness_value.

4.2.134.1 description

The description specifies additional information about the Default_thickness.

See 4.3.588 for the application assertion.

The description need not be specified for a particular Default_thickness (see 4.2.134).

If present, there shall be exactly one object that defines the description for a Default_thickness.

4.2.134.2 parameter_name

The parameter_name specifies the character, abbreviation, word or group thereof that designates the Default_thickness. The default value is 't'.

The parameter_name need not be specified for a particular Default_thickness (see 4.2.134).

4.2.134.3 thickness_value

The thickness_value specifies the actual value and the corresponding unit for the Default_thickness. The thickness_value is measured normal to the surface.

See 4.3.589 for the application assertion.

4.2.135 Defined_thread

A Defined_thread is a thread where the shape of the thread is specified by the values of the attributes. A Defined_thread may be an internal or an external thread.

A Defined_thread is a type of Thread_specification (see 4.2.518).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Defined_thread are the following:

— crest;

— minor_diameter;

— pitch_diameter.

4.2.135.1 crest

The crest specifies the distance between the opposing points of the thread. The crest is formed by the intersection of the sides of the thread if extended, if necessary, beyond the top of the thread.

NOTE - It is possible to derive the crest from the form type and the major diameter.

See 4.3.590 for the application assertion.

The crest need not be specified for a particular Defined_thread (see 4.2.135).

4.2.135.2 minor_diameter

The minor_diameter specifies the dimension of the smallest diameter of a Defined_thread.

NOTE 1 - It is possible to derive the minor_diameter from the fit class and the major diameter.

NOTE 2 - The minor_diameter applies to both an internal and an external thread.

See 4.3.590 for the application assertion.

The minor_diameter need not be specified for a particular Defined_thread (see 4.2.135).

4.2.135.3 pitch_diameter

The pitch_diameter specifies the dimension of an imaginary cylinder passing through the threads so as to make equal the widths of the threads and the widths of the spaces cut by the cylinder.

See 4.3.590 for the application assertion.

4.2.136 Derived_geometry

A Derived_geometry is the identification of a Constructive_geometric_element (see 4.2.99) that is derived from an existing aspect of the shape of a part for tolerancing purposes.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Derived_geometry are the following:

— geometry;

— is_derived_from;

— role.

4.2.136.1 geometry

The geometry specifies the Constructive_geometric_element (see 4.2.99) that is used for tolerancing.

See 4.3.591 for the application assertion.

4.2.136.2 is_derived_from

The is_derived_from specifies the set of Shape_element (see 4.2.449) objects from which the geometric element is derived.

See 4.3.592 for the application assertion.

4.2.136.3 role

The role specifies the function of the Constructive_geometric_element (see 4.2.99) when it is used as Derived_geometry.

EXAMPLE 'symmetry plane' is an example for the role.

4.2.137 Descriptive_specification

A Descriptive_specification is a textual description of an object.

NOTE - Usually, an object that is specified by a Descriptive_specification is not represented in the data structure as a Design_discipline_item_definition (see 4.2.142).

EXAMPLE 1 A Descriptive_specification may be used to describe the characteristics that distinguish a final item from the corresponding neutral item.

EXAMPLE 2 A Descriptive_specification may be used to describe a simple tool used as a resource for a Process_operation_definition (see 4.2.381).

The data associated with a Descriptive_specification are the following:

— description;

— id.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.137.1 description

The description specifies the Descriptive_specification.

EXAMPLE 1 The description specifying a final part may be 'arctic white' for the description of a car body colour. It may be 'chrome plated' for the description of an exhaust pipe. It may be 'standard cloth' for the description of the seat cover.

EXAMPLE 2 The description specifying a tool for a Process_operation_definition (see 4.2.381) may be, e.g., 'hammer' or 'screw driver'.

See 4.3.593 for the application assertion.

There shall be exactly one object that defines the description for a Descriptive_specification (see 4.2.137).

4.2.137.2 id

The id specifies the identifier of the Descriptive_specification.

The id need not be specified for a particular Descriptive_specification (see 4.2.137).

4.2.138 Design_constraint

A Design_constraint is a requirement that has to be considered in the design process of a Complex_-product (see 4.2.80). This constraint may be geometry based.

EXAMPLE 1 Ergonomic information like 'hip point' or 'forward driver vision' as well as 'door opening control lines', 'shipping critical dimensions', or 'stone throw zone' are examples for Design_constraint.

EXAMPLE 2 The diameter of a standard soft drink can is a constraint for designing the hole of a cup holder in a car.

Each Design_constraint may be a Design_constraint_version (see 4.2.141).

The data associated with a Design_constraint are the following:

— constraint_id;

— description;

— is_valid_for;

— name.

4.2.138.1 constraint_id

The constraint_id specifies the identifier of the Design_constraint.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.138.2 description

The description specifies additional information about the Design_constraint.

See 4.3.594 for the application assertion.

The description need not be specified for a particular Design_constraint (see 4.2.138).

If present, there shall be exactly one object that defines the description for a Design_constraint.

4.2.138.3 is_valid_for

The is_valid_for specifies the set of Product_class (see 4.2.392) objects that are affected by the Design_-constraint.

See 4.3.595 for the application assertion.

4.2.138.4 name

The name specifies the word or group of words by which the Design_constraint is referred to.

See 4.3.594 for the application assertion.

The name need not be specified for a particular Design_constraint (see 4.2.138).

If present, there shall be exactly one object that defines the name for a Design_constraint.

4.2.139 Design_constraint_association

A Design_constraint_association is a mechanism to associate a Design_constraint (see 4.2.138) with an object that is subject to the constraint indicated.

The data associated with a Design_constraint_association are the following:

— is_based_on;

— is_constraining;

— name.

4.2.139.1 is_based_on

The is_based_on specifies the Design_constraint (see 4.2.138) that represents the constraint.

See 4.3.597 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.139.2 is_constraining

The is_constraining specifies the object that is affected by the Design_constraint (see 4.2.138).

See 4.3.596 for the application assertion.

4.2.139.3 name

The name specifies the word or group of words by which the Design_constraint_association is referred to.

See 4.3.598 for the application assertion.

The name need not be specified for a particular Design_constraint_association (see 4.2.139).

If present, there shall be exactly one object that defines the name for a Design_constraint_association.

4.2.140 Design_constraint_relationship

A Design_constraint_relationship is a relationship between two Design_constraint (see 4.2.138) objects.

The data associated with a Design_constraint_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.140.1 description

The description specifies additional information about the Design_constraint_relationship.

See 4.3.600 for the application assertion.

The description need not be specified for a particular Design_constraint_relationship (see 4.2.140).

If present, there shall be exactly one object that defines the description for a Design_constraint_relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.140.2 related

The related specifies the second of the two Design_constraint (see 4.2.138) objects related by the Design_constraint_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.599 for the application assertion.

4.2.140.3 relating

The relating specifies the first of the two Design_constraint (see 4.2.138) objects related by the Design_constraint_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.599 for the application assertion.

4.2.140.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'decomposition': The application object defines a relationship where the related Design_constraint (see 4.2.138) is one of potentially more components into which the relating Design_constraint is broken down;

— 'precedence': The application object defines a relationship where the related Design_constraint has higher priority than the relating Design_constraint.

4.2.141 Design_constraint_version

A Design_constraint_version is a particular version of a Design_constraint (see 4.2.138).

A Design_constraint_version is a type of Design_constraint (see 4.2.138).

The data associated with a Design_constraint_version are the following:

— version_id

The version_id specifies the identification of a particular version of a Design_constraint. The version_id shall be unique within the scope of a Design_constraint.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.142 Design_discipline_item_definition

A Design_discipline_item_definition is a view of an Item_version (see 4.2.275). This view is relevant for the requirements of one or more life cycle stages and application domains and collects product data of the Item_version.

NOTE 1 - The selection of data describing an Item_version may be different for assembly purposes, shipping purposes or analysis purposes.

NOTE 2 - Each Design_discipline_item_definition may be any combination of Assembly_definition (see 4.2.27), Collection_definition (see 4.2.78), Mating_definition (see 4.2.313), and Process_state (see 4.2.391).

Each Design_discipline_item_definition may be a Mating_definition (see 4.2.313), a Collection_definition (see 4.2.78), an Assembly_definition (see 4.2.27), or a Process_state (see 4.2.391).

The data associated with a Design_discipline_item_definition are the following:

— additional_context;

— associated_item_version;

— id;

— initial_context;

— name.

4.2.142.1 additional_context

The additional_context specifies the set of Application_context (see 4.2.21) objects in which this view of the Item_version (see 4.2.275) is also relevant. The additional_context shall not contain the Application_context that is referenced as the 'initial_context'.

See 4.3.601 for the application assertion.

4.2.142.2 associated_item_version

The associated_item_version specifies the Item_version (see 4.2.275) for which the Design_discipline_item_definition is a view.

See 4.3.602 for the application assertion.

4.2.142.3 id

The id specifies the identifier of the Design_discipline_item_definition.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.142.4 initial_context

The initial_context specifies the Application_context (see 4.2.21) in which this view of the Item_version (see 4.2.275) has been designed primarily.

See 4.3.601 for the application assertion.

4.2.142.5 name

The name specifies the word or group of words used to refer to the Design_discipline_item_definition.

See 4.3.603 for the application assertion.

The name need not be specified for a particular Design_discipline_item_definition (see 4.2.142).

If present, there shall be exactly one object that defines the name for a Design_discipline_item_definition.

4.2.143 Detailed_element

A Detailed_element is a single element of a Geometric_model (see 4.2.238) or of a Styled_model (see 4.2.484).

Each Detailed_element is a Detailed_model_element (see 4.2.145), a Styled_element (see 4.2.482), or a Draughting_callout (see 4.2.169).

The data associated with a Detailed_element are the following:

— name

The name specifies the word or group of words by which the Detailed_element is referred to.

See 4.3.604 for the application assertion.

The name need not be specified for a particular Detailed_element.

If present, there shall be exactly one object that defines the name for a Detailed_element.

4.2.144 Detailed_geometric_model_element

A Detailed_geometric_model_element is the identification of a geometric element.

NOTE - The Detailed_geometric_model_element may be used to define the elements of a Geometric_-model (see 4.2.238).

A Detailed_geometric_model_element is a type of Detailed_model_element (see 4.2.145).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Each Detailed_geometric_model_element is a Geometric_set_3d (see 4.2.242), a Topologically_connected_set (see 4.2.529), a Point_direction (see 4.2.369), a Boolean_result (see 4.2.41), a Point_direction_sequence (see 4.2.371), a Half_space_solid (see 4.2.252), a Curve_set_2d (see 4.2.111), a B_rep (see 4.2.34), a Faceted_b_rep (see 4.2.195), a Point_sequence (see 4.2.375), a Face (see 4.2.191), a Curve_set_3d (see 4.2.112), a Shell (see 4.2.451), a Curve (see 4.2.108), a Csg_primitive (see 4.2.107), a Surface (see 4.2.489), a Point (see 4.2.367), a Swept_face_solid (see 4.2.502), or a Solid_replica (see 4.2.462).

4.2.145 Detailed_model_element

A Detailed_model_element is a single element of a model.

A Detailed_model_element is a type of Detailed_element (see 4.2.143).

Each Detailed_model_element is a Template_instance (see 4.2.512) or a Detailed_geometric_model_element (see 4.2.144).

4.2.146 Diameter_taper

A Diameter_taper is a taper that has the grade of the taper specified by the final, smaller, diameter. A Diameter_taper shall only be applied to features that are defined by a swept Circular_closed_profile (see 4.2.58). The final diameter is measured at the end of the sweep path.

NOTE 1 - Tapers are applied after general end conditions are applied.

EXAMPLE Figure 28 illustrates a Diameter_taper.

The data associated with a Diameter_taper are the following:

— final_diameter

The final_diameter specifies the diameter of the circle at the end of the taper.

NOTE 2 - The diameter at the beginning of the taper is provided by the referencing feature itself.

See 4.3.605 for the application assertion.

4.2.147 Digital_document

A Digital_document is a piece of product data that is archived in a digital format.

A Digital_document is a type of Document_representation (see 4.2.163).

The data associated with a Digital_document are the following:

— file

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

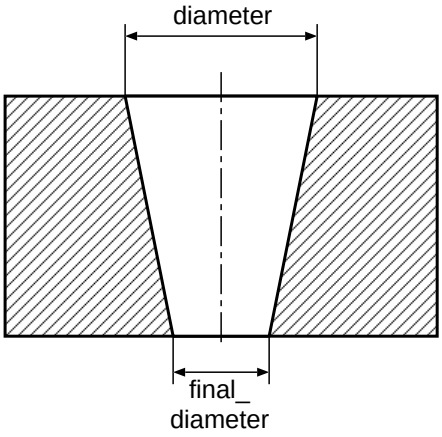

Figure 28 – Definition of a taper by two diameters

The file specifies a computer interpretable realization of the Digital_document.

See 4.3.606 for the application assertion.

4.2.148 Digital_file

A Digital_file contains computer interpretable data.

A Digital_file is a type of Document_file (see 4.2.159).

4.2.149 Dimension

A Dimension is the graphical presentation of the dimension value, of associated information, and of the symbology necessary to accurately depict its area of application.

Dimension objects cover linear dimensions, angular dimensions, curve dimensions, diameter dimensions, ordinate dimensions, radius dimensions, and leader directed dimensions.

For this particular type of Draughting_callout (see 4.2.169), the inherited attribute 'contents' shall refer to Annotation_curve (see 4.2.16) and Text (see 4.2.514) objects only.

EXAMPLE Examples for the symbology are leaders, projection curves, or dimension curves.

NOTE - The Text objects are shared with the 'primary_callout' and, if present, the 'secondary callout'.

A Dimension is a type of Draughting_callout (see 4.2.169).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Dimension are the following:

— id;

— primary_callout;

— secondary_callout.

4.2.149.1 id

The id specifies the identifier of the Dimension.

4.2.149.2 primary_callout

The primary_callout specifies the first representation of the Dimension. Both the dimension value and the possible tolerance information are expressed in a primary unit of measure.

See 4.3.607 for the application assertion.

4.2.149.3 secondary_callout

The secondary_callout specifies the second representation of the Dimension. Both the dimension value and the possible tolerance information are expressed in a secondary unit of measure.

EXAMPLE The primary unit of measure used by primary_callout could be millimetres and the secondary unit of measure used by secondary_callout could be inches.

See 4.3.607 for the application assertion.

The secondary_callout need not be specified for a particular Dimension (see 4.2.149).

4.2.150 Dimension_callout

A Dimension_callout is a combination of text and of symbology that conveys presentation information about a dimension. This includes the dimension value, dimension units, tolerance information and any related notes.

The data associated with a Dimension_callout are the following:

— callout_element;

— is_displaying.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.150.1 callout_element

The callout_element specifies the text and possibly symbol that form the Dimension_callout.

See 4.3.608 and 4.3.610 for the application assertions.

There shall be at least one object that defines the callout_element for a Dimension_callout (see 4.2.150).

4.2.150.2 is_displaying

The is_displaying specifies the Geometric_dimension (see 4.2.237) that is displayed by the Dimension_-callout.

See 4.3.609 for the application assertion.

The is_displaying need not be specified for a particular Dimension_callout (see 4.2.150).

4.2.151 Dimension_curve

A Dimension_curve is a curve that is used for the graphical representation of a dimension. If necessary, it includes the additional symbology needed to show the extent of the dimension.

EXAMPLE Figure 29 shows the use of a Dimension_curve in a drawing.

A Dimension_curve is a type of Annotation_curve (see 4.2.16).

The data associated with a Dimension_curve are the following:

— terminator

The terminator specifies the list of terminating symbols for a particular Dimension_curve.

See 4.3.611 for the application assertion.

4.2.152 Dimension_sequence_pair

A Dimension_sequence_pair is the relationship between two adjacent dimensions that share a projection curve. This may be a chained or a parallel dimension pair.

The data associated with a Dimension_sequence_pair are the following:

— predecessor;

— successor.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

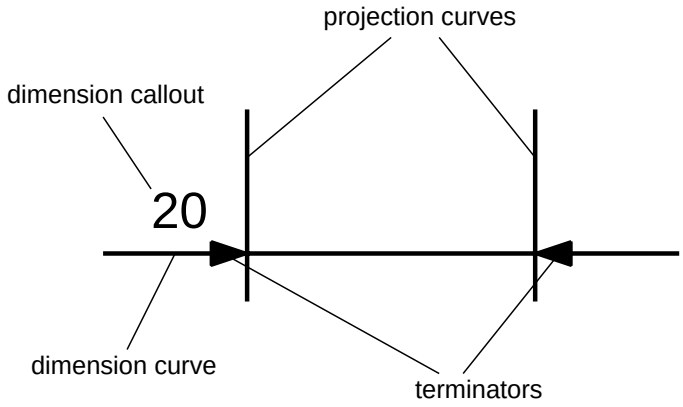

Figure 29 – Components of a dimension in a drawing

4.2.152.1 predecessor

The predecessor specifies the dimension that plays the role of a predecessor within a particular Dimension_sequence_pair.

See 4.3.612 for the application assertion.

4.2.152.2 successor

The successor specifies the dimension that plays the role of a successor within a particular Dimension_-sequence_pair.

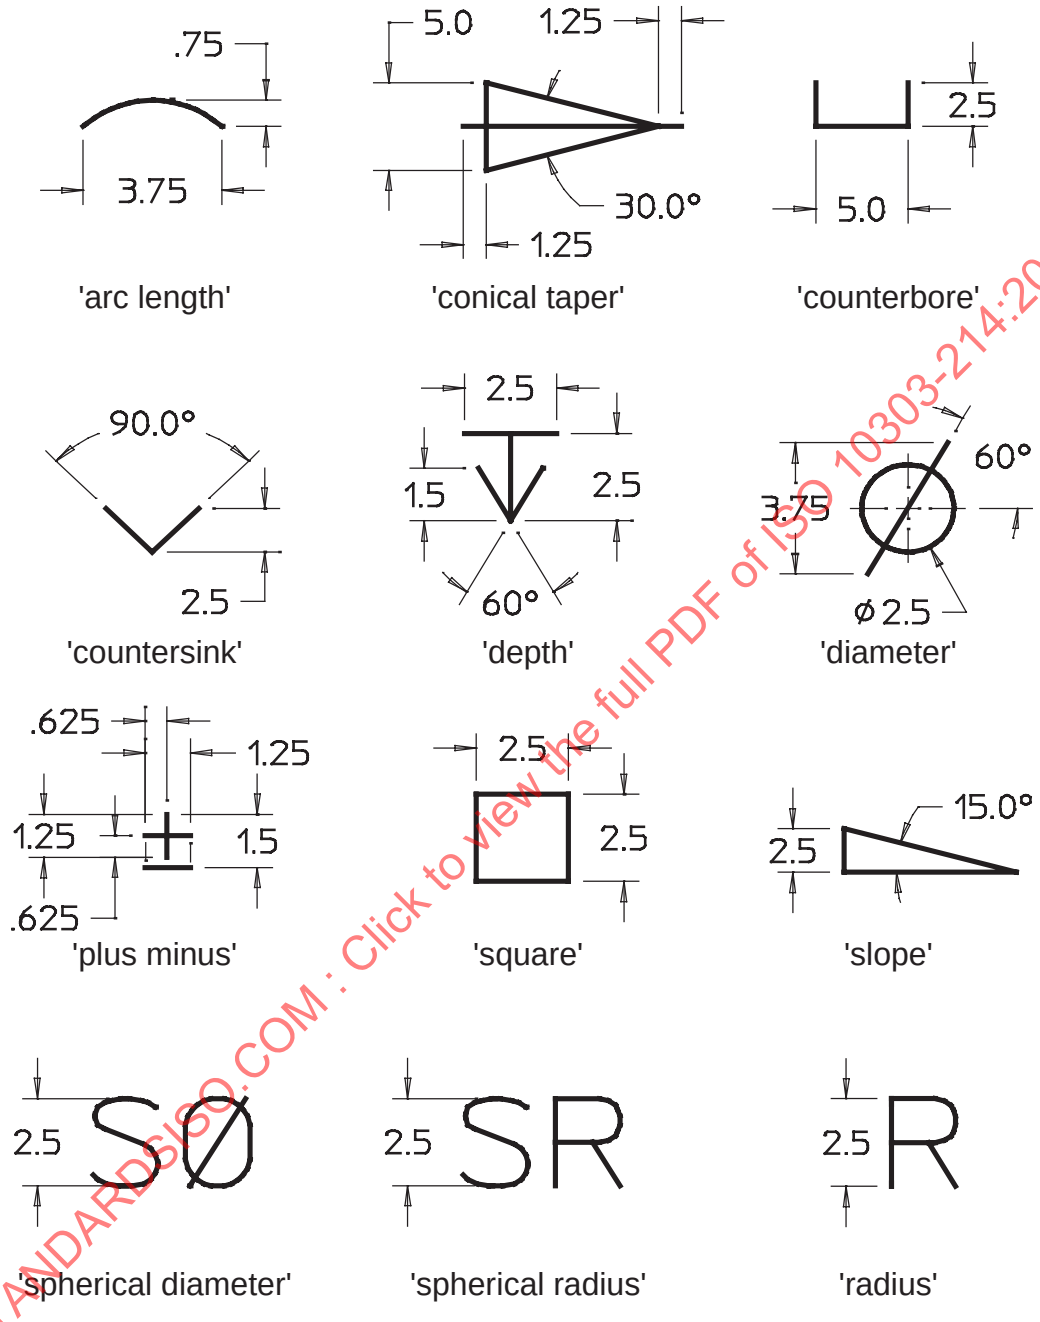
See 4.3.612 for the application assertion.

4.2.153 Dimension_symbol

A Dimension_symbol is a predefined annotation symbol used to present information about dimensions.

This AP supports the dimension symbols shown in figure 30 .

4.2.154 Directed_taper



A Directed_taper is an angular deviation from a linear path where the angular deviation is measured from the specified direction.

NOTE 1 - This type of taper is primarily applied for drafting reasons.

NOTE 2 - Tapers are applied after general end conditions are applied.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

(Dimensions shown are in mm and prior to scaling)

Figure 30 – Predefined dimension symbols

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Directed_taper are the following:

— angle;

— direction.

4.2.154.1 angle

The angle specifies the Feature_parameter (see 4.2.201) that represents the angle.

An angle between 0 and 90 degrees or between -90 and -180 degrees indicates that the profile grows larger along the reference direction. An angle between 0 and -90 degrees or between 90 and 180 degrees indicates that the profile grows smaller along the reference direction.

See 4.3.613 for the application assertion.

4.2.154.2 direction

The direction specifies the reference direction from which the taper angle is measured.

The direction is defined in the same Cartesian_coordinate_space (see 4.2.44) as the concerned Process_-feature_in_solid (see 4.2.380).

4.2.155 Document

A Document is a logical document that serves as the identifier for a container for some product data.

The data associated with a Document are the following:

— description;

— document_id;

— name.

4.2.155.1 description

The description specifies additional information about the Document.

See 4.3.614 for the application assertion.

The description need not be specified for a particular Document (see 4.2.155).

If present, there shall be exactly one object that defines the description for a Document.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.155.2 document_id

The document_id specifies the identifier of the Document.

4.2.155.3 name

The name specifies the word or group of words by which the Document is referred to.

See 4.3.614 for the application assertion.

There shall be exactly one object that defines the name for a Document (see 4.2.155).

4.2.156 Document_assignment

A Document_assignment is a mechanism to associate a document with an object, where the assigned document provides information about the object it is associated to.

Each Document_assignment may be a Partial_document_assignment (see 4.2.341).

The data associated with a Document_assignment are the following:

— assigned_document;

— is_assigned_to;

— role.

4.2.156.1 assigned_document

The assigned_document specifies the Document (see 4.2.155), a Document_version (see 4.2.167), a Document_representation (see 4.2.163), or a Document_file (see 4.2.159) that is used to provide information.

See 4.3.630, 4.3.631, 4.3.632, and 4.3.633 for the application assertions.

There shall be exactly one object that defines the assigned_document for a Document_assignment (see 4.2.156).

4.2.156.2 is_assigned_to

The is_assigned_to specifies the object that information is provided for.

EXAMPLE A document assigned to Activity_element (see 4.2.3) may provide further description of the input or output of that activity.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

See 4.3.615, 4.3.616, 4.3.617, 4.3.618, 4.3.619, 4.3.620, 4.3.621, 4.3.622, 4.3.623, 4.3.624, 4.3.625, 4.3.626, 4.3.627, 4.3.628, 4.3.629, 4.3.634, 4.3.635, 4.3.636, 4.3.637, 4.3.638, 4.3.639, 4.3.640, 4.3.641, 4.3.642, 4.3.643, 4.3.644, 4.3.645, 4.3.646, 4.3.647, 4.3.648, 4.3.649, 4.3.650, 4.3.651, 4.3.652, 4.3.653, 4.3.654, 4.3.655, 4.3.656, 4.3.657, 4.3.658, 4.3.659, 4.3.660, 4.3.661, 4.3.662, 4.3.663, 4.3.664, 4.3.665, 4.3.666, 4.3.667, 4.3.668, 4.3.669, 4.3.670, 4.3.671, and 4.3.672 for the application assertions.

There shall be exactly one object that the Document_assignment (see 4.2.156) is_assigned_to.

4.2.156.3 role

The role specifies the meaning of the Document_assignment. Where applicable, the following values shall be used:

— 'additional information': The assigned document provides information that is relevant for the associated object, but is not a description of the associated object itself;

— 'behavior': The assigned document specifies information about the behaviour of the associated object;

— 'description': The assigned document provides textual information for the associated object itself;

— 'informative': The assigned document may or may not be considered;

— 'mandatory': The associated object shall conform to the content of the assigned document;

— 'mathematical description': The assigned document specifies the associated object by providing the algorithmic specification of its behavior.

EXAMPLE For a Product component (see 4.2.394) there is a textual document assigned, explaining the functionality, size, and other characteristics by a Document_assignment with role 'description'. Another document, representing the specification of the Product_class (see 4.2.392), in which the Product_component is used, is also assigned to the same Product_component by a Document_assignment with role 'additional information'.

4.2.157 Document_content_property

A Document_content_property specifies characteristics precising the content of a Document_file (see 4.2.159) or of a Document_representation (see 4.2.163). At least one of the optional attributes shall be specified for each instance of this object.

In the case where a Document_content_property is referred by a Document_representation, the characteristics apply to all individual Document_file objects, whereas in the case where it is referred by a Document_file, the characteristics apply on an individual basis.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Document_content_property are the following:

— detail_level;

— geometry_type;

— languages;

— real_world_scale.

4.2.157.1 detail_level

The detail_level specifies the level of detail that the Document_file (see 4.2.159) or the Document_representation (see 4.2.163) provides. Where applicable, the following values shall be used:

— 'rough 3d shape': 3D shape model without edge rounds and fillets;

— 'rounded edges': 3D shape model with edge rounds and fillets.

The detail_level need not be specified for a particular Document_content_property (see 4.2.157).

4.2.157.2 geometry_type

The geometry_type specifies the kind or kinds of geometry that an object contains. Where applicable, the following values shall be used:

— '3D wireframe model': The document contains a 3D shape model in wireframe representation;

— '2D shape': The document contains a 2D shape model or contours only;

— 'surface model': The document contains a 3D shape model in surface representation;

— 'closed volume': The document contains a 3D shape model in closed body topological surface representation;

— 'solid model': The document contains a 3D shape model in advanced boundary representation;

— 'solid and surface model': The document contains a 3D shape model in surface and advanced boundary representation;

— 'assembly': The document contains an assembly structure with reference to the assembled components and their transformation matrices;

— 'assembly with mating elements': The document contains an assembly structure including the mating components only, such as screws or rivets, with exact positioning information. This assembly representation is intended to be overlayed with the assembly structure for the main components;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— ’2D drawing’: The document contains a technical drawing without 3D shape representation;

— ’drawing derived from 3D data’: The document contains a technical drawing that has been derived from a 3D shape model;

— ’drawing related to 3D data’: The document contains a technical drawing that visualizes a 3D shape model and possibly establishes associative links to the 3D shape model.

The geometry_type need not be specified for a particular Document_content_property (see 4.2.157).

4.2.157.3 languages

The languages specifies which language or languages are used in the characterized objects.

EXAMPLE ’Japanese’ and ’German’ are examples for the fact that annotation on a drawing is provided in the language ’Japanese’ or ’German’ respectively.

See 4.3.673 for the application assertion.

4.2.157.4 real_world_scale

The real_world_scale specifies the scale that is used in the Document_file (see 4.2.159) or in the Document_representation (see 4.2.163) the Document_content_property is referred by.

See 4.3.674 for the application assertion.

The real_world_scale need not be specified for a particular Document_content_property (see 4.2.157).

4.2.158 Document_creation_property

A Document_creation_property specifies characteristics of Document_file (see 4.2.159) or of Document_representation (see 4.2.163) objects. It specifies the context of the creation of the object. At least one of the optional attributes shall be specified for each instance of this object.

In the case where a Document_creation_property is referred by a Document_representation the characteristics apply to all individual Document_file objects, whereas in the case it is referred by a Document_file, the characteristics apply on an individual basis.

The data associated with a Document_creation_property are the following:

— creating_interface;

— creating_system;

— operating_system.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.158.1 creating_interface

The creating_interface specifies the computer application used to create the Document_file (see 4.2.159) or Document_representation (see 4.2.163) object.

EXAMPLE 1 'Postscript Printer Driver' is an example for a creating interface of a Physical_document (see 4.2.351).

EXAMPLE 2 'SYSTEM-C-STL' is an example for a creating interface of a Physical_model (see 4.2.354) in the case of a stereolithographic model.

The creating_interface need not be specified for a particular Document_creation_property (see 4.2.158).

4.2.158.2 creating_system

The creating_system specifies the computer application or the machine which is used to create the object that is characterized.

4.2.158.3 operating_system

The operating_system specifies the operating system that is used to execute the computer application that created the characterized object.

The operating_system need not be specified for a particular Document_creation_property (see 4.2.158).

4.2.159 Document_file

A Document_file is one of potentially more files on a computer system or in actual stacks of paper that make up a Document_representation (see 4.2.163).

Each Document_file is a Hardcopy (see 4.2.253) or a Digital_file (see 4.2.148).

The data associated with a Document_file are the following:

— content;

— creation;

— document_file_type;

— external_id_and_location;

— file_format;

— file_id;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— size;

— version_id.

4.2.159.1 content

The content characterizes the content of the Document_file.

See 4.3.675 for the application assertion.

The content need not be specified for a particular Document_file (see 4.2.159).

4.2.159.2 creation

The creation specifies further details of the context of the creation of the Document_file.

See 4.3.676 for the application assertion.

The creation need not be specified for a particular Document_file (see 4.2.159).

4.2.159.3 document_file_type

The document_file_type specifies the format of the Document_file. It shall only be specified, if the Document_file does not participate in a Document (see 4.2.155).

See 4.3.679 for the application assertion.

The document_file_type need not be specified for a particular Document_file (see 4.2.159).

4.2.159.4 external_id_and_location

The external_id_and_location specifies alternatives of the identifier and location of the Document_file.

EXAMPLE A copy of a document may be found in another department with a different id.

See 4.3.680 for the application assertion.

4.2.159.5 file_format

The file_format specifies the characteristics of the Document_file that specify the format of the object.

See 4.3.677 for the application assertion.

The file_format need not be specified for a particular Document_file (see 4.2.159).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.159.6 file_id

The file_id specifies the identifier which is used to locate the file either on a computer system or in a repository of paper documents.

4.2.159.7 size

The size specifies characteristics for the size of the Document_file.

See 4.3.678 for the application assertion.

The size need not be specified for a particular Document_file (see 4.2.159).

4.2.159.8 version_id

The version_id specifies the identification of the version that distinguishes one Document_file object from other versions of Document_file objects with the same file_id.

The version_id need not be specified for a particular Document_file (see 4.2.159).

4.2.160 Document_file_relationship

A Document_file_relationship is a relationship between two Document_file (see 4.2.159) objects. It specifies that the related Document_file is referenced from the relating Document_file.

> EXAMPLE A service manual may contain graphics for explanatory reasons. In this case the Document_-file objects that contain the graphics are referenced as related from the Document_file object that contains the body of the service manual with relation_type 'reference'.

The data associated with a Document_file_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.160.1 description

The description specifies additional information about the Document_file_relationship.

See 4.3.682 for the application assertion.

The description need not be specified for a particular Document_file_relationship (see 4.2.160).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

If present, there shall be exactly one object that defines the description for a Document_file_relationship.

4.2.160.2 related

The related specifies the second of the two objects related by the Document_file_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.681 for the application assertion.

4.2.160.3 relating

The relating specifies the first of the two objects related by the Document_file_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.681 for the application assertion.

4.2.160.4 relation_type

The relation_type specifies the meaning of the relationship. The values 'addition', 'decomposition', and 'peer' are only allowed if neither the relating nor the related Document_file (see 4.2.159) are included in a Document_representation (see 4.2.163). Where applicable, the following values shall be used:

— 'addition': The application object specifies that the related document provides supplementary or collateral information with regard to the information provided by the relating document;

EXAMPLE 1 The recommended practices for this part of ISO 10303 may be an addition.

— 'copy': The application object defines a relationship where the related Document_file is a copy of the relating Document_file;

— 'decomposition': The application object defines a relationship where the related Document_file is one of potentially more sub documents of the relating Document_file;

EXAMPLE 2 The decomposition of a document into clauses or into several CAD models is an example for 'decomposition'.

— 'derivation': The application object defines a relationship where the related Document_file is derived from the relating Document_file;

EXAMPLE 3 The derivation of a hypertext document from an text document is an example for 'derivation'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— 'peer': The application object specifies that the related document provides required information with regard to that provided by the relating document. The peer document is essential for a complete understanding;

— 'reference': The application object defines a relationship where the related document is referenced from the relating one;

EXAMPLE 4 The link in a hypertext document may be a reference.

— 'sequence': The application object defines a logical sequence where the related Document_file comes after the relating Document_file;

EXAMPLE 5 A sequence of clauses is an example for 'sequence'.

— 'substitution': The application object defines a relationship where the related Document_file replaces the relating Document_file;

— 'translation': The application object specifies that the related document is generated through a translation process from the relating document.

The values 'addition', 'decomposition', and 'peer' are used for the purpose of creating logical structures of documents. These values shall only be used for the relation_type of Document_file_relationship, if the referenced Document_file objects do not participate in a Document_representation. In the latter case, Document_structure (see 4.2.165) shall be used instead.

4.2.161 Document_format_property

A Document_format_property specifies characteristics of a Document_file (see 4.2.159) or of a Document_representation (see 4.2.163) that specify the format of the object. At least one of the optional attributes shall be specified for each instance of this object.

In the case where a Document_format_property is referred by a Document_representation, the characteristics apply to all individual Document_file objects, whereas in the case it is referred by a Document_file the characteristics apply on an individual basis.

The data associated with a Document_format_property are the following:

— character_code;

— data_format;

— size_format.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.161.1 character_code

The character_code specifies the character code that is used in the characterized object. Where applicable, the following values shall be used:

— 'binary': The document contains data in binary format;

— 'IEC 61286': The coded character set used to encode the document data according to IEC 61286;

— 'ISO 646': The coded character set used to encode the document data according to ISO 646;

NOTE 1 - The character set in ISO 646 is identical to the character set commonly known as ASCII

— 'ISO 3098-1': The coded character set used to encode the document data is according to ISO 3098-1;

— 'ISO 6937': The coded character set used to encode the document data is according to ISO/IEC 6937;

— 'ISO 8859-1': The coded character set used to encode the document data according to ISO 8859-1;

NOTE 2 - The character set in ISO 8859-1 is identical to the character set commonly known as LATIN-1.

— 'ISO 10646': The coded character set used to encode the document data according to ISO/IEC 10646.

The character_code need not be specified for a particular Document_format_property (see 4.2.161).

4.2.161.2 data_format

The data_format specifies the convention that was used to structure the information in the characterized object. Where applicable, the following values shall be used:

— 'DXF': The document contains data in Drawing Exchange File format;

— 'IGES': The document contains data in Initial Graphics Exchange Specification format;

— 'ISO 10303-203': The document contains data in ISO 10303-203 format;

— 'ISO 10303-214': The document contains data in ISO 10303-214 format;

— 'TIFF CCITT GR4': The document contains data in TIFF CCITT GR4 format;

— 'VDAFS': The document contains data in VDAFS format;

— 'VOXEL': The document contains data in VOXEL format.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data_format need not be specified for a particular Document_format_property (see 4.2.161).

4.2.161.3 size_format

The size_format specifies the dimensions of a physical presentation of the object the size_format is provided for.

EXAMPLE 1 'ISO A0' is an example for the size_format of a drawing that is stored digitally.

EXAMPLE 2 '0.2 x 0.4 x 0.4 meters' is an example for the size_format of a wooden model.

See 4.3.683 for the application assertion.

The size_format need not be specified for a particular Document_format_property (see 4.2.161).

4.2.162 Document_location_property

A Document_location_property specifies where a Document_file (see 4.2.159) or a Document_representation (see 4.2.163) can be found in a digital or physical data storage system.

In the case where a Document_location_property is referred by a Document_representation, the characteristics apply to all individual objects, whereas in the case it is referred by a Document_file, the characteristics apply on an individual basis.

The data associated with a Document_location_property are the following:

— location_name

The location_name specifies the location, where the object that refers to the Document_location_property, can be found.

EXAMPLE 1 'C:\programs' and '/usr/local/bin' are examples for a location_name.

NOTE - Multiple paths may be specified for a single object, e.g., a database in the context of an electronic vault.

EXAMPLE 2 The linking mechanism of many operating systems allows references to a single object from various places in the file system without copying its contents.

4.2.163 Document_representation

A Document_representation is one of potentially more alternative representations of a Document_version (see 4.2.167).

EXAMPLE A version of a logical document, which contains a shape model, may be represented in the different native formats of two 3D CAD systems.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Each Document_representation is a Digital_document (see 4.2.147) or a Physical_representation (see 4.2.355).

The data associated with a Document_representation are the following:

— associated_document_version;

— common_location;

— content;

— creation;

— description;

— id;

— representation_format;

— size.

4.2.163.1 associated_document_version

The associated_document_version specifies the version of the logical document that is being represented.

See 4.3.689 for the application assertion.

4.2.163.2 common_location

The common_location specifies the location of a Document_representation, where all its constituents can be found.

NOTE - Different common locations represent alternative representations of the same physical location.

See 4.3.687 for the application assertion.

4.2.163.3 content

The content specifies characteristics of the content of the Document_representation.

See 4.3.684 for the application assertion.

The content need not be specified for a particular Document_representation (see 4.2.163).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.163.4 creation

The creation specifies further details of the creation of the Document_representation.

See 4.3.685 for the application assertion.

The creation need not be specified for a particular Document_representation (see 4.2.163).

4.2.163.5 description

The description specifies additional information about the Document_representation.

See 4.3.690 for the application assertion.

The description need not be specified for a particular Document_representation (see 4.2.163).

If present, there shall be exactly one object that defines the description for a Document_representation.

4.2.163.6 id

The id specifies the identifier of the Document_representation.

4.2.163.7 representation_format

The representation_format specifies the format of the document represented by Document_representation.

See 4.3.686 for the application assertion.

The representation_format need not be specified for a particular Document_representation (see 4.2.163).

4.2.163.8 size

The size specifies the size of the represented document.

See 4.3.688 for the application assertion.

The size need not be specified for a particular Document_representation (see 4.2.163).

4.2.164 Document_size_property

A Document_size_property specifies the size of a Document_file (see 4.2.159) or of a Document_representation (see 4.2.163) object. At least one of the optional attributes shall be specified for each instance of this object.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

In the case where a Document_size_property is referred by a Document_representation, the size information is the sum of the sizes of all individual objects that are collected by this object, whereas in the case it is referred by a Document_file, the size information is the one of the individual objects that is referenced.

The data associated with a Document_size_property are the following:

— file_size;

— page_count.

4.2.164.1 file_size

The file_size specifies the Value_with_unit (see 4.2.549) that represents the size of a digitally stored document. The file_size shall only be applied in cases where the Document_size_property is referred by a Digital_document (see 4.2.147) or a Document_file (see 4.2.159).

EXAMPLE ’15021 Bytes’ and ’less than 500 Bytes’ are examples for a file_size.

See 4.3.691 for the application assertion.

The file_size need not be specified for a particular Document_size_property (see 4.2.164).

4.2.164.2 page_count

The page_count specifies the number of pages of the application object the Document_size_property is referred by. The page_count shall only be used in cases where the Document_size_property is referred by a Hardcopy (see 4.2.253) or a Physical_representation (see 4.2.355).

EXAMPLE ’42 pages’ and ’more than 1 page’ are examples of a page_count.

See 4.3.691 for the application assertion.

The page_count need not be specified for a particular Document_size_property (see 4.2.164).

4.2.165 Document_structure

A Document_structure is a relationship between two Document_representation (see 4.2.163) objects.

The data associated with a Document_structure are the following:

— description;

— related;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— relating;

— relation_type.

4.2.165.1 description

The description specifies additional information about the Document_structure.

See 4.3.693 for the application assertion.

The description need not be specified for a particular Document_structure (see 4.2.165).

If present, there shall be exactly one object that defines the description for a Document_structure.

4.2.165.2 related

The related specifies the second of the two objects related by the Document_structure.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.692 for the application assertion.

4.2.165.3 relating

The relating specifies the first of the two objects related by the Document_structure.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.692 for the application assertion.

4.2.165.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'addition': The application object specifies that the related document provides supplementary or collateral information with regard to the information provided by the relating document;

— 'copy': The application object defines a relationship where the related Document_representation (see 4.2.163) is a copy of the relating Document_representation;

— 'decomposition': The application object defines a relationship where the related Document_representation is one of potentially more sub documents of the relating Document_representation;

EXAMPLE 1 The decomposition of a document into clauses is an example for the use of this value.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— ’derivation’: The application object defines a relationship where the related Document_representation is derived from the relating Document_representation;

EXAMPLE 2 A raster image may be derived from a 3D CAD model.

EXAMPLE 3 A html version may be derived from a text document as an alternative.

— ’peer’: The application object specifies that the related document provides required information with regard to that provided by the relating document. The peer document is essential for a complete understanding;

— ’reference’: The application object defines a relationship where the related document is referenced from the relating;

EXAMPLE 4 A hyperlink is an example for a ’reference’.

— ’sequence’: The application object defines a logical sequence where the related Document_representation comes after the relating Document_representation;

EXAMPLE 5 A sequence of clauses.

— ’substitution’: The application object defines a relationship where the related Document_representation replaces the relating Document_representation;

— ’translation’: The Document_structure specifies that the related document is generated through a translation process from the relating document.

4.2.166 Document_type_property

A Document_type_property specifies the kind of a Document_file (see 4.2.159).

The data associated with a Document_type_property are the following:

— document_type_name;

— used_classification_system.

4.2.166.1 document_type_name

The document_type_name specifies the word or the group of words that describe the kind of object the characteristics are provided for. Where applicable, the following values shall be used:

— ’geometry’: The document represents a shape model;

— ’NC data’: The document represents numerical control data;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— ’FE data’: The document represents finite element data;

— ’sample data’: The document represents measured data;

— ’process plan’: The document represents process planning data;

— ’check plan’: The document represents quality control planning data;

— ’drawing’: The document represents a technical drawing.

4.2.166.2 used_classification_system

The used_classification_system specifies the Classification_system (see 4.2.71) the document_type_-name is defined in.

EXAMPLE A Document_type_property may be used with ’specification type 1’ and ’specification type 2’ as values for the attribute ’document_type_name’ due to a company wide definition. By inclusion of these types in a General_classification (see 4.2.216) with name ’specification’ and description ’specification of company XY’ these types of documents are better classified and the meaning of ’specification type 1’ and ’specification type 2’ can be further detailed in an attached document to the General_classification or by a reference to a Classification_system for document types with that organization.

See 4.3.694 for the application assertion.

The used_classification_system need not be specified for a particular Document_type_property (see 4.2.166).

4.2.167 Document_version

A Document_version is a release of a Document (see 4.2.155).

The data associated with a Document_version are the following:

— associated_document;

— description;

— id.

4.2.167.1 associated_document

The associated_document specifies the logical document the Document_version is a version of.

See 4.3.695 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.167.2 description

The description specifies additional information about the Document_version.

See 4.3.696 for the application assertion.

The description need not be specified for a particular Document_version (see 4.2.167).

If present, there shall be exactly one object that defines the description for a Document_version.

4.2.167.3 id

The id specifies the identifier of the Document_version. The id shall be unique within the scope of the associated Document (see 4.2.155).

4.2.168 Document_version_relationship

A Document_version_relationship is a relationship between two Document_version (see 4.2.167) objects.

The data associated with a Document_version_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.168.1 description

The description specifies additional information about the Document_version_relationship.

See 4.3.698 for the application assertion.

The description need not be specified for a particular Document_version_relationship (see 4.2.168).

If present, there shall be exactly one object that defines the description for a Document_version_relationship.

4.2.168.2 related

The related specifies the second of the two objects related by the Document_version_relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.697 for the application assertion.

4.2.168.3 relating

The relating specifies the first of the two objects related by the Document_version_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.697 for the application assertion.

4.2.168.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'derivation': The application object defines a deriving relationship where the related Document_version (see 4.2.167) is based on the relating Document_version which is an earlier version of the same or of a different Document (see 4.2.155);

— 'hierarchy': The application object defines a hierarchical relationship where the related Document_version is a sub version of the relating Document_version;

EXAMPLE 'Revision 1.1' and 'revision 1.2' are examples of sub-versions of 'version 1'.

— 'sequence': The application object defines a version sequence where the relating Document_version is the preceding version and the related Document_version is the following version.

Each document shall be referred to by at most one Document_version_relationship as related and a 'relation_type' of 'sequence';

— 'supplied document': The application object defines a relationship between two Document_version objects representing the same object in different organizational contexts.

NOTE - The different organizational contexts can be represented by different general organizational data associations with the related Document_version objects.

4.2.169 Draughting_callout

A Draughting_callout is a combination of annotation elements that, as collection, represent a recognized annotation concept.

EXAMPLE Figure 26 shows typical Draughting_callout objects on a drawing.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

NOTE - Each Draughting_callout may be a combination of an Associated_draughting_callout (see 4.2.29) and one of the other types of Draughting_callout.

A Draughting_callout is a type of Detailed_element (see 4.2.143).

Each Draughting_callout may be an Associated_draughting_callout (see 4.2.29).

Each Draughting_callout may be one of the following: a Surface_condition_callout (see 4.2.494), a Geometric_tolerance_callout (see 4.2.244), a Dimension (see 4.2.149), a Datum_target_callout (see 4.2.126), or a Datum_feature_callout (see 4.2.124).

The data associated with a Draughting_callout are the following:

— contents

The contents specifies the Annotation_element (see 4.2.17) objects that form the Draughting_callout.

See 4.3.699, 4.3.700, 4.3.701, and 4.3.702 for the application assertions.

There shall be at least one object that defines the contents for a Draughting_callout.

4.2.170 Drawing

A Drawing is the presentation of product data in a human interpretable form wherein the physical and functional requirements for that product data are presented by pictures or text.

The data associated with a Drawing are the following:

— drawing_id;

— drawing_revision_id;

— drawing_specification;

— drawing_type;

— language;

— title.

4.2.170.1 drawing_id

The drawing_id specifies the identifier of a particular Drawing. The drawing_id shall be unique within the scope of the object, to which the Drawing is associated to.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.170.2 drawing_revision_id

The drawing_revision_id specifies the identifier of the revision of the drawing.

4.2.170.3 drawing_specification

The drawing_specification specifies the identification of standards that the drawing conforms to. These standards specify the rationale of presentation used in the drawing.

EXAMPLE A drawing_specification could be 'ISO 129' [3].

There may be more than zero drawing_specification for a Drawing (see 4.2.170).

4.2.170.4 drawing_type

The drawing_type specifies the category of the Drawing (see 4.2.170) and may indicate the information content.

EXAMPLE A drawing_type could be 'assembly drawing', 'casting drawing', or 'piping diagram'.

4.2.170.5 language

The language specifies the languages that are used for textual information on the Drawing.

There may be more than zero language for a Drawing (see 4.2.170).

4.2.170.6 title

The title specifies the description of the content or of the subject matter of the Drawing (see 4.2.170).

EXAMPLE 'fender' and 'assembly of engine' are examples for title.

See 4.3.703 for the application assertion.

The title need not be specified for a particular Drawing.

If present, there shall be exactly one object that defines the title for a Drawing.

4.2.171 Drawing_assignment

A Drawing_assignment is a mechanism to associate a Drawing (see 4.2.170) with the object that is presented on the Drawing.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Drawing_assignment are the following:

— associated_drawing;

— is_describing.

4.2.171.1 associated_drawing

The associated_drawing specifies the Drawing (see 4.2.170) that is associated with the object.

See 4.3.707 for the application assertion.

4.2.171.2 is_describing

The is_describing specifies the object that is associated with the Drawing (see 4.2.170).

> EXAMPLE An example for assigning a Drawing to an Item_version (see 4.2.275) is the case, when two Mating_definition (see 4.2.313) objects belonging to the same Item_version but to different mating trees are shown and annotated in one Drawing for the purpose of giving additional information, e.g., for handling operations.

See 4.3.704, 4.3.705, 4.3.706, 4.3.708, 4.3.709, 4.3.710, 4.3.711, 4.3.712, 4.3.713, 4.3.714, 4.3.715, 4.3.716, 4.3.717, and 4.3.718 for the application assertions.

There shall be exactly one object that the Drawing_assignment (see 4.2.171) is_describing.

4.2.172 Drawing_sequence

A Drawing_sequence is a revision sequence between two Drawing (see 4.2.170) objects.

The data associated with a Drawing_sequence are the following:

— preceding_drawing;

— succeeding_drawing.

4.2.172.1 preceding_drawing

The preceding_drawing specifies the previous revision of the Drawing (see 4.2.170).

See 4.3.719 for the application assertion.

4.2.172.2 succeeding_drawing

The succeeding_drawing specifies the following revision of the Drawing (see 4.2.170).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.719 for the application assertion.

4.2.173 Drawing_sheet

A Drawing_sheet is a logical division of a drawing into a two-dimensional area for the presentation of product data.

NOTE - Usually, these divisions correspond to sheet paper sizes suitable for plotting.

The data associated with a Drawing_sheet are the following:

— associated_drawing;

— sheet_id;

— sheet_revision_id;

— sheet_space;

— size;

— title.

4.2.173.1 associated_drawing

The associated_drawing specifies the Drawing (see 4.2.170) that is valid for the Drawing_sheet.

See 4.3.721 for the application assertion.

4.2.173.2 sheet_id

The sheet_id specifies the page number for a particular Drawing_sheet.

4.2.173.3 sheet_revision_id

The sheet_revision_id specifies the identifier of the sheet revision.

4.2.173.4 sheet_space

The sheet_space specifies the Cartesian_coordinate_space_2d (see 4.2.45) that is valid for the drawing sheet.

See 4.3.720 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.173.5 size

The size specifies the width and the height of the Drawing_sheet.

4.2.173.6 title

The title specifies a description of the content or subject matter of the Drawing_sheet.

See 4.3.722 for the application assertion.

The title need not be specified for a particular Drawing_sheet (see 4.2.173).

If present, there shall be exactly one object that defines the title for a Drawing_sheet.

4.2.174 Duration

A Duration is the definition of a period of time.

The data associated with a Duration are the following:

— time;

— time_unit.

4.2.174.1 time

The time specifies the extend of the Duration.

4.2.174.2 time_unit

The time_unit specifies the unit in which the time is specified.

4.2.175 Duration_property

A Duration_property is a property that specifies a period of time during which a given object is used or will last.

EXAMPLE Duration_property may be used to specify the duration of a Process_operation_definition (see 4.2.381).

A Duration_property is a type of Property (see 4.2.409).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.176 Edge_loop

An Edge_loop is a closed loop made up of a sequence of edges. In this sequence the start vertex of an edge coincides with the end vertex of its preceding edge and the first vertex of the Edge_loop coincides with the last vertex.

NOTE - The Edge_loop is used for topological representation.

The data associated with an Edge_loop are the following:

— edge

The edge specifies the edges that compose the Edge_loop.

See 4.3.723 for the application assertion.

4.2.177 Edge_round

An Edge_round is a transition area between corresponding edges of two joining non-planar faces. This transition has a convex circular arc section perpendicular to the intersection of the faces and no constraints concerning changes of the radius along the Edge_round.

An Edge_round is a type of Transition_feature (see 4.2.537).

Each Edge_round may be a Constant_radius_edge_round (see 4.2.97).

The data associated with an Edge_round are the following:

— edge_round_face

The edge_round_face specifies the Face (see 4.2.191) that results from the application of an Edge_round.

See 4.3.724 for the application assertion.

4.2.178 Edge_transition

An Edge_transition is a state of geometric continuity for the intersection of two adjacent edges.

EXAMPLE Figure 31 depicts an Edge_transition.

The data associated with an Edge_transition are the following:

— edge_1;

— edge_2;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— transition;

— vertex_joint.

4.2.178.1 edge_1

The edge_1 specifies the first of the two adjacent Oriented_edge_curve (see 4.2.334) objects associated with the Edge_transition.

See 4.3.725 for the application assertion.

4.2.178.2 edge_2

The edge_2 specifies the second of the two Oriented_edge_curve (see 4.2.334) objects associated with the Edge_transition.

See 4.3.725 for the application assertion.

4.2.178.3 transition

The transition specifies the state of geometric continuity from the end vertex of the first edge to the start vertex of the second edge by a textual description. The following values shall be used:

— 'g0': G_0 continuity between two curves is a condition stating that the connected segments have common end/start points [22];

— 'g1': G_1 continuity between two curves is a condition set on the direction of the two tangents in the connection point between the curves; for true G_1 continuity no angular difference is allowed [22];

— 'g2': G_2 continuity between two curves is a condition set on the radius of curvature of the two curves in the connection point; for true G_2 continuity the radii in the connection point must be the same and the circles of curvature lie in the same plane [22].

NOTE - Information provided by the object Accuracy (see 4.2.1) applies when determining the level of continuity.

4.2.178.4 vertex_joint

The vertex_joint specifies the vertex at the intersection of the two edges the continuity is described for.

See 4.3.726 for the application assertion.

4.2.179 Effectivity

An Effectivity is the identification of the valid use of an aspect of product data tracked by date or event.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

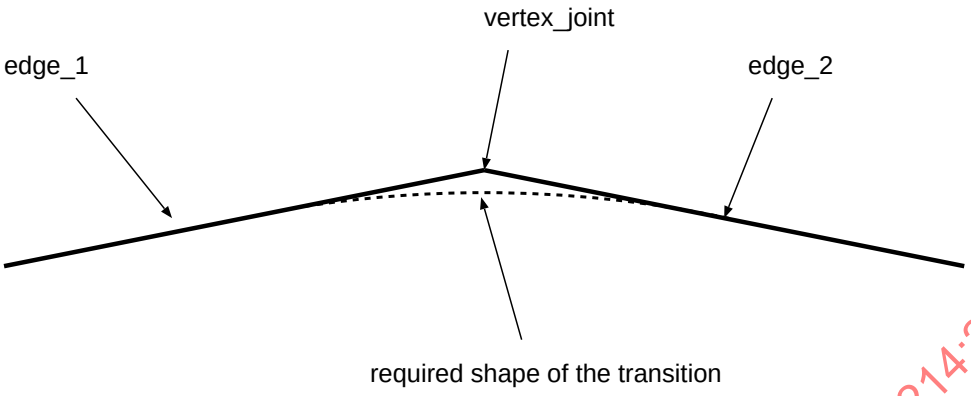


Figure 31 – Edge transition

NOTE 1 - An instance of Effectivity may define a period of ineffectivity, i.e., of invalid use, if it is referred to by an instance of Effectivity_assignment (see 4.2.180) with 'effectivity_indication' set to 'false'.

Either 'start_definition' or 'end_definition' or both shall be specified for a particular Effectivity. The only exception from this rule is an Effectivity that 'inherits' its interval from another Effectivity through an Effectivity_relationship (see 4.2.181) with relation_type 'inheritance'. If a start_definition and no end_definition is specified, the period is added to start_definition in order to get the actual end of the effectivity or ineffectivity period.

NOTE 2 - If period is not specified, the effectivity or ineffectivity period is endless.

If no start_definition, but an end_definition is specified, the period shall also be specified and is subtracted from end_definition in order to get the actual start of the effectivity or ineffectivity period.

NOTE 3 - This application protocol does not allow to specify effectivity or ineffectivity intervals which are left-unbounded.

If both start_definition and end_definition are specified, the period should not be specified because of the redundancy. If specified, it shall be equal to the measure of time between the start_definition and the end_definition of the effectivity or ineffectivity period.

The data associated with an Effectivity are the following:

— concerned_organization;

— description;

— effectivity_context;

— end_definition;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— id;

— period;

— start_definition;

— version_id.

4.2.179.1 concerned_organization

The concerned_organization specifies the set of Organization (see 4.2.331) objects in which the Effectivity is valid.

EXAMPLE The Effectivity of the same item may be different in the various production sites of a car manufacturer.

The case where the concerned_organization is an empty set means that the effectivity regards any organization that may consider the product data, the effectivity is applied to.

NOTE - As effectivity is most of the time organization dependent, it is recommended always to populate the concerned_organization

See 4.3.731 for the application assertion.

4.2.179.2 description

The description specifies additional information about the Effectivity.

See 4.3.730 for the application assertion.

The description need not be specified for a particular Effectivity (see 4.2.179).

If present, there shall be exactly one object that defines the description for an Effectivity.

4.2.179.3 effectivity_context

The effectivity_context specifies the life cycle stage for which the Effectivity is valid.

The effectivity_context need not be specified for a particular Effectivity (see 4.2.179).

4.2.179.4 end_definition

The end_definition specifies the end of the period. The bound specified by the end_definition is excluded from the interval of effectivity.

See 4.3.727 and 4.3.729 for the application assertions.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The end_definition need not be specified for a particular Effectivity (see 4.2.179).

If present, there shall be exactly one object that defines the end_definition for an Effectivity.

4.2.179.5 id

The id specifies the identifier of the Effectivity.

The id need not be specified for a particular Effectivity (see 4.2.179).

4.2.179.6 period

The period specifies the period of time in which the Effectivity is defined, either starting at the point in time specified by 'start_definition' or ending at the point in time specified by 'end_definition'. period shall be specified with a positive value.

See 4.3.728 for the application assertion.

The period need not be specified for a particular Effectivity (see 4.2.179).

4.2.179.7 start_definition

The start_definition specifies the start of the period. The bound specified by the start_definition is included in the interval of effectivity.

NOTE - The meaning of this attribute is further detailed by the attribute role of Effectivity_assignment (see 4.2.180).

Either start_definition or end_definition shall be specified for a particular Effectivity.

See 4.3.727 and 4.3.729 for the application assertions.

The start_definition need not be specified for a particular Effectivity (see 4.2.179).

If present, there shall be exactly one object that defines the start_definition for an Effectivity.

4.2.179.8 version_id

The version_id specifies the identification of a particular version of the Effectivity.

The version_id need not be specified for a particular Effectivity (see 4.2.179).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.180 Effectivity_assignment

An Effectivity_assignment associates an Effectivity (see 4.2.179) with the object whose effectivity is controlled by the associated Effectivity. The association of an Effectivity to product data does not imply any statement concerning the effectivity outside of the specified interval. The same applies in the absence of any assigned effectivity, i.e. no statement concerning the effectivity is implied.

The data associated with an Effectivity_assignment are the following:

— assigned_effectivity;

— effective_element;

— effectivity_indication;

— role.

4.2.180.1 assigned_effectivity

The assigned_effectivity specifies the Effectivity (see 4.2.179) that is assigned.

See 4.3.748 for the application assertion.

4.2.180.2 effective_element

The effective_element specifies the object that has an Effectivity (see 4.2.179) assigned to it.

See 4.3.732, 4.3.733, 4.3.734, 4.3.735, 4.3.736, 4.3.737, 4.3.738, 4.3.739, 4.3.740, 4.3.741, 4.3.742, 4.3.743, 4.3.744, 4.3.745, 4.3.746, 4.3.747, 4.3.749, 4.3.750, 4.3.751, 4.3.752, 4.3.753, 4.3.754, 4.3.755, 4.3.756, 4.3.757, 4.3.758, 4.3.759, 4.3.760, 4.3.761, 4.3.762, 4.3.763, 4.3.764, 4.3.765, 4.3.766, 4.3.767, 4.3.768, 4.3.769, 4.3.770, 4.3.771, 4.3.772, 4.3.773, 4.3.774, 4.3.775, and 4.3.776 for the application assertions.

There shall be exactly one object that defines the effective_element for an Effectivity_assignment (see 4.2.180).

4.2.180.3 effectivity_indication

The effectivity_indication specifies whether the assigned_effectivity defines a period of effectivity (value equal 'TRUE') or a period of ineffectivity (value equal 'FALSE') for the effective_element. In the first case, use of the effective_element is or was valid during the considered period.

NOTE - This does not imply that use of the effectivity_element is mandatory.

In the second case, use of effective_element is or was not valid during the considered period.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.180.4 role

The role specifies the relationship between the Effectivity (see 4.2.179) and the object that has an effectivity assigned to it. Where applicable, the following values shall be used:

— 'actual': The actual period during which the Effectivity lasted;

— 'planned': The period associated with the Effectivity defines a planned period of time during which the associated object is or was supposed to be effective;

— 'required': The associated object must be kept effective for this period.

4.2.181 Effectivity_relationship

An Effectivity_relationship is a relationship between two Effectivity (see 4.2.179) objects.

NOTE - Sometimes the effectivity is not dependent on particular dates but on the effectivity of other items. In this case the dates are not instantiated and there is an Effectivity_relationship to the reference Effectivity.

The data associated with an Effectivity_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.181.1 description

The description specifies additional information about the Effectivity_relationship.

See 4.3.778 for the application assertion.

The description need not be specified for a particular Effectivity_relationship (see 4.2.181).

If present, there shall be exactly one object that defines the description for an Effectivity_relationship.

4.2.181.2 related

The related specifies the second of the two Effectivity (see 4.2.179) objects related by the Effectivity_relationship.

NOTE - The semantics of this attribute are defined by the attribute 'relation_type'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

See 4.3.777 for the application assertion.

4.2.181.3 relating

The relating specifies the first of the two Effectivity (see 4.2.179) objects related by the Effectivity_-relationship.

NOTE - The semantics of this attribute are defined by the attribute 'relation_type'.

See 4.3.777 for the application assertion.

4.2.181.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'constraint': The time period between the start and end definition of the related Effectivity (see 4.2.179) shall be within the time period of the relating Effectivity;

— 'inheritance': The related Effectivity shall not have a 'start_definition' and 'end_definition' specified but inherits the effectivity dates from the relating Effectivity.

4.2.182 Element_delivery

An Element_delivery is the specification of the expected delivery of an Activity_element (see 4.2.3).

The data associated with an Element_delivery are the following:

— deliverable_element;

— destination;

— quantity.

4.2.182.1 deliverable_element

The deliverable_element specifies the Activity_element (see 4.2.3) that is subject to the delivery. This Activity_element shall refer to an Item_version (see 4.2.275), a Product_identification (see 4.2.398), or a Physical_instance (see 4.2.352).

See 4.3.779 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.182.2 destination

The destination specifies the Organization (see 4.2.331) the Activity_element (see 4.2.3) is to be delivered to.

See 4.3.780 for the application assertion.

4.2.182.3 quantity

The quantity specifies the number of objects referred by the Activity_element (see 4.2.3) to be delivered.

See 4.3.781 for the application assertion.

4.2.183 Ellipse

An Ellipse is a conic section defined by the lengths of the semi-major and semi-minor diameters and by the position (centre or mid point of the line joining the foci) and orientation of the curve.

An Ellipse is a type of Curve (see 4.2.108).

4.2.184 Event_reference

An Event_reference is the definition of a point in time established relative to an event.

The data associated with an Event_reference are the following:

— description;

— event_context;

— event_type;

— offset.

4.2.184.1 description

The description specifies additional information about the Event_reference.

> EXAMPLE The description may also be used to describe the event further if the event_type is not sufficient. The description may, e.g., contain a number that represents a model year.

See 4.3.821 for the application assertion.

The description need not be specified for a particular Event_reference (see 4.2.184).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

If present, there shall be exactly one object that defines the description for an Event_reference.

4.2.184.2 event_context

The event_context specifies the piece of product data the Event_reference refers to.

> EXAMPLE In the case of an Event_reference with event_type 'start of production' the event_context would refer to the Item_version (see 4.2.275) that is subject to production.

See 4.3.782, 4.3.783, 4.3.784, 4.3.785, 4.3.786, 4.3.787, 4.3.788, 4.3.789, 4.3.790, 4.3.791, 4.3.792, 4.3.793, 4.3.794, 4.3.795, 4.3.796, 4.3.797, 4.3.798, 4.3.799, 4.3.800, 4.3.801, 4.3.802, 4.3.803, 4.3.804, 4.3.805, 4.3.806, 4.3.807, 4.3.809, 4.3.810, 4.3.811, 4.3.812, 4.3.813, 4.3.814, 4.3.815, 4.3.816, 4.3.817, 4.3.818, 4.3.819, 4.3.820, 4.3.822, 4.3.823, 4.3.824, 4.3.825, 4.3.826, 4.3.827, 4.3.828, 4.3.829, 4.3.830, 4.3.831, 4.3.832, 4.3.833, 4.3.834, 4.3.835, 4.3.836, 4.3.837, 4.3.838, 4.3.839, 4.3.840, 4.3.841, 4.3.842, 4.3.843, 4.3.844, 4.3.845, 4.3.846, and 4.3.847 for the application assertions.

The event_context need not be specified for a particular Event_reference (see 4.2.184).

If present, there shall be exactly one object that defines the event_context for an Event_reference.

4.2.184.3 event_type

The event_type specifies the kind of event that serves as reference.

> EXAMPLE The event_type may be the 'start of production' of a Product_class (see 4.2.392) specified as 'event_context'

4.2.184.4 offset

The offset specifies the amount of time before or after the defined event that shall be used to calculate the actual point in time.

See 4.3.808 for the application assertion.

The offset need not be specified for a particular Event_reference (see 4.2.184).

4.2.185 External_file_id_and_location

An External_file_id_and_location specifies the location of a file in an external storage system.

The data associated with an External_file_id_and_location are the following:

— external_id;

— location.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.185.1 external_id

The external_id specifies the identifier of a document in an external storage system.

EXAMPLE An example for external_id is 'specification.txt'.

The external_id need not be specified for a particular External_file_id_and_location (see 4.2.185).

4.2.185.2 location

The location specifies the location of the Document_file (see 4.2.159) in the external storage system.

EXAMPLE 1 Examples for the location are 'D:\ project1\ ' and '/projects/project1/'.

EXAMPLE 2 The combination of file id and its location taken from the previous examples are 'D:\ project1\ specification.txt' and '/projects/project1/specification.txt' respectively.

See 4.3.848 for the application assertion.

4.2.186 External_geometric_model

An External_geometric_model is the identification of a model that contains geometry in a 3D context only.

An External_geometric_model is a type of External_model (see 4.2.189).

Each External_geometric_model may be an External_geometric_model_with_parameters (see 4.2.187).

The data associated with an External_geometric_model are the following:

— model_extent

The model_extent specifies the radius of a sphere that contains all elements of the model and whose centre is at the origin of the Cartesian_coordinate_space (see 4.2.44) of the External_geometric_model. The model_extent is specified using a length unit.

The model_extent need not be specified for a particular External_geometric_model.

4.2.187 External_geometric_model_with_parameters

An External_geometric_model_with_parameters is the identification of a model that contains geometry in a 3D context, and where some characteristics of the model may be controlled or changed in a predefined way in each occurrence of the model.

EXAMPLE A geometric model may have predefined aspect ratios of its overall dimensions, but a parameterized volume. In each occurrence of the External_geometric_model_with_parameters, the volume may be

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

specified by the user and the dimensions of the model are set automatically while the predefined aspect ratio requirements are met.

The usage of the controlled characteristics shall be subject of an agreement of common understanding by partners sharing this information.

An External_geometric_model_with_parameters is a type of External_geometric_model (see 4.2.186).

The data associated with an External_geometric_model_with_parameters are the following:

— parameter_value

The parameter_value specifies the Property_value_representation (see 4.2.414) object or group of Property_value_representation objects that may be varied in each occurrence.

See 4.3.849 for the application assertion.

4.2.188 External_library_reference

An External_library_reference is a mechanism to refer to an entry in an external library other than ISO 13584.

The data associated with an External_library_reference are the following:

— description;

— external_id;

— library_type.

4.2.188.1 description

The description specifies additional information about the External_library_reference.

See 4.3.850 for the application assertion.

The description need not be specified for a particular External_library_reference (see 4.2.188).

If present, there shall be exactly one object that defines the description for an External_library_reference.

4.2.188.2 external_id

The external_id specifies the unique identifier of the referenced entry in the external library.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.188.3 library_type

The library_type specifies the type of library that is used.

4.2.189 External_model

An External_model is the identification of a model that is described in a Digital_file (see 4.2.148) and by the Cartesian_coordinate_space (see 4.2.44) that is needed to further process the externally described information.

Each External_model is an External_picture (see 4.2.190) or an External_geometric_model (see 4.2.186).

The data associated with an External_model are the following:

— description;

— is_defined_as;

— is_defined_in;

— model_id.

4.2.189.1 description

The description specifies additional information about the External_model.

See 4.3.853 for the application assertion.

The description need not be specified for a particular External_model (see 4.2.189).

If present, there shall be exactly one object that defines the description for an External_model.

4.2.189.2 is_defined_as

The is_defined_as specifies the Digital_file (see 4.2.148) that contains the externally defined geometry information.

See 4.3.852 for the application assertion.

4.2.189.3 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) that defines the context for the externally described geometry.

See 4.3.851 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.189.4 model_id

The model_id specifies the identifier of the External_model.

4.2.190 External_picture

An External_picture is the identification of a model that is described by a two dimensional image.

An External_picture is a type of External_model (see 4.2.189).

The data associated with an External_picture are the following:

— is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space_2d (see 4.2.45) that defines the context for the externally defined geometry.

For picture formats having no explicit origin, e.g., raster format, the lower left corner is defined as the origin of the picture, the x-axis pointing to the right, the y-axis pointing to the top.

See 4.3.854 for the application assertion.

4.2.191 Face

A Face is a topological object corresponding to a piece of a surface bounded by loops.

A Face may have holes, each hole being bounded by a loop. A geometric surface is always associated with a Face. A Face has a normal N, and the tangent to a loop is T. For a loop bounding a Face, the cross product N $\times$ T points towards the interior of the Face.

A Face is a type of Detailed_geometric_model_element (see 4.2.144).

The data associated with a Face are the following:

— bound;

— face_geometry.

4.2.191.1 bound

The bound specifies the loop objects representing the boundaries of the Face.

See 4.3.855 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.191.2 face_geometry

The face_geometry specifies the basis geometry of the Face that is represented by a geometrical surface.

See 4.3.856 for the application assertion.

4.2.192 Face_bound

A Face_bound is a loop object defining the boundary of a Face (see 4.2.191).

The data associated with a Face_bound are the following:

— loop;

— outer.

4.2.192.1 loop

The loop specifies an Edge_loop (see 4.2.176) or a Vertex_loop (see 4.2.552) representing a boundary of a Face (see 4.2.191).

See 4.3.857 and 4.3.858 for the application assertions.

There shall be exactly one object that defines the loop for a Face_bound (see 4.2.192).

4.2.192.2 outer

The outer specifies whether the loop defines the outer boundary of the Face (see 4.2.191) or not.

4.2.193 Face_termination

A Face_termination is a condition specifying that a Joggle_feature (see 4.2.277) extends from the rim of a panel to the next face with which the Joggle_feature intersects.

A Face_termination is a type of Joggle_termination (see 4.2.278).

4.2.194 Face_transition

A Face_transition is the state of geometric continuity between one Face (see 4.2.191) and its neighbouring Face along one common edge.

The data associated with a Face_transition are the following:

— edge_joint;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— face_1;

— face_2;

— transition.

4.2.194.1 edge_joint

The edge_joint specifies the edge at the intersection of the two faces for which the Face_transition is describing the continuity.

NOTE - There may be cases where the two faces have more than one edge in common. In such a case the edge_joint is needed to identify for which of the edges the Face_transition is defined.

See 4.3.860 for the application assertion.

4.2.194.2 face_1

The face_1 specifies the first of the two neighbouring Face (see 4.2.191) objects.

See 4.3.859 for the application assertion.

4.2.194.3 face_2

The face_2 specifies the second of the two neighbouring Face (see 4.2.191) objects.

See 4.3.859 for the application assertion.

4.2.194.4 transition

The transition specifies the state of geometric continuity from the first face to the second face along the intersecting edge by either a textual description or the definition of the required shape. The following values shall be used:

— 'g0': G_0 continuity between two surfaces is a condition stating that the connected patches have common boundary curves [22];

— 'g1': G_1 continuity between two surfaces is a condition set on the two surface normals (in the tangency planes) along the boundary between the surfaces; for true G_1 continuity no angular difference is allowed [22];

— 'g2': G_2 continuity between two curves is a condition set on the radii of curvature of the surfaces along the boundary between the surfaces; for true G_2 continuity the radii along the boundary must be equal [22].

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - Information provided by the object Accuracy (see 4.2.1) applies when determining the level of continuity.

4.2.195 Faceted_b_rep

A Faceted_b_rep is defined by exactly one outer Faceted_closed_shell (see 4.2.197) and zero or more inner Faceted_closed_shell objects.

A Faceted_b_rep is a type of Detailed_geometric_model_element (see 4.2.144).

The data associated with a Faceted_b_rep are the following:

— outer;

— void.

4.2.195.1 outer

The outer specifies a Faceted_closed_shell (see 4.2.197) that defines the outer boundary of the Faceted_b_rep.

See 4.3.861 for the application assertion.

4.2.195.2 void

The void specifies a set of Faceted_closed_shell (see 4.2.197) objects that define internal cavities of a Faceted_b_rep.

NOTE - These shells have a normal pointing into the empty space inside.

See 4.3.861 for the application assertion.

4.2.196 Faceted_b_rep_model

A Faceted_b_rep_model is a collection of Faceted_b_rep (see 4.2.195) objects.

A Faceted_b_rep_model is a type of Geometric_model (see 4.2.238).

The data associated with a Faceted_b_rep_model are the following:

— element

The element specifies a set of Faceted_b_rep objects that form the Faceted_b_rep_model.

See 4.3.862 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.197 Faceted_closed_shell

A Faceted_closed_shell is a collection of at least four Faceted_face (see 4.2.198) objects that bounds a region in three-dimensional space. The topological normal of the shell is defined as being directed from the finite to the infinite region. A Faceted_closed_shell shall not self-intersect.

The data associated with a Faceted_closed_shell are the following:

— shell_boundary

The shell_boundary specifies the planar faces that represent the boundary of a closed shell.

See 4.3.863 for the application assertion.

4.2.198 Faceted_face

A Faceted_face is a topological object corresponding to a portion of a planar surface bounded by Poly_-loop (see 4.2.376) objects. A Faceted_face may have holes, where each hole is bounded by a Poly_loop.

The data associated with a Faceted_face are the following:

— bound;

— face_geometry.

4.2.198.1 bound

The bound specifies the Poly_loop (see 4.2.376) objects representing the boundaries of the Faceted_face.

See 4.3.865 for the application assertion.

4.2.198.2 face_geometry

The face_geometry specifies the geometric representation of a planar surface that is represented by a Plane (see 4.2.360).

See 4.3.864 for the application assertion.

4.2.199 Feature_definition

A Feature_definition is a set of parameters and type information representing a feature that is either defined as a component of an item (Included_feature (see 4.2.261)) or independently in its own coordinate space for multiple use (Placed_feature (see 4.2.356)).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Each Feature_definition is a Process_feature_in_solid (see 4.2.380), a Process_feature_in_panel (see 4.2.379), or a Replicate_feature (see 4.2.433).

The data associated with a Feature_definition are the following:

— is_defined_in;

— location_and_orientation.

4.2.199.1 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space_3d (see 4.2.46) in which the feature is defined.

In the case where the Feature_definition is used for defining an Included_feature (see 4.2.261) this Cartesian_coordinate_space_3d shall be the coordinate space in which the Included_feature is defined. In the case where the Feature_definition is used for defining a Placed_feature (see 4.2.356) this Cartesian_coordinate_space_3d is the local coordinate space of the feature.

See 4.3.867 for the application assertion.

4.2.199.2 location_and_orientation

The location_and_orientation specifies the Axis_placement (see 4.2.33) that defines the location and orientation of the feature.

See 4.3.866 for the application assertion.

The location_and_orientation need not be specified for a particular Feature_definition (see 4.2.199).

4.2.200 Feature_occurrence

A Feature_occurrence is the identification of a feature that is applied on an Item_shape (see 4.2.274).

NOTE 1 - It is therefore an aspect of this shape.

If a Feature_occurrence is related to shape information by a Shape_description_association (see 4.2.448), the representing model shall refer to the same Cartesian_coordinate_space (see 4.2.44) as any representation of the Item_shape in which the feature occurs.

NOTE 2 - For the description of the rationale behind the application of a feature (e.g., the feature function, the inherited 'description' attribute may be used.

A Feature_occurrence is a type of Shape_element (see 4.2.449).

Each Feature_occurrence is an Included_feature (see 4.2.261) or a Placed_feature (see 4.2.356).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Feature_occurrence are the following:

— maximum_feature_limit

The maximum_feature_limit specifies the Plane (see 4.2.360) beyond which a machining tool has cleared the feature.

See 4.3.868 for the application assertion.

4.2.201 Feature_parameter

A Feature_parameter is the representation of a characteristic of a Feature_definition (see 4.2.199).

The data associated with a Feature_parameter are the following:

— parameter_name;

— parameter_value.

4.2.201.1 parameter_name

The parameter_name specifies the character, abbreviation, or word by which the Feature_parameter is referred to.

EXAMPLE ’a’, ’b1’, and ’r’ are typical examples for the parameter_name.

The parameter_name need not be specified for a particular Feature_parameter (see 4.2.201).

4.2.201.2 parameter_value

The parameter_value specifies the value of the Feature_parameter.

NOTE - This includes information about units and possibly about limitations such as tolerances.

See 4.3.869 for the application assertion.

4.2.202 Feature_placement

A Feature_placement is the information about a geometric Transformation (see 4.2.533) and about a Geometric_model (see 4.2.238) that has the reference coordinate space used to define the placement of a Placed_feature (see 4.2.356).

The data associated with a Feature_placement are the following:

— placed_definition;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— placement;

— placement_reference.

4.2.202.1 placed_definition

The placed_definition specifies the Feature_definition (see 4.2.199) that is applied to a shape in order to create a feature.

See 4.3.870 for the application assertion.

4.2.202.2 placement

The placement specifies the geometric Transformation (see 4.2.533) that defines the placement and the orientation of the occurrence of a Feature_definition (see 4.2.199) in a reference coordinate space.

See 4.3.872 for the application assertion.

4.2.202.3 placement_reference

The placement_reference specifies the Geometric_model (see 4.2.238) that has the information about the reference coordinate space.

See 4.3.871 for the application assertion.

4.2.203 Featured_shape

A Featured_shape is the shape of an item that includes features. There shall be at least one Feature_occurrence (see 4.2.200) that refers to the Featured_shape through its inherited attribute composition.

NOTE - The Featured_shape may be used to create a sequence of different shapes of the same item where each single Featured_shape defines the shape at a different stage of design or of manufacturing.

EXAMPLE A sequence of Item_shape (see 4.2.274) respectively Featured_shape objects may consist of the following: Block without feature – Block with pocket – Block with pocket and hole.

A Featured_shape is a type of Item_shape (see 4.2.274).

The data associated with a Featured_shape are the following:

— base_shape

The base_shape specifies the Item_shape that identifies the shape of the item before the application of the Feature_occurrence objects that refer to the Featured_shape through the inherited attribute composition.

See 4.3.873 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.204 Fill_area

A Fill_area is a bounded area containing colouring, hatching, or tiling.

NOTE - A Fill_area communicates some aspect of a physical part characteristic or distinguishes it from its surroundings.

EXAMPLE Figure 32 depicts some fill area styles.

A Fill_area is a type of Annotation_element (see 4.2.17).

Each Fill_area may be an Associated_fill_area (see 4.2.30).

The data associated with a Fill_area are the following:

— boundary;

— reference_point.

4.2.204.1 boundary

The boundary specifies the set of curves bounding a particular fill area. The resulting loop shall be closed and shall not self-intersect and it shall be planar.

See 4.3.874 for the application assertion.

4.2.204.2 reference_point

The reference_point specifies a point within the fill area, used in the placement and initiation of the fill area appearance. The reference point is a point through that a line of a hatching pattern shall pass or at which the origin of a tile shall be located. The reference point also establishes the point at which the first visible segment of a line font used as the curve appearance for a hatching pattern starts.

The reference_point need not be specified for a particular Fill_area (see 4.2.204).

4.2.205 Fillet

A Fillet is a transition area between corresponding edges of two joining non-planar faces. This transition has a concave circular arc section perpendicular to the intersection of the faces and no constraints concerning changes of the radius along the Fillet.

A Fillet is a type of Transition_feature (see 4.2.537).

Each Fillet may be a Constant_radius_fillet (see 4.2.98).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

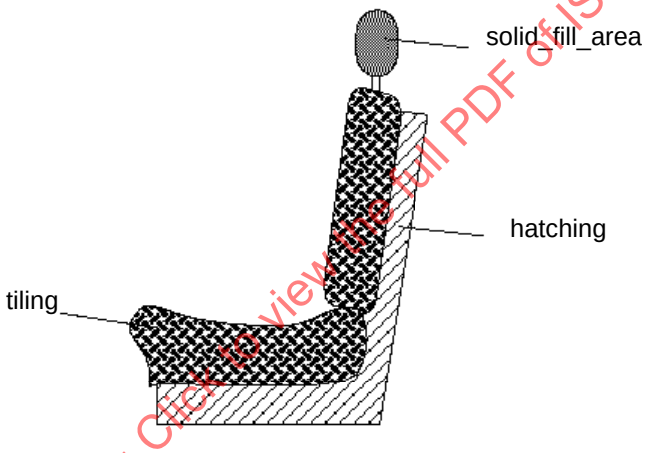

Figure 32 – Fill area styles

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Fillet are the following:

— fillet_face

The fillet_face specifies the Face (see 4.2.191) that results from the application of a Fillet.

See 4.3.875 for the application assertion.

4.2.206 Final_solution

A Final_solution is the specification of a set of additional sensual characteristics that can be applied to an Item_instance (see 4.2.271) that represents a neutral part in order to finalize its definition.

EXAMPLE In the case of a car body, the neutral parts are parts without paint; the final parts are the parts with paint. In the case of a seat, the neutral part is the seat with unspecified cover material; the final part may be the seat covered with red leather.

NOTE 1 - A Final_solution may be associated with an Item_instance that represents the finalized part through a Product_structure_relationship (see 4.2.400) with a 'relation_type' of 'realization'.

NOTE 2 - The information common to all final solutions based on the same neutral part may identified by use of instances of Make_from_relationship (see 4.2.304).

A Final_solution is a type of Alternative_solution (see 4.2.10).

The data associated with a Final_solution are the following:

— final_specification;

— final_status.

4.2.206.1 final_specification

The final_specification specifies the means of finalization that is applied to the neutral part and which may be objects of type Descriptive_specification (see 4.2.137), Physical_instance (see 4.2.352), or Design_discipline_item_definition (see 4.2.142).

EXAMPLE The final_specification may be, e.g., the Design_discipline_item_definition of a certain kind of paint.

NOTE - The Design_discipline_item_definition that is referenced here, is not a view of the Item (see 4.2.267) that results from the finalization. The Item that results from the finalization, e.g., an Item with colour, is identified by an association between Final_solution and Item_instance (see 4.2.271) through a Product_structure_relationship (see 4.2.400).

See 4.3.876, 4.3.877, and 4.3.878 for the application assertions.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

There shall be at least one object that defines the final_specification for a Final_solution (see 4.2.206).

4.2.206.2 final_status

The final_status specifies the level of completion between the neutral part and the final part.

EXAMPLE ’final for shipping overseas’, ’final for transport by truck’, or ’final for sale’ are examples for the final_status.

4.2.207 Flat_bottom

A Flat_bottom is a hole bottom that is flat.

A Flat_bottom is a type of Hole_bottom_condition (see 4.2.257).

4.2.208 Flat_slot_end_type

A Flat_slot_end_type is an end condition of a slot that is a planar face that is normal to the sweep path at its start or end point respectively. The intersection of the slot wall surfaces and the end planar shape may but need not be blended by a radius.

EXAMPLE Figure 33 depicts a Flat_slot_end_type.

A Flat_slot_end_type is a type of Slot_end_type (see 4.2.457).

The data associated with a Flat_slot_end_type are the following:

— first_radius;

— second_radius.

4.2.208.1 first_radius

The first_radius specifies the constant amount of curvature of the first of two corners of the Flat_slot_-end_type. The circle that defines the first radius is oriented normal to the first corner at each point of the corner.

The first corner of a Flat_slot_end_type is located where the slot wall intersects with the slot end at a positive value on the x-axis of the defining Open_profile (see 4.2.328). The sum of the values of the two radii shall not exceed the smallest width of the Slot_feature (see 4.2.458).

NOTE - For this definition, the profile and its x-axis is considered as ’moving’ along the sweep path from one end of the slot to the other.

See 4.3.879 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.208.2 second_radius

The second_radius specifies the constant amount of curvature of the second of two corners of the Flat_-slot_end_type. The circle that defines the first radius is oriented normal to the first corner at each point of the corner.

The second corner of a Flat_slot_end_type is located where the slot wall intersects with the slot end at a negative value on the x-axis of the defining Open_profile (see 4.2.328). The sum of the values of the two radii shall not exceed the smallest width of the Slot_feature (see 4.2.458).

NOTE - For this definition, the profile and its x-axis is considered as 'moving' along the sweep path from one end of the slot to the other.

See 4.3.879 for the application assertion.

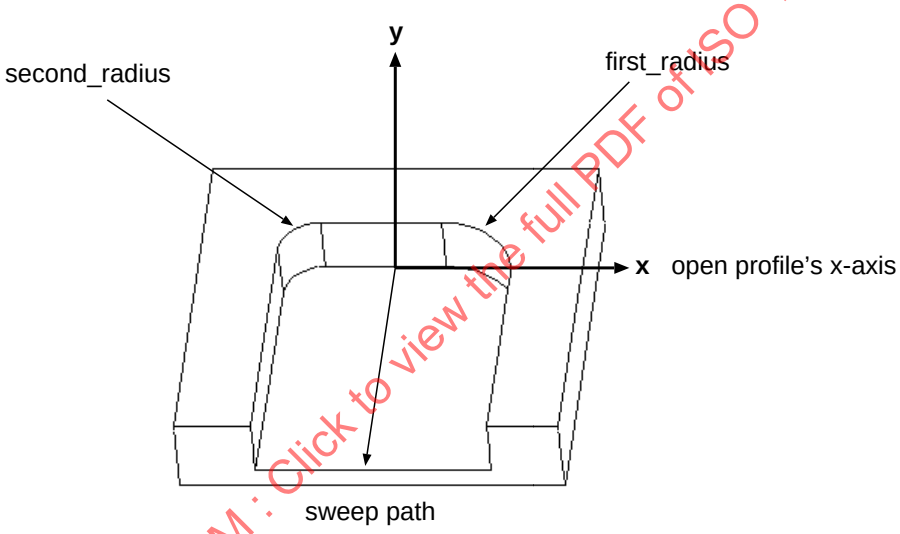

Figure 33 – Parameters defining a Flat_slot_end_type

4.2.209 Flat_with_radius_bottom

A Flat_with_radius_bottom is a hole bottom that is flat and has a corner radius that is smaller than the radius of the Round_hole (see 4.2.439).

A Flat_with_radius_bottom is a type of Hole_bottom_condition (see 4.2.257).

The data associated with a Flat_with_radius_bottom are the following:

— radius

The radius specifies the corner radius between the side and the floor of the Round_hole.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.880 for the application assertion.

4.2.210 Flat_with_taper_bottom

A Flat_with_taper_bottom is a hole bottom that is flat and has a taper along the floor edge.

A Flat_with_taper_bottom is a type of Hole_bottom_condition (see 4.2.257).

The data associated with a Flat_with_taper_bottom are the following:

— final_diameter;

— taper_angle.

4.2.210.1 final_diameter

The final_diameter specifies the diameter at the bottom of the Flat_with_taper_bottom.

See 4.3.881 for the application assertion.

4.2.210.2 taper_angle

The taper_angle specifies the angle that is used to create the taper.

See 4.3.881 for the application assertion.

4.2.211 Flatness_tolerance

A Flatness_tolerance is a constraint on a surface that defines a tolerance zone limited by two parallel planes within which the surface must lie.

A Flatness_tolerance is a type of Geometric_tolerance (see 4.2.243).

4.2.212 Form_feature_in_panel

A Form_feature_in_panel is the definition of a local modification in the shape of a panel. This modification consists of a base boundary on the panel surface and of a target face that is a result of stamping the area that is enclosed by the base boundary.

The Form_feature_in_panel is specified either by two Closed_profile_usage (see 4.2.73) objects or by a Closed_profile_usage and an Angle_specification (see 4.2.11). The use of two Angle_specification objects is not valid. In the case of a Form_feature_in_panel that has its base boundary defined by a Closed_profile (see 4.2.72), the placement of the feature shall be in a way that the base profile lies on the surface of the original panel or as close as possible if the surface is not planar.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - In order to achieve intersection of the feature wall and the base surface it may be necessary to extend the wall linearly towards the base surface.

The wall of the feature is a ruled surface. In the case of two profiles defining the feature, the following rule applies: If P_b is a point on the base, P_t the corresponding point on the target, T_b the tangent to the base profile in P_b, and V the surface normal in P_b or the punch direction respectively, then the scalar product

$$(P_t - P_b) \cdot (V \times (T_b \times V))$$

shall evaluate to zero. If no punch direction is specified, the surface normal shall be used for the definition of the ruled surface. In the case of one profile and an angle the rule for the ruled surface is implicit.

A Form_feature_in_panel is a type of Process_feature_in_panel (see 4.2.379).

The data associated with a Form_feature_in_panel are the following:

— base_boundary_defined_by;

— base_radius;

— feature_type;

— target_boundary_defined_by;

— target_face;

— target_radius.

4.2.212.1 base_boundary_defined_by

The base_boundary_defined_by specifies either a Closed_profile_usage (see 4.2.73) on the panel surface, or an Angle_specification (see 4.2.11) that defines the base boundary by applying an angle to the target boundary.

See 4.3.882 and 4.3.883 for the application assertions.

There shall be exactly one object that defines the base_boundary_defined_by for a Form_feature_in_panel (see 4.2.212).

4.2.212.2 base_radius

The base_radius specifies the blend of the edge where the Form_feature_in_panel meets the panel surface. The sum of the values of the base radius and target radius shall not exceed the minimum distance between the profile defining the base of the feature and the profile defining the target of the feature.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.884 for the application assertion.

4.2.212.3 feature_type

The feature_type specifies the kind of Form_feature_in_panel that results from the application of the specified parameters. The following values shall be used:

— 'boss';

— 'pocket';

— 'stairstep'.

NOTE - Usually a pocket in panel and a boss in panel don't differ in their shape but only in the function they perform.

EXAMPLE Figure 34 shows an example for a Form_feature_in_panel of feature_type 'stairstep'.

4.2.212.4 target_boundary_defined_by

The target_boundary_defined_by specifies either a Closed_profile_usage (see 4.2.73) that corresponds to the boundary of the target face, or an Angle_specification (see 4.2.11) that defines the target boundary by applying an angle to the base boundary.

See 4.3.882 and 4.3.883 for the application assertions.

There shall be exactly one object that defines the target_boundary_defined_by for a Form_feature_in_-panel (see 4.2.212).

4.2.212.5 target_face

The target_face specifies the Surface (see 4.2.489) or the Shell (see 4.2.451) that defines that end of the Form_feature_in_panel that results from its application.

The geometric elements representing the target shall be defined in the same Cartesian_coordinate_space (see 4.2.44) as the Form_feature_in_panel. In the case of a Form_feature_in_panel defined by a base profile and an Angle_specification (see 4.2.11), the target_face shall also be specified.

NOTE - If the target_face is not specified explicitly, it is defined implicitly as a flat face bounded by the target profile.

See 4.3.885 and 4.3.886 for the application assertions.

The target_face need not be specified for a particular Form_feature_in_panel (see 4.2.212).

If present, there shall be exactly one object that defines the target_face for a Form_feature_in_panel.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.212.6 target_radius

The target_radius specifies the blend of the edge where the feature walls meet the target face. The sum of the values of the base radius and target radius shall not exceed the minimum distance between the profile defining the base of the feature and the profile defining the target of the feature.

See 4.3.884 for the application assertion.

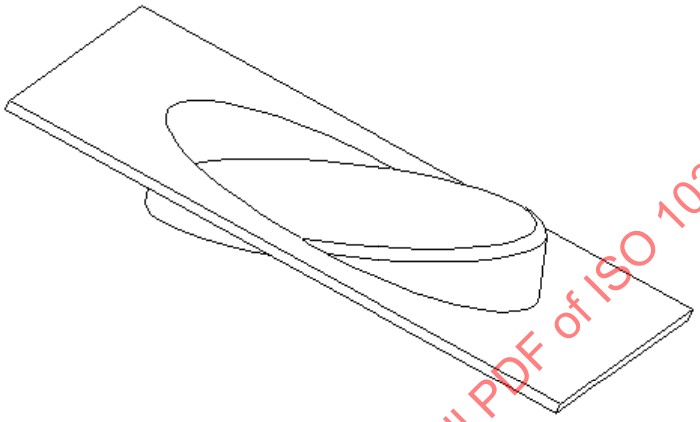

Figure 34 – Panel feature with the shape of a 'stairstep'

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.213 Full_model_change

A Full_model_change is a mechanism to describe the differences between two objects with respect to geometry, style, or presentation. A Full_model_change states the fact that the base model is fully replaced by the succeeding model.

A Full_model_change is a type of Model_change (see 4.2.315).

The data associated with a Full_model_change are the following:

— added_element;

— related_description.

4.2.213.1 added_element

The added_element specifies the elements belonging to the model or the view area representing the situation after the change that have been added during the change.

See 4.3.887 for the application assertion.

 © ISO 2001 – All rights reserved

4.2.213.2 related_description

The related_description specifies the relationship object that references the replaced (relating) and the replacing (related) model.

See 4.3.888, 4.3.889, 4.3.890, and 4.3.891 for the application assertions.

There shall be exactly one object that defines the related_description for a Full_model_change (see 4.2.213).

4.2.214 General_boss

A General_boss is a volume adding feature that is specified by an enclosed volume bounded by an arbitrary closed profile. The boundary of the General_boss shall be defined using either a General_-closed_profile (see 4.2.218) or a Ngon_profile (see 4.2.323).

EXAMPLE Figure 35 shows an example of a General_boss.

A General_boss shall not have a taper of type Directed_taper (see 4.2.154).

A General_boss is a type of Boss_feature (see 4.2.42).

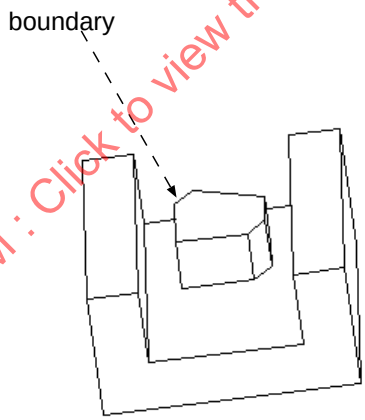

Figure 35 – Boundary of a General_boss

4.2.215 General_bottom_condition

A General_bottom_condition is a bottom of a Pocket_feature (see 4.2.366) that is an enclosed area bounded by arbitrary non-planar shape.

A General_bottom_condition is a type of Pocket_bottom_condition (see 4.2.365).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a General_bottom_condition are the following:

— floor_face;

— floor_radius.

4.2.215.1 floor_face

The floor_face specifies the Surface (see 4.2.489) or the Shell (see 4.2.451) that defines the bottom of the pocket. The geometric elements representing the floor shall be defined in the same Cartesian_-coordinate_space (see 4.2.44) as the concerned Pocket_feature (see 4.2.366).

See 4.3.893 and 4.3.894 for the application assertions.

There shall be exactly one object that defines the floor_face for a General_bottom_condition (see 4.2.215).

4.2.215.2 floor_radius

The floor_radius specifies the blend radius at the bottom edges of the Pocket_feature (see 4.2.366).

See 4.3.892 for the application assertion.

The floor_radius need not be specified for a particular General_bottom_condition (see 4.2.215).

4.2.216 General_classification

A General_classification is a classification of an object which characterizes all objects of the same kind; such a classification is independent from the application of the classified object.

EXAMPLE 1 A fastener with subclasses, such as fastener with 2 or 3 fixture holes, a bracket with sub-classes, e.g., with 90 or 100 degrees bending angle, or screws with subclasses such as metal screws or machine screws are examples for General_classification.

EXAMPLE 2 For facilitating an effective part retrieval for slotted screws, several General_classification objects may be defined to classify screws:

— A General_classification *1 with description 'slotted screws' and three subclasses with the descriptions *2: 'slotted cheese head screws - product grade A', *3: 'slotted pan head screws - product grade A', and *4: 'slotted countersunk flat head screws - product grade A'.

— Each of the General_classification objects is based on a Classification_system (see 4.2.71) that further defines where the definition of the General_classification comes from. For General_classification *1 this is a company internal Classification_system for 'screw classes'. For the other General_classification objects these are ISO standardized Classification_system objects, namely for *2 'ISO 1207' [8], for *3 'ISO 1580' [9], and for *4 'ISO 2009' [10].

— The General_classification objects may be defined as well in an ISO 13584 compliant library (PLIB). In this case, General_classification *1 references as a classification source an External_library_reference

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

(see 4.2.188) that has an id corresponding to the class_BSU, i. e. a world wide unique identification of that class as defined according to ISO 13584 – 42. In another case, the source of a General_classification may only be available as a document in paper form. In this case, General_classification *4 references a Physical_document (see 4.2.351) with document id 'DIN EN ISO 2009' and description 'slotted countersunk flat head screws - product grade A'.

— The General_classification objects may be characterized further by Classification_attribute (see 4.2.70) objects. According to ISO 1207, the General_classification *2 has the attributes *11 with id 'd' and description 'thread', *12 with id 'l' and description 'nominal length', *13 with id 'mechanical properties' and description 'property class', etc. The possible values 'M1.6', 'M2', ..., 'M10' for Classification_attribute *11 may be defined as Property_value_representation (see 4.2.414) objects in a set of the attribute allowed_value. The according specification is given as 'value_name' of the AO Property_value (see 4.2.412) referenced by 'specified_value'. The Property_value_representation refer as their definition to a General_property (see 4.2.230) with the 'property_type' 'nominal metric thread diameter'.

— To identify the designation 'Cheese head screw ISO 1207 - M5 x 20 x 4.8', a subclass of General_classification *2 is defined with the same description and classification source and the description 'slotted cheese head screws ISO 1207 -M5 x 20 x 4.8' but with the values for Classification_attribute corresponding to *11 restricted to 'M5' only, i.e., to get just the M5 screws, corresponding to *12 restricted to value '20' only, and corresponding to *13 restricted to value '4.8' only (for steel according to ISO 898 – 1 [7]).

The data associated with a General_classification are the following:

— classification_source;

— description;

— id;

— used_classification_system;

— version_id.

4.2.216.1 classification_source

The classification_source specifies the External_library_reference (see 4.2.188) or the Plib_class_reference (see 4.2.361) that contains the specification of the General_classification.

See 4.3.896 and 4.3.898 for the application assertions.

The classification_source need not be specified for a particular General_classification (see 4.2.216).

If present, there shall be exactly one object that defines the classification_source for a General_classification.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.216.2 description

The description specifies additional information about the General_classification.

EXAMPLE ’fastener with 2 fixture holes’ or ’bracket with 90 degree bending angle’ are examples for description.

See 4.3.897 for the application assertion.

The description need not be specified for a particular General_classification (see 4.2.216).

If present, there shall be exactly one object that defines the description for a General_classification.

4.2.216.3 id

The id specifies the identifier of the General_classification.

4.2.216.4 used_classification_system

The used_classification_system specifies the Classification_system (see 4.2.71) that contains the information about the definition of the classification and how to interpret the name of the General_classification.

See 4.3.895 for the application assertion.

The used_classification_system need not be specified for a particular General_classification (see 4.2.216).

4.2.216.5 version_id

The version_id specifies the identification of a particular version of the General_classification.

The version_id need not be specified for a particular General_classification (see 4.2.216).

4.2.217 General_classification_hierarchy

A General_classification_hierarchy defines a hierarchical relationship between two instances of General_classification (see 4.2.216).

EXAMPLE With General_classification, part families such as screws can be classified. Additionally subclasses can be built and linked to the super-category screws, such as machine screw or self-tapping screw.

NOTE - The General_classification_hierarchy is used to build up hierarchical structures of General_classification objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a General_classification_hierarchy are the following:

— sub_classification;

— super_classification.

4.2.217.1 sub_classification

The sub_classification specifies the lower level of General_classification (see 4.2.216) in a General_-classification_hierarchy that is included in the super class.

See 4.3.899 for the application assertion.

4.2.217.2 super_classification

The super_classification specifies the higher level of General_classification (see 4.2.216) in a General_-classification_hierarchy that includes the sub class.

See 4.3.899 for the application assertion.

4.2.218 General_closed_profile

A General_closed_profile is a planar closed profile defined by an arbitrary Curve (see 4.2.108).

The Curve shall be defined in the same Cartesian_coordinate_space (see 4.2.44) as the General_closed_-profile.

EXAMPLE Figure 36 illustrates a General_closed_profile.

The x-axis of the inherited Axis_placement (see 4.2.33) shall be tangent to the Curve in its start point, the y-axis is oriented such that the encompassed area lies in the positive direction of this axis in the start point. The Axis_placement is located in the start point of the Curve.

A General_closed_profile is a type of Closed_profile (see 4.2.72).

The data associated with a General_closed_profile are the following:

— profile_shape

The profile_shape specifies the Curve that defines the closed profile shape.

See 4.3.900 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

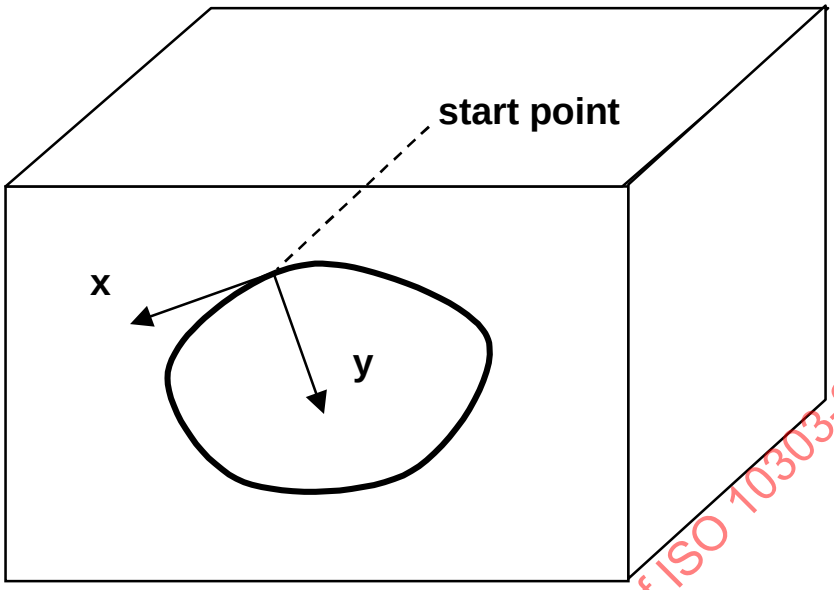

Figure 36 – Definition of a General_closed_profile

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.219 General_compound_feature

A General_compound_feature is a General_feature (see 4.2.221) that is composed of several other features.

A General_compound_feature is a type of General_feature (see 4.2.221).

The data associated with a General_compound_feature are the following:

— elements

The elements specify the features that form the General_compound_feature.

See 4.3.901, 4.3.902, 4.3.903, and 4.3.904 for the application assertions.

There shall be at least two objects that define the elements for a General_compound_feature.

4.2.220 General_compound_feature_in_solid

A General_compound_feature_in_solid is an arbitrary Compound_feature_in_solid (see 4.2.88) that is not a Compound_hole (see 4.2.91). The Axis_placement (see 4.2.33) referenced by the inherited attribute 'location_and_orientation' is dependent on the combinations of the Compound_feature_in_solid_element (see 4.2.89) specified for a particular General_compound_feature_in_solid. The location and orientation of the Axis_placement shall be subject of an agreement of common understanding by partners sharing this information.

 © ISO 2001 – All rights reserved

NOTE - The types of General_compound_feature_in_solid for which a common understanding of the use of Axis_placement exists, may be identified by particular values of the attribute 'feature_type'.

A General_compound_feature_in_solid is a type of Compound_feature_in_solid (see 4.2.88).

The data associated with a General_compound_feature_in_solid are the following:

— feature_type

The feature_type specifies a user defined name for the kind of General_compound_feature_in_solid.

4.2.221 General_feature

A General_feature is a type of feature that provides a mechanism to categorize an area of interest in a shape and to associate additional information, not intended for shape generation, with the identified aspect of the shape.

Each General_feature may be a General_compound_feature (see 4.2.219).

The data associated with a General_feature are the following:

— additional_parameter;

— feature_category;

— feature_type;

— location_and_orientation.

4.2.221.1 additional_parameter

The additional_parameter specifies General_parameter (see 4.2.226) objects that give additional information about particular aspects of the General_feature.

See 4.3.906 for the application assertion.

4.2.221.2 feature_category

The feature_category specifies the class to which the General_feature belongs.

NOTE - The values of feature_category are company specific.

EXAMPLE 'design feature', 'machining feature', and 'assembly feature' are examples for feature_category.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.221.3 feature_type

The feature_type specifies the kind of feature that is represented by the General_feature.

EXAMPLE ’planar feature’ and ’logo feature’ are examples for feature_type.

4.2.221.4 location_and_orientation

The location_and_orientation specifies an Axis_placement (see 4.2.33) that represents the location and the orientation of the General_feature in the item’s coordinate space.

Since the occurrence of a General_feature is an Included_feature (see 4.2.261) this Axis_placement as well as the shape representation of the General_feature shall be defined in a Geometric_model (see 4.2.238) referring to the same Cartesian_coordinate_space (see 4.2.44) as any representation of the corresponding Item_shape (see 4.2.274).

NOTE 1 - This Axis_placement is not a local coordinate system of the General_feature that might be used for geometric transformations.

The Axis_placement referenced by the location_and_orientation is dependent on the combinations of Path (see 4.2.342) and Profile (see 4.2.401) objects, and, in case of a General_compound_feature (see 4.2.219), of additional elements specified for a particular General_feature. The location and orientation of the Axis_placement shall be subject of an agreement of common understanding by partners sharing this information.

NOTE 2 - The types of General_feature for which a common understanding of the use of Axis_placement exists may be identified by particular values of the attribute ’feature_type’.

See 4.3.905 for the application assertion.

The location_and_orientation need not be specified for a particular General_feature (see 4.2.221).

4.2.222 General_item_definition_instance_relationship

A General_item_definition_instance_relationship is a relationship between a Design_discipline_item_definition (see 4.2.142) and an Item_instance (see 4.2.271) whose meaning is defined by the attribute ’relation_type’.

EXAMPLE The relationship between the definition (Design_discipline_item_definition) of a rubber gasket and the instances (Item_instance) of the doors the gasket is used for, is an example for a General_item_definition_instance_relationship. In this case the relationship gives information that the length of the gasket depends on the actual shape of each door.

A General_item_definition_instance_relationship is a type of Item_definition_instance_relationship (see 4.2.268).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a General_item_definition_instance_relationship are the following:

— description;

— relation_type.

4.2.222.1 description

The description specifies additional information about the General_item_definition_instance_relationship.

See 4.3.907 for the application assertion.

The description need not be specified for a particular General_item_definition_instance_relationship (see 4.2.222).

If present, there shall be exactly one object that defines the description for a General_item_definition_-instance_relationship.

4.2.222.2 relation_type

The relation_type specifies the meaning of the relationship.

4.2.223 General_item_definition_relationship

A General_item_definition_relationship is a relationship between two Design_discipline_item_definition (see 4.2.142) objects whose meaning is defined by the attribute 'relation_type'.

> EXAMPLE The functional and shape dependencies between a part of a door lock mounted on the door and the corresponding part mounted on the car body, is an example for a General_item_definition_relationship.

A General_item_definition_relationship is a type of Item_definition_relationship (see 4.2.269).

The data associated with a General_item_definition_relationship are the following:

— description;

— relation_type.

4.2.223.1 description

The description specifies additional information about the General_item_definition_relationship.

See 4.3.908 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The description need not be specified for a particular General_item_definition_relationship (see 4.2.223).

If present, there shall be exactly one object that defines the description for a General_item_definition_-relationship.

4.2.223.2 relation_type

The relation_type specifies the meaning of the relationship.

4.2.224 General_item_instance_relationship

A General_item_instance_relationship is a relationship between two Item_instance (see 4.2.271) objects whose meaning is defined by the attribute 'relation_type'.

> EXAMPLE The relationship between a door and the adjacent parts of the car body (like A-column or roof) that defines the actual gap, is an example for a General_item_instance_relationship.

A General_item_instance_relationship is a type of Item_instance_relationship (see 4.2.272).

The data associated with a General_item_instance_relationship are the following:

— description;

— relation_type.

4.2.224.1 description

The description specifies additional information about the General_item_instance_relationship.

See 4.3.909 for the application assertion.

The description need not be specified for a particular General_item_instance_relationship (see 4.2.224).

If present, there shall be exactly one object that defines the description for a General_item_instance_-relationship.

4.2.224.2 relation_type

The relation_type specifies the meaning of the relationship.

4.2.225 General_open_profile

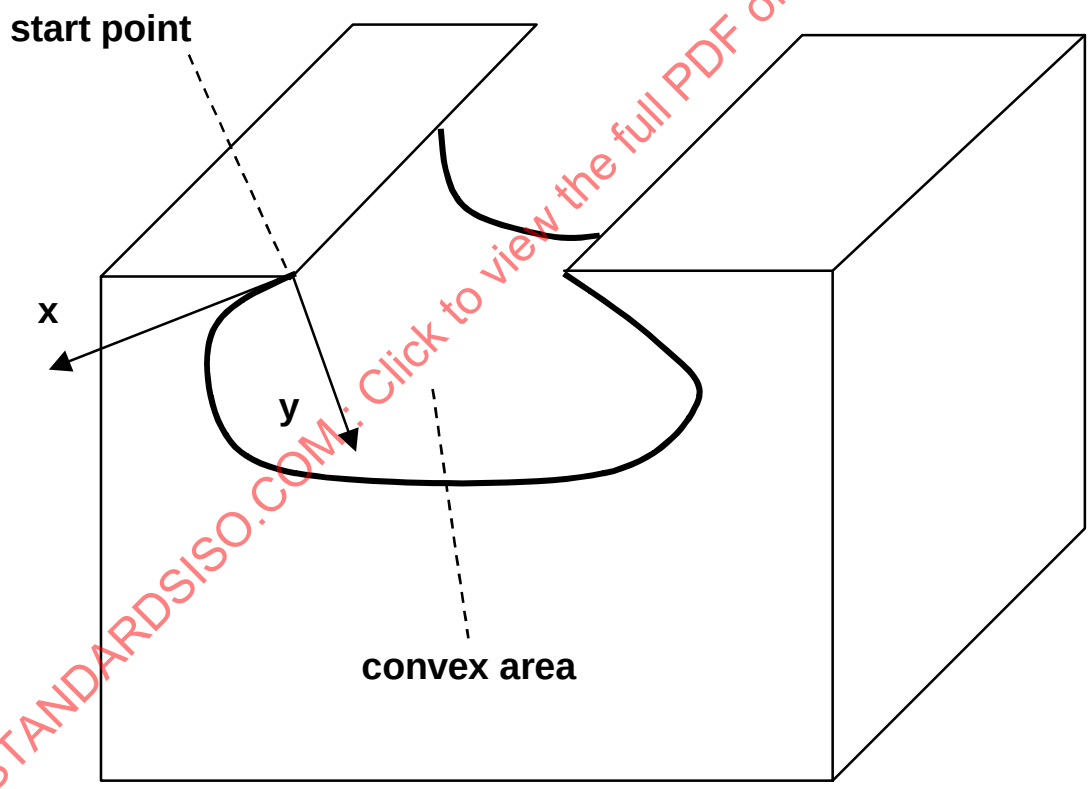
A General_open_profile is a planar profile defined by an arbitrary Curve (see 4.2.108). The area of interest is on the convex side of the General_open_profile; in the case of a removal feature the convex side is removed; in the case of a protrusion feature the convex side is added.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The x-axis of the inherited Axis_placement (see 4.2.33) is tangent to the curve in its start point, the y-axis is oriented such that the convex area lies in its positive direction in the start point of the curve outlining the profile. Axis_placement is located in the start point of that curve. The Curve shall be defined in the same Cartesian_coordinate_space (see 4.2.44) as the General_open_profile.

EXAMPLE Figure 37 illustrates a General_open_profile.



A General_open_profile is a type of Open_profile (see 4.2.328).

The data associated with a General_open_profile are the following:

— profile_shape

The profile_shape specifies the Curve that defines the open profile shape.

See 4.3.910 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Figure 37 – Definition of a General_open_profile

4.2.226 General_parameter

A General_parameter is the association of a Feature_parameter (see 4.2.201) with a General_feature (see 4.2.221) in a particular role.

© ISO 2001 – All rights reserved

The data associated with a General_parameter are the following:

— parameter_role;

— parameter_value.

4.2.226.1 parameter_role

The parameter_role specifies the kind of parameter that is represented by the General_parameter.

EXAMPLE ’width’, ’diameter’, or ’font size’ are examples for the parameter_role.

4.2.226.2 parameter_value

The parameter_value specifies the Feature_parameter (see 4.2.201) that has the value and possibly a name of the General_parameter.

See 4.3.911 for the application assertion.

4.2.227 General_path

A General_path is a path that is specified by an arbitrary Curve (see 4.2.108). The x-y-plane of the inherited Axis_placement (see 4.2.33) is normal to the Curve in its start point, i.e., the z-axis is tangent to the curve in its start point. The Axis_placement is located in the start point of the Curve.

EXAMPLE Figure 38 illustrates a General_path.

A General_path is a type of Path (see 4.2.342).

The data associated with a General_path are the following:

— path_geometry

The path_geometry specifies the Curve that defines the General_path. This Curve shall not intersect or duplicate itself.

See 4.3.912 for the application assertion.

4.2.228 General_pattern

A General_pattern is a pattern that specifies a base component and a set of arbitrary placements to arrange identical copies of the base feature. The Axis_placement (see 4.2.33) referenced by the inherited attribute ’location_and_orientation’ shall coincide with the Axis_placement of the base feature.

EXAMPLE Figure 39 depicts a General_pattern with one base feature and 5 added instances.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

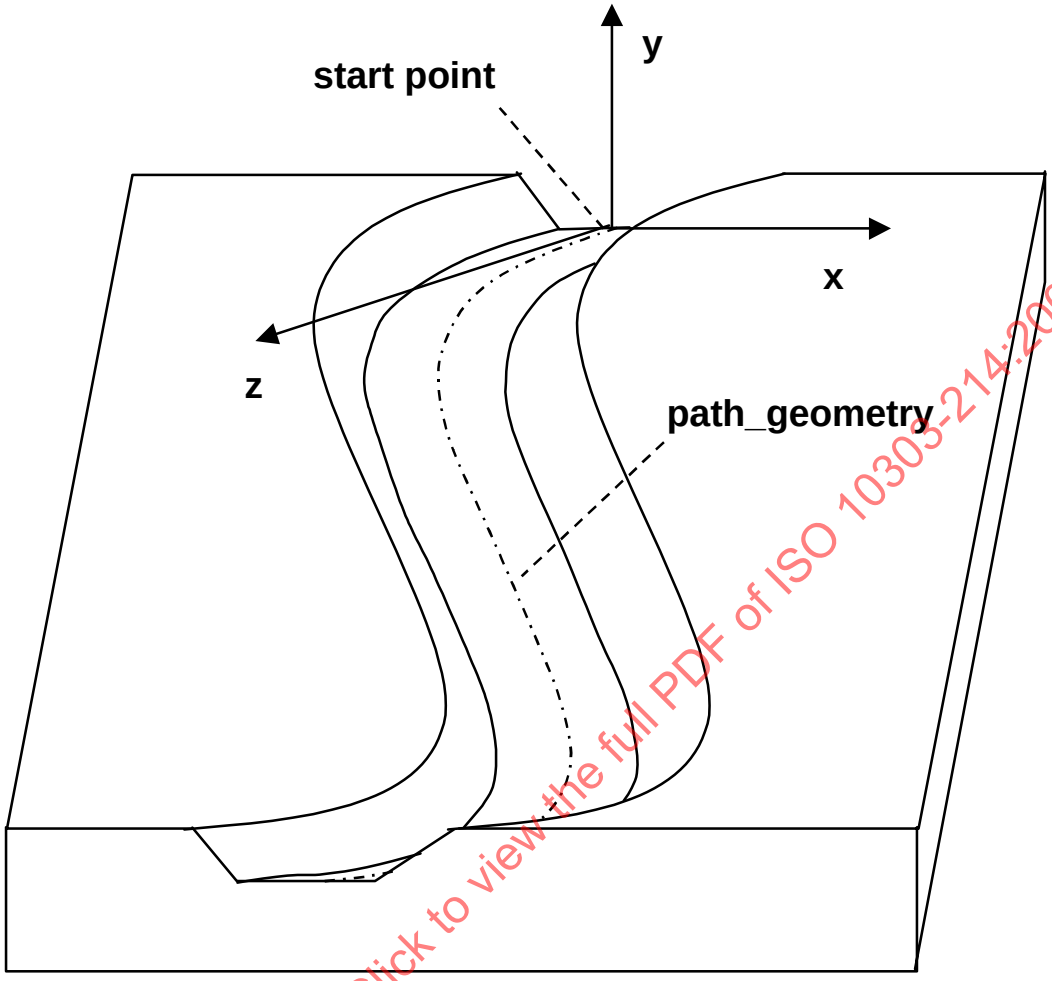


Figure 38 – Definition of a General_path

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

A General_pattern is a type of Replicate_feature (see 4.2.433).

The data associated with a General_pattern are the following:

— added_instance

The added_instance specifies the set of Axis_placement objects that represent the locations and orientations of the additional instances of the base feature in the General_pattern.

NOTE - The base feature is the first instance in the pattern. In order to form a pattern, one or more additional instances have to be specified.

The placement of the additional instances is performed by matching either the Axis_placement that serves as location for the Feature_definition (see 4.2.199) of the base feature (in the case of an Included_-

© ISO 2001 – All rights reserved

feature (see 4.2.261)) or its local coordinate system (in the case of a Placed_feature (see 4.2.356)) with the Axis_placement objects that identify the additional instances.

The Axis_placement objects are defined in the same Cartesian_coordinate_space (see 4.2.44) as the General_pattern.

See 4.3.913 for the application assertion.

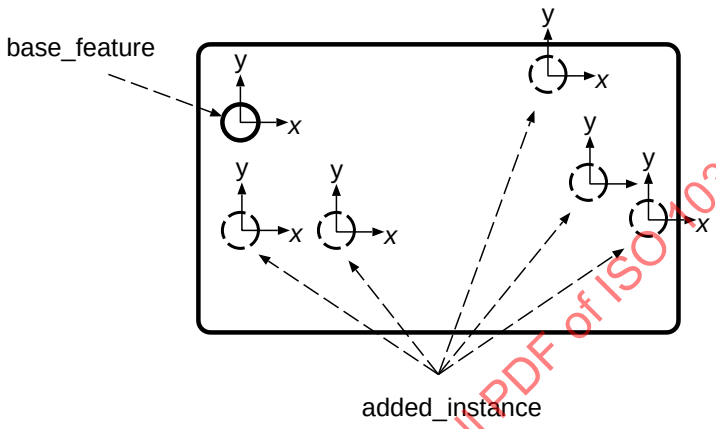

Figure 39 – Placement of additional instances in a General_pattern

4.2.229 General_pocket

A General_pocket is a pocket that is specified by a volume of arbitrary shape removed from the part.

A General_pocket is a type of Pocket_feature (see 4.2.366).

4.2.230 General_property

A General_property is the definition of a property that is specified by the attribute 'property_type'.

EXAMPLE 1 The noise emission of an engine, maintenance intervals, wheel base, and duration of parts, or electrical properties are examples for a General_property.

A General_property is a type of Property (see 4.2.409).

The data associated with a General_property are the following:

— property_type

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The property_type specifies the kind of property the General_property defines. Where applicable, the following values shall be used:

— 'overall axle distance': The overall axle distance is the distance between the first front axle and the rear most axle of the vehicle combination;

— 'positioning': The General_property is the definition of a Model_property_value (see 4.2.318) that provides an a geometric model for a Product_component (see 4.2.394) or an Item_instance (see 4.2.271) for the purpose of placement;

— 'theoretical wheelbase': The theoretical wheelbase is the distance between the resolved weight lines of front and rear axle combinations;

NOTE 1 - For a single axle either in the front or at the rear, the resolved weight line is identical to the axle centre line.

NOTE 2 - For a truck with one front axle and a combination of two rear axles, the theoretical axle distance is the distance between the front axle centre line and the resolved weight line of the rear axle combination. The resolved weight line is the calculated line, between two axles in a bogie, where the load from the axles is focused.

EXAMPLE 2 If the load distribution between two rear axles is 60% vs. 40%, then the resolved weight line is placed 40% of the total distance between the axles, from the first rear axle towards the second rear axle as shown in Figure 40.

— 'track': The track is the distance between the centre of the tyres mounted on an axle of a vehicle;

— 'wheel space': The wheel space is the distance between the perpendicular lines constructed to the longitudinal median plane of the vehicle from two points that represent the wheels situated at the same side of the axle that is of interest.

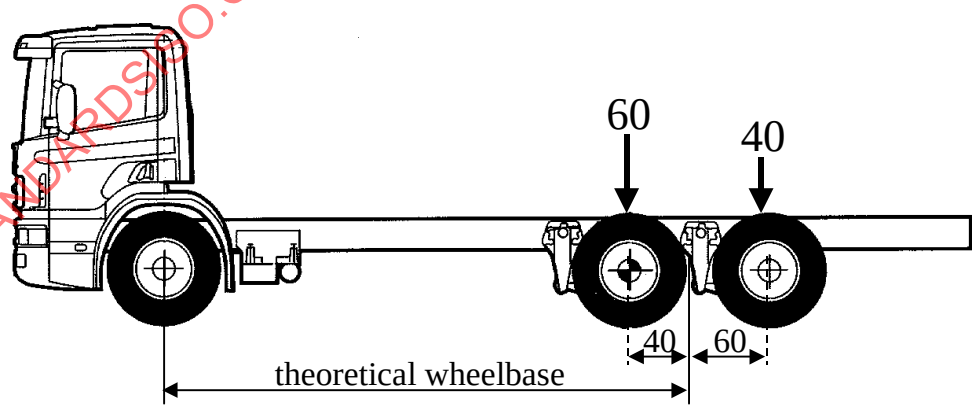

Figure 40 – Theoretical wheelbase of a truck

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.231 General_shape_dependent_property

A General_shape_dependent_property is a user-defined characteristic of an object. The 'property_value' specified by a General_shape_dependent_property is derived from geometry.

NOTE - The General_shape_dependent_property may be used for the purpose of validation of geometric models.

EXAMPLE If a geometry model is exchanged between two partners, the calculation of various properties of the bodies, such as centre of mass, overall surface, or overall volume, is performed by originator and recipient. When comparing these set of values, the existence of deficiencies in the received model can be easily detected.

A General_shape_dependent_property is a type of Shape_dependent_property (see 4.2.447).

The data associated with a General_shape_dependent_property are the following:

— property_type;

— property_value.

4.2.231.1 property_type

The property_type defines the type of characteristic that is specified for an object. The following values shall be used:

— 'centroid': The 'property_value' identifies the centre point of the mass of a body. The relative position of this point within the body is an invariant datum relative to rotation and translation;

EXAMPLE An example, where the use of this General_shape_dependent_property with property_type 'centroid' is used instead of the object Centre_of_mass (see 4.2.49), is the following: sometimes the General_shape_dependent_property is calculated by some system at some point of time. But there are cases where the information, e.g., the General_shape_dependent_property of a die, is transferred into a following stage, e.g., in order to perform a feasibility check, where there is only a simplified shape representation that does not allow to calculate the exact General_shape_dependent_property. Yet, in this stage the information about the General_shape_dependent_property is needed in order to check whether the transport of a die with a crane is feasible.

— 'surface area': The 'property_value' specifies the overall surface of the bodies contained in the referenced shape;

— 'volume': The 'property_value' specifies the overall volume of the bodies contained in the referenced shape.

4.2.231.2 property_value

The property_value specifies the value that is given for a particular characteristic.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.232 General_size_dimension

A General_size_dimension is the definition of a dimension that characterizes the size of a Shape_element (see 4.2.449) or an Annotation_curve (see 4.2.16).

A General_size_dimension is a type of Size_dimension (see 4.2.456).

The data associated with a General_size_dimension are the following:

— dimension_type;

— used_path.

4.2.232.1 dimension_type

The dimension_type specifies the kind of size dimension that is represented by the General_size_dimension. Where applicable, the following values shall be used:

— 'curved dimension': The General_size_dimension specifies the size along a non linear curve. In this case the used path references a Measurement_path (see 4.2.314) that is defined as a non-linear curve;

— 'diameter': The General_size_dimension specifies the size of a diameter of a circle;

— 'radius': The General_size_dimension specifies the size of a radius of a circular arc;

— 'length': The General_size_dimension specifies the size along a straight line that is referred to as 'length' in the referenced shape;

— 'width': The General_size_dimension specifies the size along a straight line that is referred as 'width' by the referenced shape;

— 'height': The General_size_dimension specifies the size along a straight line that is referred as 'height' in the referenced shape.

NOTE For all predefined values except for 'curved dimension' the used path references a Measurement_path that is defined as a linear curve.

4.2.232.2 used_path

The used_path specifies the Measurement_path (see 4.2.314) along which the size is measured.

See 4.3.914 for the application assertion.

The used_path need not be specified for a particular General_size_dimension (see 4.2.232).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.233 General_symbol

A General_symbol is the definition of a symbol that is either user-defined or externally defined.

4.2.234 General_tolerance_table

A General_tolerance_table is a table containing information about General_tolerances (see 4.2.235).

The data associated with a General_tolerance_table are the following:

— tolerance_type

The tolerance_type specifies the kind of the tolerance.

EXAMPLE Examples for tolerance_type are 'length dimensional tolerance', 'angular dimensional tolerance', or 'rectangularity'.

4.2.235 General_tolerances

A General_tolerances is a set of default values for dimension or geometric tolerances.

The default values are specified in a table where the correct tolerance type and values are provided per range of dimension or according to the number of significant digits of the dimension. These default values are overwritten by tolerances that are assigned explicitly to particular aspects of the shape. The concept of General_tolerances is defined in ISO 2768.

EXAMPLE The General_tolerances specifies, e.g., that for the tolerance class 'f' the tolerance value '± 0.15' is applicable for length dimensions between 30 mm and 120 mm. Figure 41 depicts an example for General_tolerances.

The data associated with a General_tolerances are the following:

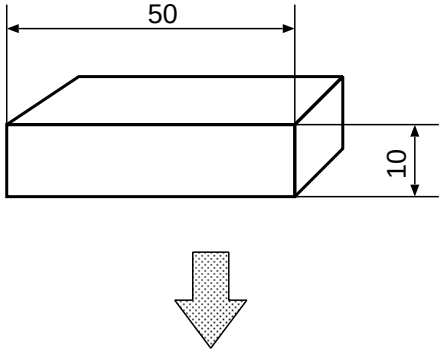
— table_definition;

— tolerance_class.

4.2.235.1 table_definition

The table_definition specifies the contents of the General_tolerances that is defined either explicitly in a General_tolerance_table (see 4.2.234) or in a document.

See 4.3.915 and 4.3.916 for the application assertions.



There shall be exactly one object that defines the table_definition for a General_tolerances (see 4.2.235).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.235.2 tolerance_class

The tolerance_class specifies the class as defined in the tolerance table that applies in the given context.

standard source: ISO 2768

length dimensional tolerance:

tolerance class	length nominal 0.5-3	3-6	6-30	30-120	120-400	etc.
f	0.05	0.05	0.1	0.15	0.2	
m	0.1	0.1	0.2	0.3	0.5	
c	0.2	0.3	0.5	0.8	1.2	
v	-	0.5	1.0	1.5	2.5	

tolerance ± mm

angular dimensional tolerance:

tolerance class	short angle length nominal 0-10	10-50	50-120	120-400	>400
f	1°	30'	20'	10'	5'
m	1°	30'	20'	10'	5'
c	1°30'	1°	30'	15'	10'
v	3°	2°	1°	30'	20'

tolerance ± °

rectangularity:

tolerance class	short angle length nominal 0-100	100-300	300-1000	1000-3000
H	0.2	0.3	0.4	0.5
K	0.4	0.6	0.8	1
L	0.6	1	1.5	2

tolerance ± mm

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.236 General_top_condition

A General_top_condition is a top condition for a Boss_feature (see 4.2.42). This top condition is an arbitrary non-planar shape.

A General_top_condition is a type of Boss_top_condition (see 4.2.43).

The data associated with a General_top_condition are the following:

— top_face

The top_face specifies the Surface (see 4.2.489) or the Shell (see 4.2.451) that defines the top of the boss. The geometric elements representing the top shall be defined in the same Cartesian_coordinate_space (see 4.2.44) as the concerned Boss_feature.

See 4.3.917 and 4.3.918 for the application assertions.

© ISO 2001 – All rights reserved

There shall be exactly one object that defines the top_face for a General_top_condition.

4.2.237 Geometric_dimension

A Geometric_dimension is the definition of the size of an element or of the distance between two elements.

NOTE - A Geometric_dimension may be presented by a Dimension_callout (see 4.2.150) showing the dimension value and its relationship to the drafted geometry or annotation.

Each Geometric_dimension is a Size_dimension (see 4.2.456) or a Location_dimension (see 4.2.301).

The data associated with a Geometric_dimension are the following:

— dimension_value;

— id.

4.2.237.1 dimension_value

The dimension_value specifies a positive value that is the value of size of the element or of the distance between the two elements.

See 4.3.919 for the application assertion.

4.2.237.2 id

The id specifies the identifier of the Geometric_dimension.

4.2.238 Geometric_model

A Geometric_model is a representation of geometry. A Geometric_model that does not reference any Detailed_geometric_model_element (see 4.2.144) objects through one of the subtypes directly shall either reference at least one Template_instance (see 4.2.512) as 'additional_element' or shall reference Axis_placement (see 4.2.33) objects exclusively.

NOTE 1 - The case, where the Geometric_model is used without creating a subtype and without referencing additional elements, is used for creating intermediate assembly models in the context of product data management systems that manage CAD models as files.

NOTE 2 - Each Geometric_model may be a Geometric_model_version (see 4.2.241) and one of the other types of Geometric_model.

Each Geometric_model may be a Geometric_model_version (see 4.2.241).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Each Geometric_model may be one of the following: a Wireframe_model_3d (see 4.2.562), a Point_-direction_model (see 4.2.370), a Wireframe_model_2d (see 4.2.561), a Hybrid_geometric_model_3d (see 4.2.259), a Geometrically_bounded_surface_model (see 4.2.248), a Surface_model (see 4.2.496), a Compound_model (see 4.2.92), a Csg_model (see 4.2.106), a B_rep_model (see 4.2.35), or a Faceted_-b_rep_model (see 4.2.196).

The data associated with a Geometric_model are the following:

— additional_element;

— description;

— is_defined_in;

— model_extent;

— model_id.

4.2.238.1 additional_element

The additional_element specifies the Template_instance (see 4.2.512) objects that are additionally imported into the Geometric_model using a Transformation (see 4.2.533). The additional_element shall be of the same type as the referring Geometric_model.

See 4.3.922 for the application assertion.

4.2.238.2 description

The description specifies additional information about the Geometric_model.

See 4.3.921 for the application assertion.

The description need not be specified for a particular Geometric_model (see 4.2.238).

If present, there shall be exactly one object that defines the description for a Geometric_model.

4.2.238.3 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) in which the Geometric_model is defined. The specified Cartesian_coordinate_space serves also as the reference coordinate space for the transformation of Template_instance (see 4.2.512) objects used as additional elements in the Geometric_-model.

See 4.3.920 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.238.4 model_extent

The model_extent specifies the radius of a sphere that contains all elements of the model and whose centre is at the origin of the Cartesian_coordinate_space (see 4.2.44) of the Geometric_model. The model_extent is specified using a length unit.

The model_extent need not be specified for a particular Geometric_model (see 4.2.238).

4.2.238.5 model_id

The model_id specifies the identifier of the Geometric_model.

4.2.239 Geometric_model_relationship

A Geometric_model_relationship is a relationship between two models. The models may be either of type Geometric_model (see 4.2.238) or of type External_model (see 4.2.189).

Each Geometric_model_relationship may be a Geometric_model_relationship_with_transformation (see 4.2.240).

The data associated with a Geometric_model_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.239.1 description

The description specifies additional information about the Geometric_model_relationship.

See 4.3.925 for the application assertion.

The description need not be specified for a particular Geometric_model_relationship (see 4.2.239).

If present, there shall be exactly one object that defines the description for a Geometric_model_relationship.

4.2.239.2 related

The related specifies the second of the two model objects related by the Geometric_model_relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.923 and 4.3.924 for the application assertions.

There shall be exactly one object that the Geometric_model_relationship (see 4.2.239) is related to.

4.2.239.3 relating

The relating specifies the first of the two model objects related by the Geometric_model_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.923 and 4.3.924 for the application assertions.

There shall be exactly one object that the Geometric_model_relationship (see 4.2.239) is relating to.

4.2.239.4 relation_type

The relation_type specifies the meaning of the relationship.

EXAMPLE The relation_type may be, e.g., 'basis for' if the relating Geometric_model (see 4.2.238) provides a detailed representation of the shape of an object and if the related Geometric_model provides an idealized representation of the shape of the same object.

4.2.240 Geometric_model_relationship_with_transformation

A Geometric_model_relationship_with_transformation is a relationship between two model objects with the additional information about a geometric Transformation (see 4.2.533). This Transformation defines the location and orientation of the related model relative to the relating model.

A Geometric_model_relationship_with_transformation is a type of Geometric_model_relationship (see 4.2.239).

The data associated with a Geometric_model_relationship_with_transformation are the following:

— model_placement

The model_placement specifies the geometric Transformation that places and orients the related model relative to the relating model.

See 4.3.926 for the application assertion.

4.2.241 Geometric_model_version

A Geometric_model_version is a particular version of a Geometric_model (see 4.2.238).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

A Geometric_model_version is a type of Geometric_model (see 4.2.238).

The data associated with a Geometric_model_version are the following:

— version_id

The version_id specifies the identification of a particular version of a Geometric_model.

4.2.242 Geometric_set_3d

A Geometric_set_3d is a set of Curve (see 4.2.108), Point (see 4.2.367), or Surface (see 4.2.489) objects that are part of a Geometrically_bounded_surface_model (see 4.2.248).

A Geometric_set_3d is a type of Detailed_geometric_model_element (see 4.2.144).

The data associated with a Geometric_set_3d are the following:

— element

The element specifies the set of geometric elements that are included in the Geometric_set_3d.

See 4.3.927, 4.3.928, and 4.3.929 for the application assertions.

There shall be at least one object that defines the element for a Geometric_set_3d.

4.2.243 Geometric_tolerance

A Geometric_tolerance is the allowable deviation of shape characteristics as defined in ISO 1101.

Each Geometric_tolerance is a Cylindricity_tolerance (see 4.2.115), a Line_profile_tolerance (see 4.2.297), a Symmetry_tolerance (see 4.2.503), a Straightness_tolerance (see 4.2.477), a Flatness_tolerance (see 4.2.211), a Position_tolerance (see 4.2.378), a Circular_runout_tolerance (see 4.2.63), a Surface_profile_tolerance (see 4.2.499), a Total_runout_tolerance (see 4.2.532), a Perpendicularity_tolerance (see 4.2.345), a Parallelism_tolerance (see 4.2.338), a Concentricity_tolerance (see 4.2.93), an Angularity_tolerance (see 4.2.15), a Coaxiality_tolerance (see 4.2.76), or a Roundness_tolerance (see 4.2.441).

The data associated with a Geometric_tolerance are the following:

— is_applied_to;

— modification;

— name;

— qualifying_note;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— segment_size;

— significant_digits;

— tolerance_value;

— value_determination.

4.2.243.1 is_applied_to

The is_applied_to specifies the shape that the Geometric_tolerance is associated to.

See 4.3.930, 4.3.931, 4.3.932, and 4.3.934 for the application assertions.

There shall be exactly one object that the Geometric_tolerance (see 4.2.243) is_applied_to.

4.2.243.2 modification

The modification specifies the Tolerance_condition (see 4.2.522) that is associated with the application or the Geometric_tolerance.

See 4.3.935 for the application assertion.

The modification need not be specified for a particular Geometric_tolerance (see 4.2.243).

4.2.243.3 name

The name specifies the word or group of words by which the Geometric_tolerance is referred to.

See 4.3.933 for the application assertion.

The name need not be specified for a particular Geometric_tolerance (see 4.2.243).

If present, there shall be exactly one object that defines the name for a Geometric_tolerance.

4.2.243.4 qualifying_note

The qualifying_note specifies additional constraints on the Geometric_tolerance.

EXAMPLE 'not concave' is an example for the qualifying_note.

See 4.3.933 for the application assertion.

The qualifying_note need not be specified for a particular Geometric_tolerance (see 4.2.243).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

If present, there shall be exactly one object that defines the qualifying_note for a Geometric_tolerance.

4.2.243.5 segment_size

The segment_size specifies the length of a segment. All along any segment of this size, taken on the toleranced element, the toleranced element shall conform to the tolerance.

The segment_size need not be specified for a particular Geometric_tolerance (see 4.2.243).

4.2.243.6 significant_digits

The significant_digits specify the number of decimal digits indicating the accuracy of the tolerance value.

The significant_digits need not be specified for a particular Geometric_tolerance (see 4.2.243).

4.2.243.7 tolerance_value

The tolerance_value specifies the tolerance magnitude expressed by a length measure with unit.

4.2.243.8 value_determination

The value_determination specifies information on how the Geometric_tolerance shall be interpreted. Where applicable, the following values shall be used:

— 'calculated': The value has been calculated from a particular representation;

— 'designed': The value represents a value intended by the design;

— 'estimated': The value has been estimated;

— 'measured': The value has been measured;

— 'required': The value represents a requirement.

NOTE - A Geometric_tolerance may be specified in the design stage of a product but it may also be documented as measured on a prototype.

The value_determination need not be specified for a particular Geometric_tolerance (see 4.2.243).

4.2.244 Geometric_tolerance_callout

A Geometric_tolerance_callout is a combination of annotation elements that represents information about a geometric tolerance.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

For this particular type of callout, the inherited attribute 'contents' shall refer to Annotation_curve (see 4.2.16), Geometric_tolerance_symbol (see 4.2.246), or Text (see 4.2.514) objects only.

A Geometric_tolerance_callout is a type of Draughting_callout (see 4.2.169).

4.2.245 Geometric_tolerance_relationship

A Geometric_tolerance_relationship is a relationship between two Geometric_tolerance (see 4.2.243) objects.

The data associated with a Geometric_tolerance_relationship are the following:

— related;

— relating;

— relation_type.

4.2.245.1 related

The related specifies the second of the two objects related by the Geometric_tolerance_relationship.

NOTE - The semantics of this attribute is defined by the attribute relation_type.

See 4.3.936 for the application assertion.

4.2.245.2 relating

The relating specifies the first of the two objects related by the Geometric_tolerance_relationship.

NOTE - The semantics of this attribute is defined by the attribute relation_type.

See 4.3.936 for the application assertion.

4.2.245.3 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'precedence': The relating Geometric_tolerance (see 4.2.243) is of higher priority than the related;

EXAMPLE A part may have a Shape_element (see 4.2.449) that has a Geometric_tolerance and that may serve as the basic shape for a pattern that may also have a Geometric_tolerance. In this case, the tolerance for the base shape usually has precedence over the tolerance for the pattern.

— 'simultaneity': The relating and the related Geometric_tolerance shall be met simultaneously.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.246 Geometric_tolerance_symbol

A Geometric_tolerance_symbol is a predefined annotation symbol used to present information about a geometric tolerance.

This AP supports the geometric tolerance symbols defined in ISO 7083, i.e., 'angularity', 'basic dimension', 'blanked datum reference', 'circular runout', 'circularity', 'concentricity', 'cylindricity', 'datum target identification', 'filled datum reference', 'flatness', 'maximum material condition', 'parallelism', 'perpendicularity', 'position', 'profile of a line', 'profile of a surface', 'projected tolerance zone', 'straightness', 'symmetry', and 'total runout'.

Additionally, symbols for 'diameter', 'least material condition', 'regardless of feature size', and 'target point' are supported.

The dimensions of the symbols are presented in figure 42.

4.2.247 Geometrical_relationship

A Geometrical_relationship is the relationship between two Design_discipline_item_definition (see 4.2.142) objects specifying two parts that are geometrically related. Therefore, the shape of the related parts shall be represented only once and can be reused for the geometrically related situation.

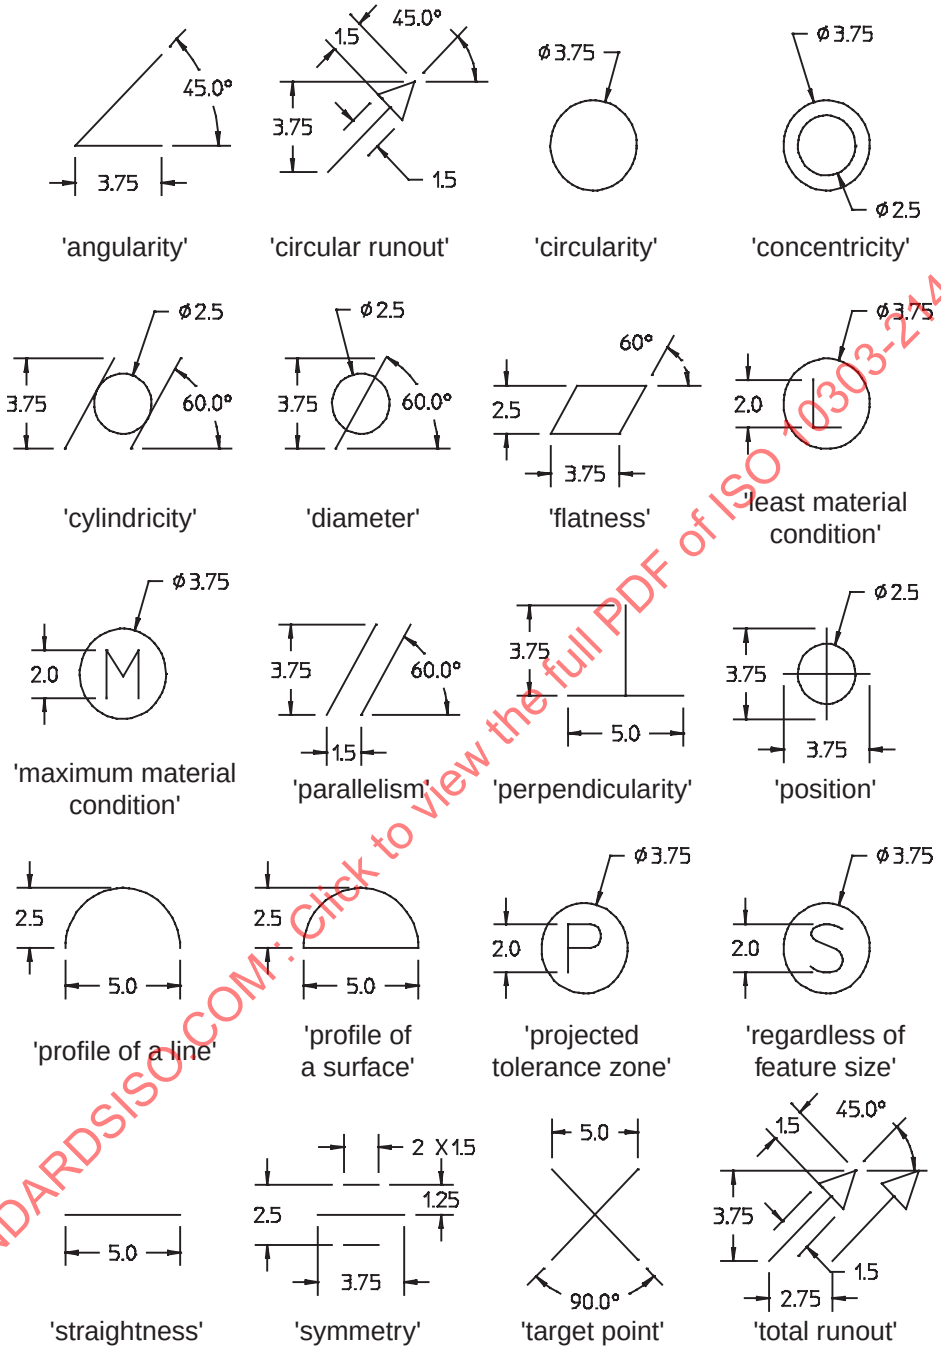
The two Design_discipline_item_definition objects that are related by this relationship shall belong to different Item_version (see 4.2.275) objects. Other properties except shape are not subject to this relationship and therefore not 'inherited' from the relating Design_discipline_item_definition to the related Design_discipline_item_definition.

> EXAMPLE Figure 43 shows an example for a Geometrical_relationship: in this case the left mudguard of a car is symmetrical to the right mudguard. A given plane mirroring transformation specifies the location of the left mudguard regarding the location of the right mudguard.

A Geometrical_relationship is a type of Item_definition_relationship (see 4.2.269).

The data associated with a Geometrical_relationship are the following:

— definition_placement;



— description.

4.2.247.1 definition_placement

The definition_placement specifies the Geometric_model_relationship_with_transformation (see 4.2.240) or the Template_instance (see 4.2.512) that has the Transformation (see 4.2.533) to be applied to the relating Design_discipline_item_definition (see 4.2.142) in order to define the location and the orientation of the related Design_discipline_item_definition. Translation, rotation, and mirroring, i.e., inversion, is

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Dimensions shown are in mm and prior to scaling

Figure 42 – Predefined geometrical tolerance symbols

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

included; scaling is not included. In the case of a Template_instance, the scale factor shall be omitted or set to 1.0.

See 4.3.937 and 4.3.939 for the application assertions.

There shall be exactly one object that defines the definition_placement for a Geometrical_relationship (see 4.2.247).

4.2.247.2 description

The description specifies additional information about the Geometrical_relationship.

See 4.3.938 for the application assertion.

The description need not be specified for a particular Geometrical_relationship (see 4.2.247).

If present, there shall be exactly one object that defines the description for a Geometrical_relationship.

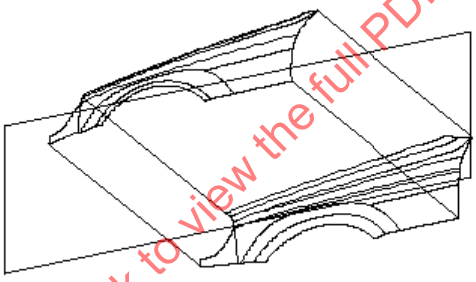


Figure 43 – Application of a Geometrical_relationship

4.2.248 Geometrically_bounded_surface_model

A Geometrically_bounded_surface_model is a surface model without topology. This model is formed by the use of points, curves and surfaces only. All unbounded curves and surfaces shall be explicitly trimmed.

A Geometrically_bounded_surface_model is a type of Geometric_model (see 4.2.238).

The data associated with a Geometrically_bounded_surface_model are the following:

— element

The element specifies the set of Geometric_set_3d (see 4.2.242) objects that form the Geometrically_-bounded_surface_model.

See 4.3.940 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.249 Ground_representation

A Ground_representation is the geometric representation of that part of the kinematic model that shall never move.

The data associated with a Ground_representation are the following:

— shape_description

The shape_description specifies the Geometric_model (see 4.2.238) of the Ground_representation.

See 4.3.941 for the application assertion.

4.2.250 Group

A Group is a collection of elements. A group may contain zero or more Detailed_element (see 4.2.143) or Shape_element (see 4.2.449) objects. If a group is referred to as 'relating' by an instance of Structuring_-method_hierarchy (see 4.2.480), it includes, by means of this instance, the Group that is referred to as 'related' by it. The nesting shall be acyclic. In case of nesting, a Group need not contain elements.

EXAMPLE 1 In a B-rep model, several drilling holes are included. The objects defining the drilling holes including the two intersection curves and the faces of the hole may be grouped together with the purpose 'drilling hole'.

EXAMPLE 2 Features can be grouped for organizational purposes, e.g., in order to identify all portions of shape that are created using features.

NOTE - For the purpose of grouping of features for process operations the use of Process_operation_-input_or_output (see 4.2.383) is appropriate.

The data associated with a Group are the following:

— element;

— name;

— purpose.

4.2.250.1 element

The element specifies the Detailed_element (see 4.2.143) or Shape_element (see 4.2.449) objects included in the Group. All elements shall be of the same type.

See 4.3.942 and 4.3.944 for the application assertions.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.250.2 name

The name specifies the word or group of words by which the Group is referred to.

See 4.3.943 for the application assertion.

There shall be exactly one object that defines the name for a Group (see 4.2.250).

4.2.250.3 purpose

The purpose specifies the rationale behind the grouping mechanism.

See 4.3.943 for the application assertion.

The purpose need not be specified for a particular Group (see 4.2.250).

If present, there shall be exactly one object that defines the purpose for a Group.

4.2.251 Group_relationship

A Group_relationship is a relationship between two Group (see 4.2.250) objects. Group_relationship shall not be used to convey the information that the related Group is an element of the relating Group.

NOTE - In order to convey such information, the use of Structuring_method_hierarchy (see 4.2.480) is appropriate.

The data associated with a Group_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.251.1 description

The description specifies additional information about the Group_relationship.

See 4.3.946 for the application assertion.

The description need not be specified for a particular Group_relationship (see 4.2.251).

If present, there shall be exactly one object that defines the description for a Group_relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.251.2 related

The related specifies the second of the two Group (see 4.2.250) objects that are related by the Group_-relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.945 for the application assertion.

4.2.251.3 relating

The relating specifies the first of the two Group (see 4.2.250) objects that are related by the Group_-relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.945 for the application assertion.

4.2.251.4 relation_type

The relation_type specifies the meaning of the relationship.

4.2.252 Half_space_solid

A Half_space_solid is the half space that is the regular subset of the domain that lies on one side of an unbounded surface. A Boolean flag shall be set to indicate whether the Half_space_solid is selected according to the normal direction of the surface. A Half_space_solid may participate in Boolean operations of the type 'intersection' or 'difference' as the second Boolean operand.

NOTE - Boxed half space solids are out of scope of this part of ISO 10303.

A Half_space_solid is a type of Detailed_geometric_model_element (see 4.2.144).

4.2.253 Hardcopy

A Hardcopy is the actual stack of paper consisting of one or more sheets, on which some product data is written, printed or plotted.

A Hardcopy is a type of Document_file (see 4.2.159).

4.2.254 Hardness

A Hardness is the hardness of a material on its surface. The hardness represents the resistance of a surface to deformation by external forces.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXAMPLE Figure 44 gives examples for the specification of surface hardness on technical drawings. On the left side a surface hardness with the measuring method 'Vickers HV30' according to ISO 4516 [13], the hardness value '620', the hardness value tolerance '+160', the treatment type 'Rht' (surface layer hardening), the hardness limit '500', the hardening depth '0,8 mm', and the hardening depth tolerance '+0,8 mm' is specified. On the right side a surface hardness with the measuring method 'Rockwell HRC' according to ISO 6508 [16], the hardness value '57', the hardness value tolerance '+6', the treatment type 'Eht' (case hardening), the hardening depth '1,2 mm', and the hardening depth tolerance '+0,7 mm' is specified.

A Hardness is a type of Surface_condition (see 4.2.492).

The data associated with a Hardness are the following:

— depth;

— description;

— environment_condition;

— hardness_value;

— measuring_method;

— measuring_position.

4.2.254.1 depth

The depth specifies the depth measured from the surface into the material where the specified hardness applies.

EXAMPLE The depth of the hardened material after a high-frequency quenching process is an example for depth.

See 4.3.948 for the application assertion.

The depth need not be specified for a particular Hardness (see 4.2.254).

4.2.254.2 description

The description specifies additional information about the Hardness.

EXAMPLE 'depth is describing the total effective case depth' is an example for description.

See 4.3.947 for the application assertion.

The description need not be specified for a particular Hardness (see 4.2.254).

If present, there shall be exactly one object that defines the description for a Hardness.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.254.3 environment_condition

The environment_condition specifies the conditions under that the specified hardness_value is valid.

There may be more than zero environment_condition for a Hardness (see 4.2.254).

4.2.254.4 hardness_value

The hardness_value specifies the value of the hardness.

See 4.3.948 for the application assertion.

4.2.254.5 measuring_method

The measuring_method specifies the method for measuring hardness values. Where applicable, the following values shall be used:

— 'brinell': The Hardness is measured according to the Brinell method;

— 'rockwell': The Hardness is measured according to the Rockwell method;

— 'vickers': The Hardness is measured according to the Vickers method.

4.2.254.6 measuring_position

The measuring_position specifies the position where the hardness is measured with respect to the part of interest.

> EXAMPLE 'core' or 'surface' are examples for measuring_position where 'core' is inside the hardened part, i.e., it is measured before a quenching process, and 'surface' is on the surface of a hardened part, i.e., it is measured after a quenching process.

The measuring_position need not be specified for a particular Hardness (see 4.2.254).

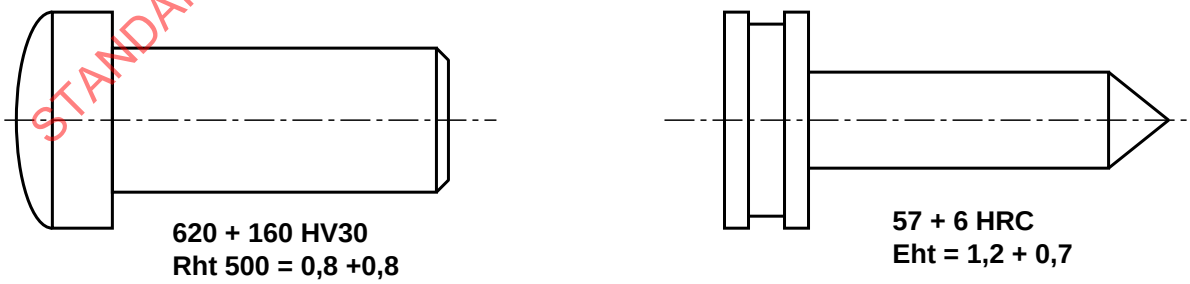

Figure 44 – Hardness

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.255 Hatching

A Hatching is a list of hatch patterns that are presented by a single and uniformly spaced geometric pattern of lines. The basis of the hatching pattern is an infinite straight line that is repeated across the fill area and clipped to the boundaries of the fill area.

NOTE - The Hatching may be defined by the user or may be externally defined.

4.2.256 Hidden_element_handling

A Hidden_element_handling is the definition of how hidden elements are handled in a Model_image (see 4.2.316).

The element types which may hide other elements, are solid and surface type geometric elements. The element types which may be hidden by these solids and surfaces, are all geometric and annotation type elements.

The data associated with a Hidden_element_handling are the following:

— hidden_element_appearance;

— is_defined_for;

— switch.

4.2.256.1 hidden_element_appearance

The hidden_element_appearance specifies the appearance characteristics of hidden elements.

EXAMPLE A curve appearance with a dashed line type shows lines that are hidden in a dashed style instead of not showing them at all.

See 4.3.949 for the application assertion.

The hidden_element_appearance need not be specified for a particular Hidden_element_handling (see 4.2.256).

4.2.256.2 is_defined_for

The is_defined_for specifies the Model_image (see 4.2.316) to which the Hidden_element_handling is applied.

See 4.3.950 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.256.3 switch

The switch specifies the status of hiding for the hidden element handling. The following values shall be used:

— 'active': The hidden elements are either not shown or visualized with a specialized appearance, defined by the attribute hidden_element_appearance;

— 'inactive': All elements are displayed as usual.

4.2.257 Hole_bottom_condition

A Hole_bottom_condition is the definition of a kind of end that characterizes a Round_hole (see 4.2.439).

EXAMPLE Figure 45 illustrates the various hole bottom conditions.

Each Hole_bottom_condition is a Flat_with_radius_bottom (see 4.2.209), a Flat_bottom (see 4.2.207), a Spherical_bottom (see 4.2.474), a Flat_with_taper_bottom (see 4.2.210), or a Conical_bottom (see 4.2.95).

The data associated with a Hole_bottom_condition are the following:

— is_applied_to

The is_applied_to specifies to which end of the path the Hole_bottom_condition applies. The following values shall be used:

— 'end': The Hole_bottom_condition is applied to that end of the Round_hole that corresponds to the end of the defining Linear_path (see 4.2.300);

— 'start': The Hole_bottom_condition is applied to that end of the Round_hole that corresponds to the start of the defining Linear_path.

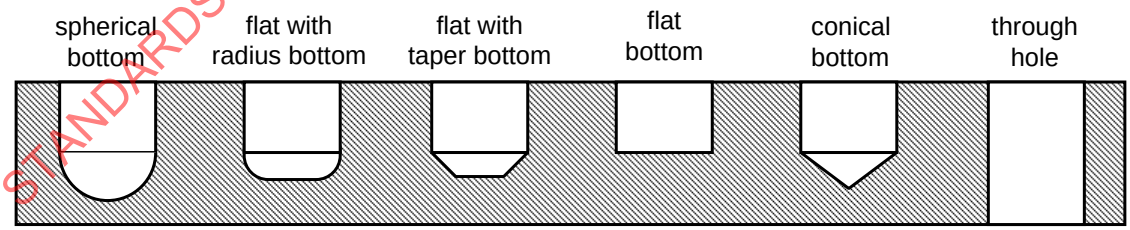

Figure 45 – Cross sections of holes

4.2.258 Hole_feature_in_panel

A Hole_feature_in_panel is a hole that is applied to a sheet like formed part.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

A Hole_feature_in_panel is a type of Process_feature_in_panel (see 4.2.379).

Each Hole_feature_in_panel may be a Panel_hole_with_barring (see 4.2.336).

The data associated with a Hole_feature_in_panel are the following:

— hole_profile;

— hole_type.

4.2.258.1 hole_profile

The hole_profile specifies a closed profile defining the shape of the Hole_feature_in_panel.

See 4.3.951 for the application assertion.

4.2.258.2 hole_type

The hole_type specifies the kind or shape of hole.

EXAMPLE 'circular' and 'rectangular' are examples for the hole_type.

The hole_type need not be specified for a particular Hole_feature_in_panel (see 4.2.258).

4.2.259 Hybrid_geometric_model_3d

A Hybrid_geometric_model_3d is a representation of geometry that consists of a set of Detailed_geometric_model_element (see 4.2.144) objects.

A Hybrid_geometric_model_3d is a type of Geometric_model (see 4.2.238).

The data associated with a Hybrid_geometric_model_3d are the following:

— element.

The element specifies a set of Detailed_geometric_model_element objects that are part of the Hybrid_geometric_model_3d; elements of type Shell (see 4.2.451) are not allowed. In case this set is empty, the Hybrid_geometric_model_3d shall reference at least one Template_instance (see 4.2.512) as 'additional_element'.

See 4.3.952 for the application assertion.

 © ISO 2001 – All rights reserved

4.2.260 Hyperbola

A Hyperbola is one branch of an open conic section defined by its radius, imaginary radius, the centre point and the direction of the line joining the centre to the focus.

A Hyperbola is a type of Curve (see 4.2.108).

4.2.261 Included_feature

An Included_feature is the identification of a feature as an element of a shape. All geometric data defining the feature are defined in the coordinate space of the part.

An Included_feature is a type of Feature_occurrence (see 4.2.200).

The data associated with an Included_feature are the following:

— definition

The definition specifies the Feature_definition (see 4.2.199), the General_feature (see 4.2.221), the Transition_feature (see 4.2.537), or the Thread_feature (see 4.2.517) that has the information concerning the type of feature and parameters that describe the feature.

See 4.3.953, 4.3.954, 4.3.955, and 4.3.956 for the application assertions.

There shall be exactly one object that defines the definition for an Included_feature.

4.2.262 Incremental_model_change

An Incremental_model_change is a mechanism to describe the differences between two Geometric_model (see 4.2.238) or Styled_model (see 4.2.484) objects with respect to geometry, style, or presentation. An Incremental_model_change states the fact that a base model has been modified and that the modifications have been included in the base model.

NOTE - Incremental_model_change objects may be chained resulting in a hierarchical description of modifications over time.

An Incremental_model_change is a type of Model_change (see 4.2.315).

The data associated with an Incremental_model_change are the following:

— added_element;

— basis_model.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.262.1 added_element

The added_element specifies the elements that have been added during the change in a container providing the coordinate space for these distinct elements.

See 4.3.957 and 4.3.959 for the application assertions.

4.2.262.2 basis_model

The basis_model specifies the Geometric_model (see 4.2.238), Styled_model (see 4.2.484), or Incremental_model_change that is subject to the changes.

See 4.3.957, 4.3.958, and 4.3.959 for the application assertions.

There shall be exactly one object that defines the basis_model for an Incremental_model_change (see 4.2.262).

4.2.263 Initial_configuration

An Initial_configuration represents the initial values of the pair parameters of a Kinematic_mechanism (see 4.2.286).

> NOTE - Some types of kinematic structures, e.g., four bar linkages, can not be uniquely based on shape parameters, such as lengths, only to determine a unique configuration of the mechanism. In those cases an Initial_configuration object provides pair parameter information that makes the configuration unique.

The data associated with an Initial_configuration are the following:

— initial_pair_values;

— is_applied_to.

4.2.263.1 initial_pair_values

The initial_pair_values specifies the initial value of the pair parameters of one or more Kinematic_pair (see 4.2.287) objects in a Kinematic_mechanism (see 4.2.286).

See 4.3.961 for the application assertion.

4.2.263.2 is_applied_to

The is_applied_to specifies the Kinematic_mechanism (see 4.2.286) that an Initial_configuration applies to.

See 4.3.960 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.264 Instance_placement

An Instance_placement is the information pertaining to the placement of a Single_instance (see 4.2.455), which is defined in its own Cartesian_coordinate_space (see 4.2.44), in the coordinate space of a reference Product_component (see 4.2.394).

NOTE - A Product_component may be placed by a transformation, using Model_property_association (see 4.2.317).

The data associated with an Instance_placement are the following:

— placed_instance;

— placement;

— reference_product_component.

4.2.264.1 placed_instance

The placed_instance specifies the Single_instance (see 4.2.455) that is placed. The coordinate system that serves as a reference for the placement shall be specified by a Model_property_association (see 4.2.317). the 'definition' of the Model_property_value (see 4.2.318) shall be a General_property (see 4.2.230) with a 'property_type' of 'positioning'.

See 4.3.964 for the application assertion.

4.2.264.2 placement

The placement specifies the Geometric_model_relationship_with_transformation (see 4.2.240) or the Template_instance (see 4.2.512) that defines the position of the 'placed_instance' relatively to the 'reference_product_component'. In the case of Template_instance, the scale shall be omitted or set to 1.0.

See 4.3.962 and 4.3.965 for the application assertions.

There shall be exactly one object that defines the placement for an Instance_placement (see 4.2.264).

4.2.264.3 reference_product_component

The reference_product_component specifies the Product_component (see 4.2.394) that specifies indirectly the reference coordinate space. A Model_property_association (see 4.2.317) shall be assigned to the reference_product_component to define this reference coordinate space.

See 4.3.963 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.265 Interpolated_configuration_sequence

An Interpolated_configuration_sequence is the motion (forward analysis) of a kinematic structure, defined by a set of configuration interpolations.

The data associated with an Interpolated_configuration_sequence are the following:

— interpolation

The interpolation specifies the Kinematic_configuration_interpolation (see 4.2.280) for the Interpolated_configuration_sequence. It defines the sequence of configuration definitions and the interpolation among them.

See 4.3.966 for the application assertion.

4.2.266 Interval_of_time

An Interval_of_time specifies a period of time.

The data associated with an Interval_of_time are the following:

— end_definition;

— start_definition.

4.2.266.1 end_definition

The end_definition defines the end of the Interval_of_time, either by referring to a bound, or specifying the extend of the Interval_of_time by a Duration (see 4.2.174). If the end_definition refers to an Event_reference (see 4.2.184) or Date_time (see 4.2.119), this particular bound of the resulting interval is excluded from it.

See 4.3.967, 4.3.968, and 4.3.969 for the application assertions.

There shall be exactly one object that defines the end_definition for an Interval_of_time (see 4.2.266).

4.2.266.2 start_definition

The start_definition defines the beginning of the Interval_of_time. The bound specified by the start_definition is included in the resulting interval.

See 4.3.967 and 4.3.969 for the application assertions.

There shall be exactly one object that defines the start_definition for an Interval_of_time (see 4.2.266).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.267 Item

An Item is either a single object or a unit in a group of objects. It collects the information that is common to all versions of the object. An Item shall always be classified as 'part', 'tool', or 'raw material' using a Specific_item_classification (see 4.2.465). Additionally, if an Assembly_definition (see 4.2.27) exists for at least one version of the Item, the Item shall be classified as being an 'assembly' using Specific_-item_classification.

NOTE - An Item may be either a single piece part, an assembly of arbitrary complexity, a raw material, or a tool.

EXAMPLE In the context of cars, an Item may be the car as a whole, the assembly of the engine, the car body, a fender, the side window glass, grease, or a stamping die.

The data associated with an Item are the following:

— description;

— id;

— name.

4.2.267.1 description

The description specifies additional information about the Item.

See 4.3.970 for the application assertion.

The description need not be specified for a particular Item (see 4.2.267).

If present, there shall be exactly one object that defines the description for an Item.

4.2.267.2 id

The id specifies the identifier of the Item. For the id, an owner shall be specified by a Person_organization_assignment (see 4.2.349) with role 'id owner'. The id shall be unique within the scope of the organization that is specified by the Person_organization_assignment with the role 'id owner'.

NOTE - The scope of uniqueness is usually dependent on the form of implementation; it may be a physical file or a data base.

4.2.267.3 name

The name specifies the word or group of words used to refer to the Item.

See 4.3.970 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

There shall be exactly one object that defines the name for an Item (see 4.2.267).

4.2.268 Item_definition_instance_relationship

An Item_definition_instance_relationship is a relationship between a Design_discipline_item_definition (see 4.2.142) and an Item_instance (see 4.2.271).

Except if specified in a specialization of this object, this relationship does not involve inheritance of data between the two related objects.

Each Item_definition_instance_relationship is a Collected_item_association (see 4.2.77), a Mated_item_-association (see 4.2.307), an Assembly_component_relationship (see 4.2.26), or a General_item_definition_instance_relationship (see 4.2.222).

The data associated with an Item_definition_instance_relationship are the following:

— related;

— relating.

4.2.268.1 related

The related specifies the Item_instance (see 4.2.271) that is part of the Item_definition_instance_relationship.

NOTE - The semantics of this attribute are defined by the specializations of Item_definition_instance_-relationship.

See 4.3.972 for the application assertion.

4.2.268.2 relating

The relating specifies the Design_discipline_item_definition (see 4.2.142) that is part of the Item_definition_instance_relationship.

NOTE - The semantics of this attribute are defined by the specializations of Item_definition_instance_-relationship.

See 4.3.971 for the application assertion.

4.2.269 Item_definition_relationship

An Item_definition_relationship is a relationship between two Design_discipline_item_definition (see 4.2.142) objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Except if specified in a specialization of this object, this relationship does not involve inheritance of data between the two related objects.

Each Item_definition_relationship is a Tool_part_relationship (see 4.2.528), a Replaced_definition_-relationship (see 4.2.430), a Geometrical_relationship (see 4.2.247), a Make_from_relationship (see 4.2.304), or a General_item_definition_relationship (see 4.2.223).

The data associated with an Item_definition_relationship are the following:

— related;

— relating.

4.2.269.1 related

The related specifies the second of the Design_discipline_item_definition (see 4.2.142) objects that are part of the relationship.

NOTE - The semantics of this attribute are defined by the specializations of Item_definition_relationship.

See 4.3.973 for the application assertion.

4.2.269.2 relating

The relating specifies the first of the Design_discipline_item_definition (see 4.2.142) objects that are part of the relationship.

NOTE - The semantics of this attribute are defined by the specializations of Item_definition_relationship.

See 4.3.973 for the application assertion.

4.2.270 Item_function_association

An Item_function_association is a mechanism to relate a Product_function (see 4.2.397) and a Design_-discipline_item_definition (see 4.2.142).

The data associated with an Item_function_association are the following:

— associated_function;

— associated_item;

— association_type;

— description.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.270.1 associated_function

The associated_function specifies the associated Product_function (see 4.2.397).

NOTE - The semantics of this attribute are defined by the attribute association_type.

See 4.3.976 for the application assertion.

4.2.270.2 associated_item

The associated_item specifies the Design_discipline_item_definition (see 4.2.142) that is associated with the Product_function (see 4.2.397).

See 4.3.974 for the application assertion.

4.2.270.3 association_type

The association_type specifies the kind of association. Where applicable, the following values shall be used:

— 'realization': the Product_function (see 4.2.397) is the primary function of the Design_discipline_-item_definition (see 4.2.142);

— 'additional functionality': the Product_function is an additional function of the Design_discipline_-item_definition. This Design_discipline_item_definition shall have at least one primary function associated by an Item_function_association with association_type 'realization'.

4.2.270.4 description

The description specifies additional information about the Item_function_association.

See 4.3.975 for the application assertion.

The description need not be specified for a particular Item_function_association (see 4.2.270).

If present, there shall be exactly one object that defines the description for an Item_function_association.

4.2.271 Item_instance

An Item_instance is the occurrence of an object in a product structure that is defined either by a Design_-discipline_item_definition (see 4.2.142) or by a Product_identification (see 4.2.398).

An Item_instance shall be used, at least once, in a Product_structure_relationship (see 4.2.400) or in an Assembly_component_relationship (see 4.2.26).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE In the case of a car, the Item (see 4.2.267) 'wheel' is defined once. Its Design_discipline_item_definition carries all the information necessary to define the wheel (e.g., its shape) independent of its usage. Additionally, there are 5 Item_instance objects for this wheel since there are 5 equal wheels used in a car: Front-left, front-right, rear-left, rear-right, and spare wheel. Each of these instances may carry additional information such as placement or function.

An Item_instance is a type of Product_constituent (see 4.2.395).

Each Item_instance is a Single_instance (see 4.2.455), a Quantified_instance (see 4.2.417), a Selected_instance (see 4.2.445), or a Specified_instance (see 4.2.472).

The data associated with an Item_instance are the following:

— definition;

— description;

— id.

4.2.271.1 definition

The definition specifies the Design_discipline_item_definition (see 4.2.142) or the Product_identification (see 4.2.398) that serves as a definition for this particular occurrence. If an appropriate Design_discipline_item_definition is available, this Design_discipline_item_definition shall be used as definition, otherwise a Product_identification shall be referenced.

See 4.3.977 and 4.3.979 for the application assertions.

There shall be exactly one object that defines the definition for an Item_instance (see 4.2.271).

4.2.271.2 description

The description specifies additional information about the Item_instance.

See 4.3.978 for the application assertion.

The description need not be specified for a particular Item_instance (see 4.2.271).

If present, there shall be exactly one object that defines the description for an Item_instance.

4.2.271.3 id

The id specifies the identifier of the Item_instance.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.272 Item_instance_relationship

An Item_instance_relationship is a relationship between two Item_instance (see 4.2.271) objects.

Except if specified in a specialization of this object, this relationship does not involve inheritance of data between the two related objects.

Each Item_instance_relationship is a General_item_instance_relationship (see 4.2.224), a Same_time_-machining_relationship (see 4.2.442), or a Replaced_usage_relationship (see 4.2.431).

The data associated with an Item_instance_relationship are the following:

— related;

— relating.

4.2.272.1 related

The related specifies the second of the two objects related by the Item_instance_relationship.

NOTE - The semantics of this attribute are defined by the specializations of Item_instance_relationship.

See 4.3.980 for the application assertion.

4.2.272.2 relating

The relating specifies the first of the two objects related by the Item_instance_relationship.

NOTE - The semantics of this attribute are defined by the specializations of Item_instance_relationship.

See 4.3.980 for the application assertion.

4.2.273 Item_property_association

An Item_property_association is a mechanism to associate a property value with an object.

An Item_property_association is a type of Property_value_association (see 4.2.413).

The data associated with an Item_property_association are the following:

— definitional;

— described_element.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.273.1 definitional

The definitional specifies whether the associated Property_value_representation (see 4.2.414) object may be used to distinguish the described_element from others of the same kind. A value of 'true' indicates that the associated Property_value_representation distinguishes it from others.

The definitional is only meaningful, if the described_element is of type Catalogue_thread (see 4.2.48) or of type Design_discipline_item_definition (see 4.2.142).

The definitional need not be specified for a particular Item_property_association (see 4.2.273).

4.2.273.2 described_element

The described_element specifies the object that is characterized by the Property_value (see 4.2.412).

See 4.3.981, 4.3.982, 4.3.983, 4.3.984, 4.3.985, 4.3.986, 4.3.987, 4.3.988, 4.3.989, 4.3.990, 4.3.991, 4.3.992, 4.3.993, 4.3.994, 4.3.995, 4.3.996, 4.3.997, 4.3.998, 4.3.999, and 4.3.1000 for the application assertions.

There shall be exactly one object that defines the described_element for an Item_property_association (see 4.2.273).

4.2.274 Item_shape

An Item_shape is the definition of the shape of a Design_discipline_item_definition (see 4.2.142), an Item_instance (see 4.2.271) or of a Physical_instance (see 4.2.352).

> EXAMPLE An Item_shape may define the shape of an Item_instance in a given usage context, e.g., in order to define the shape of a flexible pipe when placed in a car.

Each Item_shape may be a Featured_shape (see 4.2.203).

The data associated with an Item_shape are the following:

— described_object;

— description.

4.2.274.1 described_object

The described_object specifies the object whose shape the Item_shape defines.

See 4.3.1001, 4.3.1002, and 4.3.1004 for the application assertions.

There shall be exactly one object that defines the described_object for an Item_shape (see 4.2.274).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.274.2 description

The description specifies additional information about the Item_shape.

See 4.3.1003 for the application assertion.

The description need not be specified for a particular Item_shape (see 4.2.274).

If present, there shall be exactly one object that defines the description for an Item_shape.

4.2.275 Item_version

An Item_version is a version of an Item (see 4.2.267) and serves as the collector of the data characterizing a physically realizable object in various application contexts.

NOTE 1 - An Item_version may be produced, consumed, used to produce other Item_version objects, or offered to the market.

NOTE 2 - The collection of defining information may be incomplete, i.e., not all of the Design_discipline_item_definition (see 4.2.142) objects needed to define an Item_version are associated with the Item_version.

NOTE 3 - The set of Item_version objects of an Item represents the history of the Item within a particular life cycle stage or over its complete life cycle.

NOTE 4 - An Item_version does not have to be referenced by any Design_discipline_item_definition.

NOTE 5 - In the case, where two Item_version objects are related to each other by an Item_version_relationship (see 4.2.276) with a relation_type of value 'supplied part', the relating Item_version is the version carrying the necessary information, e.g., shape and properties, and the related is the version either supplied by or supplied for another company.

The data associated with an Item_version are the following:

— associated_item;

— description;

— id.

4.2.275.1 associated_item

The associated_item specifies the Item (see 4.2.267) with which the Item_version is associated.

See 4.3.1005 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.275.2 description

The description specifies additional information about the Item_version.

See 4.3.1006 for the application assertion.

The description need not be specified for a particular Item_version (see 4.2.275).

If present, there shall be exactly one object that defines the description for an Item_version.

4.2.275.3 id

The id specifies the identifier of the Item_version. The id shall be unique within the scope of the associated Item (see 4.2.267).

NOTE - A particular object is identified by the id of Item_version that serves to identify the particular version coupled with the id of the associated Item that serves to identify the generic object.

4.2.276 Item_version_relationship

An Item_version_relationship is a relationship between two Item_version (see 4.2.275) objects.

Except if specified in a specialization of this object, this relationship does not involve inheritance of data between the two related objects.

The data associated with an Item_version_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.276.1 description

The description specifies additional information about the Item_version_relationship (see 4.2.276).

See 4.3.1008 for the application assertion.

The description need not be specified for a particular Item_version_relationship.

If present, there shall be exactly one object that defines the description for an Item_version_relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.276.2 related

The related specifies the second of the two Item_version (see 4.2.275) objects related by the Item_version_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1007 for the application assertion.

4.2.276.3 relating

The relating specifies the first of the two Item_version (see 4.2.275) objects related by the Item_version_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1007 for the application assertion.

4.2.276.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'derivation': The application object defines a deriving relationship where the related Item_version (see 4.2.275) is based on the relating Item_version which is an earlier version of the same or of a different Item (see 4.2.267);

— 'hierarchy': The application object defines a hierarchical relationship where the related Item_version is a subordinate version of the relating Item_version;

EXAMPLE 1 'Rev. 1.1' and 'rev. 1.2' are subordinates of 'version 1'.

— 'sequence': The application object defines a version sequence where the relating Item_version is the preceding version of the related Item_version that is the following version. For a given Item_version there shall be at most one Item_version_relationship of this relation_type referring to this Item_version as 'relating' and at most one Item_version_relationship of this relation_type referring as 'related';

— 'supplied item': The application object defines a relationship between two Item_version objects representing the same object in different organizational contexts.

NOTE 1 - The different organizational contexts can be represented by different general organizational data associations.

NOTE 2 - The concept of Alias_identification (see 4.2.8) may also be used for Item_version. However, Item_version_relationship shall be used if the related Item_version corresponds to an item at the supplier's site and if a distinction of additional information such as name or organizational information is needed.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE 2 Usually, items that are provided by suppliers have at the supplier's site an id different from the one at the contractor's site: an item that is identified in a company by the identifier 'C425' and the version id 'V2.0' may correspond to the item that the supplier identifies as '2X45' with the version id 'V3.2'.

4.2.277 Joggle_feature

A Joggle_feature is a change in elevation of a face along a rim designed to accommodate either clearance for the insertion of another part or a contact point for attachment of another part.

EXAMPLE Figure 46 illustrates the meaning of the various parameters defining a Joggle_feature.

A Joggle_feature is a type of Process_feature_in_panel (see 4.2.379).

The data associated with a Joggle_feature are the following:

— base_radius_1;

— base_radius_2;

— defining_path;

— direction_angle_1;

— direction_angle_2;

— height;

— slope_angle_1;

— slope_angle_2;

— termination;

— top_radius_1;

— top_radius_2.

4.2.277.1 base_radius_1

The base_radius_1 specifies the radius of the blending between the base surface and that wall of the Joggle_feature that is specified by the start point of the defining path.

See 4.3.1009 for the application assertion.

The base_radius_1 need not be specified for a particular Joggle_feature (see 4.2.277).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.277.2 base_radius_2

The base_radius_2 specifies the radius of the blending between the base surface and that wall of the Joggle_feature that is specified by the end point of the defining path.

See 4.3.1009 for the application assertion.

The base_radius_2 need not be specified for a particular Joggle_feature (see 4.2.277).

4.2.277.3 defining_path

The defining_path specifies the Linear_path (see 4.2.300) whose start and end point in combination with the angles at path start and path end define the location and orientation of the side walls of the Joggle_-feature.

The Linear_path is be defined in the same Cartesian_coordinate_space (see 4.2.44) as the Joggle_feature and shall be coplanar with the panel.

See 4.3.1011 for the application assertion.

4.2.277.4 direction_angle_1

The direction_angle_1 specifies an angle between 0 degrees and 90 degrees that is measured between the Linear_path (see 4.2.300) and a line starting at the start point of the Linear_path. This line is being directed towards the rim of the panel that shall have the Joggle_feature. This line shall be coplanar with the panel, with the Linear_path and with one side wall of the Joggle_feature.

See 4.3.1009 for the application assertion.

4.2.277.5 direction_angle_2

The direction_angle_2 specifies an angle between 0 degrees and 90 degrees that is measured between the Linear_path (see 4.2.300) and a line starting at the end point of the Linear_path. This line is being directed towards the rim of the panel that shall have the Joggle_feature. This line shall be coplanar with the panel, with the Linear_path and with one side wall of the Joggle_feature.

See 4.3.1009 for the application assertion.

4.2.277.6 height

The height specifies the distance between the panel surface and the top face of the Joggle_feature.

See 4.3.1009 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.277.7 slope_angle_1

The slope_angle_1 specifies the slope angle of that side wall of the Joggle_feature that is defined by the line starting at the start of the Linear_path (see 4.2.300).

See 4.3.1009 for the application assertion.

4.2.277.8 slope_angle_2

The slope_angle_2 specifies the slope angle of that side wall of the Joggle_feature that is defined by the line starting at the end of the Linear_path (see 4.2.300).

See 4.3.1009 for the application assertion.

4.2.277.9 termination

The termination specifies the type of Joggle_termination (see 4.2.278) that defines the end condition of the Joggle_feature.

See 4.3.1010 for the application assertion.

4.2.277.10 top_radius_1

The top_radius_1 specifies the radius of the blending between the top surface and that wall of the Joggle_-feature that is specified by the start point of the defining path.

See 4.3.1009 for the application assertion.

The top_radius_1 need not be specified for a particular Joggle_feature (see 4.2.277).

4.2.277.11 top_radius_2

The top_radius_2 specifies the radius of the blending between the top surface and that wall of the Joggle_-feature that is specified by the end point of the defining path.

See 4.3.1009 for the application assertion.

The top_radius_2 need not be specified for a particular Joggle_feature (see 4.2.277).

4.2.278 Joggle_termination

A Joggle_termination is the end condition specifying the termination of a Joggle_feature (see 4.2.277).

Each Joggle_termination is a Face_termination (see 4.2.193) or a Value_termination (see 4.2.548).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

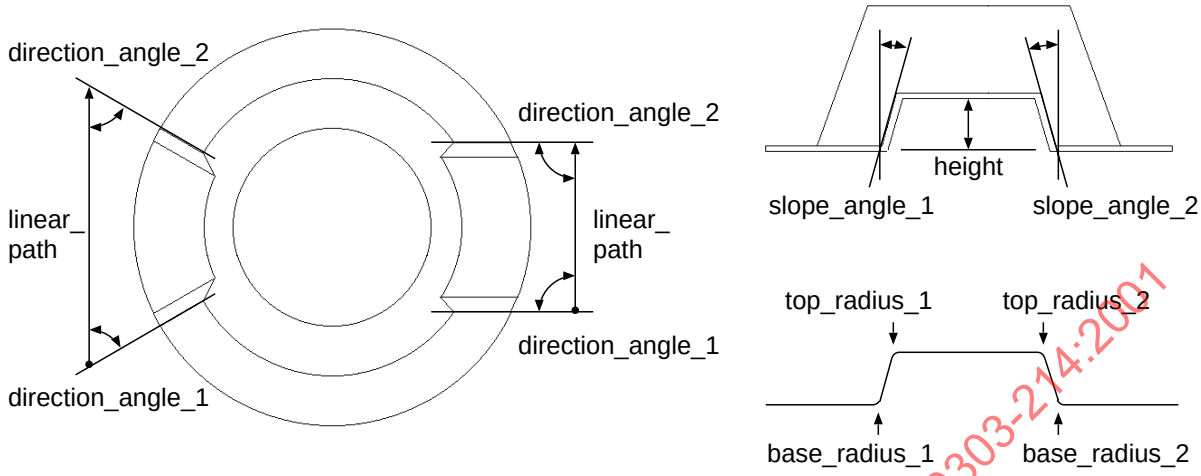

Figure 46 – Parameters defining a Joggle_feature

4.2.279 Kinematic_configuration_definition

A Kinematic_configuration_definition is a configuration of a kinematic structure. It is defined by a set of values assigned to the kinematic pairs and by the value of a parameter that enables to locate the configuration in the parameter range that is studied in the kinematic simulation.

The data associated with a Kinematic_configuration_definition are the following:

— pair_values;

— t_parameter.

4.2.279.1 pair_values

The pair_values specifies the set of values applied to the pairs.

See 4.3.1012 for the application assertion.

4.2.279.2 t_parameter

The t_parameter specifies the Path_approximation (see 4.2.343) associated to the Kinematic_configuration_definition.

See 4.3.1013 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.280 Kinematic_configuration_interpolation

A Kinematic_configuration_interpolation is the specification of the interpolation of the configurations between two configuration definitions.

The data associated with a Kinematic_configuration_interpolation are the following:

— interpolation_type;

— next_definition;

— previous_definition.

4.2.280.1 interpolation_type

The interpolation_type specifies the type of interpolation from the previous configuration definition to the next.

4.2.280.2 next_definition

The next_definition specifies the Kinematic_configuration_definition (see 4.2.279) at which the interpolation ends.

See 4.3.1014 for the application assertion.

4.2.280.3 previous_definition

The previous_definition specifies the Kinematic_configuration_definition (see 4.2.279) from which the interpolation starts.

See 4.3.1014 for the application assertion.

4.2.281 Kinematic_control

A Kinematic_control is the control information that is necessary for the analysis of a Kinematic_transformation_result (see 4.2.290).

The data associated with a Kinematic_control are the following:

— is_controlling;

— program;

— related_result.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.281.1 is_controlling

The is_controlling specifies the Kinematic_mechanism (see 4.2.286) to which the control information applies.

See 4.3.1016 for the application assertion.

4.2.281.2 program

The program specifies the set of motion definitions, i.e., the list of pre-defined states of the kinematic structure and the allowed interpolations between each state.

See 4.3.1015 for the application assertion.

4.2.281.3 related_result

The related_result specifies the set of Kinematic_transformation_result (see 4.2.290) objects for which the Kinematic_control serves as input.

See 4.3.1017 for the application assertion.

4.2.282 Kinematic_element

A Kinematic_element is a basic element used for a Kinematic_mechanism (see 4.2.286).

Each Kinematic_element is a Kinematic_link (see 4.2.284), a Kinematic_structure (see 4.2.289), a Kinematic_joint (see 4.2.283), or a Kinematic_pair (see 4.2.287).

The data associated with a Kinematic_element are the following:

— name

The name specifies the word or group of words by which the Kinematic_element is referred to.

See 4.3.1018 for the application assertion.

The name need not be specified for a particular Kinematic_element.

If present, there shall be exactly one object that defines the name for a Kinematic_element.

4.2.283 Kinematic_joint

A Kinematic_joint is the topological aspect of an ordered connection between exactly two links. The orientation is always implicitly associated with a joint. This orientation points from the first link to the second link.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE In the case of a rack and pinion pair, the orientation of the Kinematic_joint would reflect the transformation to a link representing the pinion.

A Kinematic_joint is a type of Kinematic_element (see 4.2.282).

The data associated with a Kinematic_joint are the following:

— first_link;

— pair;

— second_link.

4.2.283.1 first_link

The first_link specifies the first link of the ordered connection at the Kinematic_joint.

See 4.3.1019 for the application assertion.

4.2.283.2 pair

The pair specifies the geometric constraints of the Kinematic_joint (see 4.2.283).

See 4.3.1020 for the application assertion.

4.2.283.3 second_link

The second_link specifies the second link of the ordered connection at the Kinematic_joint.

See 4.3.1019 for the application assertion.

4.2.284 Kinematic_link

A Kinematic_link is the topological information associated with a rigid part of a Kinematic_mechanism (see 4.2.286).

A Kinematic_link is a type of Kinematic_element (see 4.2.282).

The data associated with a Kinematic_link are the following:

— representation

The representation specifies the geometric representation and the implicit link frame of the Kinematic_-link.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

See 4.3.1021 for the application assertion.

4.2.285 Kinematic_link_representation

A Kinematic_link_representation is the description of the geometry of a Kinematic_link (see 4.2.284).

The data associated with a Kinematic_link_representation are the following:

— additional_reference_frame;

— physical_description.

4.2.285.1 additional_reference_frame

The additional_reference_frame specifies additional frames that are attached to the Kinematic_link_-representation.

See 4.3.1023 for the application assertion.

4.2.285.2 physical_description

The physical_description specifies the representation of the shape of the Kinematic_link_representation (see 4.2.285).

See 4.3.1022 for the application assertion.

4.2.286 Kinematic_mechanism

A Kinematic_mechanism is an association of a Kinematic_structure (see 4.2.289) and the position of this Kinematic_structure relative to the reference coordinate system of the parent object. A Kinematic_-mechanism describes a mechanical product whose motion is constrained by joints.

The data associated with a Kinematic_mechanism are the following:

— base_link;

— base_placement;

— structure_definition.

4.2.286.1 base_link

The base_link specifies the Kinematic_link (see 4.2.284) relative to that all the other Kinematic_link objects may move. The link may be a part of another Kinematic_mechanism.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE 1 A gripping tool attached to the end of a robot arm is an example for base_link.

This does not mean that Kinematic_mechanism objects are limited to those which have the same base at all times.

EXAMPLE 2 In space applications, e.g., worm-like mechanisms have been designed that grab to a space-structure with one end, move on with the other end, fix themselves with an end-effector, and then loosen the original grip.

See 4.3.1024 for the application assertion.

4.2.286.2 base_placement

The base_placement describes the rigid placement of the link frame of the base relative to the reference coordinate system of the parent object of the mechanism.

See 4.3.1026 for the application assertion.

4.2.286.3 structure_definition

The structure_definition specifies the Kinematic_structure (see 4.2.289) that makes up the Kinematic_-mechanism.

See 4.3.1025 for the application assertion.

4.2.287 Kinematic_pair

A Kinematic_pair represents the kinematic restriction between two adjacent Kinematic_link (see 4.2.284) objects coinciding in a Kinematic_joint (see 4.2.283).

EXAMPLE Figure 47 shows an example for placement relationships between kinematic pair frames and mating links.

A Kinematic_pair is a type of Kinematic_element (see 4.2.282).

The data associated with a Kinematic_pair are the following:

— pair_type;

— transformation_item_1;

— transformation_item_2.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.287.1 pair_type

The pair_type specifies the kind of Kinematic_pair. Where applicable, the following values shall be used:

— ’cylindrical pair’: A cylindrical pair constrains the motion between two adjacent links to a translation along a common axis and a rotation about it;

— ’fully constrained pair’: A fully constrained pair prevents any relative motion between two adjacent links;

— ’gear pair’: A gear pair constrains the motion between two adjacent links to a rolling (and potentially sliding) motion of the second link along the first link;

— ’homokinetic pair’: A homokinetic pair constrains the motion between two adjacent links to two rotations about two intersecting axes. The first rotation is split into two rotations of the half-angle, one being performed before the second rotation and the remaining one after.

NOTE 1 - Three successive rotations are actually performed, but the first one and the third one being coupled, there are only two degrees of freedom.

NOTE 2 - If compared to a universal pair, a homokinetic pair differs by the fact that no reference to a ’skew angle’ is needed.

NOTE 3 - The arbitrary orientation of axes Z and X about Y is another difference with a universal pair for which the orientation of Z and X axes about the Y axes of each of the links is imposed by the physical joint. The reason for this difference is that, while a universal pair transmits a rotation movement with a modulation depending on the angular misalignment of the Y-axes of the links and on the current orientation of the Z- and X- axes about the Y-axes, a homokinetic pair transmits the rotation movement without any modulation. Thus, the description of the homokinetic_pair needs no information about the orientation of any ’physical’ Z- or X- axis.

The orientation of the Z and X axes about the Y axis is arbitrary;

— ’planar curve pair’: A planar curve pair constrains the motion of two links along a planar curve on each of the links;

— ’planar pair’: A planar pair constrains the motion between two adjacent links to a translation along the x-axis and y-axis and a rotation about the z-axis;

— ’point on planar curve pair’: A point on planar curve pair specifies the lower bound and the upper bound of the parameter range for the point on planar curve pair;

— ’point on surface pair’: A point on surface pair constrains the motion of two links such that a point defined on the second link always lies on a surface defined on the first link;

— ’prismatic pair’: A prismatic pair constrains the motion between two adjacent links to a translation along a common axis;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— 'rack and pinion pair': A rack and pinion pair describes a pinion rolling on a rack where the rotation axis of the pinion is perpendicular to the direction of the rack;

— 'revolute pair': A revolute pair constrains the motion between two adjacent links to a rotation about a common axis;

— 'rolling curve pair': A rolling curve pair specifies the rolling motion between the curves on the two links of a planar curve pair;

— 'rolling surface pair': A rolling surface pair specifies the rolling motion between the two contact surfaces of a surface pair;

— 'screw pair': A screw pair constrains the motion between two adjacent links to a rotation about, and translation along, a common axis, where the translation is proportional to the rotation;

— 'sliding curve pair': A sliding curve pair specifies the sliding motion between the curves on the two links of a planar curve pair;

— 'sliding surface pair': A sliding surface pair specifies the sliding motion between the two contact surfaces of a surface pair;

— 'spherical pair': A spherical pair constrains the motion between two adjacent links to the rotation about three independent axes that intersect in a common point;

— 'surface pair': A surface pair constrains the motion of two links along a surface on each of the links such that they always have contact in at least one common point (contact point);

— 'unconstrained pair': An unconstrained pair does not constrain the relative motion between two adjacent links;

— 'universal pair': An universal pair constrains the motion between two adjacent links to two rotations about two intersecting axes.

4.2.287.2 transformation_item_1

The transformation_item_1 specifies the rigid placement of the pair frame on the first Kinematic_link (see 4.2.284) referenced by the Kinematic_joint (see 4.2.283) associated with the Kinematic_pair.

See 4.3.1027 for the application assertion.

4.2.287.3 transformation_item_2

The transformation_item_2 specifies the rigid placement of the pair frame on the second Kinematic_link (see 4.2.284) referenced by the Kinematic_joint (see 4.2.283) associated with the Kinematic_pair.

See 4.3.1027 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

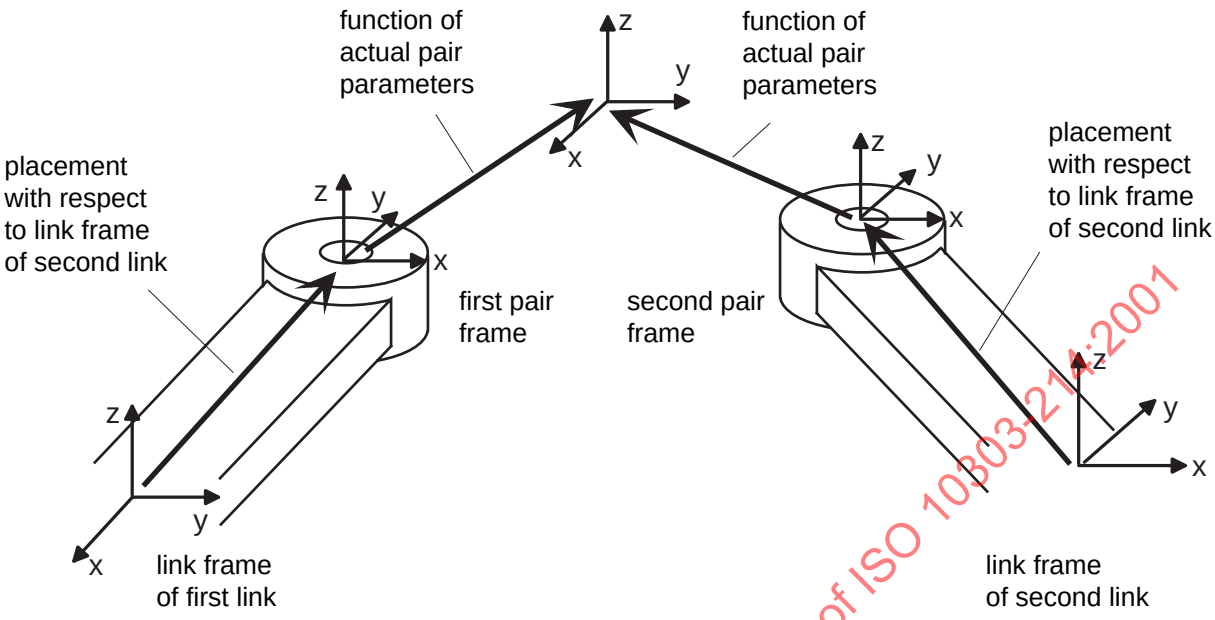

Figure 47 – Placement relationships kinematic pair frames and mating links

4.2.288 Kinematic_simulation_information

A Kinematic_simulation_information is the set of information describing the properties of an object that are related to kinematics.

The data associated with a Kinematic_simulation_information are the following:

— described_element;

— description;

— ground;

— mechanism.

4.2.288.1 described_element

The described_element specifies the set of objects to which the Kinematic_simulation_information belongs.

See 4.3.1028, 4.3.1029, 4.3.1031, 4.3.1032, 4.3.1033, 4.3.1034, 4.3.1037, and 4.3.1038 for the application assertions.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

There shall be at least one object that defines the described_element for a Kinematic_simulation_information (see 4.2.288).

4.2.288.2 description

The description specifies additional information about the Kinematic_simulation_information.

See 4.3.1036 for the application assertion.

The description need not be specified for a particular Kinematic_simulation_information (see 4.2.288).

If present, there shall be exactly one object that defines the description for a Kinematic_simulation_information.

4.2.288.3 ground

The ground specifies the environment with the coordinate space that is the reference for the kinematic data.

NOTE - A geometric description of those parts of a kinematic structure that are immobile may also be part of the ground representation.

See 4.3.1030 for the application assertion.

4.2.288.4 mechanism

The mechanism specifies the Kinematic_mechanism (see 4.2.286) objects that are part of the Kinematic_simulation_information.

See 4.3.1035 for the application assertion.

4.2.289 Kinematic_structure

A Kinematic_structure specifies the topological aspects of a kinematic representation. The topology of the Kinematic_structure is represented by means of kinematic joints, which in turn, establish a relationship between pairs of kinematic links.

A Kinematic_structure is a type of Kinematic_element (see 4.2.282).

The data associated with a Kinematic_structure are the following:

— joint

The joint specifies the set of Kinematic_joint (see 4.2.283) objects that participate in the Kinematic_structure.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

See 4.3.1039 for the application assertion.

4.2.290 Kinematic_transformation_result

A Kinematic_transformation_result is the result information of a kinematic simulation of a kinematic mechanism.

The data associated with a Kinematic_transformation_result are the following:

— is_applied_to;

— result.

4.2.290.1 is_applied_to

The is_applied_to specifies the mechanism whose motion produced the results.

See 4.3.1041 for the application assertion.

4.2.290.2 result

The result specifies the result information of the Kinematic_transformation_result. The result is represented by a set of Interpolated_configuration_sequence (see 4.2.265) objects that define the motion of a kinematic structure through interpolations.

See 4.3.1040 for the application assertion.

4.2.291 Language

A Language is a specification of the language in which an information is given.

The data associated with a Language are the following:

— country_code;

— language_code.

4.2.291.1 country_code

The country_code specifies the country, as addition to the language, according to the alpha-2 code specified in ISO 3166-1.

EXAMPLE Possible values for country_code are, e.g., 'GB' for the United Kingdom or 'US' for the United States of America.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The country_code need not be specified for a particular Language (see 4.2.291).

4.2.291.2 language_code

The language_code specifies the language of the text information in the Alpha-3 bibliographic code specified in ISO 639-2.

EXAMPLE Possible values for language_code are, e.g., 'eng' for English, 'fre' for French, 'rus' for Russian, or 'ger' for German.

4.2.292 Layer

A Layer is a general structure for the collection of geometric and annotation elements. Layers shall not be nested, i.e., a layer shall not be an element of another layer.

EXAMPLE The design of a mechanical part as a B_rep_model (see 4.2.35) is performed in several steps:

— creation of wireframe elements;

— use the wireframe elements to design the surfaces;

— use the surfaces to design the B_rep_model.

The elements created in each stage are put on separate layers. After the creation of the B_rep_model, the wireframe elements can be looked at as 'auxiliary geometry'. This is then the purpose of its layer. The visibility control of the layer is usually used to display only the B_rep_model or to display the auxiliary wireframe elements in addition, e.g., for design changes.

The data associated with a Layer are the following:

— description;

— element;

— id.

4.2.292.1 description

The description specifies additional information about the Layer.

See 4.3.1043 for the application assertion.

The description need not be specified for a particular Layer (see 4.2.292).

If present, there shall be exactly one object that defines the description for a Layer.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.292.2 element

The element specifies a piece of product data that is collected by a Layer.

NOTE - Although not explicitly modelled in the ARM, the element can be on various levels of granularity, e.g., a whole B-rep-model or a single Cartesian point.

See 4.3.1042 for the application assertion.

4.2.292.3 id

The id specifies the identifier of the Layer.

4.2.293 Leader

A Leader directs a dimension, a note, or a symbol to the intended place on an element of geometry or annotation.

A Leader is a type of Annotation_curve (see 4.2.16).

Each Leader may be an Associated_leader (see 4.2.31).

The data associated with a Leader are the following:

— terminator

The terminator specifies a list of annotation symbols that are applied to a leader and used to identify the end point or point of application of the directed annotation.

See 4.3.1044 for the application assertion.

The terminator need not be specified for a particular Leader.

4.2.294 Light_source

A Light_source is a luminous source that affects the display of surfaces within a defined Model_image (see 4.2.316).

The position of the Light_source, if specified, is defined in the coordinate space of the presented model.

The data associated with a Light_source are the following:

— colour;

— is_defined_for;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— light_type.

4.2.294.1 colour

The colour specifies the colour of a light source that is defined by the intensities of red, green, and blue proportions. The colour is either user-defined or pre-defined. Figure 24 shows the pre-defined colours.

The colour need not be specified for a particular Light_source (see 4.2.294).

4.2.294.2 is_defined_for

The is_defined_for specifies the set of Model_image (see 4.2.316) objects that the Light_source is applied to.

See 4.3.1045 for the application assertion.

4.2.294.3 light_type

The light_type specifies the kind of Light_source.

NOTE - Position and attenuation as well as additional characteristics of the Light_source are specified dependent on the kind of Light_source.

EXAMPLE 'directional', 'positional', 'spot light', or 'ambient' are examples of the light_type.

4.2.295 Limits_and_fits

A Limits_and_fits contains the necessary information to express a tolerance of the limits-and-fits system standardized by ISO 286.

The data associated with a Limits_and_fits are the following:

— deviation;

— fitting_type;

— grade.

4.2.295.1 deviation

The deviation specifies the enumeration of limits and fits class descriptors by characters.

NOTE - The characters 'A' to 'ZC' for holes or 'a' to 'zc' for shafts may be used for deviation.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.295.2 fitting_type

The fitting_type specifies whether the tolerance declaration applies to a shaft or to a hole.

The fitting_type need not be specified for a particular Limits_and_fits (see 4.2.295).

4.2.295.3 grade

The grade specifies the quality or the accuracy grade of a tolerance.

NOTE - The grade is based on the international standard tolerance grades IT01 to IT18.

4.2.296 Line

A Line is an unbounded curve that is defined by a point and a vector. The positive direction of the line is in the direction of the vector and the magnitude of the vector controls the parametrization.

A Line is a type of Curve (see 4.2.108).

4.2.297 Line_profile_tolerance

A Line_profile_tolerance is the definition of a uniform boundary along the true profile within which the elements of the surface must lie. The tolerance zone established by a Line_profile_tolerance is two dimensional.

A Line_profile_tolerance is a type of Geometric_tolerance (see 4.2.243).

The data associated with a Line_profile_tolerance are the following:

— affected_plane;

— reference_datum.

4.2.297.1 affected_plane

The affected_plane specifies the plane in which the tolerance applies.

This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane is not specified, the tolerance applies in all directions (on drawings indicated by the diameter symbol).

See 4.3.1047 for the application assertion.

The affected_plane need not be specified for a particular Line_profile_tolerance (see 4.2.297).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.297.2 reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) objects that define the reference for this type of geometric tolerance.

See 4.3.1046 for the application assertion.

4.2.298 Linear_bead_end_type

A Linear_bead_end_type is an end condition of a Bead_feature (see 4.2.39) that shall follow a linear path out of the material.

A Linear_bead_end_type is a type of Bead_end_type (see 4.2.38).

The data associated with a Linear_bead_end_type are the following:

— end_length;

— end_shape.

4.2.298.1 end_length

The end_length specifies the length of the Linear_bead_end_type.

4.2.298.2 end_shape

The end_shape specifies the shape of the Linear_bead_end_type. The following values shall be used:

— 'straight': The linear bead end is straight on the panel surface;

— 'tapered': The linear bead end is tapered towards the end point.

4.2.299 Linear_distance_dimension

A Linear_distance_dimension is the dimension of a distance calculated between two elements along a straight line.

A Linear_distance_dimension is a type of Location_dimension (see 4.2.301).

The data associated with a Linear_distance_dimension are the following:

— directed;

— orientation.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.299.1 directed

The directed specifies a Boolean value designating the importance of direction for measuring a Linear_distance_dimension. If the value is 'true' the Linear_distance_dimension is measured from origin to target. A value of 'false' indicates that the direction for measuring Linear_distance_dimension is inconsequential.

NOTE - This value may be used to indicate the sense of measurement of the distance to be privileged during metrology checks.

4.2.299.2 orientation

The orientation specifies a point and a direction along which the Linear_distance_dimension is measured.

The orientation need not be specified for a particular Linear_distance_dimension (see 4.2.299).

4.2.300 Linear_path

A Linear_path is a direction of travel along a line. The x-y-plane of the inherited Axis_placement (see 4.2.33) is normal to the line, and the Axis_placement is located in the start point of the line.

EXAMPLE Figure 48 illustrates a Linear_path.

A Linear_path is a type of Path (see 4.2.342).

The data associated with a Linear_path are the following:

— distance

The distance specifies the length of the Linear_path.

See 4.3.1048 for the application assertion.

4.2.301 Location_dimension

A Location_dimension is the dimension of the distance between two elements (origin and target).

A Location_dimension is a type of Geometric_dimension (see 4.2.237).

Each Location_dimension is a Curved_distance_dimension (see 4.2.113), a Linear_distance_dimension (see 4.2.299), or an Angular_location_dimension (see 4.2.13).

The data associated with a Location_dimension are the following:

— description;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

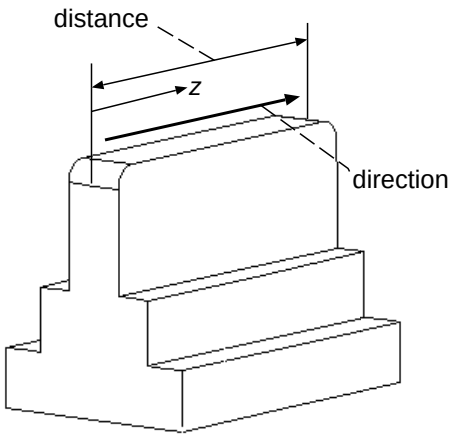

Figure 48 – Definition of a Linear_path

— origin;

— target.

4.2.301.1 description

The description specifies additional information about the Location_dimension.

See 4.3.1052 for the application assertion.

The description need not be specified for a particular Location_dimension (see 4.2.301).

If present, there shall be exactly one object that defines the description for a Location_dimension.

4.2.301.2 origin

The origin specifies the geometric or annotation element that is the origin for the Location_dimension.

See 4.3.1049, 4.3.1050, 4.3.1051, and 4.3.1053 for the application assertions.

There shall be exactly one object that defines the origin for a Location_dimension (see 4.2.301).

4.2.301.3 target

The target specifies the geometric or annotation element that is the target for the Location_dimension.

See 4.3.1049, 4.3.1050, 4.3.1051, and 4.3.1053 for the application assertions.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

There shall be exactly one object that defines the target for a Location_dimension (see 4.2.301).

4.2.302 Locator_feature

A Locator_feature is a conical impression in a panel as shown in figure 49 used to locate the panel in the tooling.

NOTE - Locator_feature objects are usually created in early die strikes for further stamping.

A Locator_feature is a type of Process_feature_in_panel (see 4.2.379).

The data associated with a Locator_feature are the following:

— base_radius;

— diameter;

— tip_angle;

— tip_radius.

4.2.302.1 base_radius

The base_radius specifies the radius of the blending between the panel surface and the wall of the Locator_feature.

See 4.3.1054 for the application assertion.

The base_radius need not be specified for a particular Locator_feature (see 4.2.302).

4.2.302.2 diameter

The diameter specifies the diameter of the cone on the panel's surface.

See 4.3.1054 for the application assertion.

4.2.302.3 tip_angle

The tip_angle specifies the opening angle of the cone.

See 4.3.1054 for the application assertion.

4.2.302.4 tip_radius

The tip_radius specifies the radius of the rounded cone tip.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.1054 for the application assertion.

The tip_radius need not be specified for a particular Locator_feature (see 4.2.302).

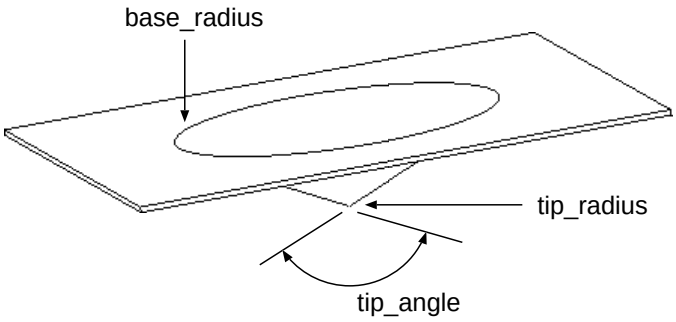

Figure 49 – Parameters defining a Locator_feature

4.2.303 Lot_configuration

A Lot_configuration is a Manufacturing_configuration (see 4.2.305) that applies to a given production batch of the product that is related with the object referred to as 'is_solution_for'.

A Lot_configuration is a type of Manufacturing_configuration (see 4.2.305).

The data associated with a Lot_configuration are the following:

— lot_id;

— lot_size.

4.2.303.1 lot_id

The lot_id specifies the identification of the batch for which the Lot_configuration applies.

4.2.303.2 lot_size

The lot_size specifies the size of the batch for which the Lot_configuration applies.

4.2.304 Make_from_relationship

A Make_from_relationship is a relationship between a Design_discipline_item_definition (see 4.2.142) which provides the definition of a raw material, or of a semi-finished item and a Design_discipline_-item_definition which provides the definition of an object manufactured out of that material, or semi-finished item. The inherited attribute 'related' specifies the raw material or the semi-finished item, and the inherited attribute 'relating' specifies the manufactured item.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

A Make_from_relationship is a type of Item_definition_relationship (see 4.2.269).

The data associated with a Make_from_relationship are the following:

— description

The description specifies additional information about the Make_from_relationship.

See 4.3.1055 for the application assertion.

The description need not be specified for a particular Make_from_relationship.

If present, there shall be exactly one object that defines the description for a Make_from_relationship.

4.2.305 Manufacturing_configuration

A Manufacturing_configuration is the association of a Product_design (see 4.2.396) with an Item_instance (see 4.2.271).

Each Manufacturing_configuration is a Serial_configuration (see 4.2.446), a Dated_configuration (see 4.2.122), or a Lot_configuration (see 4.2.303).

The data associated with a Manufacturing_configuration are the following:

— concerned_organization;

— configured_element;

— is_solution_for.

4.2.305.1 concerned_organization

The concerned_organization specifies the Organization (see 4.2.331) in which the Manufacturing_configuration is valid. The case where the concerned_organization is an empty set means that the Manufacturing_configuration regards any organization that may consider the 'configured_element'.

See 4.3.1057 for the application assertion.

4.2.305.2 configured_element

The configured_element specifies an Item_instance (see 4.2.271) that is controlled by a Manufacturing_configuration.

See 4.3.1056 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.305.3 is_solution_for

The is_solution_for specifies the design for which an Item_instance (see 4.2.271) is configured.

See 4.3.1058 for the application assertion.

4.2.306 Mass_property

A Mass_property is a quantity of matter that an object consists of.

A Mass_property is a type of Property (see 4.2.409).

4.2.307 Mated_item_association

A Mated_item_association is a relationship between a Mating_definition (see 4.2.313) and an Item_instance (see 4.2.271) that is used within the Mating_definition.

A Mated_item_association is a type of Item_definition_instance_relationship (see 4.2.268).

The data associated with a Mated_item_association are the following:

— placement;

— relating.

4.2.307.1 placement

The placement specifies the Geometric_model_relationship_with_transformation (see 4.2.240) or the Template_instance (see 4.2.512) that conveys the Transformation (see 4.2.533) information. This Transformation is used to locate and to orient the constituent in the coordinate space of the Mating_definition (see 4.2.313). In the case of a Template_instance, the scale factor shall be omitted or set to 1.0.

See 4.3.1059 and 4.3.1061 for the application assertions.

The placement need not be specified for a particular Mated_item_association (see 4.2.307).

If present, there shall be exactly one object that defines the placement for a Mated_item_association.

4.2.307.2 relating

The relating specifies the Mating_definition (see 4.2.313) that is the result of the mating operation.

See 4.3.1060 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.308 Mated_item_relationship

A Mated_item_relationship is a relationship between two Mated_item_association (see 4.2.307) objects.

This relationship specifies additional information about the mating of two particular items that go into a Mating_definition (see 4.2.313). The two Mated_item_association objects that are referenced by the Mated_item_relationship shall refer to the same Mating_definition.

The data associated with a Mated_item_relationship are the following:

— mated_shape;

— mating_material;

— related;

— relating.

4.2.308.1 mated_shape

The mated_shape specifies the Shape_element_relationship (see 4.2.450) that relates the two Shape_-element (see 4.2.449) objects that form the area of mating contact prior to mating.

See 4.3.1064 for the application assertion.

The mated_shape need not be specified for a particular Mated_item_relationship (see 4.2.308).

4.2.308.2 mating_material

The mating_material specifies the set of Quantified_instance (see 4.2.417) objects used as material for the mating.

See 4.3.1063 for the application assertion.

4.2.308.3 related

The related specifies the second of the two Mated_item_association (see 4.2.307) objects related by the Mated_item_relationship.

See 4.3.1062 for the application assertion.

4.2.308.4 relating

The relating specifies the first of the two Mated_item_association (see 4.2.307) objects related by the Mated_item_relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.1062 for the application assertion.

4.2.309 Material

A Material is the substance out of which an item is or can be made.

NOTE - For the specification of the raw material from which an item is made, the object Item (see 4.2.267) is used with an attached Specific_item_classification (see 4.2.465) with classification type 'raw material'. That object represents the material item with possibly additional information, like identification of supplier, quantity, size of the raw stock etc. and it can be used in corresponding relationships such as Make_from_-relationship (see 4.2.304) or for a Process_operation_definition (see 4.2.381).

The data associated with a Material are the following:

— described_element;

— material_name.

4.2.309.1 described_element

The described_element specifies the objects the material information is provided for.

See 4.3.1065, 4.3.1066, 4.3.1067, 4.3.1068, 4.3.1069, 4.3.1070, 4.3.1071, 4.3.1072, 4.3.1073, 4.3.1074, 4.3.1075, 4.3.1076, 4.3.1077, 4.3.1078, 4.3.1079, 4.3.1080, 4.3.1081, 4.3.1082, 4.3.1083, and 4.3.1084 for the application assertions.

There shall be at least one object that defines the described_element for a Material (see 4.2.309).

4.2.309.2 material_name

The material_name specifies the word or group of words by which the Material is referred to.

4.2.310 Material_property

A Material_property is a characteristic that depends on material aspects.

A Material_property is a type of Property (see 4.2.409).

The data associated with a Material_property are the following:

— property_name

The property_name specifies the kind of Material_property.

EXAMPLE 'EM1' is an example for a 'property_name' that may be associated with a Material_property that is described as 'elastic modulus'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.311 Material_property_association

A Material_property_association is an object that associates a Material (see 4.2.309) object with a Material_property_value_representation (see 4.2.312) object.

The data associated with a Material_property_association are the following:

— associated_property_value;

— definitional;

— described_material.

4.2.311.1 associated_property_value

The associated_property_value specifies the associated Material_property_value_representation (see 4.2.312).

See 4.3.1086 for the application assertion.

4.2.311.2 definitional

The definitional specifies whether the associated_property_value may be used to distinguish the described_material from others of the same kind. A value of 'true' indicates that the Material_property_value_representation (see 4.2.312) distinguishes the 'described_element' from others.

The definitional need not be specified for a particular Material_property_association (see 4.2.311).

4.2.311.3 described_material

The described_material specifies the Material (see 4.2.309) a property value is assigned to.

See 4.3.1085 for the application assertion.

4.2.312 Material_property_value_representation

A Material_property_value_representation is the representation of a characteristic of a material.

A Material_property_value_representation is a type of Property_value_representation (see 4.2.414).

The data associated with a Material_property_value_representation are the following:

— definition;

— environment_condition.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.312.1 definition

The definition specifies the Material_property (see 4.2.310) that defines the Material_property_value_representation.

See 4.3.1088 for the application assertion.

4.2.312.2 environment_condition

The environment_condition specifies the environmental conditions in which the defined Material_property_value_representation is applicable.

See 4.3.1087 for the application assertion.

4.2.313 Mating_definition

A Mating_definition is a view of an Item_version (see 4.2.275), defining the physical connection of two or more Item_instance (see 4.2.271) objects. It includes technical information about the kind of connection. This information is independent from the hierarchical assembly structure.

A Mating_definition is a type of Design_discipline_item_definition (see 4.2.142).

The data associated with a Mating_definition are the following:

— mating_type

The mating_type specifies the kind of mating, i.e., how the items shall be mated together. Where applicable, the following values shall be used:

— 'bolted joint': Attachment of two or more items that are screwed together using screws, bolt nuts, and washers;

— 'brazing': Attachment of two or more items established by soldering or brazing;

— 'clasping': Attachment of two or more items established by using a clamp at one common outer border;

— 'clinching': Attachment of two or more items established by pressing these items together and stamping texture at the point of contact;

— 'clipping': Attachment of two or more items established by a clip (e.g. fixing the inner door panel at the inner door plate);

— 'doweling': Attachment of two or more items using a pin that is fit into each of each part by pressing;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— ’flanging’: Attachment of two or more items by crimping a projected length of one part over the edge of the other part;

— ’foam injection’: Attachment of two or more items where foam is injected into a cavity to establish the connection;

— ’gluing’: Attachment of two items established by adhesion material;

— ’laser-welding’: Attachment of two or more items that are welded together using a laser technique;

— ’press fit’: Attachment of two or more items obtained by forces resulting from the selected size tolerances;

— ’riveting’: Attachment of two or more items that are riveted together at a certain spot using a rivet;

— ’sewing’: Attachment of two or more items that are sewn together;

EXAMPLE Upholstering cloth is sewn together to form a seat pillow.

— ’spot welding’: Attachment of two or more items that are welded together at a certain welding spot;

— ’stapling’: Attachment of two or more items at a certain spot using a nail or a wire stitch to establish the connection;

— ’welding’: Attachment of two or more items by welding together with one weld bead.

4.2.314 Measurement_path

A Measurement_path is a mechanism to identify a Curve (see 4.2.108) along which a given geometric dimension or surface texture shall be fulfilled.

The data associated with a Measurement_path are the following:

— is_defined_as;

— is_defined_in.

4.2.314.1 is_defined_as

The is_defined_as specifies the Curve (see 4.2.108) along which the measurement takes place.

See 4.3.1090 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.314.2 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) for the Curve (see 4.2.108) that defines the measurement path.

See 4.3.1089 for the application assertion.

4.2.315 Model_change

A Model_change is a mechanism to describe the differences between two objects concerning the models describing these objects.

Each Model_change is an Incremental_model_change (see 4.2.262) or a Full_model_change (see 4.2.213).

The data associated with a Model_change are the following:

— deleted_element;

— description;

— id;

— is_describing.

4.2.315.1 deleted_element

The deleted_element specifies the elements belonging to the model or view area representing the situation before the change that have been deleted during the change.

See 4.3.1092 for the application assertion.

4.2.315.2 description

The description specifies additional information about the Model_change.

See 4.3.1093 for the application assertion.

There shall be exactly one object that defines the description for a Model_change (see 4.2.315).

4.2.315.3 id

The id specifies the identifier of the Model_change.

The id need not be specified for a particular Model_change (see 4.2.315).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.315.4 is_describing

The is_describing specifies the Change (see 4.2.55) that collects the Model_change objects and the Property_change (see 4.2.410) objects.

See 4.3.1091 for the application assertion.

4.2.316 Model_image

A Model_image is a mechanism to generate a two-dimensional picture from two-dimensional or three-dimensional geometric or annotation elements. The mechanism is defined by clipping, scaling, and projecting information.

The data associated with a Model_image are the following:

— clipping;

— is_displaying;

— is_presented_in;

— name;

— scale;

— view_projection;

— view_volume_placement.

4.2.316.1 clipping

The clipping specifies the mathematical information necessary to define a two-dimensional area (clipping box) or a three-dimensional volume (clipping volume) that encloses all viewable geometric or annotation elements of a Styled_model (see 4.2.484) or of an External_model (see 4.2.189). Only those elements, or portions of elements, that fall within this two-dimensional area or three-dimensional volume shall be displayed.

The clipping need not be specified for a particular Model_image (see 4.2.316).

4.2.316.2 is_displaying

The is_displaying specifies the model that contains the information to be processed for display.

See 4.3.1094 and 4.3.1096 for the application assertions.

There shall be exactly one object that the Model_image (see 4.2.316) is_displaying.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.316.3 is_presented_in

The is_presented_in specifies the set of View (see 4.2.554) objects in which the picture defined by the Model_image is presented.

See 4.3.1097 for the application assertion.

4.2.316.4 name

The name specifies the word or group of words by which the Model_image is referred to.

See 4.3.1095 for the application assertion.

The name need not be specified for a particular Model_image (see 4.2.316).

If present, there shall be exactly one object that defines the name for a Model_image.

4.2.316.5 scale

The scale specifies the ratio between the size of the elements as defined in the shape model and the size of the elements as presented in the view. The default value for scale is 1.0.

4.2.316.6 view_projection

The view_projection specifies the type of projection. The following values shall be used:

— 'central': Central projection is used;

— 'parallel': Parallel projection is used.

4.2.316.7 view_volume_placement

The view_volume_placement specifies the coordinate space in which the viewing parameters are defined.

4.2.317 Model_property_association

A Model_property_association is an association of a Model_property_value (see 4.2.318) with objects.

> EXAMPLE In the case of a welding operation, the welding points as a part of a wireframe model can be associated with a process operation to describe the locations where the robot has to weld for a welding process operation.

The data associated with a Model_property_association are the following:

— associated_property_value;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— described_element;

— validity_context.

4.2.317.1 associated_property_value

The associated_property_value specifies the Model_property_value (see 4.2.318) that is associated to an application object.

See 4.3.1113 for the application assertion.

4.2.317.2 described_element

The described_element specifies the application object for which a Model_property_value (see 4.2.318) is provided.

See 4.3.1098, 4.3.1099, 4.3.1100, 4.3.1101, 4.3.1102, 4.3.1103, 4.3.1104, 4.3.1105, 4.3.1106, 4.3.1107, 4.3.1108, 4.3.1109, 4.3.1110, 4.3.1111, 4.3.1112, 4.3.1115, 4.3.1116, 4.3.1117, 4.3.1118, 4.3.1119, 4.3.1120, 4.3.1121, 4.3.1122, 4.3.1123, 4.3.1124, and 4.3.1125 for the application assertions.

There shall be exactly one object that defines the described_element for a Model_property_association (see 4.2.317).

4.2.317.3 validity_context

The validity_context specifies an Organization (see 4.2.331) that provides a context for the Model_-property_association.

See 4.3.1114 for the application assertion.

The validity_context need not be specified for a particular Model_property_association (see 4.2.317).

4.2.318 Model_property_value

A Model_property_value is a mechanism to assign a General_property (see 4.2.230) to an External_-model (see 4.2.189), a Geometric_model (see 4.2.238), or a Styled_model (see 4.2.484).

The data associated with a Model_property_value are the following:

— definition;

— describing_model.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.318.1 definition

The definition specifies the General_property (see 4.2.230) that is assigned to an External_model (see 4.2.189), a Geometric_model (see 4.2.238), or a Styled_model (see 4.2.484).

See 4.3.1127 for the application assertion.

4.2.318.2 describing_model

The describing_model specifies the model to which a General_property (see 4.2.230) is assigned.

See 4.3.1126, 4.3.1128, and 4.3.1129 for the application assertions.

There shall be exactly one object that defines the describing_model for a Model_property_value (see 4.2.318).

4.2.319 Moments_of_inertia

A Moments_of_inertia describes the matrix of inertia of a rigid body. The moments of inertia I are described as follows:

$$I = \begin{pmatrix} I_{xx} & -I_{xy} & -I_{xz} \\ -I_{yx} & I_{yy} & -I_{yz} \\ -I_{zx} & -I_{zy} & I_{zz} \end{pmatrix}$$

A Moments_of_inertia is a type of Shape_dependent_property (see 4.2.447).

The data associated with a Moments_of_inertia are the following:

— inertia_value;

— is_defined_in;

— reference_axis_placement.

4.2.319.1 inertia_value

The inertia_value specifies the 9 inertia coefficients.

NOTE - The matrix defined by the 'inertia_value' is symmetric with respect to the main diagonal. For that reason, the values of the coefficients are equal, if mirrored along this diagonal. As a consequence, there are 6 different values in the 'inertia_value'.

See 4.3.1132 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.319.2 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) in which the property is applicable.

NOTE - The values of geometry related properties are specified relative to a Cartesian_coordinate_space.

EXAMPLE A Centre_of_mass (see 4.2.49) may be specified in different coordinate spaces for different dimensioning applications.

See 4.3.1131 for the application assertion.

4.2.319.3 reference_axis_placement

The reference_axis_placement specifies the Axis_placement (see 4.2.33) which was used to calculate the 'inertia_value'.

See 4.3.1130 for the application assertion.

4.2.320 Multi_language_string

A Multi_language_string represents text information, expressed in one or more languages, that is associated with objects.

The data associated with a Multi_language_string are the following:

— additional_language_dependent_string;

— primary_language_dependent_string.

4.2.320.1 additional_language_dependent_string

The additional_language_dependent_string specifies the String_with_language (see 4.2.479) objects that represent the text information in a particular language.

See 4.3.1133 for the application assertion.

4.2.320.2 primary_language_dependent_string

The primary_language_dependent_string specifies the String_with_language (see 4.2.479) that represents the text information in the original language.

See 4.3.1133 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.321 Named_size

A Named_size is the definition of the size of a Document_file (see 4.2.159) or of a Document_representation (see 4.2.163) where the size is specified by a standardized identifier.

A Named_size is a type of Rectangular_size (see 4.2.427).

The data associated with a Named_size are the following:

— referenced_standard;

— size.

4.2.321.1 referenced_standard

The referenced_standard specifies a standard according to which the size is specified.

See 4.3.1134 for the application assertion.

The referenced_standard need not be specified for a particular Named_size (see 4.2.321).

4.2.321.2 size

The size specifies the size of the object. If the size differs from the dimensions specified by the inherited 'width' and 'height' attributes the size is overridden.

4.2.322 Next_higher_assembly

A Next_higher_assembly is a relationship where the attribute 'related' specifies a constituent of an assembly and the attribute 'relating' specifies the immediate parent assembly of the constituent.

NOTE - A constituent may be a single part or an assembly.

EXAMPLE The assembly carburettor may be assembled from single parts. The power train assembly is assembled from other assemblies.

A Next_higher_assembly is a type of Assembly_component_relationship (see 4.2.26).

4.2.323 Ngon_profile

A Ngon_profile is a profile that is composed of 3 or more connected straight and co-planar lines. One side of the Ngon_profile is parallel to the x-axis of the inherited Axis_placement (see 4.2.33) of the profile. This side intersects the y-axis at a negative value as shown in figure 50. The centre of the Ngon_profile coincides with the centre of the circle defining the extent of the ngon outlining the profile.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

A Ngon_profile is a type of Closed_profile (see 4.2.72).

The data associated with a Ngon_profile are the following:

— circumscribed_or_across_flats;

— corner_radius;

— diameter;

— number_of_sides.

4.2.323.1 circumscribed_or_across_flats

The circumscribed_or_across_flats specifies whether the diameter defining the Ngon_profile is the circumscribing diameter or tangent to the sides. The following values shall be used:

— 'circumscribed diameter': The circle specified by the 'diameter' is circumscribing the Ngon_profile and the corners of the Ngon_profile lay on the resulting circle;

— 'diameter across flats': The sides of the Ngon_profile are tangent to the circle specified by the 'diameter'.

4.2.323.2 corner_radius

The corner_radius specifies the size of an arc blend between any two sides of the Ngon_profile. The corner_radius shall be smaller than

$$r \cdot cos(\frac{\pi}{n})$$

where r is the circumscribed_radius and n is the number_of_sides.

See 4.3.1135 for the application assertion.

The corner_radius need not be specified for a particular Ngon_profile (see 4.2.323).

4.2.323.3 diameter

The diameter specifies the diameter of the circle used to define the Ngon_profile.

See 4.3.1135 for the application assertion.

4.2.323.4 number_of_sides

The number_of_sides specifies how many sides are needed for the Ngon_profile.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

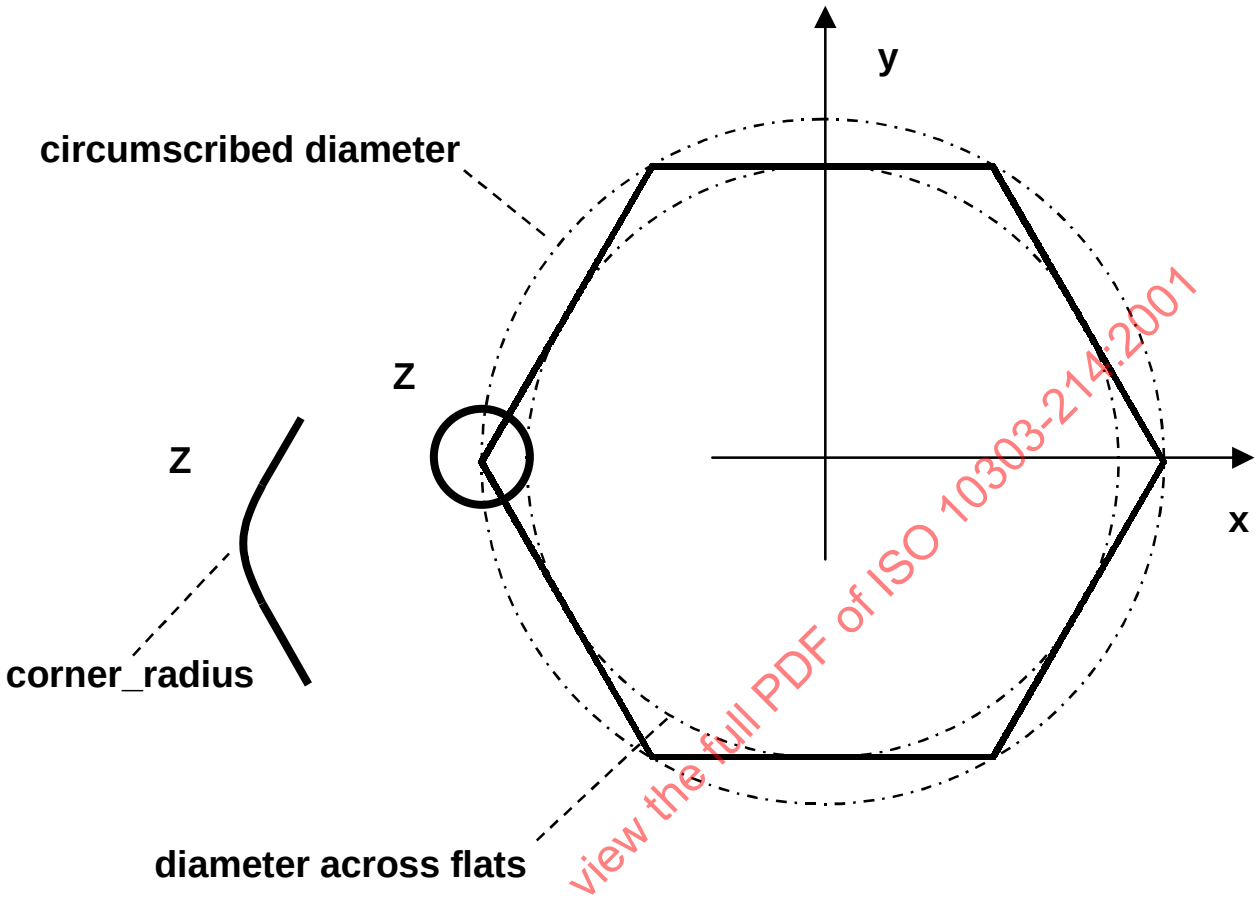

Figure 50 – Definition of a Ngon_profile

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.324 Numerical_value

A Numerical_value is a quantity expressed with a numerical value and a unit.

A Numerical_value is a type of Value_with_unit (see 4.2.549).

The data associated with a Numerical_value are the following:

— value_component

The value_component specifies the quantity of the Numerical_value.

4.2.325 Offset_curve

An Offset_curve is a curve in 2D or 3D space that is defined as a set of points for which there is at least one point on the basis curve that is at the offset distance of the considered point. At a given point of the

© ISO 2001 – All rights reserved

basis curve, the distance is measured along a vector that is the normalized cross product of the tangent of the basis curve at this point, and of a reference direction vector.

The reference direction of the offset shall be defined. An Offset_curve shall not self-intersect and may reference any type of curve except another Offset_curve.

An Offset_curve is a type of Curve (see 4.2.108).

4.2.326 Offset_surface

An Offset_surface is a surface that is defined by offsetting a base surface by a distance along the surface normal of the basis surface.

The offset distance shall not exceed the radius of curvature in any direction at any point of the basis surface.

NOTE - This constraint ensures that the offset surface does not contain any ridge or singular point.

The basis surface shall not be a rectangular composite surface or another offset surface.

An Offset_surface is a type of Surface (see 4.2.489).

4.2.327 Open_bead_end_type

An Open_bead_end_type is an end condition of a bead that passes through the end of the part.

An Open_bead_end_type is a type of Bead_end_type (see 4.2.38).

4.2.328 Open_profile

An Open_profile is characterized by two open ends.

An Open_profile is a type of Profile (see 4.2.401).

Each Open_profile is a General_open_profile (see 4.2.225), a Tee_profile (see 4.2.511), a Partial_circular_profile (see 4.2.340), a Vee_profile (see 4.2.551), a Rounded_u_profile (see 4.2.440), or a Square_u_profile (see 4.2.476).

4.2.329 Open_profile_usage

An Open_profile_usage is the identification of an Open_profile (see 4.2.328) and possibly of a geometric Transformation (see 4.2.533) used to place the Open_profile in a reference coordinate space.

An Open_profile_usage is a type of Profile_usage (see 4.2.403).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with an Open_profile_usage are the following:

— profile_limit;

— used_profile.

4.2.329.1 profile_limit

The profile_limit specifies a Plane (see 4.2.360) which intersects the profile at the distance beyond which a feature that is created using this profile is considered to be cleared.

EXAMPLE The profile_limit may be used to specify the plane beyond which a cutter has to retract in order not to damage the profile.

See 4.3.1137 for the application assertion.

The profile_limit need not be specified for a particular Open_profile_usage (see 4.2.329).

4.2.329.2 used_profile

The used_profile specifies the Open_profile (see 4.2.328) that is being used.

See 4.3.1136 for the application assertion.

4.2.330 Open_slot_end_type

An Open_slot_end_type is an end condition of a slot specifying that the slot passes through the end of the shape of the part at this end.

An Open_slot_end_type is a type of Slot_end_type (see 4.2.457).

4.2.331 Organization

An Organization is a group of people involved in a particular business process.

The data associated with an Organization are the following:

— delivery_address;

— id;

— organization_name;

— organization_type;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— postal_address;

— visitor_address.

4.2.331.1 delivery_address

The delivery_address specifies the address where goods are delivered.

The delivery_address need not be specified for a particular Organization (see 4.2.331).

4.2.331.2 id

The id specifies the identifier of the Organization.

NOTE - The assignment of this attribute is usually controlled by a registration authority. The registration authority may be a public organization that assigns identifiers to corporations, or it may be the parent corporation that assigns component identifiers to its components.

EXAMPLE The id may be the code assigned to the Organization for a stock market listing, or it may be a department number.

4.2.331.3 organization_name

The organization_name specifies the word or group of words used to refer to the Organization.

4.2.331.4 organization_type

The organization_type specifies the type of the Organization. Where applicable, the following values shall be used:

— 'company': The organization_type specifies that the Organization is a company;

— 'department': The organization_type specifies that the Organization is a department;

— 'plant': The organization_type specifies that the Organization is a plant.

The organization_type need not be specified for a particular Organization (see 4.2.331).

4.2.331.5 postal_address

The postal_address specifies the address where letter mail is delivered.

The postal_address need not be specified for a particular Organization (see 4.2.331).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.331.6 visitor_address

The visitor_address specifies the address where the organization receives visitors.

The visitor_address need not be specified for a particular Organization (see 4.2.331).

4.2.332 Organization_in_contract

An Organization_in_contract is a mechanism to associate the person who is signing a contract and the organization which the person is signing for, with a Contract (see 4.2.104).

The data associated with an Organization_in_contract are the following:

— contracted_organization;

— role_of_organization;

— signature;

— signed_contract.

4.2.332.1 contracted_organization

The contracted_organization specifies the organization that participates in the contract.

See 4.3.1140 for the application assertion.

4.2.332.2 role_of_organization

The role_of_organization specifies the function performed by the signing Organization (see 4.2.331) with respect to the contract. Where applicable, the following values shall be used:

— 'contractor': The referenced Organization assigns the tasks that are subject of the Contract (see 4.2.104);

— 'contractee': The tasks that are subject of the Contract are assigned to the referenced Organization.

4.2.332.3 signature

The signature specifies the set of Date_and_person_organization (see 4.2.118) objects representing the personnel that signed the contract on behalf of the contracted organization and the date of the signature.

See 4.3.1139 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.332.4 signed_contract

The signed_contract specifies the set of Contract (see 4.2.104) objects the Organization_in_contract participates in.

See 4.3.1138 for the application assertion.

4.2.333 Organization_relationship

An Organization_relationship is a relationship between two Organization (see 4.2.331) objects.

EXAMPLE A team belongs to a department which itself belongs to a company. This organizational structure may be built up using the Organization_relationship mechanism.

The data associated with an Organization_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.333.1 description

The description specifies additional information about the Organization_relationship.

See 4.3.1141 for the application assertion.

The description need not be specified for a particular Organization_relationship (see 4.2.333).

If present, there shall be exactly one object that defines the description for an Organization_relationship.

4.2.333.2 related

The related specifies the second Organization (see 4.2.331) in an Organization_relationship.

NOTE - The semantics of this attribute are defined by the attribute 'relation_type'.

See 4.3.1142 for the application assertion.

4.2.333.3 relating

The relating specifies the first of the two Organization (see 4.2.331) objects in an Organization_relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - The semantics of this attribute are defined by the attribute 'relation_type'.

See 4.3.1142 for the application assertion.

4.2.333.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'hierarchy': The related Organization (see 4.2.331) is a sub organization of the relating Organization;

— 'legal succession': The related Organization is the legal successor of the relating Organization;

NOTE - An additional Date_time_assignment (see 4.2.120) may be applied to the Organization_relationship (see 4.2.333) in order to specify the time when the succession takes place.

— 'reorganization': The related Organization is the successor of the relating Organization due to an organizational transfer of responsibility.

EXAMPLE The name of a department changes due to reorganization.

4.2.334 Oriented_edge_curve

An Oriented_edge_curve is a bounded segment of a curve. An Oriented_edge_curve is of finite length and is defined from the edge_start vertex to the edge_end vertex along the curve defined by the edge_geometry. Additionally, an Oriented_edge_curve has an associated orientation that specifies the mathematical sense of an Oriented_edge_curve. An Oriented_edge_curve shall not self-intersect.

The data associated with an Oriented_edge_curve are the following:

— edge_end;

— edge_geometry;

— edge_start.

4.2.334.1 edge_end

The edge_end specifies the second and last vertex of the edge.

NOTE - In the case of an edge that forms a closed loop the edge_end will be identical to the edge_start.

See 4.3.1151 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.334.2 edge_geometry

The edge_geometry specifies a curve that represents the shape of an edge. The extent of the edge is confined to that section of the curve between the start and end vertices.

See 4.3.1143, 4.3.1144, 4.3.1145, 4.3.1146, 4.3.1147, 4.3.1148, 4.3.1149, and 4.3.1150 for the application assertions.

There shall be exactly one object that defines the edge_geometry for an Oriented_edge_curve (see 4.2.334).

4.2.334.3 edge_start

The edge_start specifies the first vertex of an edge.

See 4.3.1151 for the application assertion.

4.2.335 Pair_value

A Pair_value is one particular value of the pair parameter of a Kinematic_pair (see 4.2.287).

A Pair_value shall represent either a cylindrical pair value, a gear pair value, a planar pair value, a prismatic pair value, a rack and pinion pair value, a revolute pair value, a rolling curve pair value, a rolling surface pair value, a screw pair value, a sliding curve pair value, a sliding surface pair value, a spherical pair value, or a universal pair value.

The data associated with a Pair_value are the following:

— is_applied_to

The is_applied_to specifies the Kinematic_pair that the Pair_value applies to.

See 4.3.1152 for the application assertion.

4.2.336 Panel_hole_with_barring

A Panel_hole_with_barring is a hole in a panel where the material is not completely punched out but partially bent in the punch direction.

EXAMPLE Figure 51 shows an example of a Panel_hole_with_barring.

A Panel_hole_with_barring is a type of Hole_feature_in_panel (see 4.2.258).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Panel_hole_with_barring are the following:

— angle_defined_by;

— barring_profile;

— base_radius.

4.2.336.1 angle_defined_by

The angle_defined_by specifies the angle about which the material is bent.

See 4.3.1153 for the application assertion.

The angle_defined_by need not be specified for a particular Panel_hole_with_barring (see 4.2.336).

4.2.336.2 barring_profile

The barring_profile specifies the Closed_profile (see 4.2.72) that represents that portion of the panel that is actually punched out.

NOTE - The difference in area between the barring_profile and the hole_profile is that portion of the panel that is bended at 90 degrees in punch direction.

See 4.3.1154 for the application assertion.

4.2.336.3 base_radius

The base_radius specifies the radius of the blending between the panel and the bent material.

See 4.3.1155 for the application assertion.

The base_radius need not be specified for a particular Panel_hole_with_barring (see 4.2.336).

4.2.337 Parabola

A Parabola is an open conic curve defined by its focal length, apex and the direction of the line joining the apex and focus.

NOTE - The focal length is the distance between the focus and the apex.

A Parabola is a type of Curve (see 4.2.108).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

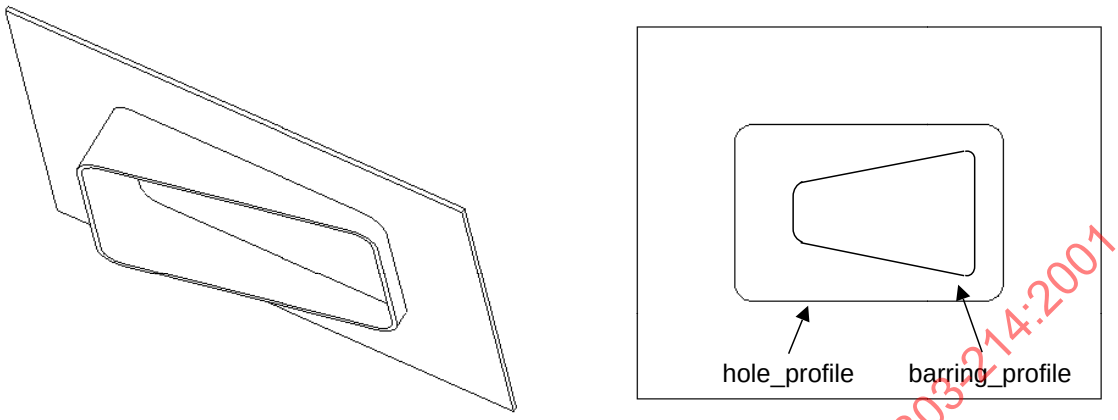

Figure 51 – Parameters defining a Panel_hole_with_barring

4.2.338 Parallelism_tolerance

A Parallelism_tolerance is a constraint that specifies that a surface or a curve shall be parallel to a reference datum, with an allowed amount of deviation. This reference datum is either a datum plane or a datum axis.

A Parallelism_tolerance specifies one of the following:

— a tolerance zone limited by two planes or two lines (if the attribute 'affected_plane' is specified) parallel to a datum plane, or axis, within which the line elements of the surface or the axis of the considered feature must lie;

— a cylindrical tolerance zone whose axis is parallel to a datum axis within which the axis of the considered feature must lie.

A Parallelism_tolerance is a type of Geometric_tolerance (see 4.2.243).

The data associated with a Parallelism_tolerance are the following:

— affected_plane;

— reference_datum.

4.2.338.1 affected_plane

The affected_plane specifies the plane in which the tolerance applies.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane is not specified, the tolerance applies in all directions (on drawings indicated by the diameter symbol).

See 4.3.1157 for the application assertion.

The affected_plane need not be specified for a particular Parallelism_tolerance (see 4.2.338).

4.2.338.2 reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) objects that define the reference for this type of geometric tolerance.

See 4.3.1156 for the application assertion.

4.2.339 Partial_circular_path

A Partial_circular_path is a path that is specified by a direction of travel along an arc of constant radius around an axis. The x-axis of the inherited Axis_placement (see 4.2.33) is co-axial to the rotation axis, and the z-axis is tangent to the curve in its start point. The y-axis is oriented such, that the actual rotation axis has a y co-ordinate equal to the radius. The Axis_placement is located in the start point of the curve described by the path.

EXAMPLE Figure 52 illustrates a Partial_circular_path.

A Partial_circular_path is a type of Circular_path (see 4.2.61).

The data associated with a Partial_circular_path are the following:

— sweep_angle

The sweep_angle specifies the angle that defines the arc shaped path.

See 4.3.1158 for the application assertion.

4.2.340 Partial_circular_profile

A Partial_circular_profile is a profile that is specified by a circular arc. The Partial_circular_profile starts at the x-axis of the inherited Axis_placement (see 4.2.33) and travels around the z-axis in positive direction. The Axis_placement coincides with the centre point outlining this profile.

NOTE - The start point of the resulting arc has a y co-ordinate of zero.

EXAMPLE Figure 53 illustrates a Partial_circular_profile.

A Partial_circular_profile is a type of Open_profile (see 4.2.328).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

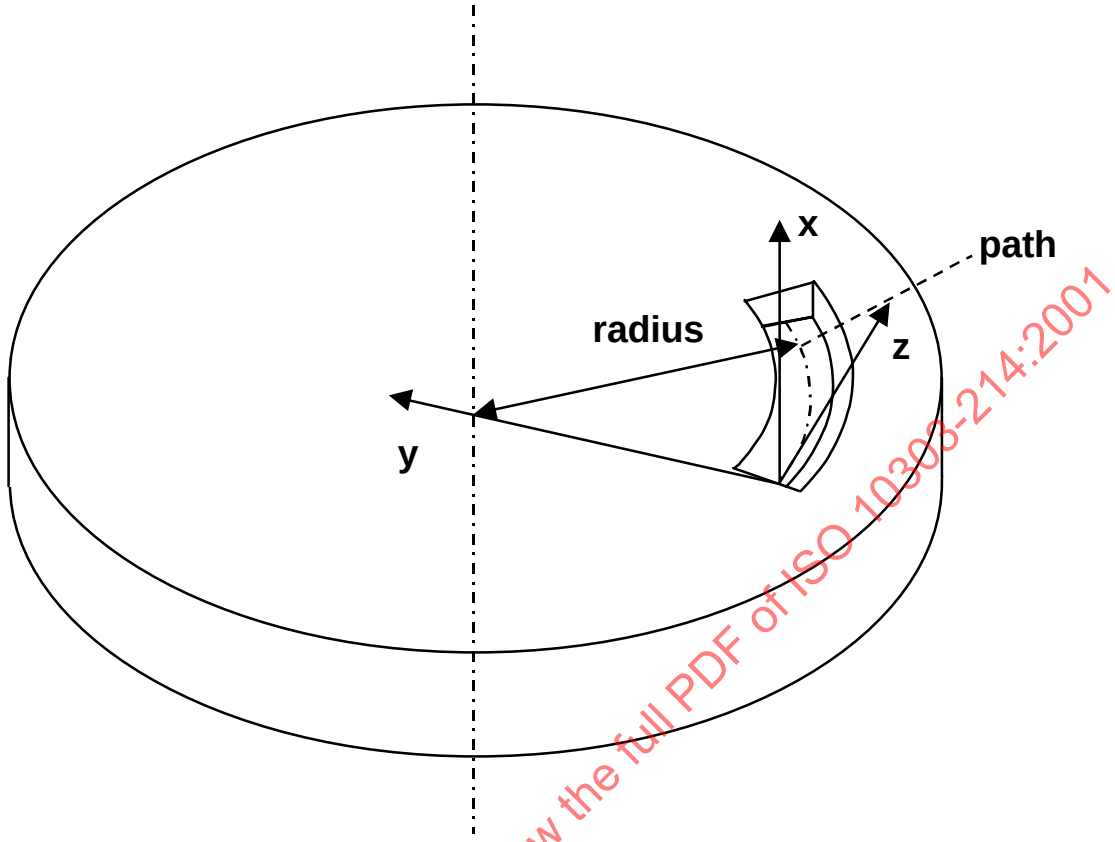

Figure 52 – Definition of a Partial_circular_path

The data associated with a Partial_circular_profile are the following:

— radius;

— sweep_angle.

4.2.340.1 radius

The radius specifies the radius of the arc to define a Partial_circular_profile.

See 4.3.1159 for the application assertion.

4.2.340.2 sweep_angle

The sweep_angle specifies the size of the angle to define a Partial_circular_profile.

See 4.3.1159 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

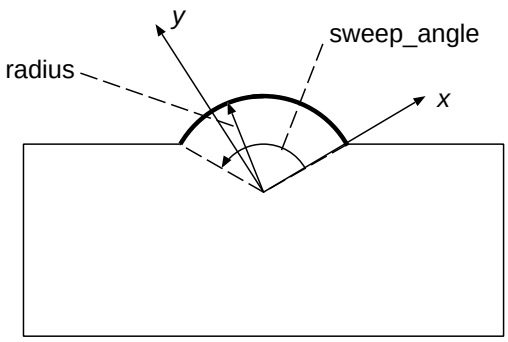

Figure 53 – Definition of a Partial_circular_profile

4.2.341 Partial_document_assignment

A Partial_document_assignment identifies a specific portion of the contents of a document. It assigns this portion to the product data for which it is relevant.

A Partial_document_assignment is a type of Document_assignment (see 4.2.156).

The data associated with a Partial_document_assignment are the following:

— document_portion

The document_portion specifies the word or group of words that convey the subject or sub contents of the Document (see 4.2.155).

> EXAMPLE If the assigned document is a service manual, the document_portion may specify that, in the given situation, only the information related to electric fuses is relevant among the overall contents of the document.

4.2.342 Path

A Path is the representation of a continuous direction of travel.

Each Path is a General_path (see 4.2.227), a Linear_path (see 4.2.300), or a Circular_path (see 4.2.61).

The data associated with a Path are the following:

— is_defined_by;

— is_defined_in.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.342.1 is_defined_by

The is_defined_by specifies the Axis_placement (see 4.2.33) to which the parameters of the Path refer. The is_defined_by is specified for the purpose of evaluation by manufacturing systems, which use the information in order to determine various machining parameters. For each type of Path it is specified, how the Axis_placement is located and oriented with respect to the curve that defines the path.

See 4.3.1160 for the application assertion.

4.2.342.2 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) in which the Path is defined. This coordinate space shall be the same as the coordinate space of the Feature_definition (see 4.2.199) that uses this Path. The is_defined_in shall be specified when the Path is used in the context of a Placed_-feature (see 4.2.356), else it shall not be used.

See 4.3.1161 for the application assertion.

The is_defined_in need not be specified for a particular Path (see 4.2.342).

4.2.343 Path_approximation

A Path_approximation is a motion parameter measure with or without units by which different discrete poses in the course of a kinematics motion are distinguished.

NOTE - In order to introduce time aspects the motion parameter may be defined with time units.

4.2.344 Path_parameter

A Path_parameter specifies the role of a Path (see 4.2.342) in a General_feature (see 4.2.221). It is used to discriminate the members of the 'additional_path_usage' of the General_feature.

The data associated with a Path_parameter are the following:

— associated_path;

— parameter_context;

— parameter_role.

4.2.344.1 associated_path

The associated_path specifies the Path (see 4.2.342) for which a role is given.

See 4.3.1163 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.344.2 parameter_context

The parameter_context specifies the General_feature (see 4.2.221) in which the associated Path (see 4.2.342) is identified.

See 4.3.1162 for the application assertion.

4.2.344.3 parameter_role

The parameter_role specifies the role of the Path (see 4.2.342) that is used as an additional Path in a General_feature (see 4.2.221).

EXAMPLE Examples for the parameter_role are 'height', 'depth', or combinations of the value of the 'feature_type' of the General_feature with such a denominator.

4.2.345 Perpendicularity_tolerance

A Perpendicularity_tolerance is a constraint that specifies that a surface or a curve shall be perpendicular to a reference datum with an allowed amount of deviation. The reference datum is either a datum plane or a datum axis.

A Perpendicularity_tolerance specifies one of the following:

— a tolerance zone limited by two parallel planes perpendicular to a datum plane, or axis, within which the surface or median plane of the considered feature must lie;

— a tolerance zone limited by two parallel planes perpendicular to a datum axis, within which the axis of the considered feature must lie;

— a cylindrical tolerance zone (if the attribute 'affected_plane' is not specified), perpendicular to a datum plane, within which the axis of the considered feature must lie;

— a tolerance zone defined by two parallel lines perpendicular to a datum plane, or axis, within which an element of the surface must lie.

A Perpendicularity_tolerance is a type of Geometric_tolerance (see 4.2.243).

The data associated with a Perpendicularity_tolerance are the following:

— affected_plane;

— reference_datum.

4.2.345.1 affected_plane

The affected_plane specifies the plane in which the tolerance applies.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane is not specified, the tolerance applies in all directions (on drawings indicated by the diameter symbol).

See 4.3.1165 for the application assertion.

The affected_plane need not be specified for a particular Perpendicularity_tolerance (see 4.2.345).

4.2.345.2 reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) objects that define the reference for this type of geometric tolerance.

See 4.3.1164 for the application assertion.

4.2.346 Person

A Person is an individual human being who has some relationship to product data. The Person shall always be identified in the context of one or more organizations.

The data associated with a Person are the following:

— person_name;

— preferred_business_address.

4.2.346.1 person_name

The person_name specifies the word or group of words used to refer to the Person.

NOTE - The person_name includes the first, middle, and last names as well as titles, if applicable.

4.2.346.2 preferred_business_address

The preferred_business_address specifies the location of the office of the Person.

The preferred_business_address need not be specified for a particular Person (see 4.2.346).

4.2.347 Person_in_organization

A Person_in_organization is the specification of a Person (see 4.2.346) in the context of an Organization (see 4.2.331).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Person_in_organization are the following:

— associated_organization;

— associated_person;

— id;

— location;

— role.

4.2.347.1 associated_organization

The associated_organization specifies the Organization (see 4.2.331) with which the Person (see 4.2.346) is associated.

See 4.3.1166 for the application assertion.

4.2.347.2 associated_person

The associated_person specifies the Person (see 4.2.346).

See 4.3.1167 for the application assertion.

4.2.347.3 id

The id specifies an identifier of the person. The identifier shall be unique within the scope of the 'associated_organization'.

EXAMPLE The id may be a staff number or a user id in a computer system.

The id need not be specified for a particular Person_in_organization (see 4.2.347).

4.2.347.4 location

The location specifies the relevant address of the Person_in_organization.

The location need not be specified for a particular Person_in_organization (see 4.2.347).

4.2.347.5 role

The role specifies the relationship between the Person (see 4.2.346) and the Organization (see 4.2.331).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.348 Person_in_organization_relationship

A Person_in_organization_relationship is an mechanism which allows to specify an relationship between two persons in an organization.

EXAMPLE The owner of important product data leaves a company and therefore has a successor. This relationship may be built up using the Person_in_organization_relationship mechanism.

The data associated with a Person_in_organization_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.348.1 description

The description specifies additional information about the Person_in_organization_relationship.

See 4.3.1168 for the application assertion.

The description need not be specified for a particular Person_in_organization_relationship (see 4.2.348).

If present, there shall be exactly one object that defines the description for a Person_in_organization_-relationship.

4.2.348.2 related

The related specifies the second of the two objects related by the Person_in_organization_relationship.

See 4.3.1169 for the application assertion.

4.2.348.3 relating

The relating specifies the first of the two objects related by the Person_in_organization_relationship.

See 4.3.1169 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.348.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'successor': The related Person_in_organization (see 4.2.347) is the successor of the relating Person_in_organization;

4.2.349 Person_organization_assignment

A Person_organization_assignment is an object that associates an Organization (see 4.2.331) or a Person_in_organization (see 4.2.347) with product data.

This assignment provides additional information for the associated object. The provision of such data through this assignment has an organizational character whereas some objects require the same kind of data mandatorily in order to be semantically complete. This assignment shall not be used to associate the corresponding organizational data with an object whose attributes are referencing the organizational data directly.

The Person_organization_assignment shall not be used for the purpose of specifying a relationship between two Person_in_organization objects, e.g., a succession in organizational responsibility. For these purposes, Person_in_organization_relationship (see 4.2.348) shall be used.

The data associated with a Person_organization_assignment are the following:

— assigned_person_organization;

— description;

— is_applied_to;

— role.

4.2.349.1 assigned_person_organization

The assigned_person_organization specifies the concerned Organization (see 4.2.331) or the Person_in_organization (see 4.2.347).

See 4.3.1210 and 4.3.1212 for the application assertions.

There shall be exactly one object that defines the assigned_person_organization for a Person_organization_assignment (see 4.2.349).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.349.2 description

The description specifies additional information about the Person_organization_assignment.

See 4.3.1209 for the application assertion.

The description need not be specified for a particular Person_organization_assignment (see 4.2.349).

If present, there shall be exactly one object that defines the description for a Person_organization_-assignment.

4.2.349.3 is_applied_to

The is_applied_to specifies the object with which the Person_organization_assignment is associated.

See 4.3.1170, 4.3.1171, 4.3.1172, 4.3.1173, 4.3.1174, 4.3.1175, 4.3.1176, 4.3.1177, 4.3.1178, 4.3.1179, 4.3.1180, 4.3.1181, 4.3.1182, 4.3.1183, 4.3.1184, 4.3.1185, 4.3.1186, 4.3.1187, 4.3.1188, 4.3.1189, 4.3.1190, 4.3.1191, 4.3.1192, 4.3.1193, 4.3.1194, 4.3.1195, 4.3.1196, 4.3.1197, 4.3.1198, 4.3.1199, 4.3.1200, 4.3.1201, 4.3.1202, 4.3.1203, 4.3.1204, 4.3.1205, 4.3.1206, 4.3.1207, 4.3.1208, 4.3.1211, 4.3.1212, 4.3.1213, 4.3.1214, 4.3.1215, 4.3.1216, 4.3.1217, 4.3.1218, 4.3.1219, 4.3.1220, 4.3.1221, 4.3.1222, 4.3.1223, 4.3.1224, 4.3.1225, 4.3.1226, 4.3.1227, 4.3.1228, 4.3.1229, 4.3.1230, 4.3.1231, 4.3.1232, 4.3.1233, 4.3.1234, 4.3.1235, and 4.3.1236 for the application assertions.

There shall be at least one object that the Person_organization_assignment (see 4.2.349) is_applied_to.

4.2.349.4 role

The role specifies the responsibility of the assigned Person (see 4.2.346) or Organization (see 4.2.331) with respect to the object that it is applied to. Where applicable, the following values shall be used:

— 'author': The referenced object has been created by the assigned Person or Organization. The author holds the copyright;

— 'classification officer': The assigned Person or Organization is formally responsible for the classification of the referenced object;

— 'creator': The referenced object has been created by the assigned Person or Organization;

— 'custodian': The assigned Person or Organization is responsible for the existence and integrity of the referenced object;

— 'customer': The assigned Person or Organization acts as a purchaser or consumer of the referenced object;

— 'design supplier': The assigned Person or Organization is the one who delivers the data describing the referenced object;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE The 'design supplier' may be a design by means of a 3D model or a drawing.

— 'editor': The assigned Person or Organization is responsible for making any changes to any attribute of the referenced object;

— 'id owner': The assigned Person or Organization is the one responsible for the designation of an identifier;

— 'location': The assigned Organization is the place where the referenced object can be found or where it takes place;

— 'manufacturer': The assigned Person or Organization is the one who produces the actual (physical) object;

— 'owner': The assigned Person or Organization owns the referenced object, and has final say over its disposition and any changes to it;

— 'supplier': The assigned Person or Organization is the one who delivers the actual (physical) object (e.g., a dealer);

— 'wholesaler': The assigned Person or Organization is the one who is in the sales chain between the manufacturer and the supplier.

4.2.350 Physical_assembly_relationship

A Physical_assembly_relationship is a mechanism to relate one Physical_instance (see 4.2.352) as a component to another Physical_instance that plays the role of an assembly.

The data associated with a Physical_assembly_relationship are the following:

— is_realization_of;

— physical_assembly;

— physical_component.

4.2.350.1 is_realization_of

The is_realization_of specifies the Item_instance (see 4.2.271) the physical component is the realization of.

See 4.3.1237 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.350.2 physical_assembly

The physical_assembly specifies the Physical_instance (see 4.2.352) that serves as the assembly in the physical structure.

See 4.3.1238 for the application assertion.

4.2.350.3 physical_component

The physical_component specifies the Physical_instance (see 4.2.352) that serves as a component in the physical structure.

See 4.3.1238 for the application assertion.

4.2.351 Physical_document

A Physical_document is a piece of product data that is archived in a non-digital form.

> EXAMPLE Paper plots of technical drawings, micro fiche, or paper documents such as calculations or test reports are examples for a Physical_document.

A Physical_document is a type of Physical_representation (see 4.2.355).

The data associated with a Physical_document are the following:

— component

The component specifies the physical realization of the Physical_document.

See 4.3.1239 for the application assertion.

4.2.352 Physical_instance

A Physical_instance is the denomination of a physically realized object. A Physical_instance may be identified by a serial number. A lot id may be provided additionally to the serial number.

The data associated with a Physical_instance are the following:

— description;

— inventory_number;

— is_realization_of;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— lot_id;

— serial_number.

4.2.352.1 description

The description specifies additional information about the Physical_instance.

See 4.3.1241 for the application assertion.

The description need not be specified for a particular Physical_instance (see 4.2.352).

If present, there shall be exactly one object that defines the description for a Physical_instance.

4.2.352.2 inventory_number

The inventory_number specifies an alphanumerical string to identify an item in the detailed list of articles, such as goods and chattels, found in the possession of a person or enterprise.

The inventory_number need not be specified for a particular Physical_instance (see 4.2.352).

4.2.352.3 is_realization_of

The is_realization_of specifies the Product_identification (see 4.2.398) or the Design_discipline_item_definition (see 4.2.142) that collects the information defining the Physical_instance.

NOTE - This kind of information is only necessary for the 'root' component in a physical assembly since for a physical component this information is already given through Physical_assembly_relationship (see 4.2.350) which references, through the corresponding Item_instance (see 4.2.271), the defining object.

See 4.3.1240 and 4.3.1242 for the application assertions.

The is_realization_of need not be specified for a particular Physical_instance (see 4.2.352).

If present, there shall be exactly one object that the Physical_instance is_realization_of.

4.2.352.4 lot_id

The lot_id specifies the identifier of the lot the Physical_instance is part of.

The lot_id need not be specified for a particular Physical_instance (see 4.2.352).

4.2.352.5 serial_number

The serial_number is an identifier that distinguishes one Physical_instance from another.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The serial_number need not be specified for a particular Physical_instance (see 4.2.352).

4.2.353 Physical_instance_test_result

A Physical_instance_test_result is a mechanism to associate a Physical_instance (see 4.2.352) with measurements made on this Physical_instance.

NOTE - This object provides means to relate the characteristics of a real object with a design intent.

The data associated with a Physical_instance_test_result are the following:

— description;

— id;

— test_activity;

— test_result;

— tested_instance.

4.2.353.1 description

The description specifies additional information about the Physical_instance_test_result.

See 4.3.1244 for the application assertion.

The description need not be specified for a particular Physical_instance_test_result (see 4.2.353).

If present, there shall be exactly one object that defines the description for a Physical_instance_test_result.

4.2.353.2 id

The id specifies the identifier of the Physical_instance_test_result.

4.2.353.3 test_activity

The test_activity specifies the Activity (see 4.2.2) or the Process_operation_occurrence (see 4.2.384) that has lead to the test result.

EXAMPLE A measuring process on a prototype is an example for a 'test_activity'.

See 4.3.1243 and 4.3.1246 for the application assertions.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The test_activity need not be specified for a particular Physical_instance_test_result (see 4.2.353).

If present, there shall be exactly one object that defines the test_activity for a Physical_instance_test_-result.

4.2.353.4 test_result

The test_result specifies the characteristics that were determined by the performed test.

See 4.3.1247 for the application assertion.

4.2.353.5 tested_instance

The tested_instance specifies the Physical_instance (see 4.2.352) that was the subject of the test activity.

See 4.3.1245 for the application assertion.

4.2.354 Physical_model

A Physical_model is a model of the shape of a part made from a certain material, e.g., clay or wood, at a certain scale. For a Physical_model, neither a Document_size_property (see 4.2.164), a Document_-format_property (see 4.2.161), nor a Document_creation_property (see 4.2.158) shall be specified.

EXAMPLE A Physical_model may be used to get an impression of the future appearance of, e.g., a car or to use it, e.g., in a wind-tunnel.

A Physical_model is a type of Physical_representation (see 4.2.355).

4.2.355 Physical_representation

A Physical_representation is a physically realizable representation of a Document_version (see 4.2.167).

A Physical_representation is a type of Document_representation (see 4.2.163).

Each Physical_representation is a Physical_document (see 4.2.351) or a Physical_model (see 4.2.354).

4.2.356 Placed_feature

A Placed_feature is the occurrence of a feature on a shape where the definition of the feature is given in its own coordinate space. A Placed_feature is the result of a Feature_placement (see 4.2.202).

NOTE 1 - A Placed_feature may or may not have shape representation.

NOTE 2 - A Placed_feature is supposed to have all information necessary to create the shape resulting from the application of the feature.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

A Placed_feature is a type of Feature_occurrence (see 4.2.200).

The data associated with a Placed_feature are the following:

— is_placed_by

The is_placed_by specifies the Feature_placement that places a Feature_definition (see 4.2.199) in a Geometric_model (see 4.2.238), and, as a consequence, results in this particular Placed_feature.

See 4.3.1248 for the application assertion.

4.2.357 Placed_target

A Placed_target is a datum target that is described implicitly by parameters with reference to its parameter_reference.

A Placed_target is a type of Datum_target (see 4.2.125).

Each Placed_target is a Target_circle (see 4.2.506), a Target_point (see 4.2.508), a Target_rectangle (see 4.2.509), or a Target_line (see 4.2.507).

The data associated with a Placed_target are the following:

— is_defined_in;

— parameter_reference.

4.2.357.1 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) in which the Axis_placement (see 4.2.33) that serves as parameter_reference is defined.

NOTE - A Placed_target is not defined in its own local and independent coordinate space but in the coordinate space of the shape that provides the datum.

See 4.3.1250 for the application assertion.

4.2.357.2 parameter_reference

The parameter_reference specifies the Axis_placement (see 4.2.33) that the parameters or the Placed_target refer to.

See 4.3.1249 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.358 Planar_bottom_condition

A Planar_bottom_condition is a bottom of a Pocket_feature (see 4.2.366) that is flat.

A Planar_bottom_condition is a type of Pocket_bottom_condition (see 4.2.365).

The data associated with a Planar_bottom_condition are the following:

— floor_location;

— floor_normal;

— floor_radius.

4.2.358.1 floor_location

The floor_location specifies a Cartesian point on the planar bottom; this point shall be defined in the same Cartesian_coordinate_space (see 4.2.44) as the concerned Pocket_feature (see 4.2.366).

4.2.358.2 floor_normal

The floor_normal specifies a direction vector that shall be defined in the same Cartesian_coordinate_-space (see 4.2.44) as the concerned Pocket_feature (see 4.2.366). The floor_normal indicates a direction normal to the planar bottom pointing away from material.

4.2.358.3 floor_radius

The floor_radius specifies the blend radius at the bottom and the side edges of the Pocket_feature (see 4.2.366).

See 4.3.1251 for the application assertion.

The floor_radius need not be specified for a particular Planar_bottom_condition (see 4.2.358).

4.2.359 Planar_top_condition

A Planar_top_condition is a top condition of a boss that is flat.

A Planar_top_condition is a type of Boss_top_condition (see 4.2.43).

The data associated with a Planar_top_condition are the following:

— top_location;

— top_normal.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.359.1 top_location

The top_location specifies a Cartesian point on the planar top; this point shall defined in the same Cartesian_coordinate_space (see 4.2.44) as the concerned Boss_feature (see 4.2.42).

4.2.359.2 top_normal

The top_normal specifies a direction vector that shall be defined in the same Cartesian_coordinate_space (see 4.2.44) as the concerned Boss_feature (see 4.2.42). The top_normal indicates a direction normal to the planar top pointing away from material.

4.2.360 Plane

A Plane is an unbounded surface with a constant normal.

NOTE - A Plane is trimmed to a finite extension by applying a Face (see 4.2.191).

A Plane is a type of Surface (see 4.2.489).

4.2.361 Plib_class_reference

A Plib_class_reference designates a class in a library compliant to ISO 13584 (Parts Library).

The data associated with a Plib_class_reference are the following:

— code;

— supplier_bsu;

— version.

4.2.361.1 code

The code specifies the class in the PLIB library. The format of this code is defined in ISO 13584-42.

4.2.361.2 supplier_bsu

The supplier_bsu (basic semantic unit) specifies the supplier of the class in a PLIB library, in which the class is defined. The format of this specification is defined in ISO 13584-26.

4.2.361.3 version

The version specifies the identification of a particular version of a class in a PLIB library. The format of this version is defined in ISO 13584-42.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.362 Plib_property_reference

A Plib_property_reference designates a property in a library compliant to ISO 13584.

The data associated with a Plib_property_reference are the following:

— code;

— name_scope;

— version.

4.2.362.1 code

The code specifies the property in the PLIB library. The format of this code is defined in ISO 13584-42.

4.2.362.2 name_scope

The name_scope specifies the Plib_class_reference (see 4.2.361) in which the property is visible.

See 4.3.1252 for the application assertion.

4.2.362.3 version

The version specifies the identification of a particular version of a property in a PLIB library. The format of this version is defined in ISO 13584-42.

4.2.363 Plus_minus_bounds

A Plus_minus_bounds is the specification of the allowable deviation from a numerical value.

The data associated with a Plus_minus_bounds are the following:

— lower_bound;

— significant_digits;

— upper_bound;

— value_determination.

4.2.363.1 lower_bound

The lower_bound specifies the value of the tolerance that shall be subtracted from the exact value to establish the minimum allowed value.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.363.2 significant_digits

The significant_digits specifies the number of decimal digits indicating the accuracy of the lower_bound and upper_bound values.

The significant_digits need not be specified for a particular Plus_minus_bounds (see 4.2.363).

4.2.363.3 upper_bound

The upper_bound specifies the value of the tolerance that shall be added to the exact value to establish the maximum allowed value.

4.2.363.4 value_determination

The value_determination specifies information on how the Plus_minus_bounds shall be interpreted. Where applicable, the following values shall be used:

— 'calculated': The value has been calculated;

— 'designed': The value represents a value intended by the design;

— 'estimated': The value has been estimated;

— 'measured': The value has been measured;

— 'required': The value represents a requirement.

NOTE - A Plus_minus_bounds may be specified in the design stage of a product but it may also be documented as measured on a prototype.

The value_determination need not be specified for a particular Plus_minus_bounds (see 4.2.363).

4.2.364 Plus_minus_toleranced_datum

A Plus_minus_toleranced_datum is an entry in a Tolerance_table_cell (see 4.2.523) that is a plus minus tolerance for a dimension.

The data associated with a Plus_minus_toleranced_datum are the following:

— tolerance_value

The tolerance_value specifies the value with unit that gives the tolerance range between the minus value and the plus value.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.365 Pocket_bottom_condition

A Pocket_bottom_condition is the definition of a kind of bottom that characterizes a Pocket_feature (see 4.2.366).

Each Pocket_bottom_condition is a General_bottom_condition (see 4.2.215) or a Planar_bottom_condition (see 4.2.358).

The data associated with a Pocket_bottom_condition are the following:

— is_applied_to

The is_applied_to specifies to which end of the path the Pocket_bottom_condition applies. The following values shall be used:

— 'end': The Pocket_bottom_condition is applied to that end of the Pocket_feature that corresponds to the end of the defining Linear_path (see 4.2.300);

— 'start': The Pocket_bottom_condition is applied to that end of the Pocket_feature that corresponds to the start of the defining Linear_path.

EXAMPLE Figure 54 illustrates the usage of the two cases.

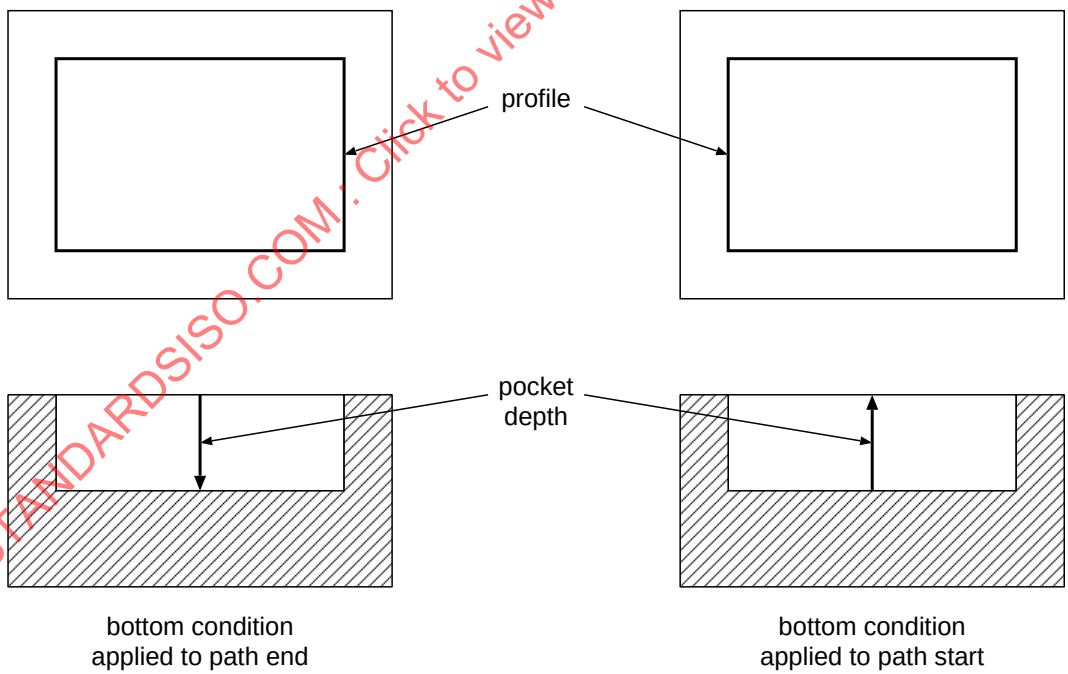

Figure 54 – Sweep path for pocket features

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.366 Pocket_feature

A Pocket_feature is the result of the removal of a volume from a shape. The removed volume is defined by a profile that is swept along a path. Additional characteristics regarding the bottom of the pocket or the walls of the pocket may also be specified.

A Pocket_feature is a type of Process_feature_in_solid (see 4.2.380).

Each Pocket_feature is a General_pocket (see 4.2.229), a Rectangular_closed_pocket (see 4.2.421), or a Rectangular_open_pocket (see 4.2.425).

The data associated with a Pocket_feature are the following:

— base_radius;

— bottom_condition;

— boundary;

— pocket_depth;

— taper.

4.2.366.1 base_radius

The base_radius specifies a radius shape blend between a Pocket_feature and the surrounding surface at its base.

See 4.3.1256 for the application assertion.

The base_radius need not be specified for a particular Pocket_feature (see 4.2.366).

4.2.366.2 bottom_condition

The bottom_condition specifies the Pocket_bottom_condition (see 4.2.365) or the Through_pocket_-bottom_condition (see 4.2.520) object that defines the type of the pocket bottom.

See 4.3.1258 and 4.3.1260 for the application assertions.

There shall be exactly one object that defines the bottom_condition for a Pocket_feature (see 4.2.366).

4.2.366.3 boundary

The boundary specifies the Profile_usage (see 4.2.403) that provides the enclosing Profile (see 4.2.401) for the Pocket_feature.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.1259 for the application assertion.

4.2.366.4 pocket_depth

The pocket_depth specifies the Linear_path (see 4.2.300) that is used to sweep the Closed_profile (see 4.2.72).

See 4.3.1257 for the application assertion.

4.2.366.5 taper

The taper specifies an angular variation of the size of the Pocket_feature along the sweep path. The variation shall be specified either by an Angle_taper (see 4.2.12) or by a Directed_taper (see 4.2.154).

See 4.3.1253, 4.3.1254, and 4.3.1255 for the application assertions.

The taper need not be specified for a particular Pocket_feature (see 4.2.366).

If present, there shall be exactly one object that defines the taper for a Pocket_feature.

4.2.367 Point

A Point is a location in a Cartesian coordinate space.

A Point is a type of Detailed_geometric_model_element (see 4.2.144).

Each Point is a Point_on_surface (see 4.2.374), a Point_on_curve (see 4.2.373), or a Cartesian_point (see 4.2.47).

4.2.368 Point_appearance

A Point_appearance is the visual appearance of a point.

The data associated with a Point_appearance are the following:

— colour;

— marker.

4.2.368.1 colour

The colour specifies the colour of a point. The colour is either user-defined or pre-defined. Figure 24 shows the pre-defined colours.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.368.2 marker

The marker specifies the Point_marker_symbol (see 4.2.372) that shall be used to present a point.

See 4.3.1261 for the application assertion.

4.2.369 Point_direction

A Point_direction is the location in space of a single axis.

EXAMPLE The Point_direction may be used to describe the position and the orientation of a machining tool.

A Point_direction is a type of Detailed_geometric_model_element (see 4.2.144).

The data associated with a Point_direction are the following:

— location;

— vector.

4.2.369.1 location

The location specifies the position of the Point_direction (see 4.2.369) in space.

See 4.3.1262 for the application assertion.

4.2.369.2 vector

The vector specifies the direction of the Point_direction in space.

4.2.370 Point_direction_model

A Point_direction_model is a model in three dimensional space consisting only of ordered sequences of points or of points with associated directions.

EXAMPLE For scanned data along planar intersections of a part, or for a model of an item, several point direction sequences can be used to specify the measured points together with the measured normal direction on the surface of the object in their sequence along the planar intersection. Another example is the specification of a tool path where the sequence specifies the tool path as a polygon and the direction specifies the direction of the tool, e.g., a miller, in each point of the path.

A Point_direction_model is a type of Geometric_model (see 4.2.238).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Point_direction_model are the following:

— point_direction_elements;

— point_elements.

4.2.370.1 point_direction_elements

The point_direction_elements specifies the Point_direction_sequence (see 4.2.371) elements of a Point_-direction_model.

See 4.3.1263 for the application assertion.

4.2.370.2 point_elements

The point_elements specifies the Point_sequence (see 4.2.375) elements of a Point_direction_model.

See 4.3.1264 for the application assertion.

4.2.371 Point_direction_sequence

A Point_direction_sequence is an ordered list of points and of associated directions.

> EXAMPLE A Point_direction_sequence may be used to represent the consecutive locations of a cutting tool during a machining operation.

A Point_direction_sequence is a type of Detailed_geometric_model_element (see 4.2.144).

The data associated with a Point_direction_sequence are the following:

— element

The element specifies the Point_direction (see 4.2.369) objects or the Point_on_surface (see 4.2.374) objects that define the consecutive points and the appropriate axis directions. In the case of a Point_on_-surface, the direction is the cross product of the principal tangent vectors u and v of the surface in this point.

See 4.3.1265 and 4.3.1266 for the application assertions.

There shall be at least one object that defines the element for a Point_direction_sequence.

4.2.372 Point_marker_symbol

A Point_marker_symbol is a predefined annotation symbol used to present a point.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

This AP supports the point marker symbols shown in figure 55 .

4.2.373 Point_on_curve

A Point_on_curve is a point that is defined by evaluating a given curve at a specified parameter value.

NOTE - A Point_on_curve implicitly represents the topological relation between a point and a curve.

A Point_on_curve is a type of Point (see 4.2.367).

4.2.374 Point_on_surface

A Point_on_surface is a point that is defined in the domain of a surface. Its actual location in 3D geometric space is obtained by evaluating the parametric equation of the surface with a particular pair of parameter values.

NOTE - The object implicitly represents the topological relation between a point and a surface.

A Point_on_surface is a type of Point (see 4.2.367).

4.2.375 Point_sequence

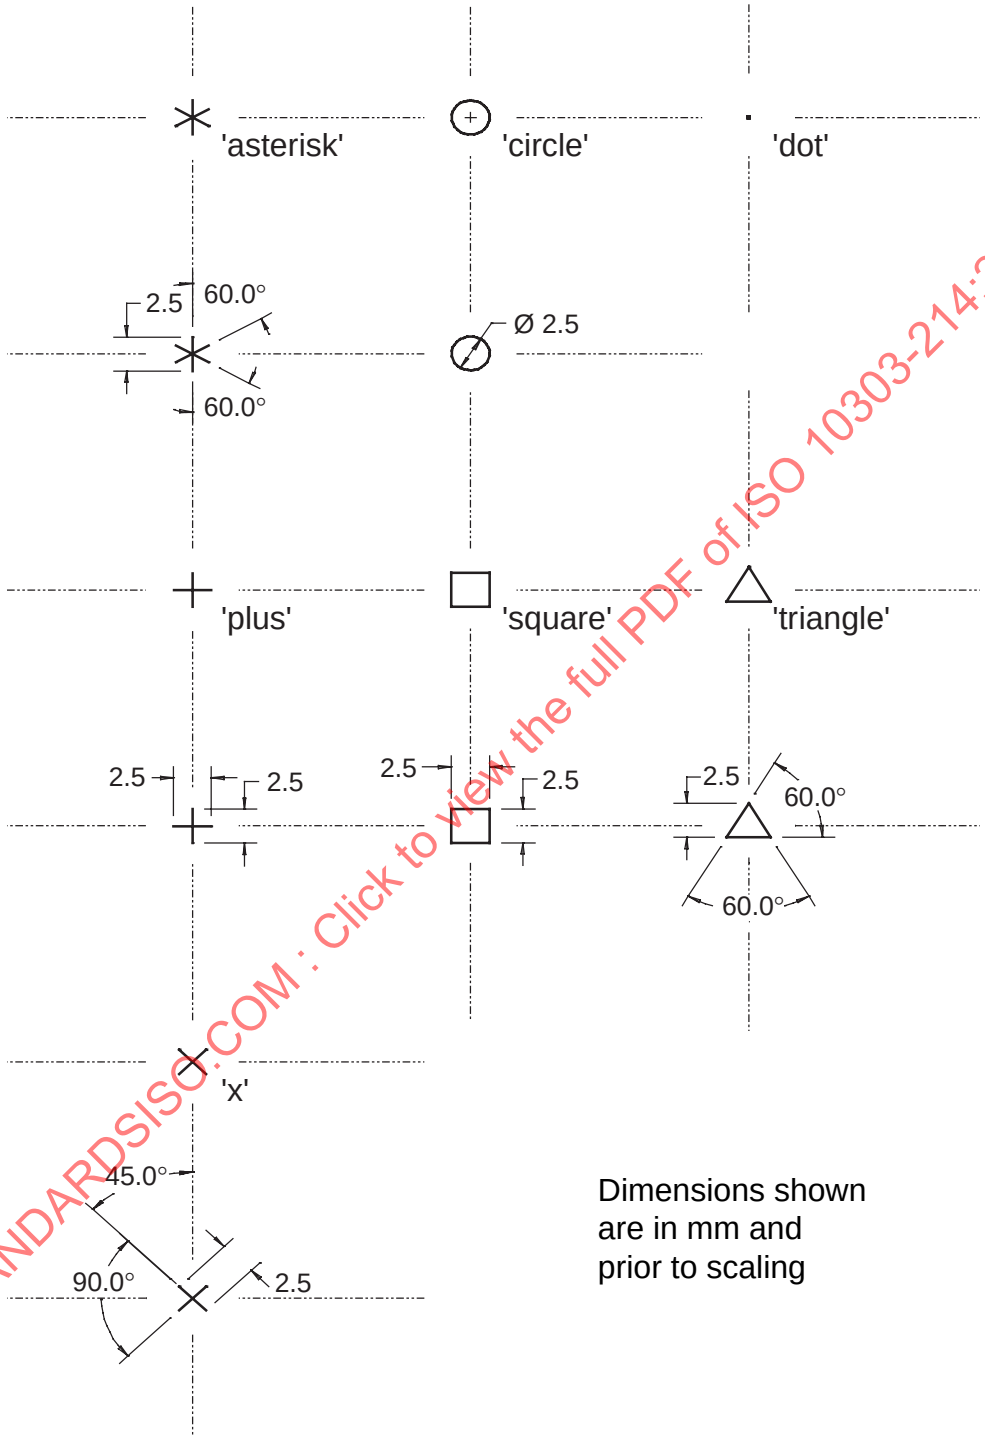
A Point_sequence is an ordered list of points.

A Point_sequence is a type of Detailed_geometric_model_element (see 4.2.144).

The data associated with a Point_sequence are the following:

— element

The element specifies the point elements that define the consecutive points.



See 4.3.1267 for the application assertion.

4.2.376 Poly_loop

A Poly_loop is a polygon. It is represented by an ordered co-planar collection of Cartesian points forming the vertices of the Poly_loop. The loop is composed of straight line segments joining a point in the collection to the succeeding point in the collection. The closing segment is from the last to the first point in the collection. The direction of the Poly_loop is in the direction of the line segments.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Figure 55 – Predefined point markers

© ISO 2001 – All rights reserved

The data associated with a Poly_loop are the following:

— outer;

— polygon.

4.2.376.1 outer

The outer specifies whether the Poly_loop represents the outer boundary of the Faceted_face (see 4.2.198) or not.

4.2.376.2 polygon

The polygon specifies the points that are joined by line segments to form a Poly_loop (see 4.2.376).

See 4.3.1268 for the application assertion.

4.2.377 Polyline

A Polyline is a curve that is represented by n-1 linear segments, defined by a list of n points. A Polyline may be closed and may self-intersect.

A Polyline is a type of Curve (see 4.2.108).

4.2.378 Position_tolerance

A Position_tolerance is a constraint on the location of a Shape_element (see 4.2.449). It defines a zone within which the centre, axis, or centre plane of the considered Shape_element is permitted to lie.

NOTE 1 - Basic dimensions establish the true position from specified datum features and between interrelated features.

NOTE 2 - The concept of position tolerances is defined in ISO 5458 [14].

A Position_tolerance is a type of Geometric_tolerance (see 4.2.243).

The data associated with a Position_tolerance are the following:

— affected_plane;

— reference_datum.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.378.1 affected_plane

The affected_plane specifies the plane in which a certain type of geometric tolerance applies. This attribute covers information that corresponds to the drawing plane on drawings. If the affected_plane attribute is not specified, the tolerance applies in all directions which results in a cylindrical tolerance zone (on drawings indicated by the diameter symbol).

EXAMPLE Figure 56 illustrates the meaning of the affected_plane in the case of a Position_tolerance.

See 4.3.1270 for the application assertion.

The affected_plane need not be specified for a particular Position_tolerance (see 4.2.378).

4.2.378.2 reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) objects that define the reference for this type of geometric tolerance.

See 4.3.1269 for the application assertion.

4.2.379 Process_feature_in_panel

A Process_feature_in_panel is a feature that is defined to be applied to a sheet like part.

A Process_feature_in_panel is a type of Feature_definition (see 4.2.199).

Each Process_feature_in_panel is a Locator_feature (see 4.2.302), a Form_feature_in_panel (see 4.2.212), a Bead_feature (see 4.2.39), a Hole_feature_in_panel (see 4.2.258), a Compound_feature_in_panel (see 4.2.85), or a Joggle_feature (see 4.2.277).

The data associated with a Process_feature_in_panel are the following:

— punch_direction

The punch_direction specifies the stamping direction when manufacturing the Process_feature_in_panel.

NOTE - Usually, the punch_direction is the direction normal to the panel surface towards that side of the panel at which the resulting Process_feature_in_panel protrudes from the surface.

The punch_direction need not be specified for a particular Process_feature_in_panel.

4.2.380 Process_feature_in_solid

A Process_feature_in_solid is a feature that is defined to be applied to a solid part. Each single Process_-feature_in_solid (i.e. not a Compound_feature_in_solid (see 4.2.88)) is specified as a volume defined by

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

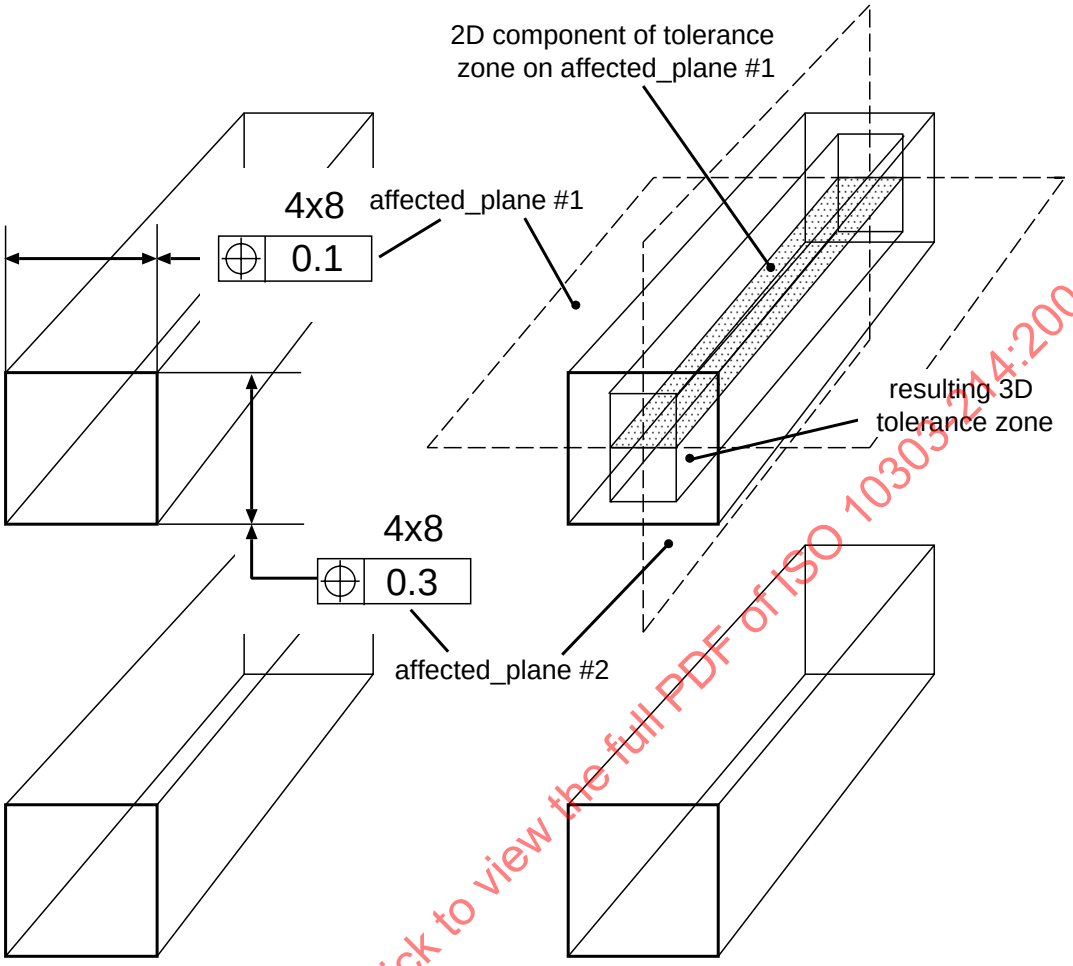


Figure 56 – Position tolerancing with affected planes

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

a Profile (see 4.2.401) and a sweep Path (see 4.2.342); depending on the type of Process_feature_in_solid this volume is either added to or subtracted from the part.

In the case where the Process_feature_in_solid is defined to be applied as an Included_feature (see 4.2.261) the feature itself as well as the Path and the Profile shall be defined in the coordinate space of the part. In the case where the Process_feature_in_solid is defined to be applied as a Placed_feature (see 4.2.356) the Process_feature_in_solid as well as the Profile shall be defined in their own local coordinate spaces; the Path shall be defined in the feature coordinate space. The spatial constraints between profile, feature, and part shall be specified by geometric Transformation (see 4.2.533) objects.

NOTE 1 - The latter allows to re-use feature definitions for multiple occurrences of the feature.

 © ISO 2001 – All rights reserved

In the case, where the Process_feature_in_solid is defined by a profile that is swept along a path the following rules apply:

Profiles that are swept along a path shall be oriented normal to the path at any position along the path. The geometric transformation placing a profile shall be in a way that the profile plane coincides with the plane normal to the path at the path start or end respectively.

Profiles that are swept along a path shall not twist along the path; no twisting in this context means that the x-axis of the profile is always parallel to the plane that is the x-z-plane of the 'first occurrence' of the profile. The z-axis of the profile is always tangent to the sweep path.

If C_1 is the path, C_2 the profile, P any point on C_1, T the tangent of C_1 at P, N the normal of C_1 at P, V the axis defined by P and N, R_c the curvature radius of C_1 at P, C_3 the curve resulting from a) positioning of C_2 in the coordinate space of the feature, b) sweeping of the curve, resulting from the previous step, along C_1 up to P, c) projection of the curve, resulting from the previous step, on the plane defined by P, T, and N, and D_{max} the maximum coordinate of C_3 along V then

— N shall exist in any point P of C_1 where $R_c < \infty$;

— $D_{max} \leq R_c$ in any point P of C_1 where $R_c < \infty$.

A Process_feature_in_solid is a type of Feature_definition (see 4.2.199).

Each Process_feature_in_solid is a Pocket_feature (see 4.2.366), a Rib_feature (see 4.2.435), a Round_-hole (see 4.2.439), a Compound_feature_in_solid (see 4.2.88), a Boss_feature (see 4.2.42), or a Slot_-feature (see 4.2.458).

The data associated with a Process_feature_in_solid are the following:

— location_and_orientation

The location_and_orientation specifies the Axis_placement (see 4.2.33) that defines the location and orientation of the feature. The location_and_orientation is specified for the purpose of evaluation by manufacturing systems, which use the information in order to determine various machining parameters. For all types of Process_feature_in_solid, except for Compound_feature_in_solid, the location_and_-orientation shall reference the same instance of Axis_placement as the Profile it refers to as one of its parameters.

NOTE 2 - The use of the location_and_orientation for Compound_feature_in_solid is defined in that particular application object.

See 4.3.1271 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.381 Process_operation_definition

A Process_operation_definition is the specification of an activity that may be included in a Process_plan (see 4.2.387). A Process_operation_definition characterizes a manufacturing or control operation.

NOTE 1 - Process_operation_definition as well as Process_operation_occurrence (see 4.2.384) may be associated with organizational data using, e.g., Person_organization_assignment (see 4.2.349). The reason for having these data available for both types of objects is the requirement to associate Process_operation_definition with organizational data in both a context independent and a context dependent way (the context is a particular Process_plan).

NOTE 2 - In the case where an instance of Process_operation_definition is associated with, e.g., two Organization (see 4.2.331) objects (e.g., as location), once context independent and once context dependent, the two locations need not be the same but should be related in a way that the context dependent location should be a specialization of the context independent location (e.g., a particular assembly line in a plant).

The data associated with a Process_operation_definition are the following:

— description;

— id;

— name;

— process_type;

— version_id.

4.2.381.1 description

The description specifies additional information about the Process_operation_definition.

See 4.3.1272 for the application assertion.

The description need not be specified for a particular Process_operation_definition (see 4.2.381).

If present, there shall be exactly one object that defines the description for a Process_operation_definition.

4.2.381.2 id

The id specifies the identifier of the Process_operation_definition that shall be unique within the scope of the associated Process_plan_version (see 4.2.389).

4.2.381.3 name

The name specifies the word or group of words by which the Process_operation_definition is referred to.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE ’operation Z10.114’ is an example for name.

See 4.3.1272 for the application assertion.

The name need not be specified for a particular Process_operation_definition (see 4.2.381).

If present, there shall be exactly one object that defines the name for a Process_operation_definition.

4.2.381.4 process_type

The process_type specifies the type of the Process_operation_definition.

EXAMPLE ’stamping’, ’milling’, ’drilling’, ’welding’, ’casting’, and ’painting’ are examples for process_-type.

4.2.381.5 version_id

The version_id specifies the identification of a particular version of a Process_operation_definition.

The version_id need not be specified for a particular Process_operation_definition (see 4.2.381).

4.2.382 Process_operation_definition_relationship

A Process_operation_definition_relationship is a relationship between two Process_operation_definition (see 4.2.381) objects.

The data associated with a Process_operation_definition_relationship are the following:

— related;

— relating;

— relation_type.

4.2.382.1 related

The related specifies the second of the two objects related by the Process_operation_definition_relationship.

NOTE - The semantics of this attribute is defined by the attribute relation_type.

See 4.3.1273 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.382.2 relating

The relating specifies the first of the two objects related by the Process_operation_definition_relationship.

NOTE - The semantics of this attribute is defined by the attribute relation_type.

See 4.3.1273 for the application assertion.

4.2.382.3 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'alternative': The application object defines a relationship where the related Process_operation_definition (see 4.2.381) may be used alternatively instead of the relating Process_operation_definition;

— 'substitution': The application object defines a relationship where the related Process_operation_definition replaces the relating Process_operation_definition;

— 'version association': The application object defines a relationship where the related Process_operation_definition is a version of the relating Process_operation_definition. In this case, only the related Process_operation_definition shall specify a version_id;

— 'version sequence': The application object defines a relationship where the relating Process_operation_definition is the preceding version and the related Process_operation_definition is the following version. In this case, both Process_operation_definition objects shall specify a version_id.

4.2.383 Process_operation_input_or_output

A Process_operation_input_or_output is the input or expected result of a Process_operation_definition (see 4.2.381).

The data associated with a Process_operation_input_or_output are the following:

— concerned_shape;

— description;

— element;

— operation;

— placement;

— role.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.383.1 concerned_shape

The concerned_shape specifies the set of Shape_element (see 4.2.449) objects that are affected by the Process_operation_occurrence (see 4.2.384).

See 4.3.1280 for the application assertion.

4.2.383.2 description

The description specifies additional information about the Process_operation_input_or_output.

See 4.3.1278 for the application assertion.

The description need not be specified for a particular Process_operation_input_or_output (see 4.2.383).

If present, there shall be exactly one object that defines the description for a Process_operation_input_-or_output.

4.2.383.3 element

The element specifies the element that plays the role of the input or the output for the operation.

See 4.3.1274, 4.3.1275, 4.3.1276, and 4.3.1277 for the application assertions.

There shall be exactly one object that defines the element for a Process_operation_input_or_output (see 4.2.383).

4.2.383.4 operation

The operation specifies the Process_operation_occurrence (see 4.2.384) that the Process_operation_-input_or_output is associated with.

See 4.3.1279 for the application assertion.

4.2.383.5 placement

The placement specifies the geometrical Transformation (see 4.2.533) between the local coordinate system of the element acting as Process_operation_input_or_output, and the reference coordinate system. The reference coordinate system is either the coordinate system of the reference tool, if present, for the concerned Process_operation_occurrence (see 4.2.384) or, if no reference tool is present, the coordinate system of the Process_operation_occurrence itself.

See 4.3.1281 for the application assertion.

The placement need not be specified for a particular Process_operation_input_or_output (see 4.2.383).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.383.6 role

The role specifies whether the identified element plays the role of an input or an output for the operation.

4.2.384 Process_operation_occurrence

A Process_operation_occurrence is the usage of a Process_operation_definition (see 4.2.381) in a Process_plan (see 4.2.387). This association states that the Process_operation_definition is part of the Process_plan.

NOTE - This mechanism enables the reuse of a Process_operation_definition in the context of more than one Process_plan.

The data associated with a Process_operation_occurrence are the following:

— id;

— is_defined_in;

— operation_definition;

— plan.

4.2.384.1 id

The id specifies the identifier of the Process_operation_occurrence.

4.2.384.2 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) of the Process_operation_occurrence for the case where none of the tools associated by Process_operation_input_or_output plays the role of a reference tool defining the reference coordinate space.

See 4.3.1282 for the application assertion.

The is_defined_in need not be specified for a particular Process_operation_occurrence (see 4.2.384).

4.2.384.3 operation_definition

The operation_definition specifies the Process_operation_definition (see 4.2.381) that defines the Process_operation_occurrence in a Process_plan (see 4.2.387).

See 4.3.1283 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.384.4 plan

The plan specifies the Process_plan (see 4.2.387) to which the Process_operation_occurrence is assigning a Process_operation_definition (see 4.2.381).

See 4.3.1284 for the application assertion.

4.2.385 Process_operation_occurrence_relationship

A Process_operation_occurrence_relationship is a relationship between two Process_operation_occurrence (see 4.2.384) objects.

NOTE - The relating Process_operation_occurrence and the related Process_operation_occurrence need not belong to the same Process_plan_version (see 4.2.389).

The data associated with a Process_operation_occurrence_relationship are the following:

— cycle_time;

— description;

— related;

— relating;

— relation_type;

— waiting_time.

4.2.385.1 cycle_time

The cycle_time specifies the interval of time within which both Process_operation_occurrence (see 4.2.384) objects have to take place in order to be declared as simultaneous.

The cycle_time need not be specified for a particular Process_operation_occurrence_relationship (see 4.2.385).

4.2.385.2 description

The description specifies additional information about the Process_operation_occurrence_relationship.

See 4.3.1285 for the application assertion.

The description need not be specified for a particular Process_operation_occurrence_relationship (see 4.2.385).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

If present, there shall be exactly one object that defines the description for a Process_operation_occurrence_relationship.

4.2.385.3 related

The related specifies the second of the two Process_operation_occurrence (see 4.2.384) objects related by a Process_operation_occurrence_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1286 for the application assertion.

4.2.385.4 relating

The relating specifies the first of the two Process_operation_occurrence (see 4.2.384) objects related by a Process_operation_occurrence_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1286 for the application assertion.

4.2.385.5 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'decomposition': The application object defines a relationship where the related Process_operation_occurrence (see 4.2.384) is one of the components of the relating Process_operation_occurrence;

— 'exclusiveness': The application object defines a relationship where the relating and the related Process_operation_occurrence shall not have any overlap in time of execution;

— 'sequence': The application object defines a relationship where the relating Process_operation_occurrence shall be completed before the related Process_operation_occurrence starts;

— 'simultaneity': The application object defines a relationship where the relating and the related Process_operation_occurrence are considered as occurring during the same time period;

NOTE 1 - The criteria for 'simultaneity' and in particular the allowed delay between two Process_operation_occurrence objects declared simultaneous, are user-dependent.

NOTE 2 - See attribute 'cycle_time' for additional information.

— 'substitution': The application object defines a relationship where the related Process_operation_occurrence replaces of the relating Process_operation_occurrence.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.385.6 waiting_time

The waiting_time specifies the time which shall elapse, at least, between the completion of the relating Process_operation_occurrence (see 4.2.384) and the start of the related Process_operation_occurrence. The referenced shall have a definition that is a Duration_property (see 4.2.175).

EXAMPLE The Process_operation_occurrence 'polishing' must not be started less than 2 hours after the Process_operation_occurrence 'painting' ended.

See 4.3.1287 for the application assertion.

The waiting_time need not be specified for a particular Process_operation_occurrence_relationship (see 4.2.385).

4.2.386 Process_operation_resource_assignment

A Process_operation_resource_assignment is a mechanism to associate a resource with a Process_operation_occurrence (see 4.2.384).

The data associated with a Process_operation_resource_assignment are the following:

— operation;

— placement;

— reason;

— reference_tool;

— resource_definition.

4.2.386.1 operation

The operation specifies the Process_operation_occurrence (see 4.2.384) with which the resource is associated.

See 4.3.1293 for the application assertion.

4.2.386.2 placement

The placement specifies the geometrical Transformation (see 4.2.533) between the local coordinate system of the Process_operation_resource_assignment and the reference coordinate system.

NOTE - The reference coordinate system is either the coordinate system of the reference tool (if present) for the concerned Process_operation_definition (see 4.2.381) or (if no reference tool is present) the coordinate system of the Process_operation_definition itself.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

In the case where the value of the attribute reference_tool is 'true', no transformation shall be defined.

See 4.3.1295 for the application assertion.

The placement need not be specified for a particular Process_operation_resource_assignment (see 4.2.386).

4.2.386.3 reason

The reason specifies the rationale behind the use of the resource for a particular Process_operation_occurrence (see 4.2.384).

See 4.3.1291 for the application assertion.

The reason need not be specified for a particular Process_operation_resource_assignment (see 4.2.386).

If present, there shall be exactly one object that defines the reason for a Process_operation_resource_assignment.

4.2.386.4 reference_tool

The reference_tool specifies whether or not the resource identified by the Process_operation_resource_assignment plays the role of the reference tool for the occurrence of an operation.

In the case where the value of this attribute is 'true', all geometric transformations within the scope of the Process_operation_occurrence (see 4.2.384) are defined with respect to the local coordinate system of the resource identified by the Process_operation_resource_assignment. There must not be more than one resource playing the role of the reference tool for one Process_operation_occurrence.

In the case where the resource is not represented as a Design_discipline_item_definition (see 4.2.142) the value of the reference_tool shall be 'false'.

4.2.386.5 resource_definition

The resource_definition specifies the tool that is used to perform the operation.

See 4.3.1288, 4.3.1289, 4.3.1290, 4.3.1292, and 4.3.1294 for the application assertions.

There shall be exactly one object that defines the resource_definition for a Process_operation_resource_assignment (see 4.2.386).

4.2.387 Process_plan

A Process_plan is the manufacturing planning information, necessary to realize or produce a particular version of an Item (see 4.2.267).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Each Process_plan may be a Process_plan_version (see 4.2.389).

The data associated with a Process_plan are the following:

— description;

— name;

— plan_id;

— produced_output.

4.2.387.1 description

The description specifies additional information about the Process_plan.

See 4.3.1297 for the application assertion.

The description need not be specified for a particular Process_plan (see 4.2.387).

If present, there shall be exactly one object that defines the description for a Process_plan.

4.2.387.2 name

The name specifies the word or group of words by which the Process_plan is referred to.

EXAMPLE ’ABO Engine Cylinder block machining line’ is an example for name.

See 4.3.1297 for the application assertion.

The name need not be specified for a particular Process_plan (see 4.2.387).

If present, there shall be exactly one object that defines the name for a Process_plan.

4.2.387.3 plan_id

The plan_id specifies the identifier of the Process_plan that shall be unique within the scope of an organization.

4.2.387.4 produced_output

The produced_output specifies the set of Item_version (see 4.2.275) objects that are produced by the operations of the Process_plan.

See 4.3.1296 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The produced_output need not be specified for a particular Process_plan (see 4.2.387).

4.2.388 Process_plan_relationship

A Process_plan_relationship is the relationship between two Process_plan (see 4.2.387) objects.

EXAMPLE If an item shall be manufactured at two different manufacturing sites, e.g., one at Paris and the other at Bordeaux, there will be two different process plans, that may be related by a Process_plan_-relationship.

The data associated with a Process_plan_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.388.1 description

The description specifies additional information about the Process_plan_relationship.

See 4.3.1298 for the application assertion.

The description need not be specified for a particular Process_plan_relationship (see 4.2.388).

If present, there shall be exactly one object that defines the description for a Process_plan_relationship.

4.2.388.2 related

The related specifies the second of the two Process_plan (see 4.2.387) objects related by a Process_-plan_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1299 for the application assertion.

4.2.388.3 relating

The relating specifies the first of the two Process_plan (see 4.2.387) objects related by a Process_plan_-relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.1299 for the application assertion.

4.2.388.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'alternative': The application object defines a relationship where the related Process_plan (see 4.2.387) may be used alternatively to the relating Process_plan;

— 'version association': The application object defines a relationship where the related Process_plan is a version of the relating Process_plan. In this case, the related Process_plan shall be a Process_-plan_version (see 4.2.389);

— 'version sequence': The application object defines a relationship where the relating Process_plan is the preceding version and the related Process_plan is the following version. In this case, both Process_plan objects shall be of type Process_plan_version.

4.2.389 Process_plan_version

A Process_plan_version is a particular version of a Process_plan (see 4.2.387).

A Process_plan_version is a type of Process_plan (see 4.2.387).

The data associated with a Process_plan_version are the following:

— version_id

The version_id specifies the identification of a particular version of a Process_plan.

4.2.390 Process_property_association

A Process_property_association is a mechanism to assign a property value to process related objects.

A Process_property_association is a type of Property_value_association (see 4.2.413).

The data associated with a Process_property_association are the following:

— described_element

The described_element specifies the object that is described by the property value.

See 4.3.1300, 4.3.1301, 4.3.1302, 4.3.1303, 4.3.1304, and 4.3.1305 for the application assertions.

There shall be exactly one object that defines the described_element for a Process_property_association.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.391 Process_state

A Process_state is a view of an in-process-item definition of a particular version of a Item (see 4.2.267). It characterizes a state of the Item_version (see 4.2.275) that occurs before the state identified by the 'related_item_definition'. The identifier of a Process_state shall be unique within the context of the Item_version and of the Process_plan_version (see 4.2.389).

NOTE - Process_state may be used to characterize intermediate states of the Item_version, if this Item_version is one of the produced outputs of a Process_plan (see 4.2.387).

A Process_state is a type of Design_discipline_item_definition (see 4.2.142).

The data associated with a Process_state are the following:

— related_item_definition

The related_item_definition specifies the Design_discipline_item_definition (see 4.2.142) that defines the final item that the in-process-item is a preliminary stage of.

See 4.3.1306 for the application assertion.

4.2.392 Product_class

A Product_class is the identification of a set of similar products to be offered to the market. Product_class objects that are related to each other by a Product_class_relationship (see 4.2.393) do not inherit any characteristics from each other.

EXAMPLE Figure 57 depicts a detail of an example of a structure build up by Product_class and Product_class_relationship objects.

The data associated with a Product_class are the following:

— description;

— id;

— level_type;

— name;

— version_id.

4.2.392.1 description

The description specifies additional information about the Product_class.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.1307 for the application assertion.

The description need not be specified for a particular Product_class (see 4.2.392).

If present, there shall be exactly one object that defines the description for a Product_class.

4.2.392.2 id

The id specifies the identifier of the Product_class that shall be unique.

NOTE - The scope of the uniqueness is usually dependent on the form of implementation; it may be e.g., a physical file or a data base.

4.2.392.3 level_type

The level_type specifies the level or category of this Product_class in a hierarchical structure of Product_-class objects. The level_type shall only be used if and only if the level_type is specified in the the context of the unit of functionality 'specification_control' (UoF S7).

EXAMPLE A high level Product_class (level_type = 'enterprise') may be used to define all Specification_-category (see 4.2.468) and Specification (see 4.2.467) objects for all Product_class objects of an enterprise with several brands and companies.

A second level Product_class (level_type = 'platform') may be used to group all products that are based on the same technical concept (platform); these products may belong to different brands.

A third level Product_class (level_type = 'car family') may be used to group all products that have a common base and a fixed set of characteristics (specification categories).

A fourth level Product_class (level_type = 'car type') may represent products that are offered to the market; this level of Product_class may be defined by the marketing department. A set of specifications sufficient to produce the car is associated with its Product_class. Within this association, a distinction is made between standard characteristics (e.g. number of doors) and options that have to be chosen (e.g., outside colour) or that may be chosen by the customer (e.g., radio).

The level_type need not be specified for a particular Product_class (see 4.2.392).

4.2.392.4 name

The name specifies the word or group of words by which the Product_class is referred to.

EXAMPLE '69 Buick Electra', 'Bugatti Royal', 'Pacific 213', and 'Airbus A320' are examples for name.

See 4.3.1307 for the application assertion.

The name need not be specified for a particular Product_class (see 4.2.392).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

If present, there shall be exactly one object that defines the name for a Product_class.

4.2.392.5 version_id

The version_id specifies the identification of a particular version of a Product_class.

The version_id need not be specified for a particular Product_class (see 4.2.392).

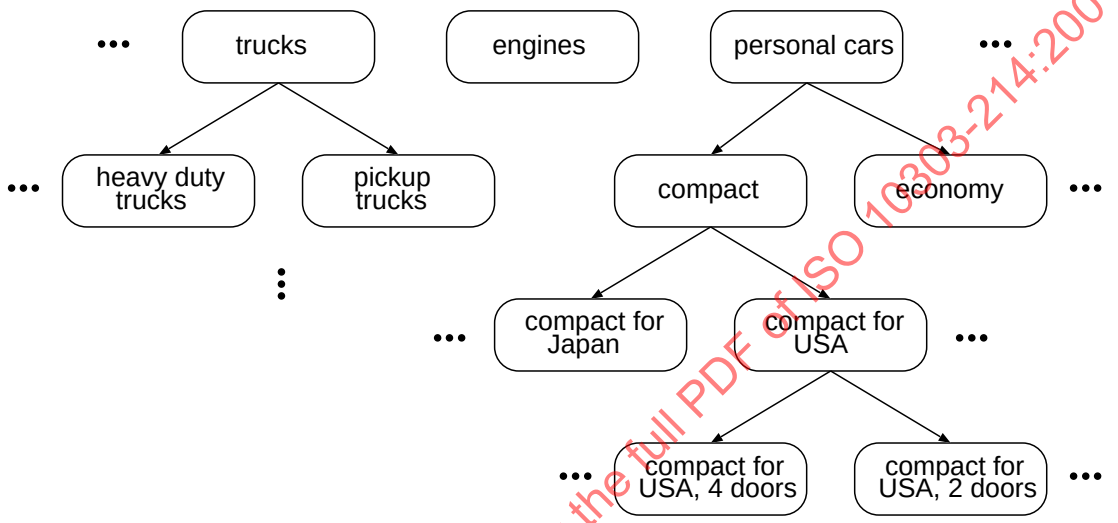

Figure 57 – Example structure of Product_class objects in a hierarchy

4.2.393 Product_class_relationship

A Product_class_relationship is a relationship between two Product_class (see 4.2.392) objects.

The data associated with a Product_class_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.393.1 description

The description specifies additional information about the Product_class_relationship.

See 4.3.1308 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The description need not be specified for a particular Product_class_relationship (see 4.2.393).

If present, there shall be exactly one object that defines the description for a Product_class_relationship.

4.2.393.2 related

The related specifies the second of the two Product_class (see 4.2.392) objects related by the Product_class_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1309 for the application assertion.

4.2.393.3 relating

The relating specifies the first of the two Product_class (see 4.2.392) objects related by the Product_class_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1309 for the application assertion.

4.2.393.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'derivation': the Product_class_relationship defines a relationship where the related Product_class (see 4.2.392) is derived from the relating Product_class;

— 'hierarchy': the Product_class_relationship defines a relationship where the relating Product_class is on a higher level in the hierarchy of Product_class objects than the related Product_class;

— 'substitution': The Product_class_relationship defines a relationship where the related Product_class replaces the relating Product_class;

— 'version sequence': the Product_class_relationship defines a relationship where the relating Product_class is the preceding version and the related Product_class is the following version.

NOTE - The relationship does not imply inheritance of any kind between the application objects that are related.

4.2.394 Product_component

A Product_component is an element in a conceptual product structure.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE 1 - A Product_component may, by intent, be generic to enable specializations. One or more distinct items may be defined from such a Product_component by adding specific characteristics.

NOTE 2 - A Product_component is a mechanism for collecting the knowledge a company has accumulated during the design of similar products.

A Product_component is a type of Complex_product (see 4.2.80) and Product_constituent (see 4.2.395).

The data associated with a Product_component are the following:

— description;

— instance_required;

— is_influenced_by;

— is_relevant_for;

— name.

4.2.394.1 description

The description specifies additional information about the Product_component.

See 4.3.1312 for the application assertion.

The description need not be specified for a particular Product_component (see 4.2.394).

If present, there shall be exactly one object that defines the description for a Product_component.

4.2.394.2 instance_required

The instance_required specifies if the existence of a corresponding Item_instance (see 4.2.271) is required for the various Alternative_solution (see 4.2.10) objects of that Product_component. A value of 'true' indicates that a corresponding Item_instance is required.

NOTE - There are Product_component objects that are not realized by parts. In these cases, no instance of an item is required.

EXAMPLE Trunk space or holes for wire harness are examples for Product_component objects that do not require instances.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.394.3 is_influenced_by

The is_influenced_by specifies the Specification_category (see 4.2.468) objects that impact the design of a solution for the Product_component in the context of the Product_class (see 4.2.392) objects that are referred to by the Class_category_association (see 4.2.64) objects.

NOTE - Each alternative solution for the Product_component (i.e. the design of these solutions) is influenced by the referenced Specification_category.

See 4.3.1311 for the application assertion.

4.2.394.4 is_relevant_for

The is_relevant_for specifies the Application_context (see 4.2.21) objects in which the Product_component has to be considered.

See 4.3.1310 for the application assertion.

4.2.394.5 name

The name specifies the word or group of words by which the Product_component is referred to.

EXAMPLE 1 'engine', 'chassis', and 'windshield wiper' are examples of name of the Product_component.

EXAMPLE 2 This attribute may also be used to indicate the type of component in a component structure such as 'BOM top node', 'BOM bottom node', 'structure BOM product node', or 'structure BOM node'.

See 4.3.1312 for the application assertion.

The name need not be specified for a particular Product_component (see 4.2.394).

If present, there shall be exactly one object that defines the name for a Product_component.

4.2.395 Product_constituent

A Product_constituent is an object that may participate in the functional, logical, or physical break-down or be an alternate realization of a Complex_product (see 4.2.80).

Each Product_constituent is a Product_component (see 4.2.394), a Product_function (see 4.2.397), or an Item_instance (see 4.2.271).

4.2.396 Product_design

A Product_design is a mechanism to associate an Item_version (see 4.2.275) with its corresponding Product_identification (see 4.2.398).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Product_design are the following:

— design;

— product.

4.2.396.1 design

The design specifies the Item_version (see 4.2.275) that meets the requirements.

See 4.3.1313 for the application assertion.

4.2.396.2 product

The product specifies the Product_identification (see 4.2.398) that represents the requirements.

See 4.3.1314 for the application assertion.

4.2.397 Product_function

A Product_function is a behaviour or an action expected from a product.

> EXAMPLE The Product_function 'transportation' with sub-functions 'acceleration' and 'retardation' or the Product_function 'illumination' with sub-functions 'exterior illumination' and 'interior illumination' are examples for Product_function objects in a hierarchical structure.

A Product_function is a type of Complex_product (see 4.2.80) and Product_constituent (see 4.2.395).

The data associated with a Product_function are the following:

— description;

— is_relevant_for;

— name.

4.2.397.1 description

The description specifies additional information about the Product_function.

See 4.3.1316 for the application assertion.

The description need not be specified for a particular Product_function (see 4.2.397).

If present, there shall be exactly one object that defines the description for a Product_function.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.397.2 is_relevant_for

The is_relevant_for specifies the Application_context (see 4.2.21) objects in which the Product_function has to be considered.

See 4.3.1315 for the application assertion.

4.2.397.3 name

The name specifies the word or group of words by which the Product_function is referred to.

See 4.3.1316 for the application assertion.

The name need not be specified for a particular Product_function (see 4.2.397).

If present, there shall be exactly one object that defines the name for a Product_function.

4.2.398 Product_identification

A Product_identification identifies a manufacturable object, or expected as so. A Product_identification is defined with respect to the Product_class (see 4.2.392) it is a member of.

NOTE 1 - The kind of product that is to be manufactured from the data of the Product_identification, is the kind of product that the associated_product_class identifies a class of.

NOTE 2 - The intent of Product_identification is the identification of one manufacturable object whereas the intent of Product_class is the gathering of products with similar characteristics.

EXAMPLE A Product_identification that is associated with a Product_class that identifies a family of Diesel engines is intended to lead to the manufacture of a particular case of Diesel engine, and the Product_-identification that is associated with a Product_class that identifies a car family will lead to the manufacture of a car.

Each Product_identification may be a Product_specification (see 4.2.399).

The data associated with a Product_identification are the following:

— associated_product_class;

— description;

— id;

— name;

— version_id.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.398.1 associated_product_class

The associated_product_class specifies the Product_class (see 4.2.392) that a product belongs to.

See 4.3.1318 for the application assertion.

4.2.398.2 description

The description specifies additional information about the Product_identification.

See 4.3.1317 for the application assertion.

The description need not be specified for a particular Product_identification (see 4.2.398).

If present, there shall be exactly one object that defines the description for a Product_identification.

4.2.398.3 id

The id specifies the identifier of the Product_identification.

4.2.398.4 name

The name specifies the word or group of words by which the Product_identification is referred to.

See 4.3.1317 for the application assertion.

The name need not be specified for a particular Product_identification (see 4.2.398).

If present, there shall be exactly one object that defines the name for a Product_identification.

4.2.398.5 version_id

The version_id specifies the identification of a particular version of a Product_identification.

The version_id need not be specified for a particular Product_identification (see 4.2.398).

4.2.399 Product_specification

A Product_specification is a Product_identification (see 4.2.398) for which one or more additional Specification (see 4.2.467) objects enhance the characterization provided for the associated Product_class (see 4.2.392).

NOTE 1 - The actual set of Specification objects for a Product_specification are obtained by the union of 'defining_specifications' and of the Specification objects related to the 'associated_product_class' through a

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Class_specification_association (see 4.2.67) or a Class_condition_association (see 4.2.65) with association_-type 'identification'.

NOTE 2 - The specification of a Product_specification may be incomplete: there may not be in 'defining_specification' any instance of Specification for some Specification_category (see 4.2.468) declared as mandatory for the 'associated_product_class'. For these Specification_category objects any Specification available in the context of the 'associated_product_class' is considered as valid for the manufacturing of the product characterized by the considered Product_specification.

EXAMPLE If the colour is not specified for a given car family, the vehicle resulting from the realization of a Product_specification associated to the Product_class representing the car family may be without paint or painted in any available colour.

A Product_specification is a type of Product_identification (see 4.2.398).

The data associated with a Product_specification are the following:

— defining_specification

The defining_specification specifies the set of Specification objects necessary to discriminate the Product_specification within its Product_class.

See 4.3.1319 for the application assertion.

4.2.400 Product_structure_relationship

A Product_structure_relationship is an association between a Complex_product (see 4.2.80) and a Product_constituent (see 4.2.395), in which the Product_constituent is a functional, logical, or physical component or a realization of the Complex_product.

The data associated with a Product_structure_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.400.1 description

The description specifies additional information about the Product_structure_relationship.

See 4.3.1321 for the application assertion.

The description need not be specified for a particular Product_structure_relationship (see 4.2.400).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

If present, there shall be exactly one object that defines the description for a Product_structure_relationship.

4.2.400.2 related

The related specifies the Product_constituent (see 4.2.395) that is a functional, logical, or physical component or a realization of the relating Complex_product (see 4.2.80).

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1322 for the application assertion.

4.2.400.3 relating

The relating specifies the Complex_product (see 4.2.80) that is decomposed functionally, logically, or physically into or realized by the related Product_constituent (see 4.2.395).

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1320 for the application assertion.

4.2.400.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'decomposition': The related Product_constituent (see 4.2.395) is one of potentially more components of the relating Complex_product (see 4.2.80). This relation type shall only be used for Complex_product and Product_constituent of the same type;

— 'functionality': The related Product_constituent is an element of the functional structure of the relating Complex_product. This relation type shall only be used with a Complex_product of type Alternative_solution (see 4.2.10) or Product_component (see 4.2.394) and with a Product_constituent of type Product_function (see 4.2.397);

EXAMPLE 1 The Product_function 'heat dissipation' may be considered as one of the functionalities to be fulfilled by any technical solution for the Product_component 'braking system'.

— 'occurrence': The related Product_constituent is an occurrence defined by the relating Complex_product. This relation type shall only be used if related Product_constituent is of type Product_component;

— 'realization': The related Product_constituent is a means for fulfilling, either partially or fully, the requirements identified with the relating Complex_product. This relation type shall be used only when the Complex_product and the Product_constituent are of different types;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE 2 The Product_component 'braking system' may be considered as a means to realize the Product_function 'braking'.

— 'specialization': The related Product_constituent fulfils the requirements of the relating Complex_product in a more specific way than defined for the relating Complex_product. This relation type shall only be used for Product_constituent and Complex_product of the same type.

4.2.401 Profile

A Profile is a planar outline. For all types of Profile, except for the general profiles, this outline is composed of various geometric parameters. The meaning of the parameters as well as the relation to the coordinate space is described for each type of Profile.

NOTE - A Profile may be used for the definition of form features.

Each Profile shall lie in the x-y-plane that is either the x-y-plane of its own local coordinate system (in the case where the Profile is used to define a feature that is applied as a Placed_feature (see 4.2.356)) or the x-y-plane defined by the Axis_placement (see 4.2.33) that serves as location_and_orientation (in the case where the Profile is used to define a feature that is applied as an Included_feature (see 4.2.261)).

Each Profile is an Open_profile (see 4.2.328) or a Closed_profile (see 4.2.72).

The data associated with a Profile are the following:

— is_defined_in;

— location_and_orientation.

4.2.401.1 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) in which the Profile is defined. In the case where the Profile is used to define a feature that is applied as a Placed_feature (see 4.2.356), this is the own local coordinate space of the Profile. In the case where the Profile is used to define a feature that is applied as an Included_feature (see 4.2.261), this is the same coordinate space, in which the Included_feature is defined.

See 4.3.1324 for the application assertion.

4.2.401.2 location_and_orientation

The location_and_orientation specifies the Axis_placement (see 4.2.33) to which the parameters of the Profile refer. The location_and_orientation is specified for the purpose of evaluation by manufacturing systems, which use the information in order to determine various machining parameters. For each type of Profile it is specified, how the Axis_placement is located and oriented with respect to the outline of the Profile. In case of a Profile that is used to define a Placed_feature (see 4.2.356) the location_and_-

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

orientation coincides with the origin and orientation of the Cartesian_coordinate_space (see 4.2.44) of the Profile.

See 4.3.1323 for the application assertion.

4.2.402 Profile_parameter

A Profile_parameter specifies the role of a Profile (see 4.2.401) in a General_feature (see 4.2.221). It is used to discriminate the members of the 'additional_profile_usage' of the General_feature.

The data associated with a Profile_parameter are the following:

— associated_profile;

— parameter_context;

— parameter_role.

4.2.402.1 associated_profile

The associated_profile specifies the Profile (see 4.2.401) for which a role is given.

See 4.3.1326 for the application assertion.

4.2.402.2 parameter_context

The parameter_context specifies the General_feature (see 4.2.221) in which the associated Profile (see 4.2.401) is identified.

See 4.3.1325 for the application assertion.

4.2.402.3 parameter_role

The parameter_role specifies the role of the Profile (see 4.2.401) that is used as an additional Profile in a General_feature (see 4.2.221).

EXAMPLE Examples for the parameter_role are 'boundary', 'diameter', or combinations of the value of the 'feature_type' of the General_feature with such a denominator.

4.2.403 Profile_usage

A Profile_usage is the identification of a Profile (see 4.2.401) and possibly of a geometric Transformation (see 4.2.533) used to place the Profile_usage in a reference coordinate space.

Each Profile_usage is a Closed_profile_usage (see 4.2.73) or an Open_profile_usage (see 4.2.329).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Profile_usage are the following:

— profile_placement;

— used_profile.

4.2.403.1 profile_placement

The profile_placement specifies the geometric Transformation (see 4.2.533) that locates and orients the Profile (see 4.2.401) in the reference coordinate space.

See 4.3.1328 for the application assertion.

The profile_placement need not be specified for a particular Profile_usage (see 4.2.403).

4.2.403.2 used_profile

The used_profile specifies the Profile (see 4.2.401) that is used.

See 4.3.1327 for the application assertion.

4.2.404 Project

A Project is an identified program of work.

NOTE - A Project may be further characterized by planned or actual dates, allowed budget, or resources.

EXAMPLE For the development of a new car, a project is set up that is responsible for the development decisions as well as for the accounting of the costs.

The data associated with a Project are the following:

— actual_end_date;

— actual_start_date;

— affected_product_class;

— description;

— id;

— name;

— planned_end_date;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— planned_start_date;

— work_program.

4.2.404.1 actual_end_date

The actual_end_date specifies the date when the Project was actually finished.

See 4.3.1330 for the application assertion.

The actual_end_date need not be specified for a particular Project (see 4.2.404).

4.2.404.2 actual_start_date

The actual_start_date specifies the date when the Project was actually started.

See 4.3.1330 for the application assertion.

The actual_start_date need not be specified for a particular Project (see 4.2.404).

4.2.404.3 affected_product_class

The affected_product_class specifies the set of Product_class (see 4.2.392) objects that are affected by the work carried out within a Project.

See 4.3.1334 for the application assertion.

4.2.404.4 description

The description specifies additional information about the Project.

See 4.3.1333 for the application assertion.

The description need not be specified for a particular Project (see 4.2.404).

If present, there shall be exactly one object that defines the description for a Project.

4.2.404.5 id

The id specifies the identifier of the Project.

4.2.404.6 name

The name specifies the word or group of words by which the Project is referred to.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.1333 for the application assertion.

There shall be exactly one object that defines the name for a Project (see 4.2.404).

4.2.404.7 planned_end_date

The planned_end_date specifies either the date when the Project is or was supposed to be finished or the planned duration of the Project.

See 4.3.1330, 4.3.1331, and 4.3.1332 for the application assertions.

The planned_end_date need not be specified for a particular Project (see 4.2.404).

If present, there shall be exactly one object that defines the planned_end_date for a Project.

4.2.404.8 planned_start_date

The planned_start_date specifies the date when the Project is or was supposed to be started.

See 4.3.1330 and 4.3.1332 for the application assertions.

The planned_start_date need not be specified for a particular Project (see 4.2.404).

If present, there shall be exactly one object that defines the planned_start_date for a Project.

4.2.404.9 work_program

The work_program specifies the Activity (see 4.2.2) objects that are carried out within the Project.

See 4.3.1329 for the application assertion.

4.2.405 Project_relationship

A Project_relationship is a relationship between two Project (see 4.2.404) objects.

The data associated with a Project_relationship are the following:

— description;

— related;

— relating;

— relation_type.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.405.1 description

The description specifies additional information about the Project_relationship.

See 4.3.1335 for the application assertion.

The description need not be specified for a particular Project_relationship (see 4.2.405).

If present, there shall be exactly one object that defines the description for a Project_relationship.

4.2.405.2 related

The related specifies the second of the two Project (see 4.2.404) objects related by a Project_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1336 for the application assertion.

4.2.405.3 relating

The relating specifies the first of the two Project (see 4.2.404) objects related by a Project_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1336 for the application assertion.

4.2.405.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'decomposition': The application object defines a relationship where the related Project (see 4.2.404) is one of potentially more components into which the relating Project is broken down;

— 'dependency': The related Project is dependent upon the relating Project;

— 'sequence': The application object defines a relationship where the relating Project shall be completed before the related Project starts;

— 'succession': The related Project is the successor of the relating Project.

4.2.406 Projection

A Projection is a condition where a Tolerance_zone (see 4.2.524) is projected from an element of a part. The projection is external to the part and made from one of the ends of the element for a specified length.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - The concept of projected tolerance zones is defined in ISO 10578 [21].

A Projection is a type of Tolerance_zone_definition (see 4.2.525).

The data associated with a Projection are the following:

— projection_end;

— projection_length.

4.2.406.1 projection_end

The projection_end specifies the Shape_element (see 4.2.449) from which the tolerance zone is projected.

See 4.3.1337 for the application assertion.

4.2.406.2 projection_length

The projection_length specifies the distance from the projection_end where the Geometric_tolerance (see 4.2.243) shall be measured.

4.2.407 Projection_curve

A Projection_curve is the extension of a point, line, surface, or theoretical point of intersection to a location outside the part outline.

A Projection_curve is a type of Annotation_curve (see 4.2.16).

Each Projection_curve may be an Associated_projection_curve (see 4.2.32).

4.2.408 Promissory_usage

A Promissory_usage is a relationship between a constituent of an assembly and the assembly itself. The relationship describes the intention to use the constituent in an assembly.

NOTE - There may not be any geometric information provided for the constituent or the assembly that are associated by a Promissory_usage.

EXAMPLE In early design stages, the Promissory_usage may be used to create preliminary BOMs for prototyping.

A Promissory_usage is a type of Assembly_component_relationship (see 4.2.26).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.409 Property

A Property is the definition of a particular quality.

NOTE - A property may reflect physics or arbitrary user defined measurements.

Each Property is a Cost_property (see 4.2.105), a Quality_property (see 4.2.416), a Duration_property (see 4.2.175), a Material_property (see 4.2.310), a General_property (see 4.2.230), a Recyclability_property (see 4.2.428), or a Mass_property (see 4.2.306).

The data associated with a Property are the following:

— allowed_unit;

— description;

— id;

— property_source;

— version_id.

4.2.409.1 allowed_unit

The allowed_unit specifies the unit or set of units that are accepted.

EXAMPLE A company may accept a mass specified in kilograms or tons, but not in grams or pounds.

A Property_value (see 4.2.412) representing the Property shall not be expressed with a Unit (see 4.2.541) that is not contained in the allowed_unit, if the allowed_unit is specified. If specified, the 'global_unit' attribute of a Property_value_representation (see 4.2.414) representing the Property shall be contained in the allowed_unit, if the allowed_unit is specified.

See 4.3.1341 for the application assertion.

4.2.409.2 description

The description specifies additional information about the Property.

See 4.3.1339 for the application assertion.

The description need not be specified for a particular Property (see 4.2.409).

If present, there shall be exactly one object that defines the description for a Property.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.409.3 id

The id specifies the identifier of the Property.

4.2.409.4 property_source

The property_source specifies the External_library_reference (see 4.2.188) or Plib_property_reference (see 4.2.362) object that defines this kind of property.

See 4.3.1338 and 4.3.1340 for the application assertions.

The property_source need not be specified for a particular Property (see 4.2.409).

If present, there shall be exactly one object that defines the property_source for a Property.

4.2.409.5 version_id

The version_id specifies the identification of a particular version of a Property.

The version_id need not be specified for a particular Property (see 4.2.409).

4.2.410 Property_change

A Property_change is a mechanism to describe the differences between two objects concerning the properties of these objects.

The data associated with a Property_change are the following:

— added_property;

— deleted_property;

— description;

— id;

— is_describing.

4.2.410.1 added_property

The added_property specifies the set of Property_value_representation (see 4.2.414) objects that have been added to that object of the described relationship that is identified as relating.

See 4.3.1344 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.410.2 deleted_property

The deleted_property specifies the Property_value_representation (see 4.2.414) objects that have been deleted from that object of the described relationship that is identified as relating.

See 4.3.1344 for the application assertion.

4.2.410.3 description

The description specifies additional information about the Property_change.

See 4.3.1343 for the application assertion.

There shall be exactly one object that defines the description for a Property_change (see 4.2.410).

4.2.410.4 id

The id specifies the identifier of the Property_change.

The id need not be specified for a particular Property_change (see 4.2.410).

4.2.410.5 is_describing

The is_describing specifies the Change (see 4.2.55) that collects the Property_change objects and the Model_change (see 4.2.315) objects.

See 4.3.1342 for the application assertion.

4.2.411 Property_relationship

A Property_relationship is a relationship between two Property (see 4.2.409) objects.

> EXAMPLE A Property_relationship may be used to indicate that the value of one Property can be derived from the value of another Property.

The data associated with a Property_relationship are the following:

— description;

— related;

— relating;

— relation_type.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.411.1 description

The description specifies additional information about the Property_relationship.

See 4.3.1345 for the application assertion.

The description need not be specified for a particular Property_relationship (see 4.2.411).

If present, there shall be exactly one object that defines the description for a Property_relationship.

4.2.411.2 related

The related specifies the second of the two Property (see 4.2.409) objects related by the Property_-relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1346 for the application assertion.

4.2.411.3 relating

The relating specifies the first of the two Property (see 4.2.409) objects related by the Property_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1346 for the application assertion.

4.2.411.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'decomposition': The Property_relationship defines a relationship where the related Property (see 4.2.409) is a member of a group of Property objects that is established by the relating Property;

— 'dependency': The related Property is dependent upon the relating Property;

— 'hierarchy': The application object defines a hierarchical relationship where the related Property is on a lower level than the relating Property;

— 'peer': The related Property shall not be used without the relating Property and vice versa;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— 'substitution': The Property_relationship defines a relationship where the related Property replaces the relating Property;

— 'value domain': The Property_relationship defines a relationship where the values assigned to the relating Property shall be within the limits indicated by the values assigned to the related Property.

EXAMPLE The output range of a 4-bit analog to digital converter is restricted to 16 discrete values, while the input voltage is restricted to a continuous range.

4.2.412 Property_value

A Property_value is the numerical or textual value of a Property_value_representation (see 4.2.414).

Each Property_value is a Value_list (see 4.2.546), a String_value (see 4.2.478), or a Value_with_unit (see 4.2.549).

The data associated with a Property_value are the following:

— value_name

The value_name specifies the word or group of words by which the Property_value is referred to.

EXAMPLE 'l1' or 'vol2' are examples for the value_name of a Property_value.

4.2.413 Property_value_association

A Property_value_association is a mechanism to assign a Property_value_representation (see 4.2.414) to an object.

Each Property_value_association is a Process_property_association (see 4.2.390) or an Item_property_association (see 4.2.273).

The data associated with a Property_value_association are the following:

— describing_property_value;

— description;

— validity_context.

4.2.413.1 describing_property_value

The describing_property_value specifies the value that is being assigned.

See 4.3.1351 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.413.2 description

The description specifies additional information about the Property_value_association.

See 4.3.1347 for the application assertion.

The description need not be specified for a particular Property_value_association (see 4.2.413).

If present, there shall be exactly one object that defines the description for a Property_value_association.

4.2.413.3 validity_context

The validity_context specifies the context in which a Property_value_association is applicable.

EXAMPLE 1 A Cost_property (see 4.2.105) is applicable in the context of supplier A and may be different if the item is supplied by a different supplier B.

EXAMPLE 2 Software can be used in different product classes, specified by the validity_context, with different parameter values.

See 4.3.1348, 4.3.1349, and 4.3.1350 for the application assertions.

The validity_context need not be specified for a particular Property_value_association (see 4.2.413).

If present, there shall be exactly one object that defines the validity_context for a Property_value_-association.

4.2.414 Property_value_representation

A Property_value_representation is the representation of Property (see 4.2.409).

Each Property_value_representation may be a Material_property_value_representation (see 4.2.312).

The data associated with a Property_value_representation are the following:

— definition;

— global_unit;

— qualifier;

— specified_value;

— value_determination.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.414.1 definition

The definition specifies the Property (see 4.2.409) that the Property_value_representation characterizes.

See 4.3.1352 for the application assertion.

4.2.414.2 global_unit

The global_unit specifies a unit that is valid for all Property_value (see 4.2.412) that are referenced as 'specified_value' by the Property_value_representation.

See 4.3.1354 for the application assertion.

The global_unit need not be specified for a particular Property_value_representation (see 4.2.414).

4.2.414.3 qualifier

The qualifier specifies the kind of the Property_value_representation. The following values shall be used:

— 'nominal': The value is the nominal value;

— 'specified': The value is specified;

— 'typical': The value is a typical value.

The qualifier need not be specified for a particular Property_value_representation (see 4.2.414).

4.2.414.4 specified_value

The specified_value specifies the Property_value (see 4.2.412) that qualifies the Property_value_representation by a Value_with_unit (see 4.2.549), a String_value (see 4.2.478), or an arbitrary aggregate thereof.

See 4.3.1353 for the application assertion.

4.2.414.5 value_determination

The value_determination specifies information on how the Property_value_representation shall be interpreted. Where applicable, the following values shall be used:

— 'calculated': The value has been calculated;

— 'designed': The value represents a value intended by the design;

— 'estimated': The value has been estimated;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— ’measured’: The value has been measured;

— ’required’: The value represents a requirement;

— ’set point’: The value is used as the initialization value.

The value_determination need not be specified for a particular Property_value_representation (see 4.2.414).

4.2.415 Property_value_representation_relationship

A Property_value_representation_relationship is a relationship between two Property_value (see 4.2.412) objects.

The data associated with a Property_value_representation_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.415.1 description

The description specifies additional information about the Property_value_representation_relationship.

See 4.3.1355 for the application assertion.

The description need not be specified for a particular Property_value_representation_relationship (see 4.2.415).

If present, there shall be exactly one object that defines the description for a Property_value_representation_relationship.

4.2.415.2 related

The related specifies the second of the two objects related by the Property_value_representation_relationship.

NOTE - The semantics of this attribute is defined by the attribute relation_type.

See 4.3.1356 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.415.3 relating

The relating specifies the first of the two objects related by the Property_value_representation_relationship.

NOTE - The semantics of this attribute is defined by the attribute relation_type.

See 4.3.1356 for the application assertion.

4.2.415.4 relation_type

The relation_type specifies the meaning of the relationship.

EXAMPLE 1 Property_value_representation (see 4.2.414) objects representing 'cycle time', 'feed time', and 'drill time' for a process may be related by a Property_value_representation_relationship with relation_type 'dependency'.

Where applicable, the following values shall be used:

— 'decomposition': The Property_value_representation_relationship specifies a relationship where the related Property_value_representation is one of potentially more sub values of the relating Property_value_representation;

— 'dependency': The Property_value_representation_relationship defines a deriving relationship where the related Property_value_representation is based on the relating Property_value_representation;

— 'equivalence': The Property_value_representation_relationship defines a relationship where the related Property_value_representation represents the same matter of fact as by the relating Property_value_representation;

EXAMPLE 2 The distance of 1 km and 1000 m is the same. 1 km is equivalent to 1000 m, but they have different values and units.

— 'substitution': The Property_value_representation_relationship defines a relationship where the related Property_value_representation replaces the relating Property_value_representation.

4.2.416 Quality_property

A Quality_property is a property that enables to provide information about the level of quality of products or processes.

EXAMPLE Within a prototype building activity several alternative manufacturing technologies are tested. A Quality_property for the resulting parts, used tools, and the used process operations may document the level of quality reached for the parts.

A Quality_property is a type of Property (see 4.2.409).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.417 Quantified_instance

A Quantified_instance is the identification of the quantified occurrence of an object that is defined either as a Design_discipline_item_definition (see 4.2.142) or as a Product_identification (see 4.2.398).

EXAMPLE 1 Radiator liquid or engine oil are examples for Quantified_instance objects.

EXAMPLE 2 In a Technical_solution (see 4.2.510) for the front left brake a certain screw is used four times.

A Quantified_instance is a type of Item_instance (see 4.2.271).

The data associated with a Quantified_instance are the following:

— quantity

The quantity specifies a Numerical_value (see 4.2.324) specifying the quantity of occurrences.

If the quantity can not be expressed as a particular value, the concept of Selected_instance (see 4.2.445) shall be used instead to represent this instance.

NOTE - The quantity may be specified as a count measure, as a mass measure, as a length measure, as an area measure, or as a volume measure.

See 4.3.1357 for the application assertion.

4.2.418 Radiused_bead_end_type

A Radiused_bead_end_type is an end condition of a bead feature. It is defined by the rotation of the bead profile at the bead start or end about its y-axis.

A Radiused_bead_end_type is a type of Bead_end_type (see 4.2.38).

4.2.419 Radiused_slot_end_type

A Radiused_slot_end_type is an end condition of a slot feature. It is defined by the rotation of the slot profile at the slot start or end about its y-axis.

NOTE - The resulting radius equals half the width of the swept profile at each position along the y-axis of the swept profile.

EXAMPLE Figure 58 depicts a Radiused_slot_end_type.

A Radiused_slot_end_type is a type of Slot_end_type (see 4.2.457).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

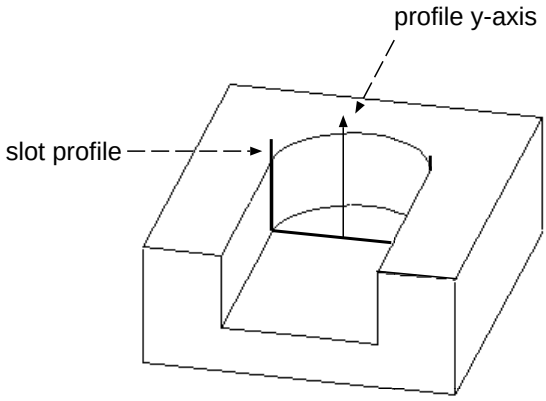

Figure 58 – Shape of a slot with radiused end

4.2.420 Rectangular_boss

A Rectangular_boss is a volume adding feature that is specified by an enclosed volume bounded by a rectangular block. The boundary of the Rectangular_boss shall be defined using a Rectangular_closed_-pocket (see 4.2.421). A Rectangular_boss shall not have a taper of type Directed_taper (see 4.2.154).

A Rectangular_boss is a type of Boss_feature (see 4.2.42).

4.2.421 Rectangular_closed_pocket

A Rectangular_closed_pocket is a volume removal feature whose enclosed volume is characterized by opposite sides being equal in length.

EXAMPLE Figure 59 shows a typical rectangular pocket.

A Rectangular_closed_pocket is a type of Pocket_feature (see 4.2.366).

The data associated with a Rectangular_closed_pocket are the following:

— boundary

The boundary specifies the Closed_profile_usage (see 4.2.73) that defines the cross section of the Rectangular_closed_pocket. The Closed_profile_usage shall reference a Rectangular_closed_profile (see 4.2.422) as used_profile.

See 4.3.1358 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

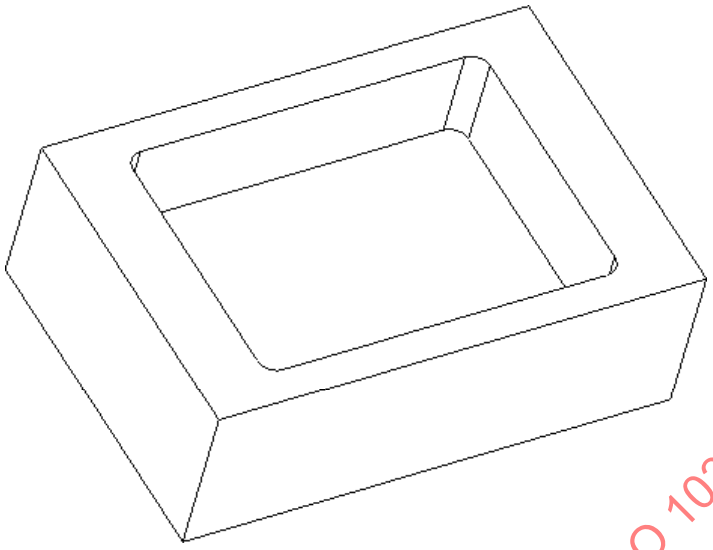

Figure 59 – Rectangular_closed_pocket in a part

4.2.422 Rectangular_closed_profile

A Rectangular_closed_profile is a closed profile that is characterized by four sides with opposite sides equal in length.

EXAMPLE Figure 60 shows a Rectangular_closed_profile.

The x-axis of the inherited Axis_placement (see 4.2.33) is parallel to the base line of the longest edges of the rectangle that defines the basis shape of this type of Profile (see 4.2.401). The y-axis is parallel to the shortest edge of the rectangle defining the basis shape. The midpoint of this rectangle coincides with the location of the Axis_placement.

A Rectangular_closed_profile is a type of Closed_profile (see 4.2.72).

The data associated with a Rectangular_closed_profile are the following:

— corner_radius;

— profile_length;

— profile_width.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.422.1 corner_radius

The corner_radius specifies the radius of fillet to be applied to the four corners of a Rectangular_closed_-profile. The following constraint applies:

$$r \leq min(\tfrac{a}{2}, \tfrac{b}{2})$$

where r is the corner_radius, a is the profile_length, and b is the profile_width.

See 4.3.1359 for the application assertion.

The corner_radius need not be specified for a particular Rectangular_closed_profile (see 4.2.422).

4.2.422.2 profile_length

The profile_length specifies the length of the longest side of a Rectangular_closed_profile. The longest side is oriented along the x-axis of the coordinate space of the Rectangular_closed_profile.

See 4.3.1359 for the application assertion.

4.2.422.3 profile_width

The profile_width specifies the length of the shortest side of a Rectangular_closed_profile. The shortest side is oriented along the y-axis of the coordinate space of the Rectangular_closed_profile.

See 4.3.1359 for the application assertion.

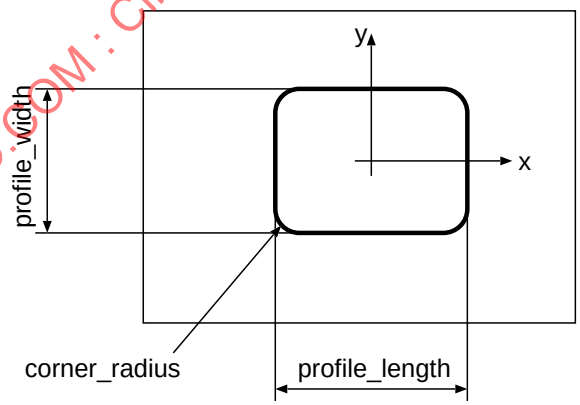

Figure 60 – Definition of a Rectangular_closed_profile

4.2.423 Rectangular_offset_pattern

A Rectangular_offset_pattern is the modification of the placement of a particular occurrence of the base feature in a Rectangular_pattern (see 4.2.426) relative to its expected placement.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE Figure 61 depicts a Rectangular_offset_pattern.

The data associated with a Rectangular_offset_pattern are the following:

— column_index;

— offset_direction;

— offset_distance;

— row_index.

4.2.423.1 column_index

The column_index specifies the index of the column of the Rectangular_offset_pattern.

4.2.423.2 offset_direction

The offset_direction specifies the offset direction of the Rectangular_offset_pattern.

The direction is defined in the same coordinate space as the Rectangular_offset_pattern and lies in a plane that is either parallel to the x-y-plane of this coordinate space (in the case where the Rectangular_offset_-pattern is applied as a Placed_feature (see 4.2.356)) or parallel to the x-y-plane of the Axis_placement (see 4.2.33) that serves as the reference (in the case where the Rectangular_offset_pattern is applied as an Included_feature (see 4.2.261)).

4.2.423.3 offset_distance

The offset_distance specifies the offset distance of the Rectangular_offset_pattern.

See 4.3.1360 for the application assertion.

4.2.423.4 row_index

The row_index specifies the index of the row of the Rectangular_offset_pattern.

4.2.424 Rectangular_omit_pattern

A Rectangular_omit_pattern is an omission of a particular occurrence of the base feature in a Rectangu-lar_pattern (see 4.2.426).

The data associated with a Rectangular_omit_pattern are the following:

— column_index;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

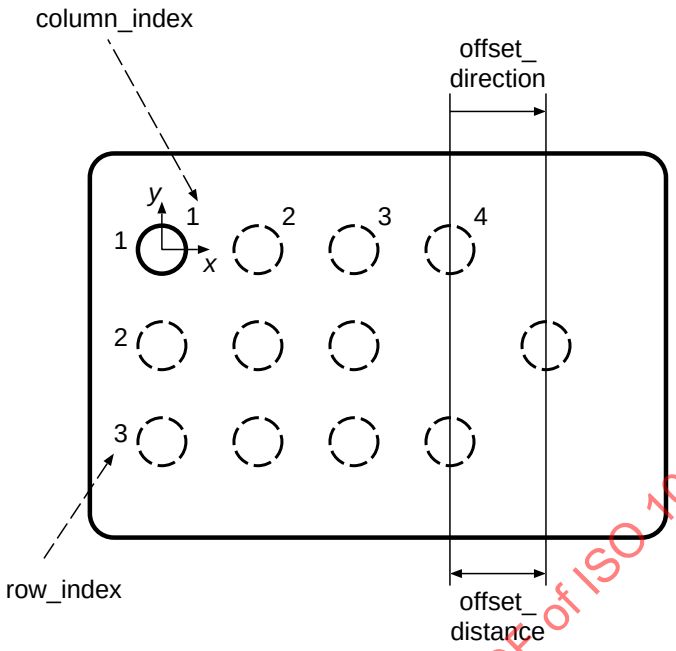

Figure 61 – Parameters defining an offset in a rectangular pattern

— row_index.

4.2.424.1 column_index

The column_index specifies the index of the column of the Rectangular_omit_pattern.

4.2.424.2 row_index

The row_index specifies the index of the row of the Rectangular_omit_pattern.

4.2.425 Rectangular_open_pocket

A Rectangular_open_pocket is a volume removal feature with opposite sides being equal in length and one side that is not closed.

A Rectangular_open_pocket is a type of Pocket_feature (see 4.2.366).

The data associated with a Rectangular_open_pocket are the following:

— boundary

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The boundary specifies the Open_profile_usage (see 4.2.329) that defines the cross section of the Rectangular_open_pocket. The Open_profile_usage shall reference a Square_u_profile (see 4.2.476) as used_profile.

See 4.3.1361 for the application assertion.

4.2.426 Rectangular_pattern

A Rectangular_pattern is a pattern defined by a base feature replicated on a rectangular grid.

The rows and columns lie in the x-y-plane of either the local pattern coordinate space (in the case of a Placed_feature (see 4.2.356)) or of the Axis_placement (see 4.2.33) representing location and orientation of the pattern.

EXAMPLE Figure 62 illustrates a Rectangular_pattern.

The inherited attribute 'location_and_orientation' shall reference the same Axis_placement as the base feature of the pattern being created.

A Rectangular_pattern is a type of Replicate_feature (see 4.2.433).

The data associated with a Rectangular_pattern are the following:

— column_layout_direction;

— column_spacing;

— columns;

— missing_feature;

— relocated_feature;

— row_layout_direction;

— row_spacing;

— rows.

4.2.426.1 column_layout_direction

The column_layout_direction specifies the direction of the column layout of the Rectangular_pattern.

The direction is defined in the same coordinate space as the Rectangular_pattern and lies in a plane that is either parallel to the x-y-plane of this coordinate space (in the case where the Rectangular_pattern is applied as a Placed_feature (see 4.2.356)) or parallel to the x-y-plane of the Axis_placement (see 4.2.33)

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

that serves as the reference (in the case where the Rectangular_pattern is applied as an Included_feature (see 4.2.261)).

4.2.426.2 column_spacing

The column_spacing specifies the spacing of the columns of the Rectangular_pattern.

See 4.3.1362 for the application assertion.

4.2.426.3 columns

The columns specifies the number of columns of the Rectangular_pattern.

4.2.426.4 missing_feature

The missing_feature specifies the Rectangular_omit_pattern (see 4.2.424) objects that define which nodes on the grid are not assigned a replicate of the base.

those instances that are missing in the Rectangular_pattern.

See 4.3.1364 for the application assertion.

4.2.426.5 relocated_feature

The relocated_feature specifies the Rectangular_offset_pattern (see 4.2.423) objects that define in which nodes of the grid a further offset is applied to the replicate.

See 4.3.1363 for the application assertion.

4.2.426.6 row_layout_direction

The row_layout_direction specifies the direction of the row layout of the Rectangular_pattern.

The direction is defined in the same coordinate space as the Rectangular_pattern and lies in a plane that is either parallel to the x-y-plane of this coordinate space (in the case where the Rectangular_pattern is applied as a Placed_feature (see 4.2.356)) or parallel to the x-y-plane of the Axis_placement (see 4.2.33) that serves as the reference (in the case where the Rectangular_pattern is applied as an Included_feature (see 4.2.261)).

4.2.426.7 row_spacing

The row_spacing specifies the spacing of the rows of the Rectangular_pattern.

See 4.3.1362 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.426.8 rows

The rows specifies the number of rows of the Rectangular_pattern.

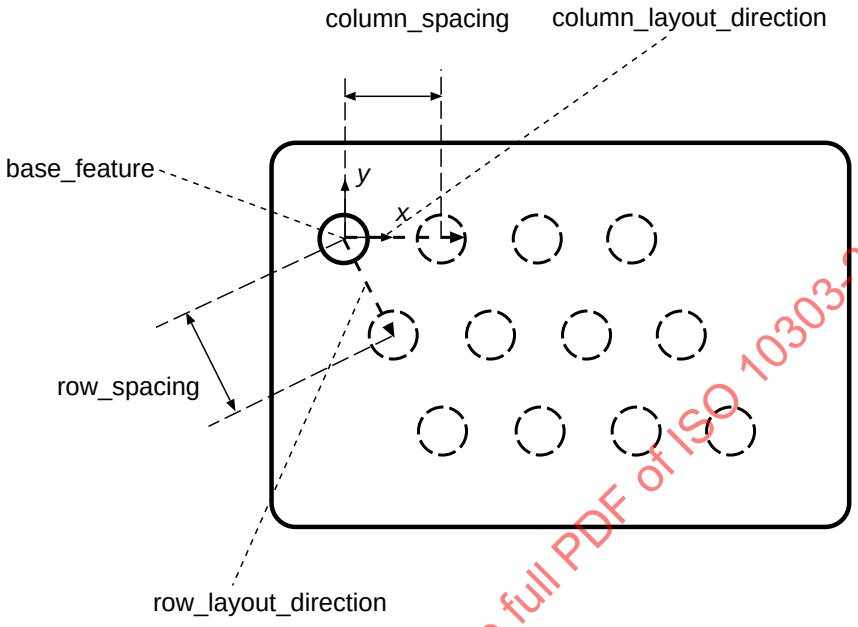

Figure 62 – Parameters defining a Rectangular_pattern

4.2.427 Rectangular_size

A Rectangular_size is the definition of the planar size of an object.

Each Rectangular_size may be a Named_size (see 4.2.321).

The data associated with a Rectangular_size are the following:

— density;

— height;

— width.

4.2.427.1 density

The density specifies the resolution of the object if it is a raster picture.

See 4.3.1365 for the application assertion.

The density need not be specified for a particular Rectangular_size (see 4.2.427).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.427.2 height

The height specifies the size of the object in vertical direction.

See 4.3.1365 for the application assertion.

4.2.427.3 width

The width specifies the size of the object in horizontal direction.

See 4.3.1365 for the application assertion.

4.2.428 Recyclability_property

A Recyclability_property is information concerning the ability to reuse objects or components of objects after their primarily intended usage.

A Recyclability_property is a type of Property (see 4.2.409).

4.2.429 Reference_plane

A Reference_plane is the definition of a plane that is used to further specify the application of Geometric_tolerance (see 4.2.243) objects. In this plane the two-dimensional tolerance zone is spread from the ideal position of the toleranced element in both directions.

NOTE - The tolerance value is twice the distance between the ideal position and the boundary of the tolerance zone.

The data associated with a Reference_plane are the following:

— plane_location;

— plane_normal.

4.2.429.1 plane_location

The plane_location specifies a Cartesian point on the reference plane.

4.2.429.2 plane_normal

The plane_normal specifies a direction vector that indicates a direction normal to the reference plane.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.430 Replaced_definition_relationship

A Replaced_definition_relationship is a relationship between two Design_discipline_item_definition (see 4.2.142) objects where the relating Design_discipline_item_definition is replaced by the related Design_discipline_item_definition.

Each Replaced_definition_relationship shall be referenced by an Effectivity (see 4.2.179) that defines the start of the validity of the replacement.

NOTE - A Replaced_definition_relationship may be used to build up version sequences of Design_discipline_item_definition objects.

A Replaced_definition_relationship is a type of Item_definition_relationship (see 4.2.269).

The data associated with a Replaced_definition_relationship are the following:

— description

The description specifies additional information about the Replaced_definition_relationship.

See 4.3.1366 for the application assertion.

The description need not be specified for a particular Replaced_definition_relationship.

If present, there shall be exactly one object that defines the description for a Replaced_definition_relationship.

4.2.431 Replaced_usage_relationship

A Replaced_usage_relationship is a relationship between two Item_instance (see 4.2.271) objects where the relating Item_instance is replaced by the related Item_instance.

Each Replaced_usage_relationship shall be referenced by an Effectivity (see 4.2.179) that defines the validity of the replacement.

A Replaced_usage_relationship is a type of Item_instance_relationship (see 4.2.272).

The data associated with a Replaced_usage_relationship are the following:

— description;

— usage_context.

4.2.431.1 description

The description specifies additional information about the Replaced_usage_relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

See 4.3.1368 for the application assertion.

The description need not be specified for a particular Replaced_usage_relationship (see 4.2.431).

If present, there shall be exactly one object that defines the description for a Replaced_usage_relationship.

4.2.431.2 usage_context

The usage_context specifies the object that identifies the context in which the replacement is applicable. In the case, where the usage_context refers to a Process_operation_input_or_output (see 4.2.383), the 'relating' Item_instance (see 4.2.271) shall be referred to as 'element' by the Process_operation_input_or_output. In the case, where the usage_context refers to an Item_definition_instance_relationship (see 4.2.268), the 'relating' Item_instance shall be referred to as 'related' by the Item_definition_instance_relationship. In the case, where the usage_context refers to a Product_structure_relationship (see 4.2.400), the 'relating' Item_instance shall be referred to as 'related' by the Product_structure_relationship.

See 4.3.1367, 4.3.1369, and 4.3.1370 for the application assertions.

There shall be exactly one object that defines the usage_context for a Replaced_usage_relationship (see 4.2.431).

4.2.432 Replicate_base_assignment

A Replicate_base_assignment is a mechanism to associate a Replicate_feature (see 4.2.433) with the Feature_definition (see 4.2.199) that is the base feature to be replicated.

The data associated with a Replicate_base_assignment are the following:

— base_feature;

— replicate_placement.

4.2.432.1 base_feature

The base_feature specifies the Feature_definition (see 4.2.199) representing the feature to be replicated.

See 4.3.1371 for the application assertion.

4.2.432.2 replicate_placement

The replicate_placement specifies the geometric Transformation (see 4.2.533) used to place the base feature in the Replicate_feature (see 4.2.433)'s coordinate space.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

In the case of a Replicate_feature applied as a Placed_feature (see 4.2.356) the replicate_placement is used to place the base feature in the local coordinate system of the Replicate_feature.

See 4.3.1372 for the application assertion.

The replicate_placement need not be specified for a particular Replicate_base_assignment (see 4.2.432).

4.2.433 Replicate_feature

A Replicate_feature is a feature that is specified by an existing base feature and the arrangement of replicates of that feature.

A Replicate_feature is a type of Feature_definition (see 4.2.199).

Each Replicate_feature is a Circular_pattern (see 4.2.62), a General_pattern (see 4.2.228), or a Rectangular_pattern (see 4.2.426).

The data associated with a Replicate_feature are the following:

— location_and_orientation;

— replicate_base.

4.2.433.1 location_and_orientation

The location_and_orientation specifies the Axis_placement (see 4.2.33) that defines the location and orientation of the feature. The location_and_orientation is specified for the purpose of evaluation by manufacturing systems, which use the information in order to determine various machining parameters. For each type of Replicate_feature it is specified, how the Axis_placement is located and oriented.

See 4.3.1373 for the application assertion.

4.2.433.2 replicate_base

The replicate_base specifies a Replicate_base_assignment (see 4.2.432) that has the information about the feature that is replicated and possibly about a transformation used to place the base feature in the coordinate space of the Replicate_feature.

See 4.3.1374 for the application assertion.

4.2.434 Retention_period

A Retention_period is the definition of a period of time that product data needs to be maintained due to organizational policy or legal requirements.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Retention_period are the following:

— earliest_end_definition;

— is_applied_to;

— latest_end_definition;

— retention_purpose;

— start_definition.

4.2.434.1 earliest_end_definition

The earliest_end_definition specifies the point in time after which any object the Retention_period is applied to may be deleted or destroyed.

In this context deletion or destruction applies to all subordinate objects that are not referenced by other objects.

See 4.3.1393, 4.3.1402, and 4.3.1403 for the application assertions.

There shall be exactly one object that defines the earliest_end_definition for a Retention_period (see 4.2.434).

4.2.434.2 is_applied_to

The is_applied_to specifies the objects whose existence is controlled by the Retention_period.

NOTE - The master document is the one for which earliest_end_definition and latest_end_definition are the same.

See 4.3.1375, 4.3.1376, 4.3.1377, 4.3.1378, 4.3.1379, 4.3.1380, 4.3.1381, 4.3.1382, 4.3.1383, 4.3.1384, 4.3.1385, 4.3.1386, 4.3.1387, 4.3.1388, 4.3.1389, 4.3.1390, 4.3.1391, 4.3.1392, 4.3.1394, 4.3.1395, 4.3.1396, 4.3.1397, 4.3.1398, 4.3.1399, 4.3.1400, 4.3.1401, 4.3.1404, 4.3.1405, 4.3.1406, 4.3.1407, 4.3.1408, 4.3.1409, 4.3.1410, 4.3.1411, 4.3.1412, 4.3.1413, 4.3.1414, 4.3.1415, 4.3.1417, 4.3.1418, 4.3.1419, 4.3.1420, 4.3.1421, 4.3.1422, 4.3.1423, 4.3.1424, 4.3.1425, 4.3.1426, 4.3.1427, 4.3.1428, 4.3.1429, 4.3.1430, 4.3.1431, 4.3.1432, 4.3.1433, 4.3.1434, 4.3.1435, 4.3.1436, 4.3.1437, 4.3.1438, 4.3.1439, 4.3.1440, 4.3.1441, and 4.3.1442 for the application assertions.

There shall be at least one object that the Retention_period (see 4.2.434) is_applied_to.

4.2.434.3 latest_end_definition

The latest_end_definition specifies the point in time before which any objects that the Retention_period is applied to shall be deleted or destroyed.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

In this context deletion or destruction applies to all subordinate objects that are not used by other objects.

See 4.3.1393, 4.3.1402, and 4.3.1403 for the application assertions.

There shall be exactly one object that defines the latest_end_definition for a Retention_period (see 4.2.434).

4.2.434.4 retention_purpose

The retention_purpose specifies the rationale behind the Retention_period.

See 4.3.1416 for the application assertion.

The retention_purpose need not be specified for a particular Retention_period (see 4.2.434).

If present, there shall be exactly one object that defines the retention_purpose for a Retention_period.

4.2.434.5 start_definition

The start_definition specifies the point in time at which the Retention_period starts.

See 4.3.1393 and 4.3.1403 for the application assertions.

There shall be exactly one object that defines the start_definition for a Retention_period (see 4.2.434).

4.2.435 Rib_feature

A Rib_feature is a feature that is applied to solid parts to increase the stability of certain regions of a part.

EXAMPLE Figure 63 illustrates a Rib_feature.

A Rib_feature is a type of Process_feature_in_solid (see 4.2.380).

The data associated with a Rib_feature are the following:

— draft_taper;

— fillet_radius;

— rib_profile;

— shoulder_radius;

— sweep_path.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.435.1 draft_taper

The draft_taper specifies a Directed_taper (see 4.2.154) that defines the value of the draft angle that is applied to the side walls of the Rib_feature and the draft direction.

See 4.3.1443 for the application assertion.

The draft_taper need not be specified for a particular Rib_feature (see 4.2.435).

4.2.435.2 fillet_radius

The fillet_radius specifies a radius shape blend between a Rib_feature and the surrounding faces.

NOTE - If different fillets are required for the various intersection between the Rib_feature and the shape of the part, Transition_feature (see 4.2.537) objects have to be applied.

See 4.3.1444 for the application assertion.

The fillet_radius need not be specified for a particular Rib_feature (see 4.2.435).

4.2.435.3 rib_profile

The rib_profile specifies the Open_profile_usage (see 4.2.329) which references the Open_profile (see 4.2.328) that is swept along the Path (see 4.2.342). The Open_profile is the cross section of the rib including the two sides and the connecting top part. It shall be shaped in a way that the two sides of the resulting Rib_feature are parallel (before the application of a Directed_taper (see 4.2.154)).

See 4.3.1445 for the application assertion.

4.2.435.4 shoulder_radius

The shoulder_radius specifies the blend radius at the shoulder of the Rib_feature.

See 4.3.1444 for the application assertion.

The shoulder_radius need not be specified for a particular Rib_feature (see 4.2.435).

4.2.435.5 sweep_path

The sweep_path specifies the Path (see 4.2.342) along which the Open_profile (see 4.2.328) is swept. The sweep process shall stop as soon as the added volume intersects the surfaces of the part.

See 4.3.1446 for the application assertion.

4.2.436 Right_angular_wedge

A Right_angular_wedge is a solid that can be envisioned as the result of intersecting a block with a plane perpendicular to one of its faces, as shown in figure 64. The received face perpendicular to the cutting plane is triangular or trapezoidal. A Right_angular_wedge is defined by its position in space, by the triangular or trapezoidal face that is defined by three values, and by the depth of the solid.

A Right_angular_wedge is a type of Csg_primitive (see 4.2.107).

4.2.437 Right_circular_cone

A Right_circular_cone is a CSG primitive in the form of a cone that may be truncated. It is defined by an axis, a point on the axis, the semi-angle of the cone, and a distance giving the location in the negative direction along the axis from the point to the base of the cone. In addition, a radius may be provided to define the size of the truncated face; this radius may be zero in order to indicate that there is no truncation but an apex.

A Right_circular_cone is a type of Csg_primitive (see 4.2.107).

4.2.438 Right_circular_cylinder

A Right_circular_cylinder is a CSG primitive in the form of a solid cylinder of finite height. It is defined by an axis point at the centre of one planar circular face, an axis, a height, and a radius. The faces are perpendicular to the axis and are circular discs with the specified radius. The height is the distance from the first circular face centre in the positive direction of the axis to the second circular centre.

© ISO 2001 – All rights reserved

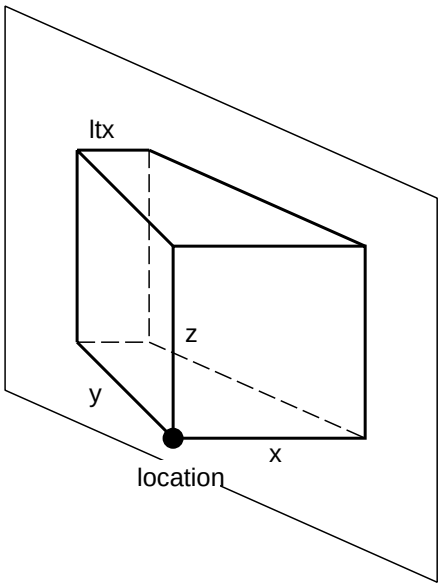

Figure 64 – Right_angular_wedge and its attributes

A Right_circular_cylinder is a type of Csg_primitive (see 4.2.107).

4.2.439 Round_hole

A Round_hole is a hole that is a removal of a volume of cylindrical shape from a solid part.

A Round_hole is a type of Process_feature_in_solid (see 4.2.380).

The data associated with a Round_hole are the following:

— bottom_condition;

— diameter;

— hole_depth;

— taper.

4.2.439.1 bottom_condition

The bottom_condition specifies the Hole_bottom_condition (see 4.2.257) that defines the type of the hole bottom.

See 4.3.1451 and 4.3.1453 for the application assertions.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

There shall be exactly one object that defines the bottom_condition for a Round_hole (see 4.2.439).

4.2.439.2 diameter

The diameter specifies the Closed_profile_usage (see 4.2.73) that defines the cross section of the hole in order to define the cylinder that is subtracted from the part. The Closed_profile_usage shall reference a Circular_closed_profile (see 4.2.58) as used_profile.

See 4.3.1448 for the application assertion.

4.2.439.3 hole_depth

The hole_depth specifies the Linear_path (see 4.2.300) that is used as sweep path.

See 4.3.1452 for the application assertion.

4.2.439.4 taper

The taper specifies a shape variation to be applied to the Round_hole.

See 4.3.1447, 4.3.1449, and 4.3.1450 for the application assertions.

The taper need not be specified for a particular Round_hole (see 4.2.439).

If present, there shall be exactly one object that defines the taper for a Round_hole.

4.2.440 Rounded_u_profile

A Rounded_u_profile is an open profile that is specified by a shape bounded by two parallel lines and a semi circle. Each line begins at the end point of the semi circle. The lines are tangent to the circle and extend infinitely. The x-axis of the inherited Axis_placement (see 4.2.33) is tangent to the arc curve in its midpoint. The y-axis is oriented such that the lines outlining the sides of the profile have positive y co-ordinates. The Axis_placement is located in the midpoint of the base curve.

EXAMPLE Figure 65 depicts a Rounded_u_profile.

A Rounded_u_profile is a type of Open_profile (see 4.2.328).

The data associated with a Rounded_u_profile are the following:

— width

The width specifies the distance across a Rounded_u_profile.

See 4.3.1454 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

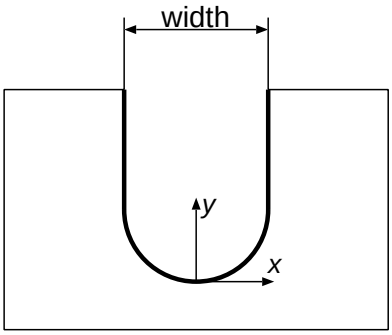

Figure 65 – Definition of a Rounded_u_profile

4.2.441 Roundness_tolerance

A Roundness_tolerance is the limitation of the amount of deviation points of a surface of revolution lying within the same plane perpendicular to a common axis may have from being equidistant from the axis. It defines a tolerance zone bounded by two concentric circles within which each element of the surface must lie. The Roundness_tolerance applies independently at any plane perpendicular to the common axis.

A Roundness_tolerance is a type of Geometric_tolerance (see 4.2.243).

4.2.442 Same_time_machining_relationship

A Same_time_machining_relationship is a relationship between two Item_instance (see 4.2.271) objects that specifies that those two objects shall be manufactured together within the same Process_operation_-occurrence (see 4.2.384).

EXAMPLE Figure 66 shows an example for this case.

A Same_time_machining_relationship is a type of Item_instance_relationship (see 4.2.272).

The data associated with a Same_time_machining_relationship are the following:

— description;

— placement.

4.2.442.1 description

The description specifies additional information about the Same_time_machining_relationship.

See 4.3.1456 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The description need not be specified for a particular Same_time_machining_relationship (see 4.2.442).

If present, there shall be exactly one object that defines the description for a Same_time_machining_-relationship.

4.2.442.2 placement

The placement specifies the geometrical Transformation (see 4.2.533) between the local coordinate system of the related Item_instance (see 4.2.271) with respect to the local coordinate system of the relating Item_instance.

NOTE - The transformation is needed to position the related Item_instance with respect to the relating Item_instance for the same time machining process.

In the case where the placement is realized by a Template_instance (see 4.2.512) the scale factor of that Template_instance shall be omitted or set to 1.

See 4.3.1455 and 4.3.1457 for the application assertions.

The placement need not be specified for a particular Same_time_machining_relationship (see 4.2.442).

If present, there shall be exactly one object that defines the placement for a Same_time_machining_-relationship.

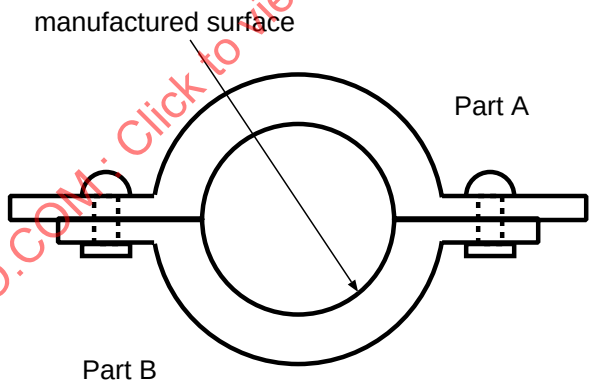

Figure 66 – Same_time_machining_relationship

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.443 Security_classification

A Security_classification is the level of confidentiality that is required in order to protect product data against unauthorized usage.

The data associated with a Security_classification are the following:

— is_applied_to;

© ISO 2001 – All rights reserved

— level;

— name;

— purpose.

4.2.443.1 is_applied_to

The is_applied_to specifies the objects with which the Security_classification is associated.

See 4.3.1458, 4.3.1459, 4.3.1460, 4.3.1461, 4.3.1462, 4.3.1463, 4.3.1464, 4.3.1465, 4.3.1466, 4.3.1467, 4.3.1468, 4.3.1469, 4.3.1470, 4.3.1471, 4.3.1472, 4.3.1473, 4.3.1474, 4.3.1475, 4.3.1476, 4.3.1477, 4.3.1479, 4.3.1480, 4.3.1481, 4.3.1482, 4.3.1483, 4.3.1484, 4.3.1485, 4.3.1486, 4.3.1487, 4.3.1489, 4.3.1490, 4.3.1491, 4.3.1492, 4.3.1493, and 4.3.1494 for the application assertions.

There shall be at least one object that the Security_classification (see 4.2.443) is_applied_to.

4.2.443.2 level

The level specifies the Security_level (see 4.2.444) associated with the object.

See 4.3.1488 for the application assertion.

4.2.443.3 name

The name specifies the word or group of words used to refer to the Security_classification.

See 4.3.1478 for the application assertion.

There shall be exactly one object that defines the name for a Security_classification (see 4.2.443).

4.2.443.4 purpose

The purpose specifies the rationale behind the Security_classification.

See 4.3.1478 for the application assertion.

The purpose need not be specified for a particular Security_classification (see 4.2.443).

If present, there shall be exactly one object that defines the purpose for a Security_classification.

4.2.444 Security_level

A Security_level is the specification of a level of security within some security classification scheme.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - The values of Security_level are company specific.

The data associated with a Security_level are the following:

— level_name;

— used_classification_system.

4.2.444.1 level_name

The level_name specifies the word or abbreviation used to refer to the Security_level.

4.2.444.2 used_classification_system

The used_classification_system specifies the Classification_system (see 4.2.71) that contains the information about how to interpret the level of the Security_level.

See 4.3.1495 for the application assertion.

The used_classification_system need not be specified for a particular Security_level (see 4.2.444).

4.2.445 Selected_instance

A Selected_instance is the identification of the occurrence of an object that is either defined as a Design_discipline_item_definition (see 4.2.142) or as a Product_identification (see 4.2.398) and whose quantity depends on certain constraints.

EXAMPLE 1 In a BOM where the exact amount of grease or glue can usually not be specified as a quantity, the specification of this grease or glue are examples for Selected_instance objects.

EXAMPLE 2 To minimize the concentricity error of a wheel, weights are attached to the rim; this set of weights is a Selected_instance. The quantity as well as the position of these weights depends on the concentricity behaviour of each particular wheel as manufactured and tested.

A Selected_instance is a type of Item_instance (see 4.2.271).

The data associated with a Selected_instance are the following:

— selected_quantity;

— selection_control.

4.2.445.1 selected_quantity

The selected_quantity specifies the quantity of the part, tool or raw material foreseen as Selected_instance. The selected_quantity shall be of type Value_limit (see 4.2.544) or Value_range (see 4.2.547).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - If the quantity is to be specified as a minimum and/or a maximum, then Value_limit or Value_range may be used.

EXAMPLE The quantity of engine oil used in a car may be in the range of 3.7 to 3.9 liters. This is expressed using Value_range as the selected_quantity.

See 4.3.1496 for the application assertion.

4.2.445.2 selection_control

The selection_control specifies the constraint that has to be evaluated for the Selected_instance.

EXAMPLE 'as required for balance' and 'as required for lubrication' are examples for a selection_control.

4.2.446 Serial_configuration

A Serial_configuration is a Manufacturing_configuration (see 4.2.305) that applies onwards from a given serial number of the product that is considered within the object referred to as 'is_solution_for'.

A Serial_configuration is a type of Manufacturing_configuration (see 4.2.305).

The data associated with a Serial_configuration are the following:

— serial_end_number;

— serial_start_number.

4.2.446.1 serial_end_number

The serial_end_number specifies the serial number of that instance of the product that is the last instance for which the Serial_configuration applies.

NOTE - If the serial_end_number is not specified, it is not foreseen that the Serial_configuration ceases to be valid; i.e., the Serial_configuration is expected to apply to all serial numbers greater than the serial start number for the product for whose characteristics the Serial_configuration identifies a solution.

The serial_end_number need not be specified for a particular Serial_configuration (see 4.2.446).

4.2.446.2 serial_start_number

The serial_start_number specifies the serial number of that instance of the product that is the first instance for which the Serial_configuration applies.

 © ISO 2001 – All rights reserved

4.2.447 Shape_dependent_property

A Shape_dependent_property is a characteristic of the shape, or of a portion of the shape of an object. This object is either an item, an occurrence of an item in the product structure or the physical realization of an item.

NOTE - A Shape_dependent_property is independent of the representations of the shape.

Each Shape_dependent_property is a Centre_of_mass (see 4.2.49), a Moments_of_inertia (see 4.2.319), or a General_shape_dependent_property (see 4.2.231).

The data associated with a Shape_dependent_property are the following:

— described_element;

— description;

— is_defined_in;

— value_determination.

4.2.447.1 described_element

The described_element specifies the object that the Shape_dependent_property is associated to.

See 4.3.1498 and 4.3.1500 for the application assertions.

There shall be exactly one object that defines the described_element for a Shape_dependent_property (see 4.2.447).

4.2.447.2 description

The description specifies additional information about the Shape_dependent_property.

See 4.3.1499 for the application assertion.

The description need not be specified for a particular Shape_dependent_property (see 4.2.447).

If present, there shall be exactly one object that defines the description for a Shape_dependent_property.

4.2.447.3 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) in which the property is applicable.

NOTE - The values of geometry related properties are specified relative to a Cartesian_coordinate_space.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXAMPLE A Centre_of_mass (see 4.2.49) may be specified in different coordinate spaces for different dimensioning applications.

See 4.3.1497 for the application assertion.

The is_defined_in need not be specified for a particular Shape_dependent_property (see 4.2.447).

4.2.447.4 value_determination

The value_determination specifies information on how the Shape_dependent_property shall be interpreted. Where applicable, the following values shall be used:

— 'calculated': The value has been calculated;

— 'designed': The value represents a value intended by the design;

— 'estimated': The value has been estimated;

— 'measured': The value has been measured;

— 'required': The value represents a requirement.

NOTE - A Shape_dependent_property may be specified in the design stage of a product but it may also be documented as measured on a prototype.

The value_determination need not be specified for a particular Shape_dependent_property (see 4.2.447).

4.2.448 Shape_description_association

A Shape_description_association is a mechanism to associate the definition of a shape or of a portion of a shape with a geometric representation.

NOTE - Through Shape_description_association, it is possible to associate objects with geometry defined in an external document; the same is possible through Document_assignment (see 4.2.156). The difference between the two possibilities is that in the case of Shape_description_association, it is the shape of the object that is assigned whereas Document_assignment may be used to assign other kinds of geometry.

The data associated with a Shape_description_association are the following:

— defining_geometry;

— is_defining_shape_for;

— role.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.448.1 defining_geometry

The defining_geometry specifies the Geometric_model (see 4.2.238) or the External_model (see 4.2.189) that contains the shape information.

See 4.3.1501 and 4.3.1504 for the application assertions.

There shall be exactly one object that defines the defining_geometry for a Shape_description_association (see 4.2.448).

4.2.448.2 is_defining_shape_for

The is_defining_shape_for specifies the object the Shape_description_association is associated with.

See 4.3.1502, 4.3.1503, 4.3.1505, 4.3.1506, 4.3.1507, 4.3.1508, and 4.3.1509 for the application assertions.

There shall be exactly one object that the Shape_description_association (see 4.2.448) is_defining_shape_for.

4.2.448.3 role

The role specifies the function performed by the referenced model. Where applicable, the following values shall be used:

— 'detailed representation': The geometry in the referenced model provides a detailed representation of the shape;

— 'idealized representation': The geometry in the referenced model provides a simplified representation of the shape, e.g., for analysis purposes.

EXAMPLE For analysis purposes an 'idealized representation' that is not fully detailed in every respect may be sufficient and be preferable due to less overhead implied by its usage.

4.2.449 Shape_element

A Shape_element is a portion of shape that has to be identified explicitly to be associated with other information.

EXAMPLE 1 In order to identify a portion of one face of a shaft that shall have a surface coating applied to it, Shape_element is used. Figure 67 shows this example.

NOTE - Shape_element objects can be classified using General_classification (see 4.2.216).

EXAMPLE 2 An example for classifying Shape_element objects is to identify all parts of an air plane that constitute the outer surface of the plane and are therefore relevant for aerodynamic analysis.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Each Shape_element may be a Coating_layer (see 4.2.75) or a Feature_occurrence (see 4.2.200).

The data associated with a Shape_element are the following:

— composition;

— description;

— element_name.

4.2.449.1 composition

The composition specifies the shape that the Shape_element is part of.

See 4.3.1510 for the application assertion.

4.2.449.2 description

The description specifies additional information about the Shape_element.

See 4.3.1511 for the application assertion.

The description need not be specified for a particular Shape_element (see 4.2.449).

If present, there shall be exactly one object that defines the description for a Shape_element.

4.2.449.3 element_name

The element_name specifies the word or group of words by which the Shape_element is referred to.

The element_name need not be specified for a particular Shape_element (see 4.2.449).

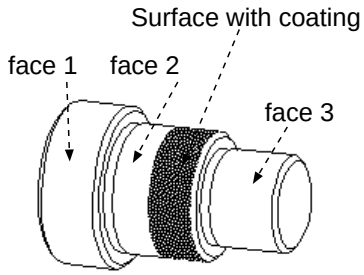

Figure 67 – Shape_element on a shaft

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.450 Shape_element_relationship

A Shape_element_relationship is a relationship between two Shape_element (see 4.2.449) objects.

The data associated with a Shape_element_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.450.1 description

The description specifies additional information about the Shape_element_relationship.

See 4.3.1512 for the application assertion.

The description need not be specified for a particular Shape_element_relationship (see 4.2.450).

If present, there shall be exactly one object that defines the description for a Shape_element_relationship.

4.2.450.2 related

The related specifies the second of the two Shape_element (see 4.2.449) objects related by a Shape_-element_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1513 for the application assertion.

4.2.450.3 relating

The relating specifies the first of the two Shape_element (see 4.2.449) objects related by a Shape_-element_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1513 for the application assertion.

4.2.450.4 relation_type

The relation_type specifies the meaning of the relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXAMPLE 'transition priority' may be used to define the precedence between two intersecting Transition_feature (see 4.2.537) objects.

4.2.451 Shell

A Shell is a collection of Face (see 4.2.191) objects that establish a Surface_model (see 4.2.496).

A Shell is a type of Detailed_geometric_model_element (see 4.2.144).

The data associated with a Shell are the following:

— included_face

The included_face specifies the set of Face objects that form a Shell.

See 4.3.1514 for the application assertion.

4.2.452 Significant_number_of_digits

A Significant_number_of_digits is an entry in a Tolerance_table_cell (see 4.2.523) representing the range of applicability of a tolerance value by specifying the presented number of digits.

The number of digits used for the dimension determine which default tolerance entry in the general tolerance table is valid for this particular dimension

The data associated with a Significant_number_of_digits are the following:

— number_of_digits

The number_of_digits specifies the significant number of digits used for a dimension specification of a part.

4.2.453 Simple_pair_range

A Simple_pair_range is the valid range of the pair parameters of a pair. A Simple_pair_range shall represent either a cylindrical pair range, a gear pair range, a planar pair range, a prismatic pair range, a rack and pinion pair range, a revolute pair range, a rolling curve pair range, a rolling surface pair range, a screw pair range, a sliding curve pair range, a sliding surface pair range, a spherical pair range, or a universal pair range.

The data associated with a Simple_pair_range are the following:

— is_applied_to

The is_applied_to specifies the Kinematic_pair (see 4.2.287) that the Simple_pair_range applies to.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.1515 for the application assertion.

4.2.454 Single_datum

A Single_datum is a single element used as reference for tolerancing purposes.

A Single_datum is a type of Datum (see 4.2.123).

The data associated with a Single_datum are the following:

— datum_name;

— is_defined_by;

— modification.

4.2.454.1 datum_name

The datum_name specifies the word or group of words by which the Single_datum is referred to.

EXAMPLE Typical names of Single_datum objects are 'A', 'B', or 'C'.

4.2.454.2 is_defined_by

The is_defined_by specifies the Datum_target_set (see 4.2.127), the Derived_geometry (see 4.2.136), or the Shape_element (see 4.2.449) that represents the Single_datum.

See 4.3.1516, 4.3.1517, and 4.3.1518 for the application assertions.

There shall be exactly one object that the Single_datum (see 4.2.454) is_defined_by.

4.2.454.3 modification

The modification specifies a Tolerance_condition (see 4.2.522) that is associated with the application of the Single_datum.

EXAMPLE Material conditions such as LMC or MMC are typical conditions.

See 4.3.1519 for the application assertion.

The modification need not be specified for a particular Single_datum (see 4.2.454).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.455 Single_instance

A Single_instance is one particular occurrence of an object that is defined either as a Design_discipline_-item_definition (see 4.2.142) or as a Product_identification (see 4.2.398).

NOTE - A Single_instance may or may not be associated with placement information using an Instance_-placement (see 4.2.264).

EXAMPLE In a Technical_solution (see 4.2.510) for the 'front left brake', a 'brake disk' is used and its position is specified by a geometric Transformation (see 4.2.533).

A Single_instance is a type of Item_instance (see 4.2.271).

4.2.456 Size_dimension

A Size_dimension is the representation of the size of an individual shape element.

A Size_dimension is a type of Geometric_dimension (see 4.2.237).

Each Size_dimension is an Angular_size_dimension (see 4.2.14), a Thickness_dimension (see 4.2.516), or a General_size_dimension (see 4.2.232).

The data associated with a Size_dimension are the following:

— is_applied_to

The is_applied_to specifies the geometric or annotation element which the Size_dimension is applied to.

See 4.3.1520 and 4.3.1521 for the application assertions.

There shall be exactly one object that the Size_dimension is_applied_to.

4.2.457 Slot_end_type

A Slot_end_type is the definition of a kind of end for a Slot_feature (see 4.2.458).

Each Slot_end_type is a Radiused_slot_end_type (see 4.2.419), a Flat_slot_end_type (see 4.2.208), an Open_slot_end_type (see 4.2.330), or a Woodruff_slot_end_type (see 4.2.563).

The data associated with a Slot_end_type are the following:

— is_applied_to

The is_applied_to specifies to which end of the path the Slot_end_type applies.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following values shall be used:

— 'end': The Slot_end_type is applied to that end of the Slot_feature that corresponds to the end of the defining Path (see 4.2.342);

— 'start': The Slot_end_type is applied to that end of the Slot_feature that corresponds to the start of the defining Path.

4.2.458 Slot_feature

A Slot_feature is a channel or depression with a continuous course.

EXAMPLE Figure 68 illustrates examples of slots.

A Slot_feature is a type of Process_feature_in_solid (see 4.2.380).

The data associated with a Slot_feature are the following:

— end_condition;

— slot_profile;

— sweep_path.

4.2.458.1 end_condition

The end_condition specifies the Slot_end_type (see 4.2.457) objects that define the type of the extremities of the slot. A Slot_feature that is defined with a Complete_circular_path (see 4.2.79) shall have two end conditions of type Open_slot_end_type (see 4.2.330).

See 4.3.1524 for the application assertion.

4.2.458.2 slot_profile

The slot_profile specifies the Open_profile_usage (see 4.2.329) that identifies the Open_profile (see 4.2.328) that is swept along the sweep path.

See 4.3.1522 for the application assertion.

4.2.458.3 sweep_path

The sweep_path specifies the Path (see 4.2.342) that serves as a sweep path for a Slot_feature.

See 4.3.1523 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

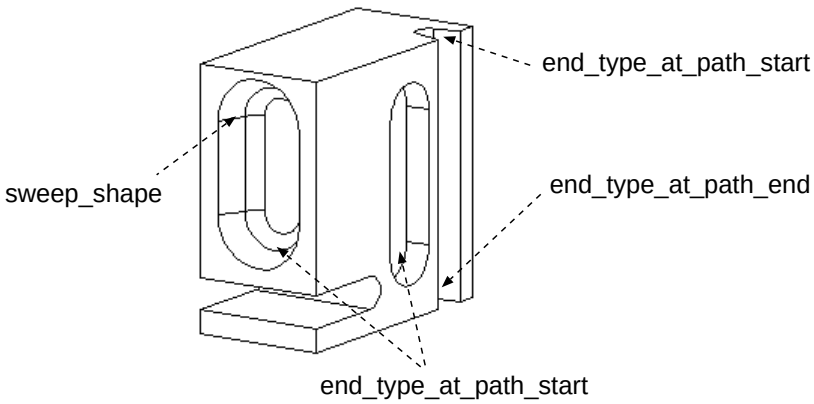

Figure 68 – various shapes of slots

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.459 Solid_fill_area

A Solid_fill_area is an enclosed area that is uniformly filled by a single colour.

4.2.460 Solid_of_linear_extrusion

A Solid_of_linear_extrusion is a solid that is formed by sweeping a planar Face (see 4.2.191) along a straight line in space about a specified depth.

A Solid_of_linear_extrusion is a type of Swept_face_solid (see 4.2.502).

4.2.461 Solid_of_revolution

A Solid_of_revolution is a solid formed by revolving a planar Face (see 4.2.191) about an axis.

The axis shall be in the plane of the Face and shall not intersect the interior of the Face. The planar Face may have holes which will sweep into holes in the solid. The direction of revolution is clockwise if viewed along the axis in the positive direction.

A Solid_of_revolution is a type of Swept_face_solid (see 4.2.502).

4.2.462 Solid_replica

A Solid_replica is a copy of a solid within a CSG tree at a new location and orientation.

NOTE - Additionally, the received object may have been uniformly resized or mirrored.

A Solid_replica is a type of Detailed_geometric_model_element (see 4.2.144).

 © ISO 2001 – All rights reserved

The data associated with a Solid_replica are the following:

— replicated_solid

The replicated_solid specifies the solid to be replicated.

See 4.3.1525, 4.3.1526, 4.3.1527, 4.3.1528, 4.3.1529, and 4.3.1530 for the application assertions.

There shall be exactly one object that defines the replicated_solid for a Solid_replica.

4.2.463 Specific_document_classification

A Specific_document_classification is a classification of a Document (see 4.2.155) with respect to specific criteria. The specific criteria are covered in the 'classification_name' attribute.

The data associated with a Specific_document_classification are the following:

— associated_document;

— classification_name;

— description.

4.2.463.1 associated_document

The associated_document the associated_document specifies the Document (see 4.2.155) with which a particular Specific_document_classification is associated.

See 4.3.1531 for the application assertion.

4.2.463.2 classification_name

The classification_name provides classification information.

NOTE The overall classification information is obtained by traversing the hierarchical tree established by Specific_item_classification_hierarchy (see 4.2.466).

Where applicable, the following values shall be used:

— 'catalogue': The assigned document is the catalogue in which the associated object is listed;

EXAMPLE The document can be the catalogue of the manufacturer.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— ’manual’: The assigned document is the handbook that is supplied for the associated object;

— ’specification’: The assigned document specifies the considerations that lead to the design finally chosen for the associated object.

4.2.463.3 description

The description specifies additional information about the Specific_document_classification.

See 4.3.1532 for the application assertion.

The description need not be specified for a particular Specific_document_classification (see 4.2.463).

If present, there shall be exactly one object that defines the description for a Specific_document_classification.

4.2.464 Specific_document_classification_hierarchy

A Specific_document_classification_hierarchy is used to build up hierarchical structures of Specific_document_classification_hierarchy objects.

The data associated with a Specific_document_classification_hierarchy are the following:

— sub_classification;

— super_classification.

4.2.464.1 sub_classification

The sub_classification specifies the lower level of Specific_document_classification (see 4.2.463) in Specific_document_classification_hierarchy that is included in the super class.

See 4.3.1533 for the application assertion.

4.2.464.2 super_classification

The super_classification specifies the higher level of Specific_document_classification (see 4.2.463) in Specific_document_classification_hierarchy that is included in the sub class.

See 4.3.1533 for the application assertion.

4.2.465 Specific_item_classification

A Specific_item_classification is a classification of an Item (see 4.2.267) with respect to specific criteria. The specific criteria are covered in the ’classification_name’ attribute.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE 1 - If an Item requires classification by more than one criterion, several Specific_item_classification objects are associated to the same Item.

NOTE 2 - For the attribute 'classification_name' a set of predefined values is specified hereafter. If values other than the proposed ones are used, they should be of general classifying nature. This kind of classification ought not to be used to classify names or identifiers of objects, e.g., in order to classify part families; for this purpose General_classification (see 4.2.216) ought to be used.

NOTE 3 - In order to assign functional information to an Item, Item_function_association (see 4.2.270) ought to be used.

The data associated with a Specific_item_classification are the following:

— associated_item;

— classification_name;

— description.

4.2.465.1 associated_item

The associated_item specifies the Item (see 4.2.267) with which a particular Specific_item_classification is associated.

See 4.3.1534 for the application assertion.

4.2.465.2 classification_name

The classification_name provides high level classification information. Where applicable, the following values shall be used:

— 'application control': This type of classification is used to indicate that an Item (see 4.2.267) shall be considered under certification aspects; these aspects may be specified further by the 'description' attribute;

EXAMPLE 1 Prior to the release of a new car to the market, both function and quality of certain parts have to be certified by an authority, e.g., the department of transportation. For such Item objects, certification requirements have to be considered during the design phase.

— 'assembly': This type of classification shall be used for any Item that has an Assembly_definition (see 4.2.27) provided for at least one of its versions, i.e., it is decomposed further;

— 'collection': This type of classification shall be used for any Item that has a Collection_definition (see 4.2.78) provided for at least one of its versions;

— 'completely knocked down': This type of classification is used to indicate that an Item is used in a production site that has assembling facilities only;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXAMPLE 2 The 'completely knocked down' may indicate that the components are shipped to and assembled in a different country.

— 'detail': This type of classification shall be used for any Item that has no Assembly_definition provided for any of its versions, i.e., it is not further decomposed;

— 'in process': This type of classification is used to indicate that the Item identifies an intermediate object in a manufacturing process;

NOTE - Detailed information about the stage the Item has within the manufacturing process may be obtained from the Process_operation_occurrence (see 4.2.384)

— 'part': The Item plays the role of a part;

— 'prototype': This type of classification is used to indicate that the Item identifies a prototype and is not intended for serial production;

— 'raw material': The Item plays the role of raw material;

— 'regulated': This type of classification is used to indicate that for an Item certain regulations have to be considered;

— 'safety': This type of classification is used to indicate that an Item is relevant for safety purposes;

— 'service': This type of classification is used to indicate that an Item is relevant for service purposes;

— 'tool': The Item plays the role of a tool.

4.2.465.3 description

The description specifies additional information about the Specific_item_classification.

See 4.3.1535 for the application assertion.

The description need not be specified for a particular Specific_item_classification (see 4.2.465).

If present, there shall be exactly one object that defines the description for a Specific_item_classification.

4.2.466 Specific_item_classification_hierarchy

A Specific_item_classification_hierarchy is used to build up hierachical structures of Specific_item_-classification (see 4.2.465).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Specific_item_classification_hierarchy are the following:

— sub_classification;

— super_classification.

4.2.466.1 sub_classification

The sub_classification specifies the lower level of Specific_item_classification (see 4.2.465) in a Specific_item_classification_hierarchy that is included in the super class.

See 4.3.1536 for the application assertion.

4.2.466.2 super_classification

The super_classification specifies the higher level of Specific_item_classification (see 4.2.465) in a Specific_item_classification_hierarchy that includes the sub class.

See 4.3.1536 for the application assertion.

4.2.467 Specification

A Specification is a characteristic of a product. A Specification discriminates one product from other members of the same Product_class (see 4.2.392). A Specification refers to a Specification_category (see 4.2.468) that completes the semantics of the Specification.

NOTE 1 - A Specification may be a characteristic of the members of more than one Product_class using Class_specification_association (see 4.2.67) objects.

NOTE 2 - A Specification in combination with a Configuration (see 4.2.94) may be used to define under which conditions an Item (see 4.2.267) is used for a product of a Product_class.

EXAMPLE 'coupe', 'hatch back', or 'sedan' are examples for specifications belonging to the Specification_category of type 'car body'. 'radio 1 with CD player' and 'radio 2 without CD player' are examples for specifications belonging to the Specification_category of type 'radio equipment'. 'disk brake' and 'drum brake' are examples for specifications belonging to the Specification_category of type 'braking system'.

The data associated with a Specification are the following:

— category;

— description;

— id;

— name;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— package;

— version_id.

4.2.467.1 category

The category specifies the Specification_category (see 4.2.468) that completes the semantics of the Specification.

See 4.3.1538 for the application assertion.

4.2.467.2 description

The description specifies additional information about the Specification.

See 4.3.1537 for the application assertion.

The description need not be specified for a particular Specification (see 4.2.467).

If present, there shall be exactly one object that defines the description for a Specification.

4.2.467.3 id

The id specifies the identifier of the Specification that shall be unique within the scope of a Specification_category (see 4.2.468).

4.2.467.4 name

The name specifies the word or group of words by which the Specification is referred to.

See 4.3.1537 for the application assertion.

The name need not be specified for a particular Specification (see 4.2.467).

If present, there shall be exactly one object that defines the name for a Specification.

4.2.467.5 package

The package specifies whether this Specification represents a package of Specification objects or not. Such a Specification combines those Specification objects that shall be offered to the market as a set. In the case where package is 'true', there shall be exactly one Specification_inclusion (see 4.2.471) per Product_class (see 4.2.392) considered, that refers to this Specification as 'if_condition'. The Specification objects that are members of the package, shall be specified as included_specification.

NOTE 1 - Commercial packages may be defined by the marketing department.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE 2 - Usually the members of a package belong to distinct Specification_category (see 4.2.468) objects.

EXAMPLE A sports package contains sports seats, a special steering wheel, special tyres and wheels. A winter package contains heated front seats, heated windshield washers, heated exterior mirrors, and special tyres.

4.2.467.6 version_id

The version_id specifies the identification of a particular version of a Specification.

The version_id need not be specified for a particular Specification (see 4.2.467).

4.2.468 Specification_category

A Specification_category is the definition of a set of Specification (see 4.2.467) objects serving the same purpose.

EXAMPLE The category 'kind of drive' for the Specification objects 'front wheel drive' and 'rear wheel drive' or the category 'level of equipment' for the Specification objects 'standard', 'comfortable', and 'luxurious' are examples for a Specification_category.

The data associated with a Specification_category are the following:

— description;

— id;

— implicit_exclusive_condition.

4.2.468.1 description

The description specifies information about the Specification_category.

EXAMPLE The description 'trim' characterizes a Specification_category for Specification (see 4.2.467) objects that controls the quality and colour of the interior parts including e.g., inner door panels and upholstery. Other examples are 'kind of drive', 'rear brake type', 'brake power regulator', 'radio equipment', or 'type of car body'.

See 4.3.1539 for the application assertion.

There shall be exactly one object that defines the description for a Specification_category (see 4.2.468).

4.2.468.2 id

The id specifies the identifier of the Specification_category that shall be unique.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - The scope of uniqueness is usually dependent on the form of implementation.

EXAMPLE The scope of uniqueness may be set by the extent of a physical file or data base.

4.2.468.3 implicit_exclusive_condition

The implicit_exclusive_condition specifies whether the Specification (see 4.2.467) objects within the Specification_category are mutually exclusive for the production of one particular product. A value of 'true' indicates that the referenced objects are mutually exclusive for the production of the particular product.

EXAMPLE 'safety equipment' is an example for a non mutually exclusive Specification_category if e.g. ABS and airbag are Specification objects in this category. 'engine' is an example for a Specification_category with an implicit_exclusive_condition since usually only one engine can be mounted for power supply.

NOTE - More complex conditions can be handled using Specification_expression (see 4.2.470) objects.

4.2.469 Specification_category_hierarchy

A Specification_category_hierarchy is used to build up hierarchical structures of Specification_category (see 4.2.468) objects.

The data associated with a Specification_category_hierarchy are the following:

— sub_category;

— super_category.

4.2.469.1 sub_category

The sub_category is the lower level of Specification_category (see 4.2.468) in Specification_category_-hierarchy.

See 4.3.1540 for the application assertion.

4.2.469.2 super_category

The super_category is the higher level of Specification_category (see 4.2.468) in Specification_category_hierarchy.

See 4.3.1540 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.470 Specification_expression

A Specification_expression is a combination of Specification (see 4.2.467) objects formed by Boolean operations.

The data associated with a Specification_expression are the following:

— description;

— id;

— operand;

— operation.

4.2.470.1 description

The description specifies additional information about the Specification_expression.

See 4.3.1541 for the application assertion.

The description need not be specified for a particular Specification_expression (see 4.2.470).

If present, there shall be exactly one object that defines the description for a Specification_expression.

4.2.470.2 id

The id specifies the identifier of the Specification_expression.

The id need not be specified for a particular Specification_expression (see 4.2.470).

4.2.470.3 operand

The operand specifies the operands of the Boolean operation that are either Specification (see 4.2.467) objects or other Specification_expression objects.

See 4.3.1542 and 4.3.1543 for the application assertions.

There shall be at least one object that defines the operand for a Specification_expression (see 4.2.470).

4.2.470.4 operation

The operation specifies the kind of Boolean operation. Four kinds of operations are permitted:

— 'and': All of the identified Specification (see 4.2.467) objects shall be used;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— 'or': A subset or all of the identified Specification objects shall be used;

— 'oneof': Exactly one of the identified Specification objects shall be used;

— 'not': The identified Specification shall not be used.

4.2.471 Specification_inclusion

A Specification_inclusion is the representation of the statement that specifies that the application of a Specification (see 4.2.467) or of a Specification_expression (see 4.2.470) implies the inclusion of an additional Specification or Specification_expression.

NOTE - The Specification_inclusion is intended to complete the set of Specification objects for a Product_-specification (see 4.2.399) in order to enable the manufacturing of the product on the basis of an initial set of Specification objects defined.

EXAMPLE The source of such a completion may be a customer order.

The data associated with a Specification_inclusion are the following:

— description;

— id;

— if_condition;

— included_specification.

4.2.471.1 description

The description specifies additional information about the Specification_inclusion.

See 4.3.1544 for the application assertion.

The description need not be specified for a particular Specification_inclusion (see 4.2.471).

If present, there shall be exactly one object that defines the description for a Specification_inclusion.

4.2.471.2 id

The id specifies the identifier of the Specification_inclusion.

The id need not be specified for a particular Specification_inclusion (see 4.2.471).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.471.3 if_condition

The if_condition specifies the Specification (see 4.2.467) or the Specification_expression (see 4.2.470) that serves as the condition for the inclusion.

See 4.3.1545 and 4.3.1546 for the application assertions.

There shall be exactly one object that defines the if_condition for a Specification_inclusion (see 4.2.471).

4.2.471.4 included_specification

The included_specification specifies the Specification (see 4.2.467) or the Specification_expression (see 4.2.470) objects that are to be included. The included_specification shall not reference a Specification_-expression with an operation of type 'or' or 'oneof', except for negating expressions, i.e., as participants in an expression preceded by a 'not' operator. Expressions of operator 'not' shall not be nested within each other.

NOTE 1 - In the case where more than one Specification is to be included a Specification_expression of type AND shall be used.

NOTE 2 - In the case where the included_specification is a NOT expression, the object actually defines an exclusion.

See 4.3.1545 and 4.3.1546 for the application assertions.

There shall be exactly one object that defines the included_specification for a Specification_inclusion (see 4.2.471).

4.2.472 Specified_instance

A Specified_instance is a mechanism to identify a certain Item_instance (see 4.2.271) in a multi level assembly structure that reuses partial decompositions.

EXAMPLE A 'chassis' consists among others of the sub assemblies 'front axle' and 'rear axle'. Both axle assemblies consist, among others, of the 'left wheel' and the 'right wheel'. In order to identify the 'left wheel' of the 'rear axle', the Specified_instance object references 'left wheel' as related_instance, 'rear axle' as 'upper_usage', and 'chassis' as 'assembly_context'.

The 'definition' of a Specified_instance shall be the same object as the one referenced by the 'related_-instance' as 'definition'.

A Specified_instance is a type of Item_instance (see 4.2.271).

The data associated with a Specified_instance are the following:

— assembly_context;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— related_instance;

— upper_usage.

4.2.472.1 assembly_context

The assembly_context specifies an Assembly_definition (see 4.2.27) object in which the instance identified by this mechanism is used.

See 4.3.1547 for the application assertion.

4.2.472.2 related_instance

The related_instance specifies the Item_instance (see 4.2.271) that is to be identified.

The related_instance shall not be of type Specified_instance.

See 4.3.1548 for the application assertion.

4.2.472.3 upper_usage

The upper_usage specifies the Item_instance (see 4.2.271) in which the related_instance is used. This Item_instance shall be the immediate upper level instance or another Specified_instance.

See 4.3.1548 for the application assertion.

4.2.473 Sphere

A Sphere is a solid of spherical shape defined by a centre point and a radius.

A Sphere is a type of Csg_primitive (see 4.2.107).

4.2.474 Spherical_bottom

A Spherical_bottom is a hole bottom that is defined by a hemisphere that is tangent to the sides of the Round_hole (see 4.2.439).

A Spherical_bottom is a type of Hole_bottom_condition (see 4.2.257).

The data associated with a Spherical_bottom are the following:

— radius

The radius specifies the distance between the centre of the sphere and its surface.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.1549 for the application assertion.

4.2.475 Spherical_surface

A Spherical_surface is a surface with a constant distance (the radius) from a central point.

A Spherical_surface is a type of Surface (see 4.2.489).

4.2.476 Square_u_profile

A Square_u_profile is an open profile that is bounded by three lines. One is the base line and has a defined length. The other two lines begin at the ends of the base line and extend infinitely. The corners of a Square_u_profile may be blended by a radius. The x-axis of the inherited Axis_placement (see 4.2.33) is parallel to the base line. The y-axis is orient such that the side lines of the outline of the profile have positive y co-ordinates. The Axis_placement is located in the midpoint of the base line.

EXAMPLE Figure 69 depicts a Square_u_profile.

A Square_u_profile is a type of Open_profile (see 4.2.328).

The data associated with a Square_u_profile are the following:

— first_angle;

— first_radius;

— second_angle;

— second_radius;

— width.

4.2.476.1 first_angle

The first_angle specifies the size of an angle between the base and that side of the profile that intersects the x-axis at a positive value.

See 4.3.1550 for the application assertion.

4.2.476.2 first_radius

The first_radius specifies a radius shape blend between the base and that side of the profile that intersects the x-axis at a positive value.

See 4.3.1550 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The first_radius need not be specified for a particular Square_u_profile (see 4.2.476).

4.2.476.3 second_angle

The second_angle specifies the size of an angle between the base and that side of the profile that intersects the x-axis at a negative value.

See 4.3.1550 for the application assertion.

4.2.476.4 second_radius

The second_radius specifies a radius shape blend between the base and that side of the profile that intersects the x-axis at a negative value.

See 4.3.1550 for the application assertion.

The second_radius need not be specified for a particular Square_u_profile (see 4.2.476).

4.2.476.5 width

The width specifies the size of the base line for a Square_u_profile.

See 4.3.1550 for the application assertion.

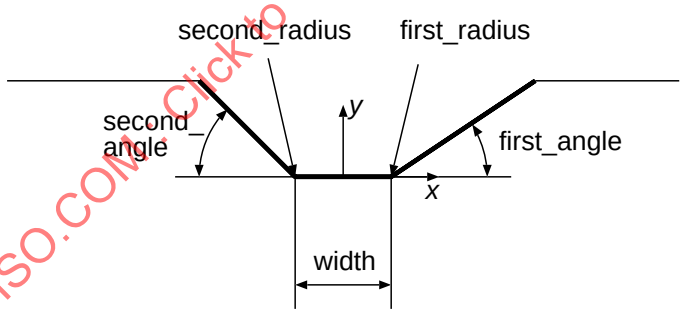

Figure 69 – Definition of a Square_u_profile

4.2.477 Straightness_tolerance

A Straightness_tolerance is a constraint on the deviation that a curve or any curve on a surface may have from being a straight line. It defines a tolerance zone within which the curve must lie.

A Straightness_tolerance is a type of Geometric_tolerance (see 4.2.243).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Straightness_tolerance are the following:

— affected_plane

The affected_plane specifies the plane in which the tolerance applies.

This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane is not specified, the tolerance applies in all directions (on drawings indicated by the diameter symbol).

See 4.3.1551 for the application assertion.

The affected_plane need not be specified for a particular Straightness_tolerance.

4.2.478 String_value

A String_value represents a sequence of one or more alphanumeric characters.

A String_value is a type of Property_value (see 4.2.412).

The data associated with a String_value are the following:

— value_specification

The value_specification specifies the string represented by the String_value.

See 4.3.1552 for the application assertion.

There shall be exactly one object that defines the value_specification for a String_value.

4.2.479 String_with_language

A String_with_language represents text information in a specific language together with an identification of the language used.

The data associated with a String_with_language are the following:

— contents;

— language_specification.

4.2.479.1 contents

The contents is textual information stored in the language identified by the language attribute.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.479.2 language_specification

The language_specification specifies the Language (see 4.2.291) in which the contents is given.

See 4.3.1553 for the application assertion.

4.2.480 Structuring_method_hierarchy

A Structuring_method_hierarchy is a mechanism to build up a nesting of Group (see 4.2.250) objects within Group or Layer (see 4.2.292) objects in structuring methods.

NOTE - This mechanism facilitates the nesting of groups in other groups and the nesting of groups in a layer, but not the nesting of one layer in another layer or group.

The data associated with a Structuring_method_hierarchy are the following:

— related;

— relating.

4.2.480.1 related

The related specifies the Group (see 4.2.250) object to be nested. A Group that contains Shape_element (see 4.2.449) objects shall not participate, directly or indirectly, in a Layer (see 4.2.292).

See 4.3.1554 for the application assertion.

4.2.480.2 relating

The relating specifies the structuring method in that the Group (see 4.2.250) is nested.

See 4.3.1554 and 4.3.1555 for the application assertions.

There shall be exactly one object that the Structuring_method_hierarchy (see 4.2.480) is relating to.

4.2.481 Styled_annotation_model

A Styled_annotation_model is a set of annotation elements.

For this particular type of Styled_model (see 4.2.484), the inherited attribute 'element' shall refer to Annotation_element (see 4.2.17) objects only.

A Styled_annotation_model is a type of Styled_model (see 4.2.484).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Styled_annotation_model are the following:

— is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) of the Styled_annotation_model.

NOTE - A Styled_annotation_model is defined in its own coordinate space since it does not refer to a Geometric_model (see 4.2.238) that has a coordinate space that could be shared.

See 4.3.1556 for the application assertion.

4.2.482 Styled_element

A Styled_element is a Detailed_element (see 4.2.143) that has presentation information.

A Styled_element is a type of Detailed_element (see 4.2.143).

Each Styled_element is an Annotation_element (see 4.2.17) or a Styled_model_element (see 4.2.485).

The data associated with a Styled_element are the following:

— appearance;

— invisible.

4.2.482.1 appearance

The appearance specifies the associated presentation information.

See 4.3.1557 for the application assertion.

4.2.482.2 invisible

The invisible specifies if the Styled_element is invisible.

4.2.483 Styled_geometric_model

A Styled_geometric_model is a set of geometric elements that have presentation information.

NOTE 1 - A Styled_geometric_model is defined in the Cartesian_coordinate_space (see 4.2.44) of the corresponding Geometric_model (see 4.2.238).

NOTE 2 - In order to exchange a 3D model and a 2D drawing of the same item, which may be specified using different length units, separate instances of Geometric_model or Styled_geometric_model in a Cartesian_coordinate_space_3d (see 4.2.46) for the model and Drawing_sheet (see 4.2.173) in a Cartesian_coordinate_space_2d (see 4.2.45) for the drawing are used.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

A Styled_geometric_model is a type of Styled_model (see 4.2.484).

The data associated with a Styled_geometric_model are the following:

— styled_geometry_context

The styled_geometry_context specifies the Geometric_model that contains the styled geometric elements.

See 4.3.1558 for the application assertion.

4.2.484 Styled_model

A Styled_model is a set of geometric or annotation elements that have presentation information.

NOTE - Each Styled_model may be a combination of a Styled_model_version (see 4.2.487) and one of the other types of Styled_model.

Each Styled_model may be a Styled_model_version (see 4.2.487).

Each Styled_model is either a Styled_geometric_model (see 4.2.483) or a Styled_annotation_model (see 4.2.481).

The data associated with a Styled_model are the following:

— additional_elements;

— description;

— element;

— model_id.

4.2.484.1 additional_elements

The additional_elements specifies the Template_instance (see 4.2.512) objects that are additionally imported into the Styled_model using a Transformation (see 4.2.533). The additional_elements shall also be of type Styled_model.

See 4.3.1561 for the application assertion.

4.2.484.2 description

The description specifies additional information about the Styled_model.

See 4.3.1559 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The description need not be specified for a particular Styled_model (see 4.2.484).

If present, there shall be exactly one object that defines the description for a Styled_model.

4.2.484.3 element

The element specifies the set of Styled_element (see 4.2.482) objects that forms the Styled_model.

See 4.3.1560 for the application assertion.

4.2.484.4 model_id

The model_id specifies the identifier of the Styled_model.

4.2.485 Styled_model_element

A Styled_model_element is a Styled_element (see 4.2.482) that represents geometry.

A Styled_model_element is a type of Styled_element (see 4.2.482).

The data associated with a Styled_model_element are the following:

— element

The element specifies the Detailed_model_element (see 4.2.145) the presentation information is attached to.

See 4.3.1562 for the application assertion.

4.2.486 Styled_model_relationship

A Styled_model_relationship is a relationship between two Styled_model (see 4.2.484) objects.

The data associated with a Styled_model_relationship are the following:

— description;

— related;

— relating;

— relation_type.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.486.1 description

The description specifies additional information about the Styled_model_relationship.

See 4.3.1563 for the application assertion.

The description need not be specified for a particular Styled_model_relationship (see 4.2.486).

If present, there shall be exactly one object that defines the description for a Styled_model_relationship.

4.2.486.2 related

The related specifies the second of the two Styled_model (see 4.2.484) objects related by the Styled_-model_relationship.

See 4.3.1564 for the application assertion.

4.2.486.3 relating

The relating specifies the first of the two Styled_model (see 4.2.484) objects related by the Styled_-model_relationship.

See 4.3.1564 for the application assertion.

4.2.486.4 relation_type

The relation_type specifies the meaning of the relationship.

4.2.487 Styled_model_version

A Styled_model_version is a particular version of a Styled_model (see 4.2.484).

A Styled_model_version is a type of Styled_model (see 4.2.484).

The data associated with a Styled_model_version are the following:

— version_id

The version_id specifies the identification of a particular version of a Styled_model.

4.2.488 Supplier_solution

A Supplier_solution is an alternative solution provided by a particular supplier.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE The Product_component (see 4.2.394) 'tyre' has a Technical_solution (see 4.2.510) of '225x50 VR17' with suppliers A, B, or C. With each of these suppliers a Supplier_solution is associated.

A Supplier_solution is a type of Alternative_solution (see 4.2.10).

The data associated with a Supplier_solution are the following:

— probability_rate;

— supplier.

4.2.488.1 probability_rate

The probability_rate specifies the share that is assigned to the supplier in the context of the base element.

The probability_rate need not be specified for a particular Supplier_solution (see 4.2.488).

4.2.488.2 supplier

The supplier specifies the Organization (see 4.2.331) that acts as supplier for the Supplier_solution.

See 4.3.1565 for the application assertion.

4.2.489 Surface

A Surface is a set of mathematical points which is the image of a continuous function defined over a connected subset of the plane R2. It can be envisioned as a set of connected points in 3-dimensional space which is always locally 2-dimensional, but need not be manifold.

NOTE - In the context of UoF G8 the Surface includes the concept of composite surfaces.

A Surface is a type of Detailed_geometric_model_element (see 4.2.144).

Each Surface is an Offset_surface (see 4.2.326), a Spherical_surface (see 4.2.475), a Trimmed_surface (see 4.2.540), a B_spline_surface (see 4.2.37), a Surface_of_linear_extrusion (see 4.2.497), a Toroidal_surface (see 4.2.530), a Surface_of_revolution (see 4.2.498), a Plane (see 4.2.360), a Cylindrical_surface (see 4.2.114), or a Conical_surface (see 4.2.96).

4.2.490 Surface_appearance

A Surface_appearance is the definition of the visual appearance of a surface.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Surface_appearance are the following:

— element;

— side.

4.2.490.1 element

The element specifies the elements that belong to a particular Surface_appearance.

EXAMPLE Surface boundaries, parameter lines, rendering, or fill areas are examples for element.

See 4.3.1566 for the application assertion.

4.2.490.2 side

The side specifies the side of a surface that the Surface_appearance is applied to.

4.2.491 Surface_appearance_element

A Surface_appearance_element is one of of various elements to be applied in the presentation of the identified side of a surface. The choice includes the appearance characteristics for the surface boundaries, isoparametric curves on surfaces, rendering, silhouettes, segmentation curves, control grids, and fill areas.

The data associated with a Surface_appearance_element are the following:

— presented_surface_condition

The presented_surface_condition specifies the Visual_appearance (see 4.2.560) that is presented by the Surface_appearance_element.

See 4.3.1567 for the application assertion.

The presented_surface_condition need not be specified for a particular Surface_appearance_element.

4.2.492 Surface_condition

A Surface_condition is a definition of a characteristic or property of a surface of an item.

NOTE - A Surface_condition may be specified during the design phase of a product as an expected characteristic of the parts resulting from the manufacturing process, but it may also be documented as measured on a prototype.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Each Surface_condition is a Visual_appearance (see 4.2.560), a Tactile_appearance (see 4.2.504), a Treatment_result (see 4.2.538), a Surface_texture (see 4.2.500), a Contact_ratio (see 4.2.102), or a Hardness (see 4.2.254).

The data associated with a Surface_condition are the following:

— is_caused_by;

— value_determination.

4.2.492.1 is_caused_by

The is_caused_by specifies the Process_operation_occurrence (see 4.2.384) that is used to produce the Surface_condition.

See 4.3.1568 for the application assertion.

The is_caused_by need not be specified for a particular Surface_condition (see 4.2.492).

4.2.492.2 value_determination

The value_determination specifies information on how the Surface_condition shall be interpreted. Where applicable, the following values shall be used:

— 'calculated': The value has been calculated from a particular representation;

— 'designed': The value represents a value intended by the design;

— 'estimated': The value has been estimated;

— 'measured': The value has been measured;

— 'required': The value represents a requirement.

The value_determination need not be specified for a particular Surface_condition (see 4.2.492).

4.2.493 Surface_condition_association

A Surface_condition_association is a mechanism to associate a Surface_condition (see 4.2.492) with an object.

The data associated with a Surface_condition_association are the following:

— described_element;

— describing_surface_condition.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.493.1 described_element

The described_element specifies the object that is characterized by the Surface_condition (see 4.2.492).

See 4.3.1569 and 4.3.1570 for the application assertions.

There shall be exactly one object that defines the described_element for a Surface_condition_association (see 4.2.493).

4.2.493.2 describing_surface_condition

The describing_surface_condition specifies the condition of a surface that is being assigned to an object.

See 4.3.1571 for the application assertion.

4.2.494 Surface_condition_callout

A Surface_condition_callout is a combination of annotation elements that represents information about a surface condition.

For this particular type of callout the inherited attribute 'contents' shall refer to Annotation_curve (see 4.2.16), Surface_condition_symbol (see 4.2.495), or Text (see 4.2.514) objects only.

A Surface_condition_callout is a type of Draughting_callout (see 4.2.169).

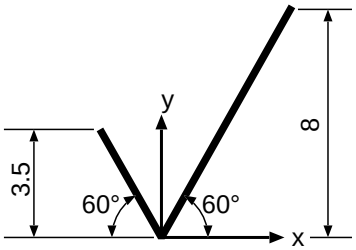
4.2.495 Surface_condition_symbol

A Surface_condition_symbol is a pre-defined annotation symbol used to present information about surface conditions.

This part of ISO 10303 supports the surface condition symbols defined in ISO 1302. These symbols are, in the context of this AP, identified by a three digit code as shown on figure 70.

4.2.496 Surface_model

A Surface_model is the representation of geometry formed by a collection of Shell (see 4.2.451) objects.



A Surface_model shall not intersect with another Surface_model except at edges and vertices.

NOTE - Two Surface_model objects may share faces.

A Surface_model is a type of Geometric_model (see 4.2.238).

Figure 70 – Pre-defined surface condition symbols

The data associated with a Surface_model are the following:

— element

The element specifies the set of Shell objects that form the Surface_model.

See 4.3.1572 for the application assertion.

4.2.497 Surface_of_linear_extrusion

A Surface_of_linear_extrusion is a surface that is defined by sweeping any curve, defined in a 3D geometric space, in a given direction. The result is an infinite surface that shall be trimmed by applying a Face (see 4.2.191).

A Surface_of_linear_extrusion is a type of Surface (see 4.2.489).

4.2.498 Surface_of_revolution

A Surface_of_revolution is a surface that is specified by a complete revolution of a curve, defined in a 3D geometric space, about an axis.

A Surface_of_revolution is a type of Surface (see 4.2.489).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.499 Surface_profile_tolerance

A Surface_profile_tolerance is the definition of a uniform boundary along an ideal profile within which the elements of a surface must lie.

The tolerance zone established by a Surface_profile_tolerance is three dimensional, extending along the length and the width of the considered feature as a whole respectively along each segment of a defined size if the segment attribute is specified.

A Surface_profile_tolerance is a type of Geometric_tolerance (see 4.2.243).

The data associated with a Surface_profile_tolerance are the following:

— reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) objects that define the reference for this type of geometric tolerance.

See 4.3.1573 for the application assertion.

4.2.500 Surface_texture

A Surface_texture is the characterization of irregularities of the surface of a shape or of a portion of a shape. Such an irregularity has a negligible impact on its dimensions but may impact some of its mechanical or functional characteristics. In the context of this AP Surface_texture covers the concepts of roughness and waviness as well as information about the method and parameters used to determine these irregularities.

A Surface_texture is a type of Surface_condition (see 4.2.492).

The data associated with a Surface_texture are the following:

— measuring_direction;

— measuring_method.

4.2.500.1 measuring_direction

The measuring_direction specifies the path in which the Surface_texture is measured on actual parts.

See 4.3.1574 for the application assertion.

The measuring_direction need not be specified for a particular Surface_texture (see 4.2.500).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.500.2 measuring_method

The measuring_method specifies the method or standard that describes the method used to characterize the Surface_texture. Where applicable, the following values shall be used:

— 'ISO 4287': The used surface texture parameters are defined in ISO 4287;

— 'ISO 12085': The used surface texture parameters are defined in ISO 12085;

— 'ISO 13565': The used surface texture parameters are defined in ISO 13565.

4.2.501 Surface_texture_parameter

A Surface_texture_parameter is a combination of a parameter name and possibly indices describing one particular parameter of a surface texture such as roughness or waviness.

The meaning of the Surface_texture_parameter is defined by the measuring method that is specified by the using Default_surface_texture (see 4.2.133) or Surface_texture (see 4.2.500).

EXAMPLE A typical Surface_texture_parameter according to ISO 4287 is Ra; in this case, the parameter name is 'R' and the index is 'a'.

NOTE - Qualifier such as 'min' or 'max' may be assigned using the subtypes of Value_with_unit (see 4.2.549).

The data associated with a Surface_texture_parameter are the following:

— described_texture;

— parameter_index;

— parameter_name;

— parameter_value.

4.2.501.1 described_texture

The described_texture specifies the surface texture that is described by the Surface_texture_parameter.

See 4.3.1575 and 4.3.1576 for the application assertions.

There shall be exactly one object that defines the described_texture for a Surface_texture_parameter (see 4.2.501).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.501.2 parameter_index

The parameter_index specifies an index that specifies the name of the Surface_texture_parameter further.

The parameter_index need not be specified for a particular Surface_texture_parameter (see 4.2.501).

4.2.501.3 parameter_name

The parameter_name specifies the word or group of words by which the Surface_texture_parameter is referred to.

EXAMPLE 1 Parameter names defined in ISO 4287 are, e.g., sampling or evaluation length 'l', primary profile parameter 'P', roughness profile parameter 'R', and waviness profile parameter 'W'. Parameter indices defined in ISO 4287 are, e.g., maximum peak height 'p', maximum valley depth 'v', maximum height 'y', mean height 'c', total height 't', arithmetical mean deviation 'a', and root mean square deviation 'q'.

EXAMPLE 2 Parameter names defined in ISO 12085 are, e.g., mean spacing of roughness motifs 'AR', mean depth of roughness motifs 'R', mean spacing of waviness motifs 'AW', and mean depth of waviness motifs 'W'.

4.2.501.4 parameter_value

The parameter_value specifies the value of the Surface_texture_parameter.

See 4.3.1577 for the application assertion.

4.2.502 Swept_face_solid

A Swept_face_solid is a solid that is defined by a sweep of a planar Face (see 4.2.191). A Swept_face_-solid shall not self-intersect.

A Swept_face_solid is a type of Detailed_geometric_model_element (see 4.2.144).

Each Swept_face_solid is a Solid_of_linear_extrusion (see 4.2.460) or a Solid_of_revolution (see 4.2.461).

The data associated with a Swept_face_solid are the following:

— swept_face

The swept_face specifies the Face that is swept.

See 4.3.1578 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.503 Symmetry_tolerance

A Symmetry_tolerance is a constraint on the amount of deviation a toleranced element may have from being symmetrical to a datum. Any edge or (median) plane of the part must lie in a tolerance zone limited by two parallel lines or planes, symmetrically located with respect to a datum.

A Symmetry_tolerance is a type of Geometric_tolerance (see 4.2.243).

The data associated with a Symmetry_tolerance are the following:

— affected_plane;

— reference_datum.

4.2.503.1 affected_plane

The affected_plane specifies the plane in which the tolerance applies.

This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane is not specified, the tolerance applies in all directions (on drawings indicated by the diameter symbol).

See 4.3.1580 for the application assertion.

The affected_plane need not be specified for a particular Symmetry_tolerance (see 4.2.503).

4.2.503.2 reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) objects that define the reference for this type of geometric tolerance.

See 4.3.1579 for the application assertion.

4.2.504 Tactile_appearance

A Tactile_appearance is the appearance of a surface of a part regarding the sense of touch.

At least one of the attributes ’id’ or ’name’ shall be instantiated.

A Tactile_appearance is a type of Surface_condition (see 4.2.492).

The data associated with a Tactile_appearance are the following:

— depth;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— description;

— id;

— name.

4.2.504.1 depth

The depth specifies the extent of the Tactile_appearance in the normal direction of the surface.

NOTE - The interpretation of the depth depends on the definition of the Tactile_appearance, i.e., on the contents of the attribute description.

See 4.3.1582 for the application assertion.

The depth need not be specified for a particular Tactile_appearance (see 4.2.504).

4.2.504.2 description

The description specifies additional information about the Tactile_appearance.

See 4.3.1581 for the application assertion.

The description need not be specified for a particular Tactile_appearance (see 4.2.504).

If present, there shall be exactly one object that defines the description for a Tactile_appearance.

4.2.504.3 id

The id specifies the identifier of the Tactile_appearance.

The id need not be specified for a particular Tactile_appearance (see 4.2.504).

4.2.504.4 name

The name specifies the word or group of words by which the Tactile_appearance is referred to.

See 4.3.1581 for the application assertion.

The name need not be specified for a particular Tactile_appearance (see 4.2.504).

If present, there shall be exactly one object that defines the name for a Tactile_appearance.

4.2.505 Target_area

A Target_area is an area bounded by a closed Shape_element (see 4.2.449). The shape of the Target_area is described explicitly by a set of curves with reference to the part coordinate system.

A Target_area is a type of Datum_target (see 4.2.125).

The data associated with a Target_area are the following:

— is_defined_by

The is_defined_by specifies the Shape_element that represents the Target_area.

See 4.3.1583 for the application assertion.

4.2.506 Target_circle

A Target_circle is a target that is defined by a circle.

The centre of the circle is specified by the placing Axis_placement (see 4.2.33). The orientation of the Target_circle is the x-y-plane of the Axis_placement.

A Target_circle is a type of Placed_target (see 4.2.357).

The data associated with a Target_circle are the following:

— diameter

The diameter specifies the diameter of the Target_circle.

4.2.507 Target_line

A Target_line is a target that is defined by a straight line.

The first end point of the Target_line is specified by the placing Axis_placement (see 4.2.33). The second end point is located on the z-axis of the Axis_placement at the specified distance.

A Target_line is a type of Placed_target (see 4.2.357).

The data associated with a Target_line are the following:

— target_length

The target_length specifies the length of the Target_line.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.508 Target_point

A Target_point is a target that is defined by a single point.

The position of the Target_point is defined by the placing Axis_placement (see 4.2.33).

A Target_point is a type of Placed_target (see 4.2.357).

4.2.509 Target_rectangle

A Target_rectangle is a target that is defined by a rectangle.

The centre of the rectangle is specified by the placing Axis_placement (see 4.2.33). The orientation of the Target_rectangle is the x-y-plane with half the length of the rectangle in positive and half the length in negative direction along the x-axis and with half the width of the rectangle in positive and half the width in negative direction along the y-axis of the Axis_placement.

A Target_rectangle is a type of Placed_target (see 4.2.357).

The data associated with a Target_rectangle are the following:

— target_length;

— target_width.

4.2.509.1 target_length

The target_length specifies the length of the Target_rectangle.

4.2.509.2 target_width

The target_width specifies the width of the Target_rectangle.

4.2.510 Technical_solution

A Technical_solution is an alternative solution where the functional requirements are fulfilled in a certain technical way.

EXAMPLE ’disc brake’, ’disc brake ventilated’, ’disc brake with ABS’ for Product_component (see 4.2.394) ’front left brake’ are examples for a Technical_solution.

A Technical_solution is a type of Alternative_solution (see 4.2.10).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a Technical_solution are the following:

— description

The description specifies additional information about the Technical_solution.

See 4.3.1584 for the application assertion.

There shall be exactly one object that defines the description for a Technical_solution.

4.2.511 Tee_profile

A Tee_profile is an open profile with a shape similar to the capital letter 'T' as shown in figure 71. The x-axis of the inherited Axis_placement (see 4.2.33) is parallel to the base line of the cross bar, the y-axis is oriented such that the curves constituting the outline of the profile have positive y co-ordinates. It is located in the midpoint of the base line of the cross bar.

A Tee_profile is a type of Open_profile (see 4.2.328).

The data associated with a Tee_profile are the following:

— cross_bar_depth;

— cross_bar_width;

— depth;

— first_angle;

— first_offset;

— radius;

— second_angle;

— second_offset;

— width.

4.2.511.1 cross_bar_depth

The cross_bar_depth specifies the depth dimension of the Tee_profile bar size.

See 4.3.1585 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.511.2 cross_bar_width

The cross_bar_width specifies the width dimension of the Tee_profile bar size.

See 4.3.1585 for the application assertion.

4.2.511.3 depth

The depth specifies the depth dimension of the Tee_profile stem.

See 4.3.1585 for the application assertion.

4.2.511.4 first_angle

The first_angle specifies the angular measurement for creating a chamfer on the open end of a Tee_-profile.

See 4.3.1585 for the application assertion.

4.2.511.5 first_offset

The first_offset specifies the distance from the edge of the Tee_profile stem to create a chamfer on the open end of a Tee_profile.

See 4.3.1585 for the application assertion.

4.2.511.6 radius

The radius specifies an arc size for blending the sides of a Tee_profile cross bar.

See 4.3.1585 for the application assertion.

The radius need not be specified for a particular Tee_profile (see 4.2.511).

4.2.511.7 second_angle

The second_angle specifies the angular measurement for creating a chamfer between the stem and the cross bar of the Tee_profile.

See 4.3.1585 for the application assertion.

4.2.511.8 second_offset

The second_offset specifies the distance from the edge between the Tee_profile stem and the Tee_profile cross bar along the stem to create a chamfer between the stem and the cross bar.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.1585 for the application assertion.

4.2.511.9 width

The width specifies the width dimension of the Tee_profile stem.

See 4.3.1585 for the application assertion.

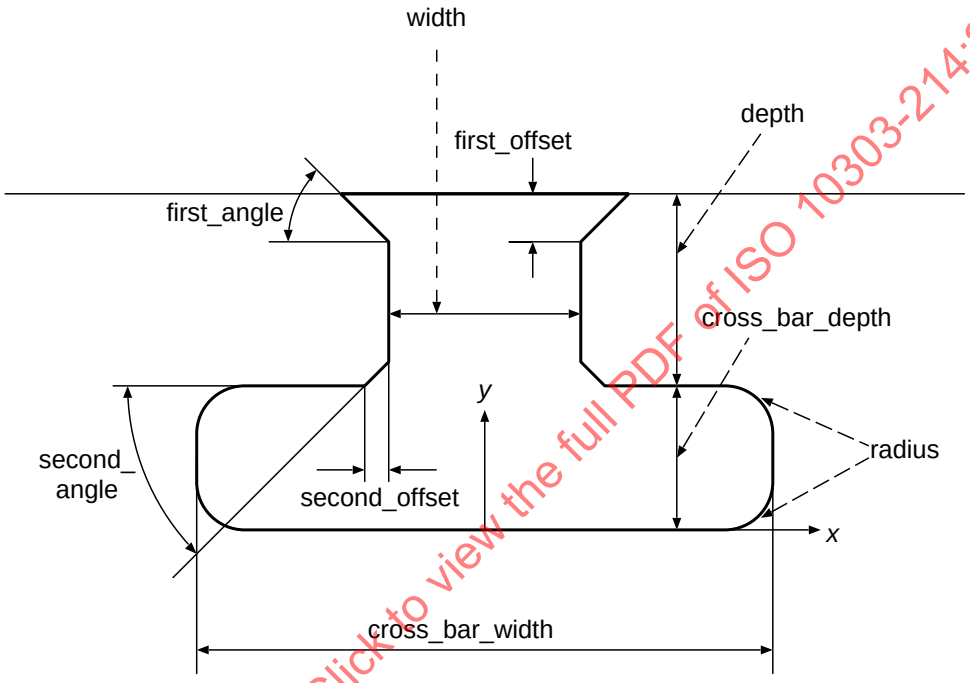

Figure 71 – Definition of a Tee_profile

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.512 Template_instance

A Template_instance is a replica of a Geometric_model (see 4.2.238), of a Styled_model (see 4.2.484), or of an External_model (see 4.2.189).

The location of the replica and any additional geometrical transformation to be applied to the replica, i.e., uniform scaling, rotation or mirroring, are specified by the attribute 'transformation'.

NOTE 1 - In the case where the units of the Cartesian coordinate space of the definition are different from the units to be applied to the Template_instance, unit conversion is required.

NOTE 2 - In case of length unit conversion this conversion applies in addition to the scale attribute.

EXAMPLE In a technical drawing of a mechanical part with several identical drilling holes, the hole geometry (circle) together with its annotation elements (diameter dimension and centrelines) is defined once. This

© ISO 2001 – All rights reserved

particular definition is instantiated several times at different locations by corresponding Template_instance objects.

A Template_instance is a type of Detailed_model_element (see 4.2.145).

The data associated with a Template_instance are the following:

— id;

— model_placement;

— scale;

— template_definition.

4.2.512.1 id

The id specifies the identifier of the Template_instance.

4.2.512.2 model_placement

The model_placement specifies the geometrical transformation applied to the instance. All transformations that can be expressed by an orthonormal 2×2 (for 2D) or 3×3 (for 3D) matrix can be applied.

EXAMPLE Examples for suitable operations are rotation and mirroring.

See 4.3.1589 for the application assertion.

4.2.512.3 scale

The scale specifies the scaling factor for all Cartesian coordinate directions. The scaling factor shall be positive. If the scaling factor is omitted, it shall be 1.0.

The scale need not be specified for a particular Template_instance (see 4.2.512).

4.2.512.4 template_definition

The template_definition specifies the object to be replicated.

See 4.3.1586, 4.3.1587, and 4.3.1588 for the application assertions.

There shall be exactly one object that defines the template_definition for a Template_instance (see 4.2.512).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.513 Terminator_symbol

A Terminator_symbol is a predefined annotation symbol used to present a line terminator.

This AP supports the terminator symbols shown in figure 72 .

4.2.514 Text

A Text is a collection of characters that convey some human interpretable information.

A Text is a type of Annotation_element (see 4.2.17).

4.2.515 Text_appearance

A Text_appearance is the definition of the visual presentation of text. Text_appearance may be predefined or user defined. Predefined text fonts are the fonts 'A' and 'B' as defined in ISO 3098 – 1 and ISO 3098 – 2. User defined text fonts are defined by thickness, colour, text rotation angle, character aspect ratio, character rotation angle, character scale, and character slant angle as shown in figure 73.

4.2.516 Thickness_dimension

A Thickness_dimension is a geometric property of an object.

A Thickness_dimension is a type of Size_dimension (see 4.2.456).

The data associated with a Thickness_dimension are the following:

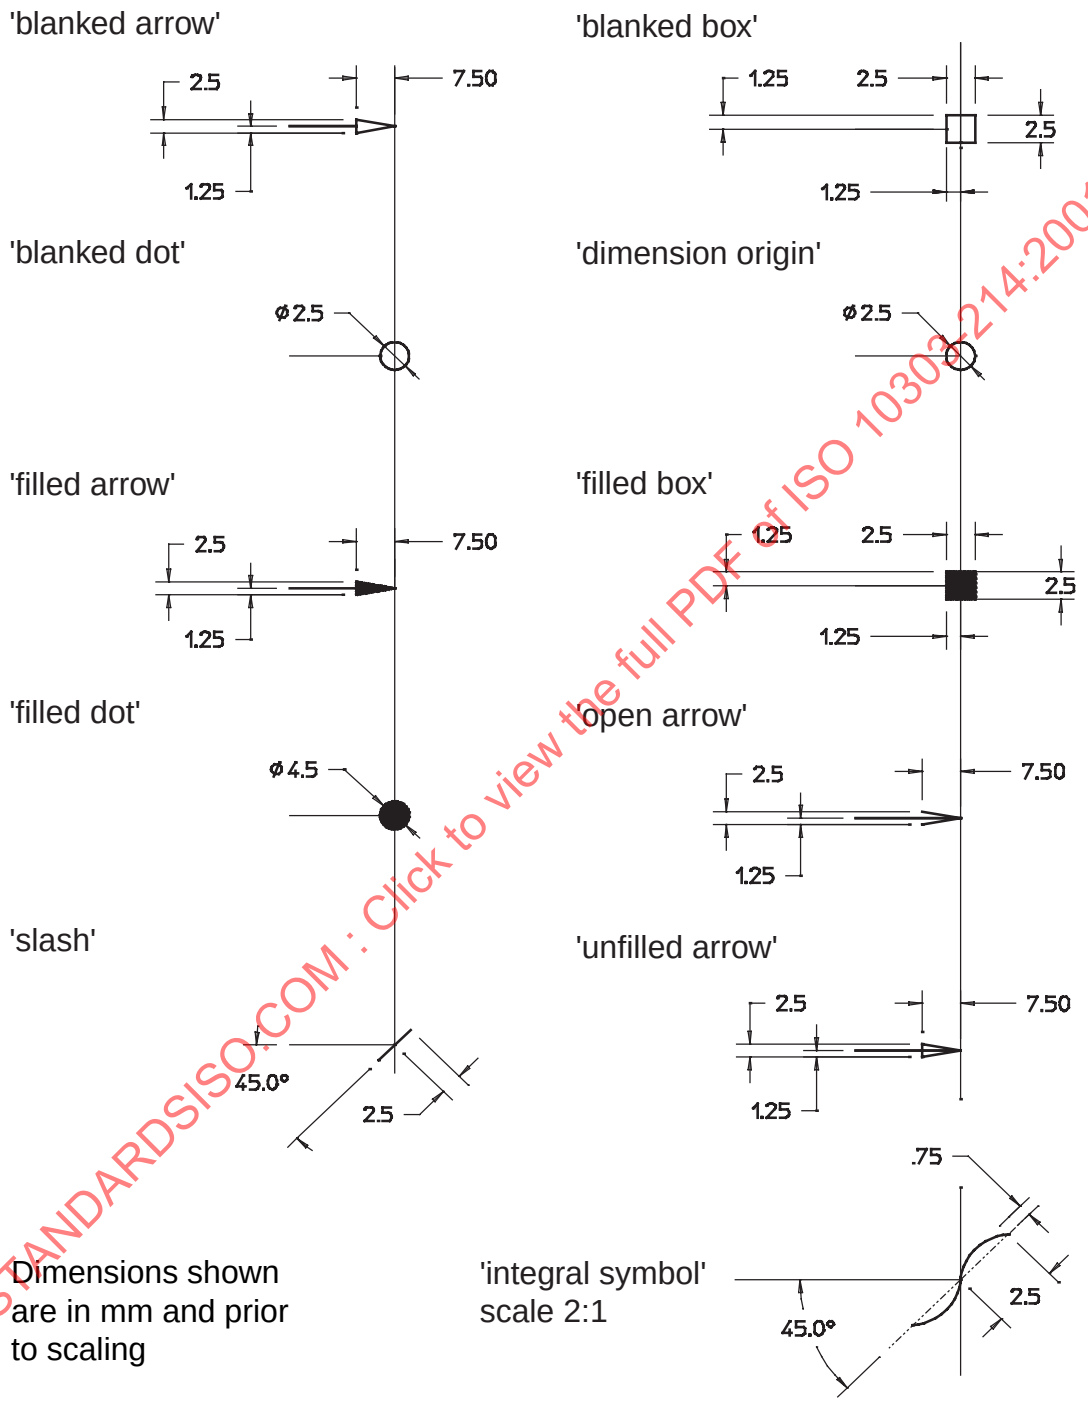
— used_path

The used_path specifies the path along which the thickness dimension is applied or measured.

See 4.3.1590 for the application assertion.

The used_path need not be specified for a particular Thickness_dimension.

4.2.517 Thread_feature



A Thread_feature is a feature that is specified by a ridge of uniform section on the form of a helix on the external or internal surface of a cylinder.

EXAMPLE 1 Thread features may be used to design screws and bolts.

EXAMPLE 2 Figure 74 shows a Thread_feature applied to a screw.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Figure 72 – Predefined terminator symbols

© ISO 2001 – All rights reserved

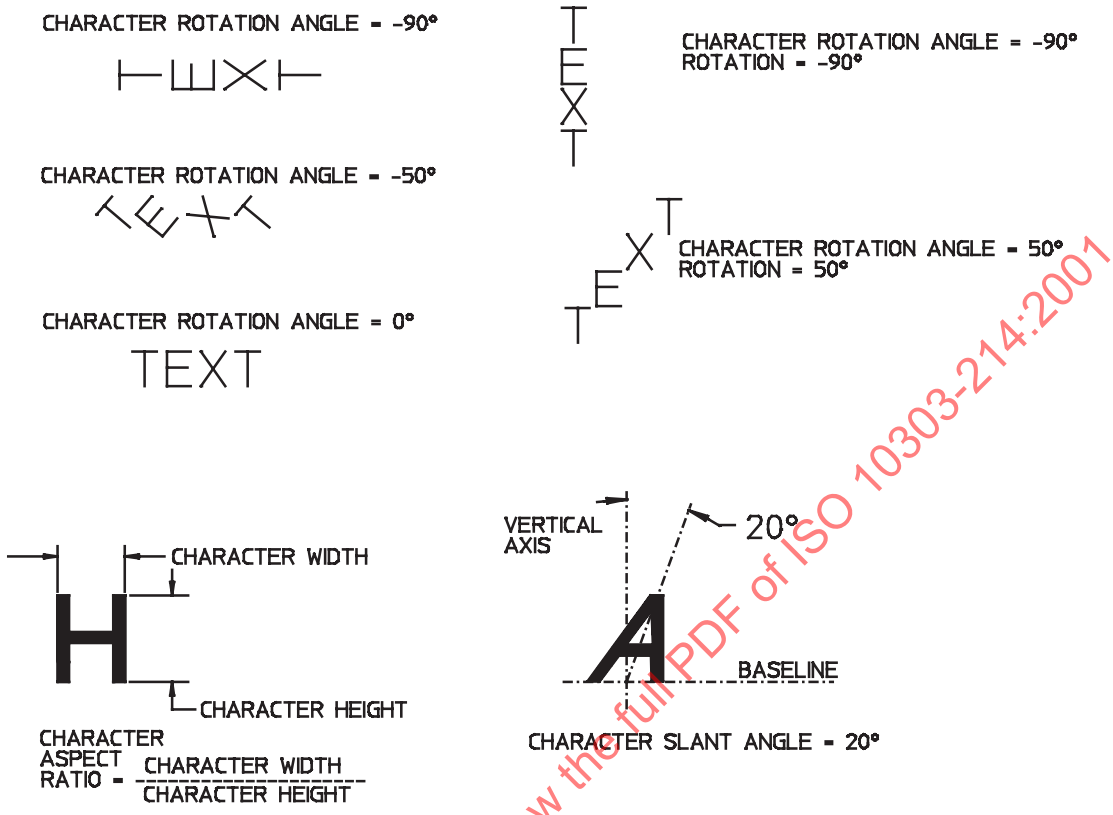


Figure 73 – Text appearance and rotation

The data associated with a Thread_feature are the following:

— effective_thread_length;

— location_and_orientation;

— maximum_thread_length;

— thread_definition.

4.2.517.1 effective_thread_length

The effective_thread_length specifies the length of the thread which is usable by the application.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.517.2 location_and_orientation

The location_and_orientation specifies an Axis_placement (see 4.2.33) whose location represents the start of the thread and whose z-axis points into the direction of the possible runout.

See 4.3.1591 for the application assertion.

4.2.517.3 maximum_thread_length

The maximum_thread_length specifies the usable thread length plus the runout.

The maximum_thread_length need not be specified for a particular Thread_feature (see 4.2.517).

4.2.517.4 thread_definition

The thread_definition specifies the Thread_specification (see 4.2.518) that contains the parameters specifying the thread.

See 4.3.1592 for the application assertion.

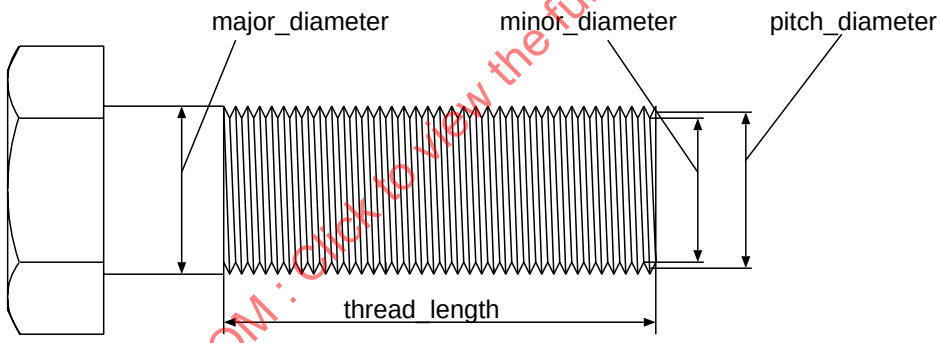

Figure 74 – Screw with thread

4.2.518 Thread_specification

A Thread_specification is a set of parameters specifying a thread independent from its application.

Each Thread_specification is a Defined_thread (see 4.2.135) or a Catalogue_thread (see 4.2.48).

The data associated with a Thread_specification are the following:

— density;

— fit_class;

— form_type;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— hand;

— inner;

— major_diameter;

— qualifier.

4.2.518.1 density

The density specifies the number of threads per the axial unit of length of measure.

See 4.3.1593 for the application assertion.

4.2.518.2 fit_class

The fit_class specifies the class of fit for the thread as defined in ISO 965-1.

EXAMPLE Examples for fit_class are '4e' and '2E'.

4.2.518.3 form_type

The form_type specifies the kind of thread. Where applicable, the following values shall be used:

— 'M': The Thread_specification specifies a general purpose metric thread;

NOTE 1 - General purpose metric threads are defined in ISO 261

— 'R': The Thread_specification specifies a pipe thread (Whitworth);

NOTE 2 - Pipe threads of type 'R' are defined in ISO 7

— 'Tr': The Thread_specification specifies a metric trapezoidal thread;

NOTE 3 - Metric trapezoidal threads are defined in ISO 2902

— 'G': The Thread_specification specifies a pipe thread;

NOTE 4 - Pipe threads of type 'G' are defined in ISO 228

— 'UNC': The Thread_specification specifies a unified coarse thread;

— 'UNF': The Thread_specification specifies a unified fine thread.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.518.4 hand

The hand specifies if the thread is right or left handed. The following values shall be used:

— 'left hand': The thread is a left handed thread;

— 'right hand': The Thread is a right handed thread.

When viewed toward an end, a right hand winds in a clockwise direction and a left hand winds in a counter-clockwise direction.

4.2.518.5 inner

The inner specifies if it is an inner or outer thread. A value of 'true' indicates that it is a thread in a hole; a value of 'false' indicates that it is a thread on a shaft.

4.2.518.6 major_diameter

The major_diameter specifies the dimension of the largest diameter of a thread.

See 4.3.1593 for the application assertion.

4.2.518.7 qualifier

The qualifier specifies the thread as text.

EXAMPLE 1 'M 20', 'Tr 40 × 7', 'G $^{3}/_{4}$', or 'R $^{1}/_{2}$' are examples for the qualifier.

EXAMPLE 2 The number of parallel helixes a thread consists of is an example for the use of the qualifier.

The qualifier need not be specified for a particular Thread_specification (see 4.2.518).

4.2.519 Through_hole_bottom_condition

A Through_hole_bottom_condition is a condition characterizing a Round_hole (see 4.2.439) that is open at both ends.

EXAMPLE Figure 45 shows the application of a Through_hole_bottom_condition.

4.2.520 Through_pocket_bottom_condition

A Through_pocket_bottom_condition is an end condition for a pocket feature that passes through two faces of a part.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.521 Tiling

A Tiling is a pattern of tiles that represents graphical symbols defined within a containment border. The containment border defines the edges of the tile. All elements contained within the border are duplicated for each tile. Tiles are placed within a fill area adjacently and do not overlap. The containment border may be blanked.

NOTE - The Tiling may be defined by the user or may be externally defined.

4.2.522 Tolerance_condition

A Tolerance_condition is the representation of a condition for a surface element wherein it contains the amount of material.

NOTE 1 - Tolerances of position are determined by a material condition of mating surfaces.

NOTE 2 - The usage of material conditions is defined in ISO 2692 [11].

The data associated with a Tolerance_condition are the following:

— condition

The condition specifies the kind of Tolerance_condition.

EXAMPLE Maximum material condition (MMC) and least material condition (LMC) are examples for a Tolerance_condition.

4.2.523 Tolerance_table_cell

A Tolerance_table_cell is the information contained in one cell of a General_tolerance_table (see 4.2.234).

EXAMPLE Figure 41 depicts an example for a General_tolerance_table.

The data associated with a Tolerance_table_cell are the following:

— cell_value;

— description;

— limit;

— table;

— tolerance_class.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.523.1 cell_value

The cell_value specifies the value of a Tolerance_table_cell.

See 4.3.1596 and 4.3.1599 for the application assertions.

There shall be exactly one object that defines the cell_value for a Tolerance_table_cell (see 4.2.523).

4.2.523.2 description

The description specifies additional information about the Tolerance_table_cell.

See 4.3.1595 for the application assertion.

The description need not be specified for a particular Tolerance_table_cell (see 4.2.523).

If present, there shall be exactly one object that defines the description for a Tolerance_table_cell.

4.2.523.3 limit

The limit specifies the limit for the values of the dimensions for which the values provided as the cell_-value are valid.

See 4.3.1597 and 4.3.1598 for the application assertions.

There shall be exactly one object that defines the limit for a Tolerance_table_cell (see 4.2.523).

4.2.523.4 table

The table specifies the General_tolerance_table (see 4.2.234) the Tolerance_table_cell belongs to.

See 4.3.1594 for the application assertion.

4.2.523.5 tolerance_class

The tolerance_class specifies the tolerance class for which the values provided in the Tolerance_table_-cell are valid.

EXAMPLE Examples for tolerance_class are ’f’ for ’fine’, ’m’ for ’medium’, ’c’ for ’coarse’, and ’v’ for ’very coarse’.

4.2.524 Tolerance_zone

A Tolerance_zone is the zone wherein all points of the toleranced element shall fall.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE Figure 75 depicts a Tolerance_zone of a straightness tolerance of ’0.1’ specified for a line.

The data associated with a Tolerance_zone are the following:

— form_type;

— is_zone_for.

4.2.524.1 form_type

The form_type specifies the shape of the Tolerance_zone.

EXAMPLE ’cylindrical’, ’parallelepiped’, or ’spherical’ are examples for form_type.

4.2.524.2 is_zone_for

The is_zone_for specifies the set of Geometric_tolerance (see 4.2.243) objects for which the Tolerance_zone defines the zone.

See 4.3.1600 for the application assertion.

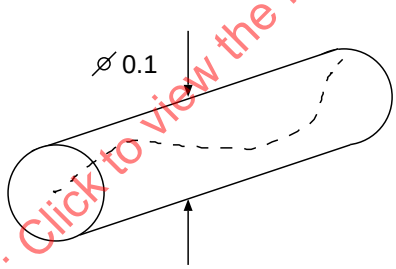

Figure 75 – Tolerance_zone

4.2.525 Tolerance_zone_definition

A Tolerance_zone_definition is the specification of the boundaries of a Tolerance_zone (see 4.2.524).

Each Tolerance_zone_definition may be a Projection (see 4.2.406).

The data associated with a Tolerance_zone_definition are the following:

— first_element;

— is_defining;

— second_element.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.525.1 first_element

The first_element specifies the Shape_element (see 4.2.449) that represents the first or, in the case of a cylindrical tolerance zone, the only boundary of the Tolerance_zone_definition.

See 4.3.1601 for the application assertion.

4.2.525.2 is_defining

The is_defining specifies the Tolerance_zone (see 4.2.524) that is specified by the Tolerance_zone_definition.

See 4.3.1602 for the application assertion.

4.2.525.3 second_element

The second_element specifies the Shape_element (see 4.2.449) that represents the second bounding element.

See 4.3.1601 for the application assertion.

The second_element need not be specified for a particular Tolerance_zone_definition (see 4.2.525).

4.2.526 Tool_attachment_point_frame

A Tool_attachment_point_frame is a kinematic attachment frame of a tool that may be attached to a link of a Kinematic_mechanism (see 4.2.286).

A Tool_attachment_point_frame is a type of Transformation_to_reference_frame (see 4.2.536).

4.2.527 Tool_centre_point_frame

A Tool_centre_point_frame is a kinematic reference frame of a tool that may be attached to a link of a Kinematic_mechanism (see 4.2.286).

A Tool_centre_point_frame is a type of Transformation_to_reference_frame (see 4.2.536).

4.2.528 Tool_part_relationship

A Tool_part_relationship is a relationship between two Design_discipline_item_definition (see 4.2.142) objects. It establishes a relationship between an item (related) and a tool (relating) that is used to produce the item.

NOTE - This relationship is, by default, valid only in the application contexts that are relevant for both related Design_discipline_item_definition objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

A Tool_part_relationship is a type of Item_definition_relationship (see 4.2.269).

The data associated with a Tool_part_relationship are the following:

— placement;

— used_technology_description.

4.2.528.1 placement

The placement specifies the relative position of the Item (see 4.2.267) representing the part with respect to the local coordinate system of the Item representing the tool.

In the case where the placement is realized by a Template_instance (see 4.2.512), the scale factor of that Template_instance shall be omitted or set to 1.

See 4.3.1603 and 4.3.1605 for the application assertions.

The placement need not be specified for a particular Tool_part_relationship (see 4.2.528).

If present, there shall be exactly one object that defines the placement for a Tool_part_relationship.

4.2.528.2 used_technology_description

The used_technology_description specifies the technology that is used to manufacture the part using this tool and, possibly, the reasons for the use of a particular technology.

See 4.3.1604 for the application assertion.

The used_technology_description need not be specified for a particular Tool_part_relationship (see 4.2.528).

If present, there shall be exactly one object that defines the used_technology_description for a Tool_-part_relationship.

4.2.529 Topologically_connected_set

A Topologically_connected_set is a collection of Face (see 4.2.191) and/or Oriented_edge_curve (see 4.2.334) objects.

A Topologically_connected_set is a type of Detailed_geometric_model_element (see 4.2.144).

The data associated with a Topologically_connected_set are the following:

— element

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The element specifies the set of Face or Oriented_edge_curve objects that are part of the Topologically_-connected_set.

See 4.3.1606 and 4.3.1607 for the application assertions.

There shall be at least one object that defines the element for a Topologically_connected_set.

4.2.530 Toroidal_surface

A Toroidal_surface is a surface that can be produced by revolving a circle about a non-intersecting line in the plane of its circle.

NOTE - Cases where the minor radius of the torus is actually greater than the major radius are possible.

A Toroidal_surface is a type of Surface (see 4.2.489).

4.2.531 Torus

A Torus is a solid that is defined by sweeping the area of one circle with minor radius about another circle with larger radius. A Torus is defined by the position in space and the radius of the larger circle, and by the radius of the swept area.

A Torus is a type of Csg_primitive (see 4.2.107).

4.2.532 Total_runout_tolerance

A Total_runout_tolerance is a geometric constraint on a cylindrical surface with respect to a datum axis the part is rotated about. The tolerance is applied simultaneously to all positions as the part is rotated 360 degrees.

NOTE 1 - Where applied to surfaces constructed around a datum axis, Total_runout_tolerance is used to control cumulative variations of circularity, straightness, coaxiality, angularity, taper, and profile of a surface.

NOTE 2 - Where applied to surfaces constructed at right angles to a datum axis, Total_runout_tolerance controls cumulative variations or perpendicularity and flatness.

A Total_runout_tolerance is a type of Geometric_tolerance (see 4.2.243).

The data associated with a Total_runout_tolerance are the following:

— angle;

— reference_datum.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.532.1 angle

The angle specifies the direction with respect to the datum axis in which a runout tolerance is controlled.

If the angle is specified the runout tolerance applies for this angle. If the angle is not specified the runout tolerance applies normal to the feature surface.

The angle need not be specified for a particular Total_runout_tolerance (see 4.2.532).

4.2.532.2 reference_datum

The reference_datum specifies the Single_datum (see 4.2.454) or the Compound_datum (see 4.2.84) objects that define the reference for this type of geometric tolerance.

See 4.3.1608 for the application assertion.

4.2.533 Transformation

A Transformation is a geometric transformation composed of translation and rotation. Scaling is not included.

Each Transformation is a Transformation_3d (see 4.2.535) or a Transformation_2d (see 4.2.534).

4.2.534 Transformation_2d

A Transformation_2d is the definition of a geometric transformation in 2D space.

A Transformation_2d is a type of Transformation (see 4.2.533).

4.2.535 Transformation_3d

A Transformation_3d is the definition of a geometric transformation in 3D space.

A Transformation_3d is a type of Transformation (see 4.2.533).

4.2.536 Transformation_to_reference_frame

A Transformation_to_reference_frame is a relative position of one kinematic frame with respect to another kinematic frame.

Each Transformation_to_reference_frame may be a Tool_attachment_point_frame (see 4.2.526) or a Tool_centre_point_frame (see 4.2.527).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.537 Transition_feature

A Transition_feature is a transition area between two faces.

A Transition_feature shall have shape representation.

Each Transition_feature is an Edge_round (see 4.2.177), a Fillet (see 4.2.205), or a Chamfer (see 4.2.51).

The data associated with a Transition_feature are the following:

— face_1;

— face_2.

4.2.537.1 face_1

The face_1 specifies the first of the two Face (see 4.2.191) objects that the Transition_feature is applied to.

See 4.3.1609 for the application assertion.

4.2.537.2 face_2

The face_2 specifies the second of the two Face (see 4.2.191) objects that the Transition_feature is applied to.

See 4.3.1609 for the application assertion.

4.2.538 Treatment_result

A Treatment_result is a general surface condition that is a result of a certain treatment.

At least one of the attributes ’id’ or ’name’ shall be instantiated.

A Treatment_result is a type of Surface_condition (see 4.2.492).

The data associated with a Treatment_result are the following:

— description;

— id;

— name;

— purpose.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.538.1 description

The description specifies additional information about the Treatment_result.

See 4.3.1610 for the application assertion.

There shall be exactly one object that defines the description for a Treatment_result (see 4.2.538).

4.2.538.2 id

The id specifies the identifier of the Treatment_result.

The id need not be specified for a particular Treatment_result (see 4.2.538).

4.2.538.3 name

The name specifies the word or group of words by which the Treatment_result is referred to.

See 4.3.1610 for the application assertion.

The name need not be specified for a particular Treatment_result (see 4.2.538).

If present, there shall be exactly one object that defines the name for a Treatment_result.

4.2.538.4 purpose

The purpose specifies the effects that are a consequence of the treatment.

See 4.3.1610 for the application assertion.

The purpose need not be specified for a particular Treatment_result (see 4.2.538).

If present, there shall be exactly one object that defines the purpose for a Treatment_result.

4.2.539 Trimmed_curve

A Trimmed_curve is a curve of finite length that is the result of trimming a curve between two points. The trimming points are the start and end points of the Trimmed_curve. These points may be specified by Cartesian points or by parameter values.

A Trimmed_curve is a type of Curve (see 4.2.108).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.540 Trimmed_surface

A Trimmed_surface is a surface of finite area with identifiable boundaries. A Trimmed_surface is either a b-spline surface, a curve bounded surface, or a rectangular composite surface. A Trimmed_surface shall only be used in Geometrically_bounded_surface_model (see 4.2.248) objects.

A Trimmed_surface is a type of Surface (see 4.2.489).

4.2.541 Unit

An Unit is a quantity chosen as a standard in terms of which other quantities may be expressed.

The types of units supported by this standard are SI units as well as derived or conversion based units as defined in ISO 10303-41.

The data associated with a Unit are the following:

— unit_name

The unit_name specifies the term representing the kind of unit.

EXAMPLE ’gram’, ’litre’, or ’volt’ are examples for the unit_name.

4.2.542 Upper_lower_limit

An Upper_lower_limit is an entry in a Tolerance_table_cell (see 4.2.523) representing the range of applicability of a tolerance value by specifying an upper and a lower limit.

For the dimensions falling into that range, the corresponding tolerance table entry shall be applied, if no other specific tolerance value has been assigned to them.

The data associated with an Upper_lower_limit are the following:

— lower_limit;

— upper_limit.

4.2.542.1 lower_limit

The lower_limit specifies the lower value of the value range.

4.2.542.2 upper_limit

The upper_limit specifies the upper value of the value range.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.543 Upper_lower_toleranced_datum

An Upper_lower_toleranced_datum is an entry in a Tolerance_table_cell (see 4.2.523) that is a tolerance range for a dimension.

The data associated with an Upper_lower_toleranced_datum are the following:

— lower_tolerance_value;

— upper_tolerance_value.

4.2.543.1 lower_tolerance_value

The lower_tolerance_value specifies the lower value with measure of the tolerance range.

4.2.543.2 upper_tolerance_value

The upper_tolerance_value specifies the upper value with measure of the tolerance range.

4.2.544 Value_limit

A Value_limit is a qualified numerical value representing either the lower limit or the upper limit of a particular physical characteristic.

EXAMPLE ’30.5 max’ and ’5 min’ are examples for a Value_limit.

A Value_limit is a type of Value_with_unit (see 4.2.549).

The data associated with a Value_limit are the following:

— limit;

— limit_qualifier.

4.2.544.1 limit

The limit specifies the value of the limit.

4.2.544.2 limit_qualifier

The limit_qualifier specifies the kind of limit. The following values shall be used:

— ’maximum’: The specified limit is an upper limit;

— ’minimum’: The specified limit is a lower limit.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.545 Value_limitation

A Value_limitation is a mechanism to add information about limitations to a Numerical_value (see 4.2.324).

The data associated with a Value_limitation are the following:

— envelope;

— is_defined_by;

— limited_value.

4.2.545.1 envelope

The envelope specifies whether a geometric constraint resulting from the limitation has to be fulfilled in itself or not. A value of 'true' indicates that the envelope of the perfect shape corresponding to the maximum material shall not be larger than the specified dimension and tolerance.

NOTE 1 - The concept of the envelope principle is defined in ISO 8015 [19].

NOTE 2 - A dimension where the envelope principle applies, appears on drawings with an 'E' enclosed in a circle following the dimension value.

The envelope need not be specified for a particular Value_limitation (see 4.2.545).

4.2.545.2 is_defined_by

The is_defined_by specifies the limitation that is associated with the Numerical_value (see 4.2.324).

See 4.3.1611 and 4.3.1613 for the application assertions.

There shall be exactly one object that the Value_limitation (see 4.2.545) is_defined_by.

4.2.545.3 limited_value

The limited_value specifies the Numerical_value (see 4.2.324) that is limited.

See 4.3.1612 for the application assertion.

4.2.546 Value_list

A Value_list is an ordered collection of Property_value (see 4.2.412) objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXAMPLE A General_property (see 4.2.230) may be composed of different property values such as 'mass', 'speed', and 'age' which are altogether necessary in a given context. The Value_list collects all of them in a given order, such that each is identifiable by its index in the list.

A Value_list is a type of Property_value (see 4.2.412).

The data associated with a Value_list are the following:

— values

The values specifies the ordered collection of Property_value objects that together are provided as a Property_value.

See 4.3.1614 for the application assertion.

4.2.547 Value_range

A Value_range is a pair of numerical values representing the range in which the value shall lie.

A Value_range is a type of Value_with_unit (see 4.2.549).

The data associated with a Value_range are the following:

— lower_limit;

— upper_limit.

4.2.547.1 lower_limit

The lower_limit specifies the minimum acceptable value that is constrained by the Value_range.

4.2.547.2 upper_limit

The upper_limit specifies the maximum acceptable value that is constrained by the Value_range.

4.2.548 Value_termination

A Value_termination specifies a condition where a Joggle_feature (see 4.2.277) has a specified depth.

EXAMPLE 76 shows a value terminated joggle feature.

A Value_termination is a type of Joggle_termination (see 4.2.278).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The data associated with a Value_termination are the following:

— angle;

— depth.

4.2.548.1 angle

The angle specifies the slope angle of the terminating face of the Joggle_feature (see 4.2.277) measured from the panel surface.

See 4.3.1615 for the application assertion.

4.2.548.2 depth

The depth specifies the distance from the rim of the panel to a point that corresponds to the end of the Joggle_feature (see 4.2.277).

See 4.3.1615 for the application assertion.

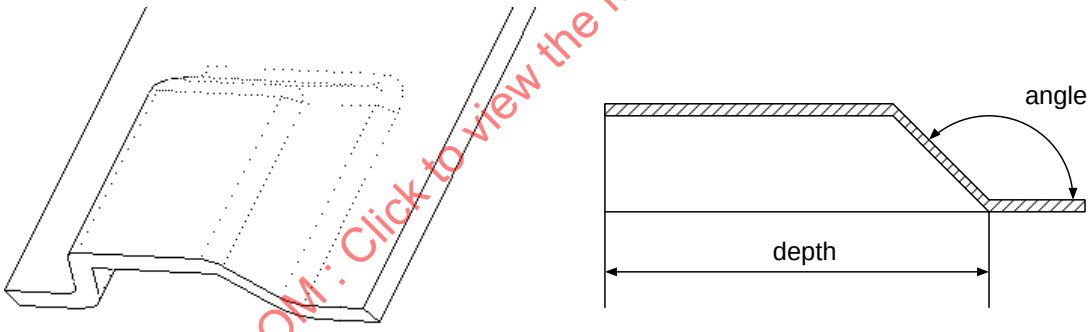

Figure 76 – Value terminated joggle feature

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.2.549 Value_with_unit

A Value_with_unit is either a single numerical measure, or a range of numerical measures with upper, lower, or upper and lower bounds.

A Value_with_unit is a type of Property_value (see 4.2.412).

Each Value_with_unit is a Value_range (see 4.2.547), a Numerical_value (see 4.2.324), or a Value_limit (see 4.2.544).

 © ISO 2001 – All rights reserved

The data associated with a Value_with_unit are the following:

— significant_digits;

— unit_component.

4.2.549.1 significant_digits

The significant_digits specifies the number of decimal digits that are relevant for the use of the Value_-with_unit. If present, the numerical measure or range may be specified using more digits than the significant digits but shall not be specified using less digits.

The significant_digits need not be specified for a particular Value_with_unit (see 4.2.549).

4.2.549.2 unit_component

The unit_component specifies the unit in which the Value_with_unit is expressed.

See 4.3.1616 for the application assertion.

The unit_component need not be specified for a particular Value_with_unit (see 4.2.549).

4.2.550 Vector_appearance

A Vector_appearance is the definition of the visual appearance of a vector.

A Vector_appearance is a type of Curve_appearance (see 4.2.109).

The data associated with a Vector_appearance are the following:

— arrow_head_type

The arrow_head_type specifies the type of the arrow head.

See 4.3.1617 for the application assertion.

4.2.551 Vee_profile

A Vee_profile is an open profile that is specified by a shape bounded by two lines that connect at a point and extend infinitely. The enclosed angle shall be smaller than 180 degrees. The connection of the two lines may be blended with a radius. The x-y-plane of the inherited Axis_placement (see 4.2.33) coincides with the x-y-plane of the base lines outlining the profile. It is located in the connection of these two lines.

NOTE - The orientation of the Axis_placement is further constrained by the 'tilt_angle' of the Vee_profile.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXAMPLE Figure 77 depicts a Vee_profile.

A Vee_profile is a type of Open_profile (see 4.2.328).

The data associated with a Vee_profile are the following:

— profile_angle;

— radius;

— tilt_angle.

4.2.551.1 profile_angle

The profile_angle specifies the size of the angle between the two sides of the Vee_profile. The angle shall be greater than 0 degrees and less than 180 degrees.

See 4.3.1618 for the application assertion.

4.2.551.2 radius

The radius specifies the size of the blend radius at the point of the 'V', or where the two sides come together.

See 4.3.1618 for the application assertion.

The radius need not be specified for a particular Vee_profile (see 4.2.551).

4.2.551.3 tilt_angle

The tilt_angle specifies the size of the angle between one side of the Vee_profile and the x-axis of the local coordinate system of the Vee_profile.

See 4.3.1618 for the application assertion.

4.2.552 Vertex_loop

A Vertex_loop is a loop that consists of only one vertex. The dimensionality of a Vertex_loop is zero.

EXAMPLE The tip of a cone is an example for the usage of a Vertex_loop.

The data associated with a Vertex_loop are the following:

— loop_vertex

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

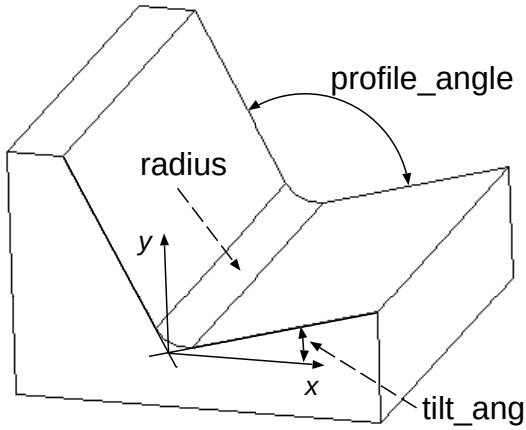

Figure 77 – Definition of a Vee_profile

The loop_vertex specifies a Vertex_point (see 4.2.553) that represents the geometry of the associated vertex.

See 4.3.1619 for the application assertion.

4.2.553 Vertex_point

A Vertex_point is a topological construct corresponding to a point. It has dimensionality 0 and extent 0. The geometric location of the Vertex_point is defined by an associated point.

The data associated with a Vertex_point are the following:

— vertex_geometry

The vertex_geometry specifies the geometric point that defines the position in geometric space of the vertex point.

See 4.3.1620 for the application assertion.

4.2.554 View

A View is the representation of a two-dimensional picture. This picture consists of the image generated by the projection mechanism defined by one Model_image (see 4.2.316) and additional View_placed_-

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

annotation (see 4.2.558). A View is placed in the coordinate space of a Drawing_sheet (see 4.2.173) or of a View_area (see 4.2.555).

The data associated with a View are the following:

— description;

— id;

— layout;

— name;

— view_placement;

— view_space.

4.2.554.1 description

The description specifies additional information about the View.

See 4.3.1623 for the application assertion.

The description need not be specified for a particular View (see 4.2.554).

If present, there shall be exactly one object that defines the description for a View.

4.2.554.2 id

The id specifies the identification of the View.

The id need not be specified for a particular View (see 4.2.554).

4.2.554.3 layout

The layout specifies either a Drawing_sheet (see 4.2.173) or a View_area (see 4.2.555) in which the View is placed.

See 4.3.1622 and 4.3.1625 for the application assertions.

There shall be exactly one object that defines the layout for a View (see 4.2.554).

4.2.554.4 name

The name specifies the word or group of words by which the View is referred to.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

See 4.3.1623 for the application assertion.

There shall be exactly one object that defines the name for a View (see 4.2.554).

4.2.554.5 view_placement

The view_placement specifies the Transformation_2d (see 4.2.534) that is used to place and orient the View on a Drawing_sheet (see 4.2.173) or on a View_area (see 4.2.555).

See 4.3.1624 for the application assertion.

4.2.554.6 view_space

The view_space specifies the two-dimensional Cartesian coordinate space where the presented picture is defined.

See 4.3.1621 for the application assertion.

4.2.555 View_area

A View_area is a collection of View (see 4.2.554) objects, placed in a specified rectangular area. The placement of the views is defined relative to the two dimensional coordinate space of the View_area.

The data associated with a View_area are the following:

— area_space;

— description;

— id;

— name;

— revision_id;

— size.

4.2.555.1 area_space

The area_space specifies the Cartesian_coordinate_space_2d (see 4.2.45) space relative to that the presented views are placed.

See 4.3.1626 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.555.2 description

The description specifies additional information about the View_area.

See 4.3.1627 for the application assertion.

The description need not be specified for a particular View_area (see 4.2.555).

If present, there shall be exactly one object that defines the description for a View_area.

4.2.555.3 id

The id specifies the identifier of the View_area.

The id need not be specified for a particular View_area (see 4.2.555).

4.2.555.4 name

The name specifies the word or group of words by which the View_area is referred to.

See 4.3.1627 for the application assertion.

The name need not be specified for a particular View_area (see 4.2.555).

If present, there shall be exactly one object that defines the name for a View_area.

4.2.555.5 revision_id

The revision_id specifies the identifier of the revision of the View_area.

The revision_id need not be specified for a particular View_area (see 4.2.555).

4.2.555.6 size

The size specifies the width and the height of the View_area.

4.2.556 View_area_assignment

A View_area_assignment is an association of a View_area (see 4.2.555) with the object that is presented on the View_area.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The data associated with a View_area_assignment are the following:

— associated_view_area;

— is_describing.

4.2.556.1 associated_view_area

The associated_view_area specifies the View_area (see 4.2.555) that is associated with the object.

See 4.3.1642 for the application assertion.

4.2.556.2 is_describing

The is_describing specifies the object that is associated with the View_area (see 4.2.555).

See 4.3.1628, 4.3.1629, 4.3.1630, 4.3.1631, 4.3.1632, 4.3.1633, 4.3.1634, 4.3.1635, 4.3.1636, 4.3.1637, 4.3.1638, 4.3.1639, 4.3.1640, and 4.3.1641 for the application assertions.

There shall be exactly one object that the View_area_assignment (see 4.2.556) is_describing.

4.2.557 View_area_relationship

A View_area_relationship is a relationship between two View_area (see 4.2.555) objects.

The data associated with a View_area_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.557.1 description

The description specifies additional information about the View_area_relationship.

See 4.3.1643 for the application assertion.

The description need not be specified for a particular View_area_relationship (see 4.2.557).

If present, there shall be exactly one object that defines the description for a View_area_relationship.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.557.2 related

The related specifies the secondary view area in the relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1644 for the application assertion.

4.2.557.3 relating

The relating specifies the primary view area in the relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1644 for the application assertion.

4.2.557.4 relation_type

The relation_type specifies the kind of relationship. Where applicable, the following values shall be used:

— 'copy': The application object defines a relationship where the related View_area (see 4.2.555) is a copy of the relating View_area;

— 'derivation': The application object defines a relationship where the related View_area is derived from the relating View_area;

— 'hierarchy': The application object defines a hierarchical relationship where the related View_area is on a lower level than the relating View_area;

— 'substitution': The application object defines a relationship where the related View_area replaces the relating View_area.

4.2.558 View_placed_annotation

A View_placed_annotation is an annotation that is located in the coordinate system of a View (see 4.2.554).

The data associated with a View_placed_annotation are the following:

— element;

— reference_view.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.558.1 element

The element specifies the annotation element that is associated to a View_placed_annotation.

See 4.3.1645 and 4.3.1646 for the application assertions.

There shall be exactly one object that defines the element for a View_placed_annotation (see 4.2.558).

4.2.558.2 reference_view

The reference_view specifies the view that is associated to a View_placed_annotation.

See 4.3.1647 for the application assertion.

4.2.559 View_relationship

A View_relationship is a relationship between two View (see 4.2.554) objects.

The data associated with a View_relationship are the following:

— description;

— related;

— relating;

— relation_type.

4.2.559.1 description

The description specifies additional information about the View_relationship.

See 4.3.1648 for the application assertion.

The description need not be specified for a particular View_relationship (see 4.2.559).

If present, there shall be exactly one object that defines the description for a View_relationship.

4.2.559.2 related

The related specifies the second of the two View (see 4.2.554) objects related by the View_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1649 for the application assertion.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.559.3 relating

The relating specifies the first of the two View (see 4.2.554) objects related by the View_relationship.

NOTE - The semantics of this attribute are defined by the attribute relation_type.

See 4.3.1649 for the application assertion.

4.2.559.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable, the following values shall be used:

— 'dependency': The related View (see 4.2.554) is dependent of the relating View. This means that the related View has the same view direction as the relating View;

4.2.560 Visual_appearance

A Visual_appearance is the appearance of a surface of a part regarding the optical impression.

At least one of the attributes 'id' or 'name' shall be instantiated.

A Visual_appearance is a type of Surface_condition (see 4.2.492).

The data associated with a Visual_appearance are the following:

— colour_id;

— colour_name;

— id;

— lustre;

— name;

— pattern;

— transparency.

4.2.560.1 colour_id

The colour_id specifies the identifier of the colour of the Visual_appearance.

EXAMPLE A colour can be identified using a code such as 'C130202250'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.2.560.2 colour_name

The colour_name specifies the word or group of words by which the colour of the Visual_appearance is referred to.

EXAMPLE A colour may be referred to, e.g., by a customer, by name such as 'arctic white'.

See 4.3.1650 for the application assertion.

The colour_name need not be specified for a particular Visual_appearance (see 4.2.560).

If present, there shall be exactly one object that defines the colour_name for a Visual_appearance.

4.2.560.3 id

The id specifies the identifier of the Visual_appearance.

The id need not be specified for a particular Visual_appearance (see 4.2.560).

4.2.560.4 lustre

The lustre specifies the kind of shining or the kind of reflection of the surface.

4.2.560.5 name

The name specifies the word or group of words by which the Visual_appearance is referred to.

See 4.3.1650 for the application assertion.

The name need not be specified for a particular Visual_appearance (see 4.2.560).

If present, there shall be exactly one object that defines the name for a Visual_appearance.

4.2.560.6 pattern

The pattern specifies the pattern used for the definition of the Visual_appearance.

EXAMPLE A pattern may be used to specify the texture of a seat cover for visual appearance purposes.

The pattern need not be specified for a particular Visual_appearance (see 4.2.560).

4.2.560.7 transparency

The transparency specifies the grade of transparency of the surface.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The transparency need not be specified for a particular Visual_appearance (see 4.2.560).

4.2.561 Wireframe_model_2d

A Wireframe_model_2d is a collection of Curve_set_2d (see 4.2.111) objects, i.e., Curve (see 4.2.108) and Point (see 4.2.367) objects defined in two-dimensional space.

A Wireframe_model_2d is a type of Geometric_model (see 4.2.238).

The data associated with a Wireframe_model_2d are the following:

— element

The element specifies the set of Curve_set_2d objects that form the Wireframe_model_2d.

See 4.3.1651 for the application assertion.

4.2.562 Wireframe_model_3d

A Wireframe_model_3d is a collection of Curve_set_3d (see 4.2.112) objects, i.e., Curve (see 4.2.108) and Point (see 4.2.367) objects defined in three-dimensional space.

A Wireframe_model_3d is a type of Geometric_model (see 4.2.238).

The data associated with a Wireframe_model_3d are the following:

— element

The element specifies the set of Curve_set_3d objects that form the Wireframe_model_3d.

See 4.3.1652 for the application assertion.

4.2.563 Woodruff_slot_end_type

A Woodruff_slot_end_type is an end condition of a slot defined by a radius tangent to the bottom of the slot and curved towards the surface of the part.

EXAMPLE Figure 78 depicts a Woodruff_slot_end_type.

A Woodruff_slot_end_type is a type of Slot_end_type (see 4.2.457).

The data associated with a Woodruff_slot_end_type are the following:

— radius

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The radius specifies the radius of the Woodruff_slot_end_type.

See 4.3.1653 for the application assertion.

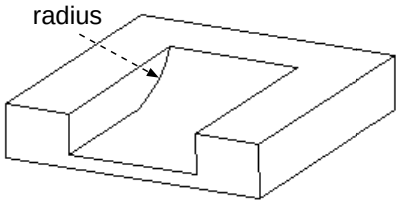

Figure 78 – Parameters defining a Woodruff_slot_end_type

4.2.564 Work_order

A Work_order is the authorization for one or more Activity (see 4.2.2) objects to be performed.

The data associated with a Work_order are the following:

— description;

— id;

— is_controlling;

— version_id;

— work_order_type.

4.2.564.1 description

The description specifies additional information about the Work_order (see 4.2.564).

See 4.3.1655 for the application assertion.

The description need not be specified for a particular Work_order.

If present, there shall be exactly one object that defines the description for a Work_order.

4.2.564.2 id

The id specifies the identifier of the Work_order.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.2.564.3 is_controlling

The is_controlling specifies the Activity (see 4.2.2) object that is controlled by this particular Work_order.

See 4.3.1654 for the application assertion.

4.2.564.4 version_id

The version_id specifies the identification of a particular version of a Work_order.

The version_id need not be specified for a particular Work_order (see 4.2.564).

4.2.564.5 work_order_type

The work_order_type specifies the kind of the Work_order. Where applicable, the following values shall be used:

— 'design deviation permit': An authorization for a deviation from the approved design data;

— 'design release': An authorization for the design of a product or of an item or to create a bill of material;

— 'management resolution': An authorization by a committee, such as the board of directors, to design or change an item;

— 'manufacturing release': An authorization for the manufacturing process of a product or of an item;

— 'production deviation permit': An authorization for a deviation from the approved manufacturing process.

4.2.565 Work_request

A Work_request is the solicitation for some work to be done.

The data associated with a Work_request are the following:

— description;

— id;

— notified_person;

— request_type;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— requestor;

— scope;

— status;

— version_id.

4.2.565.1 description

The description specifies additional information about the Work_request.

See 4.3.1685 for the application assertion.

The description need not be specified for a particular Work_request (see 4.2.565).

If present, there shall be exactly one object that defines the description for a Work_request.

4.2.565.2 id

The id specifies the identifier of the Work_request.

4.2.565.3 notified_person

The notified_person specifies the personnel that shall be informed about the Work_request and the date when the personnel or organization shall be informed.

See 4.3.1666 for the application assertion.

4.2.565.4 request_type

The request_type specifies the intention of the Work_request. Where applicable, the following values shall be used:

— 'change of standard': A request to translate a change to a standard into action;

— 'cost reduction': A request aimed at reducing the engineering and manufacturing costs of an item;

— 'customer rejection': A request resulting from a rejection by a customer;

— 'customer request': A request for an activity that is necessary to solve the request of a customer;

— 'durability improvement': A request aimed at extending the life time of an item;

— 'government regulation': A request resulting from legal requirements;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— ’procurement alignment’: A request to adjust the purchasing process of different items;

— ’production alignment’: A request to adjust the manufacturing process of different items;

— ’production relief’: A request aimed at achieving a simpler assembly and production process;

— ’production requirement’: A request for an activity that is necessary from a production point of view;

— ’quality improvement’: A request aimed at increasing the quality of an item;

— ’security reason’: A request for an activity that is necessary from a security point of view;

— ’standardization’: A request to unify variants of an item;

— ’supplier request’: A request for an activity necessary to solve the request of a supplier;

— ’technical improvement’: A request aimed at improving the technical aspects of an item;

— ’tool improvement’: A request aimed at increasing the useful life of a tool.

4.2.565.5 requestor

The requestor specifies the person or organization who issued the Work_request and the date when this person or organization issued the Work_request.

See 4.3.1666 for the application assertion.

4.2.565.6 scope

The scope specifies the objects that are subject to the Work_request.

See 4.3.1656, 4.3.1657, 4.3.1658, 4.3.1659, 4.3.1660, 4.3.1661, 4.3.1662, 4.3.1663, 4.3.1664, 4.3.1665, 4.3.1667, 4.3.1668, 4.3.1669, 4.3.1670, 4.3.1671, 4.3.1672, 4.3.1673, 4.3.1674, 4.3.1675, 4.3.1676, 4.3.1677, 4.3.1678, 4.3.1679, 4.3.1680, 4.3.1681, 4.3.1682, 4.3.1683, 4.3.1684, 4.3.1686, 4.3.1687, 4.3.1688, 4.3.1689, 4.3.1690, 4.3.1691, 4.3.1692, 4.3.1693, 4.3.1694, 4.3.1695, 4.3.1696, 4.3.1697, 4.3.1698, 4.3.1699, 4.3.1700, and 4.3.1701 for the application assertions.

4.2.565.7 status

The status specifies the stage of the Work_request. Where applicable, the following values shall be used:

— ’in work’: The request is being developed;

— ’issued’: The request has been completed and reviewed, and immediate action takes place;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— ’proposed’: The request has been completed and is awaiting review and authorization;

— ’resolved’: The request is resolved; the actions as defined by the request have been completed and no further work is required.

4.2.565.8 version_id

The version_id specifies the identification of a particular version of a Work_request.

The version_id need not be specified for a particular Work_request (see 4.2.565).

4.3 Application assertions

This subclause specifies the application assertions for the Core data for automotive mechanical design processes application protocol. Application assertions specify the relationships between application objects, the cardinality of the relationships, and the rules required for the integrity and validity of the application objects and UoFs. The application assertions and their definitions are given below.

4.3.1 Accuracy to External_geometric_model

Each Accuracy (see 4.2.1) is_defined_for zero or more External_geometric_model (see 4.2.186) objects. Each External_geometric_model is related to zero or more Accuracy objects.

NOTE - This assertion is established through accuracy_select.

4.3.2 Accuracy to Face

Each Accuracy (see 4.2.1) is_defined_for zero or more Face (see 4.2.191) objects. Each Face is related to zero or more Accuracy objects.

NOTE - This assertion is established through accuracy_select.

4.3.3 Accuracy to Geometric_model

Each Accuracy (see 4.2.1) is_defined_for zero or more Geometric_model (see 4.2.238) objects. Each Geometric_model is related to at least one Accuracy object that has an accuracy_type of ’distance’.

NOTE - This assertion is established through accuracy_select.

4.3.4 Accuracy to Multi_language_string

Each Accuracy (see 4.2.1) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Accuracy objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.5 Accuracy to Oriented_edge_curve

Each Accuracy (see 4.2.1) is_defined_for zero or more Oriented_edge_curve (see 4.2.334) objects. Each Oriented_edge_curve is related to zero or more Accuracy objects.

NOTE - This assertion is established through accuracy_select.

4.3.6 Accuracy to Vertex_point

Each Accuracy (see 4.2.1) is_defined_for zero or more Vertex_point (see 4.2.553) objects. Each Vertex_point is related to zero or more Accuracy objects.

NOTE - This assertion is established through accuracy_select.

4.3.7 Activity to Activity_method

Each Activity (see 4.2.2) refers to zero or one Activity_method (see 4.2.4) in the role of chosen_method. Each Activity_method acts as chosen_method for zero or more Activity objects.

4.3.8 Activity to Date_and_person_organization

Each Activity (see 4.2.2) refers to zero or one Date_and_person_organization (see 4.2.118) in the role of requestor. Each Date_and_person_organization acts as requestor for zero or more Activity objects.

4.3.9 Activity to Date_time

Each Activity (see 4.2.2) refers to zero or one Date_time (see 4.2.119) in the role of actual_end_date. Each Date_time acts as actual_end_date for zero or more Activity objects.

Each Activity refers to zero or one Date_time in the role of actual_start_date. Each Date_time acts as actual_start_date for zero or more Activity objects.

Each Activity refers to zero or one Date_time in the role of planned_end_date. Each Date_time acts as planned_end_date for zero or more Activity objects.

NOTE 1 - This assertion is established through period_or_date_select.

Each Activity refers to zero or one Date_time in the role of planned_start_date. Each Date_time acts as planned_start_date for zero or more Activity objects.

NOTE 2 - This assertion is established through event_or_date_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.10 Activity to Duration

Each Activity (see 4.2.2) refers to zero or one Duration (see 4.2.174) in the role of planned_end_date. Each Duration acts as planned_end_date for zero or more Activity objects.

NOTE - This assertion is established through period_or_date_select.

4.3.11 Activity to Event_reference

Each Activity (see 4.2.2) refers to zero or one Event_reference (see 4.2.184) in the role of planned_end_date. Each Event_reference acts as planned_end_date for zero or more Activity objects.

NOTE 1 - This assertion is established through period_or_date_select.

Each Activity refers to zero or one Event_reference in the role of planned_start_date. Each Event_reference acts as planned_start_date for zero or more Activity objects.

NOTE 2 - This assertion is established through event_or_date_select.

4.3.12 Activity to Multi_language_string

Each Activity (see 4.2.2) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Activity objects.

NOTE - This assertion is established through string_select.

4.3.13 Activity to Organization

Each Activity (see 4.2.2) refers to zero or more Organization (see 4.2.331) objects in the role of concerned_organization. Each Organization acts as concerned_organization for zero or more Activity objects.

Each Activity refers to zero or more Organization objects in the role of supplying_organization. Each Organization acts as supplying_organization for zero or more Activity objects.

4.3.14 Activity to Work_request

Each Activity (see 4.2.2) refers to zero or more Work_request (see 4.2.565) objects in the role of resolved_request. Each Work_request acts as resolved_request for zero or more Activity objects.

4.3.15 Activity_element to Activity

Each Activity_element (see 4.2.3) refers to exactly one Activity (see 4.2.2) in the role of associated_activity. Each Activity acts as associated_activity for zero or more Activity_element objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.16 Activity_element to Activity_method

Each Activity_element (see 4.2.3) refers to zero or one Activity_method (see 4.2.4) in the role of element. Each Activity_method acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.17 Activity_element to Alternate_item_relationship

Each Activity_element (see 4.2.3) refers to zero or one Alternate_item_relationship (see 4.2.9) in the role of element. Each Alternate_item_relationship acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.18 Activity_element to Assembly_substitute_relationship

Each Activity_element (see 4.2.3) refers to zero or one Assembly_substitute_relationship (see 4.2.28) in the role of element. Each Assembly_substitute_relationship acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.19 Activity_element to Class_category_association

Each Activity_element (see 4.2.3) refers to zero or one Class_category_association (see 4.2.64) in the role of element. Each Class_category_association acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.20 Activity_element to Class_condition_association

Each Activity_element (see 4.2.3) refers to zero or one Class_condition_association (see 4.2.65) in the role of element. Each Class_condition_association acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.21 Activity_element to Class_inclusion_association

Each Activity_element (see 4.2.3) refers to zero or one Class_inclusion_association (see 4.2.66) in the role of element. Each Class_inclusion_association acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.22 Activity_element to Class_specification_association

Each Activity_element (see 4.2.3) refers to zero or one Class_specification_association (see 4.2.67) in the role of element. Each Class_specification_association acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.23 Activity_element to Class_structure_relationship

Each Activity_element (see 4.2.3) refers to zero or one Class_structure_relationship (see 4.2.68) in the role of element. Each Class_structure_relationship acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.24 Activity_element to Complex_product

Each Activity_element (see 4.2.3) refers to zero or one Complex_product (see 4.2.80) in the role of element. Each Complex_product acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.25 Activity_element to Configuration

Each Activity_element (see 4.2.3) refers to zero or one Configuration (see 4.2.94) in the role of element. Each Configuration acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.26 Activity_element to Design_constraint

Each Activity_element (see 4.2.3) refers to zero or one Design_constraint (see 4.2.138) in the role of element. Each Design_constraint acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.27 Activity_element to Design_discipline_item_definition

Each Activity_element (see 4.2.3) refers to zero or one Design_discipline_item_definition (see 4.2.142) in the role of element. Each Design_discipline_item_definition acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.28 Activity_element to Document

Each Activity_element (see 4.2.3) refers to zero or one Document (see 4.2.155) in the role of element. Each Document acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.29 Activity_element to Document_file

Each Activity_element (see 4.2.3) refers to zero or one Document_file (see 4.2.159) in the role of element. Each Document_file acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.30 Activity_element to Document_representation

Each Activity_element (see 4.2.3) refers to zero or one Document_representation (see 4.2.163) in the role of element. Each Document_representation acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.31 Activity_element to Document_version

Each Activity_element (see 4.2.3) refers to zero or one Document_version (see 4.2.167) in the role of element. Each Document_version acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.32 Activity_element to Drawing

Each Activity_element (see 4.2.3) refers to zero or one Drawing (see 4.2.170) in the role of element. Each Drawing acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.33 Activity_element to Feature_occurrence

Each Activity_element (see 4.2.3) refers to zero or one Feature_occurrence (see 4.2.200) in the role of element. Each Feature_occurrence acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.34 Activity_element to Geometric_model

Each Activity_element (see 4.2.3) refers to zero or one Geometric_model (see 4.2.238) in the role of element. Each Geometric_model acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.35 Activity_element to Item

Each Activity_element (see 4.2.3) refers to zero or one Item (see 4.2.267) in the role of element. Each Item acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.36 Activity_element to Item_definition_instance_relationship

Each Activity_element (see 4.2.3) refers to zero or one Item_definition_instance_relationship (see 4.2.268) in the role of element. Each Item_definition_instance_relationship acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.37 Activity_element to Item_definition_relationship

Each Activity_element (see 4.2.3) refers to zero or one Item_definition_relationship (see 4.2.269) in the role of element. Each Item_definition_relationship acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.38 Activity_element to Item_instance

Each Activity_element (see 4.2.3) refers to zero or one Item_instance (see 4.2.271) in the role of element. Each Item_instance acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.39 Activity_element to Item_instance_relationship

Each Activity_element (see 4.2.3) refers to zero or one Item_instance_relationship (see 4.2.272) in the role of element. Each Item_instance_relationship acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.40 Activity_element to Item_version

Each Activity_element (see 4.2.3) refers to zero or one Item_version (see 4.2.275) in the role of element. Each Item_version acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.41 Activity_element to Kinematic_simulation_information

Each Activity_element (see 4.2.3) refers to zero or one Kinematic_simulation_information (see 4.2.288) in the role of element. Each Kinematic_simulation_information acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.42 Activity_element to Manufacturing_configuration

Each Activity_element (see 4.2.3) refers to zero or one Manufacturing_configuration (see 4.2.305) in the role of element. Each Manufacturing_configuration acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.43 Activity_element to Material

Each Activity_element (see 4.2.3) refers to zero or one Material (see 4.2.309) in the role of element. Each Material acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.44 Activity_element to Physical_assembly_relationship

Each Activity_element (see 4.2.3) refers to zero or one Physical_assembly_relationship (see 4.2.350) in the role of element. Each Physical_assembly_relationship acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.45 Activity_element to Physical_instance

Each Activity_element (see 4.2.3) refers to zero or one Physical_instance (see 4.2.352) in the role of element. Each Physical_instance acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.46 Activity_element to Process_operation_definition

Each Activity_element (see 4.2.3) refers to zero or one Process_operation_definition (see 4.2.381) in the role of element. Each Process_operation_definition acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.47 Activity_element to Process_operation_occurrence

Each Activity_element (see 4.2.3) refers to zero or one Process_operation_occurrence (see 4.2.384) in the role of element. Each Process_operation_occurrence acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.48 Activity_element to Process_plan

Each Activity_element (see 4.2.3) refers to zero or one Process_plan (see 4.2.387) in the role of element. Each Process_plan acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.49 Activity_element to Product_class

Each Activity_element (see 4.2.3) refers to zero or one Product_class (see 4.2.392) in the role of element. Each Product_class acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.50 Activity_element to Product_identification

Each Activity_element (see 4.2.3) refers to zero or one Product_identification (see 4.2.398) in the role of element. Each Product_identification acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.51 Activity_element to Product_structure_relationship

Each Activity_element (see 4.2.3) refers to zero or one Product_structure_relationship (see 4.2.400) in the role of element. Each Product_structure_relationship acts as element for zero or more Activity_-element objects.

NOTE - This assertion is established through activity_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.52 Activity_element to Property

Each Activity_element (see 4.2.3) refers to zero or one Property (see 4.2.409) in the role of element. Each Property acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.53 Activity_element to Property_value_association

Each Activity_element (see 4.2.3) refers to zero or one Property_value_association (see 4.2.413) in the role of element. Each Property_value_association acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.54 Activity_element to Specification

Each Activity_element (see 4.2.3) refers to zero or one Specification (see 4.2.467) in the role of element. Each Specification acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.55 Activity_element to Specification_category

Each Activity_element (see 4.2.3) refers to zero or one Specification_category (see 4.2.468) in the role of element. Each Specification_category acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.56 Activity_element to Specification_expression

Each Activity_element (see 4.2.3) refers to zero or one Specification_expression (see 4.2.470) in the role of element. Each Specification_expression acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.57 Activity_element to Specification_inclusion

Each Activity_element (see 4.2.3) refers to zero or one Specification_inclusion (see 4.2.471) in the role of element. Each Specification_inclusion acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.58 Activity_element to Styled_model

Each Activity_element (see 4.2.3) refers to zero or one Styled_model (see 4.2.484) in the role of element. Each Styled_model acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.59 Activity_element to View_area

Each Activity_element (see 4.2.3) refers to zero or one View_area (see 4.2.555) in the role of element. Each View_area acts as element for zero or more Activity_element objects.

NOTE - This assertion is established through activity_element_select.

4.3.60 Activity_method to Multi_language_string

Each Activity_method (see 4.2.4) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Activity_method objects.

NOTE 1 - This assertion is established through string_select.

Each Activity_method refers to zero or one Multi_language_string in the role of name. Each Multi_-language_string acts as name for zero or more Activity_method objects.

NOTE 2 - This assertion is established through string_select.

4.3.61 Activity_method_assignment to Activity_method

Each Activity_method_assignment (see 4.2.5) refers to exactly one Activity_method (see 4.2.4) in the role of assigned_method. Each Activity_method acts as assigned_method for zero or more Activity_-method_assignment objects.

4.3.62 Activity_method_assignment to Work_request

Each Activity_method_assignment (see 4.2.5) refers to exactly one Work_request (see 4.2.565) in the role of associated_request. Each Work_request acts as associated_request for zero or more Activity_-method_assignment objects.

4.3.63 Activity_relationship to Activity

Each Activity_relationship (see 4.2.6) is related to exactly one Activity (see 4.2.2). Each Activity is referenced by zero or more Activity_relationship objects as related.

NOTE 1 - The related Activity is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Each Activity_relationship is relating to exactly one Activity. Each Activity is referenced by zero or more Activity_relationship objects as relating.

NOTE 2 - The relating Activity is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.64 Activity_relationship to Multi_language_string

Each Activity_relationship (see 4.2.6) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Activity_relationship objects.

NOTE - This assertion is established through string_select.

4.3.65 Actuator to Kinematic_pair

Each Actuator (see 4.2.7) is_applied_to exactly one Kinematic_pair (see 4.2.287). Each Kinematic_pair is_referenced_by zero or one Actuator.

4.3.66 Actuator to Multi_language_string

Each Actuator (see 4.2.7) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Actuator objects.

NOTE - This assertion is established through string_select.

4.3.67 Alias_identification to Approval_status

Each Alias_identification (see 4.2.8) is_applied_to zero or one Approval_status (see 4.2.24). Each Approval_status is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.68 Alias_identification to Classification_attribute

Each Alias_identification (see 4.2.8) is_applied_to zero or one Classification_attribute (see 4.2.70). Each Classification_attribute is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.69 Alias_identification to Classification_system

Each Alias_identification (see 4.2.8) is_applied_to zero or one Classification_system (see 4.2.71). Each Classification_system is related to zero or more Alias_identification objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through alias_select.

4.3.70 Alias_identification to Complex_product

Each Alias_identification (see 4.2.8) is_applied_to zero or one Complex_product (see 4.2.80). Each Complex_product is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.71 Alias_identification to Design_discipline_item_definition

Each Alias_identification (see 4.2.8) is_applied_to zero or one Design_discipline_item_definition (see 4.2.142). Each Design_discipline_item_definition is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.72 Alias_identification to Document

Each Alias_identification (see 4.2.8) is_applied_to zero or one Document (see 4.2.155). Each Document is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.73 Alias_identification to Document_representation

Each Alias_identification (see 4.2.8) is_applied_to zero or one Document_representation (see 4.2.163). Each Document_representation is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.74 Alias_identification to Document_type_property

Each Alias_identification (see 4.2.8) is_applied_to zero or one Document_type_property (see 4.2.166). Each Document_type_property is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.75 Alias_identification to Document_version

Each Alias_identification (see 4.2.8) is_applied_to zero or one Document_version (see 4.2.167). Each Document_version is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.76 Alias_identification to General_classification

Each Alias_identification (see 4.2.8) is_applied_to zero or one General_classification (see 4.2.216). Each General_classification is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.77 Alias_identification to Geometric_model

Each Alias_identification (see 4.2.8) is_applied_to zero or one Geometric_model (see 4.2.238). Each Geometric_model is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.78 Alias_identification to Item

Each Alias_identification (see 4.2.8) is_applied_to zero or one Item (see 4.2.267). Each Item is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.79 Alias_identification to Item_instance

Each Alias_identification (see 4.2.8) is_applied_to zero or one Item_instance (see 4.2.271). Each Item_-instance is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.80 Alias_identification to Item_version

Each Alias_identification (see 4.2.8) is_applied_to zero or one Item_version (see 4.2.275). Each Item_-version is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.81 Alias_identification to Multi_language_string

Each Alias_identification (see 4.2.8) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Alias_identification objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.82 Alias_identification to Organization

Each Alias_identification (see 4.2.8) refers to zero or one Organization (see 4.2.331) in the role of alias_scope. Each Organization acts as alias_scope for zero or more Alias_identification objects.

Each Alias_identification is_applied_to zero or one Organization. Each Organization is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.83 Alias_identification to Physical_instance

Each Alias_identification (see 4.2.8) is_applied_to zero or one Physical_instance (see 4.2.352). Each Physical_instance is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.84 Alias_identification to Product_class

Each Alias_identification (see 4.2.8) is_applied_to zero or one Product_class (see 4.2.392). Each Product_class is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.85 Alias_identification to Property

Each Alias_identification (see 4.2.8) is_applied_to zero or one Property (see 4.2.409). Each Property is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.86 Alias_identification to Security_level

Each Alias_identification (see 4.2.8) is_applied_to zero or one Security_level (see 4.2.444). Each Security_level is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.87 Alias_identification to Specification

Each Alias_identification (see 4.2.8) is_applied_to zero or one Specification (see 4.2.467). Each Specification is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.88 Alias_identification to Specification_category

Each Alias_identification (see 4.2.8) is_applied_to zero or one Specification_category (see 4.2.468). Each Specification_category is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.89 Alias_identification to Styled_model

Each Alias_identification (see 4.2.8) is_applied_to zero or one Styled_model (see 4.2.484). Each Styled_model is related to zero or more Alias_identification objects.

NOTE - This assertion is established through alias_select.

4.3.90 Alternate_item_relationship to Item

Each Alternate_item_relationship (see 4.2.9) refers to exactly one Item (see 4.2.267) in the role of alternate. Each Item acts as alternate for zero or more Alternate_item_relationship objects.

Each Alternate_item_relationship refers to exactly one Item in the role of base. Each Item acts as base for zero or more Alternate_item_relationship objects.

4.3.91 Alternate_item_relationship to Multi_language_string

Each Alternate_item_relationship (see 4.2.9) refers to zero or one Multi_language_string (see 4.2.320) in the role of fulfilled_requirements. Each Multi_language_string acts as fulfilled_requirements for zero or more Alternate_item_relationship objects.

NOTE - This assertion is established through string_select.

4.3.92 Alternative_solution to Alternative_solution

Each Alternative_solution (see 4.2.10) refers to zero or one Alternative_solution in the role of base_element. Each Alternative_solution acts as base_element for zero or more Alternative_solution objects.

NOTE - This assertion is established through complex_product_select.

4.3.93 Alternative_solution to Product_component

Each Alternative_solution (see 4.2.10) refers to zero or one Product_component (see 4.2.394) in the role of base_element. Each Product_component acts as base_element for zero or more Alternative_solution objects.

NOTE - This assertion is established through complex_product_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.94 Alternative_solution to Product_function

Each Alternative_solution (see 4.2.10) refers to zero or one Product_function (see 4.2.397) in the role of base_element. Each Product_function acts as base_element for zero or more Alternative_solution objects.

NOTE - This assertion is established through complex_product_select.

4.3.95 Angle_specification to Feature_parameter

Each Angle_specification (see 4.2.11) refers to exactly one Feature_parameter (see 4.2.201) in the role of angle. Each Feature_parameter acts as angle for zero or more Angle_specification objects.

4.3.96 Angle_taper to Feature_parameter

Each Angle_taper (see 4.2.12) refers to exactly one Feature_parameter (see 4.2.201) in the role of angle. Each Feature_parameter acts as angle for zero or more Angle_taper objects.

4.3.97 Angularity_tolerance to Datum

Each Angularity_tolerance (see 4.2.15) refers to one or two Datum (see 4.2.123) objects in the role of reference_datum. Each Datum acts as reference_datum for zero or more Angularity_tolerance objects.

4.3.98 Annotation_symbol to Dimension_symbol

Each Annotation_symbol (see 4.2.19) refers to zero or one Dimension_symbol (see 4.2.153) in the role of symbol_definition. Each Dimension_symbol acts as symbol_definition for zero or more Annotation_-symbol objects.

NOTE - This assertion is established through symbol_definition_select.

4.3.99 Annotation_symbol to General_symbol

Each Annotation_symbol (see 4.2.19) refers to zero or one General_symbol (see 4.2.233) in the role of symbol_definition. Each General_symbol acts as symbol_definition for zero or more Annotation_symbol objects.

NOTE - This assertion is established through symbol_definition_select.

4.3.100 Annotation_symbol to Geometric_tolerance_symbol

Each Annotation_symbol (see 4.2.19) refers to zero or one Geometric_tolerance_symbol (see 4.2.246) in the role of symbol_definition. Each Geometric_tolerance_symbol acts as symbol_definition for zero or more Annotation_symbol objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through symbol_definition_select.

4.3.101 Annotation_symbol to Point_marker_symbol

Each Annotation_symbol (see 4.2.19) refers to zero or one Point_marker_symbol (see 4.2.372) in the role of symbol_definition. Each Point_marker_symbol acts as symbol_definition for zero or more Annotation_symbol objects.

NOTE - This assertion is established through symbol_definition_select.

4.3.102 Annotation_symbol to Surface_condition_symbol

Each Annotation_symbol (see 4.2.19) refers to zero or one Surface_condition_symbol (see 4.2.495) in the role of symbol_definition. Each Surface_condition_symbol acts as symbol_definition for zero or more Annotation_symbol objects.

NOTE - This assertion is established through symbol_definition_select.

4.3.103 Annotation_symbol to Terminator_symbol

Each Annotation_symbol (see 4.2.19) refers to zero or one Terminator_symbol (see 4.2.513) in the role of symbol_definition. Each Terminator_symbol acts as symbol_definition for zero or more Annotation_symbol objects.

NOTE - This assertion is established through symbol_definition_select.

4.3.104 Appearance_assignment to Curve_appearance

Each Appearance_assignment (see 4.2.20) refers to zero or more Curve_appearance (see 4.2.109) objects in the role of component. Each Curve_appearance acts as component for one or more Appearance_assignment objects.

NOTE - This assertion is established through appearance_select.

4.3.105 Appearance_assignment to Hatching

Each Appearance_assignment (see 4.2.20) refers to zero or more Hatching (see 4.2.255) objects in the role of component. Each Hatching acts as component for one or more Appearance_assignment objects.

NOTE - This assertion is established through appearance_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.106 Appearance_assignment to Point_appearance

Each Appearance_assignment (see 4.2.20) refers to zero or more Point_appearance (see 4.2.368) objects in the role of component. Each Point_appearance acts as component for one or more Appearance_assignment objects.

NOTE - This assertion is established through appearance_select.

4.3.107 Appearance_assignment to Solid_fill_area

Each Appearance_assignment (see 4.2.20) refers to zero or more Solid_fill_area (see 4.2.459) objects in the role of component. Each Solid_fill_area acts as component for one or more Appearance_assignment objects.

NOTE - This assertion is established through appearance_select.

4.3.108 Appearance_assignment to Surface_appearance

Each Appearance_assignment (see 4.2.20) refers to zero or more Surface_appearance (see 4.2.490) objects in the role of component. Each Surface_appearance acts as component for one or more Appearance_assignment objects.

NOTE - This assertion is established through appearance_select.

4.3.109 Appearance_assignment to Text_appearance

Each Appearance_assignment (see 4.2.20) refers to zero or more Text_appearance (see 4.2.515) objects in the role of component. Each Text_appearance acts as component for one or more Appearance_assignment objects.

NOTE - This assertion is established through appearance_select.

4.3.110 Appearance_assignment to Tiling

Each Appearance_assignment (see 4.2.20) refers to zero or more Tiling (see 4.2.521) objects in the role of component. Each Tiling acts as component for one or more Appearance_assignment objects.

NOTE - This assertion is established through appearance_select.

4.3.111 Application_context to Multi_language_string

Each Application_context (see 4.2.21) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Application_context objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.112 Approval to Activity

Each Approval (see 4.2.22) is_applied_to zero or more Activity (see 4.2.2) objects. Each Activity is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.113 Approval to Activity_element

Each Approval (see 4.2.22) is_applied_to zero or more Activity_element (see 4.2.3) objects. Each Activity_element is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.114 Approval to Activity_method_assignment

Each Approval (see 4.2.22) is_applied_to zero or more Activity_method_assignment (see 4.2.5) objects. Each Activity_method_assignment is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.115 Approval to Alternate_item_relationship

Each Approval (see 4.2.22) is_applied_to zero or more Alternate_item_relationship (see 4.2.9) objects. Each Alternate_item_relationship is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.116 Approval to Approval_status

Each Approval (see 4.2.22) refers to exactly one Approval_status (see 4.2.24) in the role of status. Each Approval_status acts as status for zero or more Approval objects.

4.3.117 Approval to Assembly_substitute_relationship

Each Approval (see 4.2.22) is_applied_to zero or more Assembly_substitute_relationship (see 4.2.28) objects. Each Assembly_substitute_relationship is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.118 Approval to Certification

Each Approval (see 4.2.22) is_applied_to zero or more Certification (see 4.2.50) objects. Each Certification is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.119 Approval to Class_category_association

Each Approval (see 4.2.22) is_applied_to zero or more Class_category_association (see 4.2.64) objects. Each Class_category_association is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.120 Approval to Class_condition_association

Each Approval (see 4.2.22) is_applied_to zero or more Class_condition_association (see 4.2.65) objects. Each Class_condition_association is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.121 Approval to Class_inclusion_association

Each Approval (see 4.2.22) is_applied_to zero or more Class_inclusion_association (see 4.2.66) objects. Each Class_inclusion_association is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.122 Approval to Class_specification_association

Each Approval (see 4.2.22) is_applied_to zero or more Class_specification_association (see 4.2.67) objects. Each Class_specification_association is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.123 Approval to Class_structure_relationship

Each Approval (see 4.2.22) is_applied_to zero or more Class_structure_relationship (see 4.2.68) objects. Each Class_structure_relationship is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.124 Approval to Classification_association

Each Approval (see 4.2.22) is_applied_to zero or more Classification_association (see 4.2.69) objects. Each Classification_association is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.125 Approval to Classification_system

Each Approval (see 4.2.22) is_applied_to zero or more Classification_system (see 4.2.71) objects. Each Classification_system is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.126 Approval to Complex_product

Each Approval (see 4.2.22) is_applied_to zero or more Complex_product (see 4.2.80) objects. Each Complex_product is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.127 Approval to Configuration

Each Approval (see 4.2.22) is_applied_to zero or more Configuration (see 4.2.94) objects. Each Configuration is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.128 Approval to Contract

Each Approval (see 4.2.22) is_applied_to zero or more Contract (see 4.2.104) objects. Each Contract is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.129 Approval to Date_and_person_organization

Each Approval (see 4.2.22) is_approved_by zero or more Date_and_person_organization (see 4.2.118) objects. Each Date_and_person_organization is related to zero or more Approval objects.

4.3.130 Approval to Date_time

Each Approval (see 4.2.22) refers to zero or one Date_time (see 4.2.119) in the role of actual_date. Each Date_time acts as actual_date for zero or more Approval objects.

Each Approval refers to zero or one Date_time in the role of planned_date. Each Date_time acts as planned_date for zero or more Approval objects.

4.3.131 Approval to Design_constraint

Each Approval (see 4.2.22) is_applied_to zero or more Design_constraint (see 4.2.138) objects. Each Design_constraint is related to zero or more Approval objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through approval_element_select.

4.3.132 Approval to Design_discipline_item_definition

Each Approval (see 4.2.22) is_applied_to zero or more Design_discipline_item_definition (see 4.2.142) objects. Each Design_discipline_item_definition is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.133 Approval to Document

Each Approval (see 4.2.22) is_applied_to zero or more Document (see 4.2.155) objects. Each Document is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.134 Approval to Document_file

Each Approval (see 4.2.22) is_applied_to zero or more Document_file (see 4.2.159) objects. Each Document_file is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.135 Approval to Document_representation

Each Approval (see 4.2.22) is_applied_to zero or more Document_representation (see 4.2.163) objects. Each Document_representation is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.136 Approval to Document_version

Each Approval (see 4.2.22) is_applied_to zero or more Document_version (see 4.2.167) objects. Each Document_version is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.137 Approval to Drawing

Each Approval (see 4.2.22) is_applied_to zero or more Drawing (see 4.2.170) objects. Each Drawing is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.138 Approval to Drawing_sheet

Each Approval (see 4.2.22) is_applied_to zero or more Drawing_sheet (see 4.2.173) objects. Each Drawing_sheet is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.139 Approval to General_classification

Each Approval (see 4.2.22) is_applied_to zero or more General_classification (see 4.2.216) objects. Each General_classification is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.140 Approval to Geometric_model

Each Approval (see 4.2.22) is_applied_to zero or more Geometric_model (see 4.2.238) objects. Each Geometric_model is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.141 Approval to Item_definition_instance_relationship

Each Approval (see 4.2.22) is_applied_to zero or more Item_definition_instance_relationship (see 4.2.268) objects. Each Item_definition_instance_relationship is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.142 Approval to Item_definition_relationship

Each Approval (see 4.2.22) is_applied_to zero or more Item_definition_relationship (see 4.2.269) objects. Each Item_definition_relationship is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.143 Approval to Item_instance

Each Approval (see 4.2.22) is_applied_to zero or more Item_instance (see 4.2.271) objects. Each Item_instance is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.144 Approval to Item_instance_relationship

Each Approval (see 4.2.22) is_applied_to zero or more Item_instance_relationship (see 4.2.272) objects. Each Item_instance_relationship is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.145 Approval to Item_version

Each Approval (see 4.2.22) is_applied_to zero or more Item_version (see 4.2.275) objects. Each Item_version is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.146 Approval to Kinematic_simulation_information

Each Approval (see 4.2.22) is_applied_to zero or more Kinematic_simulation_information (see 4.2.288) objects. Each Kinematic_simulation_information is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.147 Approval to Manufacturing_configuration

Each Approval (see 4.2.22) is_applied_to zero or more Manufacturing_configuration (see 4.2.305) objects. Each Manufacturing_configuration is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.148 Approval to Material

Each Approval (see 4.2.22) is_applied_to zero or more Material (see 4.2.309) objects. Each Material is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.149 Approval to Organization

Each Approval (see 4.2.22) refers to zero or more Organization (see 4.2.331) objects in the role of scope. Each Organization acts as scope for zero or more Approval objects.

4.3.150 Approval to Physical_assembly_relationship

Each Approval (see 4.2.22) is_applied_to zero or more Physical_assembly_relationship (see 4.2.350) objects. Each Physical_assembly_relationship is related to zero or more Approval objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through approval_element_select.

4.3.151 Approval to Physical_instance

Each Approval (see 4.2.22) is_applied_to zero or more Physical_instance (see 4.2.352) objects. Each Physical_instance is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.152 Approval to Physical_instance_test_result

Each Approval (see 4.2.22) is_applied_to zero or more Physical_instance_test_result (see 4.2.353) objects. Each Physical_instance_test_result is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.153 Approval to Process_plan

Each Approval (see 4.2.22) is_applied_to zero or more Process_plan (see 4.2.387) objects. Each Process_plan is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.154 Approval to Product_class

Each Approval (see 4.2.22) is_applied_to zero or more Product_class (see 4.2.392) objects. Each Product_class is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.155 Approval to Product_structure_relationship

Each Approval (see 4.2.22) is_applied_to zero or more Product_structure_relationship (see 4.2.400) objects. Each Product_structure_relationship is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.156 Approval to Project

Each Approval (see 4.2.22) is_applied_to zero or more Project (see 4.2.404) objects. Each Project is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.157 Approval to Property

Each Approval (see 4.2.22) is_applied_to zero or more Property (see 4.2.409) objects. Each Property is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.158 Approval to Property_value_association

Each Approval (see 4.2.22) is_applied_to zero or more Property_value_association (see 4.2.413) objects. Each Property_value_association is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.159 Approval to Specification

Each Approval (see 4.2.22) is_applied_to zero or more Specification (see 4.2.467) objects. Each Specification is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.160 Approval to Specification_category

Each Approval (see 4.2.22) is_applied_to zero or more Specification_category (see 4.2.468) objects. Each Specification_category is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.161 Approval to Specification_expression

Each Approval (see 4.2.22) is_applied_to zero or more Specification_expression (see 4.2.470) objects. Each Specification_expression is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.162 Approval to Specification_inclusion

Each Approval (see 4.2.22) is_applied_to zero or more Specification_inclusion (see 4.2.471) objects. Each Specification_inclusion is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.163 Approval to Styled_model

Each Approval (see 4.2.22) is_applied_to zero or more Styled_model (see 4.2.484) objects. Each Styled_-model is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.164 Approval to View_area

Each Approval (see 4.2.22) is_applied_to zero or more View_area (see 4.2.555) objects. Each View_area is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.165 Approval to Work_order

Each Approval (see 4.2.22) is_applied_to zero or more Work_order (see 4.2.564) objects. Each Work_-order is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.166 Approval to Work_request

Each Approval (see 4.2.22) is_applied_to zero or more Work_request (see 4.2.565) objects. Each Work_-request is related to zero or more Approval objects.

NOTE - This assertion is established through approval_element_select.

4.3.167 Approval_relationship to Approval

Each Approval_relationship (see 4.2.23) is related to exactly one Approval (see 4.2.22). Each Approval is referenced by zero or more Approval_relationship objects as related.

NOTE 1 - The related Approval is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Approval_relationship is relating to exactly one Approval. Each Approval is referenced by zero or more Approval_relationship objects as relating.

NOTE 2 - The relating Approval is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.168 Approval_relationship to Multi_language_string

Each Approval_relationship (see 4.2.23) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Approval_-relationship objects.

NOTE - This assertion is established through string_select.

4.3.169 Approval_status to Classification_system

Each Approval_status (see 4.2.24) refers to zero or one Classification_system (see 4.2.71) in the role of used_classification_system. Each Classification_system acts as used_classification_system for zero or more Approval_status objects.

4.3.170 Area_placed_annotation to Annotation_element

Each Area_placed_annotation (see 4.2.25) refers to zero or one Annotation_element (see 4.2.17) in the role of element. Each Annotation_element acts as element for zero or more Area_placed_annotation objects.

NOTE - This assertion is established through annotation_select.

4.3.171 Area_placed_annotation to Draughting_callout

Each Area_placed_annotation (see 4.2.25) refers to zero or one Draughting_callout (see 4.2.169) in the role of element. Each Draughting_callout acts as element for zero or more Area_placed_annotation objects.

NOTE - This assertion is established through annotation_select.

4.3.172 Area_placed_annotation to Drawing_sheet

Each Area_placed_annotation (see 4.2.25) refers to zero or one Drawing_sheet (see 4.2.173) in the role of reference_area. Each Drawing_sheet acts as reference_area for zero or more Area_placed_annotation objects.

NOTE - This assertion is established through area_select.

4.3.173 Area_placed_annotation to View_area

Each Area_placed_annotation (see 4.2.25) refers to zero or one View_area (see 4.2.555) in the role of reference_area. Each View_area acts as reference_area for zero or more Area_placed_annotation objects.

NOTE - This assertion is established through area_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.174 Assembly_component_relationship to Assembly_definition

Each Assembly_component_relationship (see 4.2.26) is relating to exactly one Assembly_definition (see 4.2.27). Each Assembly_definition is referenced by zero or more Assembly_component_relationship objects as relating.

NOTE - The relating Assembly_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.175 Assembly_component_relationship to Geometric_model_relationship_with_transformation

Each Assembly_component_relationship (see 4.2.26) refers to zero or one Geometric_model_relationship_with_transformation (see 4.2.240) in the role of placement. Each Geometric_model_relationship_with_transformation acts as placement for zero or more Assembly_component_relationship objects.

NOTE - This assertion is established through transformation_select.

4.3.176 Assembly_component_relationship to Template_instance

Each Assembly_component_relationship (see 4.2.26) refers to zero or one Template_instance (see 4.2.512) in the role of placement. Each template_instance acts as transformation for zero or more assembly_component_relationship objects. If it acts as transformation for more than one assembly_component_relationship, the relating assembly_definition objects shall refer to the same item_version and the related item_instance objects shall refer to the same item_version as definition (through design_discipline_item_definition).

NOTE 1 - This constraint ensures that a given template_instance represents the placement of a unique object in the coordinate space of a unique assembly.

NOTE 2 - This assertion is established through transformation_select.

4.3.177 Assembly_substitute_relationship to Assembly_component_relationship

Each Assembly_substitute_relationship (see 4.2.28) refers to exactly one Assembly_component_relationship (see 4.2.26) in the role of base. Each Assembly_component_relationship acts as base for zero or more Assembly_substitute_relationship objects.

Each Assembly_substitute_relationship refers to exactly one Assembly_component_relationship in the role of substitute. Each Assembly_component_relationship acts as substitute for zero or more Assembly_substitute_relationship objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.178 Assembly_substitute_relationship to Multi_language_string

Each Assembly_substitute_relationship (see 4.2.28) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Assembly_substitute_relationship objects.

NOTE - This assertion is established through string_select.

4.3.179 Associated_draughting_callout to Annotation_element

Each Associated_draughting_callout (see 4.2.29) is_associated_to zero or more Annotation_element (see 4.2.17) objects. Each Annotation_element is related to zero or more Associated_draughting_callout objects.

NOTE - This assertion is established through associated_element_select.

4.3.180 Associated_draughting_callout to Detailed_geometric_model_element

Each Associated_draughting_callout (see 4.2.29) is_associated_to zero or more Detailed_geometric_model_element (see 4.2.144) objects. Each Detailed_geometric_model_element is related to zero or more Associated_draughting_callout objects.

NOTE - This assertion is established through associated_element_select.

4.3.181 Associated_fill_area to Annotation_curve

Each Associated_fill_area (see 4.2.30) is_derived_from zero or more Annotation_curve (see 4.2.16) objects. Each Annotation_curve is related to zero or more Associated_fill_area objects.

NOTE - This assertion is established through fill_area_associated_element_select.

4.3.182 Associated_fill_area to Detailed_geometric_model_element

Each Associated_fill_area (see 4.2.30) is_derived_from zero or more Detailed_geometric_model_element (see 4.2.144) objects. Each Detailed_geometric_model_element is related to zero or more Associated_fill_area objects.

NOTE - This assertion is established through fill_area_associated_element_select.

4.3.183 Associated_leader to Annotation_element

Each Associated_leader (see 4.2.31) refers to zero or one Annotation_element (see 4.2.17) in the role of target. Each Annotation_element acts as target for zero or more Associated_leader objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through associated_element_select.

4.3.184 Associated_leader to Detailed_geometric_model_element

Each Associated_leader (see 4.2.31) refers to zero or one Detailed_geometric_model_element (see 4.2.144) in the role of target. Each Detailed_geometric_model_element acts as target for zero or more Associated_leader objects.

NOTE - This assertion is established through associated_element_select.

4.3.185 Associated_projection_curve to Annotation_element

Each Associated_projection_curve (see 4.2.32) is_projected_to zero or one Annotation_element (see 4.2.17). Each Annotation_element is related to zero or more Associated_projection_curve objects.

NOTE - This assertion is established through associated_element_select.

4.3.186 Associated_projection_curve to Detailed_geometric_model_element

Each Associated_projection_curve (see 4.2.32) is_projected_to zero or one Detailed_geometric_model_element (see 4.2.144). Each Detailed_geometric_model_element is related to zero or more Associated_projection_curve objects.

NOTE - This assertion is established through associated_element_select.

4.3.187 B_rep to Closed_shell

Each B_rep (see 4.2.34) refers to exactly one Closed_shell (see 4.2.74) in the role of outer. Each Closed_shell acts as outer for zero or more B_rep objects.

Each B_rep refers to zero or more Closed_shell objects in the role of void. Each Closed_shell acts as void for zero or more B_rep objects.

4.3.188 B_rep_model to B_rep

Each B_rep_model (see 4.2.35) refers to zero or more B_rep (see 4.2.34) objects in the role of element. Each B_rep acts as element for zero or more B_rep_model objects.

4.3.189 Bead_feature to Bead_end_type

Each Bead_feature (see 4.2.39) refers to exactly two Bead_end_type (see 4.2.38) objects in the role of end_condition. Each Bead_end_type acts as end_condition for zero or more Bead_feature objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.190 Bead_feature to Feature_parameter

Each Bead_feature (see 4.2.39) refers to zero or one Feature_parameter (see 4.2.201) in the role of base_radius. Each Feature_parameter acts as base_radius for zero or more Bead_feature objects.

4.3.191 Bead_feature to Open_profile_usage

Each Bead_feature (see 4.2.39) refers to exactly one Open_profile_usage (see 4.2.329) in the role of bead_profile. Each Open_profile_usage acts as bead_profile for zero or more Bead_feature objects.

4.3.192 Bead_feature to Path

Each Bead_feature (see 4.2.39) refers to exactly one Path (see 4.2.342) in the role of sweep_path. Each Path acts as sweep_path for zero or more Bead_feature objects.

4.3.193 Boolean_result to B_rep_model

Each Boolean_result (see 4.2.41) refers to zero or one B_rep_model (see 4.2.35) in the role of first_operand. Each B_rep_model acts as first_operand for zero or more Boolean_result objects.

NOTE 1 - This assertion is established through boolean_operand_select, csg_select, and non_primitive_solid_select.

Each Boolean_result refers to zero or one B_rep_model in the role of second_operand. Each B_rep_model acts as second_operand for zero or more Boolean_result objects.

NOTE 2 - This assertion is established through boolean_operand_select, csg_select, and non_primitive_solid_select.

4.3.194 Boolean_result to Boolean_result

Each Boolean_result (see 4.2.41) refers to zero or one Boolean_result in the role of first_operand. Each Boolean_result acts as first_operand for zero or more Boolean_result objects.

NOTE 1 - This assertion is established through boolean_operand_select and csg_select.

Each Boolean_result refers to zero or one Boolean_result in the role of second_operand. Each Boolean_result acts as second_operand for zero or more Boolean_result objects.

NOTE 2 - This assertion is established through boolean_operand_select and csg_select.

4.3.195 Boolean_result to Csg_primitive

Each Boolean_result (see 4.2.41) refers to zero or one Csg_primitive (see 4.2.107) in the role of first_operand. Each Csg_primitive acts as first_operand for zero or more Boolean_result objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE 1 - This assertion is established through boolean_operand_select and csg_select.

Each Boolean_result refers to zero or one Csg_primitive in the role of second_operand. Each Csg_-primitive acts as second_operand for zero or more Boolean_result objects.

NOTE 2 - This assertion is established through boolean_operand_select and csg_select.

4.3.196 Boolean_result to Faceted_b_rep_model

Each Boolean_result (see 4.2.41) refers to zero or one Faceted_b_rep_model (see 4.2.196) in the role of first_operand. Each Faceted_b_rep_model acts as first_operand for zero or more Boolean_result objects.

NOTE 1 - This assertion is established through boolean_operand_select, csg_select, and non_primitive_-solid_select.

Each Boolean_result refers to zero or one Faceted_b_rep_model in the role of second_operand. Each Faceted_b_rep_model acts as second_operand for zero or more Boolean_result objects.

NOTE 2 - This assertion is established through boolean_operand_select, csg_select, and non_primitive_-solid_select.

4.3.197 Boolean_result to Half_space_solid

Each Boolean_result (see 4.2.41) refers to zero or one Half_space_solid (see 4.2.252) in the role of first_operand. Each Half_space_solid acts as first_operand for zero or more Boolean_result objects.

NOTE 1 - This assertion is established through boolean_operand_select.

Each Boolean_result refers to zero or one Half_space_solid in the role of second_operand. Each Half_-space_solid acts as second_operand for zero or more Boolean_result objects.

NOTE 2 - This assertion is established through boolean_operand_select.

4.3.198 Boolean_result to Solid_replica

Each Boolean_result (see 4.2.41) refers to zero or one Solid_replica (see 4.2.462) in the role of first_-operand. Each Solid_replica acts as first_operand for zero or more Boolean_result objects.

NOTE 1 - This assertion is established through boolean_operand_select, csg_select, and non_primitive_-solid_select.

Each Boolean_result refers to zero or one Solid_replica in the role of second_operand. Each Solid_-replica acts as second_operand for zero or more Boolean_result objects.

NOTE 2 - This assertion is established through boolean_operand_select, csg_select, and non_primitive_-solid_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.199 Boolean_result to Swept_face_solid

Each Boolean_result (see 4.2.41) refers to zero or one Swept_face_solid (see 4.2.502) in the role of first_operand. Each Swept_face_solid acts as first_operand for zero or more Boolean_result objects.

NOTE 1 - This assertion is established through boolean_operand_select, csg_select, and non_primitive_-solid_select.

Each Boolean_result refers to zero or one Swept_face_solid in the role of second_operand. Each Swept_-face_solid acts as second_operand for zero or more Boolean_result objects.

NOTE 2 - This assertion is established through boolean_operand_select, csg_select, and non_primitive_-solid_select.

4.3.200 Boss_feature to Angle_taper

Each Boss_feature (see 4.2.42) refers to zero or one Angle_taper (see 4.2.12) in the role of taper. Each Angle_taper acts as taper for zero or more Boss_feature objects.

NOTE - This assertion is established through taper_select.

4.3.201 Boss_feature to Boss_top_condition

Each Boss_feature (see 4.2.42) refers to exactly one Boss_top_condition (see 4.2.43) in the role of top_-condition. Each Boss_top_condition acts as top_condition for zero or more Boss_feature objects.

4.3.202 Boss_feature to Closed_profile_usage

Each Boss_feature (see 4.2.42) refers to exactly one Closed_profile_usage (see 4.2.73) in the role of boundary. Each Closed_profile_usage acts as boundary for zero or more Boss_feature objects.

4.3.203 Boss_feature to Diameter_taper

Each Boss_feature (see 4.2.42) refers to zero or one Diameter_taper (see 4.2.146) in the role of taper. Each Diameter_taper acts as taper for zero or more Boss_feature objects.

NOTE - This assertion is established through taper_select.

4.3.204 Boss_feature to Directed_taper

Each Boss_feature (see 4.2.42) refers to zero or one Directed_taper (see 4.2.154) in the role of taper. Each Directed_taper acts as taper for zero or more Boss_feature objects.

NOTE - This assertion is established through taper_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.205 Boss_feature to Feature_parameter

Each Boss_feature (see 4.2.42) refers to zero or one Feature_parameter (see 4.2.201) in the role of base_radius. Each Feature_parameter acts as base_radius for zero or more Boss_feature objects.

4.3.206 Boss_feature to Linear_path

Each Boss_feature (see 4.2.42) refers to exactly one Linear_path (see 4.2.300) in the role of boss_height. Each Linear_path acts as boss_height for zero or more Boss_feature objects.

4.3.207 Boss_top_condition to Feature_parameter

Each Boss_top_condition (see 4.2.43) refers to zero or one Feature_parameter (see 4.2.201) in the role of top_radius. Each Feature_parameter acts as top_radius for zero or more Boss_top_condition objects.

4.3.208 Cartesian_coordinate_space to Unit

Each Cartesian_coordinate_space (see 4.2.44) refers to zero or more Unit (see 4.2.541) objects in the role of unit_of_values. Each Unit acts as unit_of_values for zero or more Cartesian_coordinate_space objects.

4.3.209 Centre_of_mass to Cartesian_coordinate_space

Each Centre_of_mass (see 4.2.49) is_defined_in exactly one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more Centre_of_mass objects.

4.3.210 Certification to Item_instance

Each Certification (see 4.2.50) is_applied_to zero or more Item_instance (see 4.2.271) objects. Each Item_instance is related to zero or more Certification objects.

NOTE - This assertion is established through certified_element_select.

4.3.211 Certification to Item_version

Each Certification (see 4.2.50) is_applied_to zero or more Item_version (see 4.2.275) objects. Each Item_version is related to zero or more Certification objects.

NOTE - This assertion is established through certified_element_select.

4.3.212 Certification to Item_version_relationship

Each Certification (see 4.2.50) is_applied_to zero or more Item_version_relationship (see 4.2.276) objects. Each Item_version_relationship is related to zero or more Certification objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through certified_element_select.

4.3.213 Certification to Multi_language_string

Each Certification (see 4.2.50) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Certification objects.

NOTE 1 - This assertion is established through string_select.

Each Certification refers to zero or one Multi_language_string in the role of purpose. Each Multi_-language_string acts as purpose for zero or more Certification objects.

NOTE 2 - This assertion is established through string_select.

4.3.214 Certification to Supplier_solution

Each Certification (see 4.2.50) is_applied_to zero or more Supplier_solution (see 4.2.488) objects. Each Supplier_solution is related to zero or more Certification objects.

NOTE - This assertion is established through certified_element_select.

4.3.215 Chamfer to Chamfer_definition

Each Chamfer (see 4.2.51) is_defined_by exactly one Chamfer_definition (see 4.2.53). Each Chamfer_-definition is related to zero or more Chamfer objects.

4.3.216 Chamfer to Face

Each Chamfer (see 4.2.51) refers to exactly one Face (see 4.2.191) in the role of chamfer_face. Each Face acts as chamfer_face for zero or more Chamfer objects.

4.3.217 Chamfer_angle to Feature_parameter

Each Chamfer_angle (see 4.2.52) refers to exactly one Feature_parameter (see 4.2.201) in the role of angle. Each Feature_parameter acts as angle for zero or more Chamfer_angle objects.

4.3.218 Chamfer_definition to Chamfer_angle

Each Chamfer_definition (see 4.2.53) refers to zero or one Chamfer_angle (see 4.2.52) in the role of value_2. Each Chamfer_angle acts as value_2 for zero or more Chamfer_definition objects.

NOTE - This assertion is established through chamfer_value_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.219 Chamfer_definition to Chamfer_offset

Each Chamfer_definition (see 4.2.53) refers to exactly one Chamfer_offset (see 4.2.54) in the role of offset_1. Each Chamfer_offset acts as offset_1 for zero or more Chamfer_definition objects.

Each Chamfer_definition refers to zero or one Chamfer_offset in the role of value_2. Each Chamfer_-offset acts as value_2 for zero or more Chamfer_definition objects.

NOTE - This assertion is established through chamfer_value_select.

4.3.220 Chamfer_offset to Feature_parameter

Each Chamfer_offset (see 4.2.54) refers to exactly one Feature_parameter (see 4.2.201) in the role of offset. Each Feature_parameter acts as offset for zero or more Chamfer_offset objects.

4.3.221 Change to Complex_product_relationship

Each Change (see 4.2.55) refers to zero or one Complex_product_relationship (see 4.2.81) in the role of described_change. Each Complex_product_relationship acts as described_change for zero or more Change objects.

NOTE - This assertion is established through change_relationship_select.

4.3.222 Change to Design_constraint_relationship

Each Change (see 4.2.55) refers to zero or one Design_constraint_relationship (see 4.2.140) in the role of described_change. Each Design_constraint_relationship acts as described_change for zero or more Change objects.

NOTE - This assertion is established through change_relationship_select.

4.3.223 Change to Item_version_relationship

Each Change (see 4.2.55) refers to zero or one Item_version_relationship (see 4.2.276) in the role of described_change. Each Item_version_relationship acts as described_change for zero or more Change objects.

NOTE - This assertion is established through change_relationship_select.

4.3.224 Change to Multi_language_string

Each Change (see 4.2.55) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Change objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.225 Change to Process_operation_occurrence_relationship

Each Change (see 4.2.55) refers to zero or one Process_operation_occurrence_relationship (see 4.2.385) in the role of described_change. Each Process_operation_occurrence_relationship acts as described_change for zero or more Change objects.

NOTE - This assertion is established through change_relationship_select.

4.3.226 Change to Process_plan_relationship

Each Change (see 4.2.55) refers to zero or one Process_plan_relationship (see 4.2.388) in the role of described_change. Each Process_plan_relationship acts as described_change for zero or more Change objects.

NOTE - This assertion is established through change_relationship_select.

4.3.227 Change to Replaced_definition_relationship

Each Change (see 4.2.55) refers to zero or one Replaced_definition_relationship (see 4.2.430) in the role of described_change. Each Replaced_definition_relationship acts as described_change for zero or more Change objects.

NOTE - This assertion is established through change_relationship_select.

4.3.228 Change to Replaced_usage_relationship

Each Change (see 4.2.55) refers to zero or one Replaced_usage_relationship (see 4.2.431) in the role of described_change. Each Replaced_usage_relationship acts as described_change for zero or more Change objects.

NOTE - This assertion is established through change_relationship_select.

4.3.229 Change to Shape_element_relationship

Each Change (see 4.2.55) refers to zero or one Shape_element_relationship (see 4.2.450) in the role of described_change. Each Shape_element_relationship acts as described_change for zero or more Change objects.

NOTE - This assertion is established through change_relationship_select.

4.3.230 Circular_closed_profile to Feature_parameter

Each Circular_closed_profile (see 4.2.58) refers to exactly one Feature_parameter (see 4.2.201) in the role of diameter. Each Feature_parameter acts as diameter for zero or more Circular_closed_profile objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.231 Circular_path to Feature_parameter

Each Circular_path (see 4.2.61) refers to exactly one Feature_parameter (see 4.2.201) in the role of radius. Each Feature_parameter acts as radius for zero or more Circular_path objects.

4.3.232 Circular_pattern to Circular_offset_pattern

Each Circular_pattern (see 4.2.62) refers to zero or more Circular_offset_pattern (see 4.2.59) objects in the role of relocated_feature. Each Circular_offset_pattern has base_feature defined by one or more Circular_pattern objects.

4.3.233 Circular_pattern to Circular_omit_pattern

Each Circular_pattern (see 4.2.62) refers to zero or more Circular_omit_pattern (see 4.2.60) objects in the role of missing_feature. Each Circular_omit_pattern has base_feature defined by one or more Circular_pattern objects.

4.3.234 Circular_pattern to Feature_parameter

Each Circular_pattern (see 4.2.62) refers to exactly one Feature_parameter (see 4.2.201) in the role of angular_spacing. Each Feature_parameter acts as angular_spacing for zero or more Circular_pattern objects.

Each Circular_pattern refers to zero or one Feature_parameter in the role of diameter. Each Feature_-parameter acts as diameter for zero or more Circular_pattern objects.

Each Circular_pattern refers to zero or one Feature_parameter in the role of rotation. Each Feature_-parameter acts as rotation for zero or more Circular_pattern objects.

4.3.235 Circular_runout_tolerance to Datum

Each Circular_runout_tolerance (see 4.2.63) refers to one or two Datum (see 4.2.123) objects in the role of reference_datum. Each Datum acts as reference_datum for zero or more Circular_runout_tolerance objects.

4.3.236 Class_category_association to Product_class

Each Class_category_association (see 4.2.64) refers to exactly one Product_class (see 4.2.392) in the role of associated_product_class. Each Product_class acts as associated_product_class for zero or more Class_category_association objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.237 Class_category_association to Specification_category

Each Class_category_association (see 4.2.64) refers to exactly one Specification_category (see 4.2.468) in the role of associated_category. Each Specification_category acts as associated_category for zero or more Class_category_association objects.

4.3.238 Class_condition_association to Multi_language_string

Each Class_condition_association (see 4.2.65) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Class_-condition_association objects.

NOTE - This assertion is established through string_select.

4.3.239 Class_condition_association to Product_class

Each Class_condition_association (see 4.2.65) refers to exactly one Product_class (see 4.2.392) in the role of associated_product_class. Each Product_class acts as associated_product_class for zero or more Class_condition_association objects.

4.3.240 Class_condition_association to Specification_expression

Each Class_condition_association (see 4.2.65) refers to exactly one Specification_expression (see 4.2.470) in the role of associated_condition. Each Specification_expression acts as associated_condition for zero or more Class_condition_association objects.

4.3.241 Class_inclusion_association to Multi_language_string

Each Class_inclusion_association (see 4.2.66) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Class_-inclusion_association objects.

NOTE - This assertion is established through string_select.

4.3.242 Class_inclusion_association to Product_class

Each Class_inclusion_association (see 4.2.66) refers to exactly one Product_class (see 4.2.392) in the role of associated_product_class. Each Product_class acts as associated_product_class for zero or more Class_inclusion_association objects.

4.3.243 Class_inclusion_association to Specification_inclusion

Each Class_inclusion_association (see 4.2.66) refers to exactly one Specification_inclusion (see 4.2.471) in the role of associated_inclusion. Each Specification_inclusion acts as associated_inclusion for zero or more Class_inclusion_association objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.244 Class_specification_association to Product_class

Each Class_specification_association (see 4.2.67) refers to exactly one Product_class (see 4.2.392) in the role of associated_product_class. Each Product_class acts as associated_product_class for zero or more Class_specification_association objects.

4.3.245 Class_specification_association to Specification

Each Class_specification_association (see 4.2.67) refers to exactly one Specification (see 4.2.467) in the role of associated_specification. Each Specification acts as associated_specification for zero or more Class_specification_association objects.

4.3.246 Class_structure_relationship to Multi_language_string

Each Class_structure_relationship (see 4.2.68) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Class_-structure_relationship objects.

NOTE - This assertion is established through string_select.

4.3.247 Class_structure_relationship to Product_class

Each Class_structure_relationship (see 4.2.68) is relating to exactly one Product_class (see 4.2.392). Each Product_class is referenced by zero or more Class_structure_relationship objects as relating.

NOTE - The relating Product_class is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.248 Class_structure_relationship to Product_component

Each Class_structure_relationship (see 4.2.68) is related to zero or one Product_component (see 4.2.394). Each Product_component is referenced by zero or more Class_structure_relationship objects as related.

NOTE 1 - The related Product_component is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

NOTE 2 - This assertion is established through product_function_component_select.

4.3.249 Class_structure_relationship to Product_function

Each Class_structure_relationship (see 4.2.68) is related to zero or one Product_function (see 4.2.397). Each Product_function is referenced by zero or more Class_structure_relationship objects as related.

NOTE 1 - The related Product_function is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE 2 - This assertion is established through product_function_component_select.

4.3.250 Classification_association to Activity

Each Classification_association (see 4.2.69) refers to zero or one Activity (see 4.2.2) in the role of classified_element. Each Activity acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.251 Classification_association to Activity_method

Each Classification_association (see 4.2.69) refers to zero or one Activity_method (see 4.2.4) in the role of classified_element. Each Activity_method acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.252 Classification_association to Approval_status

Each Classification_association (see 4.2.69) refers to zero or one Approval_status (see 4.2.24) in the role of classified_element. Each Approval_status acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.253 Classification_association to Catalogue_thread

Each Classification_association (see 4.2.69) refers to zero or one Catalogue_thread (see 4.2.48) in the role of classified_element. Each Catalogue_thread acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.254 Classification_association to Complex_product

Each Classification_association (see 4.2.69) refers to zero or one Complex_product (see 4.2.80) in the role of classified_element. Each Complex_product acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.255 Classification_association to Contract

Each Classification_association (see 4.2.69) refers to zero or one Contract (see 4.2.104) in the role of classified_element. Each Contract acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.256 Classification_association to Design_constraint

Each Classification_association (see 4.2.69) refers to zero or one Design_constraint (see 4.2.138) in the role of classified_element. Each Design_constraint acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.257 Classification_association to Design_discipline_item_definition

Each Classification_association (see 4.2.69) refers to zero or one Design_discipline_item_definition (see 4.2.142) in the role of classified_element. Each Design_discipline_item_definition acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.258 Classification_association to Document

Each Classification_association (see 4.2.69) refers to zero or one Document (see 4.2.155) in the role of classified_element. Each Document acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.259 Classification_association to Document_file

Each Classification_association (see 4.2.69) refers to zero or one Document_file (see 4.2.159) in the role of classified_element. Each Document_file acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.260 Classification_association to Document_representation

Each Classification_association (see 4.2.69) refers to zero or one Document_representation (see 4.2.163) in the role of classified_element. Each Document_representation acts as classified_element for zero or more Classification_association objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through classified_element_select.

4.3.261 Classification_association to Document_version

Each Classification_association (see 4.2.69) refers to zero or one Document_version (see 4.2.167) in the role of classified_element. Each Document_version acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.262 Classification_association to Feature_definition

Each Classification_association (see 4.2.69) refers to zero or one Feature_definition (see 4.2.199) in the role of classified_element. Each Feature_definition acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.263 Classification_association to General_classification

Each Classification_association (see 4.2.69) refers to exactly one General_classification (see 4.2.216) in the role of associated_classification. Each General_classification acts as associated_classification for zero or more Classification_association objects.

4.3.264 Classification_association to General_feature

Each Classification_association (see 4.2.69) refers to zero or one General_feature (see 4.2.221) in the role of classified_element. Each General_feature acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.265 Classification_association to Item

Each Classification_association (see 4.2.69) refers to zero or one Item (see 4.2.267) in the role of classified_element. Each Item acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.266 Classification_association to Item_instance

Each Classification_association (see 4.2.69) refers to zero or one Item_instance (see 4.2.271) in the role of classified_element. Each Item_instance acts as classified_element for zero or more Classification_association objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through classified_element_select.

4.3.267 Classification_association to Item_version

Each Classification_association (see 4.2.69) refers to zero or one Item_version (see 4.2.275) in the role of classified_element. Each Item_version acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.268 Classification_association to Material

Each Classification_association (see 4.2.69) refers to zero or one Material (see 4.2.309) in the role of classified_element. Each Material acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.269 Classification_association to Process_operation_definition

Each Classification_association (see 4.2.69) refers to zero or one Process_operation_definition (see 4.2.381) in the role of classified_element. Each Process_operation_definition acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.270 Classification_association to Process_operation_occurrence

Each Classification_association (see 4.2.69) refers to zero or one Process_operation_occurrence (see 4.2.384) in the role of classified_element. Each Process_operation_occurrence acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.271 Classification_association to Process_plan

Each Classification_association (see 4.2.69) refers to zero or one Process_plan (see 4.2.387) in the role of classified_element. Each Process_plan acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.272 Classification_association to Product_class

Each Classification_association (see 4.2.69) refers to zero or one Product_class (see 4.2.392) in the role of classified_element. Each Product_class acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.273 Classification_association to Product_identification

Each Classification_association (see 4.2.69) refers to zero or one Product_identification (see 4.2.398) in the role of classified_element. Each Product_identification acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.274 Classification_association to Project

Each Classification_association (see 4.2.69) refers to zero or one Project (see 4.2.404) in the role of classified_element. Each Project acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.275 Classification_association to Property

Each Classification_association (see 4.2.69) refers to zero or one Property (see 4.2.409) in the role of classified_element. Each Property acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.276 Classification_association to Property_value_association

Each Classification_association (see 4.2.69) refers to zero or one Property_value_association (see 4.2.413) in the role of classified_element. Each Property_value_association acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.277 Classification_association to Security_level

Each Classification_association (see 4.2.69) refers to zero or one Security_level (see 4.2.444) in the role of classified_element. Each Security_level acts as classified_element for zero or more Classification_association objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through classified_element_select.

4.3.278 Classification_association to Shape_element

Each Classification_association (see 4.2.69) refers to zero or one Shape_element (see 4.2.449) in the role of classified_element. Each Shape_element acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.279 Classification_association to Specification_category

Each Classification_association (see 4.2.69) refers to zero or one Specification_category (see 4.2.468) in the role of classified_element. Each Specification_category acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.280 Classification_association to Thread_feature

Each Classification_association (see 4.2.69) refers to zero or one Thread_feature (see 4.2.517) in the role of classified_element. Each Thread_feature acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.281 Classification_association to Transition_feature

Each Classification_association (see 4.2.69) refers to zero or one Transition_feature (see 4.2.537) in the role of classified_element. Each Transition_feature acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.282 Classification_association to Work_order

Each Classification_association (see 4.2.69) refers to zero or one Work_order (see 4.2.564) in the role of classified_element. Each Work_order acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.283 Classification_association to Work_request

Each Classification_association (see 4.2.69) refers to zero or one Work_request (see 4.2.565) in the role of classified_element. Each Work_request acts as classified_element for zero or more Classification_association objects.

NOTE - This assertion is established through classified_element_select.

4.3.284 Classification_attribute to General_classification

Each Classification_attribute (see 4.2.70) refers to exactly one General_classification (see 4.2.216) in the role of associated_classification. Each General_classification acts as associated_classification for zero or more Classification_attribute objects.

4.3.285 Classification_attribute to Multi_language_string

Each Classification_attribute (see 4.2.70) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Classification_attribute objects.

NOTE 1 - This assertion is established through string_select.

Each Classification_attribute refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Classification_attribute objects.

NOTE 2 - This assertion is established through string_select.

4.3.286 Classification_attribute to Property

Each Classification_attribute (see 4.2.70) refers to exactly one Property (see 4.2.409) in the role of attribute_definition. Each Property acts as attribute_definition for zero or more Classification_attribute objects.

4.3.287 Classification_attribute to Property_value_representation

Each Classification_attribute (see 4.2.70) refers to zero or more Property_value_representation (see 4.2.414) objects in the role of allowed_value. Each Property_value_representation acts as allowed_value for zero or more Classification_attribute objects.

4.3.288 Classification_system to Multi_language_string

Each Classification_system (see 4.2.71) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Classification_system objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through string_select.

4.3.289 Closed_profile_usage to Closed_profile

Each Closed_profile_usage (see 4.2.73) refers to exactly one Closed_profile (see 4.2.72) in the role of used_profile. Each Closed_profile acts as used_profile for zero or more Closed_profile_usage objects.

4.3.290 Closed_shell to Face

Each Closed_shell (see 4.2.74) refers to one or more Face (see 4.2.191) objects in the role of shell_boundary. Each Face acts as shell_boundary for zero or more Closed_shell objects.

4.3.291 Coating_layer to Material

Each Coating_layer (see 4.2.75) refers to exactly one Material (see 4.2.309) in the role of used_material. Each Material acts as used_material for zero or more Coating_layer objects.

4.3.292 Coating_layer to Thickness_dimension

Each Coating_layer (see 4.2.75) refers to zero or one Thickness_dimension (see 4.2.516) in the role of thickness. Each Thickness_dimension acts as thickness for zero or more Coating_layer objects.

4.3.293 Coaxiality_tolerance to Datum

Each Coaxiality_tolerance (see 4.2.76) refers to one or two Datum (see 4.2.123) objects in the role of reference_datum. Each Datum acts as reference_datum for zero or more Coaxiality_tolerance objects.

4.3.294 Collected_item_association to Collection_definition

Each Collected_item_association (see 4.2.77) is relating to exactly one Collection_definition (see 4.2.78). Each Collection_definition has collected_items defined by two or more Collected_item_association objects.

NOTE - The relating Collection_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.295 Collection_definition to Multi_language_string

Each Collection_definition (see 4.2.78) refers to zero or one Multi_language_string (see 4.2.320) in the role of purpose. Each Multi_language_string acts as purpose for zero or more Collection_definition objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.296 Complex_product_relationship to Complex_product

Each Complex_product_relationship (see 4.2.81) is related to exactly one Complex_product (see 4.2.80). Each Complex_product is referenced by zero or more Complex_product_relationship objects as related.

NOTE 1 - The related Complex_product is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Complex_product_relationship is relating to exactly one Complex_product. Each Complex_product is referenced by zero or more Complex_product_relationship objects as relating.

NOTE 2 - The relating Complex_product is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.297 Complex_product_relationship to Multi_language_string

Each Complex_product_relationship (see 4.2.81) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Complex_product_relationship objects.

NOTE - This assertion is established through string_select.

4.3.298 Component_placement to Geometric_model_relationship_with_transformation

Each Component_placement (see 4.2.82) refers to zero or one Geometric_model_relationship_with_transformation (see 4.2.240) in the role of placement. Each Geometric_model_relationship_with_transformation acts as placement for zero or more Component_placement objects.

NOTE - This assertion is established through transformation_select.

4.3.299 Component_placement to Product_component

Each Component_placement (see 4.2.82) refers to exactly one Product_component (see 4.2.394) in the role of placed_component. Each Product_component acts as placed_component for zero or more Component_placement objects.

Each Component_placement refers to exactly one Product_component in the role of reference_product_component. Each Product_component acts as reference_product_component for zero or more Component_placement objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.300 Component_placement to Template_instance

Each Component_placement (see 4.2.82) refers to zero or one Template_instance (see 4.2.512) in the role of placement. Each Template_instance acts as placement for zero or more Component_placement objects.

NOTE - This assertion is established through transformation_select.

4.3.301 Compound_datum to Single_datum

Each Compound_datum (see 4.2.84) is_made_up_by exactly two Single_datum (see 4.2.454) objects. Each Single_datum is related to zero or more Compound_datum objects.

4.3.302 Compound_feature_in_panel_element to Compound_feature_in_panel

Each Compound_feature_in_panel_element (see 4.2.86) is_element_for exactly one Compound_feature_in_panel (see 4.2.85). Each Compound_feature_in_panel has element defined by two or more Compound_feature_in_panel_element objects.

4.3.303 Compound_feature_in_panel_element to Process_feature_in_panel

Each Compound_feature_in_panel_element (see 4.2.86) refers to zero or one Process_feature_in_panel (see 4.2.379) in the role of feature. Each Process_feature_in_panel acts as feature for zero or more Compound_feature_in_panel_element objects.

NOTE - This assertion is established through compound_in_panel_select.

4.3.304 Compound_feature_in_panel_element to Transformation

Each Compound_feature_in_panel_element (see 4.2.86) refers to zero or one Transformation (see 4.2.533) in the role of element_placement. Each Transformation acts as element_placement for zero or more Compound_feature_in_panel_element objects.

4.3.305 Compound_feature_in_panel_element to Transition_feature

Each Compound_feature_in_panel_element (see 4.2.86) refers to zero or one Transition_feature (see 4.2.537) in the role of feature. Each Transition_feature acts as feature for zero or more Compound_-feature_in_panel_element objects.

NOTE - This assertion is established through compound_in_panel_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.306 Compound_feature_in_panel_element_relationship to Compound_feature_in_panel_element

Each Compound_feature_in_panel_element_relationship (see 4.2.87) refers to exactly one Compound_feature_in_panel_element (see 4.2.86) in the role of predecessor. Each Compound_feature_in_panel_element acts as predecessor for zero or more Compound_feature_in_panel_element_relationship objects.

Each Compound_feature_in_panel_element_relationship refers to exactly one Compound_feature_in_panel_element in the role of successor. Each Compound_feature_in_panel_element acts as successor for zero or more Compound_feature_in_panel_element_relationship objects.

4.3.307 Compound_feature_in_solid_element to Compound_feature_in_solid

Each Compound_feature_in_solid_element (see 4.2.89) is_element_for exactly one Compound_feature_in_solid (see 4.2.88). Each Compound_feature_in_solid has element defined by two or more Compound_feature_in_solid_element objects.

4.3.308 Compound_feature_in_solid_element to Process_feature_in_solid

Each Compound_feature_in_solid_element (see 4.2.89) refers to zero or one Process_feature_in_solid (see 4.2.380) in the role of feature. Each Process_feature_in_solid acts as feature for zero or more Compound_feature_in_solid_element objects.

NOTE - This assertion is established through compound_in_solid_select.

4.3.309 Compound_feature_in_solid_element to Thread_feature

Each Compound_feature_in_solid_element (see 4.2.89) refers to zero or one Thread_feature (see 4.2.517) in the role of feature. Each Thread_feature acts as feature for zero or more Compound_feature_in_solid_element objects.

NOTE - This assertion is established through compound_in_solid_select.

4.3.310 Compound_feature_in_solid_element to Transformation

Each Compound_feature_in_solid_element (see 4.2.89) refers to zero or one Transformation (see 4.2.533) in the role of element_placement. Each Transformation acts as element_placement for zero or more Compound_feature_in_solid_element objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.311 Compound_feature_in_solid_element to Transition_feature

Each Compound_feature_in_solid_element (see 4.2.89) refers to zero or one Transition_feature (see 4.2.537) in the role of feature. Each Transition_feature acts as feature for zero or more Compound_-feature_in_solid_element objects.

NOTE - This assertion is established through compound_in_solid_select.

4.3.312 Compound_feature_in_solid_element_relationship to Compound_feature_in_solid_element

Each Compound_feature_in_solid_element_relationship (see 4.2.90) refers to exactly one Compound_-feature_in_solid_element (see 4.2.89) in the role of predecessor. Each Compound_feature_in_solid_-element acts as predecessor for zero or more Compound_feature_in_solid_element_relationship objects.

Each Compound_feature_in_solid_element_relationship refers to exactly one Compound_feature_in_-solid_element in the role of successor. Each Compound_feature_in_solid_element acts as successor for zero or more Compound_feature_in_solid_element_relationship objects.

4.3.313 Compound_model to Topologically_connected_set

Each Compound_model (see 4.2.92) refers to zero or more Topologically_connected_set (see 4.2.529) objects in the role of element. Each Topologically_connected_set acts as element for zero or more Compound_model objects.

4.3.314 Concentricity_tolerance to Datum

Each Concentricity_tolerance (see 4.2.93) refers to exactly one Datum (see 4.2.123) in the role of reference_datum. Each Datum acts as reference_datum for zero or more Concentricity_tolerance objects.

4.3.315 Configuration to Alternative_solution

Each Configuration (see 4.2.94) refers to zero or one Alternative_solution (see 4.2.10) in the role of configured_element. Each Alternative_solution acts as configured_element for zero or more Configuration objects.

NOTE - This assertion is established through configured_item_select and complex_product_select.

4.3.316 Configuration to Class_condition_association

Each Configuration (see 4.2.94) is_solution_for zero or one Class_condition_association (see 4.2.65). Each Class_condition_association is related to zero or more Configuration objects.

NOTE - This assertion is established through configured_specification_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.317 Configuration to Class_specification_association

Each Configuration (see 4.2.94) is_solution_for zero or one Class_specification_association (see 4.2.67). Each Class_specification_association is related to zero or more Configuration objects.

NOTE - This assertion is established through configured_specification_select.

4.3.318 Configuration to Item_instance

Each Configuration (see 4.2.94) refers to zero or one Item_instance (see 4.2.271) in the role of configured_element. Each Item_instance acts as configured_element for zero or more Configuration objects.

NOTE - This assertion is established through configured_item_select.

4.3.319 Configuration to Process_operation_occurrence

Each Configuration (see 4.2.94) refers to zero or one Process_operation_occurrence (see 4.2.384) in the role of configured_element. Each Process_operation_occurrence acts as configured_element for zero or more Configuration objects.

NOTE - This assertion is established through configured_item_select.

4.3.320 Configuration to Process_plan

Each Configuration (see 4.2.94) refers to zero or one Process_plan (see 4.2.387) in the role of configured_element. Each Process_plan acts as configured_element for zero or more Configuration objects.

NOTE - This assertion is established through configured_item_select.

4.3.321 Configuration to Product_component

Each Configuration (see 4.2.94) refers to zero or one Product_component (see 4.2.394) in the role of configured_element. Each Product_component acts as configured_element for zero or more Configuration objects.

NOTE - This assertion is established through configured_item_select and complex_product_select.

4.3.322 Configuration to Product_function

Each Configuration (see 4.2.94) refers to zero or one Product_function (see 4.2.397) in the role of configured_element. Each Product_function acts as configured_element for zero or more Configuration objects.

NOTE - This assertion is established through configured_item_select and complex_product_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.323 Conical_bottom to Feature_parameter

Each Conical_bottom (see 4.2.95) refers to exactly one Feature_parameter (see 4.2.201) in the role of tip_angle. Each Feature_parameter acts as tip_angle for zero or more Conical_bottom objects.

Each Conical_bottom refers to zero or one Feature_parameter in the role of tip_radius. Each Feature_-parameter acts as tip_radius for zero or more Conical_bottom objects.

4.3.324 Constant_radius_edge_round to Feature_parameter

Each Constant_radius_edge_round (see 4.2.97) refers to zero or one Feature_parameter (see 4.2.201) in the role of first_offset. Each Feature_parameter acts as first_offset for zero or more Constant_radius_-edge_round objects.

Each Constant_radius_edge_round refers to exactly one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Constant_radius_edge_round objects.

Each Constant_radius_edge_round refers to zero or one Feature_parameter in the role of second_offset. Each Feature_parameter acts as second_offset for zero or more Constant_radius_edge_round objects.

4.3.325 Constant_radius_fillet to Feature_parameter

Each Constant_radius_fillet (see 4.2.98) refers to zero or one Feature_parameter (see 4.2.201) in the role of first_offset. Each Feature_parameter acts as first_offset for zero or more Constant_radius_fillet objects.

Each Constant_radius_fillet refers to exactly one Feature_parameter in the role of radius. Each Feature_-parameter acts as radius for zero or more Constant_radius_fillet objects.

Each Constant_radius_fillet refers to zero or one Feature_parameter in the role of second_offset. Each Feature_parameter acts as second_offset for zero or more Constant_radius_fillet objects.

4.3.326 Constructive_geometric_element to Axis_placement

Each Constructive_geometric_element (see 4.2.99) refers to zero or one Axis_placement (see 4.2.33) in the role of element. Each Axis_placement acts as element for zero or more Constructive_geometric_-element objects.

NOTE - This assertion is established through constructive_element_select.

4.3.327 Constructive_geometric_element to Curve

Each Constructive_geometric_element (see 4.2.99) refers to zero or one Curve (see 4.2.108) in the role of element. Each Curve acts as element for zero or more Constructive_geometric_element objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through constructive_element_select.

4.3.328 Constructive_geometric_element to Face

Each Constructive_geometric_element (see 4.2.99) refers to zero or one Face (see 4.2.191) in the role of element. Each Face acts as element for zero or more Constructive_geometric_element objects.

NOTE - This assertion is established through constructive_element_select.

4.3.329 Constructive_geometric_element to Multi_language_string

Each Constructive_geometric_element (see 4.2.99) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Constructive_geometric_element objects.

NOTE - This assertion is established through string_select.

4.3.330 Constructive_geometric_element to Oriented_edge_curve

Each Constructive_geometric_element (see 4.2.99) refers to zero or one Oriented_edge_curve (see 4.2.334) in the role of element. Each Oriented_edge_curve acts as element for zero or more Constructive_geometric_element objects.

NOTE - This assertion is established through constructive_element_select.

4.3.331 Constructive_geometric_element to Point

Each Constructive_geometric_element (see 4.2.99) refers to zero or one Point (see 4.2.367) in the role of element. Each Point acts as element for zero or more Constructive_geometric_element objects.

NOTE - This assertion is established through constructive_element_select.

4.3.332 Constructive_geometric_element to Surface

Each Constructive_geometric_element (see 4.2.99) refers to zero or one Surface (see 4.2.489) in the role of element. Each Surface acts as element for zero or more Constructive_geometric_element objects.

NOTE - This assertion is established through constructive_element_select.

4.3.333 Constructive_geometric_element to Vertex_point

Each Constructive_geometric_element (see 4.2.99) refers to zero or one Vertex_point (see 4.2.553) in the role of element. Each Vertex_point acts as element for zero or more Constructive_geometric_element objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through constructive_element_select.

4.3.334 Constructive_geometry to Constructive_geometric_element

Each Constructive_geometry (see 4.2.100) refers to one or more Constructive_geometric_element (see 4.2.99) objects in the role of element. Each Constructive_geometric_element has geometry defined by one or more Constructive_geometry objects.

4.3.335 Constructive_geometry to Multi_language_string

Each Constructive_geometry (see 4.2.100) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Constructive_geometry objects.

NOTE - This assertion is established through string_select.

4.3.336 Constructive_geometry_association to Constructive_geometry

Each Constructive_geometry_association (see 4.2.101) refers to exactly one Constructive_geometry (see 4.2.100) in the role of auxiliary_geometry. Each Constructive_geometry has associated_model defined by one or more Constructive_geometry_association objects.

Each Constructive_geometry_association refers to zero or one Constructive_geometry in the role of base_geometry. Each Constructive_geometry has associated_model defined by one or more Constructive_geometry_association objects.

NOTE - This assertion is established through constructive_geometry_select.

4.3.337 Constructive_geometry_association to Geometric_model

Each Constructive_geometry_association (see 4.2.101) refers to zero or one Geometric_model (see 4.2.238) in the role of base_geometry. Each Geometric_model acts as base_geometry for zero or more Constructive_geometry_association objects.

NOTE - This assertion is established through constructive_geometry_select.

4.3.338 Constructive_geometry_association to Multi_language_string

Each Constructive_geometry_association (see 4.2.101) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Constructive_geometry_association objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.339 Contact_ratio to Physical_model

Each Contact_ratio (see 4.2.102) refers to exactly one Physical_model (see 4.2.354) in the role of measuring_gauge. Each Physical_model acts as measuring_gauge for zero or more Contact_ratio objects.

4.3.340 Contact_ratio to Value_with_unit

Each Contact_ratio (see 4.2.102) refers to exactly one Value_with_unit (see 4.2.549) in the role of ratio_value. Each Value_with_unit acts as ratio_value for zero or more Contact_ratio objects.

4.3.341 Context_dependent_appearance_assignment to Drawing_sheet

Each Context_dependent_appearance_assignment (see 4.2.103) refers to zero or one Drawing_sheet (see 4.2.173) in the role of appearance_context. Each Drawing_sheet acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE - This assertion is established through appearance_context_select and area_select.

4.3.342 Context_dependent_appearance_assignment to Group

Each Context_dependent_appearance_assignment (see 4.2.103) refers to zero or one Group (see 4.2.250) in the role of appearance_context. Each Group acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE - This assertion is established through appearance_context_select and structuring_method_select.

4.3.343 Context_dependent_appearance_assignment to Layer

Each Context_dependent_appearance_assignment (see 4.2.103) refers to zero or one Layer (see 4.2.292) in the role of appearance_context. Each Layer acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE - This assertion is established through appearance_context_select and structuring_method_select.

4.3.344 Context_dependent_appearance_assignment to Model_image

Each Context_dependent_appearance_assignment (see 4.2.103) refers to zero or one Model_image (see 4.2.316) in the role of appearance_context. Each Model_image acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE - This assertion is established through appearance_context_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.345 Context_dependent_appearance_assignment to View

Each Context_dependent_appearance_assignment (see 4.2.103) refers to zero or one View (see 4.2.554) in the role of appearance_context. Each View acts as appearance_context for zero or more Context_-dependent_appearance_assignment objects.

NOTE - This assertion is established through appearance_context_select.

4.3.346 Context_dependent_appearance_assignment to View_area

Each Context_dependent_appearance_assignment (see 4.2.103) refers to zero or one View_area (see 4.2.555) in the role of appearance_context. Each View_area acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE - This assertion is established through appearance_context_select and area_select.

4.3.347 Contract to Activity

Each Contract (see 4.2.104) refers to zero or more Activity (see 4.2.2) objects in the role of contracted_-element. Each Activity acts as contracted_element for zero or more Contract objects.

NOTE - This assertion is established through contracted_element_select.

4.3.348 Contract to Drawing

Each Contract (see 4.2.104) refers to zero or more Drawing (see 4.2.170) objects in the role of contracted_element. Each Drawing acts as contracted_element for zero or more Contract objects.

NOTE - This assertion is established through contracted_element_select.

4.3.349 Contract to Item_version

Each Contract (see 4.2.104) refers to zero or more Item_version (see 4.2.275) objects in the role of contracted_element. Each Item_version acts as contracted_element for zero or more Contract objects.

NOTE - This assertion is established through contracted_element_select.

4.3.350 Contract to Multi_language_string

Each Contract (see 4.2.104) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Contract objects.

NOTE - This assertion is established through string_select.

4.3.351 Csg_model to B_rep_model

Each Csg_model (see 4.2.106) refers to zero or more B_rep_model (see 4.2.35) objects in the role of tree_root_expression. Each B_rep_model acts as tree_root_expression for zero or more Csg_model objects.

NOTE - This assertion is established through csg_select and non_primitive_solid_select.

4.3.352 Csg_model to Boolean_result

Each Csg_model (see 4.2.106) refers to zero or more Boolean_result (see 4.2.41) objects in the role of tree_root_expression. Each Boolean_result acts as tree_root_expression for zero or more Csg_model objects.

NOTE - This assertion is established through csg_select.

4.3.353 Csg_model to Csg_primitive

Each Csg_model (see 4.2.106) refers to zero or more Csg_primitive (see 4.2.107) objects in the role of tree_root_expression. Each Csg_primitive acts as tree_root_expression for zero or more Csg_model objects.

NOTE - This assertion is established through csg_select.

4.3.354 Csg_model to Faceted_b_rep_model

Each Csg_model (see 4.2.106) refers to zero or more Faceted_b_rep_model (see 4.2.196) objects in the role of tree_root_expression. Each Faceted_b_rep_model acts as tree_root_expression for zero or more Csg_model objects.

NOTE - This assertion is established through csg_select and non_primitive_solid_select.

4.3.355 Csg_model to Solid_replica

Each Csg_model (see 4.2.106) refers to zero or more Solid_replica (see 4.2.462) objects in the role of tree_root_expression. Each Solid_replica acts as tree_root_expression for zero or more Csg_model objects.

NOTE - This assertion is established through csg_select and non_primitive_solid_select.

4.3.356 Csg_model to Swept_face_solid

Each Csg_model (see 4.2.106) refers to zero or more Swept_face_solid (see 4.2.502) objects in the role of tree_root_expression. Each Swept_face_solid acts as tree_root_expression for zero or more Csg_model objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through csg_select and non_primitive_solid_select.

4.3.357 Curve_set_2d to Curve

Each Curve_set_2d (see 4.2.111) refers to zero or more Curve (see 4.2.108) objects in the role of element. Each Curve acts as element for zero or more Curve_set_2d objects.

NOTE - This assertion is established through point_or_curve_select.

4.3.358 Curve_set_2d to Point

Each Curve_set_2d (see 4.2.111) refers to zero or more Point (see 4.2.367) objects in the role of element. Each Point acts as element for zero or more Curve_set_2d objects.

NOTE - This assertion is established through point_or_curve_select.

4.3.359 Curve_set_3d to Curve

Each Curve_set_3d (see 4.2.112) refers to zero or more Curve (see 4.2.108) objects in the role of element. Each Curve acts as element for zero or more Curve_set_3d objects.

NOTE - This assertion is established through point_or_curve_select.

4.3.360 Curve_set_3d to Point

Each Curve_set_3d (see 4.2.112) refers to zero or more Point (see 4.2.367) objects in the role of element. Each Point acts as element for zero or more Curve_set_3d objects.

NOTE - This assertion is established through point_or_curve_select.

4.3.361 Curved_distance_dimension to Measurement_path

Each Curved_distance_dimension (see 4.2.113) refers to exactly one Measurement_path (see 4.2.314) in the role of used_path. Each Measurement_path acts as used_path for zero or more Curved_distance_-dimension objects.

4.3.362 Data_environment to Multi_language_string

Each Data_environment (see 4.2.116) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Data_environment objects.

NOTE - This assertion is established through string_select.

4.3.363 Date_and_person_assignment to Activity

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Activity (see 4.2.2) objects. Each Activity is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.364 Date_and_person_assignment to Activity_element

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Activity_element (see 4.2.3) objects. Each Activity_element is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.365 Date_and_person_assignment to Activity_method_assignment

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Activity_method_assignment (see 4.2.5) objects. Each Activity_method_assignment is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.366 Date_and_person_assignment to Alternate_item_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Alternate_item_relationship (see 4.2.9) objects. Each Alternate_item_relationship is related to zero or more Date_and_person_-assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.367 Date_and_person_assignment to Approval_status

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Approval_status (see 4.2.24) objects. Each Approval_status is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.368 Date_and_person_assignment to Assembly_substitute_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Assembly_substitute_relationship (see 4.2.28) objects. Each Assembly_substitute_relationship is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.369 Date_and_person_assignment to Certification

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Certification (see 4.2.50) objects. Each Certification is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.370 Date_and_person_assignment to Class_category_association

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Class_category_association (see 4.2.64) objects. Each Class_category_association is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.371 Date_and_person_assignment to Class_condition_association

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Class_condition_association (see 4.2.65) objects. Each Class_condition_association is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.372 Date_and_person_assignment to Class_inclusion_association

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Class_inclusion_association (see 4.2.66) objects. Each Class_inclusion_association is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.373 Date_and_person_assignment to Class_specification_association

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Class_specification_association (see 4.2.67) objects. Each Class_specification_association is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.374 Date_and_person_assignment to Class_structure_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Class_structure_relationship (see 4.2.68) objects. Each Class_structure_relationship is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.375 Date_and_person_assignment to Classification_association

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Classification_association (see 4.2.69) objects. Each Classification_association is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.376 Date_and_person_assignment to Classification_system

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Classification_system (see 4.2.71) objects. Each Classification_system is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.377 Date_and_person_assignment to Complex_product

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Complex_product (see 4.2.80) objects. Each Complex_product is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.378 Date_and_person_assignment to Complex_product_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Complex_product_relationship (see 4.2.81) objects. Each Complex_product_relationship is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.379 Date_and_person_assignment to Configuration

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Configuration (see 4.2.94) objects. Each Configuration is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.380 Date_and_person_assignment to Contract

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Contract (see 4.2.104) objects. Each Contract is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.381 Date_and_person_assignment to Date_and_person_organization

Each Date_and_person_assignment (see 4.2.117) refers to exactly one Date_and_person_organization (see 4.2.118) in the role of assigned_date_and_person. Each Date_and_person_organization acts as assigned_date_and_person for zero or more Date_and_person_assignment objects.

4.3.382 Date_and_person_assignment to Design_constraint

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Design_constraint (see 4.2.138) objects. Each Design_constraint is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.383 Date_and_person_assignment to Design_discipline_item_definition

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Design_discipline_item_definition (see 4.2.142) objects. Each Design_discipline_item_definition is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.384 Date_and_person_assignment to Document

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Document (see 4.2.155) objects. Each Document is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.385 Date_and_person_assignment to Document_file

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Document_file (see 4.2.159) objects. Each Document_file is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.386 Date_and_person_assignment to Document_representation

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Document_representation (see 4.2.163) objects. Each Document_representation is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.387 Date_and_person_assignment to Document_version

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Document_version (see 4.2.167) objects. Each Document_version is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.388 Date_and_person_assignment to Drawing

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Drawing (see 4.2.170) objects. Each Drawing is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.389 Date_and_person_assignment to Drawing_sheet

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Drawing_sheet (see 4.2.173) objects. Each Drawing_sheet is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.390 Date_and_person_assignment to Event_reference

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Event_reference (see 4.2.184) objects. Each Event_reference is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select.

4.3.391 Date_and_person_assignment to General_classification

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more General_classification (see 4.2.216) objects. Each General_classification is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.392 Date_and_person_assignment to Geometric_model

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Geometric_model (see 4.2.238) objects. Each Geometric_model is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.393 Date_and_person_assignment to Item

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Item (see 4.2.267) objects. Each Item is related to zero or more Date_and_person_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.394 Date_and_person_assignment to Item_definition_instance_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Item_definition_instance_-relationship (see 4.2.268) objects. Each Item_definition_instance_relationship is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.395 Date_and_person_assignment to Item_definition_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Item_definition_relationship (see 4.2.269) objects. Each Item_definition_relationship is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.396 Date_and_person_assignment to Item_instance

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Item_instance (see 4.2.271) objects. Each Item_instance is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.397 Date_and_person_assignment to Item_instance_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Item_instance_relationship (see 4.2.272) objects. Each Item_instance_relationship is related to zero or more Date_and_person_-assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.398 Date_and_person_assignment to Item_version

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Item_version (see 4.2.275) objects. Each Item_version is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.399 Date_and_person_assignment to Item_version_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Item_version_relationship (see 4.2.276) objects. Each Item_version_relationship is related to zero or more Date_and_person_-assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.400 Date_and_person_assignment to Kinematic_simulation_information

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Kinematic_simulation_-information (see 4.2.288) objects. Each Kinematic_simulation_information is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.401 Date_and_person_assignment to Manufacturing_configuration

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Manufacturing_configuration (see 4.2.305) objects. Each Manufacturing_configuration is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.402 Date_and_person_assignment to Material

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Material (see 4.2.309) objects. Each Material is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.403 Date_and_person_assignment to Multi_language_string

Each Date_and_person_assignment (see 4.2.117) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Date_and_-person_assignment objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.404 Date_and_person_assignment to Organization_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Organization_relationship (see 4.2.333) objects. Each Organization_relationship is related to zero or more Date_and_person_-assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.405 Date_and_person_assignment to Person_in_organization

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Person_in_organization (see 4.2.347) objects. Each Person_in_organization is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.406 Date_and_person_assignment to Person_in_organization_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Person_in_organization_-relationship (see 4.2.348) objects. Each Person_in_organization_relationship is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.407 Date_and_person_assignment to Physical_assembly_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Physical_assembly_relationship (see 4.2.350) objects. Each Physical_assembly_relationship is related to zero or more Date_-and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.408 Date_and_person_assignment to Physical_instance

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Physical_instance (see 4.2.352) objects. Each Physical_instance is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.409 Date_and_person_assignment to Physical_instance_test_result

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Physical_instance_test_-result (see 4.2.353) objects. Each Physical_instance_test_result is related to zero or more Date_and_-person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.410 Date_and_person_assignment to Process_operation_definition

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Process_operation_definition (see 4.2.381) objects. Each Process_operation_definition is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.411 Date_and_person_assignment to Process_operation_occurrence

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Process_operation_occurrence (see 4.2.384) objects. Each Process_operation_occurrence is related to zero or more Date_and_-person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.412 Date_and_person_assignment to Process_operation_resource_assignment

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Process_operation_resource_-assignment (see 4.2.386) objects. Each Process_operation_resource_assignment is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.413 Date_and_person_assignment to Process_plan

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Process_plan (see 4.2.387) objects. Each Process_plan is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.414 Date_and_person_assignment to Product_class

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Product_class (see 4.2.392) objects. Each Product_class is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.415 Date_and_person_assignment to Product_identification

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Product_identification (see 4.2.398) objects. Each Product_identification is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.416 Date_and_person_assignment to Product_structure_relationship

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Product_structure_relationship (see 4.2.400) objects. Each Product_structure_relationship is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.417 Date_and_person_assignment to Project

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Project (see 4.2.404) objects. Each Project is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.418 Date_and_person_assignment to Property

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Property (see 4.2.409) objects. Each Property is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.419 Date_and_person_assignment to Property_value_association

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Property_value_association (see 4.2.413) objects. Each Property_value_association is related to zero or more Date_and_person_-assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.420 Date_and_person_assignment to Security_classification

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Security_classification (see 4.2.443) objects. Each Security_classification is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.421 Date_and_person_assignment to Security_level

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Security_level (see 4.2.444) objects. Each Security_level is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.422 Date_and_person_assignment to Specification

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Specification (see 4.2.467) objects. Each Specification is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.423 Date_and_person_assignment to Specification_category

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Specification_category (see 4.2.468) objects. Each Specification_category is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.424 Date_and_person_assignment to Specification_expression

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Specification_expression (see 4.2.470) objects. Each Specification_expression is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.425 Date_and_person_assignment to Specification_inclusion

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Specification_inclusion (see 4.2.471) objects. Each Specification_inclusion is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.426 Date_and_person_assignment to Styled_model

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Styled_model (see 4.2.484) objects. Each Styled_model is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.427 Date_and_person_assignment to View_area

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more View_area (see 4.2.555) objects. Each View_area is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.428 Date_and_person_assignment to Work_order

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Work_order (see 4.2.564) objects. Each Work_order is related to zero or more Date_and_person_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.429 Date_and_person_assignment to Work_request

Each Date_and_person_assignment (see 4.2.117) is_applied_to zero or more Work_request (see 4.2.565) objects. Each Work_request is related to zero or more Date_and_person_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.430 Date_and_person_organization to Date_time

Each Date_and_person_organization (see 4.2.118) refers to exactly one Date_time (see 4.2.119) in the role of actual_date. Each Date_time acts as actual_date for zero or more Date_and_person_organization objects.

4.3.431 Date_and_person_organization to Organization

Each Date_and_person_organization (see 4.2.118) refers to zero or one Organization (see 4.2.331) in the role of person_or_organization. Each Organization acts as person_or_organization for zero or more Date_and_person_organization objects.

NOTE - This assertion is established through person_organization_select.

4.3.432 Date_and_person_organization to Person_in_organization

Each Date_and_person_organization (see 4.2.118) refers to zero or one Person_in_organization (see 4.2.347) in the role of person_or_organization. Each Person_in_organization acts as person_or_organization for zero or more Date_and_person_organization objects.

NOTE - This assertion is established through person_organization_select.

4.3.433 Date_time_assignment to Activity

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Activity (see 4.2.2) objects. Each Activity is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.434 Date_time_assignment to Activity_element

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Activity_element (see 4.2.3) objects. Each Activity_element is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.435 Date_time_assignment to Activity_method_assignment

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Activity_method_assignment (see 4.2.5) objects. Each Activity_method_assignment is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.436 Date_time_assignment to Alternate_item_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Alternate_item_relationship (see 4.2.9) objects. Each Alternate_item_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.437 Date_time_assignment to Approval_status

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Approval_status (see 4.2.24) objects. Each Approval_status is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.438 Date_time_assignment to Assembly_substitute_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Assembly_substitute_relationship (see 4.2.28) objects. Each Assembly_substitute_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.439 Date_time_assignment to Certification

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Certification (see 4.2.50) objects. Each Certification is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.440 Date_time_assignment to Class_category_association

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Class_category_association (see 4.2.64) objects. Each Class_category_association is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.441 Date_time_assignment to Class_condition_association

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Class_condition_association (see 4.2.65) objects. Each Class_condition_association is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.442 Date_time_assignment to Class_inclusion_association

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Class_inclusion_association (see 4.2.66) objects. Each Class_inclusion_association is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.443 Date_time_assignment to Class_specification_association

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Class_specification_association (see 4.2.67) objects. Each Class_specification_association is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.444 Date_time_assignment to Class_structure_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Class_structure_relationship (see 4.2.68) objects. Each Class_structure_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.445 Date_time_assignment to Classification_association

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Classification_association (see 4.2.69) objects. Each Classification_association is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.446 Date_time_assignment to Classification_system

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Classification_system (see 4.2.71) objects. Each Classification_system is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.447 Date_time_assignment to Complex_product

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Complex_product (see 4.2.80) objects. Each Complex_product is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.448 Date_time_assignment to Complex_product_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Complex_product_relationship (see 4.2.81) objects. Each Complex_product_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.449 Date_time_assignment to Configuration

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Configuration (see 4.2.94) objects. Each Configuration is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.450 Date_time_assignment to Contract

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Contract (see 4.2.104) objects. Each Contract is related to zero or more Date_time_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.451 Date_time_assignment to Date_time

Each Date_time_assignment (see 4.2.120) refers to exactly one Date_time (see 4.2.119) in the role of assigned_date_time. Each Date_time acts as assigned_date_time for zero or more Date_time_assignment objects.

4.3.452 Date_time_assignment to Design_constraint

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Design_constraint (see 4.2.138) objects. Each Design_constraint is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.453 Date_time_assignment to Design_discipline_item_definition

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Design_discipline_item_definition (see 4.2.142) objects. Each Design_discipline_item_definition is related to zero or more Date_time_-assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.454 Date_time_assignment to Document

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Document (see 4.2.155) objects. Each Document is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.455 Date_time_assignment to Document_file

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Document_file (see 4.2.159) objects. Each Document_file is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.456 Date_time_assignment to Document_representation

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Document_representation (see 4.2.163) objects. Each Document_representation is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.457 Date_time_assignment to Document_version

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Document_version (see 4.2.167) objects. Each Document_version is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.458 Date_time_assignment to Drawing

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Drawing (see 4.2.170) objects. Each Drawing is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.459 Date_time_assignment to Drawing_sheet

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Drawing_sheet (see 4.2.173) objects. Each Drawing_sheet is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.460 Date_time_assignment to Event_reference

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Event_reference (see 4.2.184) objects. Each Event_reference is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select.

4.3.461 Date_time_assignment to General_classification

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more General_classification (see 4.2.216) objects. Each General_classification is related to zero or more Date_time_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.462 Date_time_assignment to Geometric_model

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Geometric_model (see 4.2.238) objects. Each Geometric_model is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.463 Date_time_assignment to Item

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Item (see 4.2.267) objects. Each Item is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.464 Date_time_assignment to Item_definition_instance_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Item_definition_instance_relationship (see 4.2.268) objects. Each Item_definition_instance_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.465 Date_time_assignment to Item_definition_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Item_definition_relationship (see 4.2.269) objects. Each Item_definition_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.466 Date_time_assignment to Item_instance

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Item_instance (see 4.2.271) objects. Each Item_instance is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.467 Date_time_assignment to Item_instance_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Item_instance_relationship (see 4.2.272) objects. Each Item_instance_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.468 Date_time_assignment to Item_version

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Item_version (see 4.2.275) objects. Each Item_version is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.469 Date_time_assignment to Item_version_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Item_version_relationship (see 4.2.276) objects. Each Item_version_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.470 Date_time_assignment to Kinematic_simulation_information

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Kinematic_simulation_information (see 4.2.288) objects. Each Kinematic_simulation_information is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.471 Date_time_assignment to Manufacturing_configuration

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Manufacturing_configuration (see 4.2.305) objects. Each Manufacturing_configuration is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.472 Date_time_assignment to Material

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Material (see 4.2.309) objects. Each Material is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.473 Date_time_assignment to Multi_language_string

Each Date_time_assignment (see 4.2.120) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Date_time_-assignment objects.

NOTE - This assertion is established through string_select.

4.3.474 Date_time_assignment to Organization_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Organization_relationship (see 4.2.333) objects. Each Organization_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.475 Date_time_assignment to Person_in_organization

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Person_in_organization (see 4.2.347) objects. Each Person_in_organization is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.476 Date_time_assignment to Person_in_organization_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Person_in_organization_relationship (see 4.2.348) objects. Each Person_in_organization_relationship is related to zero or more Date_-time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.477 Date_time_assignment to Physical_assembly_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Physical_assembly_relationship (see 4.2.350) objects. Each Physical_assembly_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.478 Date_time_assignment to Physical_instance

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Physical_instance (see 4.2.352) objects. Each Physical_instance is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.479 Date_time_assignment to Physical_instance_test_result

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Physical_instance_test_result (see 4.2.353) objects. Each Physical_instance_test_result is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.480 Date_time_assignment to Process_operation_definition

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Process_operation_definition (see 4.2.381) objects. Each Process_operation_definition is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.481 Date_time_assignment to Process_operation_occurrence

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Process_operation_occurrence (see 4.2.384) objects. Each Process_operation_occurrence is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.482 Date_time_assignment to Process_operation_resource_assignment

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Process_operation_resource_assignment (see 4.2.386) objects. Each Process_operation_resource_assignment is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.483 Date_time_assignment to Process_plan

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Process_plan (see 4.2.387) objects. Each Process_plan is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.484 Date_time_assignment to Product_class

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Product_class (see 4.2.392) objects. Each Product_class is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.485 Date_time_assignment to Product_identification

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Product_identification (see 4.2.398) objects. Each Product_identification is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.486 Date_time_assignment to Product_structure_relationship

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Product_structure_relationship (see 4.2.400) objects. Each Product_structure_relationship is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.487 Date_time_assignment to Project

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Project (see 4.2.404) objects. Each Project is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.488 Date_time_assignment to Property

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Property (see 4.2.409) objects. Each Property is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.489 Date_time_assignment to Property_value_association

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Property_value_association (see 4.2.413) objects. Each Property_value_association is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.490 Date_time_assignment to Security_classification

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Security_classification (see 4.2.443) objects. Each Security_classification is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.491 Date_time_assignment to Security_level

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Security_level (see 4.2.444) objects. Each Security_level is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.492 Date_time_assignment to Specification

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Specification (see 4.2.467) objects. Each Specification is related to zero or more Date_time_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.493 Date_time_assignment to Specification_category

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Specification_category (see 4.2.468) objects. Each Specification_category is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.494 Date_time_assignment to Specification_expression

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Specification_expression (see 4.2.470) objects. Each Specification_expression is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.495 Date_time_assignment to Specification_inclusion

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Specification_inclusion (see 4.2.471) objects. Each Specification_inclusion is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.496 Date_time_assignment to Styled_model

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Styled_model (see 4.2.484) objects. Each Styled_model is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.497 Date_time_assignment to View_area

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more View_area (see 4.2.555) objects. Each View_area is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.498 Date_time_assignment to Work_order

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Work_order (see 4.2.564) objects. Each Work_order is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.499 Date_time_assignment to Work_request

Each Date_time_assignment (see 4.2.120) is_applied_to zero or more Work_request (see 4.2.565) objects. Each Work_request is related to zero or more Date_time_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.500 Date_time_interval_assignment to Activity

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Activity (see 4.2.2) objects. Each Activity is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.501 Date_time_interval_assignment to Activity_element

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Activity_element (see 4.2.3) objects. Each Activity_element is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.502 Date_time_interval_assignment to Activity_method_assignment

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Activity_method_assignment (see 4.2.5) objects. Each Activity_method_assignment is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.503 Date_time_interval_assignment to Alternate_item_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Alternate_item_relationship (see 4.2.9) objects. Each Alternate_item_relationship is related to zero or more Date_time_interval_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through general_organizational_data_select.

4.3.504 Date_time_interval_assignment to Approval_status

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Approval_status (see 4.2.24) objects. Each Approval_status is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.505 Date_time_interval_assignment to Assembly_substitute_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Assembly_substitute_relationship (see 4.2.28) objects. Each Assembly_substitute_relationship is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.506 Date_time_interval_assignment to Certification

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Certification (see 4.2.50) objects. Each Certification is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.507 Date_time_interval_assignment to Class_category_association

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Class_category_association (see 4.2.64) objects. Each Class_category_association is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.508 Date_time_interval_assignment to Class_condition_association

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Class_condition_association (see 4.2.65) objects. Each Class_condition_association is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.509 Date_time_interval_assignment to Class_inclusion_association

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Class_inclusion_association (see 4.2.66) objects. Each Class_inclusion_association is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.510 Date_time_interval_assignment to Class_specification_association

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Class_specification_association (see 4.2.67) objects. Each Class_specification_association is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.511 Date_time_interval_assignment to Class_structure_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Class_structure_relationship (see 4.2.68) objects. Each Class_structure_relationship is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.512 Date_time_interval_assignment to Classification_association

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Classification_association (see 4.2.69) objects. Each Classification_association is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.513 Date_time_interval_assignment to Classification_system

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Classification_system (see 4.2.71) objects. Each Classification_system is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.514 Date_time_interval_assignment to Complex_product

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Complex_product (see 4.2.80) objects. Each Complex_product is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.515 Date_time_interval_assignment to Complex_product_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Complex_product_relationship (see 4.2.81) objects. Each Complex_product_relationship is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.516 Date_time_interval_assignment to Configuration

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Configuration (see 4.2.94) objects. Each Configuration is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.517 Date_time_interval_assignment to Contract

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Contract (see 4.2.104) objects. Each Contract is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.518 Date_time_interval_assignment to Design_constraint

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Design_constraint (see 4.2.138) objects. Each Design_constraint is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.519 Date_time_interval_assignment to Design_discipline_item_definition

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Design_discipline_item_definition (see 4.2.142) objects. Each Design_discipline_item_definition is related to zero or more Date_time_interval_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through general_organizational_data_select.

4.3.520 Date_time_interval_assignment to Document

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Document (see 4.2.155) objects. Each Document is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.521 Date_time_interval_assignment to Document_file

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Document_file (see 4.2.159) objects. Each Document_file is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.522 Date_time_interval_assignment to Document_representation

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Document_representation (see 4.2.163) objects. Each Document_representation is related to zero or more Date_time_interval_-assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.523 Date_time_interval_assignment to Document_version

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Document_version (see 4.2.167) objects. Each Document_version is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.524 Date_time_interval_assignment to Drawing

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Drawing (see 4.2.170) objects. Each Drawing is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.525 Date_time_interval_assignment to Drawing_sheet

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Drawing_sheet (see 4.2.173) objects. Each Drawing_sheet is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.526 Date_time_interval_assignment to General_classification

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more General_classification (see 4.2.216) objects. Each General_classification is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.527 Date_time_interval_assignment to Geometric_model

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Geometric_model (see 4.2.238) objects. Each Geometric_model is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.528 Date_time_interval_assignment to Interval_of_time

Each Date_time_interval_assignment (see 4.2.121) refers to exactly one Interval_of_time (see 4.2.266) in the role of assigned_time_interval. Each Interval_of_time acts as assigned_time_interval for zero or more Date_time_interval_assignment objects.

4.3.529 Date_time_interval_assignment to Item

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Item (see 4.2.267) objects. Each Item is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.530 Date_time_interval_assignment to Item_definition_instance_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Item_definition_instance_relationship (see 4.2.268) objects. Each Item_definition_instance_relationship is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.531 Date_time_interval_assignment to Item_definition_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Item_definition_relationship (see 4.2.269) objects. Each Item_definition_relationship is related to zero or more Date_time_interval_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through general_organizational_data_select.

4.3.532 Date_time_interval_assignment to Item_instance

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Item_instance (see 4.2.271) objects. Each Item_instance is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.533 Date_time_interval_assignment to Item_instance_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Item_instance_relationship (see 4.2.272) objects. Each Item_instance_relationship is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.534 Date_time_interval_assignment to Item_version

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Item_version (see 4.2.275) objects. Each Item_version is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.535 Date_time_interval_assignment to Item_version_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Item_version_relationship (see 4.2.276) objects. Each Item_version_relationship is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.536 Date_time_interval_assignment to Kinematic_simulation_information

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Kinematic_simulation_information (see 4.2.288) objects. Each Kinematic_simulation_information is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.537 Date_time_interval_assignment to Manufacturing_configuration

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Manufacturing_configuration (see 4.2.305) objects. Each Manufacturing_configuration is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.538 Date_time_interval_assignment to Material

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Material (see 4.2.309) objects. Each Material is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.539 Date_time_interval_assignment to Multi_language_string

Each Date_time_interval_assignment (see 4.2.121) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through string_select.

4.3.540 Date_time_interval_assignment to Organization_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Organization_relationship (see 4.2.333) objects. Each Organization_relationship is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.541 Date_time_interval_assignment to Person_in_organization

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Person_in_organization (see 4.2.347) objects. Each Person_in_organization is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.542 Date_time_interval_assignment to Person_in_organization_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Person_in_organization_relationship (see 4.2.348) objects. Each Person_in_organization_relationship is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.543 Date_time_interval_assignment to Physical_assembly_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Physical_assembly_relationship (see 4.2.350) objects. Each Physical_assembly_relationship is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.544 Date_time_interval_assignment to Physical_instance

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Physical_instance (see 4.2.352) objects. Each Physical_instance is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.545 Date_time_interval_assignment to Physical_instance_test_result

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Physical_instance_test_result (see 4.2.353) objects. Each Physical_instance_test_result is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.546 Date_time_interval_assignment to Process_operation_definition

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Process_operation_definition (see 4.2.381) objects. Each Process_operation_definition is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.547 Date_time_interval_assignment to Process_operation_occurrence

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Process_operation_occurrence (see 4.2.384) objects. Each Process_operation_occurrence is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.548 Date_time_interval_assignment to Process_operation_resource_assignment

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Process_operation_resource_assignment (see 4.2.386) objects. Each Process_operation_resource_assignment is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.549 Date_time_interval_assignment to Process_plan

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Process_plan (see 4.2.387) objects. Each Process_plan is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.550 Date_time_interval_assignment to Product_class

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Product_class (see 4.2.392) objects. Each Product_class is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.551 Date_time_interval_assignment to Product_identification

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Product_identification (see 4.2.398) objects. Each Product_identification is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.552 Date_time_interval_assignment to Product_structure_relationship

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Product_structure_relationship (see 4.2.400) objects. Each Product_structure_relationship is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.553 Date_time_interval_assignment to Project

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Project (see 4.2.404) objects. Each Project is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.554 Date_time_interval_assignment to Property

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Property (see 4.2.409) objects. Each Property is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.555 Date_time_interval_assignment to Property_value_association

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Property_value_association (see 4.2.413) objects. Each Property_value_association is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.556 Date_time_interval_assignment to Security_classification

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Security_classification (see 4.2.443) objects. Each Security_classification is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.557 Date_time_interval_assignment to Security_level

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Security_level (see 4.2.444) objects. Each Security_level is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.558 Date_time_interval_assignment to Specification

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Specification (see 4.2.467) objects. Each Specification is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.559 Date_time_interval_assignment to Specification_category

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Specification_category (see 4.2.468) objects. Each Specification_category is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.560 Date_time_interval_assignment to Specification_expression

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Specification_expression (see 4.2.470) objects. Each Specification_expression is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.561 Date_time_interval_assignment to Specification_inclusion

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Specification_inclusion (see 4.2.471) objects. Each Specification_inclusion is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.562 Date_time_interval_assignment to Styled_model

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Styled_model (see 4.2.484) objects. Each Styled_model is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.563 Date_time_interval_assignment to View_area

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more View_area (see 4.2.555) objects. Each View_area is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.564 Date_time_interval_assignment to Work_order

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Work_order (see 4.2.564) objects. Each Work_order is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.565 Date_time_interval_assignment to Work_request

Each Date_time_interval_assignment (see 4.2.121) is_applied_to zero or more Work_request (see 4.2.565) objects. Each Work_request is related to zero or more Date_time_interval_assignment objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.566 Datum_target_set to Datum_target

Each Datum_target_set (see 4.2.127) refers to one or more Datum_target (see 4.2.125) objects in the role of target. Each Datum_target acts as target for zero or more Datum_target_set objects.

4.3.567 Datum_target_set to Multi_language_string

Each Datum_target_set (see 4.2.127) refers to zero or one Multi_language_string (see 4.2.320) in the role of rule_description. Each Multi_language_string acts as rule_description for zero or more Datum_target_set objects.

NOTE - This assertion is established through string_select.

4.3.568 Default_chamfer to Feature_parameter

Each Default_chamfer (see 4.2.128) refers to exactly one Feature_parameter (see 4.2.201) in the role of offset_value. Each Feature_parameter acts as offset_value for zero or more Default_chamfer objects.

4.3.569 Default_chamfer to Multi_language_string

Each Default_chamfer (see 4.2.128) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Default_chamfer objects.

NOTE - This assertion is established through string_select.

4.3.570 Default_draft_angle to Feature_parameter

Each Default_draft_angle (see 4.2.129) refers to exactly one Feature_parameter (see 4.2.201) in the role of draft_angle_value. Each Feature_parameter acts as draft_angle_value for zero or more Default_-draft_angle objects.

4.3.571 Default_draft_angle to Multi_language_string

Each Default_draft_angle (see 4.2.129) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Default_draft_angle objects.

NOTE - This assertion is established through string_select.

4.3.572 Default_edge_round to Feature_parameter

Each Default_edge_round (see 4.2.130) refers to exactly one Feature_parameter (see 4.2.201) in the role of radius_value. Each Feature_parameter acts as radius_value for zero or more Default_edge_round objects.

4.3.573 Default_edge_round to Multi_language_string

Each Default_edge_round (see 4.2.130) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Default_edge_round objects.

NOTE - This assertion is established through string_select.

4.3.574 Default_fillet to Feature_parameter

Each Default_fillet (see 4.2.131) refers to exactly one Feature_parameter (see 4.2.201) in the role of radius_value. Each Feature_parameter acts as radius_value for zero or more Default_fillet objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.575 Default_fillet to Multi_language_string

Each Default_fillet (see 4.2.131) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Default_fillet objects.

NOTE - This assertion is established through string_select.

4.3.576 Default_setting_association to Default_chamfer

Each Default_setting_association (see 4.2.132) refers to zero or more Default_chamfer (see 4.2.128) objects in the role of default_value. Each Default_chamfer acts as default_value for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_setting_select.

4.3.577 Default_setting_association to Default_draft_angle

Each Default_setting_association (see 4.2.132) refers to zero or more Default_draft_angle (see 4.2.129) objects in the role of default_value. Each Default_draft_angle acts as default_value for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_setting_select.

4.3.578 Default_setting_association to Default_edge_round

Each Default_setting_association (see 4.2.132) refers to zero or more Default_edge_round (see 4.2.130) objects in the role of default_value. Each Default_edge_round acts as default_value for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_setting_select.

4.3.579 Default_setting_association to Default_fillet

Each Default_setting_association (see 4.2.132) refers to zero or more Default_fillet (see 4.2.131) objects in the role of default_value. Each Default_fillet acts as default_value for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_setting_select.

4.3.580 Default_setting_association to Default_surface_texture

Each Default_setting_association (see 4.2.132) refers to zero or more Default_surface_texture (see 4.2.133) objects in the role of default_value. Each Default_surface_texture acts as default_value for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_setting_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.581 Default_setting_association to Default_thickness

Each Default_setting_association (see 4.2.132) refers to zero or more Default_thickness (see 4.2.134) objects in the role of default_value. Each Default_thickness acts as default_value for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_setting_select.

4.3.582 Default_setting_association to Digital_document

Each Default_setting_association (see 4.2.132) refers to zero or one Digital_document (see 4.2.147) in the role of default_context. Each Digital_document acts as default_context for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_context_select.

4.3.583 Default_setting_association to Digital_file

Each Default_setting_association (see 4.2.132) refers to zero or one Digital_file (see 4.2.148) in the role of default_context. Each Digital_file acts as default_context for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_context_select.

4.3.584 Default_setting_association to Drawing_sheet

Each Default_setting_association (see 4.2.132) refers to zero or one Drawing_sheet (see 4.2.173) in the role of default_context. Each Drawing_sheet acts as default_context for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_context_select and area_select.

4.3.585 Default_setting_association to General_tolerances

Each Default_setting_association (see 4.2.132) refers to zero or more General_tolerances (see 4.2.235) objects in the role of default_value. Each General_tolerances acts as default_value for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_setting_select.

4.3.586 Default_setting_association to Item_shape

Each Default_setting_association (see 4.2.132) refers to zero or one Item_shape (see 4.2.274) in the role of default_context. Each Item_shape acts as default_context for zero or more Default_setting_association objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through default_context_select.

4.3.587 Default_setting_association to View_area

Each Default_setting_association (see 4.2.132) refers to zero or one View_area (see 4.2.555) in the role of default_context. Each View_area acts as default_context for zero or more Default_setting_association objects.

NOTE - This assertion is established through default_context_select and area_select.

4.3.588 Default_thickness to Multi_language_string

Each Default_thickness (see 4.2.134) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Default_thickness objects.

NOTE - This assertion is established through string_select.

4.3.589 Default_thickness to Value_with_unit

Each Default_thickness (see 4.2.134) refers to exactly one Value_with_unit (see 4.2.549) in the role of thickness_value. Each Value_with_unit acts as thickness_value for zero or more Default_thickness objects.

4.3.590 Defined_thread to Feature_parameter

Each Defined_thread (see 4.2.135) refers to zero or one Feature_parameter (see 4.2.201) in the role of crest. Each Feature_parameter acts as crest for zero or more Defined_thread objects.

Each Defined_thread refers to zero or one Feature_parameter in the role of minor_diameter. Each Feature_parameter acts as minor_diameter for zero or more Defined_thread objects.

Each Defined_thread refers to exactly one Feature_parameter in the role of pitch_diameter. Each Feature_parameter acts as pitch_diameter for zero or more Defined_thread objects.

4.3.591 Derived_geometry to Constructive_geometric_element

Each Derived_geometry (see 4.2.136) refers to exactly one Constructive_geometric_element (see 4.2.99) in the role of geometry. Each Constructive_geometric_element acts as geometry for zero or more Derived_geometry objects.

4.3.592 Derived_geometry to Shape_element

Each Derived_geometry (see 4.2.136) is_derived_from one or more Shape_element (see 4.2.449) objects. Each Shape_element is related to zero or more Derived_geometry objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.593 Descriptive_specification to Multi_language_string

Each Descriptive_specification (see 4.2.137) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Descriptive_-specification objects.

NOTE - This assertion is established through string_select.

4.3.594 Design_constraint to Multi_language_string

Each Design_constraint (see 4.2.138) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Design_constraint objects.

NOTE 1 - This assertion is established through string_select.

Each Design_constraint refers to zero or one Multi_language_string in the role of name. Each Multi_-language_string acts as name for zero or more Design_constraint objects.

NOTE 2 - This assertion is established through string_select.

4.3.595 Design_constraint to Product_class

Each Design_constraint (see 4.2.138) is_valid for zero or more Product_class (see 4.2.392) objects. Each Product_class is related to zero or more Design_constraint objects.

4.3.596 Design_constraint_association to Complex_product

Each Design_constraint_association (see 4.2.139) is_constraining exactly one Complex_product (see 4.2.80). Each Complex_product is related to zero or more Design_constraint_association objects.

4.3.597 Design_constraint_association to Design_constraint

Each Design_constraint_association (see 4.2.139) is_based_on exactly one Design_constraint (see 4.2.138). Each Design_constraint is related to zero or more Design_constraint_association objects.

4.3.598 Design_constraint_association to Multi_language_string

Each Design_constraint_association (see 4.2.139) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Design_constraint_asso-ciation objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.599 Design_constraint_relationship to Design_constraint

Each Design_constraint_relationship (see 4.2.140) is related to exactly one Design_constraint (see 4.2.138). Each Design_constraint is referenced by zero or more Design_constraint_relationship objects as related.

NOTE 1 - The related Design_constraint is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Design_constraint_relationship is relating to exactly one Design_constraint. Each Design_constraint is referenced by zero or more Design_constraint_relationship objects as relating.

NOTE 2 - The relating Design_constraint is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.600 Design_constraint_relationship to Multi_language_string

Each Design_constraint_relationship (see 4.2.140) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Design_constraint_relationship objects.

NOTE - This assertion is established through string_select.

4.3.601 Design_discipline_item_definition to Application_context

Each Design_discipline_item_definition (see 4.2.142) refers to zero or more Application_context (see 4.2.21) objects in the role of additional_context. Each Application_context acts as additional_context for zero or more Design_discipline_item_definition objects.

Each Design_discipline_item_definition refers to exactly one Application_context in the role of initial_context. Each Application_context acts as initial_context for zero or more Design_discipline_item_definition objects.

4.3.602 Design_discipline_item_definition to Item_version

Each Design_discipline_item_definition (see 4.2.142) refers to exactly one Item_version (see 4.2.275) in the role of associated_item_version. Each Item_version acts as associated_item_version for zero or more Design_discipline_item_definition objects.

4.3.603 Design_discipline_item_definition to Multi_language_string

Each Design_discipline_item_definition (see 4.2.142) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Design_discipline_item_definition objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.604 Detailed_element to Multi_language_string

Each Detailed_element (see 4.2.143) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Detailed_element objects.

NOTE - This assertion is established through string_select.

4.3.605 Diameter_taper to Feature_parameter

Each Diameter_taper (see 4.2.146) refers to exactly one Feature_parameter (see 4.2.201) in the role of final_diameter. Each Feature_parameter acts as final_diameter for zero or more Diameter_taper objects.

4.3.606 Digital_document to Digital_file

Each Digital_document (see 4.2.147) refers to zero or more Digital_file (see 4.2.148) objects in the role of file. Each Digital_file acts as file for zero or more Digital_document objects.

4.3.607 Dimension to Dimension_callout

Each Dimension (see 4.2.149) refers to exactly one Dimension_callout (see 4.2.150) in the role of primary_callout. Each Dimension_callout acts as primary_callout for zero or more Dimension objects.

Each Dimension refers to zero or one Dimension_callout in the role of secondary_callout. Each Dimension_callout acts as secondary_callout for zero or more Dimension objects.

4.3.608 Dimension_callout to Dimension_symbol

Each Dimension_callout (see 4.2.150) refers to zero or more Dimension_symbol (see 4.2.153) objects in the role of callout_element. Each Dimension_symbol acts as callout_element for zero or more Dimension_callout objects.

NOTE - This assertion is established through dimension_callout_select.

4.3.609 Dimension_callout to Geometric_dimension

Each Dimension_callout (see 4.2.150) is_displaying zero or one Geometric_dimension (see 4.2.237). Each Geometric_dimension is related to zero or more Dimension_callout objects.

4.3.610 Dimension_callout to Text

Each Dimension_callout (see 4.2.150) refers to zero or more Text (see 4.2.514) objects in the role of callout_element. Each Text acts as callout_element for zero or more Dimension_callout objects.

NOTE - This assertion is established through dimension_callout_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.611 Dimension_curve to Terminator_symbol

Each Dimension_curve (see 4.2.151) refers to zero, one, or two Terminator_symbol (see 4.2.513) objects in the role of terminator. Each Terminator_symbol acts as terminator for zero or more Dimension_curve objects.

4.3.612 Dimension_sequence_pair to Dimension

Each Dimension_sequence_pair (see 4.2.152) refers to exactly one Dimension (see 4.2.149) in the role of predecessor. Each Dimension acts as predecessor for zero or more Dimension_sequence_pair objects.

Each Dimension_sequence_pair refers to exactly one Dimension in the role of successor. Each Dimension acts as successor for zero or more Dimension_sequence_pair objects.

4.3.613 Directed_taper to Feature_parameter

Each Directed_taper (see 4.2.154) refers to exactly one Feature_parameter (see 4.2.201) in the role of angle. Each Feature_parameter acts as angle for zero or more Directed_taper objects.

4.3.614 Document to Multi_language_string

Each Document (see 4.2.155) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Document objects.

NOTE 1 - This assertion is established through string_select.

Each Document refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Document objects.

NOTE 2 - This assertion is established through string_select.

4.3.615 Document_assignment to Activity

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Activity (see 4.2.2). Each Activity is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.616 Document_assignment to Activity_element

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Activity_element (see 4.2.3). Each Activity_element is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.617 Document_assignment to Activity_method

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Activity_method (see 4.2.4). Each Activity_method is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.618 Document_assignment to Approval

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Approval (see 4.2.22). Each Approval is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.619 Document_assignment to Catalogue_thread

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Catalogue_thread (see 4.2.48). Each Catalogue_thread is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.620 Document_assignment to Certification

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Certification (see 4.2.50). Each Certification is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.621 Document_assignment to Change

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Change (see 4.2.55). Each Change is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.622 Document_assignment to Class_structure_relationship

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Class_structure_relationship (see 4.2.68). Each Class_structure_relationship is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.623 Document_assignment to Classification_attribute

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Classification_attribute (see 4.2.70). Each Classification_attribute is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.624 Document_assignment to Classification_system

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Classification_system (see 4.2.71). Each Classification_system is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.625 Document_assignment to Complex_product

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Complex_product (see 4.2.80). Each Complex_product is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.626 Document_assignment to Contract

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Contract (see 4.2.104). Each Contract is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.627 Document_assignment to Descriptive_specification

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Descriptive_specification (see 4.2.137). Each Descriptive_specification is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.628 Document_assignment to Design_constraint

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Design_constraint (see 4.2.138). Each Design_constraint is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.629 Document_assignment to Design_discipline_item_definition

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Design_discipline_item_definition (see 4.2.142). Each Design_discipline_item_definition is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.630 Document_assignment to Document

Each Document_assignment (see 4.2.156) refers to zero or one Document (see 4.2.155) in the role of assigned_document. Each Document acts as assigned_document for zero or more Document_assignment objects.

NOTE - This assertion is established through assigned_document_select.

4.3.631 Document_assignment to Document_file

Each Document_assignment (see 4.2.156) refers to zero or one Document_file (see 4.2.159) in the role of assigned_document. Each Document_file acts as assigned_document for zero or more Document_assignment objects.

NOTE - This assertion is established through assigned_document_select.

4.3.632 Document_assignment to Document_representation

Each Document_assignment (see 4.2.156) refers to zero or one Document_representation (see 4.2.163) in the role of assigned_document. Each Document_representation acts as assigned_document for zero or more Document_assignment objects.

NOTE - This assertion is established through assigned_document_select.

4.3.633 Document_assignment to Document_version

Each Document_assignment (see 4.2.156) refers to zero or one Document_version (see 4.2.167) in the role of assigned_document. Each Document_version acts as assigned_document for zero or more Document_assignment objects.

NOTE - This assertion is established through assigned_document_select.

4.3.634 Document_assignment to Drawing_sheet

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Drawing_sheet (see 4.2.173). Each Drawing_sheet is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.635 Document_assignment to Feature_definition

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Feature_definition (see 4.2.199). Each Feature_definition is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.636 Document_assignment to General_classification

Each Document_assignment (see 4.2.156) is_assigned_to zero or one General_classification (see 4.2.216). Each General_classification is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.637 Document_assignment to General_feature

Each Document_assignment (see 4.2.156) is_assigned_to zero or one General_feature (see 4.2.221). Each General_feature is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.638 Document_assignment to Item

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Item (see 4.2.267). Each Item is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.639 Document_assignment to Item_definition_instance_relationship

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Item_definition_instance_relationship (see 4.2.268). Each Item_definition_instance_relationship is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.640 Document_assignment to Item_definition_relationship

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Item_definition_relationship (see 4.2.269). Each Item_definition_relationship is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.641 Document_assignment to Item_instance

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Item_instance (see 4.2.271). Each Item_instance is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.642 Document_assignment to Item_instance_relationship

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Item_instance_relationship (see 4.2.272). Each Item_instance_relationship is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.643 Document_assignment to Item_shape

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Item_shape (see 4.2.274). Each Item_shape is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.644 Document_assignment to Item_version

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Item_version (see 4.2.275). Each Item_version is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.645 Document_assignment to Material

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Material (see 4.2.309). Each Material is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.646 Document_assignment to Organization

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Organization (see 4.2.331). Each Organization is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.647 Document_assignment to Path

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Path (see 4.2.342). Each Path is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.648 Document_assignment to Person

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Person (see 4.2.346). Each Person is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.649 Document_assignment to Physical_assembly_relationship

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Physical_assembly_relationship (see 4.2.350). Each Physical_assembly_relationship is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.650 Document_assignment to Physical_instance

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Physical_instance (see 4.2.352). Each Physical_instance is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.651 Document_assignment to Physical_instance_test_result

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Physical_instance_test_result (see 4.2.353). Each Physical_instance_test_result is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.652 Document_assignment to Process_operation_occurrence

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Process_operation_occurrence (see 4.2.384). Each Process_operation_occurrence is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.653 Document_assignment to Process_plan

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Process_plan (see 4.2.387). Each Process_plan is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.654 Document_assignment to Product_class

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Product_class (see 4.2.392). Each Product_class is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.655 Document_assignment to Product_identification

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Product_identification (see 4.2.398). Each Product_identification is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.656 Document_assignment to Product_structure_relationship

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Product_structure_relationship (see 4.2.400). Each Product_structure_relationship is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.657 Document_assignment to Profile

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Profile (see 4.2.401). Each Profile is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.658 Document_assignment to Project

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Project (see 4.2.404). Each Project is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.659 Document_assignment to Property

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Property (see 4.2.409). Each Property is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select.

4.3.660 Document_assignment to Retention_period

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Retention_period (see 4.2.434). Each Retention_period is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.661 Document_assignment to Security_classification

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Security_classification (see 4.2.443). Each Security_classification is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.662 Document_assignment to Shape_element

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Shape_element (see 4.2.449). Each Shape_element is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.663 Document_assignment to Shape_element_relationship

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Shape_element_relationship (see 4.2.450). Each Shape_element_relationship is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.664 Document_assignment to Specific_item_classification

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Specific_item_classification (see 4.2.465). Each Specific_item_classification is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.665 Document_assignment to Specification

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Specification (see 4.2.467). Each Specification is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.666 Document_assignment to Specification_category

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Specification_category (see 4.2.468). Each Specification_category is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.667 Document_assignment to Surface_condition

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Surface_condition (see 4.2.492). Each Surface_condition is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.668 Document_assignment to Thread_feature

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Thread_feature (see 4.2.517). Each Thread_feature is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.669 Document_assignment to Transition_feature

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Transition_feature (see 4.2.537). Each Transition_feature is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.670 Document_assignment to View_area

Each Document_assignment (see 4.2.156) is_assigned_to zero or one View_area (see 4.2.555). Each View_area is related to zero or more Document_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.671 Document_assignment to Work_order

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Work_order (see 4.2.564). Each Work_order is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.672 Document_assignment to Work_request

Each Document_assignment (see 4.2.156) is_assigned_to zero or one Work_request (see 4.2.565). Each Work_request is related to zero or more Document_assignment objects.

NOTE - This assertion is established through documented_element_select and documented_element_sub_-select.

4.3.673 Document_content_property to Language

Each Document_content_property (see 4.2.157) refers to zero or more Language (see 4.2.291) objects in the role of languages. Each Language acts as languages for zero or more Document_content_property objects.

4.3.674 Document_content_property to Numerical_value

Each Document_content_property (see 4.2.157) refers to zero or one Numerical_value (see 4.2.324) in the role of real_world_scale. Each Numerical_value acts as real_world_scale for zero or more Document_content_property objects.

4.3.675 Document_file to Document_content_property

Each Document_file (see 4.2.159) refers to zero or one Document_content_property (see 4.2.157) in the role of content. Each Document_content_property acts as content for zero or more Document_file objects.

4.3.676 Document_file to Document_creation_property

Each Document_file (see 4.2.159) refers to zero or one Document_creation_property (see 4.2.158) in the role of creation. Each Document_creation_property acts as creation for zero or more Document_file objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.677 Document_file to Document_format_property

Each Document_file (see 4.2.159) refers to zero or one Document_format_property (see 4.2.161) in the role of file_format. Each Document_format_property acts as file_format for zero or more Document_file objects.

4.3.678 Document_file to Document_size_property

Each Document_file (see 4.2.159) refers to zero or one Document_size_property (see 4.2.164) in the role of size. Each Document_size_property acts as size for zero or more Document_file objects.

4.3.679 Document_file to Document_type_property

Each Document_file (see 4.2.159) refers to zero or one Document_type_property (see 4.2.166) in the role of document_file_type. Each Document_type_property acts as document_file_type for zero or more Document_file objects.

4.3.680 Document_file to External_file_id_and_location

Each Document_file (see 4.2.159) refers to zero or more External_file_id_and_location (see 4.2.185) objects in the role of external_id_and_location. Each External_file_id_and_location acts as external_-id_and_location for zero or more Document_file objects.

4.3.681 Document_file_relationship to Document_file

Each Document_file_relationship (see 4.2.160) is related to exactly one Document_file (see 4.2.159). Each Document_file is referenced by zero or more Document_file_relationship objects as related.

NOTE 1 - The related Document_file is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Document_file_relationship is relating to exactly one Document_file. Each Document_file is referenced by zero or more Document_file_relationship objects as relating.

NOTE 2 - The relating Document_file is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.682 Document_file_relationship to Multi_language_string

Each Document_file_relationship (see 4.2.160) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Document_-file_relationship objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.683 Document_format_property to Rectangular_size

Each Document_format_property (see 4.2.161) refers to zero or one Rectangular_size (see 4.2.427) in the role of size_format. Each Rectangular_size acts as size_format for zero or more Document_format_-property objects.

4.3.684 Document_representation to Document_content_property

Each Document_representation (see 4.2.163) refers to zero or one Document_content_property (see 4.2.157) in the role of content. Each Document_content_property acts as content for zero or more Document_representation objects.

4.3.685 Document_representation to Document_creation_property

Each Document_representation (see 4.2.163) refers to zero or one Document_creation_property (see 4.2.158) in the role of creation. Each Document_creation_property acts as creation for zero or more Document_representation objects.

4.3.686 Document_representation to Document_format_property

Each Document_representation (see 4.2.163) refers to zero or one Document_format_property (see 4.2.161) in the role of representation_format. Each Document_format_property acts as representation_format for zero or more Document_representation objects.

4.3.687 Document_representation to Document_location_property

Each Document_representation (see 4.2.163) refers to zero or more Document_location_property (see 4.2.162) objects in the role of common_location. Each Document_location_property acts as common_-location for zero or more Document_representation objects.

4.3.688 Document_representation to Document_size_property

Each Document_representation (see 4.2.163) refers to zero or one Document_size_property (see 4.2.164) in the role of size. Each Document_size_property acts as size for zero or more Document_representation objects.

4.3.689 Document_representation to Document_version

Each Document_representation (see 4.2.163) refers to exactly one Document_version (see 4.2.167) in the role of associated_document_version. Each Document_version acts as associated_document_version for zero or more Document_representation objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.690 Document_representation to Multi_language_string

Each Document_representation (see 4.2.163) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Document_representation objects.

NOTE - This assertion is established through string_select.

4.3.691 Document_size_property to Value_with_unit

Each Document_size_property (see 4.2.164) refers to zero or one Value_with_unit (see 4.2.549) in the role of file_size. Each Value_with_unit acts as file_size for zero or more Document_size_property objects.

Each Document_size_property refers to zero or one Value_with_unit in the role of page_count. Each Value_with_unit acts as page_count for zero or more Document_size_property objects.

4.3.692 Document_structure to Document_representation

Each Document_structure (see 4.2.165) is related to exactly one Document_representation (see 4.2.163). Each Document_representation is referenced by zero or more Document_structure objects as related.

NOTE 1 - The related Document_representation is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Document_structure is relating to exactly one Document_representation. Each Document_representation is referenced by zero or more Document_structure objects as relating.

NOTE 2 - The relating Document_representation is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.693 Document_structure to Multi_language_string

Each Document_structure (see 4.2.165) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Document_structure objects.

NOTE - This assertion is established through string_select.

4.3.694 Document_type_property to Classification_system

Each Document_type_property (see 4.2.166) refers to zero or one Classification_system (see 4.2.71) in the role of used_classification_system. Each Classification_system acts as used_classification_system for zero or more Document_type_property objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.695 Document_version to Document

Each Document_version (see 4.2.167) refers to exactly one Document (see 4.2.155) in the role of associated_document. Each Document has associated_version defined by one or more Document_version objects.

4.3.696 Document_version to Multi_language_string

Each Document_version (see 4.2.167) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Document_version objects.

NOTE - This assertion is established through string_select.

4.3.697 Document_version_relationship to Document_version

Each Document_version_relationship (see 4.2.168) is related to exactly one Document_version (see 4.2.167). Each Document_version is referenced by zero or more Document_version_relationship objects as related.

NOTE 1 - The related Document_version is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Document_version_relationship is relating to exactly one Document_version. Each Document_version is referenced by zero or more Document_version_relationship objects as relating.

NOTE 2 - The relating Document_version is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.698 Document_version_relationship to Multi_language_string

Each Document_version_relationship (see 4.2.168) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Document_version_relationship objects.

NOTE - This assertion is established through string_select.

4.3.699 Draughting_callout to Annotation_curve

Each Draughting_callout (see 4.2.169) refers to zero or more Annotation_curve (see 4.2.16) objects in the role of contents. Each Annotation_curve acts as contents for zero or more Draughting_callout objects.

NOTE - This assertion is established through draughting_callout_content_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.700 Draughting_callout to Annotation_subfigure

Each Draughting_callout (see 4.2.169) refers to zero or more Annotation_subfigure (see 4.2.18) objects in the role of contents. Each Annotation_subfigure acts as contents for zero or more Draughting_callout objects.

NOTE - This assertion is established through draughting_callout_content_select.

4.3.701 Draughting_callout to Annotation_symbol

Each Draughting_callout (see 4.2.169) refers to zero or more Annotation_symbol (see 4.2.19) objects in the role of contents. Each Annotation_symbol acts as contents for zero or more Draughting_callout objects.

NOTE - This assertion is established through draughting_callout_content_select.

4.3.702 Draughting_callout to Text

Each Draughting_callout (see 4.2.169) refers to zero or more Text (see 4.2.514) objects in the role of contents. Each Text acts as contents for zero or more Draughting_callout objects.

NOTE - This assertion is established through draughting_callout_content_select.

4.3.703 Drawing to Multi_language_string

Each Drawing (see 4.2.170) refers to zero or one Multi_language_string (see 4.2.320) in the role of title. Each Multi_language_string acts as title for zero or more Drawing objects.

NOTE - This assertion is established through string_select.

4.3.704 Drawing_assignment to Complex_product

Each Drawing_assignment (see 4.2.171) is_describing zero or one Complex_product (see 4.2.80). Each Complex_product is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.705 Drawing_assignment to Design_constraint

Each Drawing_assignment (see 4.2.171) is_describing zero or one Design_constraint (see 4.2.138). Each Design_constraint is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.706 Drawing_assignment to Design_discipline_item_definition

Each Drawing_assignment (see 4.2.171) is_describing zero or one Design_discipline_item_definition (see 4.2.142). Each Design_discipline_item_definition is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.707 Drawing_assignment to Drawing

Each Drawing_assignment (see 4.2.171) refers to exactly one Drawing (see 4.2.170) in the role of associated_drawing. Each Drawing acts as associated_drawing for zero or more Drawing_assignment objects.

4.3.708 Drawing_assignment to Item_definition_instance_relationship

Each Drawing_assignment (see 4.2.171) is_describing zero or one Item_definition_instance_relationship (see 4.2.268). Each Item_definition_instance_relationship is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.709 Drawing_assignment to Item_definition_relationship

Each Drawing_assignment (see 4.2.171) is_describing zero or one Item_definition_relationship (see 4.2.269). Each Item_definition_relationship is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.710 Drawing_assignment to Item_instance

Each Drawing_assignment (see 4.2.171) is_describing zero or one Item_instance (see 4.2.271). Each Item_instance is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.711 Drawing_assignment to Item_instance_relationship

Each Drawing_assignment (see 4.2.171) is_describing zero or one Item_instance_relationship (see 4.2.272). Each Item_instance_relationship is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.712 Drawing_assignment to Item_version

Each Drawing_assignment (see 4.2.171) is_describing zero or one Item_version (see 4.2.275). Each Item_version is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.713 Drawing_assignment to Process_operation_definition

Each Drawing_assignment (see 4.2.171) is_describing zero or one Process_operation_definition (see 4.2.381). Each Process_operation_definition is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.714 Drawing_assignment to Process_operation_occurrence

Each Drawing_assignment (see 4.2.171) is_describing zero or one Process_operation_occurrence (see 4.2.384). Each Process_operation_occurrence is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.715 Drawing_assignment to Process_plan

Each Drawing_assignment (see 4.2.171) is_describing zero or one Process_plan (see 4.2.387). Each Process_plan is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.716 Drawing_assignment to Product_class

Each Drawing_assignment (see 4.2.171) is_describing zero or one Product_class (see 4.2.392). Each Product_class is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.717 Drawing_assignment to Specification

Each Drawing_assignment (see 4.2.171) is_describing zero or one Specification (see 4.2.467). Each Specification is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.718 Drawing_assignment to Specification_category

Each Drawing_assignment (see 4.2.171) is_describing zero or one Specification_category (see 4.2.468). Each Specification_category is related to zero or more Drawing_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.719 Drawing_sequence to Drawing

Each Drawing_sequence (see 4.2.172) refers to exactly one Drawing (see 4.2.170) in the role of preceding_drawing. Each Drawing acts as preceding_drawing for zero or more Drawing_sequence objects.

Each Drawing_sequence refers to exactly one Drawing in the role of succeeding_drawing. Each Drawing acts as succeeding_drawing for zero or more Drawing_sequence objects.

4.3.720 Drawing_sheet to Cartesian_coordinate_space_2d

Each Drawing_sheet (see 4.2.173) refers to exactly one Cartesian_coordinate_space_2d (see 4.2.45) in the role of sheet_space. Each Cartesian_coordinate_space_2d acts as sheet_space for zero or more Drawing_sheet objects.

4.3.721 Drawing_sheet to Drawing

Each Drawing_sheet (see 4.2.173) refers to exactly one Drawing (see 4.2.170) in the role of associated_drawing. Each Drawing has sheet defined by one or more Drawing_sheet objects.

4.3.722 Drawing_sheet to Multi_language_string

Each Drawing_sheet (see 4.2.173) refers to zero or one Multi_language_string (see 4.2.320) in the role of title. Each Multi_language_string acts as title for zero or more Drawing_sheet objects.

NOTE - This assertion is established through string_select.

4.3.723 Edge_loop to Oriented_edge_curve

Each Edge_loop (see 4.2.176) refers to one or more Oriented_edge_curve (see 4.2.334) objects in the role of edge. Each Oriented_edge_curve acts as edge for zero or more Edge_loop objects.

4.3.724 Edge_round to Face

Each Edge_round (see 4.2.177) refers to exactly one Face (see 4.2.191) in the role of edge_round_face. Each Face acts as edge_round_face for zero or more Edge_round objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.725 Edge_transition to Oriented_edge_curve

Each Edge_transition (see 4.2.178) refers to exactly one Oriented_edge_curve (see 4.2.334) in the role of edge_1. Each Oriented_edge_curve acts as edge_1 for zero or more Edge_transition objects.

Each Edge_transition refers to exactly one Oriented_edge_curve in the role of edge_2. Each Oriented_edge_curve acts as edge_2 for zero or more Edge_transition objects.

4.3.726 Edge_transition to Vertex_point

Each Edge_transition (see 4.2.178) refers to exactly one Vertex_point (see 4.2.553) in the role of vertex_joint. Each Vertex_point acts as vertex_joint for zero or more Edge_transition objects.

4.3.727 Effectivity to Date_time

Each Effectivity (see 4.2.179) refers to zero or one Date_time (see 4.2.119) in the role of end_definition. Each Date_time acts as end_definition for zero or more Effectivity objects.

NOTE 1 - This assertion is established through event_or_date_select.

Each Effectivity refers to zero or one Date_time in the role of start_definition. Each Date_time acts as start_definition for zero or more Effectivity objects.

NOTE 2 - This assertion is established through event_or_date_select.

4.3.728 Effectivity to Duration

Each Effectivity (see 4.2.179) refers to zero or one Duration (see 4.2.174) in the role of period. Each Duration acts as period for zero or more Effectivity objects.

4.3.729 Effectivity to Event_reference

Each Effectivity (see 4.2.179) refers to zero or one Event_reference (see 4.2.184) in the role of end_definition. Each Event_reference acts as end_definition for zero or more Effectivity objects.

NOTE 1 - This assertion is established through event_or_date_select.

Each Effectivity refers to zero or one Event_reference in the role of start_definition. Each Event_reference acts as start_definition for zero or more Effectivity objects.

NOTE 2 - This assertion is established through event_or_date_select.

4.3.730 Effectivity to Multi_language_string

Each Effectivity (see 4.2.179) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Effectivity objects.

NOTE - This assertion is established through string_select.

4.3.731 Effectivity to Organization

Each Effectivity (see 4.2.179) refers to zero or more Organization (see 4.2.331) objects in the role of concerned_organization. Each Organization acts as concerned_organization for zero or more Effectivity objects.

4.3.732 Effectivity_assignment to Assembly_substitute_relationship

Each Effectivity_assignment (see 4.2.180) refers to zero or one Assembly_substitute_relationship (see 4.2.28) in the role of effective_element. Each Assembly_substitute_relationship acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.733 Effectivity_assignment to Class_category_association

Each Effectivity_assignment (see 4.2.180) refers to zero or one Class_category_association (see 4.2.64) in the role of effective_element. Each Class_category_association acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.734 Effectivity_assignment to Class_condition_association

Each Effectivity_assignment (see 4.2.180) refers to zero or one Class_condition_association (see 4.2.65) in the role of effective_element. Each Class_condition_association acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.735 Effectivity_assignment to Class_inclusion_association

Each Effectivity_assignment (see 4.2.180) refers to zero or one Class_inclusion_association (see 4.2.66) in the role of effective_element. Each Class_inclusion_association acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.736 Effectivity_assignment to Class_specification_association

Each Effectivity_assignment (see 4.2.180) refers to zero or one Class_specification_association (see 4.2.67) in the role of effective_element. Each Class_specification_association acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.737 Effectivity_assignment to Class_structure_relationship

Each Effectivity_assignment (see 4.2.180) refers to zero or one Class_structure_relationship (see 4.2.68) in the role of effective_element. Each Class_structure_relationship acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.738 Effectivity_assignment to Classification_system

Each Effectivity_assignment (see 4.2.180) refers to zero or one Classification_system (see 4.2.71) in the role of effective_element. Each Classification_system acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.739 Effectivity_assignment to Complex_product

Each Effectivity_assignment (see 4.2.180) refers to zero or one Complex_product (see 4.2.80) in the role of effective_element. Each Complex_product acts as effective_element for zero or more Effectivity_-assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.740 Effectivity_assignment to Complex_product_relationship

Each Effectivity_assignment (see 4.2.180) refers to zero or one Complex_product_relationship (see 4.2.81) in the role of effective_element. Each Complex_product_relationship acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.741 Effectivity_assignment to Configuration

Each Effectivity_assignment (see 4.2.180) refers to zero or one Configuration (see 4.2.94) in the role of effective_element. Each Configuration acts as effective_element for zero or more Effectivity_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through effective_element_select.

4.3.742 Effectivity_assignment to Design_constraint

Each Effectivity_assignment (see 4.2.180) refers to zero or one Design_constraint (see 4.2.138) in the role of effective_element. Each Design_constraint acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.743 Effectivity_assignment to Document

Each Effectivity_assignment (see 4.2.180) refers to zero or one Document (see 4.2.155) in the role of effective_element. Each Document acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.744 Effectivity_assignment to Document_file

Each Effectivity_assignment (see 4.2.180) refers to zero or one Document_file (see 4.2.159) in the role of effective_element. Each Document_file acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.745 Effectivity_assignment to Document_representation

Each Effectivity_assignment (see 4.2.180) refers to zero or one Document_representation (see 4.2.163) in the role of effective_element. Each Document_representation acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.746 Effectivity_assignment to Document_version

Each Effectivity_assignment (see 4.2.180) refers to zero or one Document_version (see 4.2.167) in the role of effective_element. Each Document_version acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.747 Effectivity_assignment to Drawing

Each Effectivity_assignment (see 4.2.180) refers to zero or one Drawing (see 4.2.170) in the role of effective_element. Each Drawing acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.748 Effectivity_assignment to Effectivity

Each Effectivity_assignment (see 4.2.180) refers to exactly one Effectivity (see 4.2.179) in the role of assigned_effectivity. Each Effectivity acts as assigned_effectivity for zero or more Effectivity_assignment objects.

4.3.749 Effectivity_assignment to Feature_occurrence

Each Effectivity_assignment (see 4.2.180) refers to zero or one Feature_occurrence (see 4.2.200) in the role of effective_element. Each Feature_occurrence acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.750 Effectivity_assignment to Geometric_model

Each Effectivity_assignment (see 4.2.180) refers to zero or one Geometric_model (see 4.2.238) in the role of effective_element. Each Geometric_model acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.751 Effectivity_assignment to Item

Each Effectivity_assignment (see 4.2.180) refers to zero or one Item (see 4.2.267) in the role of effective_element. Each Item acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.752 Effectivity_assignment to Item_definition_instance_relationship

Each Effectivity_assignment (see 4.2.180) refers to zero or one Item_definition_instance_relationship (see 4.2.268) in the role of effective_element. Each Item_definition_instance_relationship acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.753 Effectivity_assignment to Item_definition_relationship

Each Effectivity_assignment (see 4.2.180) refers to zero or one Item_definition_relationship (see 4.2.269) in the role of effective_element. Each Item_definition_relationship acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.754 Effectivity_assignment to Item_instance

Each Effectivity_assignment (see 4.2.180) refers to zero or one Item_instance (see 4.2.271) in the role of effective_element. Each Item_instance acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.755 Effectivity_assignment to Item_instance_relationship

Each Effectivity_assignment (see 4.2.180) refers to zero or one Item_instance_relationship (see 4.2.272) in the role of effective_element. Each Item_instance_relationship acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.756 Effectivity_assignment to Item_version

Each Effectivity_assignment (see 4.2.180) refers to zero or one Item_version (see 4.2.275) in the role of effective_element. Each Item_version acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.757 Effectivity_assignment to Kinematic_simulation_information

Each Effectivity_assignment (see 4.2.180) refers to zero or one Kinematic_simulation_information (see 4.2.288) in the role of effective_element. Each Kinematic_simulation_information acts as effective_-element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.758 Effectivity_assignment to Material

Each Effectivity_assignment (see 4.2.180) refers to zero or one Material (see 4.2.309) in the role of effective_element. Each Material acts as effective_element for zero or more Effectivity_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

NOTE - This assertion is established through effective_element_select.

4.3.759 Effectivity_assignment to Process_operation_definition

Each Effectivity_assignment (see 4.2.180) refers to zero or one Process_operation_definition (see 4.2.381) in the role of effective_element. Each Process_operation_definition acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.760 Effectivity_assignment to Process_operation_definition_relationship

Each Effectivity_assignment (see 4.2.180) refers to zero or one Process_operation_definition_relationship (see 4.2.382) in the role of effective_element. Each Process_operation_definition_relationship acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.761 Effectivity_assignment to Process_operation_occurrence

Each Effectivity_assignment (see 4.2.180) refers to zero or one Process_operation_occurrence (see 4.2.384) in the role of effective_element. Each Process_operation_occurrence acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.762 Effectivity_assignment to Process_operation_occurrence_relationship

Each Effectivity_assignment (see 4.2.180) refers to zero or one Process_operation_occurrence_relationship (see 4.2.385) in the role of effective_element. Each Process_operation_occurrence_relationship acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.763 Effectivity_assignment to Process_operation_resource_assignment

Each Effectivity_assignment (see 4.2.180) refers to zero or one Process_operation_resource_assignment (see 4.2.386) in the role of effective_element. Each Process_operation_resource_assignment acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.764 Effectivity_assignment to Process_plan

Each Effectivity_assignment (see 4.2.180) refers to zero or one Process_plan (see 4.2.387) in the role of effective_element. Each Process_plan acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.765 Effectivity_assignment to Product_class

Each Effectivity_assignment (see 4.2.180) refers to zero or one Product_class (see 4.2.392) in the role of effective_element. Each Product_class acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.766 Effectivity_assignment to Product_identification

Each Effectivity_assignment (see 4.2.180) refers to zero or one Product_identification (see 4.2.398) in the role of effective_element. Each Product_identification acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.767 Effectivity_assignment to Product_structure_relationship

Each Effectivity_assignment (see 4.2.180) refers to zero or one Product_structure_relationship (see 4.2.400) in the role of effective_element. Each Product_structure_relationship acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.768 Effectivity_assignment to Property

Each Effectivity_assignment (see 4.2.180) refers to zero or one Property (see 4.2.409) in the role of effective_element. Each Property acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.769 Effectivity_assignment to Property_value_association

Each Effectivity_assignment (see 4.2.180) refers to zero or one Property_value_association (see 4.2.413) in the role of effective_element. Each Property_value_association acts as effective_element for zero or more Effectivity_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through effective_element_select.

4.3.770 Effectivity_assignment to Security_classification

Each Effectivity_assignment (see 4.2.180) refers to zero or one Security_classification (see 4.2.443) in the role of effective_element. Each Security_classification acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.771 Effectivity_assignment to Specification

Each Effectivity_assignment (see 4.2.180) refers to zero or one Specification (see 4.2.467) in the role of effective_element. Each Specification acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.772 Effectivity_assignment to Specification_category

Each Effectivity_assignment (see 4.2.180) refers to zero or one Specification_category (see 4.2.468) in the role of effective_element. Each Specification_category acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.773 Effectivity_assignment to Specification_expression

Each Effectivity_assignment (see 4.2.180) refers to zero or one Specification_expression (see 4.2.470) in the role of effective_element. Each Specification_expression acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.774 Effectivity_assignment to Specification_inclusion

Each Effectivity_assignment (see 4.2.180) refers to zero or one Specification_inclusion (see 4.2.471) in the role of effective_element. Each Specification_inclusion acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.775 Effectivity_assignment to Styled_model

Each Effectivity_assignment (see 4.2.180) refers to zero or one Styled_model (see 4.2.484) in the role of effective_element. Each Styled_model acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.776 Effectivity_assignment to View_area

Each Effectivity_assignment (see 4.2.180) refers to zero or one View_area (see 4.2.555) in the role of effective_element. Each View_area acts as effective_element for zero or more Effectivity_assignment objects.

NOTE - This assertion is established through effective_element_select.

4.3.777 Effectivity_relationship to Effectivity

Each Effectivity_relationship (see 4.2.181) is related to exactly one Effectivity (see 4.2.179). Each Effectivity is referenced by zero or more Effectivity_relationship objects as related.

NOTE 1 - The related Effectivity is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Effectivity_relationship is relating to exactly one Effectivity. Each Effectivity is referenced by zero or more Effectivity_relationship objects as relating.

NOTE 2 - The relating Effectivity is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.778 Effectivity_relationship to Multi_language_string

Each Effectivity_relationship (see 4.2.181) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Effectivity_relationship objects.

NOTE - This assertion is established through string_select.

4.3.779 Element_delivery to Activity_element

Each Element_delivery (see 4.2.182) refers to exactly one Activity_element (see 4.2.3) in the role of deliverable_element. Each Activity_element acts as deliverable_element for zero or more Element_delivery objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.780 Element_delivery to Organization

Each Element_delivery (see 4.2.182) refers to exactly one Organization (see 4.2.331) in the role of destination. Each Organization acts as destination for zero or more Element_delivery objects.

4.3.781 Element_delivery to Value_with_unit

Each Element_delivery (see 4.2.182) refers to exactly one Value_with_unit (see 4.2.549) in the role of quantity. Each Value_with_unit acts as quantity for zero or more Element_delivery objects.

4.3.782 Event_reference to Activity

Each Event_reference (see 4.2.184) refers to zero or one Activity (see 4.2.2) in the role of event_context. Each Activity acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.783 Event_reference to Activity_element

Each Event_reference (see 4.2.184) refers to zero or one Activity_element (see 4.2.3) in the role of event_context. Each Activity_element acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.784 Event_reference to Activity_method_assignment

Each Event_reference (see 4.2.184) refers to zero or one Activity_method_assignment (see 4.2.5) in the role of event_context. Each Activity_method_assignment acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.785 Event_reference to Alternate_item_relationship

Each Event_reference (see 4.2.184) refers to zero or one Alternate_item_relationship (see 4.2.9) in the role of event_context. Each Alternate_item_relationship acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.786 Event_reference to Approval_status

Each Event_reference (see 4.2.184) refers to zero or one Approval_status (see 4.2.24) in the role of event_context. Each Approval_status acts as event_context for zero or more Event_reference objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through general_organizational_data_select.

4.3.787 Event_reference to Assembly_substitute_relationship

Each Event_reference (see 4.2.184) refers to zero or one Assembly_substitute_relationship (see 4.2.28) in the role of event_context. Each Assembly_substitute_relationship acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.788 Event_reference to Certification

Each Event_reference (see 4.2.184) refers to zero or one Certification (see 4.2.50) in the role of event_context. Each Certification acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.789 Event_reference to Class_category_association

Each Event_reference (see 4.2.184) refers to zero or one Class_category_association (see 4.2.64) in the role of event_context. Each Class_category_association acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.790 Event_reference to Class_condition_association

Each Event_reference (see 4.2.184) refers to zero or one Class_condition_association (see 4.2.65) in the role of event_context. Each Class_condition_association acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.791 Event_reference to Class_inclusion_association

Each Event_reference (see 4.2.184) refers to zero or one Class_inclusion_association (see 4.2.66) in the role of event_context. Each Class_inclusion_association acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.792 Event_reference to Class_specification_association

Each Event_reference (see 4.2.184) refers to zero or one Class_specification_association (see 4.2.67) in the role of event_context. Each Class_specification_association acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.793 Event_reference to Class_structure_relationship

Each Event_reference (see 4.2.184) refers to zero or one Class_structure_relationship (see 4.2.68) in the role of event_context. Each Class_structure_relationship acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.794 Event_reference to Classification_association

Each Event_reference (see 4.2.184) refers to zero or one Classification_association (see 4.2.69) in the role of event_context. Each Classification_association acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.795 Event_reference to Classification_system

Each Event_reference (see 4.2.184) refers to zero or one Classification_system (see 4.2.71) in the role of event_context. Each Classification_system acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.796 Event_reference to Complex_product

Each Event_reference (see 4.2.184) refers to zero or one Complex_product (see 4.2.80) in the role of event_context. Each Complex_product acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.797 Event_reference to Complex_product_relationship

Each Event_reference (see 4.2.184) refers to zero or one Complex_product_relationship (see 4.2.81) in the role of event_context. Each Complex_product_relationship acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.798 Event_reference to Configuration

Each Event_reference (see 4.2.184) refers to zero or one Configuration (see 4.2.94) in the role of event_-context. Each Configuration acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.799 Event_reference to Contract

Each Event_reference (see 4.2.184) refers to zero or one Contract (see 4.2.104) in the role of event_-context. Each Contract acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.800 Event_reference to Design_constraint

Each Event_reference (see 4.2.184) refers to zero or one Design_constraint (see 4.2.138) in the role of event_context. Each Design_constraint acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.801 Event_reference to Design_discipline_item_definition

Each Event_reference (see 4.2.184) refers to zero or one Design_discipline_item_definition (see 4.2.142) in the role of event_context. Each Design_discipline_item_definition acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.802 Event_reference to Document

Each Event_reference (see 4.2.184) refers to zero or one Document (see 4.2.155) in the role of event_-context. Each Document acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.803 Event_reference to Document_file

Each Event_reference (see 4.2.184) refers to zero or one Document_file (see 4.2.159) in the role of event_context. Each Document_file acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.804 Event_reference to Document_representation

Each Event_reference (see 4.2.184) refers to zero or one Document_representation (see 4.2.163) in the role of event_context. Each Document_representation acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.805 Event_reference to Document_version

Each Event_reference (see 4.2.184) refers to zero or one Document_version (see 4.2.167) in the role of event_context. Each Document_version acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.806 Event_reference to Drawing

Each Event_reference (see 4.2.184) refers to zero or one Drawing (see 4.2.170) in the role of event_context. Each Drawing acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.807 Event_reference to Drawing_sheet

Each Event_reference (see 4.2.184) refers to zero or one Drawing_sheet (see 4.2.173) in the role of event_context. Each Drawing_sheet acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.808 Event_reference to Duration

Each Event_reference (see 4.2.184) refers to zero or one Duration (see 4.2.174) in the role of offset. Each Duration acts as offset for zero or more Event_reference objects.

4.3.809 Event_reference to General_classification

Each Event_reference (see 4.2.184) refers to zero or one General_classification (see 4.2.216) in the role of event_context. Each General_classification acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.810 Event_reference to Geometric_model

Each Event_reference (see 4.2.184) refers to zero or one Geometric_model (see 4.2.238) in the role of event_context. Each Geometric_model acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.811 Event_reference to Item

Each Event_reference (see 4.2.184) refers to zero or one Item (see 4.2.267) in the role of event_context. Each Item acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.812 Event_reference to Item_definition_instance_relationship

Each Event_reference (see 4.2.184) refers to zero or one Item_definition_instance_relationship (see 4.2.268) in the role of event_context. Each Item_definition_instance_relationship acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.813 Event_reference to Item_definition_relationship

Each Event_reference (see 4.2.184) refers to zero or one Item_definition_relationship (see 4.2.269) in the role of event_context. Each Item_definition_relationship acts as event_context for zero or more Event_-reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.814 Event_reference to Item_instance

Each Event_reference (see 4.2.184) refers to zero or one Item_instance (see 4.2.271) in the role of event_-context. Each Item_instance acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.815 Event_reference to Item_instance_relationship

Each Event_reference (see 4.2.184) refers to zero or one Item_instance_relationship (see 4.2.272) in the role of event_context. Each Item_instance_relationship acts as event_context for zero or more Event_-reference objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.816 Event_reference to Item_version

Each Event_reference (see 4.2.184) refers to zero or one Item_version (see 4.2.275) in the role of event_context. Each Item_version acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.817 Event_reference to Item_version_relationship

Each Event_reference (see 4.2.184) refers to zero or one Item_version_relationship (see 4.2.276) in the role of event_context. Each Item_version_relationship acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.818 Event_reference to Kinematic_simulation_information

Each Event_reference (see 4.2.184) refers to zero or one Kinematic_simulation_information (see 4.2.288) in the role of event_context. Each Kinematic_simulation_information acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.819 Event_reference to Manufacturing_configuration

Each Event_reference (see 4.2.184) refers to zero or one Manufacturing_configuration (see 4.2.305) in the role of event_context. Each Manufacturing_configuration acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.820 Event_reference to Material

Each Event_reference (see 4.2.184) refers to zero or one Material (see 4.2.309) in the role of event_context. Each Material acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.821 Event_reference to Multi_language_string

Each Event_reference (see 4.2.184) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Event_reference objects.

NOTE - This assertion is established through string_select.

4.3.822 Event_reference to Organization_relationship

Each Event_reference (see 4.2.184) refers to zero or one Organization_relationship (see 4.2.333) in the role of event_context. Each Organization_relationship acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.823 Event_reference to Person_in_organization

Each Event_reference (see 4.2.184) refers to zero or one Person_in_organization (see 4.2.347) in the role of event_context. Each Person_in_organization acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.824 Event_reference to Person_in_organization_relationship

Each Event_reference (see 4.2.184) refers to zero or one Person_in_organization_relationship (see 4.2.348) in the role of event_context. Each Person_in_organization_relationship acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.825 Event_reference to Physical_assembly_relationship

Each Event_reference (see 4.2.184) refers to zero or one Physical_assembly_relationship (see 4.2.350) in the role of event_context. Each Physical_assembly_relationship acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.826 Event_reference to Physical_instance

Each Event_reference (see 4.2.184) refers to zero or one Physical_instance (see 4.2.352) in the role of event_context. Each Physical_instance acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.827 Event_reference to Physical_instance_test_result

Each Event_reference (see 4.2.184) refers to zero or one Physical_instance_test_result (see 4.2.353) in the role of event_context. Each Physical_instance_test_result acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.828 Event_reference to Process_operation_definition

Each Event_reference (see 4.2.184) refers to zero or one Process_operation_definition (see 4.2.381) in the role of event_context. Each Process_operation_definition acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.829 Event_reference to Process_operation_occurrence

Each Event_reference (see 4.2.184) refers to zero or one Process_operation_occurrence (see 4.2.384) in the role of event_context. Each Process_operation_occurrence acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.830 Event_reference to Process_operation_resource_assignment

Each Event_reference (see 4.2.184) refers to zero or one Process_operation_resource_assignment (see 4.2.386) in the role of event_context. Each Process_operation_resource_assignment acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.831 Event_reference to Process_plan

Each Event_reference (see 4.2.184) refers to zero or one Process_plan (see 4.2.387) in the role of event_context. Each Process_plan acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.832 Event_reference to Product_class

Each Event_reference (see 4.2.184) refers to zero or one Product_class (see 4.2.392) in the role of event_context. Each Product_class acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.833 Event_reference to Product_identification

Each Event_reference (see 4.2.184) refers to zero or one Product_identification (see 4.2.398) in the role of event_context. Each Product_identification acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.834 Event_reference to Product_structure_relationship

Each Event_reference (see 4.2.184) refers to zero or one Product_structure_relationship (see 4.2.400) in the role of event_context. Each Product_structure_relationship acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.835 Event_reference to Project

Each Event_reference (see 4.2.184) refers to zero or one Project (see 4.2.404) in the role of event_context. Each Project acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.836 Event_reference to Property

Each Event_reference (see 4.2.184) refers to zero or one Property (see 4.2.409) in the role of event_context. Each Property acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.837 Event_reference to Property_value_association

Each Event_reference (see 4.2.184) refers to zero or one Property_value_association (see 4.2.413) in the role of event_context. Each Property_value_association acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.838 Event_reference to Security_classification

Each Event_reference (see 4.2.184) refers to zero or one Security_classification (see 4.2.443) in the role of event_context. Each Security_classification acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.839 Event_reference to Security_level

Each Event_reference (see 4.2.184) refers to zero or one Security_level (see 4.2.444) in the role of event_context. Each Security_level acts as event_context for zero or more Event_reference objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.840 Event_reference to Specification

Each Event_reference (see 4.2.184) refers to zero or one Specification (see 4.2.467) in the role of event_context. Each Specification acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.841 Event_reference to Specification_category

Each Event_reference (see 4.2.184) refers to zero or one Specification_category (see 4.2.468) in the role of event_context. Each Specification_category acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.842 Event_reference to Specification_expression

Each Event_reference (see 4.2.184) refers to zero or one Specification_expression (see 4.2.470) in the role of event_context. Each Specification_expression acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.843 Event_reference to Specification_inclusion

Each Event_reference (see 4.2.184) refers to zero or one Specification_inclusion (see 4.2.471) in the role of event_context. Each Specification_inclusion acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.844 Event_reference to Styled_model

Each Event_reference (see 4.2.184) refers to zero or one Styled_model (see 4.2.484) in the role of event_context. Each Styled_model acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.845 Event_reference to View_area

Each Event_reference (see 4.2.184) refers to zero or one View_area (see 4.2.555) in the role of event_context. Each View_area acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.846 Event_reference to Work_order

Each Event_reference (see 4.2.184) refers to zero or one Work_order (see 4.2.564) in the role of event_context. Each Work_order acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.847 Event_reference to Work_request

Each Event_reference (see 4.2.184) refers to zero or one Work_request (see 4.2.565) in the role of event_context. Each Work_request acts as event_context for zero or more Event_reference objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.848 External_file_id_and_location to Document_location_property

Each External_file_id_and_location (see 4.2.185) refers to exactly one Document_location_property (see 4.2.162) in the role of location. Each Document_location_property acts as location for zero or more External_file_id_and_location objects.

4.3.849 External_geometric_model_with_parameters to General_parameter

Each External_geometric_model_with_parameters (see 4.2.187) refers to one or more General_parameter (see 4.2.226) objects in the role of parameter_value. Each General_parameter acts as parameter_value for zero or more External_geometric_model_with_parameters objects.

4.3.850 External_library_reference to Multi_language_string

Each External_library_reference (see 4.2.188) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more External_library_reference objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.851 External_model to Cartesian_coordinate_space

Each External_model (see 4.2.189) is_defined_in exactly one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more External_model objects.

4.3.852 External_model to Digital_file

Each External_model (see 4.2.189) is_defined_as exactly one Digital_file (see 4.2.148). Each Digital_file has associated_model_space defined by zero or one External_model.

4.3.853 External_model to Multi_language_string

Each External_model (see 4.2.189) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more External_model objects.

NOTE - This assertion is established through string_select.

4.3.854 External_picture to Cartesian_coordinate_space_2d

Each External_picture (see 4.2.190) is_defined_in exactly one Cartesian_coordinate_space_2d (see 4.2.45). Each Cartesian_coordinate_space_2d is related to zero or more External_picture objects.

4.3.855 Face to Face_bound

Each Face (see 4.2.191) refers to one or more Face_bound (see 4.2.192) objects in the role of bound. Each Face_bound acts as bound for zero or more Face objects.

4.3.856 Face to Surface

Each Face (see 4.2.191) refers to exactly one Surface (see 4.2.489) in the role of face_geometry. Each Surface acts as face_geometry for zero or more Face objects.

4.3.857 Face_bound to Edge_loop

Each Face_bound (see 4.2.192) refers to zero or one Edge_loop (see 4.2.176) in the role of loop. Each Edge_loop acts as loop for zero or more Face_bound objects.

NOTE - This assertion is established through loop_select.

4.3.858 Face_bound to Vertex_loop

Each Face_bound (see 4.2.192) refers to zero or one Vertex_loop (see 4.2.552) in the role of loop. Each Vertex_loop acts as loop for zero or more Face_bound objects.

NOTE - This assertion is established through loop_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.859 Face_transition to Face

Each Face_transition (see 4.2.194) refers to exactly one Face (see 4.2.191) in the role of face_1. Each Face acts as face_1 for zero or more Face_transition objects.

Each Face_transition refers to exactly one Face in the role of face_2. Each Face acts as face_2 for zero or more Face_transition objects.

4.3.860 Face_transition to Oriented_edge_curve

Each Face_transition (see 4.2.194) refers to exactly one Oriented_edge_curve (see 4.2.334) in the role of edge_joint. Each Oriented_edge_curve acts as edge_joint for zero or more Face_transition objects.

4.3.861 Faceted_b_rep to Faceted_closed_shell

Each Faceted_b_rep (see 4.2.195) refers to exactly one Faceted_closed_shell (see 4.2.197) in the role of outer. Each Faceted_closed_shell acts as outer for zero or more Faceted_b_rep objects.

Each Faceted_b_rep refers to zero or more Faceted_closed_shell objects in the role of void. Each Faceted_closed_shell acts as void for zero or more Faceted_b_rep objects.

4.3.862 Faceted_b_rep_model to Faceted_b_rep

Each Faceted_b_rep_model (see 4.2.196) refers to zero or more Faceted_b_rep (see 4.2.195) objects in the role of element. Each Faceted_b_rep acts as element for zero or more Faceted_b_rep_model objects.

4.3.863 Faceted_closed_shell to Faceted_face

Each Faceted_closed_shell (see 4.2.197) refers to four or more Faceted_face (see 4.2.198) objects in the role of shell_boundary. Each Faceted_face acts as shell_boundary for zero or more Faceted_closed_shell objects.

4.3.864 Faceted_face to Plane

Each Faceted_face (see 4.2.198) refers to exactly one Plane (see 4.2.360) in the role of face_geometry. Each Plane acts as face_geometry for zero or more Faceted_face objects.

4.3.865 Faceted_face to Poly_loop

Each Faceted_face (see 4.2.198) refers to one or more Poly_loop (see 4.2.376) objects in the role of bound. Each Poly_loop is_bound_for exactly one Faceted_face.

4.3.866 Feature_definition to Axis_placement

Each Feature_definition (see 4.2.199) refers to zero or one Axis_placement (see 4.2.33) in the role of location_and_orientation. Each Axis_placement acts as location_and_orientation for zero or more Feature_definition objects.

4.3.867 Feature_definition to Cartesian_coordinate_space_3d

Each Feature_definition (see 4.2.199) is_defined_in exactly one Cartesian_coordinate_space_3d (see 4.2.46). Each Cartesian_coordinate_space_3d is related to zero or more Feature_definition objects.

4.3.868 Feature_occurrence to Plane

Each Feature_occurrence (see 4.2.200) refers to exactly one Plane (see 4.2.360) in the role of maximum_feature_limit. Each Plane acts as maximum_feature_limit for zero or more Feature_occurrence objects.

4.3.869 Feature_parameter to Value_with_unit

Each Feature_parameter (see 4.2.201) refers to exactly one Value_with_unit (see 4.2.549) in the role of parameter_value. Each Value_with_unit acts as parameter_value for zero or more Feature_parameter objects.

4.3.870 Feature_placement to Feature_definition

Each Feature_placement (see 4.2.202) refers to exactly one Feature_definition (see 4.2.199) in the role of placed_definition. Each Feature_definition acts as placed_definition for zero or more Feature_placement objects.

4.3.871 Feature_placement to Geometric_model

Each Feature_placement (see 4.2.202) refers to exactly one Geometric_model (see 4.2.238) in the role of placement_reference. Each Geometric_model acts as placement_reference for zero or more Feature_placement objects.

4.3.872 Feature_placement to Transformation

Each Feature_placement (see 4.2.202) refers to exactly one Transformation (see 4.2.533) in the role of placement. Each Transformation acts as placement for zero or more Feature_placement objects.

4.3.873 Featured_shape to Item_shape

Each Featured_shape (see 4.2.203) refers to exactly one Item_shape (see 4.2.274) in the role of base_shape. Each Item_shape acts as base_shape for zero or more Featured_shape objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.874 Fill_area to Annotation_curve

Each Fill_area (see 4.2.204) refers to one or more Annotation_curve (see 4.2.16) objects in the role of boundary. Each Annotation_curve acts as boundary for zero or more Fill_area objects.

4.3.875 Fillet to Face

Each Fillet (see 4.2.205) refers to exactly one Face (see 4.2.191) in the role of fillet_face. Each Face acts as fillet_face for zero or more Fillet objects.

4.3.876 Final_solution to Descriptive_specification

Each Final_solution (see 4.2.206) refers to zero or more Descriptive_specification (see 4.2.137) objects in the role of final_specification. Each Descriptive_specification acts as final_specification for zero or more Final_solution objects.

NOTE - This assertion is established through final_definition_select.

4.3.877 Final_solution to Design_discipline_item_definition

Each Final_solution (see 4.2.206) refers to zero or more Design_discipline_item_definition (see 4.2.142) objects in the role of final_specification. Each Design_discipline_item_definition acts as final_specification for zero or more Final_solution objects.

NOTE - This assertion is established through final_definition_select.

4.3.878 Final_solution to Physical_instance

Each Final_solution (see 4.2.206) refers to zero or more Physical_instance (see 4.2.352) objects in the role of final_specification. Each Physical_instance acts as final_specification for zero or more Final_solution objects.

NOTE - This assertion is established through final_definition_select.

4.3.879 Flat_slot_end_type to Feature_parameter

Each Flat_slot_end_type (see 4.2.208) refers to exactly one Feature_parameter (see 4.2.201) in the role of first_radius. Each Feature_parameter acts as first_radius for zero or more Flat_slot_end_type objects.

Each Flat_slot_end_type refers to exactly one Feature_parameter in the role of second_radius. Each Feature_parameter acts as second_radius for zero or more Flat_slot_end_type objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.880 Flat_with_radius_bottom to Feature_parameter

Each Flat_with_radius_bottom (see 4.2.209) refers to exactly one Feature_parameter (see 4.2.201) in the role of radius. Each Feature_parameter acts as radius for zero or more Flat_with_radius_bottom objects.

4.3.881 Flat_with_taper_bottom to Feature_parameter

Each Flat_with_taper_bottom (see 4.2.210) refers to exactly one Feature_parameter (see 4.2.201) in the role of final_diameter. Each Feature_parameter acts as final_diameter for zero or more Flat_with_taper_-bottom objects.

Each Flat_with_taper_bottom refers to exactly one Feature_parameter in the role of taper_angle. Each Feature_parameter acts as taper_angle for zero or more Flat_with_taper_bottom objects.

4.3.882 Form_feature_in_panel to Angle_specification

Each Form_feature_in_panel (see 4.2.212) refers to zero or one Angle_specification (see 4.2.11) in the role of base_boundary_defined_by. Each Angle_specification acts as base_boundary_defined_by for zero or more Form_feature_in_panel objects.

NOTE 1 - This assertion is established through profile_or_angle_select.

Each Form_feature_in_panel refers to zero or one Angle_specification in the role of target_boundary_-defined_by. Each Angle_specification acts as target_boundary_defined_by for zero or more Form_-feature_in_panel objects.

NOTE 2 - This assertion is established through profile_or_angle_select.

4.3.883 Form_feature_in_panel to Closed_profile_usage

Each Form_feature_in_panel (see 4.2.212) refers to zero or one Closed_profile_usage (see 4.2.73) in the role of base_boundary_defined_by. Each Closed_profile_usage acts as base_boundary_defined_by for zero or more Form_feature_in_panel objects.

NOTE 1 - This assertion is established through profile_or_angle_select.

Each Form_feature_in_panel refers to zero or one Closed_profile_usage in the role of target_boundary_-defined_by. Each Closed_profile_usage acts as target_boundary_defined_by for zero or more Form_-feature_in_panel objects.

NOTE 2 - This assertion is established through profile_or_angle_select.

 © ISO 2001 – All rights reserved

4.3.884 Form_feature_in_panel to Feature_parameter

Each Form_feature_in_panel (see 4.2.212) refers to exactly one Feature_parameter (see 4.2.201) in the role of base_radius. Each Feature_parameter acts as base_radius for zero or more Form_feature_in_panel objects.

Each Form_feature_in_panel refers to exactly one Feature_parameter in the role of target_radius. Each Feature_parameter acts as target_radius for zero or more Form_feature_in_panel objects.

4.3.885 Form_feature_in_panel to Shell

Each Form_feature_in_panel (see 4.2.212) refers to zero or one Shell (see 4.2.451) in the role of target_face. Each Shell acts as target_face for zero or more Form_feature_in_panel objects.

NOTE - This assertion is established through general_end_select.

4.3.886 Form_feature_in_panel to Surface

Each Form_feature_in_panel (see 4.2.212) refers to zero or one Surface (see 4.2.489) in the role of target_face. Each Surface acts as target_face for zero or more Form_feature_in_panel objects.

NOTE - This assertion is established through general_end_select.

4.3.887 Full_model_change to Detailed_element

Each Full_model_change (see 4.2.213) refers to zero or more Detailed_element (see 4.2.143) objects in the role of added_element. Each Detailed_element acts as added_element for zero or more Full_model_change objects.

4.3.888 Full_model_change to Geometric_model_relationship

Each Full_model_change (see 4.2.213) refers to zero or one Geometric_model_relationship (see 4.2.239) in the role of related_description. Each Geometric_model_relationship acts as related_description for zero or more Full_model_change objects.

NOTE - This assertion is established through model_change_select.

4.3.889 Full_model_change to Styled_model_relationship

Each Full_model_change (see 4.2.213) refers to zero or one Styled_model_relationship (see 4.2.486) in the role of related_description. Each Styled_model_relationship acts as related_description for zero or more Full_model_change objects.

NOTE - This assertion is established through model_change_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.890 Full_model_change to View_area_relationship

Each Full_model_change (see 4.2.213) refers to zero or one View_area_relationship (see 4.2.557) in the role of related_description. Each View_area_relationship acts as related_description for zero or more Full_model_change objects.

NOTE - This assertion is established through model_change_select.

4.3.891 Full_model_change to View_relationship

Each Full_model_change (see 4.2.213) refers to zero or one View_relationship (see 4.2.559) in the role of related_description. Each View_relationship acts as related_description for zero or more Full_model_change objects.

NOTE - This assertion is established through model_change_select.

4.3.892 General_bottom_condition to Feature_parameter

Each General_bottom_condition (see 4.2.215) refers to zero or one Feature_parameter (see 4.2.201) in the role of floor_radius. Each Feature_parameter acts as floor_radius for zero or more General_bottom_condition objects.

4.3.893 General_bottom_condition to Shell

Each General_bottom_condition (see 4.2.215) refers to zero or one Shell (see 4.2.451) in the role of floor_face. Each Shell acts as floor_face for zero or more General_bottom_condition objects.

NOTE - This assertion is established through general_end_select.

4.3.894 General_bottom_condition to Surface

Each General_bottom_condition (see 4.2.215) refers to zero or one Surface (see 4.2.489) in the role of floor_face. Each Surface acts as floor_face for zero or more General_bottom_condition objects.

NOTE - This assertion is established through general_end_select.

4.3.895 General_classification to Classification_system

Each General_classification (see 4.2.216) refers to zero or one Classification_system (see 4.2.71) in the role of used_classification_system. Each Classification_system has allowed_classification defined by zero or more General_classification objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.896 General_classification to External_library_reference

Each General_classification (see 4.2.216) refers to zero or one External_library_reference (see 4.2.188) in the role of classification_source. Each External_library_reference acts as classification_source for zero or more General_classification objects.

NOTE - This assertion is established through class_source_select.

4.3.897 General_classification to Multi_language_string

Each General_classification (see 4.2.216) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more General_classification objects.

NOTE - This assertion is established through string_select.

4.3.898 General_classification to Plib_class_reference

Each General_classification (see 4.2.216) refers to zero or one Plib_class_reference (see 4.2.361) in the role of classification_source. Each Plib_class_reference acts as classification_source for zero or more General_classification objects.

NOTE - This assertion is established through class_source_select.

4.3.899 General_classification_hierarchy to General_classification

Each General_classification_hierarchy (see 4.2.217) refers to exactly one General_classification (see 4.2.216) in the role of sub_classification. Each General_classification acts as sub_classification for zero or more General_classification_hierarchy objects.

Each General_classification_hierarchy refers to exactly one General_classification in the role of super_classification. Each General_classification acts as super_classification for zero or more General_classification_hierarchy objects.

4.3.900 General_closed_profile to Curve

Each General_closed_profile (see 4.2.218) refers to exactly one Curve (see 4.2.108) in the role of profile_shape. Each Curve acts as profile_shape for zero or more General_closed_profile objects.

4.3.901 General_compound_feature to Feature_definition

Each General_compound_feature (see 4.2.219) refers to zero or more Feature_definition (see 4.2.199) objects in the role of elements. Each Feature_definition acts as elements for zero or more General_compound_feature objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through feature_definition_select.

4.3.902 General_compound_feature to General_feature

Each General_compound_feature (see 4.2.219) refers to zero or more General_feature (see 4.2.221) objects in the role of elements. Each General_feature acts as elements for zero or more General_compound_feature objects.

NOTE - This assertion is established through feature_definition_select.

4.3.903 General_compound_feature to Thread_feature

Each General_compound_feature (see 4.2.219) refers to zero or more Thread_feature (see 4.2.517) objects in the role of elements. Each Thread_feature acts as elements for zero or more General_compound_feature objects.

NOTE - This assertion is established through feature_definition_select.

4.3.904 General_compound_feature to Transition_feature

Each General_compound_feature (see 4.2.219) refers to zero or more Transition_feature (see 4.2.537) objects in the role of elements. Each Transition_feature acts as elements for zero or more General_compound_feature objects.

NOTE - This assertion is established through feature_definition_select.

4.3.905 General_feature to Axis_placement

Each General_feature (see 4.2.221) refers to zero or one Axis_placement (see 4.2.33) in the role of location_and_orientation. Each Axis_placement acts as location_and_orientation for zero or more General_feature objects.

4.3.906 General_feature to General_parameter

Each General_feature (see 4.2.221) refers to zero or more General_parameter (see 4.2.226) objects in the role of additional_parameter. Each General_parameter acts as additional_parameter for zero or more General_feature objects.

4.3.907 General_item_definition_instance_relationship to Multi_language_string

Each General_item_definition_instance_relationship (see 4.2.222) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more General_item_definition_instance_relationship objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through string_select.

4.3.908 General_item_definition_relationship to Multi_language_string

Each General_item_definition_relationship (see 4.2.223) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more General_item_definition_relationship objects.

NOTE - This assertion is established through string_select.

4.3.909 General_item_instance_relationship to Multi_language_string

Each General_item_instance_relationship (see 4.2.224) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more General_item_instance_relationship objects.

NOTE - This assertion is established through string_select.

4.3.910 General_open_profile to Curve

Each General_open_profile (see 4.2.225) refers to exactly one Curve (see 4.2.108) in the role of profile_-shape. Each Curve acts as profile_shape for zero or more General_open_profile objects.

4.3.911 General_parameter to Feature_parameter

Each General_parameter (see 4.2.226) refers to exactly one Feature_parameter (see 4.2.201) in the role of parameter_value. Each Feature_parameter acts as parameter_value for zero or more General_parameter objects.

4.3.912 General_path to Curve

Each General_path (see 4.2.227) refers to exactly one Curve (see 4.2.108) in the role of path_geometry. Each Curve acts as path_geometry for zero or more General_path objects.

4.3.913 General_pattern to Axis_placement

Each General_pattern (see 4.2.228) refers to one or more Axis_placement (see 4.2.33) objects in the role of added_instance. Each Axis_placement acts as added_instance for zero or more General_pattern objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.914 General_size_dimension to Measurement_path

Each General_size_dimension (see 4.2.232) refers to zero or one Measurement_path (see 4.2.314) in the role of used_path. Each Measurement_path acts as used_path for zero or more General_size_dimension objects.

4.3.915 General_tolerances to Document_file

Each General_tolerances (see 4.2.235) refers to zero or one Document_file (see 4.2.159) in the role of table_definition. Each Document_file acts as table_definition for zero or more General_tolerances objects.

NOTE - This assertion is established through general_tolerance_table_select.

4.3.916 General_tolerances to General_tolerance_table

Each General_tolerances (see 4.2.235) refers to zero or one General_tolerance_table (see 4.2.234) in the role of table_definition. Each General_tolerance_table acts as table_definition for zero or more General_tolerances objects.

NOTE - This assertion is established through general_tolerance_table_select.

4.3.917 General_top_condition to Shell

Each General_top_condition (see 4.2.236) refers to zero or one Shell (see 4.2.451) in the role of top_face. Each Shell acts as top_face for zero or more General_top_condition objects.

NOTE - This assertion is established through general_end_select.

4.3.918 General_top_condition to Surface

Each General_top_condition (see 4.2.236) refers to zero or one Surface (see 4.2.489) in the role of top_face. Each Surface acts as top_face for zero or more General_top_condition objects.

NOTE - This assertion is established through general_end_select.

4.3.919 Geometric_dimension to Value_with_unit

Each Geometric_dimension (see 4.2.237) refers to exactly one Value_with_unit (see 4.2.549) in the role of dimension_value. Each Value_with_unit acts as dimension_value for zero or more Geometric_dimension objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.920 Geometric_model to Cartesian_coordinate_space

Each Geometric_model (see 4.2.238) is_defined_in exactly one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more Geometric_model objects.

4.3.921 Geometric_model to Multi_language_string

Each Geometric_model (see 4.2.238) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Geometric_model objects.

NOTE - This assertion is established through string_select.

4.3.922 Geometric_model to Template_instance

Each Geometric_model (see 4.2.238) refers to zero or more Template_instance (see 4.2.512) objects in the role of additional_element. Each Template_instance acts as additional_element for zero or more Geometric_model objects.

4.3.923 Geometric_model_relationship to External_model

Each Geometric_model_relationship (see 4.2.239) is related to zero or one External_model (see 4.2.189). Each External_model is referenced by zero or more Geometric_model_relationship objects as related.

NOTE 1 - The related External_model is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

NOTE 2 - This assertion is established through geometric_or_external_model_select.

Each Geometric_model_relationship is relating to zero or one External_model. Each External_model is referenced by zero or more Geometric_model_relationship objects as relating.

NOTE 3 - The relating External_model is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

NOTE 4 - This assertion is established through geometric_or_external_model_select.

4.3.924 Geometric_model_relationship to Geometric_model

Each Geometric_model_relationship (see 4.2.239) is related to zero or one Geometric_model (see 4.2.238). Each Geometric_model is referenced by zero or more Geometric_model_relationship objects as related.

NOTE 1 - The related Geometric_model is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

NOTE 2 - This assertion is established through geometric_or_external_model_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Each Geometric_model_relationship is relating to zero or one Geometric_model. Each Geometric_-model is referenced by zero or more Geometric_model_relationship objects as relating.

NOTE 3 - The relating Geometric_model is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

NOTE 4 - This assertion is established through geometric_or_external_model_select.

4.3.925 Geometric_model_relationship to Multi_language_string

Each Geometric_model_relationship (see 4.2.239) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Geometric_-model_relationship objects.

NOTE - This assertion is established through string_select.

4.3.926 Geometric_model_relationship_with_transformation to Transformation

Each Geometric_model_relationship_with_transformation (see 4.2.240) refers to exactly one Transformation (see 4.2.533) in the role of model_placement. Each Transformation acts as model_placement for zero or more Geometric_model_relationship_with_transformation objects.

4.3.927 Geometric_set_3d to Curve

Each Geometric_set_3d (see 4.2.242) refers to zero or more Curve (see 4.2.108) objects in the role of element. Each Curve acts as element for zero or more Geometric_set_3d objects.

NOTE - This assertion is established through point_or_curve_or_surface_select and point_or_curve_select.

4.3.928 Geometric_set_3d to Point

Each Geometric_set_3d (see 4.2.242) refers to zero or more Point (see 4.2.367) objects in the role of element. Each Point acts as element for zero or more Geometric_set_3d objects.

NOTE - This assertion is established through point_or_curve_or_surface_select and point_or_curve_select.

4.3.929 Geometric_set_3d to Surface

Each Geometric_set_3d (see 4.2.242) refers to zero or more Surface (see 4.2.489) objects in the role of element. Each Surface acts as element for zero or more Geometric_set_3d objects.

NOTE - This assertion is established through point_or_curve_or_surface_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.930 Geometric_tolerance to Annotation_curve

Each Geometric_tolerance (see 4.2.243) is_applied_to zero or one Annotation_curve (see 4.2.16). Each Annotation_curve is related to zero or more Geometric_tolerance objects.

NOTE - This assertion is established through placed_element_select and element_with_dimension_select.

4.3.931 Geometric_tolerance to Constructive_geometric_element

Each Geometric_tolerance (see 4.2.243) is_applied_to zero or one Constructive_geometric_element (see 4.2.99). Each Constructive_geometric_element is related to zero or more Geometric_tolerance objects.

NOTE - This assertion is established through placed_element_select.

4.3.932 Geometric_tolerance to Derived_geometry

Each Geometric_tolerance (see 4.2.243) is_applied_to zero or one Derived_geometry (see 4.2.136). Each Derived_geometry is related to zero or more Geometric_tolerance objects.

NOTE - This assertion is established through placed_element_select.

4.3.933 Geometric_tolerance to Multi_language_string

Each Geometric_tolerance (see 4.2.243) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Geometric_tolerance objects.

NOTE 1 - This assertion is established through string_select.

Each Geometric_tolerance refers to zero or one Multi_language_string in the role of qualifying_note. Each Multi_language_string acts as qualifying_note for zero or more Geometric_tolerance objects.

NOTE 2 - This assertion is established through string_select.

4.3.934 Geometric_tolerance to Shape_element

Each Geometric_tolerance (see 4.2.243) is_applied_to zero or one Shape_element (see 4.2.449). Each Shape_element is related to zero or more Geometric_tolerance objects.

NOTE - This assertion is established through placed_element_select and element_with_dimension_select.

4.3.935 Geometric_tolerance to Tolerance_condition

Each Geometric_tolerance (see 4.2.243) refers to zero or one Tolerance_condition (see 4.2.522) in the role of modification. Each Tolerance_condition acts as modification for zero or more Geometric_tolerance objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.936 Geometric_tolerance_relationship to Geometric_tolerance

Each Geometric_tolerance_relationship (see 4.2.245) is related to exactly one Geometric_tolerance (see 4.2.243). Each Geometric_tolerance is referenced by zero or more Geometric_tolerance_relationship objects as related.

NOTE 1 - The related Geometric_tolerance is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Geometric_tolerance_relationship is relating to exactly one Geometric_tolerance. Each Geometric_tolerance is referenced by zero or more Geometric_tolerance_relationship objects as relating.

NOTE 2 - The relating Geometric_tolerance is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.937 Geometrical_relationship to Geometric_model_relationship_with_transformation

Each Geometrical_relationship (see 4.2.247) refers to zero or one Geometric_model_relationship_with_transformation (see 4.2.240) in the role of definition_placement. Each Geometric_model_relationship_with_transformation acts as definition_placement for zero or more Geometrical_relationship objects.

NOTE - This assertion is established through transformation_select.

4.3.938 Geometrical_relationship to Multi_language_string

Each Geometrical_relationship (see 4.2.247) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Geometrical_relationship objects.

NOTE - This assertion is established through string_select.

4.3.939 Geometrical_relationship to Template_instance

Each Geometrical_relationship (see 4.2.247) refers to zero or one Template_instance (see 4.2.512) in the role of definition_placement. Each Template_instance acts as definition_placement for zero or more Geometrical_relationship objects.

NOTE - This assertion is established through transformation_select.

4.3.940 Geometrically_bounded_surface_model to Geometric_set_3d

Each Geometrically_bounded_surface_model (see 4.2.248) refers to zero or more Geometric_set_3d (see 4.2.242) objects in the role of element. Each Geometric_set_3d acts as element for zero or more Geometrically_bounded_surface_model objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.941 Ground_representation to Geometric_model

Each Ground_representation (see 4.2.249) refers to exactly one Geometric_model (see 4.2.238) in the role of shape_description. Each Geometric_model acts as shape_description for zero or more Ground_-representation objects.

4.3.942 Group to Detailed_element

Each Group (see 4.2.250) refers to zero or more Detailed_element (see 4.2.143) objects in the role of element. Each Detailed_element acts as element for zero or more Group objects.

NOTE - This assertion is established through group_element_select.

4.3.943 Group to Multi_language_string

Each Group (see 4.2.250) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Group objects.

NOTE 1 - This assertion is established through string_select.

Each Group refers to zero or one Multi_language_string in the role of purpose. Each Multi_language_-string acts as purpose for zero or more Group objects.

NOTE 2 - This assertion is established through string_select.

4.3.944 Group to Shape_element

Each Group (see 4.2.250) refers to zero or more Shape_element (see 4.2.449) objects in the role of element. Each Shape_element acts as element for zero or more Group objects.

NOTE - This assertion is established through group_element_select.

4.3.945 Group_relationship to Group

Each Group_relationship (see 4.2.251) is related to exactly one Group (see 4.2.250). Each Group is referenced by zero or more Group_relationship objects as related.

NOTE 1 - The related Group is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Group_relationship is relating to exactly one Group. Each Group is referenced by zero or more Group_relationship objects as relating.

NOTE 2 - The relating Group is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.946 Group_relationship to Multi_language_string

Each Group_relationship (see 4.2.251) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Group_relationship objects.

NOTE - This assertion is established through string_select.

4.3.947 Hardness to Multi_language_string

Each Hardness (see 4.2.254) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Hardness objects.

NOTE - This assertion is established through string_select.

4.3.948 Hardness to Value_with_unit

Each Hardness (see 4.2.254) refers to zero or one Value_with_unit (see 4.2.549) in the role of depth. Each Value_with_unit acts as depth for zero or more Hardness objects.

Each Hardness refers to exactly one Value_with_unit in the role of hardness_value. Each Value_with_-unit acts as hardness_value for zero or more Hardness objects.

4.3.949 Hidden_element_handling to Appearance_assignment

Each Hidden_element_handling (see 4.2.256) refers to zero or one Appearance_assignment (see 4.2.20) in the role of hidden_element_appearance. Each Appearance_assignment acts as hidden_element_ap-pearance for zero or more Hidden_element_handling objects.

4.3.950 Hidden_element_handling to Model_image

Each Hidden_element_handling (see 4.2.256) is_defined_for one or more Model_image (see 4.2.316) objects. Each Model_image has zero or one Hidden_element_handling.

4.3.951 Hole_feature_in_panel to Closed_profile_usage

Each Hole_feature_in_panel (see 4.2.258) refers to exactly one Closed_profile_usage (see 4.2.73) in the role of hole_profile. Each Closed_profile_usage acts as hole_profile for zero or more Hole_feature_in_-panel objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.952 Hybrid_geometric_model_3d to Detailed_geometric_model_element

Each Hybrid_geometric_model_3d (see 4.2.259) refers to zero or more Detailed_geometric_model_element (see 4.2.144) objects in the role of element. Each Detailed_geometric_model_element acts as element for zero or more Hybrid_geometric_model_3d objects.

4.3.953 Included_feature to Feature_definition

Each Included_feature (see 4.2.261) refers to zero or one Feature_definition (see 4.2.199) in the role of definition. Each Feature_definition acts as definition for zero or more Included_feature objects.

NOTE - This assertion is established through feature_definition_select.

4.3.954 Included_feature to General_feature

Each Included_feature (see 4.2.261) refers to zero or one General_feature (see 4.2.221) in the role of definition. Each General_feature acts as definition for zero or more Included_feature objects.

NOTE - This assertion is established through feature_definition_select.

4.3.955 Included_feature to Thread_feature

Each Included_feature (see 4.2.261) refers to zero or one Thread_feature (see 4.2.517) in the role of definition. Each Thread_feature acts as definition for zero or more Included_feature objects.

NOTE - This assertion is established through feature_definition_select.

4.3.956 Included_feature to Transition_feature

Each Included_feature (see 4.2.261) refers to zero or one Transition_feature (see 4.2.537) in the role of definition. Each Transition_feature acts as definition for zero or more Included_feature objects.

NOTE - This assertion is established through feature_definition_select.

4.3.957 Incremental_model_change to Geometric_model

Each Incremental_model_change (see 4.2.262) refers to zero or more Geometric_model (see 4.2.238) objects in the role of added_element. Each Geometric_model acts as added_element for zero or more Incremental_model_change objects.

NOTE 1 - This assertion is established through model_change_element_select.

Each Incremental_model_change refers to zero or one Geometric_model in the role of basis_model. Each Geometric_model acts as basis_model for zero or more Incremental_model_change objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE 2 - This assertion is established through incremental_change_select and model_change_element_-select.

4.3.958 Incremental_model_change to Incremental_model_change

Each Incremental_model_change (see 4.2.262) refers to zero or one Incremental_model_change in the role of basis_model. Each Incremental_model_change acts as basis_model for zero or more Incremental_model_change objects.

NOTE - This assertion is established through incremental_change_select.

4.3.959 Incremental_model_change to Styled_model

Each Incremental_model_change (see 4.2.262) refers to zero or more Styled_model (see 4.2.484) objects in the role of added_element. Each Styled_model acts as added_element for zero or more Incremental_-model_change objects.

NOTE 1 - This assertion is established through model_change_element_select.

Each Incremental_model_change refers to zero or one Styled_model in the role of basis_model. Each Styled_model acts as basis_model for zero or more Incremental_model_change objects.

NOTE 2 - This assertion is established through incremental_change_select and model_change_element_-select.

4.3.960 Initial_configuration to Kinematic_mechanism

Each Initial_configuration (see 4.2.263) is_applied_to exactly one Kinematic_mechanism (see 4.2.286). Each Kinematic_mechanism is related to zero or more Initial_configuration objects.

4.3.961 Initial_configuration to Pair_value

Each Initial_configuration (see 4.2.263) refers to one or more Pair_value (see 4.2.335) objects in the role of initial_pair_values. Each Pair_value acts as initial_pair_values for zero or more Initial_configuration objects.

4.3.962 Instance_placement to Geometric_model_relationship_with_transformation

Each Instance_placement (see 4.2.264) refers to zero or one Geometric_model_relationship_with_transformation (see 4.2.240) in the role of placement. Each Geometric_model_relationship_with_transformation acts as placement for zero or more Instance_placement objects.

NOTE - This assertion is established through transformation_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.963 Instance_placement to Product_component

Each Instance_placement (see 4.2.264) refers to exactly one Product_component (see 4.2.394) in the role of reference_product_component. Each Product_component acts as reference_product_component for zero or more Instance_placement objects.

4.3.964 Instance_placement to Single_instance

Each Instance_placement (see 4.2.264) refers to exactly one Single_instance (see 4.2.455) in the role of placed_instance. Each Single_instance acts as placed_instance for zero or more Instance_placement objects.

4.3.965 Instance_placement to Template_instance

Each Instance_placement (see 4.2.264) refers to zero or one Template_instance (see 4.2.512) in the role of placement. Each Template_instance acts as placement for zero or more Instance_placement objects.

NOTE - This assertion is established through transformation_select.

4.3.966 Interpolated_configuration_sequence to Kinematic_configuration_interpolation

Each Interpolated_configuration_sequence (see 4.2.265) refers to one or more Kinematic_configuration_interpolation (see 4.2.280) objects in the role of interpolation. Each Kinematic_configuration_interpolation acts as interpolation for zero or more Interpolated_configuration_sequence objects.

4.3.967 Interval_of_time to Date_time

Each Interval_of_time (see 4.2.266) refers to zero or one Date_time (see 4.2.119) in the role of end_definition. Each Date_time acts as end_definition for zero or more Interval_of_time objects.

NOTE 1 - This assertion is established through period_or_date_select.

Each Interval_of_time refers to zero or one Date_time in the role of start_definition. Each Date_time acts as start_definition for zero or more Interval_of_time objects.

NOTE 2 - This assertion is established through event_or_date_select.

4.3.968 Interval_of_time to Duration

Each Interval_of_time (see 4.2.266) refers to zero or one Duration (see 4.2.174) in the role of end_definition. Each Duration acts as end_definition for zero or more Interval_of_time objects.

NOTE - This assertion is established through period_or_date_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.969 Interval_of_time to Event_reference

Each Interval_of_time (see 4.2.266) refers to zero or one Event_reference (see 4.2.184) in the role of end_definition. Each Event_reference acts as end_definition for zero or more Interval_of_time objects.

NOTE 1 - This assertion is established through period_or_date_select.

Each Interval_of_time refers to zero or one Event_reference in the role of start_definition. Each Event_reference acts as start_definition for zero or more Interval_of_time objects.

NOTE 2 - This assertion is established through event_or_date_select.

4.3.970 Item to Multi_language_string

Each Item (see 4.2.267) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Item objects.

NOTE 1 - This assertion is established through string_select.

Each Item refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Item objects.

NOTE 2 - This assertion is established through string_select.

4.3.971 Item_definition_instance_relationship to Design_discipline_item_definition

Each Item_definition_instance_relationship (see 4.2.268) is relating to exactly one Design_discipline_item_definition (see 4.2.142). Each Design_discipline_item_definition is referenced by zero or more Item_definition_instance_relationship objects as relating.

NOTE - The relating Design_discipline_item_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.972 Item_definition_instance_relationship to Item_instance

Each Item_definition_instance_relationship (see 4.2.268) is related to exactly one Item_instance (see 4.2.271). Each Item_instance is referenced by zero or more Item_definition_instance_relationship objects as related.

NOTE - The related Item_instance is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.973 Item_definition_relationship to Design_discipline_item_definition

Each Item_definition_relationship (see 4.2.269) is related to exactly one Design_discipline_item_definition (see 4.2.142). Each Design_discipline_item_definition is referenced by zero or more Item_definition_relationship objects as related.

NOTE 1 - The related Design_discipline_item_definition is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Item_definition_relationship is relating to exactly one Design_discipline_item_definition. Each Design_discipline_item_definition is referenced by zero or more Item_definition_relationship objects as relating.

NOTE 2 - The relating Design_discipline_item_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.974 Item_function_association to Design_discipline_item_definition

Each Item_function_association (see 4.2.270) refers to exactly one Design_discipline_item_definition (see 4.2.142) in the role of associated_item. Each Design_discipline_item_definition acts as associated_item for zero or more Item_function_association objects.

4.3.975 Item_function_association to Multi_language_string

Each Item_function_association (see 4.2.270) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Item_function_association objects.

NOTE - This assertion is established through string_select.

4.3.976 Item_function_association to Product_function

Each Item_function_association (see 4.2.270) refers to exactly one Product_function (see 4.2.397) in the role of associated_function. Each Product_function acts as associated_function for zero or more Item_function_association objects.

4.3.977 Item_instance to Design_discipline_item_definition

Each Item_instance (see 4.2.271) refers to zero or one Design_discipline_item_definition (see 4.2.142) in the role of definition. Each Design_discipline_item_definition acts as definition for zero or more Item_instance objects.

NOTE - This assertion is established through instance_definition_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.978 Item_instance to Multi_language_string

Each Item_instance (see 4.2.271) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Item_instance objects.

NOTE - This assertion is established through string_select.

4.3.979 Item_instance to Product_identification

Each Item_instance (see 4.2.271) refers to zero or one Product_identification (see 4.2.398) in the role of definition. Each Product_identification acts as definition for zero or more Item_instance objects.

NOTE - This assertion is established through instance_definition_select.

4.3.980 Item_instance_relationship to Item_instance

Each Item_instance_relationship (see 4.2.272) is related to exactly one Item_instance (see 4.2.271). Each Item_instance is referenced by zero or more Item_instance_relationship objects as related.

NOTE 1 - The related Item_instance is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Item_instance_relationship is relating to exactly one Item_instance. Each Item_instance is referenced by zero or more Item_instance_relationship objects as relating.

NOTE 2 - The relating Item_instance is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.981 Item_property_association to Catalogue_thread

Each Item_property_association (see 4.2.273) refers to zero or one Catalogue_thread (see 4.2.48) in the role of described_element. Each Catalogue_thread acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.982 Item_property_association to Complex_product

Each Item_property_association (see 4.2.273) refers to zero or one Complex_product (see 4.2.80) in the role of described_element. Each Complex_product acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.983 Item_property_association to Design_constraint

Each Item_property_association (see 4.2.273) refers to zero or one Design_constraint (see 4.2.138) in the role of described_element. Each Design_constraint acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.984 Item_property_association to Design_discipline_item_definition

Each Item_property_association (see 4.2.273) refers to zero or one Design_discipline_item_definition (see 4.2.142) in the role of described_element. Each Design_discipline_item_definition acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.985 Item_property_association to Document_file

Each Item_property_association (see 4.2.273) refers to zero or one Document_file (see 4.2.159) in the role of described_element. Each Document_file acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.986 Item_property_association to Document_representation

Each Item_property_association (see 4.2.273) refers to zero or one Document_representation (see 4.2.163) in the role of described_element. Each Document_representation acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.987 Item_property_association to Feature_definition

Each Item_property_association (see 4.2.273) refers to zero or one Feature_definition (see 4.2.199) in the role of described_element. Each Feature_definition acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.988 Item_property_association to General_feature

Each Item_property_association (see 4.2.273) refers to zero or one General_feature (see 4.2.221) in the role of described_element. Each General_feature acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.989 Item_property_association to Item_definition_instance_relationship

Each Item_property_association (see 4.2.273) refers to zero or one Item_definition_instance_relationship (see 4.2.268) in the role of described_element. Each Item_definition_instance_relationship acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.990 Item_property_association to Item_definition_relationship

Each Item_property_association (see 4.2.273) refers to zero or one Item_definition_relationship (see 4.2.269) in the role of described_element. Each Item_definition_relationship acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.991 Item_property_association to Item_instance

Each Item_property_association (see 4.2.273) refers to zero or one Item_instance (see 4.2.271) in the role of described_element. Each Item_instance acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.992 Item_property_association to Item_instance_relationship

Each Item_property_association (see 4.2.273) refers to zero or one Item_instance_relationship (see 4.2.272) in the role of described_element. Each Item_instance_relationship acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.993 Item_property_association to Item_shape

Each Item_property_association (see 4.2.273) refers to zero or one Item_shape (see 4.2.274) in the role of described_element. Each Item_shape acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.994 Item_property_association to Product_class

Each Item_property_association (see 4.2.273) refers to zero or one Product_class (see 4.2.392) in the role of described_element. Each Product_class acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.995 Item_property_association to Product_identification

Each Item_property_association (see 4.2.273) refers to zero or one Product_identification (see 4.2.398) in the role of described_element. Each Product_identification acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.996 Item_property_association to Product_structure_relationship

Each Item_property_association (see 4.2.273) refers to zero or one Product_structure_relationship (see 4.2.400) in the role of described_element. Each Product_structure_relationship acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.997 Item_property_association to Shape_element

Each Item_property_association (see 4.2.273) refers to zero or one Shape_element (see 4.2.449) in the role of described_element. Each Shape_element acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.998 Item_property_association to Shape_element_relationship

Each Item_property_association (see 4.2.273) refers to zero or one Shape_element_relationship (see 4.2.450) in the role of described_element. Each Shape_element_relationship acts as described_element for zero or more Item_property_association objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through item_property_select.

4.3.999 Item_property_association to Thread_feature

Each Item_property_association (see 4.2.273) refers to zero or one Thread_feature (see 4.2.517) in the role of described_element. Each Thread_feature acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.1000 Item_property_association to Transition_feature

Each Item_property_association (see 4.2.273) refers to zero or one Transition_feature (see 4.2.537) in the role of described_element. Each Transition_feature acts as described_element for zero or more Item_property_association objects.

NOTE - This assertion is established through item_property_select.

4.3.1001 Item_shape to Design_discipline_item_definition

Each Item_shape (see 4.2.274) refers to zero or one Design_discipline_item_definition (see 4.2.142) in the role of described_object. Each Design_discipline_item_definition acts as described_object for zero or one Item_shape.

NOTE - This assertion is established through item_information_select.

4.3.1002 Item_shape to Item_instance

Each Item_shape (see 4.2.274) refers to zero or one Item_instance (see 4.2.271) in the role of described_object. Each Item_instance acts as described_object for zero or one Item_shape.

NOTE - This assertion is established through item_information_select.

4.3.1003 Item_shape to Multi_language_string

Each Item_shape (see 4.2.274) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Item_shape objects.

NOTE - This assertion is established through string_select.

4.3.1004 Item_shape to Physical_instance

Each Item_shape (see 4.2.274) refers to zero or one Physical_instance (see 4.2.352) in the role of described_object. Each Physical_instance acts as described_object for zero or more Item_shape objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through item_information_select.

4.3.1005 Item_version to Item

Each Item_version (see 4.2.275) refers to exactly one Item (see 4.2.267) in the role of associated_item. Each Item has associated_version defined by one or more Item_version objects.

4.3.1006 Item_version to Multi_language_string

Each Item_version (see 4.2.275) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Item_version objects.

NOTE - This assertion is established through string_select.

4.3.1007 Item_version_relationship to Item_version

Each Item_version_relationship (see 4.2.276) is related to exactly one Item_version (see 4.2.275). Each Item_version is referenced by zero or more Item_version_relationship objects as related.

NOTE 1 - The related Item_version is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Item_version_relationship is relating to exactly one Item_version. Each Item_version is referenced by zero or more Item_version_relationship objects as relating.

NOTE 2 - The relating Item_version is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1008 Item_version_relationship to Multi_language_string

Each Item_version_relationship (see 4.2.276) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Item_version_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1009 Joggle_feature to Feature_parameter

Each Joggle_feature (see 4.2.277) refers to zero or one Feature_parameter (see 4.2.201) in the role of base_radius_1. Each Feature_parameter acts as base_radius_1 for zero or more Joggle_feature objects.

Each Joggle_feature refers to zero or one Feature_parameter in the role of base_radius_2. Each Feature_parameter acts as base_radius_2 for zero or more Joggle_feature objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Each Joggle_feature refers to exactly one Feature_parameter in the role of direction_angle_1. Each Feature_parameter acts as direction_angle_1 for zero or more Joggle_feature objects.

Each Joggle_feature refers to exactly one Feature_parameter in the role of direction_angle_2. Each Feature_parameter acts as direction_angle_2 for zero or more Joggle_feature objects.

Each Joggle_feature refers to exactly one Feature_parameter in the role of height. Each Feature_parameter acts as height for zero or more Joggle_feature objects.

Each Joggle_feature refers to exactly one Feature_parameter in the role of slope_angle_1. Each Feature_parameter acts as slope_angle_1 for zero or more Joggle_feature objects.

Each Joggle_feature refers to exactly one Feature_parameter in the role of slope_angle_2. Each Feature_parameter acts as slope_angle_2 for zero or more Joggle_feature objects.

Each Joggle_feature refers to zero or one Feature_parameter in the role of top_radius_1. Each Feature_parameter acts as top_radius_1 for zero or more Joggle_feature objects.

Each Joggle_feature refers to zero or one Feature_parameter in the role of top_radius_2. Each Feature_parameter acts as top_radius_2 for zero or more Joggle_feature objects.

4.3.1010 Joggle_feature to Joggle_termination

Each Joggle_feature (see 4.2.277) refers to exactly one Joggle_termination (see 4.2.278) in the role of termination. Each Joggle_termination acts as termination for zero or more Joggle_feature objects.

4.3.1011 Joggle_feature to Linear_path

Each Joggle_feature (see 4.2.277) refers to exactly one Linear_path (see 4.2.300) in the role of defining_path. Each Linear_path acts as defining_path for zero or more Joggle_feature objects.

4.3.1012 Kinematic_configuration_definition to Pair_value

Each Kinematic_configuration_definition (see 4.2.279) refers to one or more Pair_value (see 4.2.335) objects in the role of pair_values. Each Pair_value acts as pair_values for zero or more Kinematic_configuration_definition objects.

4.3.1013 Kinematic_configuration_definition to Path_approximation

Each Kinematic_configuration_definition (see 4.2.279) refers to exactly one Path_approximation (see 4.2.343) in the role of t_parameter. Each Path_approximation acts as t_parameter for zero or more Kinematic_configuration_definition objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1014 Kinematic_configuration_interpolation to Kinematic_configuration_definition

Each Kinematic_configuration_interpolation (see 4.2.280) refers to exactly one Kinematic_configuration_definition (see 4.2.279) in the role of next_definition. Each Kinematic_configuration_definition acts as next_definition for zero or more Kinematic_configuration_interpolation objects.

Each Kinematic_configuration_interpolation refers to exactly one Kinematic_configuration_definition in the role of previous_definition. Each Kinematic_configuration_definition acts as previous_definition for zero or more Kinematic_configuration_interpolation objects.

4.3.1015 Kinematic_control to Interpolated_configuration_sequence

Each Kinematic_control (see 4.2.281) refers to one or more Interpolated_configuration_sequence (see 4.2.265) objects in the role of program. Each Interpolated_configuration_sequence acts as program for zero or more Kinematic_control objects.

4.3.1016 Kinematic_control to Kinematic_mechanism

Each Kinematic_control (see 4.2.281) is_controlling exactly one Kinematic_mechanism (see 4.2.286). Each Kinematic_mechanism is related to zero or more Kinematic_control objects.

4.3.1017 Kinematic_control to Kinematic_transformation_result

Each Kinematic_control (see 4.2.281) refers to zero or more Kinematic_transformation_result (see 4.2.290) objects in the role of related_result. Each Kinematic_transformation_result acts as related_result for zero or more Kinematic_control objects.

4.3.1018 Kinematic_element to Multi_language_string

Each Kinematic_element (see 4.2.282) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Kinematic_element objects.

NOTE – This assertion is established through string_select.

4.3.1019 Kinematic_joint to Kinematic_link

Each Kinematic_joint (see 4.2.283) refers to exactly one Kinematic_link (see 4.2.284) in the role of first_link. Each Kinematic_link acts as first_link for zero or more Kinematic_joint objects.

Each Kinematic_joint refers to exactly one Kinematic_link in the role of second_link. Each Kinematic_link acts as second_link for zero or more Kinematic_joint objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1020 Kinematic_joint to Kinematic_pair

Each Kinematic_joint (see 4.2.283) refers to exactly one Kinematic_pair (see 4.2.287) in the role of pair. Each Kinematic_pair has joint defined by exactly one Kinematic_joint.

4.3.1021 Kinematic_link to Kinematic_link_representation

Each Kinematic_link (see 4.2.284) refers to exactly one Kinematic_link_representation (see 4.2.285) in the role of representation. Each Kinematic_link_representation acts as representation for zero or more Kinematic_link objects.

4.3.1022 Kinematic_link_representation to Geometric_model

Each Kinematic_link_representation (see 4.2.285) refers to exactly one Geometric_model (see 4.2.238) in the role of physical_description. Each Geometric_model acts as physical_description for zero or more Kinematic_link_representation objects.

4.3.1023 Kinematic_link_representation to Transformation_to_reference_frame

Each Kinematic_link_representation (see 4.2.285) refers to zero or more Transformation_to_reference_-frame (see 4.2.536) objects in the role of additional_reference_frame. Each Transformation_to_reference_frame acts as additional_reference_frame for zero or more Kinematic_link_representation objects.

4.3.1024 Kinematic_mechanism to Kinematic_link

Each Kinematic_mechanism (see 4.2.286) refers to exactly one Kinematic_link (see 4.2.284) in the role of base_link. Each Kinematic_link acts as base_link for zero or more Kinematic_mechanism objects.

4.3.1025 Kinematic_mechanism to Kinematic_structure

Each Kinematic_mechanism (see 4.2.286) refers to exactly one Kinematic_structure (see 4.2.289) in the role of structure_definition. Each Kinematic_structure is_referenced_by exactly one Kinematic_-mechanism.

4.3.1026 Kinematic_mechanism to Transformation_to_reference_frame

Each Kinematic_mechanism (see 4.2.286) refers to exactly one Transformation_to_reference_frame (see 4.2.536) in the role of base_placement. Each Transformation_to_reference_frame acts as base_placement for zero or more Kinematic_mechanism objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1027 Kinematic_pair to Transformation_to_reference_frame

Each Kinematic_pair (see 4.2.287) refers to exactly one Transformation_to_reference_frame (see 4.2.536) in the role of transformation_item_1. Each Transformation_to_reference_frame acts as transformation_item_1 for zero or more Kinematic_pair objects.

Each Kinematic_pair refers to exactly one Transformation_to_reference_frame in the role of transformation_item_2. Each Transformation_to_reference_frame acts as transformation_item_2 for zero or more Kinematic_pair objects.

4.3.1028 Kinematic_simulation_information to Complex_product

Each Kinematic_simulation_information (see 4.2.288) refers to zero or more Complex_product (see 4.2.80) objects in the role of described_element. Each Complex_product acts as described_element for zero or more Kinematic_simulation_information objects.

NOTE - This assertion is established through simulation_context_select.

4.3.1029 Kinematic_simulation_information to Design_discipline_item_definition

Each Kinematic_simulation_information (see 4.2.288) refers to zero or more Design_discipline_item_definition (see 4.2.142) objects in the role of described_element. Each Design_discipline_item_definition acts as described_element for zero or more Kinematic_simulation_information objects.

NOTE - This assertion is established through simulation_context_select.

4.3.1030 Kinematic_simulation_information to Ground_representation

Each Kinematic_simulation_information (see 4.2.288) refers to exactly one Ground_representation (see 4.2.249) in the role of ground. Each Ground_representation is_referenced_by one or more Kinematic_simulation_information objects.

4.3.1031 Kinematic_simulation_information to Item_definition_instance_relationship

Each Kinematic_simulation_information (see 4.2.288) refers to zero or more Item_definition_instance_relationship (see 4.2.268) objects in the role of described_element. Each Item_definition_instance_relationship acts as described_element for zero or more Kinematic_simulation_information objects.

NOTE - This assertion is established through simulation_context_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1032 Kinematic_simulation_information to Item_definition_relationship

Each Kinematic_simulation_information (see 4.2.288) refers to zero or more Item_definition_relationship (see 4.2.269) objects in the role of described_element. Each Item_definition_relationship acts as described_element for zero or more Kinematic_simulation_information objects.

NOTE - This assertion is established through simulation_context_select.

4.3.1033 Kinematic_simulation_information to Item_instance

Each Kinematic_simulation_information (see 4.2.288) refers to zero or more Item_instance (see 4.2.271) objects in the role of described_element. Each Item_instance acts as described_element for zero or more Kinematic_simulation_information objects.

NOTE - This assertion is established through simulation_context_select.

4.3.1034 Kinematic_simulation_information to Item_instance_relationship

Each Kinematic_simulation_information (see 4.2.288) refers to zero or more Item_instance_relationship (see 4.2.272) objects in the role of described_element. Each Item_instance_relationship acts as described_element for zero or more Kinematic_simulation_information objects.

NOTE - This assertion is established through simulation_context_select.

4.3.1035 Kinematic_simulation_information to Kinematic_mechanism

Each Kinematic_simulation_information (see 4.2.288) refers to one or more Kinematic_mechanism (see 4.2.286) objects in the role of mechanism. Each Kinematic_mechanism is_referenced_by one or more Kinematic_simulation_information objects.

4.3.1036 Kinematic_simulation_information to Multi_language_string

Each Kinematic_simulation_information (see 4.2.288) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Kinematic_simulation_information objects.

NOTE - This assertion is established through string_select.

4.3.1037 Kinematic_simulation_information to Product_class

Each Kinematic_simulation_information (see 4.2.288) refers to zero or more Product_class (see 4.2.392) objects in the role of described_element. Each Product_class acts as described_element for zero or more Kinematic_simulation_information objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through simulation_context_select.

4.3.1038 Kinematic_simulation_information to Product_specification

Each Kinematic_simulation_information (see 4.2.288) refers to zero or more Product_specification (see 4.2.399) objects in the role of described_element. Each Product_specification acts as described_element for zero or more Kinematic_simulation_information objects.

NOTE - This assertion is established through simulation_context_select.

4.3.1039 Kinematic_structure to Kinematic_joint

Each Kinematic_structure (see 4.2.289) refers to one or more Kinematic_joint (see 4.2.283) objects in the role of joint. Each Kinematic_joint is_referenced_by one or more Kinematic_structure objects.

4.3.1040 Kinematic_transformation_result to Interpolated_configuration_sequence

Each Kinematic_transformation_result (see 4.2.290) refers to one or more Interpolated_configuration_-sequence (see 4.2.265) objects in the role of result. Each Interpolated_configuration_sequence acts as result for zero or more Kinematic_transformation_result objects.

4.3.1041 Kinematic_transformation_result to Kinematic_mechanism

Each Kinematic_transformation_result (see 4.2.290) is_applied_to exactly one Kinematic_mechanism (see 4.2.286). Each Kinematic_mechanism is related to zero or more Kinematic_transformation_result objects.

4.3.1042 Layer to Detailed_element

Each Layer (see 4.2.292) refers to one or more Detailed_element (see 4.2.143) objects in the role of element. Each Detailed_element acts as element for zero or more Layer objects.

4.3.1043 Layer to Multi_language_string

Each Layer (see 4.2.292) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Layer objects.

NOTE - This assertion is established through string_select.

4.3.1044 Leader to Terminator_symbol

Each Leader (see 4.2.293) refers to zero or one Terminator_symbol (see 4.2.513) in the role of terminator. Each Terminator_symbol acts as terminator for zero or more Leader objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1045 Light_source to Model_image

Each Light_source (see 4.2.294) is_defined_for one or more Model_image (see 4.2.316) objects. Each Model_image is related to zero or more Light_source objects.

4.3.1046 Line_profile_tolerance to Datum

Each Line_profile_tolerance (see 4.2.297) refers to zero, one, two, or three Datum (see 4.2.123) objects in the role of reference_datum. Each Datum acts as reference_datum for zero or more Line_profile_tolerance objects.

4.3.1047 Line_profile_tolerance to Reference_plane

Each Line_profile_tolerance (see 4.2.297) refers to zero or one Reference_plane (see 4.2.429) in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Line_profile_tolerance objects.

4.3.1048 Linear_path to Feature_parameter

Each Linear_path (see 4.2.300) refers to exactly one Feature_parameter (see 4.2.201) in the role of distance. Each Feature_parameter acts as distance for zero or more Linear_path objects.

4.3.1049 Location_dimension to Annotation_curve

Each Location_dimension (see 4.2.301) refers to zero or one Annotation_curve (see 4.2.16) in the role of origin. Each Annotation_curve acts as origin for zero or more Location_dimension objects.

NOTE 1 - This assertion is established through placed_element_select and element_with_dimension_select.

Each Location_dimension refers to zero or one Annotation_curve in the role of target. Each Annotation_curve acts as target for zero or more Location_dimension objects.

NOTE 2 - This assertion is established through placed_element_select and element_with_dimension_select.

4.3.1050 Location_dimension to Constructive_geometric_element

Each Location_dimension (see 4.2.301) refers to zero or one Constructive_geometric_element (see 4.2.99) in the role of origin. Each Constructive_geometric_element acts as origin for zero or more Location_dimension objects.

NOTE 1 - This assertion is established through placed_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Each Location_dimension refers to zero or one Constructive_geometric_element in the role of target. Each Constructive_geometric_element acts as target for zero or more Location_dimension objects.

NOTE 2 - This assertion is established through placed_element_select.

4.3.1051 Location_dimension to Derived_geometry

Each Location_dimension (see 4.2.301) refers to zero or one Derived_geometry (see 4.2.136) in the role of origin. Each Derived_geometry acts as origin for zero or more Location_dimension objects.

NOTE 1 - This assertion is established through placed_element_select.

Each Location_dimension refers to zero or one Derived_geometry in the role of target. Each Derived_-geometry acts as target for zero or more Location_dimension objects.

NOTE 2 - This assertion is established through placed_element_select.

4.3.1052 Location_dimension to Multi_language_string

Each Location_dimension (see 4.2.301) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Location_dimension objects.

NOTE - This assertion is established through string_select.

4.3.1053 Location_dimension to Shape_element

Each Location_dimension (see 4.2.301) refers to zero or one Shape_element (see 4.2.449) in the role of origin. Each Shape_element acts as origin for zero or more Location_dimension objects.

NOTE 1 - This assertion is established through placed_element_select and element_with_dimension_se-lect.

Each Location_dimension refers to zero or one Shape_element in the role of target. Each Shape_element acts as target for zero or more Location_dimension objects.

NOTE 2 - This assertion is established through placed_element_select and element_with_dimension_se-lect.

4.3.1054 Locator_feature to Feature_parameter

Each Locator_feature (see 4.2.302) refers to zero or one Feature_parameter (see 4.2.201) in the role of base_radius. Each Feature_parameter acts as base_radius for zero or more Locator_feature objects.

Each Locator_feature refers to exactly one Feature_parameter in the role of diameter. Each Feature_-parameter acts as diameter for zero or more Locator_feature objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Each Locator_feature refers to exactly one Feature_parameter in the role of tip_angle. Each Feature_-parameter acts as tip_angle for zero or more Locator_feature objects.

Each Locator_feature refers to zero or one Feature_parameter in the role of tip_radius. Each Feature_-parameter acts as tip_radius for zero or more Locator_feature objects.

4.3.1055 Make_from_relationship to Multi_language_string

Each Make_from_relationship (see 4.2.304) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Make_from_-relationship objects.

NOTE - This assertion is established through string_select.

4.3.1056 Manufacturing_configuration to Item_instance

Each Manufacturing_configuration (see 4.2.305) refers to exactly one Item_instance (see 4.2.271) in the role of configured_element. Each Item_instance acts as configured_element for zero or more Manufac-turing_configuration objects.

4.3.1057 Manufacturing_configuration to Organization

Each Manufacturing_configuration (see 4.2.305) refers to zero or more Organization (see 4.2.331) ob-jects in the role of concerned_organization. Each Organization acts as concerned_organization for zero or more Manufacturing_configuration objects.

4.3.1058 Manufacturing_configuration to Product_design

Each Manufacturing_configuration (see 4.2.305) is_solution_for exactly one Product_design (see 4.2.396). Each Product_design is related to zero or more Manufacturing_configuration objects.

4.3.1059 Mated_item_association to Geometric_model_relationship_with_transformation

Each Mated_item_association (see 4.2.307) refers to zero or one Geometric_model_relationship_with_-transformation (see 4.2.240) in the role of placement. Each Geometric_model_relationship_with_trans-formation acts as placement for zero or more Mated_item_association objects.

NOTE - This assertion is established through transformation_select.

4.3.1060 Mated_item_association to Mating_definition

Each Mated_item_association (see 4.2.307) is relating to exactly one Mating_definition (see 4.2.313). Each Mating_definition has mated_items defined by two or more Mated_item_association objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - The relating Mating_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1061 Mated_item_association to Template_instance

Each Mated_item_association (see 4.2.307) refers to zero or one Template_instance (see 4.2.512) in the role of placement. Each Template_instance acts as placement for zero or more Mated_item_association objects.

NOTE - This assertion is established through transformation_select.

4.3.1062 Mated_item_relationship to Mated_item_association

Each Mated_item_relationship (see 4.2.308) is related to exactly one Mated_item_association (see 4.2.307). Each Mated_item_association is referenced by zero or more Mated_item_relationship objects as related.

NOTE 1 - The related Mated_item_association is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Mated_item_relationship is relating to exactly one Mated_item_association. Each Mated_item_association is referenced by zero or more Mated_item_relationship objects as relating.

NOTE 2 - The relating Mated_item_association is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1063 Mated_item_relationship to Quantified_instance

Each Mated_item_relationship (see 4.2.308) refers to zero or more Quantified_instance (see 4.2.417) objects in the role of mating_material. Each Quantified_instance acts as mating_material for zero or more Mated_item_relationship objects.

4.3.1064 Mated_item_relationship to Shape_element_relationship

Each Mated_item_relationship (see 4.2.308) refers to zero or one Shape_element_relationship (see 4.2.450) in the role of mated_shape. Each Shape_element_relationship acts as mated_shape for zero or more Mated_item_relationship objects.

4.3.1065 Material to Catalogue_thread

Each Material (see 4.2.309) refers to zero or more Catalogue_thread (see 4.2.48) objects in the role of described_element. Each Catalogue_thread acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1066 Material to Complex_product

Each Material (see 4.2.309) refers to zero or more Complex_product (see 4.2.80) objects in the role of described_element. Each Complex_product acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1067 Material to Design_constraint

Each Material (see 4.2.309) refers to zero or more Design_constraint (see 4.2.138) objects in the role of described_element. Each Design_constraint acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1068 Material to Design_discipline_item_definition

Each Material (see 4.2.309) refers to zero or more Design_discipline_item_definition (see 4.2.142) objects in the role of described_element. Each Design_discipline_item_definition acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1069 Material to Document_file

Each Material (see 4.2.309) refers to zero or more Document_file (see 4.2.159) objects in the role of described_element. Each Document_file acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1070 Material to Document_representation

Each Material (see 4.2.309) refers to zero or more Document_representation (see 4.2.163) objects in the role of described_element. Each Document_representation acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1071 Material to Feature_definition

Each Material (see 4.2.309) refers to zero or more Feature_definition (see 4.2.199) objects in the role of described_element. Each Feature_definition acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1072 Material to General_feature

Each Material (see 4.2.309) refers to zero or more General_feature (see 4.2.221) objects in the role of described_element. Each General_feature acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1073 Material to Item_definition_instance_relationship

Each Material (see 4.2.309) refers to zero or more Item_definition_instance_relationship (see 4.2.268) objects in the role of described_element. Each Item_definition_instance_relationship acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1074 Material to Item_definition_relationship

Each Material (see 4.2.309) refers to zero or more Item_definition_relationship (see 4.2.269) objects in the role of described_element. Each Item_definition_relationship acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1075 Material to Item_instance

Each Material (see 4.2.309) refers to zero or more Item_instance (see 4.2.271) objects in the role of described_element. Each Item_instance acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1076 Material to Item_instance_relationship

Each Material (see 4.2.309) refers to zero or more Item_instance_relationship (see 4.2.272) objects in the role of described_element. Each Item_instance_relationship acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1077 Material to Item_shape

Each Material (see 4.2.309) refers to zero or more Item_shape (see 4.2.274) objects in the role of described_element. Each Item_shape acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1078 Material to Product_class

Each Material (see 4.2.309) refers to zero or more Product_class (see 4.2.392) objects in the role of described_element. Each Product_class acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1079 Material to Product_identification

Each Material (see 4.2.309) refers to zero or more Product_identification (see 4.2.398) objects in the role of described_element. Each Product_identification acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1080 Material to Product_structure_relationship

Each Material (see 4.2.309) refers to zero or more Product_structure_relationship (see 4.2.400) objects in the role of described_element. Each Product_structure_relationship acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1081 Material to Shape_element

Each Material (see 4.2.309) refers to zero or more Shape_element (see 4.2.449) objects in the role of described_element. Each Shape_element acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1082 Material to Shape_element_relationship

Each Material (see 4.2.309) refers to zero or more Shape_element_relationship (see 4.2.450) objects in the role of described_element. Each Shape_element_relationship acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1083 Material to Thread_feature

Each Material (see 4.2.309) refers to zero or more Thread_feature (see 4.2.517) objects in the role of described_element. Each Thread_feature acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1084 Material to Transition_feature

Each Material (see 4.2.309) refers to zero or more Transition_feature (see 4.2.537) objects in the role of described_element. Each Transition_feature acts as described_element for zero or more Material objects.

NOTE - This assertion is established through item_property_select.

4.3.1085 Material_property_association to Material

Each Material_property_association (see 4.2.311) refers to exactly one Material (see 4.2.309) in the role of described_material. Each Material acts as described_material for zero or more Material_property_association objects.

4.3.1086 Material_property_association to Material_property_value_representation

Each Material_property_association (see 4.2.311) refers to exactly one Material_property_value_representation (see 4.2.312) in the role of associated_property_value. Each Material_property_value_representation acts as associated_property_value for zero or more Material_property_association objects.

4.3.1087 Material_property_value_representation to Data_environment

Each Material_property_value_representation (see 4.2.312) refers to exactly one Data_environment (see 4.2.116) in the role of environment_condition. Each Data_environment acts as environment_condition for zero or more Material_property_value_representation objects.

4.3.1088 Material_property_value_representation to Material_property

Each Material_property_value_representation (see 4.2.312) refers to exactly one Material_property (see 4.2.310) in the role of definition. Each Material_property acts as definition for zero or more Material_property_value_representation objects.

4.3.1089 Measurement_path to Cartesian_coordinate_space

Each Measurement_path (see 4.2.314) is_defined_in exactly one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more Measurement_path objects.

4.3.1090 Measurement_path to Curve

Each Measurement_path (see 4.2.314) is_defined_as exactly one Curve (see 4.2.108). Each Curve is related to zero or more Measurement_path objects.

© ISO 2001 – All rights reserved

4.3.1091 Model_change to Change

Each Model_change (see 4.2.315) is_describing exactly one Change (see 4.2.55). Each Change is related to zero or more Model_change objects.

4.3.1092 Model_change to Detailed_element

Each Model_change (see 4.2.315) refers to zero or more Detailed_element (see 4.2.143) objects in the role of deleted_element. Each Detailed_element acts as deleted_element for zero or more Model_change objects.

4.3.1093 Model_change to Multi_language_string

Each Model_change (see 4.2.315) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Model_change objects.

NOTE - This assertion is established through string_select.

4.3.1094 Model_image to External_model

Each Model_image (see 4.2.316) is_displaying zero or one External_model (see 4.2.189). Each External_model is related to zero or more Model_image objects.

NOTE - This assertion is established through presented_model_select.

4.3.1095 Model_image to Multi_language_string

Each Model_image (see 4.2.316) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Model_image objects.

NOTE - This assertion is established through string_select.

4.3.1096 Model_image to Styled_model

Each Model_image (see 4.2.316) is_displaying zero or one Styled_model (see 4.2.484). Each Styled_model is related to zero or more Model_image objects.

NOTE - This assertion is established through presented_model_select.

4.3.1097 Model_image to View

Each Model_image (see 4.2.316) is_presented_in exactly one View (see 4.2.554). Each View has image defined by zero or one Model_image.

4.3.1098 Model_property_association to Activity

Each Model_property_association (see 4.2.317) refers to zero or one Activity (see 4.2.2) in the role of described_element. Each Activity acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and process_property_select.

4.3.1099 Model_property_association to Activity_method_assignment

Each Model_property_association (see 4.2.317) refers to zero or one Activity_method_assignment (see 4.2.5) in the role of described_element. Each Activity_method_assignment acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and process_property_select.

4.3.1100 Model_property_association to Catalogue_thread

Each Model_property_association (see 4.2.317) refers to zero or one Catalogue_thread (see 4.2.48) in the role of described_element. Each Catalogue_thread acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1101 Model_property_association to Complex_product

Each Model_property_association (see 4.2.317) refers to zero or one Complex_product (see 4.2.80) in the role of described_element. Each Complex_product acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1102 Model_property_association to Design_constraint

Each Model_property_association (see 4.2.317) refers to zero or one Design_constraint (see 4.2.138) in the role of described_element. Each Design_constraint acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1103 Model_property_association to Design_discipline_item_definition

Each Model_property_association (see 4.2.317) refers to zero or one Design_discipline_item_definition (see 4.2.142) in the role of described_element. Each Design_discipline_item_definition acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1104 Model_property_association to Document_file

Each Model_property_association (see 4.2.317) refers to zero or one Document_file (see 4.2.159) in the role of described_element. Each Document_file acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1105 Model_property_association to Document_representation

Each Model_property_association (see 4.2.317) refers to zero or one Document_representation (see 4.2.163) in the role of described_element. Each Document_representation acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1106 Model_property_association to Feature_definition

Each Model_property_association (see 4.2.317) refers to zero or one Feature_definition (see 4.2.199) in the role of described_element. Each Feature_definition acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1107 Model_property_association to General_feature

Each Model_property_association (see 4.2.317) refers to zero or one General_feature (see 4.2.221) in the role of described_element. Each General_feature acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1108 Model_property_association to Item_definition_instance_relationship

Each Model_property_association (see 4.2.317) refers to zero or one Item_definition_instance_relationship (see 4.2.268) in the role of described_element. Each Item_definition_instance_relationship acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1109 Model_property_association to Item_definition_relationship

Each Model_property_association (see 4.2.317) refers to zero or one Item_definition_relationship (see 4.2.269) in the role of described_element. Each Item_definition_relationship acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1110 Model_property_association to Item_instance

Each Model_property_association (see 4.2.317) refers to zero or one Item_instance (see 4.2.271) in the role of described_element. Each Item_instance acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1111 Model_property_association to Item_instance_relationship

Each Model_property_association (see 4.2.317) refers to zero or one Item_instance_relationship (see 4.2.272) in the role of described_element. Each Item_instance_relationship acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1112 Model_property_association to Item_shape

Each Model_property_association (see 4.2.317) refers to zero or one Item_shape (see 4.2.274) in the role of described_element. Each Item_shape acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1113 Model_property_association to Model_property_value

Each Model_property_association (see 4.2.317) refers to exactly one Model_property_value (see 4.2.318) in the role of associated_property_value. Each Model_property_value acts as associated_property_value for zero or more Model_property_association objects.

4.3.1114 Model_property_association to Organization

Each Model_property_association (see 4.2.317) refers to zero or one Organization (see 4.2.331) in the role of validity_context. Each Organization acts as validity_context for zero or more Model_property_association objects.

4.3.1115 Model_property_association to Process_operation_definition

Each Model_property_association (see 4.2.317) refers to zero or one Process_operation_definition (see 4.2.381) in the role of described_element. Each Process_operation_definition acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and process_property_select.

4.3.1116 Model_property_association to Process_operation_occurrence

Each Model_property_association (see 4.2.317) refers to zero or one Process_operation_occurrence (see 4.2.384) in the role of described_element. Each Process_operation_occurrence acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and process_property_select.

4.3.1117 Model_property_association to Process_operation_resource_assignment

Each Model_property_association (see 4.2.317) refers to zero or one Process_operation_resource_assignment (see 4.2.386) in the role of described_element. Each Process_operation_resource_assignment acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and process_property_select.

4.3.1118 Model_property_association to Process_plan

Each Model_property_association (see 4.2.317) refers to zero or one Process_plan (see 4.2.387) in the role of described_element. Each Process_plan acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and process_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1119 Model_property_association to Product_class

Each Model_property_association (see 4.2.317) refers to zero or one Product_class (see 4.2.392) in the role of described_element. Each Product_class acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1120 Model_property_association to Product_identification

Each Model_property_association (see 4.2.317) refers to zero or one Product_identification (see 4.2.398) in the role of described_element. Each Product_identification acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1121 Model_property_association to Product_structure_relationship

Each Model_property_association (see 4.2.317) refers to zero or one Product_structure_relationship (see 4.2.400) in the role of described_element. Each Product_structure_relationship acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1122 Model_property_association to Shape_element

Each Model_property_association (see 4.2.317) refers to zero or one Shape_element (see 4.2.449) in the role of described_element. Each Shape_element acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1123 Model_property_association to Shape_element_relationship

Each Model_property_association (see 4.2.317) refers to zero or one Shape_element_relationship (see 4.2.450) in the role of described_element. Each Shape_element_relationship acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1124 Model_property_association to Thread_feature

Each Model_property_association (see 4.2.317) refers to zero or one Thread_feature (see 4.2.517) in the role of described_element. Each Thread_feature acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1125 Model_property_association to Transition_feature

Each Model_property_association (see 4.2.317) refers to zero or one Transition_feature (see 4.2.537) in the role of described_element. Each Transition_feature acts as described_element for zero or more Model_property_association objects.

NOTE - This assertion is established through model_property_select and item_property_select.

4.3.1126 Model_property_value to External_model

Each Model_property_value (see 4.2.318) refers to zero or one External_model (see 4.2.189) in the role of describing_model. Each External_model acts as describing_model for zero or one Model_property_value.

NOTE - This assertion is established through model_property_representation_select.

4.3.1127 Model_property_value to General_property

Each Model_property_value (see 4.2.318) refers to exactly one General_property (see 4.2.230) in the role of definition. Each General_property acts as definition for zero or more Model_property_value objects.

4.3.1128 Model_property_value to Geometric_model

Each Model_property_value (see 4.2.318) refers to zero or one Geometric_model (see 4.2.238) in the role of describing_model. Each Geometric_model acts as describing_model for zero or one Model_property_value.

NOTE - This assertion is established through model_property_representation_select.

4.3.1129 Model_property_value to Styled_model

Each Model_property_value (see 4.2.318) refers to zero or one Styled_model (see 4.2.484) in the role of describing_model. Each Styled_model acts as describing_model for zero or one Model_property_value.

NOTE - This assertion is established through model_property_representation_select.

4.3.1130 Moments_of_inertia to Axis_placement

Each Moments_of_inertia (see 4.2.319) refers to exactly one Axis_placement (see 4.2.33) in the role of reference_axis_placement. Each Axis_placement acts as reference_axis_placement for zero or more Moments_of_inertia objects.

4.3.1131 Moments_of_inertia to Cartesian_coordinate_space

Each Moments_of_inertia (see 4.2.319) is_defined_in exactly one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more Moments_of_inertia objects.

4.3.1132 Moments_of_inertia to Numerical_value

Each Moments_of_inertia (see 4.2.319) refers to one, two, or three Numerical_value (see 4.2.324) objects in the role of inertia_value. Each Numerical_value acts as inertia_value for zero or more Moments_of_inertia objects.

4.3.1133 Multi_language_string to String_with_language

Each Multi_language_string (see 4.2.320) refers to zero or more String_with_language (see 4.2.479) objects in the role of additional_language_dependent_string. Each String_with_language has used_by defined by one or more Multi_language_string objects.

Each Multi_language_string refers to exactly one String_with_language in the role of primary_language_dependent_string. Each String_with_language has used_by defined by one or more Multi_language_string objects.

4.3.1134 Named_size to Classification_system

Each Named_size (see 4.2.321) refers to zero or one Classification_system (see 4.2.71) in the role of referenced_standard. Each Classification_system acts as referenced_standard for zero or more Named_size objects.

4.3.1135 Ngon_profile to Feature_parameter

Each Ngon_profile (see 4.2.323) refers to zero or one Feature_parameter (see 4.2.201) in the role of corner_radius. Each Feature_parameter acts as corner_radius for zero or more Ngon_profile objects.

Each Ngon_profile refers to exactly one Feature_parameter in the role of diameter. Each Feature_parameter acts as diameter for zero or more Ngon_profile objects.

4.3.1136 Open_profile_usage to Open_profile

Each Open_profile_usage (see 4.2.329) refers to exactly one Open_profile (see 4.2.328) in the role of used_profile. Each Open_profile acts as used_profile for zero or more Open_profile_usage objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1137 Open_profile_usage to Plane

Each Open_profile_usage (see 4.2.329) refers to zero or one Plane (see 4.2.360) in the role of profile_limit. Each Plane acts as profile_limit for zero or more Open_profile_usage objects.

4.3.1138 Organization_in_contract to Contract

Each Organization_in_contract (see 4.2.332) refers to one or more Contract (see 4.2.104) objects in the role of signed_contract. Each Contract has release defined by zero or more Organization_in_contract objects.

4.3.1139 Organization_in_contract to Date_and_person_organization

Each Organization_in_contract (see 4.2.332) refers to zero or more Date_and_person_organization (see 4.2.118) objects in the role of signature. Each Date_and_person_organization acts as signature for zero or more Organization_in_contract objects.

4.3.1140 Organization_in_contract to Organization

Each Organization_in_contract (see 4.2.332) refers to exactly one Organization (see 4.2.331) in the role of contracted_organization. Each Organization acts as contracted_organization for zero or more Organization_in_contract objects.

4.3.1141 Organization_relationship to Multi_language_string

Each Organization_relationship (see 4.2.333) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Organization_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1142 Organization_relationship to Organization

Each Organization_relationship (see 4.2.333) is related to exactly one Organization (see 4.2.331). Each Organization is referenced by zero or more Organization_relationship objects as related.

NOTE 1 - The related Organization is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Organization_relationship is relating to exactly one Organization. Each Organization is referenced by zero or more Organization_relationship objects as relating.

NOTE 2 - The relating Organization is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1143 Oriented_edge_curve to B_spline_curve

Each Oriented_edge_curve (see 4.2.334) refers to zero or one B_spline_curve (see 4.2.36) in the role of edge_geometry. Each B_spline_curve acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE - This assertion is established through topologically_bounded_curve_select.

4.3.1144 Oriented_edge_curve to Circle

Each Oriented_edge_curve (see 4.2.334) refers to zero or one Circle (see 4.2.56) in the role of edge_-geometry. Each Circle acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE - This assertion is established through topologically_bounded_curve_select.

4.3.1145 Oriented_edge_curve to Curve_on_surface

Each Oriented_edge_curve (see 4.2.334) refers to zero or one Curve_on_surface (see 4.2.110) in the role of edge_geometry. Each Curve_on_surface acts as edge_geometry for zero or more Oriented_edge_-curve objects.

NOTE - This assertion is established through topologically_bounded_curve_select.

4.3.1146 Oriented_edge_curve to Ellipse

Each Oriented_edge_curve (see 4.2.334) refers to zero or one Ellipse (see 4.2.183) in the role of edge_-geometry. Each Ellipse acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE - This assertion is established through topologically_bounded_curve_select.

4.3.1147 Oriented_edge_curve to Hyperbola

Each Oriented_edge_curve (see 4.2.334) refers to zero or one Hyperbola (see 4.2.260) in the role of edge_geometry. Each Hyperbola acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE - This assertion is established through topologically_bounded_curve_select.

4.3.1148 Oriented_edge_curve to Line

Each Oriented_edge_curve (see 4.2.334) refers to zero or one Line (see 4.2.296) in the role of edge_-geometry. Each Line acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE - This assertion is established through topologically_bounded_curve_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1149 Oriented_edge_curve to Parabola

Each Oriented_edge_curve (see 4.2.334) refers to zero or one Parabola (see 4.2.337) in the role of edge_-geometry. Each Parabola acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE - This assertion is established through topologically_bounded_curve_select.

4.3.1150 Oriented_edge_curve to Polyline

Each Oriented_edge_curve (see 4.2.334) refers to zero or one Polyline (see 4.2.377) in the role of edge_-geometry. Each Polyline acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE - This assertion is established through topologically_bounded_curve_select.

4.3.1151 Oriented_edge_curve to Vertex_point

Each Oriented_edge_curve (see 4.2.334) refers to exactly one Vertex_point (see 4.2.553) in the role of edge_end. Each Vertex_point acts as edge_end for zero or more Oriented_edge_curve objects.

Each Oriented_edge_curve refers to exactly one Vertex_point in the role of edge_start. Each Vertex_-point acts as edge_start for zero or more Oriented_edge_curve objects.

4.3.1152 Pair_value to Kinematic_pair

Each Pair_value (see 4.2.335) is_applied_to exactly one Kinematic_pair (see 4.2.287). Each Kinematic_-pair is related to zero or more Pair_value objects.

4.3.1153 Panel_hole_with_barring to Angle_specification

Each Panel_hole_with_barring (see 4.2.336) refers to zero or one Angle_specification (see 4.2.11) in the role of angle_defined_by. Each Angle_specification acts as angle_defined_by for zero or more Panel_-hole_with_barring objects.

4.3.1154 Panel_hole_with_barring to Closed_profile_usage

Each Panel_hole_with_barring (see 4.2.336) refers to exactly one Closed_profile_usage (see 4.2.73) in the role of barring_profile. Each Closed_profile_usage acts as barring_profile for zero or more Panel_-hole_with_barring objects.

4.3.1155 Panel_hole_with_barring to Feature_parameter

Each Panel_hole_with_barring (see 4.2.336) refers to zero or one Feature_parameter (see 4.2.201) in the role of base_radius. Each Feature_parameter acts as base_radius for zero or more Panel_hole_with_-barring objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1156 Parallelism_tolerance to Datum

Each Parallelism_tolerance (see 4.2.338) refers to one or two Datum (see 4.2.123) objects in the role of reference_datum. Each Datum acts as reference_datum for zero or more Parallelism_tolerance objects.

4.3.1157 Parallelism_tolerance to Reference_plane

Each Parallelism_tolerance (see 4.2.338) refers to zero or one Reference_plane (see 4.2.429) in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Parallelism_tolerance objects.

4.3.1158 Partial_circular_path to Feature_parameter

Each Partial_circular_path (see 4.2.339) refers to exactly one Feature_parameter (see 4.2.201) in the role of sweep_angle. Each Feature_parameter acts as sweep_angle for zero or more Partial_circular_path objects.

4.3.1159 Partial_circular_profile to Feature_parameter

Each Partial_circular_profile (see 4.2.340) refers to exactly one Feature_parameter (see 4.2.201) in the role of radius. Each Feature_parameter acts as radius for zero or more Partial_circular_profile objects.

Each Partial_circular_profile refers to exactly one Feature_parameter in the role of sweep_angle. Each Feature_parameter acts as sweep_angle for zero or more Partial_circular_profile objects.

4.3.1160 Path to Axis_placement

Each Path (see 4.2.342) is_defined_by exactly one Axis_placement (see 4.2.33). Each Axis_placement is related to zero or more Path objects.

4.3.1161 Path to Cartesian_coordinate_space

Each Path (see 4.2.342) is_defined_in zero or one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more Path objects.

4.3.1162 Path_parameter to General_feature

Each Path_parameter (see 4.2.344) refers to exactly one General_feature (see 4.2.221) in the role of parameter_context. Each General_feature acts as parameter_context for zero or more Path_parameter objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1163 Path_parameter to Path

Each Path_parameter (see 4.2.344) refers to exactly one Path (see 4.2.342) in the role of associated_path. Each Path acts as associated_path for zero or more Path_parameter objects.

4.3.1164 Perpendicularity_tolerance to Datum

Each Perpendicularity_tolerance (see 4.2.345) refers to one, two, or three Datum (see 4.2.123) objects in the role of reference_datum. Each Datum acts as reference_datum for zero or more Perpendicularity_-tolerance objects.

4.3.1165 Perpendicularity_tolerance to Reference_plane

Each Perpendicularity_tolerance (see 4.2.345) refers to zero or one Reference_plane (see 4.2.429) in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Perpendicularity_-tolerance objects.

4.3.1166 Person_in_organization to Organization

Each Person_in_organization (see 4.2.347) refers to exactly one Organization (see 4.2.331) in the role of associated_organization. Each Organization acts as associated_organization for zero or more Person_-in_organization objects.

4.3.1167 Person_in_organization to Person

Each Person_in_organization (see 4.2.347) refers to exactly one Person (see 4.2.346) in the role of associated_person. Each Person has associated_organization defined by one or more Person_in_organization objects.

4.3.1168 Person_in_organization_relationship to Multi_language_string

Each Person_in_organization_relationship (see 4.2.348) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Person_in_organization_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1169 Person_in_organization_relationship to Person_in_organization

Each Person_in_organization_relationship (see 4.2.348) is related to exactly one Person_in_organization (see 4.2.347). Each Person_in_organization is referenced by zero or more Person_in_organization_-relationship objects as related.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE 1 - The related Person_in_organization is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Person_in_organization_relationship is relating to exactly one Person_in_organization. Each Person_in_organization is referenced by zero or more Person_in_organization_relationship objects as relating.

NOTE 2 - The relating Person_in_organization is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1170 Person_organization_assignment to Activity

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Activity (see 4.2.2) objects. Each Activity is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1171 Person_organization_assignment to Activity_element

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Activity_element (see 4.2.3) objects. Each Activity_element is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1172 Person_organization_assignment to Activity_method_assignment

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Activity_method_assignment (see 4.2.5) objects. Each Activity_method_assignment is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1173 Person_organization_assignment to Alternate_item_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Alternate_item_relationship (see 4.2.9) objects. Each Alternate_item_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1174 Person_organization_assignment to Approval_status

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Approval_status (see 4.2.24) objects. Each Approval_status is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1175 Person_organization_assignment to Assembly_substitute_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Assembly_substitute_-relationship (see 4.2.28) objects. Each Assembly_substitute_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1176 Person_organization_assignment to Certification

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Certification (see 4.2.50) objects. Each Certification is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1177 Person_organization_assignment to Class_category_association

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Class_category_association (see 4.2.64) objects. Each Class_category_association is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1178 Person_organization_assignment to Class_condition_association

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Class_condition_association (see 4.2.65) objects. Each Class_condition_association is related to zero or more Person_organization_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1179 Person_organization_assignment to Class_inclusion_association

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Class_inclusion_association (see 4.2.66) objects. Each Class_inclusion_association is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1180 Person_organization_assignment to Class_specification_association

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Class_specification_-association (see 4.2.67) objects. Each Class_specification_association is related to zero or more Person_-organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1181 Person_organization_assignment to Class_structure_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Class_structure_relationship (see 4.2.68) objects. Each Class_structure_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1182 Person_organization_assignment to Classification_association

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Classification_association (see 4.2.69) objects. Each Classification_association is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1183 Person_organization_assignment to Classification_system

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Classification_system (see 4.2.71) objects. Each Classification_system is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1184 Person_organization_assignment to Complex_product

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Complex_product (see 4.2.80) objects. Each Complex_product is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1185 Person_organization_assignment to Complex_product_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Complex_product_relationship (see 4.2.81) objects. Each Complex_product_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1186 Person_organization_assignment to Configuration

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Configuration (see 4.2.94) objects. Each Configuration is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1187 Person_organization_assignment to Contract

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Contract (see 4.2.104) objects. Each Contract is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1188 Person_organization_assignment to Design_constraint

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Design_constraint (see 4.2.138) objects. Each Design_constraint is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1189 Person_organization_assignment to Design_discipline_item_definition

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Design_discipline_-item_definition (see 4.2.142) objects. Each Design_discipline_item_definition is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1190 Person_organization_assignment to Document

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Document (see 4.2.155) objects. Each Document is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1191 Person_organization_assignment to Document_file

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Document_file (see 4.2.159) objects. Each Document_file is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1192 Person_organization_assignment to Document_representation

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Document_representation (see 4.2.163) objects. Each Document_representation is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1193 Person_organization_assignment to Document_version

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Document_version (see 4.2.167) objects. Each Document_version is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1194 Person_organization_assignment to Drawing

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Drawing (see 4.2.170) objects. Each Drawing is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1195 Person_organization_assignment to Drawing_sheet

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Drawing_sheet (see 4.2.173) objects. Each Drawing_sheet is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1196 Person_organization_assignment to Event_reference

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Event_reference (see 4.2.184) objects. Each Event_reference is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select.

4.3.1197 Person_organization_assignment to General_classification

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more General_classification (see 4.2.216) objects. Each General_classification is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1198 Person_organization_assignment to Geometric_model

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Geometric_model (see 4.2.238) objects. Each Geometric_model is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1199 Person_organization_assignment to Item

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Item (see 4.2.267) objects. Each Item is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1200 Person_organization_assignment to Item_definition_instance_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Item_definition_instance_-relationship (see 4.2.268) objects. Each Item_definition_instance_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1201 Person_organization_assignment to Item_definition_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Item_definition_relationship (see 4.2.269) objects. Each Item_definition_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1202 Person_organization_assignment to Item_instance

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Item_instance (see 4.2.271) objects. Each Item_instance is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1203 Person_organization_assignment to Item_instance_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Item_instance_relationship (see 4.2.272) objects. Each Item_instance_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1204 Person_organization_assignment to Item_version

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Item_version (see 4.2.275) objects. Each Item_version is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1205 Person_organization_assignment to Item_version_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Item_version_relationship (see 4.2.276) objects. Each Item_version_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1206 Person_organization_assignment to Kinematic_simulation_information

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Kinematic_simulation_information (see 4.2.288) objects. Each Kinematic_simulation_information is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1207 Person_organization_assignment to Manufacturing_configuration

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Manufacturing_configuration (see 4.2.305) objects. Each Manufacturing_configuration is related to zero or more Person_organization_assignment objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1208 Person_organization_assignment to Material

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Material (see 4.2.309) objects. Each Material is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1209 Person_organization_assignment to Multi_language_string

Each Person_organization_assignment (see 4.2.349) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Person_organization_assignment objects.

NOTE - This assertion is established through string_select.

4.3.1210 Person_organization_assignment to Organization

Each Person_organization_assignment (see 4.2.349) refers to zero or one Organization (see 4.2.331) in the role of assigned_person_organization. Each Organization acts as assigned_person_organization for zero or more Person_organization_assignment objects.

NOTE - This assertion is established through person_organization_select.

4.3.1211 Person_organization_assignment to Organization_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Organization_relationship (see 4.2.333) objects. Each Organization_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_-organizational_data_select.

4.3.1212 Person_organization_assignment to Person_in_organization

Each Person_organization_assignment (see 4.2.349) refers to zero or one Person_in_organization (see 4.2.347) in the role of assigned_person_organization. Each Person_in_organization acts as assigned_-person_organization for zero or more Person_organization_assignment objects.

NOTE 1 - This assertion is established through person_organization_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Each Person_organization_assignment is_applied_to zero or more Person_in_organization objects. Each Person_in_organization is related to zero or more Person_organization_assignment objects.

NOTE 2 - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1213 Person_organization_assignment to Person_in_organization_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Person_in_organization_relationship (see 4.2.348) objects. Each Person_in_organization_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1214 Person_organization_assignment to Physical_assembly_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Physical_assembly_relationship (see 4.2.350) objects. Each Physical_assembly_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1215 Person_organization_assignment to Physical_instance

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Physical_instance (see 4.2.352) objects. Each Physical_instance is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1216 Person_organization_assignment to Physical_instance_test_result

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Physical_instance_test_result (see 4.2.353) objects. Each Physical_instance_test_result is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1217 Person_organization_assignment to Process_operation_definition

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Process_operation_definition (see 4.2.381) objects. Each Process_operation_definition is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1218 Person_organization_assignment to Process_operation_occurrence

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Process_operation_occurrence (see 4.2.384) objects. Each Process_operation_occurrence is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1219 Person_organization_assignment to Process_operation_resource_assignment

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Process_operation_resource_assignment (see 4.2.386) objects. Each Process_operation_resource_assignment is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1220 Person_organization_assignment to Process_plan

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Process_plan (see 4.2.387) objects. Each Process_plan is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1221 Person_organization_assignment to Product_class

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Product_class (see 4.2.392) objects. Each Product_class is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1222 Person_organization_assignment to Product_identification

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Product_identification (see 4.2.398) objects. Each Product_identification is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1223 Person_organization_assignment to Product_structure_relationship

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Product_structure_relationship (see 4.2.400) objects. Each Product_structure_relationship is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select and general_organizational_data_select.

4.3.1224 Person_organization_assignment to Project

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Project (see 4.2.404) objects. Each Project is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.1225 Person_organization_assignment to Property

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Property (see 4.2.409) objects. Each Property is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

4.3.1226 Person_organization_assignment to Property_value_association

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Property_value_association (see 4.2.413) objects. Each Property_value_association is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_organizational_data_select, and general_organizational_data_sub_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1227 Person_organization_assignment to Security_classification

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Security_classification (see 4.2.443) objects. Each Security_classification is related to zero or more Person_organization_-assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.1228 Person_organization_assignment to Security_level

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Security_level (see 4.2.444) objects. Each Security_level is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.1229 Person_organization_assignment to Specification

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Specification (see 4.2.467) objects. Each Specification is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.1230 Person_organization_assignment to Specification_category

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Specification_category (see 4.2.468) objects. Each Specification_category is related to zero or more Person_organization_-assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.1231 Person_organization_assignment to Specification_expression

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Specification_expression (see 4.2.470) objects. Each Specification_expression is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1232 Person_organization_assignment to Specification_inclusion

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Specification_inclusion (see 4.2.471) objects. Each Specification_inclusion is related to zero or more Person_organization_-assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.1233 Person_organization_assignment to Styled_model

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Styled_model (see 4.2.484) objects. Each Styled_model is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.1234 Person_organization_assignment to View_area

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more View_area (see 4.2.555) objects. Each View_area is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.1235 Person_organization_assignment to Work_order

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Work_order (see 4.2.564) objects. Each Work_order is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.1236 Person_organization_assignment to Work_request

Each Person_organization_assignment (see 4.2.349) is_applied_to zero or more Work_request (see 4.2.565) objects. Each Work_request is related to zero or more Person_organization_assignment objects.

NOTE - This assertion is established through date_time_person_organization_element_select, general_-organizational_data_select, and general_organizational_data_sub_select.

4.3.1237 Physical_assembly_relationship to Item_instance

Each Physical_assembly_relationship (see 4.2.350) is_realization_of exactly one Item_instance (see 4.2.271). Each Item_instance is related to zero or more Physical_assembly_relationship objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1238 Physical_assembly_relationship to Physical_instance

Each Physical_assembly_relationship (see 4.2.350) refers to exactly one Physical_instance (see 4.2.352) in the role of physical_assembly. Each Physical_instance acts as physical_assembly for zero or more Physical_assembly_relationship objects.

Each Physical_assembly_relationship refers to exactly one Physical_instance in the role of physical_-component. Each Physical_instance acts as physical_component for zero or more Physical_assembly_-relationship objects.

4.3.1239 Physical_document to Hardcopy

Each Physical_document (see 4.2.351) refers to zero or more Hardcopy (see 4.2.253) objects in the role of component. Each Hardcopy acts as component for zero or more Physical_document objects.

4.3.1240 Physical_instance to Design_discipline_item_definition

Each Physical_instance (see 4.2.352) is_realization_of zero or one Design_discipline_item_definition (see 4.2.142). Each Design_discipline_item_definition is related to zero or more Physical_instance objects.

NOTE - This assertion is established through physical_instance_definition_select.

4.3.1241 Physical_instance to Multi_language_string

Each Physical_instance (see 4.2.352) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Physical_instance objects.

NOTE - This assertion is established through string_select.

4.3.1242 Physical_instance to Product_identification

Each Physical_instance (see 4.2.352) is_realization_of zero or one Product_identification (see 4.2.398). Each Product_identification is related to zero or more Physical_instance objects.

NOTE - This assertion is established through physical_instance_definition_select.

4.3.1243 Physical_instance_test_result to Activity

Each Physical_instance_test_result (see 4.2.353) refers to zero or one Activity (see 4.2.2) in the role of test_activity. Each Activity acts as test_activity for zero or more Physical_instance_test_result objects.

NOTE - This assertion is established through test_activity_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1244 Physical_instance_test_result to Multi_language_string

Each Physical_instance_test_result (see 4.2.353) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Physical_instance_test_result objects.

NOTE - This assertion is established through string_select.

4.3.1245 Physical_instance_test_result to Physical_instance

Each Physical_instance_test_result (see 4.2.353) refers to exactly one Physical_instance (see 4.2.352) in the role of tested_instance. Each Physical_instance acts as tested_instance for zero or more Physical_instance_test_result objects.

4.3.1246 Physical_instance_test_result to Process_operation_occurrence

Each Physical_instance_test_result (see 4.2.353) refers to zero or one Process_operation_occurrence (see 4.2.384) in the role of test_activity. Each Process_operation_occurrence acts as test_activity for zero or more Physical_instance_test_result objects.

NOTE - This assertion is established through test_activity_select.

4.3.1247 Physical_instance_test_result to Property_value_representation

Each Physical_instance_test_result (see 4.2.353) refers to zero or more Property_value_representation (see 4.2.414) objects in the role of test_result. Each Property_value_representation acts as test_result for zero or more Physical_instance_test_result objects.

4.3.1248 Placed_feature to Feature_placement

Each Placed_feature (see 4.2.356) is_placed_by exactly one Feature_placement (see 4.2.202). Each Feature_placement is related to zero or more Placed_feature objects.

4.3.1249 Placed_target to Axis_placement

Each Placed_target (see 4.2.357) refers to exactly one Axis_placement (see 4.2.33) in the role of parameter_reference. Each Axis_placement acts as parameter_reference for zero or more Placed_target objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1250 Placed_target to Cartesian_coordinate_space

Each Placed_target (see 4.2.357) is_defined_in exactly one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more Placed_target objects.

4.3.1251 Planar_bottom_condition to Feature_parameter

Each Planar_bottom_condition (see 4.2.358) refers to zero or one Feature_parameter (see 4.2.201) in the role of floor_radius. Each Feature_parameter acts as floor_radius for zero or more Planar_bottom_-condition objects.

4.3.1252 Plib_property_reference to Plib_class_reference

Each Plib_property_reference (see 4.2.362) refers to exactly one Plib_class_reference (see 4.2.361) in the role of name_scope. Each Plib_class_reference acts as name_scope for zero or more Plib_property_-reference objects.

4.3.1253 Pocket_feature to Angle_taper

Each Pocket_feature (see 4.2.366) refers to zero or one Angle_taper (see 4.2.12) in the role of taper. Each Angle_taper acts as taper for zero or more Pocket_feature objects.

NOTE - This assertion is established through taper_select.

4.3.1254 Pocket_feature to Diameter_taper

Each Pocket_feature (see 4.2.366) refers to zero or one Diameter_taper (see 4.2.146) in the role of taper. Each Diameter_taper acts as taper for zero or more Pocket_feature objects.

NOTE - This assertion is established through taper_select.

4.3.1255 Pocket_feature to Directed_taper

Each Pocket_feature (see 4.2.366) refers to zero or one Directed_taper (see 4.2.154) in the role of taper. Each Directed_taper acts as taper for zero or more Pocket_feature objects.

NOTE - This assertion is established through taper_select.

4.3.1256 Pocket_feature to Feature_parameter

Each Pocket_feature (see 4.2.366) refers to zero or one Feature_parameter (see 4.2.201) in the role of base_radius. Each Feature_parameter acts as base_radius for zero or more Pocket_feature objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1257 Pocket_feature to Linear_path

Each Pocket_feature (see 4.2.366) refers to exactly one Linear_path (see 4.2.300) in the role of pocket_depth. Each Linear_path acts as pocket_depth for zero or more Pocket_feature objects.

4.3.1258 Pocket_feature to Pocket_bottom_condition

Each Pocket_feature (see 4.2.366) refers to zero or one Pocket_bottom_condition (see 4.2.365) in the role of bottom_condition. Each Pocket_bottom_condition acts as bottom_condition for zero or more Pocket_feature objects.

NOTE - This assertion is established through pocket_bottom_condition_select.

4.3.1259 Pocket_feature to Profile_usage

Each Pocket_feature (see 4.2.366) refers to exactly one Profile_usage (see 4.2.403) in the role of boundary. Each Profile_usage acts as boundary for zero or more Pocket_feature objects.

4.3.1260 Pocket_feature to Through_pocket_bottom_condition

Each Pocket_feature (see 4.2.366) refers to zero or one Through_pocket_bottom_condition (see 4.2.520) in the role of bottom_condition. Each Through_pocket_bottom_condition acts as bottom_condition for zero or more Pocket_feature objects.

NOTE - This assertion is established through pocket_bottom_condition_select.

4.3.1261 Point_appearance to Point_marker_symbol

Each Point_appearance (see 4.2.368) refers to exactly one Point_marker_symbol (see 4.2.372) in the role of marker. Each Point_marker_symbol acts as marker for zero or more Point_appearance objects.

4.3.1262 Point_direction to Cartesian_point

Each Point_direction (see 4.2.369) refers to exactly one Cartesian_point (see 4.2.47) in the role of location. Each Cartesian_point acts as location for zero or more Point_direction objects.

4.3.1263 Point_direction_model to Point_direction_sequence

Each Point_direction_model (see 4.2.370) refers to zero or more Point_direction_sequence (see 4.2.371) objects in the role of point_direction_elements. Each Point_direction_sequence acts as point_direction_elements for zero or more Point_direction_model objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1264 Point_direction_model to Point_sequence

Each Point_direction_model (see 4.2.370) refers to zero or more Point_sequence (see 4.2.375) objects in the role of point_elements. Each Point_sequence acts as point_elements for zero or more Point_direction_model objects.

4.3.1265 Point_direction_sequence to Point_direction

Each Point_direction_sequence (see 4.2.371) refers to zero or more Point_direction (see 4.2.369) objects in the role of element. Each Point_direction acts as element for zero or more Point_direction_sequence objects.

NOTE - This assertion is established through point_direction_element_select.

4.3.1266 Point_direction_sequence to Point_on_surface

Each Point_direction_sequence (see 4.2.371) refers to zero or more Point_on_surface (see 4.2.374) objects in the role of element. Each Point_on_surface acts as element for zero or more Point_direction_sequence objects.

NOTE - This assertion is established through point_direction_element_select.

4.3.1267 Point_sequence to Cartesian_point

Each Point_sequence (see 4.2.375) refers to one or more Cartesian_point (see 4.2.47) objects in the role of element. Each Cartesian_point acts as element for zero or more Point_sequence objects.

4.3.1268 Poly_loop to Cartesian_point

Each Poly_loop (see 4.2.376) refers to three or more Cartesian_point (see 4.2.47) objects in the role of polygon. Each Cartesian_point acts as polygon for zero or more Poly_loop objects.

4.3.1269 Position_tolerance to Datum

Each Position_tolerance (see 4.2.378) refers to zero, one, two, or three Datum (see 4.2.123) objects in the role of reference_datum. Each Datum acts as reference_datum for zero or more Position_tolerance objects.

4.3.1270 Position_tolerance to Reference_plane

Each Position_tolerance (see 4.2.378) refers to zero or one Reference_plane (see 4.2.429) in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Position_tolerance objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1271 Process_feature_in_solid to Axis_placement

Each Process_feature_in_solid (see 4.2.380) refers to exactly one Axis_placement (see 4.2.33) in the role of location_and_orientation. Each Axis_placement acts as location_and_orientation for zero or more Process_feature_in_solid objects.

4.3.1272 Process_operation_definition to Multi_language_string

Each Process_operation_definition (see 4.2.381) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Process_operation_definition objects.

NOTE 1 - This assertion is established through string_select.

Each Process_operation_definition refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Process_operation_definition objects.

NOTE 2 - This assertion is established through string_select.

4.3.1273 Process_operation_definition_relationship to Process_operation_definition

Each Process_operation_definition_relationship (see 4.2.382) is related to exactly one Process_operation_definition (see 4.2.381). Each Process_operation_definition is referenced by zero or more Process_operation_definition_relationship objects as related.

NOTE 1 - The related Process_operation_definition is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Process_operation_definition_relationship is relating to exactly one Process_operation_definition. Each Process_operation_definition is referenced by zero or more Process_operation_definition_relationship objects as relating.

NOTE 2 - The relating Process_operation_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1274 Process_operation_input_or_output to Assembly_component_relationship

Each Process_operation_input_or_output (see 4.2.383) refers to zero or one Assembly_component_relationship (see 4.2.26) in the role of element. Each Assembly_component_relationship acts as element for zero or more Process_operation_input_or_output objects.

NOTE - This assertion is established through process_operation_input_or_output_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1275 Process_operation_input_or_output to Design_discipline_item_definition

Each Process_operation_input_or_output (see 4.2.383) refers to zero or one Design_discipline_item_definition (see 4.2.142) in the role of element. Each Design_discipline_item_definition acts as element for zero or more Process_operation_input_or_output objects.

NOTE - This assertion is established through process_operation_input_or_output_select.

4.3.1276 Process_operation_input_or_output to Item_instance

Each Process_operation_input_or_output (see 4.2.383) refers to zero or one Item_instance (see 4.2.271) in the role of element. Each Item_instance acts as element for zero or more Process_operation_input_or_output objects.

NOTE - This assertion is established through process_operation_input_or_output_select.

4.3.1277 Process_operation_input_or_output to Mated_item_association

Each Process_operation_input_or_output (see 4.2.383) refers to zero or one Mated_item_association (see 4.2.307) in the role of element. Each Mated_item_association acts as element for zero or more Process_operation_input_or_output objects.

NOTE - This assertion is established through process_operation_input_or_output_select.

4.3.1278 Process_operation_input_or_output to Multi_language_string

Each Process_operation_input_or_output (see 4.2.383) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Process_operation_input_or_output objects.

NOTE - This assertion is established through string_select.

4.3.1279 Process_operation_input_or_output to Process_operation_occurrence

Each Process_operation_input_or_output (see 4.2.383) refers to exactly one Process_operation_occurrence (see 4.2.384) in the role of operation. Each Process_operation_occurrence acts as operation for zero or more Process_operation_input_or_output objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1280 Process_operation_input_or_output to Shape_element

Each Process_operation_input_or_output (see 4.2.383) refers to zero or more Shape_element (see 4.2.449) objects in the role of concerned_shape. Each Shape_element acts as concerned_shape for zero or more Process_operation_input_or_output objects.

4.3.1281 Process_operation_input_or_output to Transformation

Each Process_operation_input_or_output (see 4.2.383) refers to zero or one Transformation (see 4.2.533) in the role of placement. Each Transformation acts as placement for zero or more Process_operation_-input_or_output objects.

4.3.1282 Process_operation_occurrence to Cartesian_coordinate_space

Each Process_operation_occurrence (see 4.2.384) is_defined_in zero or one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more Process_operation_occurrence objects.

4.3.1283 Process_operation_occurrence to Process_operation_definition

Each Process_operation_occurrence (see 4.2.384) refers to exactly one Process_operation_definition (see 4.2.381) in the role of operation_definition. Each Process_operation_definition acts as operation_definition for zero or more Process_operation_occurrence objects.

4.3.1284 Process_operation_occurrence to Process_plan

Each Process_operation_occurrence (see 4.2.384) refers to exactly one Process_plan (see 4.2.387) in the role of plan. Each Process_plan acts as plan for zero or more Process_operation_occurrence objects.

4.3.1285 Process_operation_occurrence_relationship to Multi_language_string

Each Process_operation_occurrence_relationship (see 4.2.385) refers to zero or one Multi_language_-string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Process_operation_occurrence_relationship objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1286 Process_operation_occurrence_relationship to Process_operation_occurrence

Each Process_operation_occurrence_relationship (see 4.2.385) is related to exactly one Process_operation_occurrence (see 4.2.384). Each Process_operation_occurrence is referenced by zero or more Process_operation_occurrence_relationship objects as related.

NOTE 1 - The related Process_operation_occurrence is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Process_operation_occurrence_relationship is relating to exactly one Process_operation_occurrence. Each Process_operation_occurrence is referenced by zero or more Process_operation_occurrence_relationship objects as relating.

NOTE 2 - The relating Process_operation_occurrence is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1287 Process_operation_occurrence_relationship to Property_value

Each Process_operation_occurrence_relationship (see 4.2.385) refers to zero or one Property_value (see 4.2.412) in the role of waiting_time. Each Property_value acts as waiting_time for zero or more Process_operation_occurrence_relationship objects.

4.3.1288 Process_operation_resource_assignment to Descriptive_specification

Each Process_operation_resource_assignment (see 4.2.386) refers to zero or one Descriptive_specification (see 4.2.137) in the role of resource_definition. Each Descriptive_specification acts as resource_definition for zero or more Process_operation_resource_assignment objects.

NOTE - This assertion is established through resource_definition_select.

4.3.1289 Process_operation_resource_assignment to Design_discipline_item_definition

Each Process_operation_resource_assignment (see 4.2.386) refers to zero or one Design_discipline_item_definition (see 4.2.142) in the role of resource_definition. Each Design_discipline_item_definition acts as resource_definition for zero or more Process_operation_resource_assignment objects.

NOTE - This assertion is established through resource_definition_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1290 Process_operation_resource_assignment to Item_instance

Each Process_operation_resource_assignment (see 4.2.386) refers to zero or one Item_instance (see 4.2.271) in the role of resource_definition. Each Item_instance acts as resource_definition for zero or more Process_operation_resource_assignment objects.

NOTE - This assertion is established through resource_definition_select.

4.3.1291 Process_operation_resource_assignment to Multi_language_string

Each Process_operation_resource_assignment (see 4.2.386) refers to zero or one Multi_language_string (see 4.2.320) in the role of reason. Each Multi_language_string acts as reason for zero or more Process_operation_resource_assignment objects.

NOTE - This assertion is established through string_select.

4.3.1292 Process_operation_resource_assignment to Physical_instance

Each Process_operation_resource_assignment (see 4.2.386) refers to zero or one Physical_instance (see 4.2.352) in the role of resource_definition. Each Physical_instance acts as resource_definition for zero or more Process_operation_resource_assignment objects.

NOTE - This assertion is established through resource_definition_select.

4.3.1293 Process_operation_resource_assignment to Process_operation_occurrence

Each Process_operation_resource_assignment (see 4.2.386) refers to exactly one Process_operation_occurrence (see 4.2.384) in the role of operation. Each Process_operation_occurrence acts as operation for zero or more Process_operation_resource_assignment objects.

4.3.1294 Process_operation_resource_assignment to Product_component

Each Process_operation_resource_assignment (see 4.2.386) refers to zero or one Product_component (see 4.2.394) in the role of resource_definition. Each Product_component acts as resource_definition for zero or more Process_operation_resource_assignment objects.

NOTE - This assertion is established through resource_definition_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1295 Process_operation_resource_assignment to Transformation

Each Process_operation_resource_assignment (see 4.2.386) refers to zero or one Transformation (see 4.2.533) in the role of placement. Each Transformation acts as placement for zero or more Process_-operation_resource_assignment objects.

4.3.1296 Process_plan to Item_version

Each Process_plan (see 4.2.387) refers to zero or more Item_version (see 4.2.275) objects in the role of produced_output. Each Item_version acts as produced_output for zero or more Process_plan objects.

4.3.1297 Process_plan to Multi_language_string

Each Process_plan (see 4.2.387) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Process_plan objects.

NOTE 1 - This assertion is established through string_select.

Each Process_plan refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Process_plan objects.

NOTE 2 - This assertion is established through string_select.

4.3.1298 Process_plan_relationship to Multi_language_string

Each Process_plan_relationship (see 4.2.388) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Process_-plan_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1299 Process_plan_relationship to Process_plan

Each Process_plan_relationship (see 4.2.388) is related to exactly one Process_plan (see 4.2.387). Each Process_plan is referenced by zero or more Process_plan_relationship objects as related.

NOTE 1 - The related Process_plan is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Process_plan_relationship is relating to exactly one Process_plan. Each Process_plan is referenced by zero or more Process_plan_relationship objects as relating.

NOTE 2 - The relating Process_plan is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1300 Process_property_association to Activity

Each Process_property_association (see 4.2.390) refers to zero or one Activity (see 4.2.2) in the role of described_element. Each Activity acts as described_element for zero or more Process_property_association objects.

NOTE - This assertion is established through process_property_select.

4.3.1301 Process_property_association to Activity_method_assignment

Each Process_property_association (see 4.2.390) refers to zero or one Activity_method_assignment (see 4.2.5) in the role of described_element. Each Activity_method_assignment acts as described_element for zero or more Process_property_association objects.

NOTE - This assertion is established through process_property_select.

4.3.1302 Process_property_association to Process_operation_definition

Each Process_property_association (see 4.2.390) refers to zero or one Process_operation_definition (see 4.2.381) in the role of described_element. Each Process_operation_definition acts as described_element for zero or more Process_property_association objects.

NOTE - This assertion is established through process_property_select.

4.3.1303 Process_property_association to Process_operation_occurrence

Each Process_property_association (see 4.2.390) refers to zero or one Process_operation_occurrence (see 4.2.384) in the role of described_element. Each Process_operation_occurrence acts as described_element for zero or more Process_property_association objects.

NOTE - This assertion is established through process_property_select.

4.3.1304 Process_property_association to Process_operation_resource_assignment

Each Process_property_association (see 4.2.390) refers to zero or one Process_operation_resource_assignment (see 4.2.386) in the role of described_element. Each Process_operation_resource_assignment acts as described_element for zero or more Process_property_association objects.

NOTE - This assertion is established through process_property_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1305 Process_property_association to Process_plan

Each Process_property_association (see 4.2.390) refers to zero or one Process_plan (see 4.2.387) in the role of described_element. Each Process_plan acts as described_element for zero or more Process_property_association objects.

NOTE - This assertion is established through process_property_select.

4.3.1306 Process_state to Design_discipline_item_definition

Each Process_state (see 4.2.391) refers to exactly one Design_discipline_item_definition (see 4.2.142) in the role of related_item_definition. Each Design_discipline_item_definition acts as related_item_definition for zero or more Process_state objects.

4.3.1307 Product_class to Multi_language_string

Each Product_class (see 4.2.392) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Product_class objects.

NOTE 1 - This assertion is established through string_select.

Each Product_class refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Product_class objects.

NOTE 2 - This assertion is established through string_select.

4.3.1308 Product_class_relationship to Multi_language_string

Each Product_class_relationship (see 4.2.393) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Product_class_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1309 Product_class_relationship to Product_class

Each Product_class_relationship (see 4.2.393) is related to exactly one Product_class (see 4.2.392). Each Product_class is referenced by zero or more Product_class_relationship objects as related.

NOTE 1 - The related Product_class is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Product_class_relationship is relating to exactly one Product_class. Each Product_class is referenced by zero or more Product_class_relationship objects as relating.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE 2 - The relating Product_class is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1310 Product_component to Application_context

Each Product_component (see 4.2.394) is_relevant_for zero or more Application_context (see 4.2.21) objects. Each Application_context is related to zero or more Product_component objects.

4.3.1311 Product_component to Class_category_association

Each Product_component (see 4.2.394) is_influenced_by zero or more Class_category_association (see 4.2.64) objects. Each Class_category_association is related to zero or more Product_component objects.

4.3.1312 Product_component to Multi_language_string

Each Product_component (see 4.2.394) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Product_component objects.

NOTE 1 - This assertion is established through string_select.

Each Product_component refers to zero or one Multi_language_string in the role of name. Each Multi_-language_string acts as name for zero or more Product_component objects.

NOTE 2 - This assertion is established through string_select.

4.3.1313 Product_design to Item_version

Each Product_design (see 4.2.396) refers to exactly one Item_version (see 4.2.275) in the role of design. Each Item_version has associated_product defined by zero or one Product_design.

4.3.1314 Product_design to Product_identification

Each Product_design (see 4.2.396) refers to exactly one Product_identification (see 4.2.398) in the role of product. Each Product_identification has associated_design defined by zero or one Product_design.

4.3.1315 Product_function to Application_context

Each Product_function (see 4.2.397) is_relevant_for zero or more Application_context (see 4.2.21) objects. Each Application_context is related to zero or more Product_function objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1316 Product_function to Multi_language_string

Each Product_function (see 4.2.397) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Product_function objects.

NOTE 1 - This assertion is established through string_select.

Each Product_function refers to zero or one Multi_language_string in the role of name. Each Multi_-language_string acts as name for zero or more Product_function objects.

NOTE 2 - This assertion is established through string_select.

4.3.1317 Product_identification to Multi_language_string

Each Product_identification (see 4.2.398) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Product_identification objects.

NOTE 1 - This assertion is established through string_select.

Each Product_identification refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Product_identification objects.

NOTE 2 - This assertion is established through string_select.

4.3.1318 Product_identification to Product_class

Each Product_identification (see 4.2.398) refers to exactly one Product_class (see 4.2.392) in the role of associated_product_class. Each Product_class acts as associated_product_class for zero or more Product_identification objects.

4.3.1319 Product_specification to Specification

Each Product_specification (see 4.2.399) refers to one or more Specification (see 4.2.467) objects in the role of defining_specification. Each Specification acts as defining_specification for zero or more Product_specification objects.

4.3.1320 Product_structure_relationship to Complex_product

Each Product_structure_relationship (see 4.2.400) is relating to exactly one Complex_product (see 4.2.80). Each Complex_product is referenced by zero or more Product_structure_relationship objects as relating.

NOTE - The relating Complex_product is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1321 Product_structure_relationship to Multi_language_string

Each Product_structure_relationship (see 4.2.400) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Product_structure_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1322 Product_structure_relationship to Product_constituent

Each Product_structure_relationship (see 4.2.400) is related to exactly one Product_constituent (see 4.2.395). Each Product_constituent is referenced by zero or more Product_structure_relationship objects as related.

NOTE - The related Product_constituent is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

4.3.1323 Profile to Axis_placement

Each Profile (see 4.2.401) refers to exactly one Axis_placement (see 4.2.33) in the role of location_and_orientation. Each Axis_placement acts as location_and_orientation for zero or more Profile objects.

4.3.1324 Profile to Cartesian_coordinate_space

Each Profile (see 4.2.401) is_defined_in exactly one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more Profile objects.

4.3.1325 Profile_parameter to General_feature

Each Profile_parameter (see 4.2.402) refers to exactly one General_feature (see 4.2.221) in the role of parameter_context. Each General_feature acts as parameter_context for zero or more Profile_parameter objects.

4.3.1326 Profile_parameter to Profile

Each Profile_parameter (see 4.2.402) refers to exactly one Profile (see 4.2.401) in the role of associated_profile. Each Profile acts as associated_profile for zero or more Profile_parameter objects.

4.3.1327 Profile_usage to Profile

Each Profile_usage (see 4.2.403) refers to exactly one Profile (see 4.2.401) in the role of used_profile. Each Profile acts as used_profile for zero or more Profile_usage objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1328 Profile_usage to Transformation

Each Profile_usage (see 4.2.403) refers to zero or one Transformation (see 4.2.533) in the role of profile_-placement. Each Transformation acts as profile_placement for zero or more Profile_usage objects.

4.3.1329 Project to Activity

Each Project (see 4.2.404) refers to zero or more Activity (see 4.2.2) objects in the role of work_program. Each Activity has associated_project defined by zero or one Project.

4.3.1330 Project to Date_time

Each Project (see 4.2.404) refers to zero or one Date_time (see 4.2.119) in the role of actual_end_date. Each Date_time acts as actual_end_date for zero or more Project objects.

Each Project refers to zero or one Date_time in the role of actual_start_date. Each Date_time acts as actual_start_date for zero or more Project objects.

Each Project refers to zero or one Date_time in the role of planned_end_date. Each Date_time acts as planned_end_date for zero or more Project objects.

NOTE 1 - This assertion is established through period_or_date_select.

Each Project refers to zero or one Date_time in the role of planned_start_date. Each Date_time acts as planned_start_date for zero or more Project objects.

NOTE 2 - This assertion is established through event_or_date_select.

4.3.1331 Project to Duration

Each Project (see 4.2.404) refers to zero or one Duration (see 4.2.174) in the role of planned_end_date. Each Duration acts as planned_end_date for zero or more Project objects.

NOTE - This assertion is established through period_or_date_select.

4.3.1332 Project to Event_reference

Each Project (see 4.2.404) refers to zero or one Event_reference (see 4.2.184) in the role of planned_-end_date. Each Event_reference acts as planned_end_date for zero or more Project objects.

NOTE 1 - This assertion is established through period_or_date_select.

Each Project refers to zero or one Event_reference in the role of planned_start_date. Each Event_-reference acts as planned_start_date for zero or more Project objects.

NOTE 2 - This assertion is established through event_or_date_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1333 Project to Multi_language_string

Each Project (see 4.2.404) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Project objects.

NOTE 1 - This assertion is established through string_select.

Each Project refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Project objects.

NOTE 2 - This assertion is established through string_select.

4.3.1334 Project to Product_class

Each Project (see 4.2.404) refers to zero or more Product_class (see 4.2.392) objects in the role of affected_product_class. Each Product_class acts as affected_product_class for zero or more Project objects.

4.3.1335 Project_relationship to Multi_language_string

Each Project_relationship (see 4.2.405) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Project_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1336 Project_relationship to Project

Each Project_relationship (see 4.2.405) is related to exactly one Project (see 4.2.404). Each Project is referenced by zero or more Project_relationship objects as related.

NOTE 1 - The related Project is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Project_relationship is relating to exactly one Project. Each Project is referenced by zero or more Project_relationship objects as relating.

NOTE 2 - The relating Project is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1337 Projection to Shape_element

Each Projection (see 4.2.406) refers to exactly one Shape_element (see 4.2.449) in the role of projection_end. Each Shape_element acts as projection_end for zero or more Projection objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1338 Property to External_library_reference

Each Property (see 4.2.409) refers to zero or one External_library_reference (see 4.2.188) in the role of property_source. Each External_library_reference acts as property_source for zero or more Property objects.

NOTE - This assertion is established through property_source_select.

4.3.1339 Property to Multi_language_string

Each Property (see 4.2.409) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Property objects.

NOTE - This assertion is established through string_select.

4.3.1340 Property to Plib_property_reference

Each Property (see 4.2.409) refers to zero or one Plib_property_reference (see 4.2.362) in the role of property_source. Each Plib_property_reference acts as property_source for zero or more Property objects.

NOTE - This assertion is established through property_source_select.

4.3.1341 Property to Unit

Each Property (see 4.2.409) refers to zero or more Unit (see 4.2.541) objects in the role of allowed_unit. Each Unit acts as allowed_unit for zero or more Property objects.

4.3.1342 Property_change to Change

Each Property_change (see 4.2.410) is_describing exactly one Change (see 4.2.55). Each Change is related to zero or more Property_change objects.

4.3.1343 Property_change to Multi_language_string

Each Property_change (see 4.2.410) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Property_change objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1344 Property_change to Property_value_representation

Each Property_change (see 4.2.410) refers to zero or more Property_value_representation (see 4.2.414) objects in the role of added_property. Each Property_value_representation acts as added_property for zero or more Property_change objects.

Each Property_change refers to zero or more Property_value_representation objects in the role of deleted_property. Each Property_value_representation acts as deleted_property for zero or more Property_change objects.

4.3.1345 Property_relationship to Multi_language_string

Each Property_relationship (see 4.2.411) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Property_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1346 Property_relationship to Property

Each Property_relationship (see 4.2.411) is related to exactly one Property (see 4.2.409). Each Property is referenced by zero or more Property_relationship objects as related.

NOTE 1 - The related Property is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Property_relationship is relating to exactly one Property. Each Property is referenced by zero or more Property_relationship objects as relating.

NOTE 2 - The relating Property is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1347 Property_value_association to Multi_language_string

Each Property_value_association (see 4.2.413) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Property_value_association objects.

NOTE - This assertion is established through string_select.

4.3.1348 Property_value_association to Organization

Each Property_value_association (see 4.2.413) refers to zero or one Organization (see 4.2.331) in the role of validity_context. Each Organization acts as validity_context for zero or more Property_value_association objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through validity_context_select.

4.3.1349 Property_value_association to Product_class

Each Property_value_association (see 4.2.413) refers to zero or one Product_class (see 4.2.392) in the role of validity_context. Each Product_class acts as validity_context for zero or more Property_value_-association objects.

NOTE - This assertion is established through validity_context_select.

4.3.1350 Property_value_association to Product_identification

Each Property_value_association (see 4.2.413) refers to zero or one Product_identification (see 4.2.398) in the role of validity_context. Each Product_identification acts as validity_context for zero or more Property_value_association objects.

NOTE - This assertion is established through validity_context_select.

4.3.1351 Property_value_association to Property_value_representation

Each Property_value_association (see 4.2.413) refers to exactly one Property_value_representation (see 4.2.414) in the role of describing_property_value. Each Property_value_representation acts as describing_property_value for zero or more Property_value_association objects.

4.3.1352 Property_value_representation to Property

Each Property_value_representation (see 4.2.414) refers to exactly one Property (see 4.2.409) in the role of definition. Each Property acts as definition for zero or more Property_value_representation objects.

4.3.1353 Property_value_representation to Property_value

Each Property_value_representation (see 4.2.414) refers to exactly one Property_value (see 4.2.412) in the role of specified_value. Each Property_value acts as specified_value for zero or more Property_-value_representation objects.

4.3.1354 Property_value_representation to Unit

Each Property_value_representation (see 4.2.414) refers to zero or one Unit (see 4.2.541) in the role of global_unit. Each Unit acts as global_unit for zero or more Property_value_representation objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1355 Property_value_representation_relationship to Multi_language_string

Each Property_value_representation_relationship (see 4.2.415) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Property_value_representation_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1356 Property_value_representation_relationship to Property_value_representation

Each Property_value_representation_relationship (see 4.2.415) is related to exactly one Property_value_representation (see 4.2.414). Each Property_value_representation is referenced by zero or more Property_value_representation_relationship objects as related.

NOTE 1 - The related Property_value_representation is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Property_value_representation_relationship is relating to exactly one Property_value_representation. Each Property_value_representation is referenced by zero or more Property_value_representation_relationship objects as relating.

NOTE 2 - The relating Property_value_representation is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1357 Quantified_instance to Numerical_value

Each Quantified_instance (see 4.2.417) refers to exactly one Numerical_value (see 4.2.324) in the role of quantity. Each Numerical_value acts as quantity for zero or more Quantified_instance objects.

4.3.1358 Rectangular_closed_pocket to Closed_profile_usage

Each Rectangular_closed_pocket (see 4.2.421) refers to exactly one Closed_profile_usage (see 4.2.73) in the role of boundary. Each Closed_profile_usage acts as boundary for zero or more Rectangular_closed_pocket objects.

4.3.1359 Rectangular_closed_profile to Feature_parameter

Each Rectangular_closed_profile (see 4.2.422) refers to zero or one Feature_parameter (see 4.2.201) in the role of corner_radius. Each Feature_parameter acts as corner_radius for zero or more Rectangular_closed_profile objects.

Each Rectangular_closed_profile refers to exactly one Feature_parameter in the role of profile_length. Each Feature_parameter acts as profile_length for zero or more Rectangular_closed_profile objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Each Rectangular_closed_profile refers to exactly one Feature_parameter in the role of profile_width. Each Feature_parameter acts as profile_width for zero or more Rectangular_closed_profile objects.

4.3.1360 Rectangular_offset_pattern to Feature_parameter

Each Rectangular_offset_pattern (see 4.2.423) refers to exactly one Feature_parameter (see 4.2.201) in the role of offset_distance. Each Feature_parameter acts as offset_distance for zero or more Rectangular_offset_pattern objects.

4.3.1361 Rectangular_open_pocket to Open_profile_usage

Each Rectangular_open_pocket (see 4.2.425) refers to exactly one Open_profile_usage (see 4.2.329) in the role of boundary. Each Open_profile_usage acts as boundary for zero or more Rectangular_open_pocket objects.

4.3.1362 Rectangular_pattern to Feature_parameter

Each Rectangular_pattern (see 4.2.426) refers to exactly one Feature_parameter (see 4.2.201) in the role of column_spacing. Each Feature_parameter acts as column_spacing for zero or more Rectangular_pattern objects.

Each Rectangular_pattern refers to exactly one Feature_parameter in the role of row_spacing. Each Feature_parameter acts as row_spacing for zero or more Rectangular_pattern objects.

4.3.1363 Rectangular_pattern to Rectangular_offset_pattern

Each Rectangular_pattern (see 4.2.426) refers to zero or more Rectangular_offset_pattern (see 4.2.423) objects in the role of relocated_feature. Each Rectangular_offset_pattern has base_feature defined by one or more Rectangular_pattern objects.

4.3.1364 Rectangular_pattern to Rectangular_omit_pattern

Each Rectangular_pattern (see 4.2.426) refers to zero or more Rectangular_omit_pattern (see 4.2.424) objects in the role of missing_feature. Each Rectangular_omit_pattern has base_feature defined by one or more Rectangular_pattern objects.

4.3.1365 Rectangular_size to Value_with_unit

Each Rectangular_size (see 4.2.427) refers to zero or one Value_with_unit (see 4.2.549) in the role of density. Each Value_with_unit acts as density for zero or more Rectangular_size objects.

Each Rectangular_size refers to exactly one Value_with_unit in the role of height. Each Value_with_unit acts as height for zero or more Rectangular_size objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Each Rectangular_size refers to exactly one Value_with_unit in the role of width. Each Value_with_unit acts as width for zero or more Rectangular_size objects.

4.3.1366 Replaced_definition_relationship to Multi_language_string

Each Replaced_definition_relationship (see 4.2.430) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Replaced_definition_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1367 Replaced_usage_relationship to Item_definition_instance_relationship

Each Replaced_usage_relationship (see 4.2.431) refers to zero or one Item_definition_instance_relationship (see 4.2.268) in the role of usage_context. Each Item_definition_instance_relationship acts as usage_context for zero or more Replaced_usage_relationship objects.

NOTE - This assertion is established through instance_usage_context_select.

4.3.1368 Replaced_usage_relationship to Multi_language_string

Each Replaced_usage_relationship (see 4.2.431) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Replaced_usage_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1369 Replaced_usage_relationship to Process_operation_input_or_output

Each Replaced_usage_relationship (see 4.2.431) refers to zero or one Process_operation_input_or_output (see 4.2.383) in the role of usage_context. Each Process_operation_input_or_output acts as usage_context for zero or more Replaced_usage_relationship objects.

NOTE - This assertion is established through instance_usage_context_select.

4.3.1370 Replaced_usage_relationship to Product_structure_relationship

Each Replaced_usage_relationship (see 4.2.431) refers to zero or one Product_structure_relationship (see 4.2.400) in the role of usage_context. Each Product_structure_relationship acts as usage_context for zero or more Replaced_usage_relationship objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through instance_usage_context_select.

4.3.1371 Replicate_base_assignment to Feature_definition

Each Replicate_base_assignment (see 4.2.432) refers to exactly one Feature_definition (see 4.2.199) in the role of base_feature. Each Feature_definition acts as base_feature for zero or more Replicate_base_assignment objects.

4.3.1372 Replicate_base_assignment to Transformation

Each Replicate_base_assignment (see 4.2.432) refers to zero or one Transformation (see 4.2.533) in the role of replicate_placement. Each Transformation acts as replicate_placement for zero or more Replicate_base_assignment objects.

4.3.1373 Replicate_feature to Axis_placement

Each Replicate_feature (see 4.2.433) refers to exactly one Axis_placement (see 4.2.33) in the role of location_and_orientation. Each Axis_placement acts as location_and_orientation for zero or more Replicate_feature objects.

4.3.1374 Replicate_feature to Replicate_base_assignment

Each Replicate_feature (see 4.2.433) refers to exactly one Replicate_base_assignment (see 4.2.432) in the role of replicate_base. Each Replicate_base_assignment acts as replicate_base for zero or more Replicate_feature objects.

4.3.1375 Retention_period to Activity

Each Retention_period (see 4.2.434) is_applied_to zero or more Activity (see 4.2.2) objects. Each Activity is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1376 Retention_period to Activity_element

Each Retention_period (see 4.2.434) is_applied_to zero or more Activity_element (see 4.2.3) objects. Each Activity_element is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1377 Retention_period to Activity_method_assignment

Each Retention_period (see 4.2.434) is_applied_to zero or more Activity_method_assignment (see 4.2.5) objects. Each Activity_method_assignment is related to zero or more Retention_period objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through general_organizational_data_select.

4.3.1378 Retention_period to Alternate_item_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Alternate_item_relationship (see 4.2.9) objects. Each Alternate_item_relationship is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1379 Retention_period to Approval_status

Each Retention_period (see 4.2.434) is_applied_to zero or more Approval_status (see 4.2.24) objects. Each Approval_status is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1380 Retention_period to Assembly_substitute_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Assembly_substitute_relationship (see 4.2.28) objects. Each Assembly_substitute_relationship is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1381 Retention_period to Certification

Each Retention_period (see 4.2.434) is_applied_to zero or more Certification (see 4.2.50) objects. Each Certification is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1382 Retention_period to Class_category_association

Each Retention_period (see 4.2.434) is_applied_to zero or more Class_category_association (see 4.2.64) objects. Each Class_category_association is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1383 Retention_period to Class_condition_association

Each Retention_period (see 4.2.434) is_applied_to zero or more Class_condition_association (see 4.2.65) objects. Each Class_condition_association is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1384 Retention_period to Class_inclusion_association

Each Retention_period (see 4.2.434) is_applied_to zero or more Class_inclusion_association (see 4.2.66) objects. Each Class_inclusion_association is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1385 Retention_period to Class_specification_association

Each Retention_period (see 4.2.434) is_applied_to zero or more Class_specification_association (see 4.2.67) objects. Each Class_specification_association is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1386 Retention_period to Class_structure_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Class_structure_relationship (see 4.2.68) objects. Each Class_structure_relationship is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1387 Retention_period to Classification_association

Each Retention_period (see 4.2.434) is_applied_to zero or more Classification_association (see 4.2.69) objects. Each Classification_association is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1388 Retention_period to Classification_system

Each Retention_period (see 4.2.434) is_applied_to zero or more Classification_system (see 4.2.71) objects. Each Classification_system is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1389 Retention_period to Complex_product

Each Retention_period (see 4.2.434) is_applied_to zero or more Complex_product (see 4.2.80) objects. Each Complex_product is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1390 Retention_period to Complex_product_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Complex_product_relationship (see 4.2.81) objects. Each Complex_product_relationship is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1391 Retention_period to Configuration

Each Retention_period (see 4.2.434) is_applied_to zero or more Configuration (see 4.2.94) objects. Each Configuration is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1392 Retention_period to Contract

Each Retention_period (see 4.2.434) is_applied_to zero or more Contract (see 4.2.104) objects. Each Contract is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1393 Retention_period to Date_time

Each Retention_period (see 4.2.434) refers to zero or one Date_time (see 4.2.119) in the role of earliest_end_definition. Each Date_time acts as earliest_end_definition for zero or more Retention_period objects.

NOTE 1 - This assertion is established through period_or_date_select.

Each Retention_period refers to zero or one Date_time in the role of latest_end_definition. Each Date_time acts as latest_end_definition for zero or more Retention_period objects.

NOTE 2 - This assertion is established through period_or_date_select.

Each Retention_period refers to zero or one Date_time in the role of start_definition. Each Date_time acts as start_definition for zero or more Retention_period objects.

NOTE 3 - This assertion is established through event_or_date_select.

4.3.1394 Retention_period to Design_constraint

Each Retention_period (see 4.2.434) is_applied_to zero or more Design_constraint (see 4.2.138) objects. Each Design_constraint is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1395 Retention_period to Design_discipline_item_definition

Each Retention_period (see 4.2.434) is_applied_to zero or more Design_discipline_item_definition (see 4.2.142) objects. Each Design_discipline_item_definition is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1396 Retention_period to Document

Each Retention_period (see 4.2.434) is_applied_to zero or more Document (see 4.2.155) objects. Each Document is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1397 Retention_period to Document_file

Each Retention_period (see 4.2.434) is_applied_to zero or more Document_file (see 4.2.159) objects. Each Document_file is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1398 Retention_period to Document_representation

Each Retention_period (see 4.2.434) is_applied_to zero or more Document_representation (see 4.2.163) objects. Each Document_representation is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1399 Retention_period to Document_version

Each Retention_period (see 4.2.434) is_applied_to zero or more Document_version (see 4.2.167) objects. Each Document_version is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1400 Retention_period to Drawing

Each Retention_period (see 4.2.434) is_applied_to zero or more Drawing (see 4.2.170) objects. Each Drawing is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1401 Retention_period to Drawing_sheet

Each Retention_period (see 4.2.434) is_applied_to zero or more Drawing_sheet (see 4.2.173) objects. Each Drawing_sheet is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1402 Retention_period to Duration

Each Retention_period (see 4.2.434) refers to zero or one Duration (see 4.2.174) in the role of earliest_end_definition. Each Duration acts as earliest_end_definition for zero or more Retention_period objects.

NOTE 1 - This assertion is established through period_or_date_select.

Each Retention_period refers to zero or one Duration in the role of latest_end_definition. Each Duration acts as latest_end_definition for zero or more Retention_period objects.

NOTE 2 - This assertion is established through period_or_date_select.

4.3.1403 Retention_period to Event_reference

Each Retention_period (see 4.2.434) refers to zero or one Event_reference (see 4.2.184) in the role of earliest_end_definition. Each Event_reference acts as earliest_end_definition for zero or more Retention_period objects.

NOTE 1 - This assertion is established through period_or_date_select.

Each Retention_period refers to zero or one Event_reference in the role of latest_end_definition. Each Event_reference acts as latest_end_definition for zero or more Retention_period objects.

NOTE 2 - This assertion is established through period_or_date_select.

Each Retention_period refers to zero or one Event_reference in the role of start_definition. Each Event_reference acts as start_definition for zero or more Retention_period objects.

NOTE 3 - This assertion is established through event_or_date_select.

4.3.1404 Retention_period to General_classification

Each Retention_period (see 4.2.434) is_applied_to zero or more General_classification (see 4.2.216) objects. Each General_classification is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1405 Retention_period to Geometric_model

Each Retention_period (see 4.2.434) is_applied_to zero or more Geometric_model (see 4.2.238) objects. Each Geometric_model is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1406 Retention_period to Item

Each Retention_period (see 4.2.434) is_applied_to zero or more Item (see 4.2.267) objects. Each Item is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1407 Retention_period to Item_definition_instance_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Item_definition_instance_relationship (see 4.2.268) objects. Each Item_definition_instance_relationship is related to zero or more Retention_-period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1408 Retention_period to Item_definition_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Item_definition_relationship (see 4.2.269) objects. Each Item_definition_relationship is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1409 Retention_period to Item_instance

Each Retention_period (see 4.2.434) is_applied_to zero or more Item_instance (see 4.2.271) objects. Each Item_instance is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1410 Retention_period to Item_instance_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Item_instance_relationship (see 4.2.272) objects. Each Item_instance_relationship is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1411 Retention_period to Item_version

Each Retention_period (see 4.2.434) is_applied_to zero or more Item_version (see 4.2.275) objects. Each Item_version is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1412 Retention_period to Item_version_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Item_version_relationship (see 4.2.276) objects. Each Item_version_relationship is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1413 Retention_period to Kinematic_simulation_information

Each Retention_period (see 4.2.434) is_applied_to zero or more Kinematic_simulation_information (see 4.2.288) objects. Each Kinematic_simulation_information is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1414 Retention_period to Manufacturing_configuration

Each Retention_period (see 4.2.434) is_applied_to zero or more Manufacturing_configuration (see 4.2.305) objects. Each Manufacturing_configuration is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1415 Retention_period to Material

Each Retention_period (see 4.2.434) is_applied_to zero or more Material (see 4.2.309) objects. Each Material is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1416 Retention_period to Multi_language_string

Each Retention_period (see 4.2.434) refers to zero or one Multi_language_string (see 4.2.320) in the role of retention_purpose. Each Multi_language_string acts as retention_purpose for zero or more Retention_period objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1417 Retention_period to Organization_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Organization_relationship (see 4.2.333) objects. Each Organization_relationship is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1418 Retention_period to Person_in_organization

Each Retention_period (see 4.2.434) is_applied_to zero or more Person_in_organization (see 4.2.347) objects. Each Person_in_organization is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1419 Retention_period to Person_in_organization_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Person_in_organization_relationship (see 4.2.348) objects. Each Person_in_organization_relationship is related to zero or more Retention_-period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1420 Retention_period to Physical_assembly_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Physical_assembly_relationship (see 4.2.350) objects. Each Physical_assembly_relationship is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1421 Retention_period to Physical_instance

Each Retention_period (see 4.2.434) is_applied_to zero or more Physical_instance (see 4.2.352) objects. Each Physical_instance is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1422 Retention_period to Physical_instance_test_result

Each Retention_period (see 4.2.434) is_applied_to zero or more Physical_instance_test_result (see 4.2.353) objects. Each Physical_instance_test_result is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1423 Retention_period to Process_operation_definition

Each Retention_period (see 4.2.434) is_applied_to zero or more Process_operation_definition (see 4.2.381) objects. Each Process_operation_definition is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1424 Retention_period to Process_operation_occurrence

Each Retention_period (see 4.2.434) is_applied_to zero or more Process_operation_occurrence (see 4.2.384) objects. Each Process_operation_occurrence is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1425 Retention_period to Process_operation_resource_assignment

Each Retention_period (see 4.2.434) is_applied_to zero or more Process_operation_resource_assignment (see 4.2.386) objects. Each Process_operation_resource_assignment is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1426 Retention_period to Process_plan

Each Retention_period (see 4.2.434) is_applied_to zero or more Process_plan (see 4.2.387) objects. Each Process_plan is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1427 Retention_period to Product_class

Each Retention_period (see 4.2.434) is_applied_to zero or more Product_class (see 4.2.392) objects. Each Product_class is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1428 Retention_period to Product_identification

Each Retention_period (see 4.2.434) is_applied_to zero or more Product_identification (see 4.2.398) objects. Each Product_identification is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1429 Retention_period to Product_structure_relationship

Each Retention_period (see 4.2.434) is_applied_to zero or more Product_structure_relationship (see 4.2.400) objects. Each Product_structure_relationship is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select.

4.3.1430 Retention_period to Project

Each Retention_period (see 4.2.434) is_applied_to zero or more Project (see 4.2.404) objects. Each Project is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1431 Retention_period to Property

Each Retention_period (see 4.2.434) is_applied_to zero or more Property (see 4.2.409) objects. Each Property is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1432 Retention_period to Property_value_association

Each Retention_period (see 4.2.434) is_applied_to zero or more Property_value_association (see 4.2.413) objects. Each Property_value_association is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1433 Retention_period to Security_classification

Each Retention_period (see 4.2.434) is_applied_to zero or more Security_classification (see 4.2.443) objects. Each Security_classification is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1434 Retention_period to Security_level

Each Retention_period (see 4.2.434) is_applied_to zero or more Security_level (see 4.2.444) objects. Each Security_level is related to zero or more Retention_period objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1435 Retention_period to Specification

Each Retention_period (see 4.2.434) is_applied_to zero or more Specification (see 4.2.467) objects. Each Specification is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1436 Retention_period to Specification_category

Each Retention_period (see 4.2.434) is_applied_to zero or more Specification_category (see 4.2.468) objects. Each Specification_category is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1437 Retention_period to Specification_expression

Each Retention_period (see 4.2.434) is_applied_to zero or more Specification_expression (see 4.2.470) objects. Each Specification_expression is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1438 Retention_period to Specification_inclusion

Each Retention_period (see 4.2.434) is_applied_to zero or more Specification_inclusion (see 4.2.471) objects. Each Specification_inclusion is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1439 Retention_period to Styled_model

Each Retention_period (see 4.2.434) is_applied_to zero or more Styled_model (see 4.2.484) objects. Each Styled_model is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1440 Retention_period to View_area

Each Retention_period (see 4.2.434) is_applied_to zero or more View_area (see 4.2.555) objects. Each View_area is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1441 Retention_period to Work_order

Each Retention_period (see 4.2.434) is_applied_to zero or more Work_order (see 4.2.564) objects. Each Work_order is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1442 Retention_period to Work_request

Each Retention_period (see 4.2.434) is_applied_to zero or more Work_request (see 4.2.565) objects. Each Work_request is related to zero or more Retention_period objects.

NOTE - This assertion is established through general_organizational_data_select and general_organizational_data_sub_select.

4.3.1443 Rib_feature to Directed_taper

Each Rib_feature (see 4.2.435) refers to zero or one Directed_taper (see 4.2.154) in the role of draft_taper. Each Directed_taper acts as draft_taper for zero or more Rib_feature objects.

4.3.1444 Rib_feature to Feature_parameter

Each Rib_feature (see 4.2.435) refers to zero or one Feature_parameter (see 4.2.201) in the role of fillet_radius. Each Feature_parameter acts as fillet_radius for zero or more Rib_feature objects.

Each Rib_feature refers to zero or one Feature_parameter in the role of shoulder_radius. Each Feature_parameter acts as shoulder_radius for zero or more Rib_feature objects.

4.3.1445 Rib_feature to Open_profile_usage

Each Rib_feature (see 4.2.435) refers to exactly one Open_profile_usage (see 4.2.329) in the role of rib_profile. Each Open_profile_usage acts as rib_profile for zero or more Rib_feature objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1446 Rib_feature to Path

Each Rib_feature (see 4.2.435) refers to exactly one Path (see 4.2.342) in the role of sweep_path. Each Path acts as sweep_path for zero or more Rib_feature objects.

4.3.1447 Round_hole to Angle_taper

Each Round_hole (see 4.2.439) refers to zero or one Angle_taper (see 4.2.12) in the role of taper. Each Angle_taper acts as taper for zero or more Round_hole objects.

NOTE - This assertion is established through taper_select.

4.3.1448 Round_hole to Closed_profile_usage

Each Round_hole (see 4.2.439) refers to exactly one Closed_profile_usage (see 4.2.73) in the role of diameter. Each Closed_profile_usage acts as diameter for zero or more Round_hole objects.

4.3.1449 Round_hole to Diameter_taper

Each Round_hole (see 4.2.439) refers to zero or one Diameter_taper (see 4.2.146) in the role of taper. Each Diameter_taper acts as taper for zero or more Round_hole objects.

NOTE - This assertion is established through taper_select.

4.3.1450 Round_hole to Directed_taper

Each Round_hole (see 4.2.439) refers to zero or one Directed_taper (see 4.2.154) in the role of taper. Each Directed_taper acts as taper for zero or more Round_hole objects.

NOTE - This assertion is established through taper_select.

4.3.1451 Round_hole to Hole_bottom_condition

Each Round_hole (see 4.2.439) refers to zero or one Hole_bottom_condition (see 4.2.257) in the role of bottom_condition. Each Hole_bottom_condition acts as bottom_condition for zero or more Round_hole objects.

NOTE - This assertion is established through hole_bottom_condition_select.

4.3.1452 Round_hole to Linear_path

Each Round_hole (see 4.2.439) refers to exactly one Linear_path (see 4.2.300) in the role of hole_depth. Each Linear_path acts as hole_depth for zero or more Round_hole objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1453 Round_hole to Through_hole_bottom_condition

Each Round_hole (see 4.2.439) refers to zero or one Through_hole_bottom_condition (see 4.2.519) in the role of bottom_condition. Each Through_hole_bottom_condition acts as bottom_condition for zero or more Round_hole objects.

NOTE - This assertion is established through hole_bottom_condition_select.

4.3.1454 Rounded_u_profile to Feature_parameter

Each Rounded_u_profile (see 4.2.440) refers to exactly one Feature_parameter (see 4.2.201) in the role of width. Each Feature_parameter acts as width for zero or more Rounded_u_profile objects.

4.3.1455 Same_time_machining_relationship to Geometric_model_relationship_with_transformation

Each Same_time_machining_relationship (see 4.2.442) refers to zero or one Geometric_model_relationship_with_transformation (see 4.2.240) in the role of placement. Each Geometric_model_relationship_with_transformation acts as placement for zero or more Same_time_machining_relationship objects.

NOTE - This assertion is established through transformation_select.

4.3.1456 Same_time_machining_relationship to Multi_language_string

Each Same_time_machining_relationship (see 4.2.442) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Same_time_machining_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1457 Same_time_machining_relationship to Template_instance

Each Same_time_machining_relationship (see 4.2.442) refers to zero or one Template_instance (see 4.2.512) in the role of placement. Each Template_instance acts as placement for zero or more Same_time_machining_relationship objects.

NOTE - This assertion is established through transformation_select.

4.3.1458 Security_classification to Activity

Each Security_classification (see 4.2.443) is_applied_to zero or more Activity (see 4.2.2) objects. Each Activity is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1459 Security_classification to Activity_element

Each Security_classification (see 4.2.443) is_applied_to zero or more Activity_element (see 4.2.3) objects. Each Activity_element is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1460 Security_classification to Assembly_substitute_relationship

Each Security_classification (see 4.2.443) is_applied_to zero or more Assembly_substitute_relationship (see 4.2.28) objects. Each Assembly_substitute_relationship is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1461 Security_classification to Class_structure_relationship

Each Security_classification (see 4.2.443) is_applied_to zero or more Class_structure_relationship (see 4.2.68) objects. Each Class_structure_relationship is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1462 Security_classification to Classification_system

Each Security_classification (see 4.2.443) is_applied_to zero or more Classification_system (see 4.2.71) objects. Each Classification_system is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1463 Security_classification to Complex_product

Each Security_classification (see 4.2.443) is_applied_to zero or more Complex_product (see 4.2.80) objects. Each Complex_product is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1464 Security_classification to Configuration

Each Security_classification (see 4.2.443) is_applied_to zero or more Configuration (see 4.2.94) objects. Each Configuration is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1465 Security_classification to Design_constraint

Each Security_classification (see 4.2.443) is_applied_to zero or more Design_constraint (see 4.2.138) objects. Each Design_constraint is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1466 Security_classification to Document

Each Security_classification (see 4.2.443) is_applied_to zero or more Document (see 4.2.155) objects. Each Document is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1467 Security_classification to Document_file

Each Security_classification (see 4.2.443) is_applied_to zero or more Document_file (see 4.2.159) objects. Each Document_file is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1468 Security_classification to Document_representation

Each Security_classification (see 4.2.443) is_applied_to zero or more Document_representation (see 4.2.163) objects. Each Document_representation is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1469 Security_classification to Document_version

Each Security_classification (see 4.2.443) is_applied_to zero or more Document_version (see 4.2.167) objects. Each Document_version is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1470 Security_classification to Drawing

Each Security_classification (see 4.2.443) is_applied_to zero or more Drawing (see 4.2.170) objects. Each Drawing is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1471 Security_classification to Drawing_sheet

Each Security_classification (see 4.2.443) is_applied_to zero or more Drawing_sheet (see 4.2.173) objects. Each Drawing_sheet is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1472 Security_classification to Geometric_model

Each Security_classification (see 4.2.443) is_applied_to zero or more Geometric_model (see 4.2.238) objects. Each Geometric_model is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1473 Security_classification to Item

Each Security_classification (see 4.2.443) is_applied_to zero or more Item (see 4.2.267) objects. Each Item is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1474 Security_classification to Item_version

Each Security_classification (see 4.2.443) is_applied_to zero or more Item_version (see 4.2.275) objects. Each Item_version is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1475 Security_classification to Kinematic_simulation_information

Each Security_classification (see 4.2.443) is_applied_to zero or more Kinematic_simulation_information (see 4.2.288) objects. Each Kinematic_simulation_information is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1476 Security_classification to Manufacturing_configuration

Each Security_classification (see 4.2.443) is_applied_to zero or more Manufacturing_configuration (see 4.2.305) objects. Each Manufacturing_configuration is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1477 Security_classification to Material

Each Security_classification (see 4.2.443) is_applied_to zero or more Material (see 4.2.309) objects. Each Material is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1478 Security_classification to Multi_language_string

Each Security_classification (see 4.2.443) refers to zero or one Multi_language_string (see 4.2.320) in the role of name. Each Multi_language_string acts as name for zero or more Security_classification objects.

NOTE 1 - This assertion is established through string_select.

Each Security_classification refers to zero or one Multi_language_string in the role of purpose. Each Multi_language_string acts as purpose for zero or more Security_classification objects.

NOTE 2 - This assertion is established through string_select.

4.3.1479 Security_classification to Physical_assembly_relationship

Each Security_classification (see 4.2.443) is_applied_to zero or more Physical_assembly_relationship (see 4.2.350) objects. Each Physical_assembly_relationship is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1480 Security_classification to Physical_instance

Each Security_classification (see 4.2.443) is_applied_to zero or more Physical_instance (see 4.2.352) objects. Each Physical_instance is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1481 Security_classification to Physical_instance_test_result

Each Security_classification (see 4.2.443) is_applied_to zero or more Physical_instance_test_result (see 4.2.353) objects. Each Physical_instance_test_result is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1482 Security_classification to Process_plan

Each Security_classification (see 4.2.443) is_applied_to zero or more Process_plan (see 4.2.387) objects. Each Process_plan is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1483 Security_classification to Product_class

Each Security_classification (see 4.2.443) is_applied_to zero or more Product_class (see 4.2.392) objects. Each Product_class is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1484 Security_classification to Product_structure_relationship

Each Security_classification (see 4.2.443) is_applied_to zero or more Product_structure_relationship (see 4.2.400) objects. Each Product_structure_relationship is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1485 Security_classification to Project

Each Security_classification (see 4.2.443) is_applied_to zero or more Project (see 4.2.404) objects. Each Project is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1486 Security_classification to Property

Each Security_classification (see 4.2.443) is_applied_to zero or more Property (see 4.2.409) objects. Each Property is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1487 Security_classification to Property_value_association

Each Security_classification (see 4.2.443) is_applied_to zero or more Property_value_association (see 4.2.413) objects. Each Property_value_association is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1488 Security_classification to Security_level

Each Security_classification (see 4.2.443) refers to exactly one Security_level (see 4.2.444) in the role of level. Each Security_level acts as level for zero or more Security_classification objects.

4.3.1489 Security_classification to Specification

Each Security_classification (see 4.2.443) is_applied_to zero or more Specification (see 4.2.467) objects. Each Specification is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1490 Security_classification to Specification_category

Each Security_classification (see 4.2.443) is_applied_to zero or more Specification_category (see 4.2.468) objects. Each Specification_category is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1491 Security_classification to Styled_model

Each Security_classification (see 4.2.443) is_applied_to zero or more Styled_model (see 4.2.484) objects. Each Styled_model is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1492 Security_classification to View_area

Each Security_classification (see 4.2.443) is_applied_to zero or more View_area (see 4.2.555) objects. Each View_area is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1493 Security_classification to Work_order

Each Security_classification (see 4.2.443) is_applied_to zero or more Work_order (see 4.2.564) objects. Each Work_order is related to zero or more Security_classification objects.

NOTE - This assertion is established through security_element_select.

4.3.1494 Security_classification to Work_request

Each Security_classification (see 4.2.443) is_applied_to zero or more Work_request (see 4.2.565) objects. Each Work_request is related to zero or more Security_classification objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through security_element_select.

4.3.1495 Security_level to Classification_system

Each Security_level (see 4.2.444) refers to zero or one Classification_system (see 4.2.71) in the role of used_classification_system. Each Classification_system acts as used_classification_system for zero or more Security_level objects.

4.3.1496 Selected_instance to Value_with_unit

Each Selected_instance (see 4.2.445) refers to exactly one Value_with_unit (see 4.2.549) in the role of selected_quantity. Each Value_with_unit acts as selected_quantity for zero or more Selected_instance objects.

4.3.1497 Shape_dependent_property to Cartesian_coordinate_space

Each Shape_dependent_property (see 4.2.447) is_defined_in zero or one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more Shape_dependent_property objects.

4.3.1498 Shape_dependent_property to Item_shape

Each Shape_dependent_property (see 4.2.447) refers to zero or one Item_shape (see 4.2.274) in the role of described_element. Each Item_shape acts as described_element for zero or more Shape_dependent_-property objects.

NOTE - This assertion is established through shaped_element_select.

4.3.1499 Shape_dependent_property to Multi_language_string

Each Shape_dependent_property (see 4.2.447) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Shape_-dependent_property objects.

NOTE - This assertion is established through string_select.

4.3.1500 Shape_dependent_property to Shape_element

Each Shape_dependent_property (see 4.2.447) refers to zero or one Shape_element (see 4.2.449) in the role of described_element. Each Shape_element acts as described_element for zero or more Shape_-dependent_property objects.

NOTE - This assertion is established through shaped_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1501 Shape_description_association to External_geometric_model

Each Shape_description_association (see 4.2.448) refers to zero or one External_geometric_model (see 4.2.186) in the role of defining_geometry. Each External_geometric_model acts as defining_geometry for zero or more Shape_description_association objects.

NOTE - This assertion is established through shape_definition_select.

4.3.1502 Shape_description_association to Feature_definition

Each Shape_description_association (see 4.2.448) is_defining_shape_for zero or one Feature_definition (see 4.2.199). Each Feature_definition is related to zero or more Shape_description_association objects.

NOTE - This assertion is established through shape_information_select and feature_definition_select.

4.3.1503 Shape_description_association to General_feature

Each Shape_description_association (see 4.2.448) is_defining_shape_for zero or one General_feature (see 4.2.221). Each General_feature is related to zero or more Shape_description_association objects.

NOTE - This assertion is established through shape_information_select and feature_definition_select.

4.3.1504 Shape_description_association to Geometric_model

Each Shape_description_association (see 4.2.448) refers to zero or one Geometric_model (see 4.2.238) in the role of defining_geometry. Each Geometric_model acts as defining_geometry for zero or more Shape_description_association objects.

NOTE - This assertion is established through shape_definition_select.

4.3.1505 Shape_description_association to Item_shape

Each Shape_description_association (see 4.2.448) is_defining_shape_for zero or one Item_shape (see 4.2.274). Each Item_shape is related to zero or more Shape_description_association objects.

NOTE - This assertion is established through shape_information_select and shaped_element_select.

4.3.1506 Shape_description_association to Shape_element

Each Shape_description_association (see 4.2.448) is_defining_shape_for zero or one Shape_element (see 4.2.449). Each Shape_element is related to zero or more Shape_description_association objects.

NOTE - This assertion is established through shape_information_select and shaped_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1507 Shape_description_association to Shape_element_relationship

Each Shape_description_association (see 4.2.448) is_defining_shape_for zero or one Shape_element_relationship (see 4.2.450). Each Shape_element_relationship is related to zero or more Shape_description_association objects.

NOTE - This assertion is established through shape_information_select.

4.3.1508 Shape_description_association to Thread_feature

Each Shape_description_association (see 4.2.448) is_defining_shape_for zero or one Thread_feature (see 4.2.517). Each Thread_feature is related to zero or more Shape_description_association objects.

NOTE - This assertion is established through shape_information_select and feature_definition_select.

4.3.1509 Shape_description_association to Transition_feature

Each Shape_description_association (see 4.2.448) is_defining_shape_for zero or one Transition_feature (see 4.2.537). Each Transition_feature is related to zero or more Shape_description_association objects.

NOTE - This assertion is established through shape_information_select and feature_definition_select.

4.3.1510 Shape_element to Item_shape

Each Shape_element (see 4.2.449) refers to exactly one Item_shape (see 4.2.274) in the role of composition. Each Item_shape acts as composition for zero or more Shape_element objects.

4.3.1511 Shape_element to Multi_language_string

Each Shape_element (see 4.2.449) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Shape_element objects.

NOTE - This assertion is established through string_select.

4.3.1512 Shape_element_relationship to Multi_language_string

Each Shape_element_relationship (see 4.2.450) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Shape_element_relationship objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1513 Shape_element_relationship to Shape_element

Each Shape_element_relationship (see 4.2.450) is related to exactly one Shape_element (see 4.2.449). Each Shape_element is referenced by zero or more Shape_element_relationship objects as related.

NOTE 1 - The related Shape_element is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Shape_element_relationship is relating to exactly one Shape_element. Each Shape_element is referenced by zero or more Shape_element_relationship objects as relating.

NOTE 2 - The relating Shape_element is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1514 Shell to Face

Each Shell (see 4.2.451) refers to one or more Face (see 4.2.191) objects in the role of included_face. Each Face acts as included_face for zero or more Shell objects.

4.3.1515 Simple_pair_range to Kinematic_pair

Each Simple_pair_range (see 4.2.453) is_applied_to exactly one Kinematic_pair (see 4.2.287). Each Kinematic_pair is related to zero or more Simple_pair_range objects.

4.3.1516 Single_datum to Datum_target_set

Each Single_datum (see 4.2.454) is_defined_by zero or one Datum_target_set (see 4.2.127). Each Datum_target_set is related to zero or more Single_datum objects.

NOTE - This assertion is established through datum_representation_select.

4.3.1517 Single_datum to Derived_geometry

Each Single_datum (see 4.2.454) is_defined_by zero or one Derived_geometry (see 4.2.136). Each Derived_geometry is related to zero or more Single_datum objects.

NOTE - This assertion is established through datum_representation_select.

4.3.1518 Single_datum to Shape_element

Each Single_datum (see 4.2.454) is_defined_by zero or one Shape_element (see 4.2.449). Each Shape_element is related to zero or more Single_datum objects.

NOTE - This assertion is established through datum_representation_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1519 Single_datum to Tolerance_condition

Each Single_datum (see 4.2.454) refers to zero or one Tolerance_condition (see 4.2.522) in the role of modification. Each Tolerance_condition acts as modification for zero or more Single_datum objects.

4.3.1520 Size_dimension to Annotation_curve

Each Size_dimension (see 4.2.456) is_applied_to zero or one Annotation_curve (see 4.2.16). Each Annotation_curve is related to zero or more Size_dimension objects.

NOTE - This assertion is established through element_with_dimension_select.

4.3.1521 Size_dimension to Shape_element

Each Size_dimension (see 4.2.456) is_applied_to zero or one Shape_element (see 4.2.449). Each Shape_element is related to zero or more Size_dimension objects.

NOTE - This assertion is established through element_with_dimension_select.

4.3.1522 Slot_feature to Open_profile_usage

Each Slot_feature (see 4.2.458) refers to exactly one Open_profile_usage (see 4.2.329) in the role of slot_profile. Each Open_profile_usage acts as slot_profile for zero or more Slot_feature objects.

4.3.1523 Slot_feature to Path

Each Slot_feature (see 4.2.458) refers to exactly one Path (see 4.2.342) in the role of sweep_path. Each Path acts as sweep_path for zero or more Slot_feature objects.

4.3.1524 Slot_feature to Slot_end_type

Each Slot_feature (see 4.2.458) refers to exactly two Slot_end_type (see 4.2.457) objects in the role of end_condition. Each Slot_end_type acts as end_condition for zero or more Slot_feature objects.

4.3.1525 Solid_replica to B_rep_model

Each Solid_replica (see 4.2.462) refers to zero or one B_rep_model (see 4.2.35) in the role of replicated_solid. Each B_rep_model acts as replicated_solid for zero or more Solid_replica objects.

NOTE - This assertion is established through csg_select and non_primitive_solid_select.

4.3.1526 Solid_replica to Boolean_result

Each Solid_replica (see 4.2.462) refers to zero or one Boolean_result (see 4.2.41) in the role of replicated_solid. Each Boolean_result acts as replicated_solid for zero or more Solid_replica objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - This assertion is established through csg_select.

4.3.1527 Solid_replica to Csg_primitive

Each Solid_replica (see 4.2.462) refers to zero or one Csg_primitive (see 4.2.107) in the role of replicated_solid. Each Csg_primitive acts as replicated_solid for zero or more Solid_replica objects.

NOTE - This assertion is established through csg_select.

4.3.1528 Solid_replica to Faceted_b_rep_model

Each Solid_replica (see 4.2.462) refers to zero or one Faceted_b_rep_model (see 4.2.196) in the role of replicated_solid. Each Faceted_b_rep_model acts as replicated_solid for zero or more Solid_replica objects.

NOTE - This assertion is established through csg_select and non_primitive_solid_select.

4.3.1529 Solid_replica to Solid_replica

Each Solid_replica (see 4.2.462) refers to zero or one Solid_replica in the role of replicated_solid. Each Solid_replica acts as replicated_solid for zero or more Solid_replica objects.

NOTE - This assertion is established through csg_select and non_primitive_solid_select.

4.3.1530 Solid_replica to Swept_face_solid

Each Solid_replica (see 4.2.462) refers to zero or one Swept_face_solid (see 4.2.502) in the role of replicated_solid. Each Swept_face_solid acts as replicated_solid for zero or more Solid_replica objects.

NOTE - This assertion is established through csg_select and non_primitive_solid_select.

4.3.1531 Specific_document_classification to Document

Each Specific_document_classification (see 4.2.463) refers to one or more Document (see 4.2.155) objects in the role of associated_document. Each Document acts as associated_document for zero or more Specific_document_classification objects.

4.3.1532 Specific_document_classification to Multi_language_string

Each Specific_document_classification (see 4.2.463) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Specific_document_classification objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1533 Specific_document_classification_hierarchy to Specific_document_classification

Each Specific_document_classification_hierarchy (see 4.2.464) refers to exactly one Specific_document_classification (see 4.2.463) in the role of sub_classification. Each Specific_document_classification acts as sub_classification for zero or more Specific_document_classification_hierarchy objects.

Each Specific_document_classification_hierarchy refers to exactly one Specific_document_classification in the role of super_classification. Each Specific_document_classification acts as super_classification for zero or more Specific_document_classification_hierarchy objects.

4.3.1534 Specific_item_classification to Item

Each Specific_item_classification (see 4.2.465) refers to one or more Item (see 4.2.267) objects in the role of associated_item. Each Item has item_classification defined by one or more Specific_item_classification objects.

4.3.1535 Specific_item_classification to Multi_language_string

Each Specific_item_classification (see 4.2.465) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Specific_item_classification objects.

NOTE - This assertion is established through string_select.

4.3.1536 Specific_item_classification_hierarchy to Specific_item_classification

Each Specific_item_classification_hierarchy (see 4.2.466) refers to exactly one Specific_item_classification (see 4.2.465) in the role of sub_classification. Each Specific_item_classification acts as sub_classification for zero or more Specific_item_classification_hierarchy objects.

Each Specific_item_classification_hierarchy refers to exactly one Specific_item_classification in the role of super_classification. Each Specific_item_classification acts as super_classification for zero or more Specific_item_classification_hierarchy objects.

4.3.1537 Specification to Multi_language_string

Each Specification (see 4.2.467) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Specification objects.

NOTE 1 - This assertion is established through string_select.

Each Specification refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Specification objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE 2 - This assertion is established through string_select.

4.3.1538 Specification to Specification_category

Each Specification (see 4.2.467) refers to exactly one Specification_category (see 4.2.468) in the role of category. Each Specification_category acts as category for zero or more Specification objects.

4.3.1539 Specification_category to Multi_language_string

Each Specification_category (see 4.2.468) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Specification_-category objects.

NOTE - This assertion is established through string_select.

4.3.1540 Specification_category_hierarchy to Specification_category

Each Specification_category_hierarchy (see 4.2.469) refers to exactly one Specification_category (see 4.2.468) in the role of sub_category. Each Specification_category acts as sub_category for zero or more Specification_category_hierarchy objects.

Each Specification_category_hierarchy refers to exactly one Specification_category in the role of super_-category. Each Specification_category acts as super_category for zero or more Specification_category_-hierarchy objects.

4.3.1541 Specification_expression to Multi_language_string

Each Specification_expression (see 4.2.470) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Specification_-expression objects.

NOTE - This assertion is established through string_select.

4.3.1542 Specification_expression to Specification

Each Specification_expression (see 4.2.470) refers to zero or more Specification (see 4.2.467) objects in the role of operand. Each Specification acts as operand for zero or more Specification_expression objects.

NOTE - This assertion is established through specification_operand_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1543 Specification_expression to Specification_expression

Each Specification_expression (see 4.2.470) refers to zero or more Specification_expression objects in the role of operand. Each Specification_expression acts as operand for zero or more Specification_-expression objects.

NOTE - This assertion is established through specification_operand_select.

4.3.1544 Specification_inclusion to Multi_language_string

Each Specification_inclusion (see 4.2.471) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Specification_-inclusion objects.

NOTE - This assertion is established through string_select.

4.3.1545 Specification_inclusion to Specification

Each Specification_inclusion (see 4.2.471) refers to zero or one Specification (see 4.2.467) in the role of if_condition. Each Specification acts as if_condition for zero or more Specification_inclusion objects.

NOTE 1 - This assertion is established through specification_operand_select.

Each Specification_inclusion refers to zero or one Specification in the role of included_specification. Each Specification acts as included_specification for zero or more Specification_inclusion objects.

NOTE 2 - This assertion is established through specification_operand_select.

4.3.1546 Specification_inclusion to Specification_expression

Each Specification_inclusion (see 4.2.471) refers to zero or one Specification_expression (see 4.2.470) in the role of if_condition. Each Specification_expression acts as if_condition for zero or more Specification_inclusion objects.

NOTE 1 - This assertion is established through specification_operand_select.

Each Specification_inclusion refers to zero or one Specification_expression in the role of included_specification. Each Specification_expression acts as included_specification for zero or more Specification_-inclusion objects.

NOTE 2 - This assertion is established through specification_operand_select.

4.3.1547 Specified_instance to Assembly_definition

Each Specified_instance (see 4.2.472) refers to exactly one Assembly_definition (see 4.2.27) in the role of assembly_context. Each Assembly_definition acts as assembly_context for zero or more Specified_instance objects.

4.3.1548 Specified_instance to Item_instance

Each Specified_instance (see 4.2.472) refers to exactly one Item_instance (see 4.2.271) in the role of related_instance. Each Item_instance acts as related_instance for zero or more Specified_instance objects.

Each Specified_instance refers to exactly one Item_instance in the role of upper_usage. Each Item_instance acts as upper_usage for zero or more Specified_instance objects.

4.3.1549 Spherical_bottom to Feature_parameter

Each Spherical_bottom (see 4.2.474) refers to exactly one Feature_parameter (see 4.2.201) in the role of radius. Each Feature_parameter acts as radius for zero or more Spherical_bottom objects.

4.3.1550 Square_u_profile to Feature_parameter

Each Square_u_profile (see 4.2.476) refers to exactly one Feature_parameter (see 4.2.201) in the role of first_angle. Each Feature_parameter acts as first_angle for zero or more Square_u_profile objects.

Each Square_u_profile refers to zero or one Feature_parameter in the role of first_radius. Each Feature_parameter acts as first_radius for zero or more Square_u_profile objects.

Each Square_u_profile refers to exactly one Feature_parameter in the role of second_angle. Each Feature_parameter acts as second_angle for zero or more Square_u_profile objects.

Each Square_u_profile refers to zero or one Feature_parameter in the role of second_radius. Each Feature_parameter acts as second_radius for zero or more Square_u_profile objects.

Each Square_u_profile refers to exactly one Feature_parameter in the role of width. Each Feature_parameter acts as width for zero or more Square_u_profile objects.

4.3.1551 Straightness_tolerance to Reference_plane

Each Straightness_tolerance (see 4.2.477) refers to zero or one Reference_plane (see 4.2.429) in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Straightness_tolerance objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1552 String_value to Multi_language_string

Each String_value (see 4.2.478) refers to zero or one Multi_language_string (see 4.2.320) in the role of value_specification. Each Multi_language_string acts as value_specification for zero or more String_-value objects.

NOTE - This assertion is established through string_select.

4.3.1553 String_with_language to Language

Each String_with_language (see 4.2.479) refers to exactly one Language (see 4.2.291) in the role of language_specification. Each Language acts as language_specification for zero or more String_with_-language objects.

4.3.1554 Structuring_method_hierarchy to Group

Each Structuring_method_hierarchy (see 4.2.480) is related to exactly one Group (see 4.2.250). Each Group is referenced by zero or more Structuring_method_hierarchy objects as related.

NOTE 1 - The related Group is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Structuring_method_hierarchy is relating to zero or one Group. Each Group is referenced by zero or more Structuring_method_hierarchy objects as relating.

NOTE 2 - The relating Group is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

NOTE 3 - This assertion is established through structuring_method_select.

4.3.1555 Structuring_method_hierarchy to Layer

Each Structuring_method_hierarchy (see 4.2.480) is relating to zero or one Layer (see 4.2.292). Each Layer is referenced by zero or more Structuring_method_hierarchy objects as relating.

NOTE 1 - The relating Layer is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

NOTE 2 - This assertion is established through structuring_method_select.

4.3.1556 Styled_annotation_model to Cartesian_coordinate_space

Each Styled_annotation_model (see 4.2.481) is_defined_in exactly one Cartesian_coordinate_space (see 4.2.44). Each Cartesian_coordinate_space is related to zero or more Styled_annotation_model objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1557 Styled_element to Appearance_assignment

Each Styled_element (see 4.2.482) refers to exactly one Appearance_assignment (see 4.2.20) in the role of appearance. Each Appearance_assignment acts as appearance for zero or more Styled_element objects.

4.3.1558 Styled_geometric_model to Geometric_model

Each Styled_geometric_model (see 4.2.483) refers to exactly one Geometric_model (see 4.2.238) in the role of styled_geometry_context. Each Geometric_model acts as styled_geometry_context for zero or more Styled_geometric_model objects.

4.3.1559 Styled_model to Multi_language_string

Each Styled_model (see 4.2.484) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Styled_model objects.

NOTE - This assertion is established through string_select.

4.3.1560 Styled_model to Styled_element

Each Styled_model (see 4.2.484) refers to one or more Styled_element (see 4.2.482) objects in the role of element. Each Styled_element acts as element for zero or more Styled_model objects.

4.3.1561 Styled_model to Template_instance

Each Styled_model (see 4.2.484) refers to zero or more Template_instance (see 4.2.512) objects in the role of additional_elements. Each Template_instance acts as additional_elements for zero or more Styled_model objects.

4.3.1562 Styled_model_element to Detailed_model_element

Each Styled_model_element (see 4.2.485) refers to exactly one Detailed_model_element (see 4.2.145) in the role of element. Each Detailed_model_element acts as element for zero or more Styled_model_element objects.

4.3.1563 Styled_model_relationship to Multi_language_string

Each Styled_model_relationship (see 4.2.486) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Styled_model_relationship objects.

NOTE - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1564 Styled_model_relationship to Styled_model

Each Styled_model_relationship (see 4.2.486) is related to exactly one Styled_model (see 4.2.484). Each Styled_model is referenced by zero or more Styled_model_relationship objects as related.

NOTE 1 - The related Styled_model is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Styled_model_relationship is relating to exactly one Styled_model. Each Styled_model is referenced by zero or more Styled_model_relationship objects as relating.

NOTE 2 - The relating Styled_model is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1565 Supplier_solution to Organization

Each Supplier_solution (see 4.2.488) refers to exactly one Organization (see 4.2.331) in the role of supplier. Each Organization acts as supplier for zero or more Supplier_solution objects.

4.3.1566 Surface_appearance to Surface_appearance_element

Each Surface_appearance (see 4.2.490) refers to one or more Surface_appearance_element (see 4.2.491) objects in the role of element. Each Surface_appearance_element acts as element for zero or more Surface_appearance objects.

4.3.1567 Surface_appearance_element to Visual_appearance

Each Surface_appearance_element (see 4.2.491) refers to zero or one Visual_appearance (see 4.2.560) in the role of presented_surface_condition. Each Visual_appearance acts as presented_surface_condition for zero or more Surface_appearance_element objects.

4.3.1568 Surface_condition to Process_operation_occurrence

Each Surface_condition (see 4.2.492) is_caused_by zero or one Process_operation_occurrence (see 4.2.384). Each Process_operation_occurrence is related to zero or more Surface_condition objects.

4.3.1569 Surface_condition_association to Item_shape

Each Surface_condition_association (see 4.2.493) refers to zero or one Item_shape (see 4.2.274) in the role of described_element. Each Item_shape acts as described_element for zero or more Surface_condition_association objects.

NOTE - This assertion is established through shaped_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1570 Surface_condition_association to Shape_element

Each Surface_condition_association (see 4.2.493) refers to zero or one Shape_element (see 4.2.449) in the role of described_element. Each Shape_element acts as described_element for zero or more Surface_-condition_association objects.

NOTE - This assertion is established through shaped_element_select.

4.3.1571 Surface_condition_association to Surface_condition

Each Surface_condition_association (see 4.2.493) refers to exactly one Surface_condition (see 4.2.492) in the role of describing_surface_condition. Each Surface_condition acts as describing_surface_condition for zero or more Surface_condition_association objects.

4.3.1572 Surface_model to Shell

Each Surface_model (see 4.2.496) refers to zero or more Shell (see 4.2.451) objects in the role of element. Each Shell acts as element for zero or more Surface_model objects.

4.3.1573 Surface_profile_tolerance to Datum

Each Surface_profile_tolerance (see 4.2.499) refers to zero, one, two, or three Datum (see 4.2.123) objects in the role of reference_datum. Each Datum acts as reference_datum for zero or more Surface_profile_tolerance objects.

4.3.1574 Surface_texture to Measurement_path

Each Surface_texture (see 4.2.500) refers to zero or one Measurement_path (see 4.2.314) in the role of measuring_direction. Each Measurement_path acts as measuring_direction for zero or more Surface_-texture objects.

4.3.1575 Surface_texture_parameter to Default_surface_texture

Each Surface_texture_parameter (see 4.2.501) refers to zero or one Default_surface_texture (see 4.2.133) in the role of described_texture. Each Default_surface_texture acts as described_texture for one or more Surface_texture_parameter objects.

NOTE - This assertion is established through texture_select.

4.3.1576 Surface_texture_parameter to Surface_texture

Each Surface_texture_parameter (see 4.2.501) refers to zero or one Surface_texture (see 4.2.500) in the role of described_texture. Each Surface_texture acts as described_texture for one or more Surface_-texture_parameter objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through texture_select.

4.3.1577 Surface_texture_parameter to Value_with_unit

Each Surface_texture_parameter (see 4.2.501) refers to exactly one Value_with_unit (see 4.2.549) in the role of parameter_value. Each Value_with_unit acts as parameter_value for zero or more Surface_-texture_parameter objects.

4.3.1578 Swept_face_solid to Face

Each Swept_face_solid (see 4.2.502) refers to exactly one Face (see 4.2.191) in the role of swept_face. Each Face acts as swept_face for zero or more Swept_face_solid objects.

4.3.1579 Symmetry_tolerance to Datum

Each Symmetry_tolerance (see 4.2.503) refers to one, two, or three Datum (see 4.2.123) objects in the role of reference_datum. Each Datum acts as reference_datum for zero or more Symmetry_tolerance objects.

4.3.1580 Symmetry_tolerance to Reference_plane

Each Symmetry_tolerance (see 4.2.503) refers to zero or one Reference_plane (see 4.2.429) in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Symmetry_tolerance objects.

4.3.1581 Tactile_appearance to Multi_language_string

Each Tactile_appearance (see 4.2.504) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Tactile_appearance objects.

NOTE 1 - This assertion is established through string_select.

Each Tactile_appearance refers to zero or one Multi_language_string in the role of name. Each Multi_-language_string acts as name for zero or more Tactile_appearance objects.

NOTE 2 - This assertion is established through string_select.

4.3.1582 Tactile_appearance to Value_with_unit

Each Tactile_appearance (see 4.2.504) refers to zero or one Value_with_unit (see 4.2.549) in the role of depth. Each Value_with_unit acts as depth for zero or more Tactile_appearance objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1583 Target_area to Shape_element

Each Target_area (see 4.2.505) is_defined_by exactly one Shape_element (see 4.2.449). Each Shape_-element is related to zero or more Target_area objects.

4.3.1584 Technical_solution to Multi_language_string

Each Technical_solution (see 4.2.510) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Technical_solution objects.

NOTE - This assertion is established through string_select.

4.3.1585 Tee_profile to Feature_parameter

Each Tee_profile (see 4.2.511) refers to exactly one Feature_parameter (see 4.2.201) in the role of cross_-bar_depth. Each Feature_parameter acts as cross_bar_depth for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of cross_bar_width. Each Feature_-parameter acts as cross_bar_width for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of depth. Each Feature_parameter acts as depth for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of first_angle. Each Feature_-parameter acts as first_angle for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of first_offset. Each Feature_-parameter acts as first_offset for zero or more Tee_profile objects.

Each Tee_profile refers to zero or one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of second_angle. Each Feature_-parameter acts as second_angle for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of second_offset. Each Feature_-parameter acts as second_offset for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of width. Each Feature_parameter acts as width for zero or more Tee_profile objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1586 Template_instance to External_model

Each Template_instance (see 4.2.512) refers to zero or one External_model (see 4.2.189) in the role of template_definition. Each External_model acts as template_definition for zero or more Template_-instance objects.

NOTE - This assertion is established through template_definition_select.

4.3.1587 Template_instance to Geometric_model

Each Template_instance (see 4.2.512) refers to zero or one Geometric_model (see 4.2.238) in the role of template_definition. Each Geometric_model acts as template_definition for zero or more Template_-instance objects.

NOTE - This assertion is established through template_definition_select.

4.3.1588 Template_instance to Styled_model

Each Template_instance (see 4.2.512) refers to zero or one Styled_model (see 4.2.484) in the role of template_definition. Each Styled_model acts as template_definition for zero or more Template_instance objects.

NOTE - This assertion is established through template_definition_select.

4.3.1589 Template_instance to Transformation

Each Template_instance (see 4.2.512) refers to exactly one Transformation (see 4.2.533) in the role of model_placement. Each Transformation acts as model_placement for zero or more Template_instance objects.

4.3.1590 Thickness_dimension to Measurement_path

Each Thickness_dimension (see 4.2.516) refers to zero or one Measurement_path (see 4.2.314) in the role of used_path. Each Measurement_path acts as used_path for zero or more Thickness_dimension objects.

4.3.1591 Thread_feature to Axis_placement

Each Thread_feature (see 4.2.517) refers to exactly one Axis_placement (see 4.2.33) in the role of location_and_orientation. Each Axis_placement acts as location_and_orientation for zero or more Thread_-feature objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1592 Thread_feature to Thread_specification

Each Thread_feature (see 4.2.517) refers to exactly one Thread_specification (see 4.2.518) in the role of thread_definition. Each Thread_specification acts as thread_definition for zero or more Thread_feature objects.

4.3.1593 Thread_specification to Feature_parameter

Each Thread_specification (see 4.2.518) refers to exactly one Feature_parameter (see 4.2.201) in the role of density. Each Feature_parameter acts as density for zero or more Thread_specification objects.

Each Thread_specification refers to exactly one Feature_parameter in the role of major_diameter. Each Feature_parameter acts as major_diameter for zero or more Thread_specification objects.

4.3.1594 Tolerance_table_cell to General_tolerance_table

Each Tolerance_table_cell (see 4.2.523) refers to exactly one General_tolerance_table (see 4.2.234) in the role of table. Each General_tolerance_table has cell defined by one or more Tolerance_table_cell objects.

4.3.1595 Tolerance_table_cell to Multi_language_string

Each Tolerance_table_cell (see 4.2.523) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Tolerance_table_cell objects.

NOTE - This assertion is established through string_select.

4.3.1596 Tolerance_table_cell to Plus_minus_toleranced_datum

Each Tolerance_table_cell (see 4.2.523) refers to zero or one Plus_minus_toleranced_datum (see 4.2.364) in the role of cell_value. Each Plus_minus_toleranced_datum acts as cell_value for zero or more Tolerance_table_cell objects.

NOTE - This assertion is established through cell_entry_select.

4.3.1597 Tolerance_table_cell to Significant_number_of_digits

Each Tolerance_table_cell (see 4.2.523) refers to zero or one Significant_number_of_digits (see 4.2.452) in the role of limit. Each Significant_number_of_digits acts as limit for zero or more Tolerance_table_cell objects.

NOTE - This assertion is established through limit_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1598 Tolerance_table_cell to Upper_lower_limit

Each Tolerance_table_cell (see 4.2.523) refers to zero or one Upper_lower_limit (see 4.2.542) in the role of limit. Each Upper_lower_limit acts as limit for zero or more Tolerance_table_cell objects.

NOTE - This assertion is established through limit_select.

4.3.1599 Tolerance_table_cell to Upper_lower_toleranced_datum

Each Tolerance_table_cell (see 4.2.523) refers to zero or one Upper_lower_toleranced_datum (see 4.2.543) in the role of cell_value. Each Upper_lower_toleranced_datum acts as cell_value for zero or more Tolerance_table_cell objects.

NOTE - This assertion is established through cell_entry_select.

4.3.1600 Tolerance_zone to Geometric_tolerance

Each Tolerance_zone (see 4.2.524) is_zone_for one or more Geometric_tolerance (see 4.2.243) objects. Each Geometric_tolerance is related to zero or more Tolerance_zone objects.

4.3.1601 Tolerance_zone_definition to Shape_element

Each Tolerance_zone_definition (see 4.2.525) refers to exactly one Shape_element (see 4.2.449) in the role of first_element. Each Shape_element acts as first_element for zero or more Tolerance_zone_definition objects.

Each Tolerance_zone_definition refers to zero or one Shape_element in the role of second_element. Each Shape_element acts as second_element for zero or more Tolerance_zone_definition objects.

4.3.1602 Tolerance_zone_definition to Tolerance_zone

Each Tolerance_zone_definition (see 4.2.525) is_defining exactly one Tolerance_zone (see 4.2.524). Each Tolerance_zone is related to zero or more Tolerance_zone_definition objects.

4.3.1603 Tool_part_relationship to Geometric_model_relationship_with_transformation

Each Tool_part_relationship (see 4.2.528) refers to zero or one Geometric_model_relationship_with_transformation (see 4.2.240) in the role of placement. Each Geometric_model_relationship_with_transformation acts as placement for zero or more Tool_part_relationship objects.

NOTE - This assertion is established through transformation_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

4.3.1604 Tool_part_relationship to Multi_language_string

Each Tool_part_relationship (see 4.2.528) refers to zero or one Multi_language_string (see 4.2.320) in the role of used_technology_description. Each Multi_language_string acts as used_technology_description for zero or more Tool_part_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1605 Tool_part_relationship to Template_instance

Each Tool_part_relationship (see 4.2.528) refers to zero or one Template_instance (see 4.2.512) in the role of placement. Each Template_instance acts as placement for zero or more Tool_part_relationship objects.

NOTE - This assertion is established through transformation_select.

4.3.1606 Topologically_connected_set to Face

Each Topologically_connected_set (see 4.2.529) refers to zero or more Face (see 4.2.191) objects in the role of element. Each Face acts as element for zero or more Topologically_connected_set objects.

NOTE - This assertion is established through connected_element_select.

4.3.1607 Topologically_connected_set to Oriented_edge_curve

Each Topologically_connected_set (see 4.2.529) refers to zero or more Oriented_edge_curve (see 4.2.334) objects in the role of element. Each Oriented_edge_curve acts as element for zero or more Topologically_connected_set objects.

NOTE - This assertion is established through connected_element_select.

4.3.1608 Total_runout_tolerance to Datum

Each Total_runout_tolerance (see 4.2.532) refers to one or two Datum (see 4.2.123) objects in the role of reference_datum. Each Datum acts as reference_datum for zero or more Total_runout_tolerance objects.

4.3.1609 Transition_feature to Face

Each Transition_feature (see 4.2.537) refers to exactly one Face (see 4.2.191) in the role of face_1. Each Face acts as face_1 for zero or more Transition_feature objects.

Each Transition_feature refers to exactly one Face in the role of face_2. Each Face acts as face_2 for zero or more Transition_feature objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1610 Treatment_result to Multi_language_string

Each Treatment_result (see 4.2.538) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Treatment_result objects.

NOTE 1 - This assertion is established through string_select.

Each Treatment_result refers to zero or one Multi_language_string in the role of name. Each Multi_-language_string acts as name for zero or more Treatment_result objects.

NOTE 2 - This assertion is established through string_select.

Each Treatment_result refers to zero or one Multi_language_string in the role of purpose. Each Multi_-language_string acts as purpose for zero or more Treatment_result objects.

NOTE 3 - This assertion is established through string_select.

4.3.1611 Value_limitation to Limits_and_fits

Each Value_limitation (see 4.2.545) is_defined_by zero or one Limits_and_fits (see 4.2.295). Each Lim-its_and_fits is related to zero or more Value_limitation objects.

NOTE - This assertion is established through limitation_definition_select.

4.3.1612 Value_limitation to Numerical_value

Each Value_limitation (see 4.2.545) refers to exactly one Numerical_value (see 4.2.324) in the role of limited_value. Each Numerical_value has limitation defined by zero or one Value_limitation.

4.3.1613 Value_limitation to Plus_minus_bounds

Each Value_limitation (see 4.2.545) is_defined_by zero or one Plus_minus_bounds (see 4.2.363). Each Plus_minus_bounds is related to zero or more Value_limitation objects.

NOTE - This assertion is established through limitation_definition_select.

4.3.1614 Value_list to Property_value

Each Value_list (see 4.2.546) refers to one or more Property_value (see 4.2.412) objects in the role of values. Each Property_value acts as values for zero or more Value_list objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1615 Value_termination to Feature_parameter

Each Value_termination (see 4.2.548) refers to exactly one Feature_parameter (see 4.2.201) in the role of angle. Each Feature_parameter acts as angle for zero or more Value_termination objects.

Each Value_termination refers to exactly one Feature_parameter in the role of depth. Each Feature_parameter acts as depth for zero or more Value_termination objects.

4.3.1616 Value_with_unit to Unit

Each Value_with_unit (see 4.2.549) refers to zero or one Unit (see 4.2.541) in the role of unit_component. Each Unit acts as unit_component for zero or more Value_with_unit objects.

4.3.1617 Vector_appearance to Terminator_symbol

Each Vector_appearance (see 4.2.550) refers to exactly one Terminator_symbol (see 4.2.513) in the role of arrow_head_type. Each Terminator_symbol acts as arrow_head_type for zero or more Vector_appearance objects.

4.3.1618 Vee_profile to Feature_parameter

Each Vee_profile (see 4.2.551) refers to exactly one Feature_parameter (see 4.2.201) in the role of profile_angle. Each Feature_parameter acts as profile_angle for zero or more Vee_profile objects.

Each Vee_profile refers to zero or one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Vee_profile objects.

Each Vee_profile refers to exactly one Feature_parameter in the role of tilt_angle. Each Feature_parameter acts as tilt_angle for zero or more Vee_profile objects.

4.3.1619 Vertex_loop to Vertex_point

Each Vertex_loop (see 4.2.552) refers to exactly one Vertex_point (see 4.2.553) in the role of loop_vertex. Each Vertex_point acts as loop_vertex for zero or more Vertex_loop objects.

4.3.1620 Vertex_point to Point

Each Vertex_point (see 4.2.553) refers to exactly one Point (see 4.2.367) in the role of vertex_geometry. Each Point acts as vertex_geometry for zero or more Vertex_point objects.

4.3.1621 View to Cartesian_coordinate_space_2d

Each View (see 4.2.554) refers to exactly one Cartesian_coordinate_space_2d (see 4.2.45) in the role of view_space. Each Cartesian_coordinate_space_2d acts as view_space for zero or more View objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1622 View to Drawing_sheet

Each View (see 4.2.554) refers to zero or one Drawing_sheet (see 4.2.173) in the role of layout. Each Drawing_sheet acts as layout for zero or more View objects.

NOTE - This assertion is established through area_select.

4.3.1623 View to Multi_language_string

Each View (see 4.2.554) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more View objects.

NOTE 1 - This assertion is established through string_select.

Each View refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more View objects.

NOTE 2 - This assertion is established through string_select.

4.3.1624 View to Transformation_2d

Each View (see 4.2.554) refers to exactly one Transformation_2d (see 4.2.534) in the role of view_placement. Each Transformation_2d acts as view_placement for zero or more View objects.

4.3.1625 View to View_area

Each View (see 4.2.554) refers to zero or one View_area (see 4.2.555) in the role of layout. Each View_area acts as layout for zero or more View objects.

NOTE - This assertion is established through area_select.

4.3.1626 View_area to Cartesian_coordinate_space_2d

Each View_area (see 4.2.555) refers to exactly one Cartesian_coordinate_space_2d (see 4.2.45) in the role of area_space. Each Cartesian_coordinate_space_2d acts as area_space for zero or more View_area objects.

4.3.1627 View_area to Multi_language_string

Each View_area (see 4.2.555) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more View_area objects.

NOTE 1 - This assertion is established through string_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Each View_area refers to zero or one Multi_language_string in the role of name. Each Multi_language_-string acts as name for zero or more View_area objects.

NOTE 2 - This assertion is established through string_select.

4.3.1628 View_area_assignment to Complex_product

Each View_area_assignment (see 4.2.556) is_describing zero or one Complex_product (see 4.2.80). Each Complex_product is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1629 View_area_assignment to Design_constraint

Each View_area_assignment (see 4.2.556) is_describing zero or one Design_constraint (see 4.2.138). Each Design_constraint is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1630 View_area_assignment to Design_discipline_item_definition

Each View_area_assignment (see 4.2.556) is_describing zero or one Design_discipline_item_definition (see 4.2.142). Each Design_discipline_item_definition is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1631 View_area_assignment to Item_definition_instance_relationship

Each View_area_assignment (see 4.2.556) is_describing zero or one Item_definition_instance_relationship (see 4.2.268). Each Item_definition_instance_relationship is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1632 View_area_assignment to Item_definition_relationship

Each View_area_assignment (see 4.2.556) is_describing zero or one Item_definition_relationship (see 4.2.269). Each Item_definition_relationship is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1633 View_area_assignment to Item_instance

Each View_area_assignment (see 4.2.556) is_describing zero or one Item_instance (see 4.2.271). Each Item_instance is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1634 View_area_assignment to Item_instance_relationship

Each View_area_assignment (see 4.2.556) is_describing zero or one Item_instance_relationship (see 4.2.272). Each Item_instance_relationship is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1635 View_area_assignment to Item_version

Each View_area_assignment (see 4.2.556) is_describing zero or one Item_version (see 4.2.275). Each Item_version is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1636 View_area_assignment to Process_operation_definition

Each View_area_assignment (see 4.2.556) is_describing zero or one Process_operation_definition (see 4.2.381). Each Process_operation_definition is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1637 View_area_assignment to Process_operation_occurrence

Each View_area_assignment (see 4.2.556) is_describing zero or one Process_operation_occurrence (see 4.2.384). Each Process_operation_occurrence is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1638 View_area_assignment to Process_plan

Each View_area_assignment (see 4.2.556) is_describing zero or one Process_plan (see 4.2.387). Each Process_plan is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1639 View_area_assignment to Product_class

Each View_area_assignment (see 4.2.556) is_describing zero or one Product_class (see 4.2.392). Each Product_class is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1640 View_area_assignment to Specification

Each View_area_assignment (see 4.2.556) is_describing zero or one Specification (see 4.2.467). Each Specification is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1641 View_area_assignment to Specification_category

Each View_area_assignment (see 4.2.556) is_describing zero or one Specification_category (see 4.2.468). Each Specification_category is related to zero or more View_area_assignment objects.

NOTE - This assertion is established through presentation_association_select.

4.3.1642 View_area_assignment to View_area

Each View_area_assignment (see 4.2.556) refers to exactly one View_area (see 4.2.555) in the role of associated_view_area. Each View_area acts as associated_view_area for zero or more View_area_assignment objects.

4.3.1643 View_area_relationship to Multi_language_string

Each View_area_relationship (see 4.2.557) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more View_area_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1644 View_area_relationship to View_area

Each View_area_relationship (see 4.2.557) is related to exactly one View_area (see 4.2.555). Each View_area is referenced by zero or more View_area_relationship objects as related.

NOTE 1 - The related View_area is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each View_area_relationship is relating to exactly one View_area. Each View_area is referenced by zero or more View_area_relationship objects as relating.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE 2 - The relating View_area is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1645 View_placed_annotation to Annotation_element

Each View_placed_annotation (see 4.2.558) refers to zero or one Annotation_element (see 4.2.17) in the role of element. Each Annotation_element acts as element for zero or more View_placed_annotation objects.

NOTE - This assertion is established through annotation_select.

4.3.1646 View_placed_annotation to Draughting_callout

Each View_placed_annotation (see 4.2.558) refers to zero or one Draughting_callout (see 4.2.169) in the role of element. Each Draughting_callout acts as element for zero or more View_placed_annotation objects.

NOTE - This assertion is established through annotation_select.

4.3.1647 View_placed_annotation to View

Each View_placed_annotation (see 4.2.558) refers to exactly one View (see 4.2.554) in the role of reference_view. Each View acts as reference_view for zero or more View_placed_annotation objects.

4.3.1648 View_relationship to Multi_language_string

Each View_relationship (see 4.2.559) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more View_relationship objects.

NOTE - This assertion is established through string_select.

4.3.1649 View_relationship to View

Each View_relationship (see 4.2.559) is related to exactly one View (see 4.2.554). Each View is referenced by zero or more View_relationship objects as related.

NOTE 1 - The related View is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each View_relationship is relating to exactly one View. Each View is referenced by zero or more View_relationship objects as relating.

NOTE 2 - The relating View is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1650 Visual_appearance to Multi_language_string

Each Visual_appearance (see 4.2.560) refers to zero or one Multi_language_string (see 4.2.320) in the role of colour_name. Each Multi_language_string acts as colour_name for zero or more Visual_appearance objects.

NOTE 1 - This assertion is established through string_select.

Each Visual_appearance refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Visual_appearance objects.

NOTE 2 - This assertion is established through string_select.

4.3.1651 Wireframe_model_2d to Curve_set_2d

Each Wireframe_model_2d (see 4.2.561) refers to zero or more Curve_set_2d (see 4.2.111) objects in the role of element. Each Curve_set_2d acts as element for zero or more Wireframe_model_2d objects.

4.3.1652 Wireframe_model_3d to Curve_set_3d

Each Wireframe_model_3d (see 4.2.562) refers to zero or more Curve_set_3d (see 4.2.112) objects in the role of element. Each Curve_set_3d acts as element for zero or more Wireframe_model_3d objects.

4.3.1653 Woodruff_slot_end_type to Feature_parameter

Each Woodruff_slot_end_type (see 4.2.563) refers to exactly one Feature_parameter (see 4.2.201) in the role of radius. Each Feature_parameter acts as radius for zero or more Woodruff_slot_end_type objects.

4.3.1654 Work_order to Activity

Each Work_order (see 4.2.564) is_controlling exactly one Activity (see 4.2.2). Each Activity has authorization defined by zero or one Work_order.

4.3.1655 Work_order to Multi_language_string

Each Work_order (see 4.2.564) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Work_order objects.

NOTE - This assertion is established through string_select.

4.3.1656 Work_request to Activity_method

The assertion between work_request and activity_method in the role of scope exists only because of the select type structure and shall not be instantiated.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

NOTE - This assertion is established through activity_element_select.

4.3.1657 Work_request to Alternate_item_relationship

Each Work_request (see 4.2.565) refers to zero or more Alternate_item_relationship (see 4.2.9) objects in the role of scope. Each Alternate_item_relationship acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1658 Work_request to Assembly_substitute_relationship

Each Work_request (see 4.2.565) refers to zero or more Assembly_substitute_relationship (see 4.2.28) objects in the role of scope. Each Assembly_substitute_relationship acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1659 Work_request to Class_category_association

Each Work_request (see 4.2.565) refers to zero or more Class_category_association (see 4.2.64) objects in the role of scope. Each Class_category_association acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1660 Work_request to Class_condition_association

Each Work_request (see 4.2.565) refers to zero or more Class_condition_association (see 4.2.65) objects in the role of scope. Each Class_condition_association acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1661 Work_request to Class_inclusion_association

Each Work_request (see 4.2.565) refers to zero or more Class_inclusion_association (see 4.2.66) objects in the role of scope. Each Class_inclusion_association acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1662 Work_request to Class_specification_association

Each Work_request (see 4.2.565) refers to zero or more Class_specification_association (see 4.2.67) objects in the role of scope. Each Class_specification_association acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1663 Work_request to Class_structure_relationship

Each Work_request (see 4.2.565) refers to zero or more Class_structure_relationship (see 4.2.68) objects in the role of scope. Each Class_structure_relationship acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1664 Work_request to Complex_product

Each Work_request (see 4.2.565) refers to zero or more Complex_product (see 4.2.80) objects in the role of scope. Each Complex_product acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1665 Work_request to Configuration

Each Work_request (see 4.2.565) refers to zero or more Configuration (see 4.2.94) objects in the role of scope. Each Configuration acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1666 Work_request to Date_and_person_organization

Each Work_request (see 4.2.565) refers to one or more Date_and_person_organization (see 4.2.118) objects in the role of notified_person. Each Date_and_person_organization acts as notified_person for zero or more Work_request objects.

Each Work_request refers to exactly one Date_and_person_organization in the role of requestor. Each Date_and_person_organization acts as requestor for zero or more Work_request objects.

4.3.1667 Work_request to Design_constraint

Each Work_request (see 4.2.565) refers to zero or more Design_constraint (see 4.2.138) objects in the role of scope. Each Design_constraint acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

4.3.1668 Work_request to Design_discipline_item_definition

Each Work_request (see 4.2.565) refers to zero or more Design_discipline_item_definition (see 4.2.142) objects in the role of scope. Each Design_discipline_item_definition acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1669 Work_request to Document

Each Work_request (see 4.2.565) refers to zero or more Document (see 4.2.155) objects in the role of scope. Each Document acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1670 Work_request to Document_file

Each Work_request (see 4.2.565) refers to zero or more Document_file (see 4.2.159) objects in the role of scope. Each Document_file acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1671 Work_request to Document_representation

Each Work_request (see 4.2.565) refers to zero or more Document_representation (see 4.2.163) objects in the role of scope. Each Document_representation acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1672 Work_request to Document_version

Each Work_request (see 4.2.565) refers to zero or more Document_version (see 4.2.167) objects in the role of scope. Each Document_version acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1673 Work_request to Drawing

Each Work_request (see 4.2.565) refers to zero or more Drawing (see 4.2.170) objects in the role of scope. Each Drawing acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

4.3.1674 Work_request to Feature_occurrence

Each Work_request (see 4.2.565) refers to zero or more Feature_occurrence (see 4.2.200) objects in the role of scope. Each Feature_occurrence acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1675 Work_request to Geometric_model

Each Work_request (see 4.2.565) refers to zero or more Geometric_model (see 4.2.238) objects in the role of scope. Each Geometric_model acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1676 Work_request to Item

Each Work_request (see 4.2.565) refers to zero or more Item (see 4.2.267) objects in the role of scope. Each Item acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1677 Work_request to Item_definition_instance_relationship

Each Work_request (see 4.2.565) refers to zero or more Item_definition_instance_relationship (see 4.2.268) objects in the role of scope. Each Item_definition_instance_relationship acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1678 Work_request to Item_definition_relationship

Each Work_request (see 4.2.565) refers to zero or more Item_definition_relationship (see 4.2.269) objects in the role of scope. Each Item_definition_relationship acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1679 Work_request to Item_instance

Each Work_request (see 4.2.565) refers to zero or more Item_instance (see 4.2.271) objects in the role of scope. Each Item_instance acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1680 Work_request to Item_instance_relationship

Each Work_request (see 4.2.565) refers to zero or more Item_instance_relationship (see 4.2.272) objects in the role of scope. Each Item_instance_relationship acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1681 Work_request to Item_version

Each Work_request (see 4.2.565) refers to zero or more Item_version (see 4.2.275) objects in the role of scope. Each Item_version acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1682 Work_request to Kinematic_simulation_information

Each Work_request (see 4.2.565) refers to zero or more Kinematic_simulation_information (see 4.2.288) objects in the role of scope. Each Kinematic_simulation_information acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1683 Work_request to Manufacturing_configuration

Each Work_request (see 4.2.565) refers to zero or more Manufacturing_configuration (see 4.2.305) objects in the role of scope. Each Manufacturing_configuration acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1684 Work_request to Material

Each Work_request (see 4.2.565) refers to zero or more Material (see 4.2.309) objects in the role of scope. Each Material acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1685 Work_request to Multi_language_string

Each Work_request (see 4.2.565) refers to zero or one Multi_language_string (see 4.2.320) in the role of description. Each Multi_language_string acts as description for zero or more Work_request objects.

NOTE - This assertion is established through string_select.

4.3.1686 Work_request to Physical_assembly_relationship

Each Work_request (see 4.2.565) refers to zero or more Physical_assembly_relationship (see 4.2.350) objects in the role of scope. Each Physical_assembly_relationship acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1687 Work_request to Physical_instance

Each Work_request (see 4.2.565) refers to zero or more Physical_instance (see 4.2.352) objects in the role of scope. Each Physical_instance acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1688 Work_request to Process_operation_definition

Each Work_request (see 4.2.565) refers to zero or more Process_operation_definition (see 4.2.381) objects in the role of scope. Each Process_operation_definition acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1689 Work_request to Process_operation_occurrence

Each Work_request (see 4.2.565) refers to zero or more Process_operation_occurrence (see 4.2.384) objects in the role of scope. Each Process_operation_occurrence acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1690 Work_request to Process_plan

Each Work_request (see 4.2.565) refers to zero or more Process_plan (see 4.2.387) objects in the role of scope. Each Process_plan acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1691 Work_request to Product_class

Each Work_request (see 4.2.565) refers to zero or more Product_class (see 4.2.392) objects in the role of scope. Each Product_class acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

© ISO 2001 – All rights reserved

4.3.1692 Work_request to Product_identification

Each Work_request (see 4.2.565) refers to zero or more Product_identification (see 4.2.398) objects in the role of scope. Each Product_identification acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1693 Work_request to Product_structure_relationship

Each Work_request (see 4.2.565) refers to zero or more Product_structure_relationship (see 4.2.400) objects in the role of scope. Each Product_structure_relationship acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1694 Work_request to Property

Each Work_request (see 4.2.565) refers to zero or more Property (see 4.2.409) objects in the role of scope. Each Property acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1695 Work_request to Property_value_association

Each Work_request (see 4.2.565) refers to zero or more Property_value_association (see 4.2.413) objects in the role of scope. Each Property_value_association acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1696 Work_request to Specification

Each Work_request (see 4.2.565) refers to zero or more Specification (see 4.2.467) objects in the role of scope. Each Specification acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1697 Work_request to Specification_category

Each Work_request (see 4.2.565) refers to zero or more Specification_category (see 4.2.468) objects in the role of scope. Each Specification_category acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1698 Work_request to Specification_expression

Each Work_request (see 4.2.565) refers to zero or more Specification_expression (see 4.2.470) objects in the role of scope. Each Specification_expression acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1699 Work_request to Specification_inclusion

Each Work_request (see 4.2.565) refers to zero or more Specification_inclusion (see 4.2.471) objects in the role of scope. Each Specification_inclusion acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1700 Work_request to Styled_model

Each Work_request (see 4.2.565) refers to zero or more Styled_model (see 4.2.484) objects in the role of scope. Each Styled_model acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

4.3.1701 Work_request to View_area

Each Work_request (see 4.2.565) refers to zero or more View_area (see 4.2.555) objects in the role of scope. Each View_area acts as scope for zero or more Work_request objects.

NOTE - This assertion is established through activity_element_select.

5 Application interpreted model

5.1 Mapping table

This clause contains the mapping table that shows how each UoF and application object of this part of ISO 10303 (see clause 4) maps to one or more AIM constructs (see annex A). The mapping table is organized in five columns.

Column 1) Application element: Name of an application element as it appears in the application object definition in 4.2. Application object names are written in uppercase. Attribute names and assertions are listed after the application object to which they belong and are written in lower case.

Column 2) AIM element: Name of an AIM element as it appears in the AIM (see annex A), the term 'IDENTICAL MAPPING', or the term 'PATH'. AIM entities are written in lower case. Attribute names of AIM entities are referred to as <entity name> . <attribute name>. The mapping of an application element may result in several related AIM elements. Each of these AIM elements requires a line of

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

its own in the table. The term ‘IDENTICAL MAPPING’ indicates that both application objects of an application assertion map to the same AIM element. The term ‘PATH’ indicates that the application assertion maps to the entire reference path.

Column 3) Source: For those AIM elements that are interpreted from the integrated resources or the application interpreted constructs, this is the number of the corresponding part of ISO 10303. For those AIM elements that are created for the purpose of this part of ISO 10303, this is the number of this part. Entities or types that are defined within the integrated resources have an AIC as the source reference if the use of the entity or type for the mapping is within the scope of the AIC.

Column 4) Rules: One or more numbers may be given that refer to rules that apply to the current AIM element or reference path. For rules that are derived from relationships between application objects, the same rule is referred to by the mapping entries of all the involved AIM elements. The expanded names of the rules are listed after the table.

Column 5) Reference path: To describe fully the mapping of an application object, it may be necessary to specify a reference path through several related AIM elements. The reference path column documents the role of an AIM element relative to the AIM element in the row succeeding it. Two or more such related AIM elements define the interpretation of the integrated resources that satisfies the requirement specified by the application object. For each AIM element that has been created for use within this part of ISO 10303, a reference path up to its supertype from an integrated resource is specified.

For the expression of reference paths the following notational conventions apply:

a) `[]` : enclosed section constrains multiple AIM elements or sections of the reference path are required to satisfy an information requirement;

b) `()` : enclosed section constrains multiple AIM elements or sections of the reference path are identified as alternatives within the mapping to satisfy an information requirement;

c) `{}` : enclosed section constrains the reference path to satisfy an information requirement;

d) `<>` : enclosed section constrains at one or more required reference path;

e) `||` : enclosed section constrains the supertype entity;

f) `->` : attribute references the entity or select type given in the following row;

g) `<-` : entity or select type is referenced by the attribute in the following row;

h) `[i]` : attribute is an aggregation of which a single member is given in the following row;

i) `[n]` : attribute is an aggregation of which member `n` is given in the following row;

j) `=>` : entity is a supertype of the entity given in the following row;

k) `<=` : entity is a subtype of the entity given in the following row;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

l) = : the string, select, or enumeration type is constrained to a choice or value;

m) \ : the reference path expression continues on the next line.

NOTE - The following note numbers correspond to the footnotemarks listed in the table above:

1 The ARM attribute 'element_name' that is inherited from shape_element is not available for a coating layer.

2 The ARM element 'ratio_value' uses the same attribute of representation_item as the inherited ARM attribute 'value_name' of value_with_unit. The 'ratio value' qualification shall be appended to the representation_item.name representing the 'value_name'.

3 The mapping of the ARM attribute 'depth' uses the same attribute of representation_item as the inherited ARM attribute 'value_name' of value_-with_unit. If the depth is present, the qualification 'depth' it shall be appended to the representation_item.name representing the ARM attribute 'value_name'.

4 The mapping of the ARM attribute 'hardness_value' uses the same attribute of representation_item as the inherited ARM attribute 'value_name' of value_with_unit. The qualification 'hardness' shall be appended to the representation_item.name representing the ARM attribute 'value_name'.

5 The ARM attribute 'parameter_index' maps to the same attribute of representation_item as the ARM attribute 'parameter_name'. If the 'parameter_-index' is present, it shall be appended to the representation_item.name representing the 'parameter_name'.

6 The mapping of ARM attribute 'depth' uses the same attribute of representation_item as the inherited ARM attribute 'value_name' of value_-with_unit. If the depth is present, the qualification 'depth' it shall be appended to the representation_item.name representing the ARM attribute 'value_name'.

B_SPLINE_SURFACE	b_spline_surface	515		
BLOCK	block	515		
BOOLEAN_RESULT #1: If the b_rep does nt contain any interior bounds. #2: If the b_rep has at least one void in its interior. #3: If the primitive is a sphere. #4: If the primitive is a block. #5: If the primitive is a right angular wedge. #6: If the primitive is a torus. #7: If the primitive is a right angular cone. #8: If the element is a right angular cylinder. #9: If all faces are planar and all edges are straight lines. #10: If the brep has at least one void in its interior. #11: If the solid is created by a sweep of revolution. #12: If the solid is created by a sweep of extrusion.	boolean_result	515
