NOTE - The following note numbers correspond to the footnotemarks listed in the table above:

1 The use of the subtype product_definition_formation_with_specified_source is not recommended in the general case. If compatibility with AP203 is required for a postprocessor, the postprocessor should at a minimum process the information from the supertype entity product_definition_formation.

NOTE - The following note numbers correspond to the footnotemarks listed in the table above:

1 If collection_definition is also of type assembly_definition and/or mating_definition, it is assumed, that only one of the attributes collection_definition.purpose, assembly_definition.assembly_type, or mating_definition.mating_type is instantiated.

2 Permissive list value 'version hierarchy' in ARM renamed to 'hierarchy' as product_definition_formation_relationship already implies a relationship between two version objects.

3 Permissive list value 'version sequence' in ARM renamed to 'sequence' as product_definition_formation_relationship already implies a relationship between two version objects.

4 The optional attribute cartesian_transformation_operator.scl is omitted

5 The optional attribute cartesian_transformation_operator.scl is omitted

6 Due to the SET, there is no order or specific semantics related to the usage of relating_product_concept_feature or related_product_concept_feature.

7 In case the SET of operands is greater than two, a tree structure has to be built using the constructs stated in the parentheses. In this case, all concept_feature_relationship_with_condition instances used reference the same concept_feature_operator as the conditional_operator.

8 Due to the SET, there is no order or specific semantics related to the usage of relating_product_concept_feature or related_product_concept_feature.

9 In case the SET of operands is greater than two, a tree structure has to be built using the constructs stated in the parentheses.

5.2 AIM EXPRESS short listing

This clause specifies the EXPRESS schema that uses elements from the integrated resources (and the AICs) and contains the types, entity specializations, rules, and functions that are specific to this part of ISO 10303. This clause also specifies modifications to the text for constructs that are imported from the integrated resources (and the AICs). The definitions and EXPRESS provided in the integrated resources for constructs used in the AIM may include select list items and subtypes that are not imported into the AIM. Requirements stated in the integrated resources that refer to such items and subtypes apply exclusively to those items that are imported into the AIM.

NOTE - The following conventions apply for the definition text:

— Terms written in boldface refer to the AIM objects, i.e., '**circle**' refers to the entity as defined in ISO 10303-42;

— Terms written in normal face refer to the concept, i.e., 'circle' refers to the concept of a round plane figure whose circumference is everywhere equidistant from its centre.

EXPRESS specification:

5.2.1 Fundamental concepts and assumptions

This subclause describes fundamental concepts and assumptions related to the data structure defined within this part of ISO 10303.

ISO 10303-214 is designed to be used for data exchange, sharing, modeling, and storage in the design phase.

The intention is to gather information on a technical **product** related to various applications of product data.

5.2.1.1 Usage of global rules

Many of the relationships among different entities in the integrated resource parts of ISO 10303 are specified using the most generic cardinality of zero or more between two related entities. This cardinality means that the relationship is optional or there may be one or more instances of a related entity that is related to a single instance of the relating entity or vice versa.

This part of ISO 10303 uses global rules to constrain these cardinalities. Examples of these rules include **product_requires_category** and **restrict_effectivity_for_effectivity_relationship**.

Global rules are also used to restrict values of STRING type attributes to be only those that are applicable within the context of ISO 10303-214.

5.2.1.2 Product, Product Versions, and Views on Product Versions

Every **product** has to be related with one or more instances of **product_definition_formation**, each representing a version of the **product**.

A **product_definition_formation** may be represented by different instances of **representation** such as various kinds of geometric representations, kinematic structures, drawings, i.e., different kinds of data for a **product**.

Product_definition represents a view onto the data of a **product_definition_formation** and establishes the relationship to the various **representation**s. Note that **representation**s may be shared by serveral **product_definition**s (views). Also a **product_definition** may have several alternative **representation**s of the same kind, e.g. **shape_representation**s of a wireframe and a surface model, attached to it.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

5.2.1.3 Context information

5.2.1.3.1 application_context

The **application_context** entity identifies the application domain that defined the data. The **application_context** entity may have an identifier associated with it through the entity **id_attribute** and its **attribute_value** attribute. The **application_context** entity may have a description associated with it through the entity **description_attribute** via the attribute **attribute_value**. The **application** attribute identifies the name of the general application domain that defined the data.

This entity should be instantiated once in the data set for each relevant application domain. Where appropriate, the value 'assembly study', 'digital mock up', 'process planning', 'electrical design', or 'mechanical design' should be used. Note that 'electrical design' and 'mechanical design' are not understood to mean the design life cycle - e.g., within the application domain 'mechanical design', you may have concurrent 'manufacturing' and 'design' life-cycle view definitions.

5.2.1.3.2 product_context

The **product_context** entity is a subtype of **application_context_element**. All STEP products must be founded in a **product_context** to specify the point of view on the application. The **product_context** entity identifies the engineering discipline's point of view from which the data is being presented. This entity will establish the context perspective and source of requirements for product entities. The **discipline_type** attribute contains a description of the discipline point of view for a product. It is recommended to instantiate this entity exactly once in the data set.

5.2.1.3.3 product_definition_context

The **product_definition_context** entity is a subtype of **application_context_element**. All STEP **product_definition**s must be founded in a **product_definition_context** to identify the product definition type and life-cycle stage from which the data is viewed.

There are two ways to implement the **product_definition_context**:

— association of a single primary context with a **product_definition**;

— assignment of more than one (additional) context to a **product_definition**.

The value of the attribute **product_definition.frame_of_reference** is a **product_definition_context** that represents the 'primary' defining context for a view. In general this defining context is qualified both by type (**product_definition_context.name**) and by life-cycle (**product_definition_context.life_cycle_stage**) information. The primary context also has associated application domain information. The inherited **name** attribute provides a distinction on the type of view on a part version ('part definition') from one of a document version ('digital document definition', 'physical document definition'). This attribute may also indicate other types of definitions: e.g., 'functional definition', 'conceptual definition',

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

or 'spatial' and/or 'zonal'. The **life_cycle_stage** attribute identifies the life-cycle view on the associated **product_definition**. Recommended values include 'design' and 'manufacturing'.

The **product_definition_context_association** entity allows for multiple additional contexts to be associated with a single **product_definition**. There is always one required 'primary' context that identifies the defining application domain and life-cycle information. Additional **product_definition_context** entities identify additional concurrent relevant views on the **product_definition**. These **product_definition_contexts** are related to the product definition by **product_definition_context_association**.

5.2.1.4 Shape of a product

5.2.1.4.1 Relating the shape of a product to administrative product data

The shape of a **product** is represented by **shape_representation**. This entity and its subtypes are defining valid combinations of entities of type **geometric_representation_item** and **topological_representation_item** to describe the shape of the **product**.

Shape_representation is related to **product_definition** by **shape_definition_representation** and **product_definition_shape**, which points to **product_definition** via two select types: **characterized_definition** and **characterized_product_definition**. Due to the global rule **shape_representation_subtype_exclusiveness**, **shape_representation** shall be an instance of at most one of its subtypes.

5.2.1.4.2 Identification of a portion of the shape of a product

A portion of the whole shape of a **product** may be identified by a **shape_aspect** that points to a **product_definition_shape**. The **shape_aspect** may be related via **shape_definition_representation** to **shape_representation**, representing the portion of shape.

5.2.1.4.3 Types of shape representation

By this part of ISO 10303 nine model types for representation of the shape of a **product** are defined:

— geometrically bounded 2D wireframe model represented by **geometrically_bounded_2d_wireframe_representation** (represented in the ARM by UoF G1);

— geometrically bounded 3D wireframe model represented by **geometrically_bounded_wireframe_shape_representation** (represented in the ARM by UoF G2);

— geometrically bounded surface model represented by **geometrically_bounded_surface_shape_representation** (represented in the ARM by UoF G8);

— connected surface model represented by **manifold_surface_shape_representation** (represented in the ARM by UoF G3);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— faceted Brep model represented by **faceted_brep_shape_representation** (represented in the ARM by UoF G4);

— Brep model represented by **advanced_brep_shape_representation** (represented in the ARM by UoF G5);

— compound Brep model represented by **compound_shape_representation** and as special cases **edge_-based_wireframe_shape_representation**, and **non_manifold_surface_shape_representation** (represented in the ARM by UoF G6);

— CSG model represented by **csg_shape_representation** (represented in the ARM by UoF G7);

— hybrid model represented by **shape_representation** with a **name** of 'hybrid 3D shape representation' (included in the ARM in UoF S2).

All these except for the last are subtypes of **shape_representation**. Each type is self contained, meaning that one type may not contain another, enforced by the global rule **shape_representation_subtype_-exclusiveness**. Local rules, defined for every subtype, describe restrictions on geometric and topological entities, as applicable, that may be referenced by the respective **shape_representation** subtype. The local rules in the subtypes of **shape_representation** uniformly allow for instances of **axis2_placement**, **mapped_item**, and one or more specific subtypes of **geometric_representation_item** according to the subtype of **shape_representation**. In the case of a **mapped_item**, the mapped_representation of the associated instance of **representation_map** is restricted to the same subtype of **shape_representation** in order to avoid mixed shape representation types.

The **shape_representation** with a **name** of 'hybrid 3D shape representation' is an exception of this rule. It is especially created to allow for a mix of different kinds of **shape_representation** as it usually occurs in CAD systems. Therefore the allowed types of instances of **geometric_representation_item** are not further constrained, and the type the **mapped_representation** for a **mapped_item** instance is restricted to **shape_representation** only, but not to a specific subtype.

5.2.1.4.4 Relation of units, coordinate space, and accuracy information to shape information

Information on units related to the shape of a **product** as well as information on the coordinate space and the accuracy (uncertainty) of the shape information is assigned to instances of **shape_representation** by subtypes of **representation_context**, i.e. **global_unit_assigned_context**, **geometric_representation_-context**, and **global_uncertainty_assigned_context**, respectively.

These subtypes allow for definition of a set of units, of the coordinate space dimension, and of one to three accuracy values for distance, angular, and curvature accuracy to be assigned to a **shape_representation**.

In the case where an instance of **representation_context** shall be shared by two or more **shape_representation** instances with different accuracy values, complex instances of **shape_representation** and **uncertainty_assigned_representation** shall be used to assign the various accuracy values through the **uncertainty_assigned_representation** instances independent from the **representation_context**. The

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

accuracy information defined by the **uncertainty_assigned_representation** takes precedence over any **global_uncertainty_assigned_context** that is referenced by the **shape_representation**.

5.2.1.5 Product structure

This clause describes the AIM entities used by this part of ISO 10303 that provide the capability to describe explicit hierarchical product structures representing assemblies and the constituents of those assemblies. These explicit part structures can be used to define the traditional engineering and manufacturing bill of material indentured parts list. Each assembly and constituent part within an explicit hierarchical product structure is defined by a **product** that is element in the set of **products** of a **product_related_product_category** with a name of 'part'. A **product** that is categorized as part may be a single piece part or an assembly of arbitrary complexity. Associated **product_definition_formation**s represent specific versions of the base product. **Product_definition**s attached to these **product_definition_formation**s represent particular views on a **product_definition_formation** that may only be relevant for the requirements of particular life-cycle stages (e.g., design, manufacturing) and application domains. There may be more than one **product_definition** associated with a particular **product_definition_formation**.

— A **product_definition** that has a **product_definition_context** with the atribute name set to 'part definition' represents a definitional view on the part, collecting data, e.g., from a particular application domain or life-cycle, about the part independently of its usage, e.g., as constituent of some other part.

Relationships between **product_definition**s that have an associated **product_definition_context** with a name of 'part definition' are the principle elements used to define explicit hierarchical product structures.

— An **assembly_component_usage** relationship represents the general assembly relationship between two parts by associating two **product_definition**s. The **related_product_definition** defines a view on the component, the **relating_product_definition** defines a view of the assembly part. Both **product_definition**s are definitional views, i.e., they have an associated **product_definition_context** with a name of 'part definition'.

In order to define different types of assembly relationships, **assembly_component_usage** has various subtypes:

— The **next_assembly_usage_occurrence** relationship represents a specific usage, i.e., an ocurrence of a component definition in the next higher parent assembly.

If a **next_assembly_usage_occurrence** is not instantiated in combination with a **quantified_assembly_component_usage**, it is used to represent a single occurrence of the component part in the context of the immediate next higher assembly part.

— The **promissory_usage_occurrence** relationship represents the usage of a component within a higher-level assembly that must not be the immediate parent, e.g., in the case where the detailed assembly structure between the component and the higher-level assembly is not represented. It specifies the intention to use the constituent in an assembly.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

A **promissory_usage_occurrence** may be instantiated in combination with a **quantified_assembly_component_usage**.

— The **quantified_assembly_component_usage** relationship is an **assembly_component_usage** that associates a quantity with the component usage. It can be used to describe that a component is used multiple times, e.g. **quantity** is set to '5 each' for five wheel fixture bolts, in the context of the assembly, but does not allow independent identification of individual occurrences of this component usage. Another usage of the **quantity** is for material like components, e.g. '0.5 ml' of oil.

If the **quantity**, in which the component part is used in the assembly can not be expressed as a particular value, but depends on certain constraints, an **assembly_component_usage** relationship with a name of 'selected instance usage' shall be used instead of the **quantified_assembly_component_usage** subtype with an associated **property_definition** and an associated **representation** with a **name** of 'selection criteria' that defines the quantity by a **representation_item** with **name** 'selection quantity' of type **measure_representation_item** or **value_range**.

— In order to identify a specific occurrence of a component in an assembly which is not the immediate parent assembly, the **specified_higher_usage_occurrence** entity is used, because the path from the higher-level parent assembly to the lower-level component may be ambigous. The **specified_higher_usage_occurrence** relationship represents an individual occurrence of the component part within a higher-level parent assembly. It shall not be instantiated in combination with a **next_assembly_usage_occurrence** or a **promissory_usage_occurrence**.

The **specified_higher_usage_occurrence** identifies with its inherited attribute **related_product_definition** the component in the assembly structure, with its inherited attribute **relating_product_definition** the higher-level parent assembly, with the **next_usage** attribute the component usage within the immediate parent assembly, and with its **upper_usage** attribute the usage between the higher-level parent assembly and the immediate parent identified by **next_usage**. In case the higher-level parent assembly to the component has more than one intermediate assembly level the **upper_usage** attribute refers to another **specified_higher_usage_occurrence** (recursive use). See Figure 79 for an example instantiation.

The **assembly_component_usage** and its subtypes described above represent individual usages, i.e., occurrences, of either a single or multiple instances of a component part in the context of an assembly part, i.e., within an explicit hierarchical part structure. In order to be able to use and represent these individual occurrences in the context of specification control (UoF S7), e.g., to configure them for the usage in the context of a **product_class**, or to use them in the context of variational bills of material as product constituents in conceptual or functional definitions or in alternative solution definitions of those, a separate **product_definition** has to be created describing an individual occurrence view of the component part.

When moving from an explicit part structure to a variational product structure, individual usages of a component part in the context of an assembly part that are described as part of an explicit hierarchical part structure by **assembly_component_usage** relationships or its subtypes, have to be related to a corresponding **product_definition** with an associated **product_definition_context** with a **name** of 'part occurrence' through a **product_definition_occurrence_relationship**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

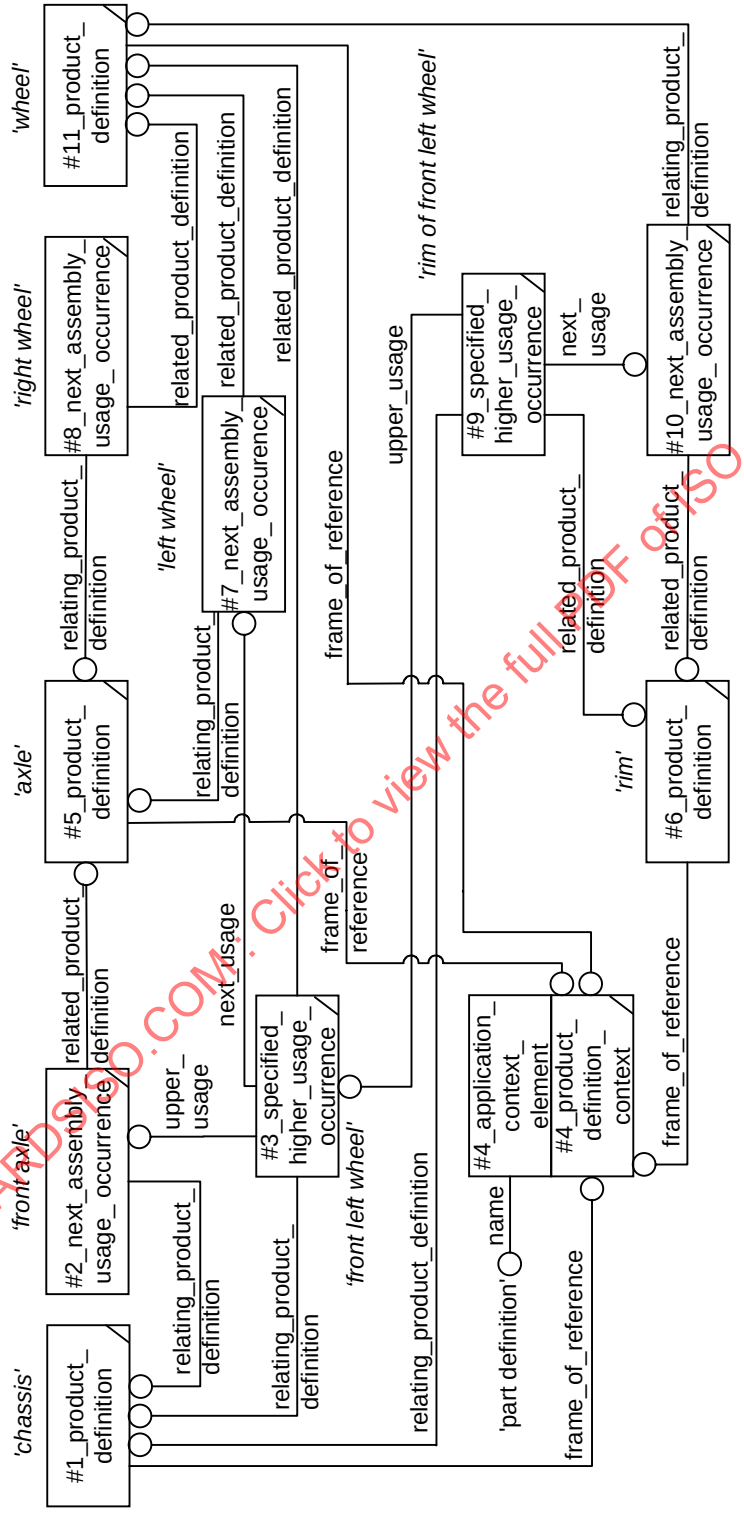

Figure 79 – example instantiation for specified_higher_usage_occurrence

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The **product_definition_occurrence_relationship** associates this **product_definition** and the **assembly_component_usage**. The **product_definition** referenced by the **occurrence** attribute has an associated **product_definition_context** with a **name** of 'part occurrence'. It represents explicitly an occurrence of the component that is also implicitly defined by the associated **assembly_component_usage**. The definitional **product_definition** of the component (with **product_definition_context** with **name** 'part definition') is referred to by the inherited **related_product_definition** attribute of the **assembly_component_usage** as well as associated to the **product_definition** representing explicitly the occurrence through a **product_definition_relationship** with a **name** of 'definition usage' (see Figure 80 for an example instantiation).

Thus, the **product_definition_occurrence_relationship** allows the association of an individual occurrence of a constituent part definition in an explicit part structure, represented by **assembly_component_usage** relationships, to a specific **product_definition** describing explicitly the individual occurrence of the component part in the context of specification control (UoF S7). See Specification control in clause 5.2.1.8 for further details about the usage of those **product_definition**s for specification control.

5.2.1.6 Shape of an assembly

5.2.1.6.1 Relating the shape of a component to the shape of its assembly

In order to build assembly structures, relationships between the assembly and component(s) have to be defined.

Two alternatives for the implementation of assembly structure representations are recommended:

— one alternative describes the assembly with the shape of the components built in. With this approach the shape of the component is mapped into the shape of the assembly via **mapped_item**;

— the other alternative describes the components and the assembly with their own shape information together with the transformation information between the assembly and the component. This approach uses the **representation_relationship_with_transformation**.

Both mechanisms make sense even in mixed combinations. The product structure, i.e. **next_assembly_usage_occurrence** is identical and is required for both approaches.

5.2.1.6.2 mapped_item approach

This approach represents the assembled model completely. It is appropriate for explicit representation of assemblies. It uses **mapped_item** in combination with **representation_map** which takes a **representation**, i.e. the **shape_representation** of the component and turns it into an item in a second **representation**, i.e. a **mapped_item** included in the **shape_representation** of the assembly. The transformation to be applied is determined from the mapping origin and the mapping target, which are items of the two instances of **representation** and therefore founded in the two contexts. **Mapped_item** is constrained such that:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

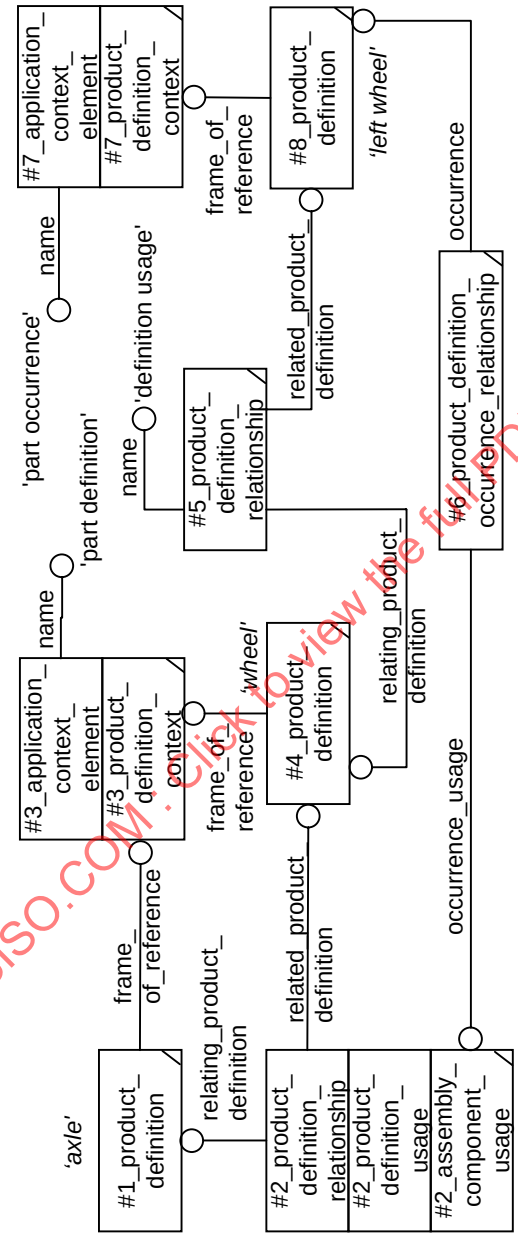

Figure 80 – example for usage of product_definition_occurrence_relationship

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— no **mapped_item** shall be dependent on itself to define the **representation** being mapped (acyclic);

— the **mapping_origin** shall be in the context of the **representation** referenced by **mapped_item. mapping_source. mapped_representation**;

— the **mapping_target** shall be in the context of the **representation** including the **mapped_item**.

There is no constraint to prevent both instances of **representation** having the same context (i.e. the new item is shifted in position but does not change spaces). This allows the use of **mapped_item** to position sub-models in a single coordinate space. It is even possible to define an identity matrix transformation by referring to the same entity instance as both **mapping_origin** and **mapping_target**. This represents the case where a component is defined in (one of) its final positions. Until it is mapped into the second **representation**, it is not included in the **representation** even though defined in the same space.

The mapping of the Assembly_component_relationship implies that the relationships between the assembly and the component on the **product_definition** level and the **mapped_item** for the **shape_representation** level have to be linked through an additional separate **shape_representation** containing, only the **mapped_item**and a **shape_definition_representation** and a **product_definition_shape**. This is necessary to distinguish between several occurrences of the same component within an assembly.

5.2.1.6.3 representation_relationship_with_transformation approach

This approach represents the components and the set of instructions how to build the assembly. This approach is adequate for the implicit representation of assemblies.

Thus, **representation_relationship_with_transformation** is used to define the relative positions within an assembly. It does not allow for:

— inclusion: The decision to create a **representation** that brings all the components together, is left to the receiving system;

— the ability to define a component in one position and then to replicate it in the same space.

The **shape_representation** may be defined explicitly and completely for the assembly and the **representation_relationship_with_transformation** gives just the additional information how an instance of **shape_representation** for a component geometrically relates to the shape of the assembly.

The rule **coordinated_assembly_and_shape** implies that the relationships between the assembly and the component on the **product_definition** level and the **shape_representation** level have to be linked through a **context_dependent_shape_representation**. This is necessary to distinguish between several occurrences of the same component within an assembly.

According to ISO 10303-43 the attributes **rep_1** and **rep_2** of **representation_relationship_with_-transformation** are determined as follows:

— **rep_1** is defined as the **representation** with a context to which the transformation applies;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

— **rep_2** is the **representation** with a context which is the result of the transformation.

Based on this definition, the attributes of **representation_relationship_with_transformation** should be instantiated as follows:

— **rep_1** references the **shape_representation** for the **product_definition** that is the **related_product_definition** (identifying the component) of the **assembly_component_usage**;

— **rep_2** references the **shape_representation** for the **product_definition** that is the **relating_product_definition** (identifying the assembly) of the **assembly_component_usage**.

Further restrictions are implied by the informal proposition on **representation_relationship_with_transformation**, defined in ISO 10303-43: If the transformation is an **item_defined_transformation**, the ordering of the instances of **representation** given for the inherited attributes of **representation_relationship** shall be consistent with the ordering of the two instances of **representation_item** given as attributes of **item_defined_transformation**.

Therefore the inherited attributes **relating_representation_item** and **related_representation_item** of **item_defined_transformation** shall be used as follows:

— **related_representation_item** references the **representation_item**, e.g., **axis2_placement_3d**, in a representation for the **product_definition** that is the **related_product_definition** of the **assembly_component_usage**, identifying the component;

— **relating_representation_item** references the **representation_item**, e.g., **axis2_placement_3d**, in a representation for the **product_definition** that is the **relating_product_definition** of the **assembly_component_usage**, identifying the assembly.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

5.2.1.6.4 Representation of transformations

Transformation information is represented for an **item_defined_transformation** using the inherited attributes **relating_representation_item** and **related_representation_item**, and for a **mapped_item** using attribute **mapping_target** of **mapped_item** and attribute **mapping_origin** of the referenced **representation_map** as a combination of two instances of **representation_item**.

The allowed combinations for these two instances of **representation_item** are as follows:

— **axis2_placement_3d** for the **related_representation_item** or **mapping_origin** attribute and another instance of **axis2_placement_3d** for the **relating_representation_item** or **mapping_target** attribute;

— **axis2_placement_3d** for the **related_representation_item** or **mapping_origin** attribute and an instance of **cartesian_transformation_operator_3d** for the **relating_representation_item** or **mapping_target attribute**;

 © ISO 2001 – All rights reserved

— **axis2_placement_2d** for the **related_representation_item** or **mapping_origin** attribute and another instance of **axis2_placement_2d** for the **relating_representation_item** or **mapping_target** attribute;

— **axis2_placement_2d** for the **related_representation_item** or **mapping_origin** attribute and an instance of **cartesian_transformation_operator_2d** for the **relating_representation_item** or **mapping_target** attribute.

For a **representation_relationship_with_transformation** there may be also an instance of **functionally_defined_transformation** used that is a **cartesian_transformation_operator**.

For any usage of an instance of **cartesian_transformation_operator** to define the transformation information of an instance of **assembly_component_usage** the derived attribute **scl** shall be 1.0, since scaling is not allowed for components within an assembly.

5.2.1.7 Document management

5.2.1.7.1 Document identification

This standard deals with documents as products, according to an interpretation of 'Document as Product'. As with 'Part as Product', there are three basic concepts central to document identification:

— product, product versions, and views on product versions;

— context information;

— type classification.

These fundamental concepts are described for 'Part as Product' also in clause 5.2.1.2. The following provides specifics on the distinction and additions for the 'Document as Product' approach.

'Document as Product' identifies a managed document object in a PDM system. A managed document is under revision control, and may distinguish various representation definitions of a document version. The document version represents the minimum identification of a managed document under revision control. A document representation definition may optionally be associated with one or more constituent external files that make it up.

EXAMPLE 1 A configuration controlled managed paper document like a drawing would generally be represented by the entity **product**, with version identification and a (physical) representation/view definition according to the 'Document as Product' approach.

External files in the PDM schema represent a simple external reference to a named file. An external file is not managed independently by the system - there is usually no revision control or any representation definitions of external files. Version identification may optionally be associated with an external file, but this is for information only and is not used for managed revision control.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

If a file is under configuration control, it should be represented as a constituent of a document definition. In this case it is actually the managed document that is under direct configuration control, the file is in this way indirectly under configuration control. A change to the file results in a change to the managed document (i.e., a new version) - the changed file is a constituent of a document definition of the new document version. A simple external reference alone is not configuration controlled, it is just an external file reference to product data.

Documents may be associated with product data in a specified role, to represent some relationship between a document and other elements of product data. Constraints may also be specified on this association, in order to distinguish an applicable portion of an entire document or file in the association. With 'Document as Product', additional entities are required to relate a managed document to other product data. Included among these is the entity **document**. The **document.id** should not be used as valid user data - the **document** entity does not always need to be instantiated using 'Document as Product', it is done only to assign the **document** to other product data via **applied_document_reference**.

5.2.1.7.2 Document as product

The interpretation of 'Document as Product' uses basic product master identification for the fundamental requirements of document identification, versioning, and representation definition. 'Document as Product' is distinguished from 'Part as Product' in each of the three basic elements of product identification:

— product, product versions, and views on product versions - document identification has specific requirements to assign documents to other product data, and to optionally associate with the constituent external file(s) that make up a specific document definition;

— context information - document identification has different context information than part identification;

— type classification - document identification has a different type classification than part identification.

Document, Document versions, and Document definitions

As with 'Part as Product', the concepts of base identification, version identification, and view definition are structurally the same as in 'Document as Product'.

Base document identification is represented by the entity **product** referred to by a **product_related_product_category** with a **name** of 'document' (to make the destinction to 'Part as Product') and is always associated with at least one document version represented by the entity **product_definition_formation**. Multiple document versions of a base document identification may be related together by **product_definition_formation_relationship** to represent document version history.

Context information

Context information provides a scope and necessary circumstance for product identification information. It consists of two separate and related areas:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— Application Protocol Identification;

— Product_definition_context.

Application protocol identification and general context information are handled structurally the same for 'Document as Product' as for 'Part as Product'. A single instance of the entity **application_context** should be referenced by all **product_context** entities, for both parts and documents. This **application_context** should be referenced by the single instance of the entity **application_protocol_definition**.

The application context information is managed differently to distinguish documents from parts:

— Life-cycle information is not maintained for 'Document as Product', as it is for 'Part as Product' to identify the development life-cycle stages by the **life_cycle_stage** attribute of **product_definition_context**. When a managed document is assigned to a part master, the life-cycle stage of the part master identification may be extrapolated as relevant to the document;

— to distinguish a document definition, the inherited **name** attribute of **product_definition_context** is set to 'digital document definition' or 'physical document definition' to distinguish from the value 'part definition' used in 'Part as Product'. A 'digital document definition' represents an electronic document while a 'physical document definition' stands for a 'hardcopy', typically a paper document.

5.2.1.7.3 Document definition

The **product_definition** entity denotes the definition of a particular view of a representation of a document version. There may be more than one document definition associated with a single document version. The document definition of a document version is used for association of document properties, to build document structures, or to associate a document with the set of constituent external files that make it up. The entity **product_definition** supports property association and document structure by **product_definition_relationship**. The subtype **product_definition_with_associated_documents** is used to associate a representation of a document version with the set of constituent files that make it up. The **id** attribute indicates the unique identifier of the document definition. The value shall be unique relative to other **product_definition** entities related to the same **product_definition_formation**. The **description** attribute provides optional additional words describing the document definition; the **formation** attribute references the document version of which this is a document definition; the **frame_of_reference** attribute references the context information related to this document definition.

5.2.1.7.4 Document type classification

Following the 'document as product' approach the type classification of managed documents is done in symmetry to the specific type classification for parts.

There are two classification mechanisms that can be used when exchanging classification information with this Standard. One type of classification works by assigning categories to product data items. These categories are identified by name labels that define the related classification. This type of classification is

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

referred to as specific classification in the ARM. It provides the basic capability to distinguish **product** entities interpreted to represent documents from those interpreted as parts by **product_related_product_category** referring to the product and with the inherited **name** attribute set to 'document' for the 'Document as Product' case or to 'part', 'tool', or 'raw material' for the 'Part as Product' case. Other values for the **name** attribute may be used additionally for a more specific classification of **documents**.

The specific classification capability relies exclusively on the name labels of the categories for the interpretation of the category semantics. Exchanges of specific classification information are only meaningful when the category names are agreed upon between the exchange partners.

All the categories used for the specific document type classification of managed documents should be defined in a single taxonomy. The category hierarchy is defined via relating the categories as super/subcategories by a **product_category_relationship**.

To fulfil advanced requirement there is the possibility to classify product data items according to a classification system with explicit reference to the classification criteria and related properties of the product data items. This classification mechanism is called General_classification in the ARM. The class or **externally_defined_class** entity identifies the classification information. This information can be associated to product, **product_definition_formation**, **product_definition** and **document_file** by **applied_classification_assignment**. It allows for the classification of documents, document versions, document representations and document files in the ARM.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

5.2.1.7.5 External files

External files represent a simple external reference to a named file. The external file may identify a digital file or a physical, 'hardcopy' file. As opposed to a managed 'Document as Product', an external file is not managed by the system - there is no capability for managed revision control or any document representation definitions for an external file. An external file is simply an external reference that may be associated with other product data. **Document_file** properties may be associated with an external file as with an identified managed document. In the case where properties differ with different versions, the managed 'Document as Product' approach shall be used.

If a file is under configuration control, it should be represented as a constituent of a document definition view/representation according to 'Document as Product'. In this case, it is actually the managed document that is under direct configuration control; the file is, in this way, indirectly under configuration control. A change to the file results in a change to the managed document (i.e., a new version) - the changed file would be mapped as a constituent of a view/representation definition of the new document version. A simple external reference alone is not configuration controlled, it is just an external file reference to product data.

While managed revision control representing multiple versions and version history is not available for external files, external files may have an optional version identification providing a string labelling the version of the file. Identification of an external file is done using the entity **document_file**. The **document_file** entity is a defined subtype of the entity **document**. It is also a subtype of the entity **characterized_object**, which allows association of properties to the identification of an external file.

 © ISO 2001 – All rights reserved

A simple one-level type classification can be applied to external files. A **document_file** provides in its attribute kind a pointer to the entity **document_type**. **Document_type.product_data_type** can be used for the classification of the type of the **document_file**. This simple classification shall only be used, if the 'Document as Product' approach is not used.

5.2.1.8 Specification control

This clause describes the AIM entities used by this part of ISO 10303 that provide the capability to describe automotive products with a large number of variants.

EXAMPLE 1 Examples for automotive products are passenger cars, trucks, busses, engines, or components of these products.

Because of the large number of variants there is no explicit representation for each of the variants that could be produced. The main concepts that are used to handle this large number of variants are illustrated in Figure 81.

These main concepts are the following:

— **product_class** is used to identify a set of similar products to be offered to the market;

A **product_class** is a **product_concept** and a **characterized_object**. The **characterized_object** may have **property_definition** entities associated to it through **property_definition.definition** and the select type **characterized_definition**. The instances of **product_class** may build a hierarchical tree-like structure through instances of **product_concept_relationship** that have the attribute **name** set to 'hierarchy' and that reference with the attribute **related_product_concept** the **product_class** that is a subclass of the **product_class** referenced by the attribute **relating_product_concept**.

— **product_concept_feature** is used to describe a characteristic of the products within a **product_class**;

The **product_concept_feature** is associated to a **product_class** through a **product_concept_feature_association** with the attribute name set to 'replaceable standard', 'non replaceable standard', 'availability', 'identification', 'option', 'part usage', or any other non standardized value. For a definition of the meaning of the standardized values see ARM definition for Class_specification_association in clause 4.2.67.3 for the permissive list definition. A **package_product_concept_feature** is a subtype of **product_concept_feature** that is used when the characteristic is in fact a set of other characteristics, e.g., a package of several options for a passenger car. In this case there is an **inclusion_product_concept_feature**, a subtype of **conditional_concept_feature**, with the inherited attribute **condition** referencing a **concept_feature_relationship_with_condition** with the attribute **conditional_operator** set to 'implication'. The inherited attribute **relating_product_concept_feature** of the **concept_feature_relationship_with_condition** references the **package_product_concept_feature**, and the inherited attribute **related_product_concept_feature** references either the one **product_concept_feature** that belongs to the package or another **conditional_concept_feature** that references the **product_concept_feature** instances of the package through an 'and' operation (for an example of package with two **product_concept_feature** see figure 82).

— **product_concept_feature_category** is used to group similar instances of **product_concept_feature**, e.g., the different outside colour characteristics of the products;

A **product_concept_feature_category** is a **group** that groups instances of **product_concept_feature**. Instances of **product_concept_feature** are assigned to **product_concept_feature_category** through **applied_group_assignment** that is a subtype of **group_assignment**. For this **group_assignment** the attribute **items** references, through the select type **group_item**, instances of **product_concept_feature** or **package_product_concept_feature**, the attribute **assigned_group** references **product_concept_feature_category** or **exclusive_product_concept_feature_category**, the attribute **role** references **object_role** with the attribute **name** set to 'specification category member'.

Exclusive_product_concept_feature_category is a subtype of **product_concept_feature_category** that is used when the members of the **group** are mutually exclusive in their usage within a product, e.g., there is exactly one outside colour that can be choosen for a particular product. **Product_concept_feature_category** is associated to **product_class** through **product_concept_feature_category_usage** that is subtype of **group_assignment**. For this **group_assignment** the attribute **items** references, through the select type **category_usage_item**, an instance of **product_class**, the attribute **assigned_group** references **product_concept_feature_category** or **exclusive_product_concept_feature_category**, the attribute **role** references **object_role** with the attribute **name** set to 'mandatory category usage' or 'optional category usage'. For a definition of the meaning of the two values see ARM definition for Class_category_association in clause 4.2.64.3.

— **conditional_concept_feature** is used to control the usage of a product classified as 'part' or 'tool' (by **product_related_product_category**) within the products of a **product_class** and to represent global conditions for instances of a **product_class**;

The **conditional_concept_feature** is subtype of **product_concept_feature**. The **conditional_concept_feature** is used to build up boolean conditions for instances of **product_concept_feature**. The **conditional_concept_feature** references with its attribute **condition** a **concept_feature_relationship_with_condition** that represents a binary boolean operation. A **concept_feature_relationship_with_condition** is subtype of **concept_feature_relationship** with the attribute **conditional_operator** pointing to a **concept_feature_operator** with the attribute **name** set to 'and', 'or', 'oneof', 'not', or 'implication'. The intended usage of the unary 'not' operation is that the inherited attributes **relating_product_concept_feature** and **related_product_concept_feature** reference the same instance of **product_concept_feature**. The value 'implication' is only allowed, if a suptype of **conditional_concept_feature** is used, i.e., **inclusion_product_concept_feature**. This is ensured by the rule **restrict_concept_feature_operator**. For a definition of the meaning of the other values see ARM definition for Specification_expression in clause 4.2.470.4.

Conditional_concept_feature may be associated to a **product_class** through **product_concept_feature_association** with the attribute **name** set to 'part usage', 'identification', 'validity', 'design case', or any other non standardized value. For a definition of the meaning of the standardized values see ARM definition of Class_condition_association in clause 4.2.65.3. The value 'part usage', which is also applicable for the association of a **product_concept_feature** to a **product_class**, see above, indicates that the **conditional_concept_feature** (or **product_concept_feature**) controls the usage of a part within a product of the associated **product_class**. In this case the **product_concept_feature_association** is

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

referenced by a **configured_effectivity_context_assignment** that is a subtype of **effectivity_context_assignment** through the select type **configured_effectivity_context_item**.

— **product_definition** that has a **product_definition_context** with the inherited attribute **name** set to 'functional definition' is used to describe the functional requirements for the products or the components of the products of a **product_class**;

Such instances of **product_definition** for functional requirements may be related to instances of **product_class** through an instance of **configuration_design** and **configuration_item**. In this case the attribute **name** of **configuration_design** is set to 'functionality'. For a definition of the meaning of the standardized value see ARM definition of Class_structure_relationship in clause 4.2.68.4.

— **product_definition** that has a **product_definition_context** with the inherited attribute **name** set to 'conceptual definition' is used to describe the common decomposition structure of all products of a **product_class**;

Such instances of **product_definition** for a common decomposition structure may be related to instances of **product_class** through an instance of **configuration_design** and **configuration_item**. In this case the attribute name of **configuration_design** is set to 'realization'. For a definition of the meaning of the standardized value see ARM definition of Class_structure_relationship in clause 4.2.68.4.

— **product_definition** that has a **product_definition_context** with the inherited attribute **name** set to 'alternative definition' is used to describe the variants for a **product_definition** with contect 'functional definition' or 'conceptual definition';

An instance of **product_definition** with context 'alternative definition' shall be associated to another product definition where it is a variant of through an instance of **product_definition_relationship** with the attribute **name** set to 'solution alternative definition'. The **related_product_definition** points to the variant (with context 'alternative definition') and the **relating_product_definition** references a **product_definition** with context 'functional definition', 'conceptual definition', or 'alternative definition'. In the latter case the **product_definition** instance with context 'alternative solution' defines a variant of another instance of **product_definition** with context 'alternative solution', e.g., where the first level defines technically different solutions and the second level defines different suppliers for the same technical solution.

All instances of **product_definition** with context 'alternative definition' that are defined through this path as variant of the same instance of **product_definition** are the mutually exclusive alternate solutions, i.e., variants.

— **product_definition** that has a **product_definition_context** with the inherited attribute **name** set to 'part occurrence' is used to identify an occurrence of a component in an assembly structure, e.g., to identify the component occurrences of a **product_definition** with context 'alternative definition';

A **product_definition** with context 'part occurrence' defines exactly one occurrence of a part within a given assembly structure. An instance of **product_definition** with context 'part occurrence' may be defined as an element, i.e., as **related_product_definition**, of a **product_definition** instance with context

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

'alternative solution', i.e., as **relating_product_definition**, through a **product_defininition_relationship** with the attribute **name** set to 'realization'.

A **product_definition** with context 'part occurrence' may also represent a component occurrence in an explicit product structure defined by **assembly_component_usage**. In this case it is linked to the **assembly_component_usage** by a **product_definition_occurrence_relationship**, see clause 5.2.1.5.

— **product_definition_usage** with the attribute **name** set to 'decomposition', 'occurrence', 'realization', 'functionality', or 'specializaton' is used to define the structure for **product_definition** instances with context 'functional definition', 'conceptual definition', or 'alternative definition' as **relating_product_definition**;

The **related_product_definition** is an instance of **product_definition** with context 'functional definition', 'conceptual definition', or 'part occurrence'. With this tree-like decomposition structures for **product_definition** instances with the same context, attribute **name** set to 'decomposition', 'specialization', or 'occurrence' as well as relationships between **product_definition_instances** with different context, attribute **name** set to 'realization' or 'functionality', can be defined. For a detailed definition of the meaning of the standardized values for the attribute **name** of **product_definition_relationship** see ARM definition of Product_structure_relationship in clause 4.2.400.4.

— **configured_effectivity_context_assignment** and **configured_effectivity_assignment** are used to link a **product_definition** instance with context 'part occurrence', 'alternative definition', 'conceptual definition', or 'functional definition' with its usage case, i.e., the condition under which it is used;

The **configured_effectivity_context_assignment** is a subtype of **effectivity_context_assignment** that references with its attribute **items**, through the select type **configured_effectivity_context_item**, the **product_concept_feature_association** that defines the usage case or condition. The inherited attribute **assigned_effectivity_assignment** references the **configured_effectivity_assignment** instance.

Configured_effectivity_assignment is a subtype of **effectivity_assignment** that references with its attribute **items**, through the select type **configured_effectivity_item**, the **product_definition** with context 'part occurrence', 'alternative definition', 'conceptual definition', or 'functional definition' to which the usage case or condition applies, e.g., the variant to be controlled. The attribute **role** references an **object_role** instance with the attribute **name** set to 'design' or 'usage' and with the attribute **description** set to 'inherited', 'local', or 'exception'. For a definition of the meaning of the standardized values for the **name** attribute and for the **description** attribute see ARM definition of Configuration in class 4.2.94.1 and clause 4.2.94.3 respectively.

Configured_effectivity_assignment references with its inherited attribute **assigned_effectivity** an instance of **effectivity** that is instantiated solely as the supertype **effectivity** (i.e. not as one of the **effectivity** subtypes) with an **id** of 'configuration validity' to indicate the valid use of the item contained in the **items** attribute. **Dated_effectivity** or **time_interval_based_effectivity** instances may additionally be assigned to a **configured_effectivity_assignment** through **applied_effectivity_assignment** instances to indicate the time range for which the configuration is valid.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— **configurable_item** is used to identify a manufacturable product out of a **product_class** by its specific characteristics (**product_concept_feature** instances), e.g., a customer order for a passenger car;

Configurable_item is a subtype of **configuration_item** that references with its inherited attribute **item_concept** the **product_class** of the manufacturable product. The attribute **item_concept_feature** points to a set of **product_concept_feature_association** instances that define the specified characteristics of the manufacturable product.

— **product_definition** that has a **product_definition_context** with the inherited attribute **name** set to 'physical occurrence' is used to identify actually manufactured physical parts or products by their serial number, lot id, or inventory number.

The attribute **id** of the **product_definition** instance represents the serial number, the lot id and/or inventory number may be associated to this instance additionally through **applied_identification_assignment** with the attribute **role** referencing an instance of **identification_role** with the attribute **name** set to 'lot context' and/or 'inventory number', respectively. If none of these ids are defined, then **product_definition** with context 'physical occurrence' shall be linked to a **product_definition** with context 'part definition' through a **product_definition_relationship** with name 'physical realization'.

5.2.1.9 Form Features

This clause describes the concept concerning the definition and application of form features in this part of ISO 10303. This standard includes the definition of various form features for the application in panel like parts, i.e., with negligible thickness, and for the application in solid volume parts. Also included is a concept for so-called general features whose semantics and parameters are not predefined as well as for transition features and for threads. This standard distinguishes between the definition of the features that is realized by the entity **feature_definition** which is a subtype of **characterized_object** and their occurrence on a part. Predefined form features specified for an application in panels are **bead**, **joggle**, **hole_in_panel**, **barring_hole**, **locator**, and **feature_in_panel** that has either the shape of a boss, a pocket, or a stairstep. These features are provided with a set of parameters, profiles, or paths that are sufficient to determine the shape of a part after the feature is applied. Predefined form features specified for an application in solid parts are **boss**, **pocket**, **rib**, **round_hole**, and **slot**. These features are specified by a volume that is defined by a set of parameters, a profile, and by a path along which the profile is swept. The feature itself is created by adding or subtracting this volume from the shape of the part. All additional parameters are provided in an implicit representation that is of type **shape_representation_with_parameters**. For the definition of predefined features a set of predefined profiles, i.e. **circular_closed_profile**, **ngon_closed_profile**, **rectangular_closed_profile**, **partial_circular_profile**, **rounded_u_profile**, **square_u_profile**, **tee_profile**, and **vee_profile**, as well as two general profiles, **closed_path_profile** and **open_path_profile**, are included. The paths that may be used to define form features are represented by the entity **path_feature_component**. This is either a predefined type of path, if **path_feature_component.name** is set to 'linear', 'partial circular', or 'complete circular', that is specified by a set of parameters or a general type of path, if the **path_feature_component.name** is set to 'complex'. In the latter case the path is specified by a **curve**. Paths and profiles are specified as instances of **shape_aspect**. Here, a distinction is made between the definition of such feature components and their occurrence. The definitions of paths and profiles are subtypes of **shape_aspect** that reference a **fea-**

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

ture_component_definition which is a subtype of **characterized_object** as **of_shape**. This definition of a feature component is associated with its occurrence which is a **shape_aspect** of a **feature_definition** through a subtype of **shape_aspect_relationship** named **shape_defining_relationship**. For the application of form feature definitions this standard supports two approaches:

— by the entity **instanced_feature** that is a **shape_aspect** of the **product_definition_shape** and at the same time a subtype of **feature_definition**;

— by the entity **placed_feature** that is also a **shape_aspect** of the **product_definition_shape** and related to the **feature_definition** by an instance of **mapped_item** and **representation_map**.

The approach using **instanced_feature** supports the identification of 'areas of interest' on an already designed shape that are of a certain meaning to the user, e.g., that correspond to a process operation. The identification of parameters on these features does not mean that a variation of the parameter values results in an automatic update of the shape but is only meant to support the specification of these areas in a more appropriate way, e.g., to support process planning. In the case of the application of a feature as an **instanced_feature** the feature itself as well as all of its components, paths or profiles, are defined in the part coordinate system. The approach using **placed_feature** supports the definition of the feature independent of its application in its own coordinate system and a placement of the **representation** of the **feature_definition** into the **representation** of the **placed_feature** using a **mapped_item** and a **representation_map**. The shape of the feature need not be represented since a receiving system is supposed to be able to create the shape that results from the application of the **feature_definition** on a base shape interpreting the values of the feature parameters and the semantics included in the type of feature. In the case of the application of a feature as a **placed_feature** the feature itself and possibly a path used for the feature definition are defined in one coordinate system, a profile that is used is defined in its own coordinate system. Profiles are placed in the feature coordinate system using a **mapped_item** and a **representation_map**. This standard supports the application of surface conditions and tolerances to form features only implicitly by applying surface conditions and tolerances to elements of the shape representation of the form feature. An exception are tolerances applied to the location and orientation of the features that may be realized by using **axis2_placement** entities representing the feature coordinate system. Thread features are available as **instanced_feature**s only. The identification of a thread is splitted in two parts. First, a type of thread is specified. This specification may represent all necessary parameters either explicitly, if a **thread** is used, or by an **externally_defined_feature_definition** that refers to an external specification. The type of thread is applied to the shape of a part by an **applied_area** that identifies the effective length ant the placement of the thread onto the part. Two mechanisms of creating complex features using the flat **feature_definition**s as base features are supported, the **compound_feature** and the **replicate_feature**. The **compound_feature** allows to create hierarchies of either solid features or panel features.

EXAMPLE 1 In order to create a fixture point on a solid piece part, a **compound_feature** is created that consists of a **boss** and a **thread_feature**.

A special case of a **compound_feature** is the **composite_hole**, which is the definition of two commonly used types of **compound_feature**s, the countersunk and the counterbore hole. The other mechanism is the **replicate_feature** that supports the repretative use of a base feature in order to create patterns on the surface of a piece part. Three types of patterns are supported. The **circular_pattern** and the

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

rectangular_pattern define the layout of the resulting pattern by parameters. The resulting pattern lies in a plane. The ommission and offsetting of elements of the pattern are supported by the use of **pattern_omit_membership** and **pattern_offset_membership**, which identify **shape_aspect**s of **feature_component_definition**s that represent the omitted or offsetted elements of a pattern. The layout resulting from such an operation is identified as a **modified_pattern**. The **feature_pattern** is the third mechanism for creating patterns. It supports the definition of an arbitrary layout that is not restricted to lying in a plane. Such a pattern is defined by a set of **axis2_placement**s that participate in the implicit representation of the **feature_pattern**. Compound features and patterns of features may be nested within each other and are applicable for both the **instanced_feature** and the **placed_feature** approach.

EXAMPLE 2 A flange is created by means of a **compound_feature** that consists of a **round_hole** and a **thread** applied to it, and a **circular_pattern** that distributes the compound along the flange.

5.2.1.10 Process planning

This clause describes the concept concerning the definition and application of process plans and the included process operations in this part of ISO10303. This standard includes the definition of reusable process operations and occurrences of process operations in specific process plans. This standard defines the relation from a process operation to the concerned product description as input or output to that process operation. This standard also defines the relation from a process operation to the concerned tool or manufacturing resource as the resource used to perform the process operation. The manufacturing planning information is defined by a **process_plan**, which is a subtype of **action**. If the manufacturing planning information is directly concerned with a specific product version, **product_definition_formation**, as output from the process plan definition the manufacturing planning information is defined by **product_process_plan** which is subtype of **product_definition_process**. A version of the **process_plan** is defined by associating the supertype **action** with **identification_item**, **identification_assignment**and **identification_role** with the name value 'version'. Multiple **process_plan** objects can be related to each other using **action_relationship**. This relation is used to handle multiple versions of the same **process_plan** concerning the same product. The definition of a process step within a **process_plan** is described by **process_operation** which is a subtype of **action_method**. The **process_operation** defines a general process step and can be associated to multiple and different process plans, in this way reuse of generically defined process steps is allowed. When a process step is used in a process plan, the association is considered to define an occurrence of the **process_operation** in the **process_plan**. This association, occurrence, is defined by **action** and **action_relationship** linking the two by **action_relationship.related_action**. The relation to the concerned process step description is **action.choosen_method** which relates to the **process_operation** via its supertype **action_method**. The relation to the concerned process plan is **action_relationship.relating_action** which relates to the **process_plan**, or the **product_process_plan** and **product_definition_process** if a **product_definition_formation** is defined as output, via its supertype **action**. Two occurrences of a process step can be related to each other with **action_relationship**. The general use of this relationship is to build structures of occurrences, e.g. process operation lists. This relationship can express different semantics depending on the value assigned in **action_relationship.name**:

— 'alternative': This value gives that the action given by the **action_relationship.related** can be used as an alternative to the **action** given by the **action_relationship.relating**. This value can be used for two purposes, one where the related **action** performs the same result, e.g. a hole, as the relating

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

and the other where the related and relating represents two different paths in the process plan, for example running products through a storage area or not.

— 'decomposition': Provides an ability to describe hierarchical structure within a process plan. Can be used to define more detailed levels of a process. For example a milling process consists of rouge and fine operations. In this case **action_relationship.relating** shall give the action which is on a higher level and **action_relationship.related** shall give the action which is on the lower level in the hierarchy.

— 'exclusiveness': This value gives that the two associated action's may not have an overlap in time of execution. However the sequence is not relevant in this relationship.

— 'sequence': This value gives that the action given by the **action_relationship.relating** shall be completed before the **action_relationship.related** is allowed to start.

— 'simultaneity': This value gives that the two associated action's are carried out simultaneously. The time interval within which both action's have to take place to be considered simultaneous is defined by **applied_time_interval_assignment**.

The 'decomposition' and 'alternative' values give a structural meaning to the relationship whereas the 'sequence', 'exclusiveness' and 'simultaneity' values add the meaning on the time of execution to the relationship.

In order to express the refinement of parts or material into products by the process plan, relevant parts of the product structure or descriptions can be associated to a particular occurrence of a process step in the process plan. Association of the relevant product description is made by **product_process_association** where the value of **product_process_association.name** defines whether the associated product description appears as an input or an output to the occurrence of the process step. Values used are 'input' or 'output'. This assures that the input and output is relevant only for the occurrence of a particular process step within a particular process plan enabling the reuse of generically defined process steps.

To each occurrence of a process step the manufacturing resource(s) used to perform the operation can be associated using **requirement_for_action_resource** which is subtype from **action_resource_requirement**. The concerned occurrence of a process step is defined by **action_resource_requirement.operations** and the performing resource by **action_resource_requirement.resources**. The performing manufacturing resource is defined by **product_defintion_resource** which is subtype of **action_resource** and **product_definition** where the value of the associated **application_context_element.name** gives semantically different meaning to the use of the resource:

— **Product_definition** with **application_context_element.name** 'conceptual definition' and **product_definition.formation** associated to **product_definition_formation** with **product_category.name** 'conceptual product': This represents a conceptually defined manufacturing resource;

— **Product_definition** with **application_context_element.name** 'part definition': This represents a definition of a unique manufacturing resource of a certain type;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— **Product_definition** with **application_context_element.name** 'part occurrence': This represents a definition of a unique manufacturing resource, which occurs at a certain place in a manufacturing system structure.

Product_definition with **application_context_element.name** 'physical occurrence': This represents a physical manufacturing resource in an existing manufacturing system.

In the general case a textual description can be used to define a manufacturing resource. This definition is given in the **resource_requirement_type** by the **action_resource_requirement.kind**.

5.2.1.11 Dimensioning and Tolerances

This standard supports dimensioning with respect to size and location. The dimensions may be tolerated by individual tolerances or by provision of general tolerances. Default values may be assigned for thickness and dimensions through a **representation** that has a **representation_context** with a **context_type** of 'default setting' and a **name** of 'default thickness' for characterization of piece parts with an evenly shaped cross section or for sheet metal, and a **name** of 'default setting' for general tolerances that apply to all dimensions of a work piece. The concept of **limits_and_fits** and plus minus bounds by specification of a **tolerance_value** with **upper_bound** and **lower_bound** are supported. A tolerance table may be provided using a **default_tolerance_table** that consists of a set of **default_tolerance_table_cell**s which provide a relationship between ranges of dimensions and the applicable tolerance values. Geometric tolerances are supported as defined in ISO 10303-519 and are in accordance with ISO 1101. Location of parts in in datum reference frame is accomplished by use of **datum_target**s. These may be defined either explicitly by identification of a **shape_aspect** that refers to an area with a closed boundary, or implicitly using **placed_datum_target_feature**, by which points, lines, circles, and rectangles may be defined by specification of an **axis2_placement** and the necessary parameters. Compound datums that consist of two **datum** objects may be created using the **common_datum**. The usage of **common_datum** is shown in Figure 83.

The geometric tolerances support the concept of viewing planes, i.e., if a viewing plane is specified, the geometric tolerance applies in a tolerance zone that is bounded by two planes a distance apart as specified by the tolerance value, and with infinite extent normal to the viewing plane. This capability is provided for **line_profile_tolerance**, **parallelism_tolerance**, **perpendicularity_tolerance**, **position_tolerance**, **straightness_tolerance**, and **symmetry_tolerance**. A viewing plane is specified by a **shape_aspect_relationship** with a **name** of 'affected plane association' that associates the toleranced **shape_aspect** and another **shape_aspect** that identifies a plane, see Figure 84. In the case of using viewing planes, the **tolerance_zone** is made up by the superposition of all boundaries defined by the viewing planes. The necessity to associate viewing planes and the tolerance objects they apply to requires the instantiation of a **shape_aspect** of the tolerated item for each use case.

5.2.3.1 automotive_design entity definitions

5.2.3.1.1 applied_action_assignment

An **applied_action_assignment** is a type of **action_assignment** that assigns an **action** to an **action_item**.

EXPRESS specification:

```
*)
ENTITY applied_action_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF action_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **action** is assigned.

Associated global rule:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following global rule defined in this part of ISO 10303 applies to the **applied_action_assignment** entity:

– restrict_applied_action_assignment (see 5.2.4.78).

5.2.3.1.2 applied_action_request_assignment

An **applied_action_request_assignment** is a type of **action_request_assignment** that assigns an **versioned_action_request** to an **action_request_item**.

EXPRESS specification:

```
*)
ENTITY applied_action_request_assignment
  SUBTYPE OF (action_request_assignment);
  items : SET [1:?] OF action_request_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **versioned_action_request** is assigned.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **applied_action_request_assignment** entity:

– restrict_applied_action_request_assignment (see 5.2.4.79).

5.2.3.1.3 applied_approval_assignment

An **applied_approval_assignment** is a type of **approval_assignment** that assigns an **approval** to an **approval_item**.

EXPRESS specification:

```
*)
ENTITY applied_approval_assignment
  SUBTYPE OF (approval_assignment);
  items : SET [1:?] OF approval_item;
END_ENTITY;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

```
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **contract** is assigned.

5.2.3.1.8 applied_date_and_time_assignment

An **applied_date_and_time_assignment** is a type of **date_and_time_assignment** that assigns a **date_and_time** to a **date_and_time_item**.

EXPRESS specification:

```
*)
ENTITY applied_date_and_time_assignment
  SUBTYPE OF (date_and_time_assignment);
  items : SET [1:?] OF date_and_time_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **date_and_time** is assigned.

5.2.3.1.9 applied_date_assignment

An **applied_date_assignment** is a type of **date_assignment** that assigns a **date** to a **date_item**.

EXPRESS specification:

```
*)
ENTITY applied_date_assignment
  SUBTYPE OF (date_assignment);
  items : SET [1:?] OF date_item;
WHERE
 WR1: ( NOT ( SELF.role. name = 'actual end' ) ) OR
     item_correlation ( SELF.items , ['ACTION' ,
     'ORGANIZATIONAL_PROJECT' , 'EFFECTIVITY'] ) ;
END_ENTITY;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Attribute definitions:

items: the set of **items** to which the **date** is assigned.

Formal propositions:

WR1: If the **role** has a **name** of 'actual end', only items of type **action**, **organizational_project**, or **effectivity** shall be in the set of **items**.

5.2.3.1.10 applied_document_reference

An **applied_document_reference** is a type of **document_reference** that assigns a **document** to a **document_reference_item**.

EXPRESS specification:

```
*)
ENTITY applied_document_reference
  SUBTYPE OF (document_reference);
  items : SET [1:?] OF document_reference_item;
WHERE
 WR1: ( NOT ( SELF.role. name = 'general tolerance definition' )
     ) OR item_correlation ( SELF.items , ['REPRESENTATION'] ) ;
 WR2: ( SELF.role. name = 'general tolerance definition' ) OR
     item_correlation ( SELF.items , ['ACTION' ,
     'ACTION_DIRECTIVE' , 'ACTION_METHOD' ,
     'ACTION_RELATIONSHIP', 'APPLIED_ACTION_ASSIGNMENT' ,
     'APPROVAL' , 'CERTIFICATION' , 'CLASS' , 'CLASS_SYSTEM' ,
     'CONFIGURATION_DESIGN' , 'CONFIGURATION_ITEM' , 'CONTRACT'
     , 'FEATURE_DEFINITION' , 'GENERAL_PROPERTY' ,
     'MATERIAL_DESIGNATION' , 'ORGANIZATION' ,
     'ORGANIZATIONAL_PROJECT' , 'PERSON' , 'PRODUCT_CONCEPT' ,
     'PRODUCT_CONCEPT_FEATURE' ,
     'PRODUCT_CONCEPT_FEATURE_CATEGORY' , 'PRODUCT_DEFINITION' ,
     'PRODUCT_DEFINITION_FORMATION' ,
     'PRODUCT_DEFINITION_FORMATION_RELATIONSHIP' ,
     'PRODUCT_DEFINITION_RELATIONSHIP' ,
     'PRODUCT_DEFINITION_SUBSTITUTE' ,
     'PRODUCT_RELATED_PRODUCT_CATEGORY' , 'PROPERTY_DEFINITION'
     , 'REPRESENTATION' , 'RESOURCE_REQUIREMENT_TYPE' ,
     'SECURITY_CLASSIFICATION' , 'SHAPE_ASPECT' ,
     'SHAPE_ASPECT_RELATIONSHIP' , 'VERSIONED_ACTION_REQUEST'] )
     ;
END_ENTITY;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Attribute definitions:

items: the set of **items** to which the **document** is assigned.

Formal propositions:

WR1: If the **role** has a **name** of 'general tolerance definition', only items of type **representation** shall be in the set of **items**.

WR2: If the **name** of the **role** is not 'general tolerance definition', only items of type **action**, **action_directive**, **action_method**, **action_relationship**, **applied_action_assignment**, **approval**, **certification**, **class**, **class_system**, **configuration_design**, **configuration_item**, **contract**, **feature_definition**, **general_property**, **material_designation**, **organization**, **organizational_project**, **person**, **product_concept**, **product_concept_feature**, **product_concept_feature_category**, **product_definition**, **product_definition_formation**, **product_definition_formation_relationship**, **product_definition_relationship**, **product_definition_substitute**, **product_related_product_category**, **property_definition**, **representation**, **resource_requirement_type**, **security_classification**, **shape_aspect**, **shape_aspect_relationship**, or **versioned_action_request** shall be in the set of **items**.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **applied_document_reference** entity:

– restrict_default_settings (see 5.2.4.94).

5.2.3.1.11 applied_document_usage_constraint_assignment

An **applied_document_usage_constraint_assignment** is a type of **document_usage_constraint_assignment** that assigns a **document_usage_constraint** to a **document_reference_item**.

EXPRESS specification:

```
*)
ENTITY applied_document_usage_constraint_assignment
  SUBTYPE OF (document_usage_constraint_assignment);
  items : SET [1:?] OF document_reference_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **document_usage_constraint** is assigned.

5.2.3.1.12 applied_effectivity_assignment

An **applied_effectivity_assignment** is a type of **effectivity_assignment** that assigns an **effectivity** to an **effectivity_item**.

EXPRESS specification:

```
*)
ENTITY applied_effectivity_assignment
  SUBTYPE OF (effectivity_assignment);
  items : SET [1:?] OF effectivity_item;
WHERE
 WR1: SIZEOF ( ['AUTOMOTIVE_DESIGN.'+ 'LOT_EFFECTIVITY' ,
     'AUTOMOTIVE_DESIGN.'+ 'SERIAL_NUMBERED_EFFECTIVITY',
     'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION_EFFECTIVITY']*
     TYPEOF ( SELF.assigned_effectivity ) ) =0;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **effectivity** is assigned.

Formal propositions:

WR1: An **applied_effectivity_assignment** shall have an **assigned_effectivity** which is not of type **lot_effectivity**, **serial_numbered_effectivity**, or **product_definition_effectivity**.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **applied_effectivity_assignment** entity:

– product_definition_replacement_requires_effectivity_assignment (see 5.2.4.72);

– restrict_effectivity_assignment_for_class_category_usage (see 5.2.4.97).

5.2.3.1.13 applied_event_occurrence_assignment

An **applied_event_occurrence_assignment** is a type of **event_occurrence_assignment** that assigns an **event_occurrence** to an **event_occurrence_item**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
ENTITY applied_event_occurrence_assignment
  SUBTYPE OF (event_occurrence_assignment);
  items : SET [1:?] OF event_occurrence_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **event_occurrence** is assigned.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **applied_event_occurrence_-assignment** entity:

– restrict_applied_event_occurrence_assignment (see 5.2.4.81).

5.2.3.1.14 applied_external_identification_assignment

An **applied_external_identification_assignment** is a type of **external_identification_assignment** that assigns an external identifier and an external source to an **external_identification_item**.

EXPRESS specification:

```
*)
ENTITY applied_external_identification_assignment
  SUBTYPE OF (external_identification_assignment);
  items : SET [1:?] OF external_identification_item;
WHERE
 WR1: ( NOT ( SELF.role. name =
      'alternative document id and location' ) ) OR
      item_correlation ( SELF.items , ['DOCUMENT_FILE'] ) ;
 WR2: ( NOT ( SELF.role. name ='version' ) ) OR item_correlation
      ( SELF.items , ['EXTERNALLY_DEFINED_CLASS' ,
      'EXTERNALLY_DEFINED_GENERAL_PROPERTY'] ) ;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **identifier** is assigned.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Formal propositions:

WR1: If the **role** has a **name** of 'alternative document id and location', only items of type **document_file** shall be in the set of **items**.

WR2: If the **role** has a **name** of 'version', only items of type **externally_defined_class**, or **externally_defined_general_property** shall be in the set of **items**.

5.2.3.1.15 applied_group_assignment

An **applied_group_assignment** is a type of **group_assignment** that assigns a **group** to a **group_item**.

EXPRESS specification:

```
*)
ENTITY applied_group_assignment
  SUBTYPE OF (group_assignment);
  items : SET [1:?] OF group_item;
WHERE
 WR1: ( NOT ( SELF.role. name ='exclusiveness' ) ) OR
     item_correlation ( SELF.items , ['ACTION'] ) ;
 WR2: ( NOT ( SELF.role. name ='simultaneity' ) ) OR
     item_correlation ( SELF.items , ['ACTION'] ) ;
 WR3: ( NOT ( SELF.role. name = 'specification category member'
     ) ) OR item_correlation ( SELF.items ,
     ['PRODUCT_CONCEPT_FEATURE'] ) ;
 WR4: ( NOT ( SELF.role. name = 'group membership' ) ) OR
     item_correlation ( SELF.items ,
     ['GEOMETRIC_REPRESENTATION_ITEM' , 'SHAPE_ASPECT'] ) ;
 WR5: ( NOT ( SELF.role. name = 'group membership' ) ) OR ( (
     SIZEOF ( SELF.items ) = SIZEOF ( QUERY ( i <* SELF.items |
     'AUTOMOTIVE_DESIGN.'+ 'GEOMETRIC_REPRESENTATION_ITEM' IN
     TYPEOF ( i ) ) ) ) OR ( SIZEOF ( SELF.items ) = SIZEOF (
     QUERY ( i <* SELF.items | 'AUTOMOTIVE_DESIGN.'+
     'SHAPE_ASPECT' IN TYPEOF ( i ) ) ) ) ) ;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **group** is assigned.

Formal propositions:

WR1: If the **role** has a **name** of 'exclusiveness', only items of type **action** shall be in the set of **items**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

WR2: If the **role** has a **name** of 'simultaneity', only items of type **action** shall be in the set of **items**.

WR3: If the **role** has a **name** of 'specification category member', only items of type **product_concept_-feature** shall be in the set of **items**.

WR4: If the **role** has a **name** of 'group membership', only items of type **geometric_representation_-item** or **shape_aspect** shall be in the set of **items**.

WR5: If the **role** has a **name** of 'group membership', the set of **items** shall include either objects of type **geometric_representation_item** or **shape_aspect**.

5.2.3.1.16 applied_identification_assignment

An **applied_identification_assignment** is a type of **identification_assignment** that assigns an **identifier** to an **identification_item**.

EXPRESS specification:

```
*)
ENTITY applied_identification_assignment
  SUBTYPE OF (identification_assignment);
  items : SET [1:?] OF identification_item;
WHERE
 WR1: ( NOT ( SELF.role. name ='version' ) ) OR item_correlation
     ( SELF.items , ['ACTION' , 'ACTION_DIRECTIVE' ,

```
     'PRODUCT_DEFINITION_FORMATION' , 'PROPERTY_DEFINITION' ,
     'SECURITY_CLASSIFICATION_LEVEL' , 'SHAPE_REPRESENTATION'] )
     ;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **identifier** is assigned.

Formal propositions:

WR1: If the **role** has a **name** of 'version', only items of type **action**, **action_directive**, **shape_representation**, **effectivity**, **product_concept**, **configuration_item**, **product_definition**, **product_concept_feature**, **document_file**, **class**, **applied_identification_assignment**, **draughting_model**, **mechanical_design_geometric_presentation_representation**, or **presentation_area** shall be in the set of **items**.

WR2: If the **role** has a **name** of 'lot context', only items of type **product_definition** shall be in the set of **items**.

WR3: If the **role** has a **name** of 'property change id context', only items of type **property_definition_relationship**, **shape_aspect_relationship**, or **action_property** shall be in the set of **items**.

WR4: If the **role** has a **name** of 'size id', only items of type **dimensional_size** shall be in the set of **items**.

WR5: If the **role** has a **name** of 'model change id', only items of type **property_definition**, or **action_property** shall be in the set of **items**.

WR6: If the **role** has a **name** of 'alias', only items of type **application_context**, **approval_status**, **assembly_component_usage**, **class**, **class_system**, **document_type**, **draughting_model**, **general_property**, **mechanical_design_geometric_presentation_representation**, **organization**, **product**, **product_concept**, **product_concept_feature**, **product_concept_feature_category**, **product_definition**, **product_definition_formation**, **property_definition**, **security_classification_level**, or **shape_representation** shall be in the set of **items**.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **applied_identification_assignment** entity:

– restrict_version_assignment_for_applied_identification_assignment (see 5.2.4.197).

5.2.3.1.17 applied_ineffectivity_assignment

An **applied_ineffectivity_assignment** is a type of **effectivity_assignment** that specifies that the associated **effectivity_item**s are set ineffective.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
ENTITY applied_ineffectivity_assignment
  SUBTYPE OF (effectivity_assignment);
  items : SET [1:?] OF effectivity_item;
WHERE
 WR1: SIZEOF ( ['AUTOMOTIVE_DESIGN.'+ 'LOT_EFFECTIVITY' ,
     'AUTOMOTIVE_DESIGN.'+ 'SERIAL_NUMBERED_EFFECTIVITY' ,
     'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION_EFFECTIVITY']*
     TYPEOF ( SELF.assigned_effectivity ) ) =0;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** that are set ineffective by the **applied_ineffectivity_assignment**.

Formal propositions:

WR1: An **applied_ineffectivity_assignment** shall have an **assigned_effectivity** which is not of type **lot_effectivity**, **serial_numbered_effectivity**, or **product_definition_effectivity**.

5.2.3.1.18 applied_name_assignment

An **applied_name_assignment** is a type of **name_assignment** that assigns a **name** to a **name_item**.

EXPRESS specification:

```
*)
ENTITY applied_name_assignment
  SUBTYPE OF (name_assignment);
  items : SET [1:?] OF name_item;
WHERE
 WR1: ( NOT ( SELF.role. name = 'kinematic element name' ) ) OR
     item_correlation ( SELF.items , ['KINEMATIC_STRUCTURE' ,
     'KINEMATIC_JOINT' , 'KINEMATIC_LINK'] ) ;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **name** is assigned.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Formal propositions:

WR1: If the **role** has a **name** of 'kinematic element name', only items of type **kinematic_structure**, **kinematic_joint**, or **kinematic_link** shall be in the set of **items**.

5.2.3.1.19 applied_organization_assignment

An **applied_organization_assignment** is a type of **organization_assignment** that assigns an **organization** to an **organization_item**.

EXPRESS specification:

```
*)
ENTITY applied_organization_assignment
  SUBTYPE OF (organization_assignment);
  items : SET [1:?] OF organization_item;
WHERE
 WR1: ( NOT ( SELF.role. name = 'organization in contract' ) )
     OR item_correlation ( SELF.items , ['CONTRACT'] ) ;
 WR2: ( NOT ( SELF.role. name = 'signing for contract' ) ) OR
     item_correlation ( SELF.items ,
     ['APPLIED_ORGANIZATION_ASSIGNMENT'] ) ;
 WR3: ( NOT ( SELF.role. name = 'validity context' ) ) OR
     item_correlation ( SELF.items , ['ACTION_PROPERTY' ,
     'RESOURCE_PROPERTY' , 'PROPERTY_DEFINITION'] ) ;
 WR4: ( NOT ( SELF.role. name = 'alias scope' ) ) OR
     item_correlation ( SELF.items ,
     ['APPLIED_IDENTIFICATION_ASSIGNMENT'] ) ;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **organization** is assigned.

Formal propositions:

WR1: If the **role** has a **name** of 'organization in contract', only items of type **contract** shall be in the set of **items**.

WR2: If the **role** has a **name** of 'signing for contract', only items of type **applied_organization_assignment** shall be in the set of **items**.

WR3: If the **role** has a **name** of 'validity context', only items of type **action_property**, **resource_property**, or **property_definition** shall be in the set of **items**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

WR4: If the **role** has a **name** of 'alias scope', only items of type **applied_identification_assignment** shall be in the set of **items**.

5.2.3.1.20 applied_organizational_project_assignment

An **applied_organizational_project_assignment** is a type of **organizational_project_assignment** that assigns an **organizational_project** to an **organizational_project_item**.

EXPRESS specification:

```
*)
ENTITY applied_organizational_project_assignment
  SUBTYPE OF (organizational_project_assignment);
  items : SET [1:?] OF organizational_project_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **organizational_project** is assigned.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **applied_organizational_-project_assignment** entity:

– restrict_applied_organizational_project_assignment (see 5.2.4.82).

5.2.3.1.21 applied_person_and_organization_assignment

An **applied_person_and_organization_assignment** is a type of **person_and_organization_assign-ment** that assigns a **person_and_organization** to a **person_and_organization_item**.

EXPRESS specification:

```
*)
ENTITY applied_person_and_organization_assignment
  SUBTYPE OF (person_and_organization_assignment);
  items : SET [1:?] OF person_and_organization_item;
WHERE
 WR1: ( NOT ( SELF.role. name = 'signing for contract' ) ) OR
     item_correlation ( SELF.items ,
     ['APPLIED_ORGANIZATION_ASSIGNMENT'] ) ;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **person_and_organization** is assigned.

Formal propositions:

WR1: If the **role** has a **name** of 'signing for contract', only items of type **applied_organization_assignment** shall be in the set of **items**.

5.2.3.1.22 applied_presented_item

An **applied_presented_item** is a type of **presented_item** that that assigns an item in the **presented_item_select** to a **presentation_representation** or a **presentation_set**.

EXPRESS specification:

```
*)
ENTITY applied_presented_item
  SUBTYPE OF (presented_item);
  items : SET [1:?] OF presented_item_select;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **presentation_representation** or **presentation_area** is assigned.

5.2.3.1.23 applied_security_classification_assignment

An **applied_security_classification_assignment** is a type of **security_classification_assignment** that assigns a **security_classification** to a **security_classification_item**.

EXPRESS specification:

```
*)
ENTITY applied_security_classification_assignment
  SUBTYPE OF (security_classification_assignment);
  items : SET [1:?] OF security_classification_item;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **security_classification** is assigned.

5.2.3.1.24 applied_time_interval_assignment

An **applied_time_interval_assignment** is a type of **time_interval_assignment** that assigns a **time_interval** to a **time_interval_item**.

EXPRESS specification:

```
*)
ENTITY applied_time_interval_assignment
  SUBTYPE OF (time_interval_assignment);
  items : SET [1:?] OF time_interval_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **time_interval** is assigned.

5.2.3.1.25 attribute_language_assignment

A **attribute_language_assignment** is a type of **attribute_classification_assignment**. It associates the specification of a language used for a string valued attribute to the entity instance that has this attribute. The attribute value is further classified as either being specified in the original language or as a translation thereof.

EXPRESS specification:

```
*)
ENTITY attribute_language_assignment
  SUBTYPE OF (attribute_classification_assignment);
  items : SET [1:?] OF attribute_language_item;

DERIVE
language : label := SELF\attribute_classification_assignment.
                        assigned_class.name;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
WHERE
 WR1:SELF\attribute_classification_assignment. role.name IN
     ['primary' , 'translated'];
 WR2:'AUTOMOTIVE_DESIGN.'+'LANGUAGE' IN TYPEOF (
     SELF\attribute_classification_assignment. assigned_class )
     ;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of objects to which the language classification is assigned.

language: The **language** specifies the **name** of the **assigned_class** that provides an identification for the language in which an attribute value is specified.

Formal propositions:

WR1: The language used to specify the string valued attributes in the set of **items** shall be marked either as the 'primary' language or as 'translated'.

WR2: The instance referenced as **assigned_class** shall be of type **language**.

5.2.3.1.26 barring_hole

A **barring_hole** is a type of **feature_definition** representing a hole in a panel part where the puched material is partially bended in the punch direction. See ARM definition for Panel_hole_with_barring in paragraph 4.2.336 for more information.

EXPRESS specification:

```
*)
ENTITY barring_hole
  SUBTYPE OF (feature_definition);
WHERE
 WR1: SIZEOF ( QUERY ( sa <* get_shape_aspects ( SELF ) | ( sa.
     name = 'hole profile' ) AND ( sa. description =
     'closed profile occurrence' ) AND ( SIZEOF ( QUERY ( sar <*

Formal propositions:

WR1: The **boss_top** shall be an aspect of the shape of a **feature_component_definition**.

WR2: The **description** of the **boss_top** shall be either 'planar' or 'complex'.

WR3: If the **description** of the **boss_top** is 'planar', the **boss_top** shall have exactly one **direction_-shape_representation**.

WR4: If the **description** of the **boss_top** is 'planar', the **boss_top** shall have exactly one **location_-shape_representation**.

WR5: If the **description** of the **boss_top** is 'complex', the **boss_top** shall have exactly one **face_-shape_representation**.

WR6: The **boss_top** shall be the **relating_shape_aspect** in exactly one **feature_component_relation-ship** with a **name** of 'boss top usage' and a **description** of either 'boss height start' or 'boss height end' in which the **related_shape_aspect** is a **shape_aspect** of a **boss** with a **name** of 'top condition occurrence'.

WR7: The **boss_top** shall have at most one **shape_representation_with_parameters** to specify its implicit representation. If present, this implicit representation shall contain at most one **representation_-item** it its set of **items**.

WR8: If present, the **representation_item** shall be of type **measure_representation_item** and **length_-measure_with_unit** and shall have a **name** of 'top radius'.

5.2.3.1.31 camera_image_2d_with_scale

A **camera_image_2d_with_scale** is a type of **camera_image** with a derived **scale**. The **scale** is the ratio between the size of the viewport and the size of the view window of the **camera_model**.

NOTE 1 - The viewport specifies the rectangular boundary of the view as it is depicted in the drawing sheet.

NOTE 2 - The definition of this entity is identical to the definition in ISO 10303-202.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
ENTITY camera_image_2d_with_scale
  SUBTYPE OF (camera_image);

DERIVE
scale: positive_ratio_measure :=
       (SELF\mapped_item.mapping_target\planar_extent.size_in_x) /
       (SELF\mapped_item.mapping_source.mapping_origin\
             camera_model_d2.view_window\planar_extent.size_in_x);
WHERE
 WR1: ( 'AUTOMOTIVE_DESIGN.'+ 'CAMERA_MODEL_D2' IN TYPEOF (

Formal propositions:

WR1: The **circular_pattern** shall have exactly one implicit representation of type **shape_representation_with_parameters**. This **representation** shall contain between two and five **representation_item**s in its set of **items**.

WR2: The implicit representation of the **circular_pattern** shall contain at most one **representation_item** of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'diameter'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

WR3: The implicit representation of the **circular_pattern** shall contain at most one **representation_item** of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'base feature rotation'.

WR4: The implicit representation of the **circular_pattern** shall contain exactly one **representation_item** of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of 'number of features'.

WR5: The implicit representation of the **circular_pattern** shall contain exactly one **representation_item** of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'angular spacing'.

Informal propositions:

IP1: The location of the **circular_pattern** shall be defined at the centre of the circle.

IP2: The **circular_pattern** shall be defined in the X-Y plane, with the X direction intersecting the placement position of the first base feature.

5.2.3.1.37 class

A **class** is a type of **group** that is a classification of an object which characterizes all objects of the same kind; such a classification is independent from the application of the classified object.

EXPRESS specification:

```
*)
ENTITY class
  SUBTYPE OF (group);
END_ENTITY;
(*
```

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **class** entity:

– restrict_class_system_assignment_for_class (see 5.2.4.87);

– restrict_group_relationship_for_general_classification_hierarchy (see 5.2.4.102);

– restrict_version_assignment_for_class (see 5.2.4.198).

5.2.3.1.38 class_system

A **class_system** is a type of **group** that specifies a method for classifying objects.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
ENTITY class_system
  SUBTYPE OF (group);
END_ENTITY;
(*
```

5.2.3.1.39 class_usage_effectivity_context_assignment

A **class_usage_effectivity_context_assignment** is a type of **effectivity_context_assignment** that assigns an **applied_effectivity_assignment** specifying the **effectivity_item**s that impact the design of a solution for an **effectivity_context_item**.

EXPRESS specification:

```
*)
ENTITY class_usage_effectivity_context_assignment
  SUBTYPE OF (effectivity_context_assignment);
  items : SET [1:?] OF class_usage_effectivity_context_item;
WHERE
 WR1:SELF.role. name = 'class usage influence' ;
 WR2: SIZEOF ( QUERY ( i <* SELF.items | NOT (
      'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION' IN TYPEOF ( i )
      ) ) ) =0;
 WR3: ( 'AUTOMOTIVE_DESIGN.'+ 'APPLIED_EFFECTIVITY_ASSIGNMENT'
      IN TYPEOF ( SELF.assigned_effectivity_assignment ) ) AND (
      SIZEOF ( TYPEOF ( SELF.assigned_effectivity_assignment.
      assigned_effectivity ) ) =1 ) AND (
      SELF.assigned_effectivity_assignment.
      assigned_effectivity.id = 'class usage' ) AND ( SIZEOF (
      QUERY ( i <* SELF.assigned_effectivity_assignment\
      applied_effectivity_assignment.items | NOT (
      'AUTOMOTIVE_DESIGN.'+
      'PRODUCT_CONCEPT_FEATURE_CATEGORY_USAGE' IN TYPEOF ( i ) )
      ) ) =0 ) ;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** for which the **applied_effectivity_assignment** identifies a design impact.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Formal propositions:

WR1: The **class_usage_effectivity_context_assignment** shall have a **role** with a **name** of 'class usage influence'.

WR2: The **class_usage_effectivity_context_assignment** shall only have **product_definition**s in its set of **items** which reference as **frame_of_reference** a **product_definition_context** with a **name** of 'conceptual definition'.

WR3: The **class_usage_effectivity_context_assignment** shall reference an **applied_effectivity_assignment** with an **assigned_effectivity** which is not of an **effectivity** subtype and which has an **id** of 'class usage' and which has only **product_concept_feature_category_usage** objects in the set of **items**.

5.2.3.1.40 closed_path_profile

A **closed_path_profile** is a type of **shape_aspect** that consists of a connected set of curves and possibly a reference system that may be used to place the **closed_path_profile**. See ARM definition for General_closed_profile in paragraph 4.2.218 for more information.

EXPRESS specification:

```
*)
ENTITY closed_path_profile
  SUBTYPE OF (shape_aspect);
WHERE
 WR1:'AUTOMOTIVE_DESIGN.'+ 'FEATURE_COMPONENT_DEFINITION' IN
     TYPEOF ( SELF.of_shape.definition ) ;

     ) | ( 'AUTOMOTIVE_DESIGN.'+ 'PATH_SHAPE_REPRESENTATION' IN
     TYPEOF ( pdr. used_representation ) ) AND ( SIZEOF ( QUERY
     ( i <* pdr. used_representation.items | ( i.name=
     'profile shape' ) ) ) =1 ) ) ) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **closed_path_profile** shall be an aspect of the shape of a **feature_component_definition**.

WR2: The **closed_path_profile** shall have exactly one implicit representation defined by a **shape_-representation_with_parameters**.

WR3: The **shape_representation_with_parameters** that represents the **closed_path_profile** shall contain one **representation_item** in its set of **items**.

WR4: Exactly one **representation_item** used for the implicit representation of a **closed_path_profile** shall be of type **placement** with a **name** of 'orientation'.

WR5: The **closed_path_profile** shall have exactly one **path_shape_representation**.

WR6: The **representation_item** contained in the **path_shape_representation** shall have a **name** of 'profile shape'.

Informal propositions:

IP1: The **closed_path_profile** shall be planar and shall lie in the X-Y plane of the reference system if this is present.

5.2.3.1.41 composite_hole

A **composite_hole** is a type of **compound_feature** that is the representation of two **round_hole**s for the purpose of creating two commonly used **round_hole** combinations, the countersunk hole and the counterbore hole. The counterbore hole is the representation of two **round_hole**s with one having a larger diameter than the second. The countersunk hole is the representation of two **round_hole**s, the first having a larger diameter than the second with a linear decrease in diameter until it is the same as the second. This linear decrease shall be represented by a **taper**. See ARM definition for Compound_hole in paragraph 4.2.91 for more information.

Formal propositions:

WR1: The **description** of the **composite_hole** shall be either 'counterbore' or 'countersunk'.

WR2: The basis shape of the **composite_hole** shall be refered to by a **composite_shape_aspect** with a **name** of 'compound feature in solid'. This **shape_aspect** shall be the **relating_shape_aspect** of exactly two instances of **feature_component_relationship**.

WR3: The **feature_component_relationship**s refering to the basis shape shall refer both either to instances of **instanced_feature** or to instances of **placed_feature** as their **related_shape_aspect**. In case the **related_shape_aspect**s are of type **instanced_feature** they shall be of type **round_hole**, else the **placed_feature**s shall refer to **round_hole**s as their base features.

WR4: The **round_hole**s that comprise the **composite_hole** shall not have diameters that are equal in length.

WR5: If the **description** of the **composite_hole** is 'countersunk', exactly one **round_hole** that comprises it shall be a tapered hole.

5.2.3.1.42 compound_feature

A **compound_feature** is a type of **feature_definition** that is the representation of several other features and their relationships to one another for the purpose of creating unique user defined features. See ARM definitions for Compound_feature_in_panel in paragraph 4.2.85 and for Compound_feature_in_solid in paragraph 4.2.88 for more information.

EXPRESS specification:

WR4: The **configured_effectivity_assignment** shall have as **role** an **object_role** with a **name** of 'design' or 'usage'.

WR5: If the **configured_effectivity_assignment** has as **role** an **object_role** with a **name** of 'design', it may not have **product_definition**s in its set of **items** which reference as **frame_of_reference** a **product_definition_context** with a **name** of 'part occurrence'.

WR6: If the **configured_effectivity_assignment** has as **role** an **object_role** with a **name** of 'usage', it may not have **product_definition**s in its set of **items** which reference as **frame_of_reference** a **product_definition_context** with a **name** of 'conceptual definition', or 'functional definition'.

WR7: The **configured_effectivity_assignment** shall have as **role** an **object_role** with a **description** of 'exception', 'inherited', or 'local'.

WR8: The **configured_effectivity_assignment** shall be referenced as **assigned_effectivity_assignment** by exactly one **configured_effectivity_context_assignment**.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **configured_effectivity_assignment** entity:

– restrict_effectivity_usage (see 5.2.4.99).

5.2.3.1.45 configured_effectivity_context_assignment

A **configured_effectivity_context_assignment** is a type of **effectivity_context_assignment** that specifies the characteristic or combination of characteristics for which the **configured_effectivity_item**s in the set of **items** of the **assigned_effectivity_assignment** provide a solution.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
ENTITY configured_effectivity_context_assignment
  SUBTYPE OF (effectivity_context_assignment);
  items : SET [1:?] OF configured_effectivity_context_item;
WHERE
 WR1:'AUTOMOTIVE_DESIGN.'+ 'CONFIGURED_EFFECTIVITY_ASSIGNMENT'
     IN TYPEOF ( SELF.assigned_effectivity_assignment ) ;
 WR2: SIZEOF ( SELF.items ) =1;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of items that specify the characteristic or combination of characteristics for which the **configured_effectivity_item**s in the set of **items** of the **assigned_effectivity_assignment** provide a solution.

Formal propositions:

WR1: The **configured_effectivity_context_assignment** shall reference as **assigned_effectivity_assignment** a **configured_effectivity_assignment**.

WR2: The **configured_effectivity_context_assignment** shall have exactly one item in its set of **items**.

5.2.3.1.46 constructive_geometry_representation

A **constructive_geometry_representation** is a type of **representation** that is a collection of non-shape geometry that is used to support the definition of the geometry that is representing the shape of the part. See ARM definition for Constructive_geometry in paragraph 4.2.100 for more information.

EXPRESS specification:

```
*)
ENTITY constructive_geometry_representation
  SUBTYPE OF (representation);
WHERE
 WR1: ( 'AUTOMOTIVE_DESIGN.'+ 'GEOMETRIC_REPRESENTATION_CONTEXT'
     IN TYPEOF ( SELF.context_of_items ) ) AND (
     {2<=SELF.context_of_items\
     geometric_representation_context.coordinate_space_dimension<=3}
     ) ;
 WR2: SIZEOF ( QUERY ( cgr_i <* SELF.items | SIZEOF (
     ['AUTOMOTIVE_DESIGN.'+ 'PLACEMENT' , 'AUTOMOTIVE_DESIGN.'+
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
     'CURVE' , 'AUTOMOTIVE_DESIGN.'+ 'EDGE' ,
     'AUTOMOTIVE_DESIGN.'+ 'FACE' , 'AUTOMOTIVE_DESIGN.'+
     'POINT' , 'AUTOMOTIVE_DESIGN.'+ 'SURFACE' ,
      'AUTOMOTIVE_DESIGN.'+ 'FACE_SURFACE' ,
     'AUTOMOTIVE_DESIGN.'+ 'VERTEX_POINT']* TYPEOF ( cgr_i ) )
     <>1 ) ) =0;
 WR3: SIZEOF ( USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.'+'REPRESENTATION_RELATIONSHIP.'+
     'REP_2' ) ) >0;
 WR4: SIZEOF ( USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.'+'REPRESENTATION_MAP.'+
     'MAPPED_REPRESENTATION' ) ) =0;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **constructive_geometry_representation** shall have a **geometric_representation_context** as **context_of_items**. This **geometric_representation_context** shall have a **coordinate_space_dimension** of value '2' or '3'.

WR2: The **items** in the **constructive_geometry_representation** shall be of type **placement**, **curve**, **edge**, **face**, **point**, **surface**, **face_surface** or **vertex_point**.

WR3: The **constructive_geometry_representation** shall play the role of **rep_2** for at least one **constructive_geometry_representation_relationship**.

WR4: The **constructive_geometry_representation** shall not play the role of **mapped_representation** for a **representation_map**.

5.2.3.1.47 constructive_geometry_representation_relationship

A **constructive_geometry_representation_relationship** is a type of **representation_relationship** that associates the geometry representing the shape of a part with the constructive geometry which was used for its definition or a constructive geometry with another constructive geometry which was used for its definition.

EXPRESS specification:

```
*)
ENTITY constructive_geometry_representation_relationship
  SUBTYPE OF (representation_relationship);
WHERE
 WR1: ( SELF.rep_1. context_of_items:=:SELF.rep_2.
     context_of_items ) AND ( 'AUTOMOTIVE_DESIGN.'+
     'GEOMETRIC_REPRESENTATION_CONTEXT' IN TYPEOF ( SELF.rep_1.
     context_of_items ) ) ;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
 WR2:'AUTOMOTIVE_DESIGN.'+
     'CONSTRUCTIVE_GEOMETRY_REPRESENTATION' IN TYPEOF (
     SELF.rep_2 ) ;
 WR3: SIZEOF ( ['AUTOMOTIVE_DESIGN.'+ 'SHAPE_REPRESENTATION' ,
     'AUTOMOTIVE_DESIGN.'+
     'CONSTRUCTIVE_GEOMETRY_REPRESENTATION']* TYPEOF (
     SELF.rep_1 ) ) =1;
 WR4: NOT (
     'AUTOMOTIVE_DESIGN.'+'REPRESENTATION_RELATIONSHIP_WITH_TRANSFORMATION'
     IN TYPEOF ( SELF ) ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: Both **representation**s playing the roles of **rep_1** and **rep_2** of the **constructive_geometry_-representation_relationship** shall share the same **geometric_representation_context**.

WR2: The **representation** playing the role of **rep_2** of the **constructive_geometry_representation_-relationship** shall be of type **constructive_geometry_representation**.

WR3: The **representation** playing the role of **rep_1** of the **constructive_geometry_representation_-relationship** shall be of type **shape_representation** or **constructive_geometry_representation**.

WR4: The **constructive_geometry_representation_relationship** shall not be of type **representation_-relationship_with_transformation**.

5.2.3.1.48 contact_ratio_representation

A **contact_ratio_representation** is a type of **representation** that represents the ratio of contact between an object and a measuring gauge. For more information see ARM definition for Contact_ratio in paragraph 4.2.102.

EXPRESS specification:

```
*)
ENTITY contact_ratio_representation
  SUBTYPE OF (representation);
WHERE
 WR1: ( SIZEOF ( SELF.items ) =1 ) AND ( SIZEOF ( QUERY ( i <*
     SELF.items | ( SIZEOF ( ['AUTOMOTIVE_DESIGN.'+
     'MEASURE_REPRESENTATION_ITEM' , 'AUTOMOTIVE_DESIGN.'+
     'VALUE_RANGE']* TYPEOF ( i ) ) =1 ) AND ( i.name =
     'ratio value' ) ) ) =1 ) ;
 WR2: ( SIZEOF ( QUERY ( pdr <* USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.'+'PROPERTY_DEFINITION_REPRESENTATION.'+
     'USED_REPRESENTATION' ) | pdr. name =
     'contact ratio reference' ) ) =1 ) AND ( SIZEOF ( QUERY (
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
     pdr <* USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.'+'PROPERTY_DEFINITION_REPRESENTATION.'+
     'USED_REPRESENTATION' ) | ( pdr. name =
     'contact ratio reference' ) AND ( 'AUTOMOTIVE_DESIGN.'+
     'PHYSICALLY_MODELLED_PRODUCT_DEFINITION' IN TYPEOF ( pdr.
     definition.definition ) ) ) ) =1 ) ;
 WR3: ( SIZEOF ( USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.'+'PROPERTY_DEFINITION_REPRESENTATION.'+
     'USED_REPRESENTATION' ) ) =1 ) AND ( SIZEOF ( QUERY ( pdr
     <* USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.'+'PROPERTY_DEFINITION_REPRESENTATION.'+
     'USED_REPRESENTATION' ) | SIZEOF ( QUERY ( gpa <* USEDIN (
     pdr. definition ,
     'AUTOMOTIVE_DESIGN.'+'GENERAL_PROPERTY_ASSOCIATION.'+
     'DERIVED_DEFINITION' ) | ( 'AUTOMOTIVE_DESIGN.'+
     'GENERAL_PROPERTY' IN TYPEOF ( gpa. base_definition ) ) AND
     ( gpa. base_definition.name ='surface_condition' ) ) ) =1 )
     ) =1 ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: Each instance of **contact_ratio_representation** shall contain exactly one **representation_item** in its set of **items**. This **representation_item** shall be of type **measure_representation_item** or of type **value_range** and it shall have a **name** of 'ratio value'.

WR2: Each instance of **contact_ratio_representation** shall be referenced as the **used_representation** by exactly one **property_definition_representation** that has a **name** of 'contact ratio reference'. This **property_definition_representation** shall relate the **representation** with a **physically_modelled_product_definition**.

WR3: Each instance of **contact_ratio_representation** shall be referenced by exactly one **property_definition_representation**. This **property_definition_representation** shall relate the **representation** with a **property_definition** that is the **derived_definition** of a **general_property_association** that refers as **base_definition** to a **general_property** with a **name** of 'surface_condition'.

5.2.3.1.49 default_tolerance_table

A **default_tolerance_table** is a type of **representation** that specifies information about general tolerances. See ARM definition for General_tolerance_table in paragraph 4.2.234 for more information.

EXPRESS specification:

```
*)
ENTITY default_tolerance_table
  SUBTYPE OF (representation);
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
WHERE
 WR1: SIZEOF ( QUERY ( i <* SELF.items | NOT (
      'AUTOMOTIVE_DESIGN.'+ 'DEFAULT_TOLERANCE_TABLE_CELL' IN
      TYPEOF ( i ) ) ) ) =0;
 WR2: ( SIZEOF ( QUERY ( rr <* USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.'+'REPRESENTATION_RELATIONSHIP.'+
      'REP_1' ) | rr. name<> 'general tolerance definition' ) )
      =0 ) AND ( SIZEOF ( QUERY ( rr <* USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.'+'REPRESENTATION_RELATIONSHIP.'+
      'REP_1' ) | ( rr. name = 'general tolerance definition' )
      AND ( rr. rep_2.name<> 'default tolerances' ) ) ) =0 ) AND
      ( SIZEOF ( USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.'+'REPRESENTATION_RELATIONSHIP.'+
      'REP_2' ) ) =0 ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: An instance of **default_tolerance_table** shall contain only **representation_item**s of type **default_tolerance_table_cell** in its set or **items**.

WR2: An instance of **default_tolerance_table** shall not be referenced by any **representation_relationship** except as **rep_1** by zero or more **representation_relationship**s with a **name** of 'general tolerance definition'. If such **representation_relationships** exist, they shall reference as **rep_2 representation**s with a **name** of 'default tolerances'.

5.2.3.1.50 default_tolerance_table_cell

A **default_tolerance_table_cell** is a type of **compound_representation_item** that specifies one cell entry in a **default_tolerance_table**. See ARM definition for Tolerance_table_cell in paragraph 4.2.523 for more information.

EXPRESS specification:

```
*)
ENTITY default_tolerance_table_cell
  SUBTYPE OF (compound_representation_item);
WHERE
 WR1: SIZEOF ( QUERY ( x <* USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.'+'REPRESENTATION.'+ 'ITEMS' ) |
      'AUTOMOTIVE_DESIGN.'+ 'DEFAULT_TOLERANCE_TABLE' IN TYPEOF (
      x ) ) ) =1;
 WR2:default_tolerance_table_cell_wr2 (
      SELF\compound_representation_item. item_element ) ;
 WR3:default_tolerance_table_cell_wr3 (
      SELF\compound_representation_item. item_element ) ;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
 WR4:default_tolerance_table_cell_wr4 (
     SELF\compound_representation_item. item_element ) ;
 WR5:default_tolerance_table_cell_wr5 (
     SELF\compound_representation_item. item_element ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: A **default_tolerance_table_cell** shall be in the set of **items** of exactly one **default_tolerance_table**.

WR2: Each instance of **default_tolerance_table_cell** shall refer to at most five **representation_item**s as **item_element**.

WR3: Either exactly one **representation_item** in the set of **item_element**s shall be a **measure_representation_item** with the **name** of 'significant number of digits' or there shall be two **representation_item**s of type **measure_representation_item** where one of them has the **name** of 'lower limit' and the other one has the **name** of 'upper limit'.

WR4: Either exactly one **representation_item** in the set of **item_element**s shall be a **measure_representation_item** with the **name** of 'plus minus tolerance value' or there shall be two **representation_item**s of type **measure_representation_item** where one of them has the **name** of 'lower tolerance value' and the other one has the **name** of 'upper tolerance value'.

WR5: At most one **representation_item** in the set of **item_element**s shall be of type **descriptive_representation_item**. If present, this **descriptive_representation_item** shall have a **name** of 'cell description'.

5.2.3.1.51 derived_unit_variable

A **derived_unit_variable** is a type of **derived_unit** and **variable_semantics** that represents the unit in an explicitly defined mathematical function.

EXPRESS specification:

```
*)
ENTITY derived_unit_variable
  SUBTYPE OF (derived_unit, variable_semantics);

INVERSE
associated_variable_environment: environment FOR semantics;
END_ENTITY;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Attribute definitions:

associated_variable_environment: the **environment** that specifies the representation for the derived unit.

5.2.3.1.52 directed_angle

A **directed_angle** is a type of **shape_aspect** that specifies an angle value and the element from which the angle is measured. See ARM definition for Angle_specification in paragraph 4.2.11 for more information.

EXPRESS specification:

```
*)
ENTITY directed_angle
  SUBTYPE OF (shape_aspect);
WHERE
 WR1:'AUTOMOTIVE_DESIGN.'+ 'FEATURE_COMPONENT_DEFINITION' IN
     TYPEOF ( SELF.of_shape. definition ) ;
 WR2: SIZEOF ( QUERY ( pdr <*
     get_shape_aspect_property_definition_representations ( SELF
     ) | ( 'AUTOMOTIVE_DESIGN.'+
     'SHAPE_REPRESENTATION_WITH_PARAMETERS' IN TYPEOF ( pdr.
     used_representation ) ) ) ) =1;
 WR3: SIZEOF ( QUERY ( pdr <*
     get_shape_aspect_property_definition_representations ( SELF
     ) | ( 'AUTOMOTIVE_DESIGN.'+
     'SHAPE_REPRESENTATION_WITH_PARAMETERS' IN TYPEOF ( pdr.
     used_representation ) ) AND ( SIZEOF ( pdr.
     used_representation.items ) =1 ) ) ) =1;
 WR4:SELF.description IN [ 'punch direction' , 'profile normal'
     , 'surface normal' ];
 WR5: SIZEOF ( QUERY ( pdr <*
     get_shape_aspect_property_definition_representations ( SELF
     ) | ( 'AUTOMOTIVE_DESIGN.'+
     'SHAPE_REPRESENTATION_WITH_PARAMETERS' IN TYPEOF ( pdr.
     used_representation ) ) AND ( SIZEOF ( QUERY ( i <* pdr.
     used_representation.items | ( i.name='angle' ) AND ( SIZEOF
     ( ['AUTOMOTIVE_DESIGN.'+ 'MEASURE_REPRESENTATION_ITEM' ,
     'AUTOMOTIVE_DESIGN.'+
     'PLANE_ANGLE_MEASURE_WITH_UNIT']*TYPEOF ( i ) ) =2 ) ) ) =1
     ) ) ) =1;
END_ENTITY;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Formal propositions:

WR1: The **directed_angle** shall be an aspect of the shape of a **feature_component_definition**.

WR2: The **directed_angle** shall have exactly one implicit representation defined by a **shape_representation_with_parameters**.

WR3: The **shape_representation_with_parameters** that represents the shape of the **directed_angle** shall contain exactly one **representation_item** in its set of **items**.

WR4: The **description** of the **directed_angle** shall be either 'punch direction', 'profile normal', or 'surface normal'.

WR5: The implicit representation of the **directed_angle** shall have exactly one **representation_item** in its set of **items**. This **representation_item** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** and shall have a **name** of 'angle'.

5.2.3.1.53 directed_dimensional_location

A **directed_dimensional_location** is a type of **dimensional_location** that specifies that the direction of the location dimension is of interest, i.e., the dimension is specified from the **relating_shape_aspect** to the **related_shape_aspect**.

EXPRESS specification:

```
*)
ENTITY directed_dimensional_location
  SUBTYPE OF (dimensional_location);
END_ENTITY;
(*
```

5.2.3.1.54 direction_shape_representation

A **direction_shape_representation** is a type of **shape_representation** that represents a direction vector in two or three dimensional space.

EXPRESS specification:

```
*)
ENTITY direction_shape_representation
  SUBTYPE OF (shape_representation);
WHERE
 WR1: SIZEOF ( SELF.items ) =1;
 WR2: SIZEOF ( QUERY ( i <* SELF.items | 'AUTOMOTIVE_DESIGN.'+
     'DIRECTION' IN TYPEOF ( i ) ) ) =1;
END_ENTITY;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
(*
```

Formal propositions:

WR1: The **direction_shape_representation** shall have exactly one **representation_item** in its set of **items**.

WR2: The geometric element that is used to represent the **direction_shape_representation** shall be a **direction**.

5.2.3.1.55 document_file

A **document_file** is of type document and of type **characterized_object** and characterizes files with properties, e.g. file size, creating system, etc.

EXPRESS specification:

```
*)
ENTITY document_file
  SUBTYPE OF (document,characterized_object);
WHERE
 WR1:SELF\characterized_object. name =’’;
 WR2: NOT EXISTS ( SELF\characterized_object. description ) ;
 WR3: SIZEOF ( QUERY ( drt <* SELF\document.
     representation_types | drt. name IN [’digital’ ,
     ’physical’] ) ) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The name of the **characterized_object** shall not be used, use name of document.

WR2: The description of the **characterized_object** shall not be used, use description of document.

WR3: The document shall have exactly one **document_representation_type** with a **name** of either ’digital’ or ’physical’.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **document_file** entity:

– restrict_properties_of_document_file (see 5.2.4.185);

– restrict_version_assignment_for_document_file (see 5.2.4.200).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

5.2.3.1.56 document_product_equivalence

A **document_product_equivalence** is a type of **document_product_association**. It specifies the equivalence of a **product**, a **product_definition**, or **product_definition_formation** instance with a **document** instance.

EXPRESS specification:

```
*)
ENTITY document_product_equivalence
  SUBTYPE OF (document_product_association);
WHERE
 WR1:SELF.name ='equivalence';
 WR2: NOT ( 'AUTOMOTIVE_DESIGN.'+ 'PRODUCT' IN TYPEOF (
     SELF.related_product ) ) OR ( ( SELF.relating_document.
     kind.product_data_type =
     'configuration controlled document' ) AND ( SIZEOF ( QUERY
     ( prpc <* USEDIN ( SELF.related_product ,
     'AUTOMOTIVE_DESIGN.'+'PRODUCT_RELATED_PRODUCT_CATEGORY.'+
     'PRODUCTS' ) | prpc. name ='document' ) ) =1 ) ) ;
 WR3: NOT ( 'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION_FORMATION'
     IN TYPEOF ( SELF.related_product ) ) OR ( (
     SELF.relating_document. kind.product_data_type =
     'configuration controlled document version' ) AND ( SIZEOF
     ( QUERY ( prpc <* USEDIN (
     SELF.related_product\product_definition_formation.
     of_product ,
     'AUTOMOTIVE_DESIGN.PRODUCT_RELATED_PRODUCT_CATEGORY.PRODUCTS'
     ) | prpc. name ='document' ) ) =1 ) ) ;
 WR4: NOT ( 'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION' IN TYPEOF
     ( SELF.related_product ) ) OR ( ( SELF.relating_document.
     kind.product_data_type =
     'configuration controlled document definition' ) AND (
     SIZEOF ( QUERY ( prpc <* USEDIN (
     SELF.related_product\product_definition.
     formation.of_product ,
     'AUTOMOTIVE_DESIGN.PRODUCT_RELATED_PRODUCT_CATEGORY.PRODUCTS'
     ) | prpc. name ='document' ) ) =1 ) ) ;
END_ENTITY;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Formal propositions:

WR1: The name of the **document_product_association** shall be 'equivalence'.

WR2: If the **related_product** is a **product** then the **relating_document** shall have a **document_type** with **product_data_type** 'configuration controlled document' and there is exactly one **product_related_product_category** with a **name** of 'document' for the **product**.

© ISO 2001 – All rights reserved

WR3: If the **related_product** is a **product_definition_formation** then the **relating_document** shall have a **document_type** with **product_data_type** 'configuration controlled document version' and there is exactly one **product_related_product_category** with a **name** of 'document' for the **product** of the related **product_definition_formation**.

WR4: If the **related_product** is a **product_definition** then the **relating_document** shall have a **document_type** with **product_data_type** 'configuration controlled document definition' and there is exactly one **product_related_product_category** with a **name** of 'document' for the **product** of the related **product_definition**.

5.2.3.1.57 draughting_pre_defined_text_font

A **draughting_pre_defined_text_font** is a type of **pre_defined_text_font** that is identified by name. The definition of the appearance of each **draughting_pre_defined_text_font** is given in ISO 3098-1.

NOTE - The definition of this entity is identical to the definition in ISO 10303–202.

EXPRESS specification:

```
*)
ENTITY draughting_pre_defined_text_font
  SUBTYPE OF (pre_defined_text_font);
WHERE
 WR1:SELF.name IN [ 'ISO 3098-1 font A' , 'ISO 3098-1 font B' ];
END_ENTITY;
(*
```

Formal propositions:

WR1: The name of the **draughting_pre_defined_text_font** shall be 'ISO 3098-1 font A' or 'ISO 3098-1 font B'.

Attribute value definitions:

The **draughting_pre_defined_text_font**s are:

ISO 3098-1 font A: the text font denoted as Lettering A in clause 3 of ISO 3098-1.

ISO 3098-1 font B: the text font denoted as Lettering B in clause 3 of ISO 3098-1.

5.2.3.1.58 draughting_specification_reference

A **draughting_specification_reference** is a type of **document_reference** that is the designation of an external draughting specification for a drawing revision.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE - The definition of this entity is identical to the definition in ISO 10303 – 505.

EXPRESS specification:

```
*)
ENTITY draughting_specification_reference
  SUBTYPE OF (document_reference);
  specified_items : SET [1:?] OF specified_item;
WHERE
 WR1: ( SELF.assigned_document. kind.product_data_type =
     'draughting specification' ) ;
END_ENTITY;
(*
```

Attribute definitions:

specified_items: The **drawing_revision**s to which a draughting specification is applied.

Formal propositions:

WR1: Each document assigned shall be a draughting specification.

5.2.3.1.59 drawing_sheet_layout

A **drawing_sheet_layout** is a symbol that presents the layout or format for a drawing sheet.

EXPRESS specification:

```
*)
ENTITY drawing_sheet_layout
  SUBTYPE OF (draughting_symbol_representation);
END_ENTITY;
(*
```

5.2.3.1.60 edge_round

An **edge_round** is a type of **transition_feature** that is the representation of a circular convex transition between two faces. See ARM definition for Edge_round in paragraph 4.2.177 for more information.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
ENTITY edge_round
  SUBTYPE OF (transition_feature);
WHERE
 WR1: ( SELF.description<> 'constant radius' ) XOR ( SIZEOF (

Formal propositions:

WR1: An **edge_round** has an implicit representation of type **shape_representation_with_parameters** if and only if it has a **description** of 'constant radius'.

WR2: If the **description** of the **edge_round** is 'constant radius', the implicit representation shall contain between one and three **representation_item**s in its set of **items**.

WR3: If the **description** of the **edge_round** is 'constant radius', the implicit representation shall only contain **representation_item**s in its set of **items** that have a **name** of either 'radius', 'first offset', or 'second offset'.

WR4: If the **description** of the **edge_round** is 'constant radius', exactly one **representation_item** used for the implicit representation of the **edge_round** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'radius'.

WR5: If the **description** of the **edge_round** is 'constant radius', at most one **representation_item** used for the implicit representation of the **edge_round** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'first offset'.

WR6: If the **description** of the **edge_round** is 'constant radius', at most one **representation_item** used for the implicit representation of the **edge_round** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'second offset'.

```

Formal propositions:

WR1: The **element_delivery** shall be referenced as **assigned_action** by exactly one **applied_action_assignment**. This **applied_action_assignment** shall reference as its **role** an **object_role** that has a **name** of 'deliverable element' and shall have exactly one element in its set of **items**. This element shall be of type **applied_action_assignment** and shall have exactly one element in its set of **items**. This element shall be of type **configuration_item**, or shall be a **product_definition** which references as **frame_of_reference** a **product_definition_context** with a **name** of 'physical occurrence', or shall be a **product_definition_formation** which references as **of_product** a **product** which is referenced by a **product_related_product_category** with a **name** of either 'part', 'raw material', or 'tool'.

WR2: There shall be exactly one instance of **applied_organization_assignment** that contains the **element_delivery** in its set of **items**. This **applied_organization_assignment** shall reference as its **role** an **organization_role** that has a **name** of 'destination'.

WR3: There shall be exactly one instance of **action_property** that references the **element_delivery** as its **definition**. This **action_property** shall be referenced as the **property** by exactly one instance of **action_property_representation**. This **action_property_representation** shall reference as its **representation** a **representation** that has a **name** of 'delivery quantity' and that contains exactly one **representation_item** in its set of **items**. This **representation_item** shall be a **measure_representation_item**, or a **value_range**.

WR4: The **element_delivery** shall not be referenced by an **action_relationship**.

5.2.3.1.62 exclusive_product_concept_feature_category

An **exclusive_product_concept_feature_category** is a type of **product_concept_feature_category** in which the contained **product_concept_feature** instances describe mutually exclusive characteristics of a product. See ARM definition for Specification_category in paragraph 4.2.468 for more information.

EXPRESS specification:

```
*)
ENTITY exclusive_product_concept_feature_category
  SUBTYPE OF (product_concept_feature_category);
END_ENTITY;
(*
```

5.2.3.1.63 expression_conversion_based_unit

An **expression_conversion_based_unit** is a type of **context_dependent_unit** and **variable_semantics** that represents the unit in an explicitly defined mathematical function.

EXPRESS specification:

```
*)
ENTITY expression_conversion_based_unit
  SUBTYPE OF (context_dependent_unit, variable_semantics);

INVERSE
associated_variable_environment: environment FOR semantics;
END_ENTITY;
(*
```

Attribute definitions:

associated_variable_environment: the **environment** that specifies the representation for the derived unit.

5.2.3.1.64 externally_defined_class

An **externally_defined_class** is a type of **externally_defined_item** and **class** that represents classification information whose identification and definition is defined externally, i.e., not within this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
ENTITY externally_defined_class
  SUBTYPE OF (class,externally_defined_item);
END_ENTITY;
(*
```

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **externally_defined_class** entity:

– externally_defined_class_with_known_source_requirement (see 5.2.4.59);

– plib_class_reference_requires_version (see 5.2.4.66).

5.2.3.1.65 externally_defined_feature_definition

An **externally_defined_feature_definition** is a type of **externally_defined_item**. It relates the document containing a feature specification to a **feature_definition**. See ARM definition for Catalogue_-thread in paragraph 4.2.48 for more information.

EXPRESS specification:

```

     ) =0;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **externally_defined_feature_definition** shall have a **item_id** of 'external thread' and a **source** of 'external feature specification'.

WR2: The **externally_defined_feature_definition** shall be referenced in the role of **items** by an **applied_classification_assignment** or either an **applied_document_reference** or an **applied_document_usage_constraint_assignment**.

WR3: The **shape_representation_with_parameters** that represents the **externally_defined_feature_definition** shall contain between six and seven **representation_item**s in its set of **items**.

WR4: Exactly one **representation_item** used for the implicit representation of the **externally_defined_feature_definition** shall be of type **descriptive_representation_item** with a **name** of 'thread side' and a **description** of either 'internal' or 'external'.

WR5: Exactly one **representation_item** used for the implicit representation of the **externally_defined_feature_definition** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'major diameter'.

WR6: Exactly one **representation_item** used for the implicit representation of the **externally_defined_feature_definition** shall be of type **measure_representation_item** and **ratio_measure_with_unit** with a **name** of 'number of threads'.

WR7: Exactly one **representation_item** used for the implicit representation of the **externally_defined_feature_definition** shall be of type **descriptive_representation_item** with a **name** of 'fit class'.

WR8: Exactly one **representation_item** used for the implicit representation of the **externally_defined_feature_definition** shall be of type **descriptive_representation_item** with a **name** of 'form'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

WR9: Exactly one **representation_item** used for the implicit representation of the **externally_defined_feature_definition** shall be of type **descriptive_representation_item** with a **name** of 'hand'. The **descriptive_representation_item** shall have a **description** of either 'left hand' or 'right hand'.

WR10: The implicit representation of the **externally_defined_feature_definition** shall contain at most one **representation_item** of type **descriptive_representation_item** that has a **name** of 'qualifier'.

WR11: The implicit representation of a **externally_defined_feature_definition** shall contain only **representation_item**s with a name of either 'thread side', 'major diameter', 'number of threads', 'fit class', 'form', 'hand', or 'qualifier'.

5.2.3.1.66 externally_defined_general_property

An **externally_defined_general_property** is a type of **general_property** and **externally_defined_item** that represents general property definition information which is defined externally, i.e., not within this part of ISO 10303.

EXPRESS specification:

```
*)
ENTITY externally_defined_general_property
  SUBTYPE OF (general_property,externally_defined_item);
END_ENTITY;
(*
```

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **externally_defined_general_property** entity:

– plib_property_reference_requires_name_scope (see 5.2.4.67);

– plib_property_reference_requires_version (see 5.2.4.68).

5.2.3.1.67 face_shape_representation

A **face_shape_representation** is a type of **shape_representation** that represents a portion of the boundary of a part by a topologically bounded face or shell.

EXPRESS specification:

```
*)
ENTITY face_shape_representation
  SUBTYPE OF (shape_representation);
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
WHERE
 WR1: SIZEOF ( SELF.items ) =1;
 WR2: SIZEOF ( QUERY ( i <* SELF.items | SIZEOF (
     ['AUTOMOTIVE_DESIGN.'+ 'FACE' , 'AUTOMOTIVE_DESIGN.'+
     'CLOSED_SHELL' , 'AUTOMOTIVE_DESIGN.'+ 'OPEN_SHELL']*TYPEOF
     ( i ) ) =1 ) ) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **face_shape_representation** shall have exactly one **representation_item** in its set of **items**.

WR2: The item that is used to represent the **face_shape_representation** shall be a either a **face**, a **closed_shell**, or an **open_shell**.

5.2.3.1.68 feature_component_definition

A **feature_component_definition** is a type of **characterized_object** that is used as a constituent of a preconceived form pattern.

EXPRESS specification:

```
*)
ENTITY feature_component_definition
  SUBTYPE OF (characterized_object);
WHERE
 WR1: SIZEOF ( get_shape_aspects ( SELF ) ) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: A **feature_component_definition** shall be the basis shape for exactly one **shape_aspect**.

Informal propositions:

IP1: The **feature_component_definition**s that serve as definitions for modifications of a **circular_-pattern** or a **rectangular_pattern** shall be used in at least one definition of a pattern.

NOTE - See definition for Circular_offset_pattern in paragraph 4.2.59, for Circular_omit_pattern in paragraph 4.2.60, for Rectangular_offset_pattern in paragraph 4.2.423, and for Rectangular_omit_pattern in paragraph 4.2.424 for further information.

5.2.3.1.69 feature_component_relationship

A **feature_component_relationship** is a type of **shape_aspect_relationship** that is used to relate features with implicitly represented components.

EXAMPLE 1 A **chamfer** may have the implicit chamfer offset amount defined with a **feature_component_relationship**.

EXPRESS specification:

```
*)
ENTITY feature_component_relationship
  SUBTYPE OF (shape_aspect_relationship);
WHERE
 WR1: ( 'AUTOMOTIVE_DESIGN.'+ 'TRANSITION_FEATURE' IN TYPEOF (
     SELF.related_shape_aspect ) ) OR ( SIZEOF (
     ['AUTOMOTIVE_DESIGN.'+ 'FEATURE_DEFINITION' ,
     'AUTOMOTIVE_DESIGN.'+
     'FEATURE_COMPONENT_DEFINITION']*TYPEOF (
     SELF.related_shape_aspect. of_shape.definition ) ) =1 ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **feature_component_relationship** shall reference as **related_shape_aspect** an aspect of the shape of a **transition_feature**, a **feature_definition** or a **feature_component_definition**.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **feature_component_relationship** entity:

– subtype_exclusiveness_feature_component_relationship (see 5.2.4.226).

5.2.3.1.70 feature_definition

A **feature_definition** is a type of **characterized_object** that is a preconceived form pattern. See ARM definition for Feature_definition in paragraph 4.2.199 for more information.

EXPRESS specification:

```
*)
ENTITY feature_definition

Formal propositions:

WR1: The **feature_definition** shall have at most one implicit **representation** of type **shape_representation_with_parameters**.

WR2: If a implicit representation is present, at most one **representation_item** in this representation of the **feature_definition** shall be a **placement** with a **name** of 'orientation'. This **placement** shall define a reference location and orientation for the origin of the **feature_definition**.

WR3: If the **feature_definition** is of type **barring_hole**, **bead**, **hole_in_panel**, **feature_in_panel**, **joggle**, or **locator**, or is a **compound_feature** with a basis shape of an **shape_aspect** with a **name** of

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

'compound feature in panel', it shall be represented by at most one **direction_shape_representation**. If present, this **representation** shall have a **name** of 'punch direction'.

WR4: If an implicit representation is present, it shall have a **geometric_representation_context** as its **context_of_items** that has a **coordinate_space_dimension** equal to 3.

WR5: If the **feature_definition** is of type **boss**, **rib**, **slot**, **round_hole**, or **pocket**, or is a **compound_feature** that has a basis shape refered to by a **composite_shape_aspect** with a **name** of 'compound feature in solid', The **feature_definition** shall have exactly one implicit representation, and this representation shall contain a **representation_item** of type **placement** and a **name** of 'orientation'.

WR6: The subtypes **bead**, **barring_hole**, **boss**, **compound_feature**, **externally_defined_feature_definition**, **feature_in_panel**, **general_feature**, **hole_in_panel**, **joggle**, **locator**, **pocket**, **rib**, **replicate_feature**, **round_hole**, **slot**, and **thread** of **feature_definition** shall be mutually exclusive.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **feature_definition** entity:

– subtype_exclusiveness_feature_definition (see 5.2.4.227).

5.2.3.1.71 feature_in_panel

A **feature_in_panel** is a type of **feature_definition** applicable to panel parts. A **feature_in_panel** consists of a ruled surface between two closed profiles one of which lies on the panel. See ARM definition for Form_feature_in_panel in paragraph 4.2.212 for more information.

END_ENTITY;
(*
```

Formal propositions:

WR1: A **fillet** has an implicit representation if and only if it has a **description** of 'constant radius'.

WR2: If the **description** of the **fillet** is 'constant radius', the implicit representation shall contain between one and three **representation_item**s in its set of **items**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

WR3: If the **description** of the **fillet** is 'constant radius', the implicit representation shall only contain **representation_item**s in its set of **items** that have a **name** of either 'radius', 'first offset', or 'second offset'.

WR4: If the **description** of the **fillet** is 'constant radius', exactly one **representation_item** used for the implicit representation of the **fillet** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'radius'.

WR5: If the **description** of the **fillet** is 'constant radius', at most one **representation_item** used for the implicit representation of the **fillet** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'first offset'.

WR6: If the **description** of the **fillet** is 'constant radius', at most one **representation_item** used for the implicit representation of the **fillet** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'second offset'.

WR7: The **fillet** shall be defined by exactly **representation** of type **face_shape_representation** with a **name** of 'first face shape'.

WR8: The **fillet** shall be defined by exactly **representation** of type **face_shape_representation** with a **name** of 'second face shape'.

WR9: The **fillet** shall be defined by exactly **representation** of type **face_shape_representation** with a **name** of 'fillet face'.

5.2.3.1.75 general_feature

A **general_feature** is a type of **feature_definition** that provides a mechanism to categorize an area of interest in a shape and to associate additional information with it. See ARM definition for General_feature in paragraph 4.2.221 for more information.

EXPRESS specification:

```
*)
ENTITY general_feature
  SUBTYPE OF (feature_definition);
WHERE
 WR1: ( SIZEOF ( get_property_definition_representations ( SELF
     ) ) <=1 ) AND ( SIZEOF ( QUERY ( pdr <*
     get_property_definition_representations ( SELF ) |

     related_shape_aspect ) ) ) ) >=2 ) ) ) <=1 ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **general_feature** shall represented by at most one implicit representation. If present, this **representation** shall be of type **shape_representation_with_parameters**.

WR2: If the **general_feaure** is the basis shape for one or more occurrences of **shape_aspect** with a **description** of 'course of travel occurrence', these **shape_aspect**s shall be the **related_shape_aspect** of a **shape_defining_relationship** that has a **name** of 'course of travel'.

WR3: The aspects of the basis shape that have a **description** of 'course of travel occurrence' shall be the **related_shape_aspect** of a **shape_defining_relationship** that refers to a **path_feature_component** as **relating_shape_aspect**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

WR4: If the **general_feaure** is the basis shape for one or more occurrences of **shape_aspect** with a **description** of 'boundary occurrence', these **shape_aspect**s shall be the **related_shape_aspect** of a **shape_defining_relationship** that has a **description** of 'profile usage'.

WR5: The basis shape of a **general_feature** shall be refered to by at most one **shape_aspect** that is of type **composite_shape_aspect**. If present, this **shape_aspect** shall have a **name** of 'general compound feature' and shall be the **relating_shape_aspect** of at least two **feature_component_relationship**s. These **feature_component_relationship**s shall refer to **instanced_feature** instances as their **related_shape_aspect**.

5.2.3.1.76 general_material_property

A **general_material_property** is a type of **general_property** that depends on material aspects.

EXPRESS specification:

```
*)
ENTITY general_material_property
  SUBTYPE OF (general_property);
WHERE
 WR1: SIZEOF ( QUERY ( gpa <* USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.GENERAL_PROPERTY_ASSOCIATION.'+'BASE_DEFINITION'
     ) | NOT ( 'AUTOMOTIVE_DESIGN.'+ 'MATERIAL_PROPERTY' IN
     TYPEOF ( gpa. derived_definition ) ) ) ) =0;
END_ENTITY;
(*
```

Formal propositions:

WR1: A **general_material_property** may only be referenced as the **base_definition** by **general_property_association** instances which reference as **derived_definition** a **property_definition** of type **material_property**.

5.2.3.1.77 hardness_representation

A **hardness_representation** is a type of **representation** that representats the hardness of an object. For more information see ARM definition for Hardness in paragraph 4.2.254.

EXPRESS specification:

```
*)
ENTITY hardness_representation
  SUBTYPE OF (representation);
WHERE
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
 WR1: ( {2<= SIZEOF ( SELF.items ) <=4} ) AND ( SIZEOF ( QUERY (
      i <* items | ( 'AUTOMOTIVE_DESIGN.'+
      'DESCRIPTIVE_REPRESENTATION_ITEM' IN TYPEOF ( i ) ) AND (
      i.name IN [ 'measuring method' , 'measuring position' ] ) )
      ) + SIZEOF ( QUERY ( i <* items | ( SIZEOF (
      ['AUTOMOTIVE_DESIGN.'+ 'MEASURE_REPRESENTATION_ITEM' ,

      AND ( i.name IN ['depth' , 'hardness'] ) ) ) = SIZEOF (
      SELF.items ) ) ;
 WR2: SIZEOF ( QUERY ( i <* SELF.items | i.name =
      'measuring method' ) ) =1;
 WR3: SIZEOF ( QUERY ( i <* SELF.items | i.name ='hardness' ) )
      =1;
 WR4: SIZEOF ( QUERY ( i <* SELF.items | i.name =
      'measuring position' ) ) <=1;
 WR5: SIZEOF ( QUERY ( i <* SELF.items | i.name ='depth' ) )
      <=1;
 WR6: ( SIZEOF ( USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.'+'PROPERTY_DEFINITION_REPRESENTATION.'+
      'USED_REPRESENTATION' ) ) =1 ) AND ( SIZEOF ( QUERY ( pdr
      <* USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.'+'PROPERTY_DEFINITION_REPRESENTATION.'+
      'USED_REPRESENTATION' ) | SIZEOF ( QUERY ( gpa <* USEDIN (
      pdr. definition ,
      'AUTOMOTIVE_DESIGN.'+'GENERAL_PROPERTY_ASSOCIATION.'+
      'DERIVED_DEFINITION' ) | ( 'AUTOMOTIVE_DESIGN.'+
      'GENERAL_PROPERTY' IN TYPEOF ( gpa. base_definition ) ) AND
      ( gpa. base_definition.name ='surface_condition' ) ) ) =1 )
      ) =1 ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: Each instance of **hardness_representation** shall contain between two and four **representation_items** in its set of **items**. These **representation_items** shall either be of type **descriptive_representation_item** and have a **name** of either 'measuring method' or 'measuring position', or shall be of type **measure_representation_item** or **value_range** and have a **name** of either 'depth' or 'hardness'.

WR2: Each instance of **hardness_representation** shall contain exactly one **representation_item** in its set of **items** that has a **name** of 'measuring method'.

WR3: Each instance of **hardness_representation** shall contain exactly one **representation_item** in its set of **items** that has a **name** of 'hardness'.

WR4: Each instance of **hardness_representation** shall contain at most one **representation_item** in its set of **items** that has a **name** of 'measuring position'.

WR5: Each instance of **hardness_representation** shall contain at most one **representation_item** in its set of **items** that has a **name** of 'depth'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

WR6: Each instance of **hardness_representation** shall be referenced by exactly one **property_definition_representation**. This **property_definition_representation** shall relate the **representation** with a **property_definition** that is the **derived_definition** of a **general_property_association** that refers as **base_definition** to a **general_property** with a **name** of 'surface_condition'.

Informal propositions:

IP1: If the **hardness_representation** contains **qualified_representation_item**s that refer to a **type_qualifier** representing the value determination then all of the **representation_item**s shall also be **qualified_representation_item**s that refer to the same instance of **type_qualifier**.

5.2.3.1.78 hidden_element_over_riding_styled_item

The **hidden_element_over_riding_styled_item** is a type of **context_dependent_over_riding_styled_item** that specifies the handling of hidden elements. See ARM definition for Hidden_element_handling in paragraph 4.2.256 for more information.

EXPRESS specification:

```
*)
ENTITY hidden_element_over_riding_styled_item
  SUBTYPE OF (context_dependent_over_riding_styled_item);
WHERE
 WR1: SIZEOF ( SELF.style_context ) =1;
 WR2:'AUTOMOTIVE_DESIGN.'+ 'PRESENTATION_VIEW' IN TYPEOF (
     SELF.style_context[1] ) ;
 WR3:'AUTOMOTIVE_DESIGN.'+ 'CAMERA_IMAGE' IN TYPEOF ( SELF.item
     ) ;

     'AUTOMOTIVE_DESIGN.'+ 'PRESENTATION_VIEW' IN TYPEOF ( rep )
     ) ) >0;
END_ENTITY;
(*
```

Formal propositions:

WR1: There shall be exactly one **style_context**.

WR2: The **style_context** shall be a **presentation_view**.

WR3: The item where the overriding style is applied for all hidden elements shall be a **camera_image**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

WR4: The **mapping_origin** of the item shall be a **camera_model_d3_with_hlhsr**.

WR5: The **hidden_element_over_riding_styled_item** shall be included in the set of items of a **presentation_view**.

5.2.3.1.79 hole_bottom

A **hole_bottom** is a type of **shape_aspect** that is the end condition for a **round_hole**. See ARM definition for Conical_bottom in paragraph 4.2.95, for Flat_bottom in paragraph 4.2.207, for Flat_with_taper_bottom in paragraph 4.2.210, for Flat_with_radius_bottom in paragraph 4.2.209, for Spherical_bottom in paragraph 4.2.474, and for Through_hole_bottom_condition in paragraph 4.2.519 for more information.

EXPRESS specification:

Formal propositions:

WR1: The **hole_bottom** shall be an aspect of the shape of a **feature_component_definition**.

WR2: The **description** of the **hole_bottom** shall be either 'through', 'flat', 'flat with taper', 'flat with radius', 'spherical', or 'conical'.

WR3: If the **description** of the **hole_bottom** is 'flat' or 'through', the **hole_bottom** shall not have any **representation**.

WR4: If the **description** of the **hole_bottom** is 'flat with radius', 'flat with taper', 'spherical', or 'conical', the **hole_bottom** shall have exactly one **shape_representation_with_parameters** to specify its implicit representation.

WR5: If the **description** of the **hole_bottom** is 'flat with taper' the **shape_representation_with_parameters** that represents the **hole_bottom** shall contain exactly two **representation_item**s in its set of **items**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

WR6: If the **description** of the **hole_bottom** is 'conical', the **shape_representation_with_parameters** that represents the **hole_bottom** shall contain one or two **representation_item**s in its set of **items**.

WR7: If the **description** of the **hole_bottom** is 'flat with radius' or 'spherical', there shall be exactly one implicit representation, andi it shall conatin exactly one **representation_item**.

WR8: If the **description** of the **hole_bottom** is 'flat with radius', exactly one **representation_item** used for the implicit representation of a **hole_bottom** shall have a **name** of 'corner radius'. This **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit**.

WR9: If the **description** of the **hole_bottom** is 'spherical', exactly one **representation_item** used for the implicit representation of a **hole_bottom** shall have a **name** of 'radius'. This **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit**.

WR10: If the **description** of the **hole_bottom** is 'conical', at most one **representation_item** used for the implicit representation of a **hole_bottom** shall have a **name** of 'tip radius'. This **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit**.

WR11: If the **description** of the **hole_bottom** is 'conical', exactly one **representation_item** used for the implicit representation of a **hole_bottom** shall have a **name** of 'tip angle'. This **representation_item** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit**.

WR12: If the **description** of the **hole_bottom** is 'flat with taper', the implicit representation shall contain exactly one **representation_item** that has a **name** of 'final diameter' and is of type **measure_representation_item** and **length_measure_with_unit**.

WR13: If the **description** of the **hole_bottom** is 'flat with taper', the implicit representation shall contain exactly one **representation_item** that has a **name** of 'taper diameter' and is of type **measure_representation_item** and **plane_angle_measure_with_unit**.

WR14: The **hole_bottom** shall be the **relating_shape_aspect** in exactly one **feature_component_relationship** with a **description** of 'hole bottom usage'. The **related_shape_aspect** of this **feature_component_relationship** shall have a **description** of 'bottom condition occurrence'.

WR15: If the **description** of the **hole_bottom** is not 'through', the **feature_component_relationship** that refers to it, shall have a **name** of either 'hole depth start' or 'hole depth end'.

5.2.3.1.80 hole_in_panel

A **hole_in_panel** is a type of **feature_definition** applicable to panel parts. A **hole_in_panel** is an opening in a panel bounded by a closed profile that is created by a stamping process. See ARM definition for Hole_feature_in_panel in paragraph 4.2.258 for more information.

EXPRESS specification:

```
*)
ENTITY hole_in_panel
  SUBTYPE OF (feature_definition);
WHERE
```

     get_property_definition_representations ( SELF ) | SIZEOF (
     pdr. used_representation.items ) =1 ) ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **hole_in_panel** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'hole profile' and a **description** of 'closed profile occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **description** of 'profile usage' and a **relating_shape_aspect** that references a **circular_closed_profile**, **ngon_closed_profile**, **rectangular_closed_profile**, or **closed_path_profile**.

WR2: If an implicit representation of the **hole_in_panel** is present, it shall contain at most one **representation_item** in its set of **items**.

5.2.3.1.81 homokinetic_pair

A **homokinetic_pair** is a type of **universal_pair**, where the rotation of input axis and output axis are uniform.

EXPRESS specification:

```
*)
ENTITY homokinetic_pair
  SUBTYPE OF (universal_pair);
WHERE
 WR1: NOT EXISTS ( SELF.input_skew_angle ) ;
END_ENTITY;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Formal propositions:

WR1: For a **homokinetic_pair** the **input_skew_angle** shall be omitted.

5.2.3.1.82 inclusion_product_concept_feature

An **inclusion_product_concept_feature** is a type of **conditional_concept_feature** that is the representation of the statement that the application of a **product_concept_feature** or of a **conditional_concept_feature** implies the inclusion of an additional **product_concept_feature** or **conditional_concept_feature**. See Specification_inclusion 4.2.471 for more information

EXPRESS specification:

```
*)
ENTITY inclusion_product_concept_feature
  SUBTYPE OF (conditional_concept_feature);

5.2.3.1.83 instanced_feature

An **instanced_feature** is a type of **shape_aspect** and of **feature_definition** that is the identification of a preconceived form pattern on a part. See ARM definition for Included_feature in paragraph 4.2.261 for more information.

EXPRESS specification:

```
*)
ENTITY instanced_feature
  SUBTYPE OF (shape_aspect,feature_definition);
WHERE
 WR1:'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION' IN TYPEOF (
     SELF.of_shape. definition ) ;

     ) | ( 'AUTOMOTIVE_DESIGN.'+ 'PLANAR_SHAPE_REPRESENTATION'
     IN TYPEOF ( pdr. used_representation ) ) AND ( pdr.
     used_representation.name = 'maximum feature limit' ) ) )
     =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **instanced_feature** shall be an aspect of the shape of a **product_definition**.

WR2: The **instanced_feature** shall lie on the boundary of the part.

WR3: The **instanced_feature** shall be **represented_by** exactly one **planar_shape_representation**. This **planar_shape_representation** shall have a **name** of 'maximum feature limit'.

5.2.3.1.84 joggle

A **joggle** is a type of **feature_definition** applicable to panel parts. A **joggle** is a change in elevation of a face along a rim desgned to accommodate either clearance for the insertion of another part or a contact point for attachment of another part. See ARM definition for Joggle_feature in paragraph 4.2.277 for more information.

EXPRESS specification:

5.2.3.1.86 known_source

A **known_source** is a type of **external_source** and of **pre_defined_item** that is a source of information whose name and content are predetermined. It provides a mechanism to refer to an entry in an external library.

EXPRESS specification:

```
*)
ENTITY known_source
  SUBTYPE OF (external_source, pre_defined_item);
END_ENTITY;
(*
```

Informal propositions:

IP1: The contents of the **item_id** attribute of **externally_defined_item**s that reference a **known_source** as their **source** has to be formatted according to the rules specified for this **known_source**.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **known_source** entity:

– restrict_name_for_known_source (see 5.2.4.175).

5.2.3.1.87 language

A **language** is a type of **group** that is a a specification of the language in which an information is given. The **group** shall specify in its **name** a language code according to ISO 639-2, and, if present, in its

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

description a country code according to ISO 3166-1. See ARM definition for String_with_language for more information.

EXPRESS specification:

```
*)
ENTITY language
  SUBTYPE OF (group);
WHERE
 WR1: ( SIZEOF ( QUERY ( ca <* USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.'+'CLASSIFICATION_ASSIGNMENT.'+'ASSIGNED_CLASS'

```
WHERE
 WR1:'AUTOMOTIVE_DESIGN.'+ 'LANGUAGE' IN TYPEOF (
     SELF.assigned_class ) ;
 WR2:SELF.role. name ='language';
 WR3: SIZEOF ( SELF.items ) = SIZEOF ( QUERY ( i <* SELF.items |
     ( 'AUTOMOTIVE_DESIGN.'+ 'REPRESENTATION' IN TYPEOF ( i ) )
     AND ( i\representation. name = 'document content' ) ) ) ;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which a **language** is assigned.

Formal propositions:

WR1: The instance referenced as **assigned_class** shall be of type **language**.

WR2: The **name** of the **classification_role** referenced as **role** shall be 'language'.

WR3: The **representation**s in the set of items shall be of **name** 'document content'.

5.2.3.1.89 location_shape_representation

A **location_shape_representation** is a type of **shape_representation** that represents a geometric position or a reference point.

EXPRESS specification:

```
*)
ENTITY location_shape_representation
  SUBTYPE OF (shape_representation);
WHERE
 WR1: SIZEOF ( SELF.items ) =1;
 WR2: SIZEOF ( QUERY ( i <* SELF.items | 'AUTOMOTIVE_DESIGN.'+
     'POINT' IN TYPEOF ( i ) ) ) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **location_shape_representation** shall have exactly one **representation_item** in its set of **items**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

WR2: The geometric element that is used to represent the **location_shape_representation** shall be a **point**.

5.2.3.1.90 locator

A **locator** is a type of **feature_definition** applicable to panel parts. A **locator** is a conical impression used to locate the panel in the tooling. See ARM definition for Locator_feature in paragraph 4.2.302 for more information.

EXPRESS specification:

```
*)
ENTITY locator
  SUBTYPE OF (feature_definition);
WHERE
 WR1: SIZEOF ( QUERY ( pdr <*
     get_property_definition_representations ( SELF ) | (
     'AUTOMOTIVE_DESIGN.'+
     'SHAPE_REPRESENTATION_WITH_PARAMETERS' IN TYPEOF ( pdr.
     used_representation ) ) AND NOT ( {2<= SIZEOF ( pdr.
     used_representation.items ) <=5} ) ) ) =0;
 WR2: SIZEOF ( QUERY ( pdr <*
     get_property_definition_representations ( SELF ) | (
     'AUTOMOTIVE_DESIGN.'+
     'SHAPE_REPRESENTATION_WITH_PARAMETERS' IN TYPEOF ( pdr.
     used_representation ) ) AND ( SIZEOF ( QUERY ( i <* pdr.
     used_representation.items | ( i.name='diameter' ) AND (
     SIZEOF ( ['AUTOMOTIVE_DESIGN.'+
     'MEASURE_REPRESENTATION_ITEM' , 'AUTOMOTIVE_DESIGN.'+
     'LENGTH_MEASURE_WITH_UNIT']*TYPEOF ( i ) ) =2 ) ) ) =1 ) )
     ) =1;
 WR3: SIZEOF ( QUERY ( pdr <*
     get_property_definition_representations ( SELF ) | (

     'LENGTH_MEASURE_WITH_UNIT']*TYPEOF ( i ) ) =2 ) ) ) =1 ) )
     ) <=1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The implicit representation of the locator shall contain between two and five **representation_item**s in its set of **items**.

WR2: The implicit representation of the **locator** shall contain exactly one **representation_item** of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'diameter'.

WR3: The implicit representation of the **locator** shall contain at most one **representation_item** of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'tip radius'.

WR4: The implicit representation of the **locator** shall contain exactly one **representation_item** of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'tip angle'.

WR5: The implicit representation of the **locator** shall contain at most one **representation_item** of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'base radius'.

5.2.3.1.91 modified_pattern

A **modified_pattern** is a type of **replicate_feature** that represents the result of a collection of omissions and offsets of a base feature in either a **rectangular_pattern** or a **circular_pattern**.

EXPRESS specification:

```
*)
ENTITY modified_pattern
  SUBTYPE OF (replicate_feature);
WHERE
 WR1: SIZEOF ( QUERY ( sa <* get_shape_aspects ( SELF ) | (
     SIZEOF ( QUERY ( sar <* USEDIN ( sa ,
     'AUTOMOTIVE_DESIGN.'+'SHAPE_ASPECT_RELATIONSHIP.'+
     'RELATING_SHAPE_ASPECT' ) | ( sar. description =
     'base pattern' ) AND ( SIZEOF ( ['AUTOMOTIVE_DESIGN.'+
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

```
     'CIRCULAR_PATTERN' , 'AUTOMOTIVE_DESIGN.'+
     'RECTANGULAR_PATTERN']* TYPEOF ( sar.
     related_shape_aspect.of_shape. definition ) ) =1 ) ) ) =1 )
     ) ) =1;
 WR2: SIZEOF ( QUERY ( sa <* get_shape_aspects ( SELF ) | (
     SIZEOF ( QUERY ( sar <* USEDIN ( sa ,
     'AUTOMOTIVE_DESIGN.'+'SHAPE_ASPECT_RELATIONSHIP.'+
     'RELATING_SHAPE_ASPECT' ) | ( SIZEOF ( QUERY ( sar1 <*
     USEDIN ( sar. related_shape_aspect ,
     'AUTOMOTIVE_DESIGN.'+'SHAPE_ASPECT_RELATIONSHIP.'+
     'RELATED_SHAPE_ASPECT' ) | ( sar.
     related_shape_aspect:<>:sar1. related_shape_aspect ) AND (
     SIZEOF ( ['AUTOMOTIVE_DESIGN.'+ 'PATTERN_OFFSET_MEMBERSHIP'
     , 'AUTOMOTIVE_DESIGN.'+ 'PATTERN_OMIT_MEMBERSHIP']* TYPEOF
     ( sar1 ) ) =1 ) ) ) =1 ) ) ) >=1 ) ) ) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The basis shape of the **modified_pattern** shall have an aspect of shape that is the **relating_shape_aspect** in exactly one **shape_aspect_relationship** that has a **description** of 'base pattern'. This **shape_aspect_relationship** shall refer as **related_shape_aspect** to an **shape_aspect** that is an aspect of the basis shape of either a **circular_pattern** or a **rectangular_pattern**.

WR2: The basis shape of the **modified_pattern** shall have an aspect of shape that is the **relating_shape_aspect** in at least one **shape_aspect_relationship** in which the **related_shape_aspect** is the **related_shape_aspect** in a different instance of **shape_aspect_relationship** that is either a **pattern_offset_membership** or **pattern_omit_membership**.

5.2.3.1.92 moments_of_inertia_representation

A **moments_of_inertia_representation** is a type of **representation** that describes the law of inertia in the context of the rotation of a rigid body. The 9 inertia values are represented as a **list_representation_item** containing 3 elements, each describing one row of the inertia matrix, and each having 3 elements that describe the columns of each row.

EXPRESS specification:

```
*)
ENTITY moments_of_inertia_representation
  SUBTYPE OF (representation);
WHERE
 WR1: ( SIZEOF ( SELF.items ) =1 ) AND ( SIZEOF ( QUERY ( i <*
     SELF.items | ( 'AUTOMOTIVE_DESIGN.'+
     'COMPOUND_REPRESENTATION_ITEM' IN TYPEOF ( i ) ) AND (
     i.name = 'moments of inertia matrix' ) ) ) =1 ) ;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
 WR2: SIZEOF ( QUERY ( i <* SELF.items | ( 'AUTOMOTIVE_DESIGN.'+
     'COMPOUND_REPRESENTATION_ITEM' IN TYPEOF ( i ) ) AND (
     SIZEOF ( i\compound_representation_item. item_element ) =3
     ) AND ( 'AUTOMOTIVE_DESIGN.'+ 'LIST_REPRESENTATION_ITEM' IN
     TYPEOF ( i\compound_representation_item. item_element ) )
     AND value_range_aggregate_rep_item (
     i\compound_representation_item. item_element ) ) ) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **moments_of_inertia_representation** contains exactly one **representation_item** in its set of **items**. This **representation_item** is of type **compound_representation_item** and has a **name** of 'moments of inertia matrix'.

WR2: The **compound_representation_item** that is contained in the **moments_of_inertia_representation** references exactly three **representation_item**s. These **representation_item**s are of type **compound_representation_item** and reached through **list_representation_item**. Each of these **compound_representation_item**s references three **measure_representation_item**s through **list_representation_item**.

5.2.3.1.93 multi_language_attribute_assignment

The **multi_language_attribute_assignment** is a type of **attribute_value_assignment**. It specifes an alternative value for the string valued attribute of an existing entity and the name of that attribute.

EXPRESS specification:

```
*)
ENTITY multi_language_attribute_assignment
  SUBTYPE OF (attribute_value_assignment);
  items : SET [1:?] OF multi_language_attribute_item;

DERIVE
language : label := get_multi_language(SELF);

WHERE
 WR1:SELF\attribute_value_assignment. role.name =
     'alternate language' ;
 WR2: ( SIZEOF ( USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.ATTRIBUTE_LANGUAGE_ASSIGNMENT.ITEMS' ) )
     =1 ) AND ( SIZEOF ( QUERY ( ala <* USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.'+'ATTRIBUTE_LANGUAGE_ASSIGNMENT.'+
     'ITEMS' ) | ala. attribute_name ='attribute_value' ) ) =1 )
     ;
END_ENTITY;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
(*
```

Attribute definitions:

items: the set of **items** for which an alternative string value is specified.

language: The **language** specifies the **attribute_language_assignemnt** that refers as **items** to this object and provides the information concerning the language, in which an attribute value is specified.

Formal propositions:

WR1: The **attribute_value_role** specified by the **multi_language_attribute_assignment** shall have a **name** of 'alternate language'.

WR2: The **multi_language_attribute_assignment** shall be used exactly one time in role of **items** by an **attribute_language_assignment**. This **attribute_language_assignment** shall have a **attribute_name** of 'attribute_value'.

Informal propositions:

IP1: The **attribute_name** shall be the name of the attribute for which an alternative value is specified.

5.2.3.1.94 named_unit_variable

A **named_unit_variable** is a type of **named_unit** and **variable_semantics** that represents the unit in an explicitly defined mathematical function.

EXPRESS specification:

```
*)
ENTITY named_unit_variable
  SUBTYPE OF (named_unit, variable_semantics);

INVERSE
associated_variable_environment: environment FOR semantics;
END_ENTITY;
(*
```

Attribute definitions:

associated_variable_environment: the **environment** that specifies the representation for the derived unit.

5.2.3.1.95 ngon_closed_profile

A **ngon_closed_profile** is a type of **shape_aspect** that consists of an enclosed 2D area and a reference system for the parameters of the **ngon_closed_profile**. The enclosed area is defined by three or more straight sides with the corners lying on one circle. The reference system is used to define location and orientation of the **square_u_profile** and consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for Ngon_profile in paragraph 4.2.323 for more information.

EXPRESS specification:

```
*)
ENTITY ngon_closed_profile
  SUBTYPE OF (shape_aspect);
WHERE
 WR1:'AUTOMOTIVE_DESIGN.'+ 'FEATURE_COMPONENT_DEFINITION' IN
     TYPEOF ( SELF.of_shape. definition ) ;

     AND ( SIZEOF ( ['AUTOMOTIVE_DESIGN.'+
     'MEASURE_REPRESENTATION_ITEM' , 'AUTOMOTIVE_DESIGN.'+
     'LENGTH_MEASURE_WITH_UNIT']*TYPEOF ( i ) ) =2 ) ) ) =
     SIZEOF ( QUERY ( i <* pdr. used_representation.items | (
     i.name = 'corner radius' ) ) ) ) ) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **ngon_closed_profile** shall be an aspect of the shape of a **feature_component_definition**.

WR2: The **ngon_closed_profile** shall have exactly one implicit representation defined by a **shape_representation_with_parameters**.

WR3: The **shape_representation_with_parameters** that represents the **ngon_closed_profile** shall contain three or four **representation_item**s in its set of **items**.

WR4: The implicit representation of an **ngon_closed_profile** shall contain only **representation_item**s in its set of **items** that have a **name** of either 'orientation', 'number of sides', 'circumscribed diameter', 'diameter across flats', or 'corner radius'.

WR5: Exactly one **representation_item** used for the implicit representation of an **ngon_closed_profile** shall be of type **placement** with a **name** of 'orientation'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

WR6: Exactly one **representation_item** used for the implicit representation of an **ngon_closed_profile** shall be of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of ‘number of sides’.

WR7: Exactly one **representation_item** used for the implicit representation of an **ngon_closed_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of either ‘circumscribed diameter’ or ’diameter across flats’.

WR8: At most one **representation_item** used for the implicit representation of an **ngon_closed_profile** shall have a **name** of ’corner radius’. If present, this **representation_item** shall be of type **measure_-representation_item** and **length_measure_with_unit**.

Informal propositions:

IP1: The **ngon_closed_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **ngon_closed_profile** is defined at the centre of the defining circle.

IP3: One of the sides of the ngon shall be parallel to the X direction intersecting the negative Y direction.

5.2.3.1.96 open_path_profile

An **open_path_profile** is a type of **shape_aspect** that consists of a connected set of curves and a reference system that may be used to place the **open_path_profile**. The start vertex and end vertex for the set of curves do not connect creating an area open on one side. The reference system consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for General_-open_profile in paragraph 4.2.225 for more information.

EXPRESS specification:

```
*)
ENTITY open_path_profile

Formal propositions:

WR1: The **partial_circular_profile** shall be an aspect of the shape of a **feature_component_definition**.

WR2: The **partial_circular_profile** shall have exactly one implicit representation defined by a **shape_representation_with_parameters**.

WR3: The **shape_representation_with_parameters** that represents the **partial_circular_profile** shall contain exactly three **representation_item**s in its set of **items**.

WR4: The implicit representation of the **partial_circular_profile** shall contain only **representation_item**s that have a **name** of 'orientation', 'sweep angle', or 'radius'.

WR5: Exactly one **representation_item** used for the implicit representation of a **partial_circular_profile** shall be of type **placement** with a **name** of 'orientation'.

WR6: Exactly one **representation_item** used for the implicit representation of a **partial_circular_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'radius'.

WR7: Exactly one **representation_item** used for the implicit representation of a **partial_circular_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'sweep angle'.

WR8: The **partial_circular_profile** shall be represented by at most one **planar_shape_representation**. If present, this **planar_shape_representation** shall have a **name** of 'profile limit'.

Informal propositions:

IP1: The **partial_circular_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **partial_circular_profile** is defined at the arc origin.

IP3: The arc that defines the **partial_circular_profile** shall start at the X axis.

5.2.3.1.99 path_feature_component

A **path_feature_component** is a type of **shape_aspect** that represents a path used to define preconceived form patterns. The **path_feature_component** may be represented explicitly by a curve or a set of curves or implicitly by parameters that are defined in a reference system. The reference system is an **axis_placement**. See ARM definition for Path in paragraph 4.2.342, for General_path in paragraph 4.2.227, for Linear_path in paragraph 4.2.300, for Circular_path in paragraph 4.2.61, for Complete_circular_path in paragraph 4.2.79, and for Partial_circular_path in paragraph 4.2.339 for more information.

     ;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **pattern_omit_membership** shall refer as **relating_shape_aspect** to an aspect of the basis shape of either a **circular_pattern** or a **rectangular_pattern**.

WR2: The **related_shape_aspect** that defines the omission in the **pattern_offset_membership** shall be incorporated in at least one basis shape of a **modified_pattern** by a **feature_component_relationship** with a **description** of 'modified pattern'.

WR3: The **shape_aspect** that is referenced by **related_shape_aspect** of the **pattern_omit_membership** shall have exactly one **representation**.

WR4: If the **shape_aspect** referenced as the **relating_shape_aspect** of the **pattern_omit_membership** is an aspect of the shape of the basis shape of a **circular_pattern**, the **representation** of the **shape_aspect** referenced by the **related_shape_aspect** of the **pattern_omit_membership** shall contain one **representation_item** in its set of **items**.

WR5: If the **shape_aspect** referenced by the **relating_shape_aspect** of the **pattern_omit_membership** is an aspect of the basis shape of a **circular_pattern**, exactly one **representation_item** used for the **representation** of the **shape_aspect** referenced by the **related_shape_aspect** of the **pattern_omit_membership** shall be of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of 'index number'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

WR6: If the **shape_aspect** referenced by the **relating_shape_aspect** of the **pattern_omit_membership** is an aspect of the basis shape of a **rectangular_pattern**, the **representation** of the **shape_aspect** referenced by the **related_shape_aspect** of the **pattern_omit_membership** shall contain two **representation_item**s in its set of **items**.

WR7: If the **shape_aspect** referenced by the **relating_shape_aspect** of the **pattern_omit_membership** is an aspect of the basis shape of a **rectangular_pattern**, exactly one **representation_item** used for the **representation** of the **shape_aspect** referenced by the **related_shape_aspect** of the **pattern_omit_membership** shall be of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of 'row index'.

WR8: If the **shape_aspect** referenced by the **relating_shape_aspect** of the **pattern_omit_membership** is an aspect of the basis shape of a **rectangular_pattern**, exactly one **representation_item** used for the **representation** of the **shape_aspect** referenced by the **related_shape_aspect** of the **pattern_omit_membership** shall be of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of 'column index'.

5.2.3.1.103 person_and_organization_address

A **person_and_organization_address** is a type of **personal_address** and **organizatiional_address**. It specifies the relevant address of a **person_and_organization**. See ARM definition for Person_in_organization for more information.

EXPRESS specification:

```
*)
ENTITY person_and_organization_address
  SUBTYPE OF (organizational_address,personal_address);
WHERE
 WR1: SIZEOF ( SELF\personal_address. people ) =1;
 WR2: SIZEOF ( SELF\organizational_address. organizations ) =1;
 WR3: SIZEOF ( QUERY ( pao <* USEDIN ( SELF.people[1] ,
      'AUTOMOTIVE_DESIGN.PERSON_AND_ORGANIZATION.THE_PERSON' ) |
      pao. the_organization:=:SELF\organizational_address.
      organizations[1] ) ) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: There shall be exactly one item of type **person** in the set of **people**.

WR2: There shall be exactly one item of type **organization** in the set of **organizations**.

WR3: For each instance of type **person_and_organization_address** there exist a corresponding instance of type **person_and_organization**. The instance referenced by the attribute **people** of the instance of type **person_and_organization_address** is identical to the instance referenced by the attribue

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

the_person of the instance of type **person_and_organization**. The instance referenced by the attribute **organizations** of the instance of type **person_and_organization_address** is identical to the instance referenced by the attribue **the_organization** of the instance of type **person_and_organization**.

5.2.3.1.104 physically_modelled_product_definition

A **physically_modelled_product_definition** is a type of **product_definition_with_associated_documentss** that specifies a model of a shape of the part which is physically available. See ARM definition for Physical_model in paragraph 4.2.354 for more information.

EXPRESS specification:

```
*)
ENTITY physically_modelled_product_definition
  SUBTYPE OF (product_definition_with_associated_documents);
WHERE
 WR1:SELF.frame_of_reference\ application_context_element.name =
     'physical model occurrence' ;
 WR2: ( SIZEOF ( documentation_ids ) =1 ) AND ( SIZEOF ( QUERY (
     d <* documentation_ids | ( SIZEOF ( QUERY ( drt <*
     d.representation_types | ( drt. name ='physical' ) ) ) =1 )
     ) ) =1 ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **physically_modelled_product_definition** shall reference as its **frame_of_reference** a **product_definition_context** that has a **name** of 'physical model occurrence'.

WR2: The **physically_modelled_product_definition** shall have exactly one **document** in its set of **documentation_ids**. This **document** shall reference as its **representation_type** a **document_representation_type** that has a **name** of 'physical'.

Informal propositions:

IP1: In case the **physically_modelled_product_definition** is not referenced by a **product_definition_shape** as the **definition**, the scale shall be 1:1.

5.2.3.1.105 placed_datum_target_feature

A **placed_datum_target_feature** is a type of **datum_target** that represents the implicit definition of a datum target for tolerancing purposes. See ARM definition for Placed_target in paragraph 4.2.357 for more information.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXPRESS specification:

```

     ) =1 ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **description** for the **placed_datum_target_feature** shall be either 'point', 'line', 'rectangle' or 'circle'.

WR2: A **placed_datum_target_feature** shall have exactly one implicit representation.

WR3: Exactly one **representation_item** used for the implicit representation of the **placed_datum_-target_feature** shall be of type **placement** with a **name** of 'orientation'.

WR4: If the **placed_datum_target_feature** is a point, the **representation** shall contain exactly one **representation_item** in its set of **items**.

WR5: If the **placed_datum_target_feature** is a line or circle, the **representation** shall contain exactly two **representation_item**s in its set of **items**.

WR6: If the **placed_datum_target_feature** is a rectangle, the **representation** shall contain exactly three **representation_item**s in its set of **items**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

WR7: If the **description** of the **placed_datum_target_feature** is 'circle', exactly one **representation_item** used for the implicit representation of the **placed_datum_target_feature** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'target diameter'.

WR8: If the **description** of the **placed_datum_target_feature** is 'line', exactly one **representation_item** used for the implicit representation of the **placed_datum_target_feature** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'target length'.

WR9: If the **description** of the **placed_datum_target_feature** is 'rectangle', exactly one **representation_item** used for the implicit representation of the **placed_datum_target_feature** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'target length'.

WR10: If the **description** of the **placed_datum_target_feature** is 'rectangle', exactly one **representation_item** used for the implicit representation of the **placed_datum_target_feature** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'target width'.

5.2.3.1.106 placed_feature

A **placed_feature** is a type of **shape_aspect** that is the identification of a preconceived form pattern on a part as a result of the placement of a **feature_definition** which is defined in its own context. See ARM definition for Placed_feature in paragraph 4.2.356 for more information.

EXPRESS specification:

```
*)
ENTITY placed_feature
  SUBTYPE OF (shape_aspect);
WHERE
 WR1:'AUTOMOTIVE_DESIGN.'+'PRODUCT_DEFINITION' IN TYPEOF (
     SELF.of_shape. definition ) ;
 WR2: SIZEOF ( QUERY ( pdr <*
     get_shape_aspect_property_definition_representations ( SELF
     ) | ( 'AUTOMOTIVE_DESIGN.'+ 'SHAPE_REPRESENTATION' IN
     TYPEOF ( pdr. used_representation ) ) AND ( pdr.
     used_representation.name = 'feature definition placement' )
     AND ( SIZEOF ( QUERY ( i <* pdr. used_representation.items
     | ( 'AUTOMOTIVE_DESIGN.'+ 'MAPPED_ITEM' IN TYPEOF ( i ) )
     AND ( SIZEOF ( QUERY ( pdr1 <* USEDIN ( i\mapped_item.
     mapping_source.mapped_representation ,
     'AUTOMOTIVE_DESIGN.PROPERTY_DEFINITION_REPRESENTATION.USED_REPRESENTATION'
     ) | ( 'AUTOMOTIVE_DESIGN.'+ 'FEATURE_DEFINITION' IN TYPEOF
     ( pdr1. definition\property_definition. definition ) ) ) )
     =1 ) ) ) =1 ) ) ) =1;
 WR3: SIZEOF ( QUERY ( pdr <*
     get_shape_aspect_property_definition_representations ( SELF
     ) | ( 'AUTOMOTIVE_DESIGN.'+ 'PLANAR_SHAPE_REPRESENTATION'
     IN TYPEOF ( pdr. used_representation ) ) AND ( pdr.
     used_representation.name = 'maximum feature limit' ) ) )
     =1;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
END_ENTITY;
(*
```

Formal propositions:

WR1: The **placed_feature** shall be an aspect of the shape of a **product_definition**.

WR2: The **placed_feature** shall have a **shape_representation** with a **name** of 'feature definition placement' that contains a **mapped_item** in its set of **items**. This **mapped_item** shall reference a **representation_map** that references the **shape_representation** of a **feature_definition** as **mapped_representation**.

WR3: The **placed_feature** shall be represented by exactly one **planar_shape_representation**. This **planar_shape_representation** shall have a **name** of 'maximum feature limit'.

Informal propositions:

IP1: If an **placed_feature** has a **shape_representation** and if the **product_definition_shape** that is referenced as **of_shape** by the **placed_feature** has a **shape_representation** then these **shape_representation**s shall have the same **geometric_representation_context**.

5.2.3.1.107 planar_shape_representation

A **planar_shape_representation** is a type of **shape_representation** that represents a plane.

EXPRESS specification:

```
*)
ENTITY planar_shape_representation
  SUBTYPE OF (shape_representation);
WHERE
 WR1: SIZEOF ( SELF.items ) =1;
 WR2: SIZEOF ( QUERY ( i <* SELF.items | 'AUTOMOTIVE_DESIGN.'+

     'VEE_PROFILE']* TYPEOF ( sa ) ) =1 ) ) =1 ) ) =1 ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **planar_shape_representation** shall contain exactly one **representation_item** in its set of **items**.

WR2: The **planar_shape_representation** shall refer to a **plane** as its representation.

WR3: The **planar_shape_representation** shall have a **name** of either 'profile limit' or 'maximum feature limit'.

WR4: If the **planar_shape_representation** has a **name** of 'maximum feature limit', it shall be the representation of a **shape_aspect** that is either of type **instanced_feature** or **placed_feature**.

WR5: If the **planar_shape_representation** has a **name** of 'profile limit', it shall be the representation of a **shape_aspect** that is of type **open_path_profile**, **partial_circular_profile**, **rounded_u_profile**, **square_u_profile**, **tee_profile**, or **vee_profile**.

5.2.3.1.108 pocket

A **pocket** is a type of **feature_definition** that is the representation of a volume that is removed from a solid base shape. This volume may be enclosed in which case it is represented by sweeping a closed profile along a linear path represented by a **path_feature_component**. If the removed volume is not enclosed it is represented by sweeping an open profile. The bottom of the pocket is represented by a **pocket_bottom**. The walls of a **pocket** may have a slope that is represented by a **taper**. See ARM definition for General_pocket in paragraph 4.2.229, Rectangular_closed_pocket in paragraph 4.2.421, and Rectangular_open_pocket in paragraph 4.2.425 for more information.

EXPRESS specification:

Formal propositions:

WR1: The **pocket** shall have a **description** of 'open rectangular', 'closed rectangular', or 'complex'.

WR2: If the **pocket** has a **description** of 'complex', the **pocket** shall be the basis shape for exactly one **shape_aspect** with a **description** of 'boundary occurrence'. This **shape_aspect** shall be the **related_-shape_aspect** in exactly one **shape_defining_relationship** with a **description** of 'profile usage'in which

© ISO 2001 – All rights reserved

the **relating_shape_aspect** is a **circular_closed_profile**, **ngon_closed_profile**, **closed_path_profile**, **partial_circular_profile**, **rounded_u_profile**, **vee_profile**, **tee_profile**, or **open_path_profile**.

WR3: If the **pocket** has a **description** of 'closed rectangular', the **pocket** shall be the basis shape for exactly one **shape_aspect** with a **description** of 'closed boundary occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **description** of 'profile usage' in which the **relating_shape_aspect** is a **rectangular_closed_profile**.

WR4: If the **pocket** has a **description** of 'open rectangular', the **pocket** shall be the basis shape for exactly one **shape_aspect** with a **description** of 'open boundary occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **description** of 'profile usage' in which the **relating_shape_aspect** is a **square_u_profile**.

WR5: The **pocket** shall be the basis shape for exactly one **shape_aspect** with a **description** of 'pocket depth occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'pocket depth' and a **description** of 'path feature component usage' in which the **relating_shape_aspect** is a **path_feature_component** with a **description** of 'linear'.

WR6: The **pocket** shall be the basis shape for exactly one **shape_aspect** with a**description** of 'bottom condition occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **feature_component_relationship** with a **description** of 'pocket bottom usage' in which the **relating_shape_aspect** is a **pocket_bottom**.

WR7: The **pocket** shall be the basis shape for at most one **shape_aspect** with a **description** of 'change in boundary occurrence'. If present, this **shape_aspect** shall be the **related_shape_aspect** in exactly one **feature_component_relationship** with a **description** of 'taper usage' in which the **relating_shape_aspect** is a **taper** with a **description** of either 'angle taper' or 'directed taper'.

WR8: The implicit representation of the **pocket** shall contain between one and two **representation_items** in its set of **items**.

WR9: The implicit representation of the **pocket** shall only contain **representation_items** in its set of **items** that have a **name** of either 'orientation' or 'fillet radius'.

WR10: The implicit representation of the **pocket** shall contain at most one **representation_items** in its set of **items** that has a **name** of 'base radius'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit**.

5.2.3.1.109 pocket_bottom

A **pocket_bottom** is a type of **shape_aspect** that is the bottom condition for a **pocket**. See ARM definition for Pocket_bottom_condition in paragraph 4.2.365, for Planar_bottom_condition in paragraph 4.2.358, for Through_pocket_bottom_condition in paragraph 4.2.520, and for General_bottom_condition in paragraph 4.2.215 for more information.

```

Formal propositions:

WR1: The **pocket_bottom** shall be an aspect of the shape of a **feature_component_definition**.

WR2: The **description** of the **pocket_bottom** shall be either 'planar', 'complex', or 'through'.

WR3: If the **pocket_bottom** has a **description** of 'planar' or 'complex', the **pocket_bottom** shall have its implicit representation specified by at most one **shape_representation_with_parameters**. If present, the implicit representation shall contain exactly one **representation_item** in its set of **items**. It shall be of type **measure_representation_item** and **length_measure_with_unit** and shall have a **name** of 'radius'.

WR4: If the **pocket_bottom** has a **description** of 'planar' or 'complex', the **feature_component_-relationship** that refers to the **pocket_bottom** as the **relating_shape_aspect** shall have a **name** of either 'pocket depth start' or 'pocket depth end'.

WR5: If the **description** of the **pocket_bottom** is 'complex', the **pocket_bottom** shall be represented by exactly one **face_shape_representation**. This representation shall have a **name** of 'floor'.

WR6: If the **description** of the **pocket_bottom** is 'planar', the **pocket_bottom** shall be represented by exactly one **location_shape_representation**. This representation shall have a **name** of 'floor location'.

WR7: If the **description** of the **pocket_bottom** is 'planar', the **pocket_bottom** shall be represented by exactly one **direction_shape_representation**. This representation shall have a **name** of 'floor normal'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

WR8: If the **description** of the **pocket_bottom** is 'through', the **pocket_bottom** shall not be represented implicitly by a **shape_representation_with_parameters**.

WR9: The **pocket_bottom** shall be the **relating_shape_aspect** in exactly one **feature_component_relationship**. This **feature_component_relationship** shall have a **description** of 'pocket bottom usage' and shall reference as the **related_shape_aspect** an aspect of the shape of a **pocket** that has a **description** of 'bottom condition occurrence'.

5.2.3.1.110 point_placement_shape_representation

A **point_placement_shape_representation** is a type of **shape_representation** that consists of sequences of pairs of points and directions. See ARM definition for Point_direction_model in paragraph 4.2.370 for more information.

EXPRESS specification:

```
*)
ENTITY point_placement_shape_representation
  SUBTYPE OF (shape_representation);
WHERE
 WR1: SIZEOF ( QUERY ( i <* SELF.items | SIZEOF (
     ['AUTOMOTIVE_DESIGN.'+ 'COMPOUND_REPRESENTATION_ITEM' ,
     'AUTOMOTIVE_DESIGN.'+ 'MAPPED_ITEM' , 'AUTOMOTIVE_DESIGN.'+
     'AXIS2_PLACEMENT_3D']* TYPEOF ( i ) ) <>1 ) ) =0;
 WR2: SIZEOF ( QUERY ( i <* SELF.items | SIZEOF (
     ['AUTOMOTIVE_DESIGN.'+ 'COMPOUND_REPRESENTATION_ITEM' ,
     'AUTOMOTIVE_DESIGN.'+ 'MAPPED_ITEM']* TYPEOF ( i ) ) =1 ) )
     >0;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **items** in a **point_placement_shape_representation** shall be of type **compound_representation_item**, **mapped_item**, or **axis2_placement_3d**.

WR2: At least one of the **items** in a **point_placement_shape_representation** shall be either a **compound_representation_item** or a **mapped_item**.

Informal propositions:

IP1: For each **compound_representation_item** in the set of **items** the **item_element** shall be of type **list_representation_item**.

IP2: For each **compound_representation_item** in the set of **items** the **list_representation_item** shall include only **representation_item**s of type **placement** or **point**.

5.2.3.1.117 process_plan

A **process_plan** is a type of **action** that specifies the information necessary for manufacturing planning. See ARM definition for Process_plan in paragraph 4.2.387 for more information.

EXPRESS specification:

```
*)
ENTITY process_plan
  SUBTYPE OF (action);
WHERE
 WR1: SIZEOF ( QUERY ( ar <* USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.'+'ACTION_RELATIONSHIP.'+
      'RELATED_ACTION' ) | SIZEOF ( ['AUTOMOTIVE_DESIGN.'+
      'PROCESS_PLAN' , 'AUTOMOTIVE_DESIGN.'+
      'PRODUCT_PROCESS_PLAN']* TYPEOF ( ar. relating_action ) )
      <>1 ) ) =0;
 WR2: SIZEOF ( QUERY ( ar <* USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.'+'ACTION_RELATIONSHIP.'+
      'RELATING_ACTION' ) | ( SIZEOF ( ['AUTOMOTIVE_DESIGN.'+
      'PROCESS_PLAN' , 'AUTOMOTIVE_DESIGN.'+
      'PRODUCT_PROCESS_PLAN']* TYPEOF ( ar. related_action ) ) =1
      ) OR ( ( ar. name = 'process operation occurrence' ) AND (
      'AUTOMOTIVE_DESIGN.'+ 'PROCESS_OPERATION' IN TYPEOF ( ar.
      related_action.chosen_method ) ) ) ) = SIZEOF ( USEDIN (
      SELF , 'AUTOMOTIVE_DESIGN.'+'ACTION_RELATIONSHIP.'+
      'RELATING_ACTION' ) ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **process_plan** shall only be referenced as the **related_action** by **action_relationship**s that reference as the **relating_action** a **process_plan** or a **product_process_plan**.

WR2: The **process_plan** shall only be referenced as the **relating_action** by **action_relationship**s that reference as the **related_action** a **process_plan**, or a **product_process_plan**, or by **action_relationship**s that have a **name** of 'process operation occurrence' and that reference as the **related_action** an **action** that refers to a **process_operation** as its **chosen_method**.

5.2.3.1.118 product_class

A **product_class** is a type of **product_concept** and **characterized_object** that is the identification of a set of similar products to be offered to the market. See ARM definition for Product_class in paragraph 4.2.392 for more information.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
ENTITY product_class
  SUBTYPE OF (product_concept,characterized_object);
END_ENTITY;
(*
```

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_class** entity:

– restrict_configuration_design_for_product_class (see 5.2.4.93).

5.2.3.1.119 product_concept_feature_category

A **product_concept_feature_category** is a type of **group** that specifies a set of similar **product_concept_feature** instances. See ARM definition for Specification_category in paragraph 4.2.468 for more information.

EXPRESS specification:

```
*)
ENTITY product_concept_feature_category
  SUBTYPE OF (group);
WHERE
 WR1: SIZEOF ( QUERY ( aga <* USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.GROUP_ASSIGNMENT.'+'ASSIGNED_GROUP' ) |
      ( 'AUTOMOTIVE_DESIGN.'+ 'APPLIED_GROUP_ASSIGNMENT' IN
      TYPEOF ( aga ) ) AND ( ( aga. role.name<>
      'specification category member' ) OR ( SIZEOF ( QUERY ( i
      <* aga. items | ( 'AUTOMOTIVE_DESIGN.'+
      'PRODUCT_CONCEPT_FEATURE' IN TYPEOF ( i ) ) AND NOT (
      'AUTOMOTIVE_DESIGN.'+ 'CONDITIONAL_CONCEPT_FEATURE' IN
      TYPEOF ( i ) ) ) ) <> SIZEOF ( aga. items ) ) ) ) =0;
END_ENTITY;
(*
```

Formal propositions:

WR1: A **product_concept_feature_category** shall only be referenced as **assigned_group** by **applied_group_assignment** instances which reference as **role** an **object_role** with a **name** of 'specification category member' and which only contain **product_concept_feature**s in their set of **items** which are not of type **conditional_concept_feature**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_concept_feature_-category** entity:

– product_concept_feature_requires_category (see 5.2.4.71);

– restrict_group_relationship_for_specification_category (see 5.2.4.103).

5.2.3.1.120 product_concept_feature_category_usage

A **product_concept_feature_category_usage** is a type of **group_assignment** that is the assignment of a **product_concept_feature_category** to a **product_class**. Additionally this assignment specifies if the usage of one or more **product_concept_feature**s belonging to this **product_concept_feature_category** is mandatory or optional for all products of that **product_class**.

EXPRESS specification:

```
*)
ENTITY product_concept_feature_category_usage
  SUBTYPE OF (group_assignment);
  items : SET [1:?] OF category_usage_item;
WHERE
 WR1:'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_CONCEPT_FEATURE_CATEGORY' IN
     TYPEOF ( SELF.assigned_group ) ;
 WR2:SELF.role. name IN [ 'mandatory category usage' ,
     'optional category usage' ];
END_ENTITY;
(*
```

Attribute definitions:

items: the set of items to which the **product_concept_feature_category** is assigned.

Formal propositions:

WR1: The **product_concept_feature_category_usage** shall have an **assigned_group** which is of type **product_concept_feature_category**.

WR2: The **product_concept_feature_category_usage** shall have as **role** an **object_role** with a **name** of 'mandatory category usage' or 'optional category usage'.

Associated global rule:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following global rule defined in this part of ISO 10303 applies to the **product_concept_feature_category_usage** entity:

– restrict_effectivity_assignment_for_class_category_usage (see 5.2.4.97).

5.2.3.1.121 product_definition_resource

A **product_definition_resource** is a type of **product_definition** and **action_resource** that specifies a tool that is used to perform a Process_operation.

EXPRESS specification:

```
*)
ENTITY product_definition_resource
  SUBTYPE OF (action_resource,product_definition);
WHERE
 WR1: SIZEOF ( USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.'+'REQUIREMENT_FOR_ACTION_RESOURCE.'+
      'RESOURCES' ) ) >0;
 WR2:SELF.frame_of_reference. name IN ['part_definition' ,
      'part occurrence' , 'physical occurrence' ];
END_ENTITY;
(*
```

Formal propositions:

WR1: A **product_definition_resource** is contained in the set of **resources** of at least one **requirement_for_action_resource**.

WR2: A **product_definition_resource** shall reference as its **frame_of_reference** a **product_definition_context** with a **name** of 'part_definition', 'part occurrence', or 'physical occurrence'.

5.2.3.1.122 product_identification

A **product_identification** is a type of **configuration_item** and **characterized_object** that identifies a manufacturable object, or expected as so, which is defined with respect to the **product_class** it is a member of.

EXPRESS specification:

```
*)
ENTITY product_identification
  SUBTYPE OF (configuration_item,characterized_object);
WHERE
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
 WR1: SIZEOF ( QUERY ( cd <* USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.CONFIGURATION_DESIGN.CONFIGURATION' ) |
      ( 'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION_FORMATION' IN
      TYPEOF ( cd. design ) ) AND ( SIZEOF ( QUERY ( prpc <*
      USEDIN ( cd. design\product_definition_formation.
      of_product ,

      ) ) ) <=1;
 WR2:'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_CLASS' IN TYPEOF (
      SELF.item_concept ) ;
 WR3: NOT ( 'AUTOMOTIVE_DESIGN.'+ 'CONFIGURABLE_ITEM' IN TYPEOF
      ( SELF ) ) OR ( 'AUTOMOTIVE_DESIGN.'+
      'PRODUCT_SPECIFICATION' IN TYPEOF ( SELF ) ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: Each **product_identification** shall be referenced as the **configuration** by at most one instance of **configuration_design** that references as **design** a **product_definition_formation** which references as **of_product** a **product** which is contained in the of **products** set of a **product_related_product_category** with a **name** of either 'part', 'raw material', or 'tool'.

WR2: Each **product_identification** shall reference as its **item_concept** a **product_class**.

WR3: If a **product_identification** is of type **configurable_item** it shall also be of type **product_specification**. If a **product_identification** is of type **product_specification** it shall also be of type **configurable_item**.

5.2.3.1.123 product_process_plan

A **product_process_plan** is a type of **product_definition_process** that specifies the information necessary for manufacturing planning to realize or produce a product. See ARM definition for Process_plan in paragraph 4.2.387 for more information.

EXPRESS specification:

```
*)
ENTITY product_process_plan
  SUBTYPE OF (product_definition_process);
WHERE
 WR1: SIZEOF ( QUERY ( ar <* USEDIN ( SELF ,
      'AUTOMOTIVE_DESIGN.'+'ACTION_RELATIONSHIP.'+

     'PROCESS' ) | ( ppa. name<> 'produced output' ) OR NOT (
     'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION' IN TYPEOF ( ppa.
     defined_product ) ) ) ) =0;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **product_process_plan** shall only be referenced as the **related_action** by **action_relationship**s that reference as the **relating_action** a **process_plan** or a **product_process_plan**.

WR2: The **product_process_plan** shall only be referenced as the **relating_action** by **action_relationship**s that reference as the **related_action** a **process_plan** or a **product_process_plan**, or by **action_relationship**s that have a **name** of 'process operation occurrence' and that reference as the **related_action** an **action** that refers to a **process_operation** as its **chosen_method**.

WR3: The **product_process_plan** shall only be referenced as **process** by **process_product_association**s that have a **name** of 'produced output' and that reference as **defined_product** a **product_definition**.

5.2.3.1.124 product_specification

A **product_specification** is a type of **product_identification** and **configurable_item** for which one or more **product_concept_feature** objects enhance the characterization provided for its associated **product_class**.

EXPRESS specification:

```
*)
ENTITY product_specification
  SUBTYPE OF (product_identification,configurable_item);
END_ENTITY;
(*
```

5.2.3.1.125 rectangular_closed_profile

A **rectangular_closed_profile** is a type of **shape_aspect** that consists of an enclosed 2D area and a reference system for the parameters of the **rectangular_closed_profile**. The enclosed area is defined by four straight sides with opposite sides equal in length. The reference system is used to define location and orientation of the **rectangular_closed_profile** and consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for Rectangular_closed_profile in paragraph 4.2.422 for more information.

EXPRESS specification:

```
*)
ENTITY rectangular_closed_profile
  SUBTYPE OF (shape_aspect);

END_ENTITY;
(*
```

Formal propositions:

WR1: The **rectangular_closed_profile** shall be an aspect of the shape of a **feature_component_definition**.

WR2: The **rectangular_closed_profile** shall have exactly one implicit representation defined by a **shape_representation_with_parameters**.

WR3: The **shape_representation_with_parameters** that represents the **rectangular_closed_profile** shall contain three or four **representation_item**s in its set of **items**.

WR4: The implicit representation of a **rectangular_closed_profile** shall contain only **representation_item**s in its set of **items** that have a **name** of either 'orientation', 'length', 'width', or 'corner radius'.

WR5: Exactly one **representation_item** used for the implicit representation of a **rectangular_closed_profile** shall be of type **placement** with a **name** of 'orientation'.

WR6: Exactly one **representation_item** used for the implicit representation of a **rectangular_closed_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'width'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

WR7: Exactly one **representation_item** used for the implicit representation of a **rectangular_closed_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'length'.

WR8: At most one **representation_item** used for the implicit representation of a **rectangular_closed_profile** shall have a **name** of 'corner radius'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit**.

Informal propositions:

IP1: The **rectangular_closed_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **rectangular_closed_profile** is defined at the centre of the rectangle.

IP3: The length of the **rectangular_closed_profile** is defined in the X direction and the width is defined in the Y direction of the reference system.

5.2.3.1.126 rectangular_pattern

A **rectangular_pattern** is a type of **replicate_feature** representing a pattern where a number of occurrences of a base feature are equally arranged in rows and columns. See ARM definition for Rectangular_pattern in paragraph 4.2.426 for more information.

EXPRESS specification:

```
*)

Formal propositions:

WR1: A **rep_item_group** shall be contained in the set of **assigned_item**s of a **presentation_layer_-assignment**.

WR2: A **rep_item_group** shall be contained in the set of **items** of a **representation** with a **name** of 'group representation'.

WR3: The **rep_item_group** shall only be referenced by **group_assignments** that reference as **role** an **object_role** that has a **name** of 'group membership'.

WR4: The items in a **rep_item_group** shall be of type **geometric_representation_item**, **topological_-representation_item**, **mapped_item**, or **styled_item**.

5.2.3.1.128 replicate_feature

A **replicate_feature** is a type of **feature_definition** representing a pattern or a modification of a pattern for the replication of features. See ARM definition for Replicate_feature in paragraph 4.2.433 for more information.

EXPRESS specification:

```
*)
ENTITY replicate_feature
  SUBTYPE OF (feature_definition);
WHERE
 WR1: SIZEOF ( QUERY ( pdr <*
     get_property_definition_representations ( SELF ) | (
     'AUTOMOTIVE_DESIGN.'+
     'SHAPE_REPRESENTATION_WITH_PARAMETERS' IN TYPEOF ( pdr.
     used_representation ) ) ) ) =1;
 WR2: SIZEOF ( QUERY ( pdr <*

     related_shape_aspect.of_shape. definition ) ) ) =1 ) ) )
     =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **replicate_feature** shall have exactly one implicit representation of type **shape_representation_with_parameters**.

WR2: The implicit representation of the **replicate_feature** shall contain exactly one **representation_item** that is of type **placement** and a **name** of 'orientation'

WR3: The basis shape of the **replicate_feature** shall have an aspect of shape that is the **relating_shape_aspect** of a **feature_component_relationship** with a **name** of 'pattern basis' and a **related_shape_aspect** that is an aspect of the basis shape of a **feature_definition**.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **replicate_feature** entity:

– subtype_exclusiveness_replicate_feature (see 5.2.4.240).

5.2.3.1.129 retention

A **retention** is a type of **action** that defines a period of time that product data needs to be retained due to organizational policy or to legal requirements. See See ARM definition for Retention_period in paragraph 4.2.434 for more information.

EXPRESS specification:

```
*)

Formal propositions:

WR1: The **retention** shall be referenced as the **assigned_action** by at least one instance of **applied_action_assignment** that has a **role** with **name** 'retention'.

WR2: The **retention** shall be contained in the set of **items** of exactly one **applied_time_interval_assignment** that references as its **role** a **time_interval_role** with a **name** of 'minimum retention period', and shall be contained in the set of **items** of exactly one **applied_time_interval_assignment** that references as its **role** a **time_interval_role** with a **name** of 'maximum retention period'. Both **applied_time_interval_assignment** instances shall reference as **assigned_time_interval** a **time_interval_with_bounds** that has its **primary_bound** and either one of **secondary_bound** or **duration** attributes instantiated. Both **applied_time_interval_assignment** instances shall have the same **primary_bound**.

WR3: The **retention** shall not be referenced by an **action_relationship**.

Associated global rules:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The following global rules defined in this part of ISO 10303 apply to the **retention** entity:

– dependent_instantiable_retention (see 5.2.4.42);

– retention_requires_retention_assignment (see 5.2.4.211).

5.2.3.1.130 rib

A **rib** is a type of **feature_definition** that is the representation of a volume that is added to a solid base shape in order to increase the stability of certain regions of the part. This added volume is represented by sweeping an open profile along a path represented by a **path_feature_component**. The walls of a **rib** may have an additional slope that is represented by a **taper**. See ARM definition for Rib_feature in paragraph 4.2.435 for more information.

Informal propositions:

IP1: The **rounded_u_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **rounded_u_profile** is defined at the midpoint of the arc.

IP3: The **rounded_u_profile** is defined with the X direction tangent to the arc at the midpoint, and the Y direction in the direction of the open end of the profile.

5.2.3.1.133 shape_aspect_transition

A **shape_aspect_transition** is a type of **shape_aspect_relationship** that specifies a relationship between two **shape_aspect**s that represent either two **edge**s or two **face**s of a product for the purpose of specifying the geometric continuity at the transition of those two **shape_aspect**s. See ARM definition for Edge_-transition in paragraph 4.2.178 and for Face_transition in paragraph 4.2.194 for more information.

EXPRESS specification:

```
*)
ENTITY shape_aspect_transition

      =0 ) ) ) =0 ) ) ) =0 ) ) =0 ) ) =0 ) ) =0;
 WR4:SELF.name IN ['g0' , 'g1' , 'g2'];
END_ENTITY;
(*
```

Formal propositions:

WR1: The **shape_aspect**s that play the role of either **relating_shape_aspect** or **related_shape_aspect** shall be associated to **representation**s that contain either an **edge** in both or a **face** in both.

WR2: If the **representation**s contain **edge**s they shall share at least one instance of **vertex**.

WR3: If the **representation**s contain **face**s they shall share at least one instance of **edge**.

WR4: The **shape_aspect_transition** shall have a **name** of either 'g0','g1, or 'g2'.

5.2.3.1.134 shape_defining_relationship

A **shape_defining_relationship** is a type of **shape_aspect_relationship** that is used to relate features with components that define the basic shape of the feature such as profiles or sweep paths.

EXPRESS specification:

```
*)
ENTITY shape_defining_relationship
  SUBTYPE OF (shape_aspect_relationship);
WHERE
 WR1: ( SELF\shape_aspect_relationship. description<>
      'profile usage' ) OR ( SIZEOF ( ['AUTOMOTIVE_DESIGN.'+
      'RECTANGULAR_CLOSED_PROFILE' , 'AUTOMOTIVE_DESIGN.'+
      'CIRCULAR_CLOSED_PROFILE' , 'AUTOMOTIVE_DESIGN.'+
      'NGON_CLOSED_PROFILE' , 'AUTOMOTIVE_DESIGN.'+
      'CLOSED_PATH_PROFILE' , 'AUTOMOTIVE_DESIGN.'+
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
     'OPEN_PATH_PROFILE' , 'AUTOMOTIVE_DESIGN.'+
     'PARTIAL_CIRCULAR_PROFILE' , 'AUTOMOTIVE_DESIGN.'+
     'ROUNDED_U_PROFILE' , 'AUTOMOTIVE_DESIGN.'+
     'SQUARE_U_PROFILE' , 'AUTOMOTIVE_DESIGN.'+ 'TEE_PROFILE' ,
     'AUTOMOTIVE_DESIGN.'+ 'VEE_PROFILE']* TYPEOF (
     SELF\shape_aspect_relationship. relating_shape_aspect ) )
     =1 ) ;
 WR2: ( SELF\shape_aspect_relationship. description<>
     'path feature component usage' ) OR ( 'AUTOMOTIVE_DESIGN.'+
     'PATH_FEATURE_COMPONENT' IN TYPEOF (
     SELF\shape_aspect_relationship. relating_shape_aspect ) ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: If the **shape_defining_relationship** has a **description** of 'profile usage', the **relating_shape_aspect** shall be of type **rectangular_closed_profile**, **circular_closed_profile**, **ngon_closed_profile**, **closed_path_profile**, **open_path_profile**, **partial_circular_profile**, **rounded_u_profile**, **square_u_profile**, **tee_profile**, or **vee_profile**.

WR2: If the **shape_defining_relationship** has a **description** of 'path feature component usage', the **relating_shape_aspect** shall be of type **path_feature_component**.

5.2.3.1.135 shape_representation_with_parameters

A **shape_representation_with_parameters** is a type of **shape_representation** in which the shape of a **product_definition** or **shape_aspect** is defined implicitly using measurements and descriptive parameters.

EXAMPLE 1 The shape of a box may be specified by a **shape_representation_with_parameters** by giving measurements for its height, length, and width.

EXPRESS specification:

```
*)
ENTITY shape_representation_with_parameters
  SUBTYPE OF (shape_representation);
WHERE
 WR1: SIZEOF ( QUERY ( i <* SELF.items | SIZEOF (
     ['AUTOMOTIVE_DESIGN.'+ 'PLACEMENT' , 'AUTOMOTIVE_DESIGN.'+
     'MEASURE_REPRESENTATION_ITEM' , 'AUTOMOTIVE_DESIGN.'+
     'DESCRIPTIVE_REPRESENTATION_ITEM']* TYPEOF ( i ) ) =1 ) ) =
     SIZEOF ( SELF.items ) ;
END_ENTITY;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Formal propositions:

WR1: The elements that specify the parameters for a **shape_representation_with_parameters** shall be of type **placement**, **measure_representation_item**, or **descriptive_representation_item**.

5.2.3.1.136 slot

A **slot** is a type of **feature_definition** that is the representation of a volume that is removed from a solid base shape. This removed volume is represented by sweeping an open profile along a path represented by a **path_feature_component**. Each end of the **slot** is represented by a **slot_end**. See ARM definition for Slot_feature in paragraph 4.2.458 for more information.

EXPRESS specification:

```
*)

5.2.3.1.138 square_u_profile

A **square_u_profile** is a type of **shape_aspect** that consists of three connected straight lines and a reference system for the parameters of the **square_u_profile**. The reference system is used to define location and orientation of the **square_u_profile** and consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for Square_u_profile in paragraph 4.2.476 for more information.

Formal propositions:

WR1: The **square_u_profile** shall be an aspect of the shape of a **feature_component_definition**.

WR2: The **square_u_profile** shall have exactly one implicit representation defined by a **shape_representation_with_parameters**.

WR3: The **shape_representation_with_parameters** that represents the **square_u_profile** shall contain between four and six **representation_item**s in its set of **items**.

WR4: The implicit representation of a **square_u_profile** shall contain only **representation_item**s in its set of **items** that have a **name** of either 'orientation', 'width', 'first angle', 'second angle', 'first radius', or 'second radius'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

WR5: Exactly one **representation_item** used for the implicit representation of a **square_u_profile** shall be of type **placement** with a **name** of ‘orientation’.

WR6: Exactly one **representation_item** used for the implicit representation of a **square_u_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of ‘width’.

WR7: Exactly one **representation_item** used for the implicit representation of a **square_u_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of ‘first angle’.

WR8: Exactly one **representation_item** used for the implicit representation of a **square_u_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of ‘second angle’.

WR9: At most one **representation_item** used for the implicit representation of a **square_u_profile** shall have a **name** of ’first radius’. If present, this **representation_item** shall be of type **measure_-representation_item** and **length_measure_with_unit**.

WR10: At most one **representation_item** used for the implicit representation of a **square_u_profile** shall have a **name** of ’second radius’. If present, this **representation_item** shall be of type **measure_-representation_item** and **length_measure_with_unit**.

WR11: The **square_u_profile** shall be represented by at most one **planar_shape_representation**. If present, this **planar_shape_representation** shall have a **name** of ’profile limit’.

Informal propositions:

IP1: The **square_u_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **square_u_profile** is defined at the midpoint of the base line.

IP3: The **square_u_profile** is defined with the base line in the X direction and the Y direction in the direction of the open end of the profile.

5.2.3.1.139 surface_condition_callout

A **surface_condition_callout** is a type of **draughting_callout** that presents a surface condition.

EXPRESS specification:

```

```
     ( c ) ) <>1 ) ) =0;
END_ENTITY;
(*
```

Formal propositions:

WR1: The elements in the inherited attribute **contents** shall be of type **annotation_curve_occurrence**, **annotation_symbol_occurrence**, or **annotation_text_occurrence**.

5.2.3.1.140 surface_texture_representation

A **surface_texture_representation** is a type of **representation** that represents a surface texture such as roughness or waviness. The kind of surface texture that is represented is given in the **name**s of the **representation_item**s. The method or standard according to which the surface texture is represented is specified in the **description** of the **descriptive_representation_item**. For more information see ARM definition for Surface_texture in paragraph 4.2.500.

EXPRESS specification:

```
*)
ENTITY surface_texture_representation
  SUBTYPE OF (representation);
WHERE

5.2.3.1.143 tee_profile

A **tee_profile** is a type of **shape_aspect** that consists of an upside down T shape and a reference system for the parameters of the **tee_profile**. The **tee_profile** consist of a stem and a perpendicular crossbar. The stem has two parallel lines connected at their ends by the crossbar. The crossbar is a rectangle. The profile is symmetric about the centreline of the stem. The reference system is used to define location and orientation of the **tee_profile** and consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for Tee_profile in paragraph 4.2.511 for more information.

EXPRESS specification:

Formal propositions:

WR1: The **tee_profile** shall be an aspect of the shape of a **feature_component_definition**.

WR2: The **tee_profile** shall have exactly one implicit representation defined by a **shape_representation_with_parameters**.

WR3: The **shape_representation_with_parameters** that represents the **tee_profile** shall contain between nine and ten **representation_item**s in its set of **items**.

WR4: The implicit representation of a **tee_profile** shall contain only **representation_item**s in its set of **items** that have a **name** of either 'orientation', 'width', 'depth', 'cross bar width', 'cross bar depth', 'first offset', 'second offset', 'first angle', 'second angle', or 'radius'.

WR5: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **placement** with a **name** of 'orientation'.

WR6: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'width'.

WR7: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'depth'.

WR8: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'cross bar width'.

WR9: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'cross bar depth'.

WR10: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'first offset'.

WR11: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'second offset'.

WR12: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'first angle'.

WR13: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'second angle'.

WR14: At most one **representation_item** used for the implicit representation of a **tee_profile** shall have a **name** of 'radius'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit**.

WR15: The **tee_profile** shall be represented by at most one **planar_shape_representation**. If present, this **planar_shape_representation** shall have a **name** of 'profile limit'.

Informal propositions:

IP1: The **tee_profile** shall be planar and shall lie in the X-Y plane of the reference system.

Formal propositions:

WR1: The **shape_representation_with_parameters** that represents the **thread** shall contain between seven and ten **representation_item**s in its set of **items**.

WR2: Exactly one **representation_item** used for the implicit representation of the **thread** shall be of type **descriptive_representation_item** with a **name** of 'thread side' and a **description** of either 'internal' or 'external'.

WR3: Exactly one **representation_item** used for the implicit representation of the **thread** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'major diameter'.

WR4: At most one **representation_item** used for the implicit representation of the **thread** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'minor diameter'.

WR5: Exactly one **representation_item** used for the implicit representation of the **thread** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'pitch diameter'.

WR6: At most one **representation_item** used for the implicit representation of the **thread** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'crest'.

WR7: Exactly one **representation_item** used for the implicit representation of the **thread** shall be of type **measure_representation_item** and **ratio_measure_with_unit** with a **name** of 'number of threads'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

WR8: Exactly one **representation_item** used for the implicit representation of the **thread** shall be of type **descriptive_representation_item** with a **name** of 'fit class'.

WR9: Exactly one **representation_item** used for the implicit representation of the **thread** shall be of type **descriptive_representation_item** with a **name** of 'form'.

WR10: Exactly one **representation_item** used for the implicit representation of the **thread** shall be of type **descriptive_representation_item** with a **name** of 'hand'. The **descriptive_representation_item** shall have a **description** of either 'left hand' or 'right hand'.

WR11: The implicit representation of the **thread** shall contain at most one **representation_item** of type **descriptive_representation_item** that has a **name** of 'qualifier'.

WR12: The implicit representation of a **thread** shall contain only **representation_item**s with a **name** of either "thread side', 'major diameter', 'minor diameter', 'pitch diameter', 'crest', 'number of threads', 'fit class', 'form', 'hand', or 'qualifier'.

5.2.3.1.145 transition_feature

A **transition_feature** is a type of **shape_aspect** that is the representation of a transition between two surfaces. See ARM definition for Transition_feature in paragraph 4.2.537 for more information.

EXPRESS specification:

```
*)
ENTITY transition_feature
  SUBTYPE OF (shape_aspect);
WHERE
 WR1:'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION' IN TYPEOF (
     SELF.of_shape. definition ) ;
 WR2: SIZEOF ( ['AUTOMOTIVE_DESIGN.'+ 'CHAMFER' ,
     'AUTOMOTIVE_DESIGN.'+ 'EDGE_ROUND' , 'AUTOMOTIVE_DESIGN.'+
     'FILLET']* TYPEOF ( SELF ) ) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **transition_feature** shall be an aspect of the shape of a **product_definition**.

WR2: Each instance of **transition_feature** shall be either a **chamfer**, an **edge_round**, or a **fillet**.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **transition_feature** entity:

– subtype_exclusiveness_transition_feature (see 5.2.4.251).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

5.2.3.1.146 value_range

A **value_range** is a type of **compound_representation_item** that specifies a range of values defined either by two **measure_representation_item**s, or two **value_representation_item**s. See ARM definition for Value_range in paragraph 4.2.547 for more information.

EXPRESS specification:

```
*)
ENTITY value_range
  SUBTYPE OF (compound_representation_item);
WHERE
 WR1: ( 'AUTOMOTIVE_DESIGN.'+ 'SET_REPRESENTATION_ITEM' IN
     TYPEOF ( item_element ) ) AND value_range_wr1 (
     item_element ) ;
 WR2:value_range_wr2 ( item_element ) ;
 WR3:value_range_wr3 ( item_element ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **value_range** shall have a **set_representation_item** as its **item_element**. This **set_representation_item** shall have exactly two **representation_item**s of the same type in its set that are either **measure_representation_item**s or **value_representation_item**s.

WR2: One of the **representation_item**s in the set specified by **item_element** shall have a **name** of 'upper limit', and the other a **name** of 'lower limit'.

WR3: If the set specified by **item_element** consists of **measure_representation_item**s, then the **measure_representation_item**s shall point to the same instance of **named_unit** or **derived_unit** as their respective **unit_component**.

5.2.3.1.147 vector_style

A **vector_style** is a type of **curve_style** and **pre_defined_terminator_symbol** that defines the visual appearance of a vector.

EXPRESS specification:

```
*)
ENTITY vector_style
  SUBTYPE OF (pre_defined_terminator_symbol,curve_style);
END_ENTITY;
(*
```

WR6: Exactly one **representation_item** used for the implicit representation of a **vee_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'profile angle'.

WR7: Exactly one **representation_item** used for the implicit representation of a **vee_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'tilt angle'.

WR8: At most one **representation_item** used for the implicit representation of a **vee_profile** shall have a **name** of 'profile radius'. If present, this **representation_item** shall be of type **measure_representation_item** with a **value_component** of type **length_measure_with_unit**.

WR9: The **vee_profile** shall be represented by at most one **planar_shape_representation**. If present, this **planar_shape_representation** shall have a **name** of 'profile limit'.

Informal propositions:

IP1: The **vee_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **vee_profile** is defined at the position where the two lines connect.

5.2.3.1.149 visual_appearance_representation

A **visual_appearance_representation** is a type of **representation** that representats the visual appearance of an object. For more information see ARM definition for Visual_appearance in paragraph 4.2.560.

EXPRESS specification:

```
*)
ENTITY visual_appearance_representation
  SUBTYPE OF (representation);
WHERE
 WR1: ( {2<= SIZEOF ( SELF.items ) <=5} ) AND ( SIZEOF ( QUERY (
      i <* items | ( 'AUTOMOTIVE_DESIGN.'+
      'DESCRIPTIVE_REPRESENTATION_ITEM' IN TYPEOF ( i ) ) AND (
      i.name IN [ 'colour id' , 'colour name' , 'lustre' ,
      'pattern' , 'transparency'] ) ) ) = SIZEOF ( SELF.items ) )
      ;
 WR2: SIZEOF ( QUERY ( i <* SELF.items | i.name = 'colour id' )
      ) =1;
 WR3: SIZEOF ( QUERY ( i <* SELF.items | i.name ='lustre' ) )
      =1;
 WR4: SIZEOF ( QUERY ( i <* SELF.items | i.name = 'colour name'
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
     ) ) <=1;
 WR5: SIZEOF ( QUERY ( i <* SELF.items | i.name ='pattern' ) )
     <=1;
 WR6: SIZEOF ( QUERY ( i <* SELF.items | i.name ='transparency'
     ) ) <=1;
 WR7: ( SIZEOF ( USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.'+'PROPERTY_DEFINITION_REPRESENTATION.'+
     'USED_REPRESENTATION' ) ) =1 ) AND ( SIZEOF ( QUERY ( pdr
     <* USEDIN ( SELF ,
     'AUTOMOTIVE_DESIGN.'+'PROPERTY_DEFINITION_REPRESENTATION.'+
     'USED_REPRESENTATION' ) | SIZEOF ( QUERY ( gpa <* USEDIN (
     pdr. definition ,
     'AUTOMOTIVE_DESIGN.'+'GENERAL_PROPERTY_ASSOCIATION.'+
     'DERIVED_DEFINITION' ) | ( 'AUTOMOTIVE_DESIGN.'+
     'GENERAL_PROPERTY' IN TYPEOF ( gpa. base_definition ) ) AND
     ( gpa. base_definition.name ='surface_condition' ) ) ) =1 )
     ) =1 ) ;
END_ENTITY;
(*
```

Formal propositions:

WR1: Each instance of **visual_appearance_representation** shall contain between two and five **representation_item**s in its set of **items**. These **representation_item**s shall be of type **descriptive_representation_item** and have a **name** of 'colour id', 'colour name', 'lustre', 'pattern', or 'transparency'.

WR2: Each instance of **visual_appearance_representation** shall contain exactly one **representation_item** in its set of **items** that has a **name** of 'colour id'.

WR3: Each instance of **visual_appearance_representation** shall contain exactly one **representation_item** in its set of **items** that has a **name** of 'lustre'.

WR4: Each instance of **visual_appearance_representation** shall contain at most one **representation_item** in its set of **items** that has a **name** of 'colour name'.

WR5: Each instance of **visual_appearance_representation** shall contain at most one **representation_item** in its set of **items** that has a **name** of 'pattern'.

WR6: Each instance of **visual_appearance_representation** shall contain at most one **representation_item** in its set of **items** that has a **name** of 'transparency'.

WR7: Each instance of **hardness_representation** shall be referenced by exactly one **property_definition_representation**. This **property_definition_representation** shall relate the **representation** with a **property_definition** that is the **derived_definition** of a **general_property_association** that refers as **base_definition** to a **general_property** with a **name** of 'surface_condition'.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Informal propositions:

IP1: If the **visual_appearance_representation** contains **qualified_representation_item**s that refer to a **type_qualifier** representing the value determination then all of the **representation_item**s shall also be **qualified_representation_item**s that refer to the same instance of **type_qualifier**.

5.2.3.2 automotive_design imported entity modifications

5.2.3.2.1 action

The base definition of the **action** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **action** entity:

– restrict_action_resource_requirement_for_process_operation (see 5.2.4.76);

– restrict_multi_language_for_action (see 5.2.4.104);

– restrict_version_assignment_for_action (see 5.2.4.194);

– subtype_exclusiveness_action (see 5.2.4.216).

5.2.3.2.2 action_directive

The base definition of the **action_directive** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **action_directive** entity:

– dependent_instantiable_action_directive (see 5.2.4.9);

– restrict_multi_language_for_action_directive (see 5.2.4.105);

– restrict_version_assignment_for_action_directive (see 5.2.4.195).

5.2.3.2.3 action_method

The base definition of the **action_method** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **action_method** entity:

– restrict_multi_language_for_action_method (see 5.2.4.106);

– restrict_version_assignment_for_action_method (see 5.2.4.196).

5.2.3.2.4 action_property

The base definition of the **action_property** entity is given in ISO 10303 – 49. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **action_property** entity:

– full_model_change_completeness_for_action_property (see 5.2.4.61);

– restrict_multi_language_for_action_property (see 5.2.4.107).

5.2.3.2.5 action_relationship

The base definition of the **action_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **action_relationship** entity:

– restrict_multi_language_for_action_relationship (see 5.2.4.108).

5.2.3.2.6 action_request_status

The base definition of the **action_request_status** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **action_request_status** entity:

– versioned_action_request_requires_status (see 5.2.4.271).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

5.2.3.2.7 action_resource_requirement

The base definition of the **action_resource_requirement** entity is given in ISO 10303 – 49. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **action_resource_requirement** entity:

– restrict_action_resource_requirement_for_process_operation (see 5.2.4.76).

5.2.3.2.8 action_resource_type

The base definition of the **action_resource_type** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **action_resource_type** entity:

– dependent_instantiable_action_resource_type (see 5.2.4.10).

5.2.3.2.9 address

The base definition of the **address** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **address** entity:

– subtype_mandatory_address (see 5.2.4.252).

5.2.3.2.10 alternate_product_relationship

The base definition of the **alternate_product_relationship** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **alternate_product_relationship** entity:

– restrict_multi_language_for_alternate_product_relationship (see 5.2.4.109).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

5.2.3.2.11 annotation_occurrence

The base definition of the **annotation_occurrence** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **annotation_occurrence** entity:

– subtype_mandatory_annotation_occurrence (see 5.2.4.253).

5.2.3.2.12 application_context

The base definition of the **application_context** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **application_context** entity:

– application_protocol_definition_required (see 5.2.4.1);

– restrict_multi_language_for_application_context (see 5.2.4.110).

5.2.3.2.13 approval

The base definition of the **approval** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **approval** entity:

– approval_requires_approval_assignment (see 5.2.4.3);

– restrict_approval (see 5.2.4.83).

5.2.3.2.14 approval_date_time

The base definition of the **approval_date_time** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **approval_date_time** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

– restrict_approval (see 5.2.4.83).

5.2.3.2.15 approval_person_organization

The base definition of the **approval_person_organization** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **approval_person_organization** entity:

– approval_person_organization_requires_date_time (see 5.2.4.2).

5.2.3.2.16 approval_relationship

The base definition of the **approval_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **approval_relationship** entity:

– restrict_multi_language_for_approval_relationship (see 5.2.4.111).

5.2.3.2.17 approval_role

The base definition of the **approval_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **approval_role** entity:

– dependent_instantiable_approval_role (see 5.2.4.11).

5.2.3.2.18 approval_status

The base definition of the **approval_status** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **approval_status** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

– restrict_class_system_assignment_for_approval_status (see 5.2.4.86).

5.2.3.2.19 assembly_component_usage

The base definition of the **assembly_component_usage** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **assembly_component_usage** entity:

– restrict_product_definitions_for_product_definition_relationship (see 5.2.4.184);

– selected_instance_usage_requires_representation (see 5.2.4.213).

5.2.3.2.20 assembly_component_usage_substitute

The base definition of the **assembly_component_usage_substitute** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **assembly_component_usage_-substitute** entity:

– restrict_multi_language_for_assembly_component_usage_substitute (see 5.2.4.112).

5.2.3.2.21 attribute_value_role

The base definition of the **attribute_value_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **attribute_value_role** entity:

– dependent_instantiable_attribute_value_role (see 5.2.4.12).

5.2.3.2.22 camera_image

The base definition of the **camera_image** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rules:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following global rules defined in this part of ISO 10303 apply to the **camera_image** entity:

– restrict_camera_image_in_view (see 5.2.4.84);

– subtype_mandatory_camera_image (see 5.2.4.254).

5.2.3.2.23 camera_model

The base definition of the **camera_model** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **camera_model** entity:

– subtype_mandatory_camera_model (see 5.2.4.255).

5.2.3.2.24 certification

The base definition of the **certification** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **certification** entity:

– restrict_multi_language_for_certification (see 5.2.4.113).

5.2.3.2.25 characterized_object

The base definition of the **characterized_object** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **characterized_object** entity:

– subtype_exclusiveness_characterized_object (see 5.2.4.217).

5.2.3.2.26 classification_assignment

The base definition of the **classification_assignment** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The following global rule defined in this part of ISO 10303 applies to the **classification_assignment** entity:

– subtype_exclusiveness_classification_assignment (see 5.2.4.218).

5.2.3.2.27 classification_role

The base definition of the **classification_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **classification_role** entity:

– dependent_instantiable_classification_role (see 5.2.4.13).

5.2.3.2.28 colour

The base definition of the **colour** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **colour** entity:

– subtype_exclusiveness_colour (see 5.2.4.219).

5.2.3.2.29 colour_rgb

The base definition of the **colour_rgb** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **colour_rgb** entity:

– dependent_instantiable_colour_rgb (see 5.2.4.14).

5.2.3.2.30 colour_specification

The base definition of the **colour_specification** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **colour_specification** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

– subtype_mandatory_colour_specification (see 5.2.4.256).

5.2.3.2.31 compound_representation_item

The base definition of the **compound_representation_item** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **compound_representation_item** entity:

– subtype_exclusiveness_compound_representation_item (see 5.2.4.220).

5.2.3.2.32 concept_feature_operator

The base definition of the **concept_feature_operator** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **concept_feature_operator** entity:

– restrict_concept_feature_operator (see 5.2.4.92).

5.2.3.2.33 configurable_item

The base definition of the **configurable_item** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **configurable_item** entity:

– subtype_mandatory_configurable_item (see 5.2.4.257).

5.2.3.2.34 configuration_design

The base definition of the **configuration_design** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **configuration_design** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

– restrict_configuration_design_for_product_class (see 5.2.4.93);

– restrict_multi_language_for_configuration_design (see 5.2.4.114).

5.2.3.2.35 configuration_item

The base definition of the **configuration_item** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **configuration_item** entity:

– restrict_multi_language_for_configuration_item (see 5.2.4.115);

– restrict_version_assignment_for_configuration_item (see 5.2.4.199).

5.2.3.2.36 contract

The base definition of the **contract** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **contract** entity:

– restrict_multi_language_for_contract (see 5.2.4.116).

5.2.3.2.37 contract_type

The base definition of the **contract_type** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **contract_type** entity:

– dependent_instantiable_contract_type (see 5.2.4.15).

5.2.3.2.38 curve_style

The base definition of the **curve_style** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following global rule defined in this part of ISO 10303 applies to the **curve_style** entity:

– dependent_instantiable_curve_style (see 5.2.4.16).

5.2.3.2.39 curve_style_font

The base definition of the **curve_style_font** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **curve_style_font** entity:

– curve_font_usage (see 5.2.4.8).

5.2.3.2.40 data_environment

The base definition of the **data_environment** entity is given in ISO 10303 – 45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **data_environment** entity:

– restrict_multi_language_for_data_environment (see 5.2.4.117).

5.2.3.2.41 date

The base definition of the **date** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **date** entity:

– dependent_instantiable_date (see 5.2.4.17).

5.2.3.2.42 date_and_time

The base definition of the **date_and_time** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **date_and_time** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

– dependent_instantiable_date_and_time (see 5.2.4.18).

5.2.3.2.43 date_role

The base definition of the **date_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **date_role** entity:

– dependent_instantiable_date_role (see 5.2.4.19);

– restrict_multi_language_for_date_role (see 5.2.4.118).

5.2.3.2.44 date_time_role

The base definition of the **date_time_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **date_time_role** entity:

– dependent_instantiable_date_time_role (see 5.2.4.20);

– restrict_multi_language_for_date_time_role (see 5.2.4.119).

5.2.3.2.45 derived_unit

The base definition of the **derived_unit** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **derived_unit** entity:

– dependent_instantiable_derived_unit (see 5.2.4.21).

5.2.3.2.46 descriptive_representation_item

The base definition of the **descriptive_representation_item** entity is given in ISO 10303 – 45. The following modifications apply to this part of ISO 10303.

Associated global rules:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following global rules defined in this part of ISO 10303 apply to the **descriptive_representation_item** entity:

– restrict_class_system_assignment_for_descriptive_representation_item (see 5.2.4.88);

– restrict_multi_language_for_descriptive_representation_item (see 5.2.4.120).

5.2.3.2.47 dimensional_size

The base definition of the **dimensional_size** entity is given in ISO 10303 – 47. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **dimensional_size** entity:

– dependent_instantiable_dimensional_size (see 5.2.4.22).

5.2.3.2.48 document_product_association

The base definition of the **document_product_association** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **document_product_association** entity:

– subtype_mandatory_document_product_association (see 5.2.4.258).

5.2.3.2.49 document_reference

The base definition of the **document_reference** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **document_reference** entity:

– subtype_exclusiveness_document_reference (see 5.2.4.221).

5.2.3.2.50 document_relationship

The base definition of the **document_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **document_relationship** entity:

– restrict_multi_language_for_document_relationship (see 5.2.4.121).

5.2.3.2.51 document_type

The base definition of the **document_type** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **document_type** entity:

– restrict_class_system_assignment_for_document_type (see 5.2.4.89).

5.2.3.2.52 document_usage_role

The base definition of the **document_usage_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **document_usage_role** entity:

– dependent_instantiable_document_usage_role (see 5.2.4.23).

5.2.3.2.53 draughting_callout

The base definition of the **draughting_callout** entity is given in ISO 10303 – 101. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **draughting_callout** entity:

– subtype_mandatory_draughting_callout (see 5.2.4.259).

5.2.3.2.54 draughting_model

The base definition of the **draughting_model** entity is given in ISO 10303 – 520. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **draughting_model** entity:

– restrict_version_assignment_for_draughting_model (see 5.2.4.201).

5.2.3.2.55 draughting_subfigure_representation

The base definition of the **draughting_subfigure_representation** entity is given in ISO 10303 – 504. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **draughting_subfigure_representation** entity:

– draughting_subfigure_representation_layers (see 5.2.4.53).

5.2.3.2.56 draughting_title

The base definition of the **draughting_title** entity is given in ISO 10303 – 101. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **draughting_title** entity:

– restrict_drawing (see 5.2.4.96);

– restrict_multi_language_for_draughting_title (see 5.2.4.122).

5.2.3.2.57 drawing_revision

The base definition of the **drawing_revision** entity is given in ISO 10303 – 101. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **drawing_revision** entity:

– restrict_drawing (see 5.2.4.96).

5.2.3.2.58 drawing_sheet_revision

The base definition of the **drawing_sheet_revision** entity is given in ISO 10303 – 101. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **drawing_sheet_revision** entity:

– drawing_sheet_annotation_layers (see 5.2.4.54);

– sheets_belong_to_one_drawing (see 5.2.4.214).

5.2.3.2.59 effectivity

The base definition of the **effectivity** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **effectivity** entity:

– restrict_effectivity_usage (see 5.2.4.99);

– restrict_multi_language_for_effectivity (see 5.2.4.123);

– restrict_version_assignment_for_effectivity (see 5.2.4.202);

– subtype_exclusiveness_effectivity (see 5.2.4.222).

5.2.3.2.60 effectivity_assignment

The base definition of the **effectivity_assignment** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **effectivity_assignment** entity:

– subtype_exclusiveness_effectivity_assignment (see 5.2.4.223).

5.2.3.2.61 effectivity_context_assignment

The base definition of the **effectivity_context_assignment** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following global rule defined in this part of ISO 10303 applies to the **effectivity_context_assignment** entity:

– subtype_exclusiveness_effectivity_context_assignment (see 5.2.4.224).

5.2.3.2.62 effectivity_context_role

The base definition of the **effectivity_context_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **effectivity_context_role** entity:

– dependent_instantiable_effectivity_context_role (see 5.2.4.24).

5.2.3.2.63 effectivity_relationship

The base definition of the **effectivity_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **effectivity_relationship** entity:

– restrict_effectivity_for_effectivity_relationship (see 5.2.4.98);

– restrict_multi_language_for_effectivity_relationship (see 5.2.4.124).

5.2.3.2.64 event_occurrence

The base definition of the **event_occurrence** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **event_occurrence** entity:

– event_occurrence_requires_event_occurrence_assignment (see 5.2.4.57);

– restrict_multi_language_for_event_occurrence (see 5.2.4.125).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

5.2.3.2.65 event_occurrence_assignment

The base definition of the **event_occurrence_assignment** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **event_occurrence_assignment** entity:

– event_occurrence_requires_event_occurrence_assignment (see 5.2.4.57).

5.2.3.2.66 event_occurrence_role

The base definition of the **event_occurrence_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **event_occurrence_role** entity:

– dependent_instantiable_event_occurrence_role (see 5.2.4.25).

5.2.3.2.67 executed_action

The base definition of the **executed_action** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **executed_action** entity:

– executed_action_requires_action_status (see 5.2.4.58).

5.2.3.2.68 external_source

The base definition of the **external_source** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **external_source** entity:

– restrict_multi_language_for_external_source (see 5.2.4.126).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

5.2.3.2.69 externally_defined_curve_font

The base definition of the **externally_defined_curve_font** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_curve_font** entity:

– curve_font_usage (see 5.2.4.8).

5.2.3.2.70 externally_defined_item

The base definition of the **externally_defined_item** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **externally_defined_item** entity:

– subtype_exclusiveness_externally_defined_item (see 5.2.4.225);

– subtype_mandatory_externally_defined_item (see 5.2.4.260).

5.2.3.2.71 externally_defined_item_relationship

The base definition of the **externally_defined_item_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_item_relationship** entity:

– restrict_externally_defined_item_relationship (see 5.2.4.100).

5.2.3.2.72 externally_defined_symbol

The base definition of the **externally_defined_symbol** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_symbol** entity:

– dependent_instantiable_externally_defined_symbol (see 5.2.4.26).

5.2.3.2.73 externally_defined_text_font

The base definition of the **externally_defined_text_font** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_text_font** entity:

– text_font_usage (see 5.2.4.269).

5.2.3.2.74 fill_area_style

The base definition of the **fill_area_style** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **fill_area_style** entity:

– dependent_instantiable_fill_area_style (see 5.2.4.27).

5.2.3.2.75 fill_area_style_colour

The base definition of the **fill_area_style_colour** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **fill_area_style_colour** entity:

– dependent_instantiable_fill_area_style_colour (see 5.2.4.28).

5.2.3.2.76 fill_area_style_tile_symbol_with_style

The base definition of the **fill_area_style_tile_symbol_with_style** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **fill_area_style_tile_symbol_-with_style** entity:

– fill_area_style_tile_symbol_constraint (see 5.2.4.60).

5.2.3.2.77 founded_item

The base definition of the **founded_item** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **founded_item** entity:

– subtype_exclusiveness_founded_item (see 5.2.4.228);

– subtype_mandatory_founded_item (see 5.2.4.261).

5.2.3.2.78 general_property

The base definition of the **general_property** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **general_property** entity:

– restrict_multi_language_for_general_property (see 5.2.4.127);

– restrict_version_assignment_for_general_property (see 5.2.4.203).

5.2.3.2.79 general_property_association

The base definition of the **general_property_association** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **general_property_association** entity:

– restrict_general_property_association_for_externally_defined_general_property (see 5.2.4.101);

– restrict_product_definition_context_for_external_properties (see 5.2.4.180).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

5.2.3.2.80 general_property_relationship

The base definition of the **general_property_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **general_property_relationship** entity:

– restrict_multi_language_for_general_property_relationship (see 5.2.4.128).

5.2.3.2.81 geometric_representation_context

The base definition of the **geometric_representation_context** entity is given in ISO 10303 – 42. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **geometric_representation_context** entity:

– dimensionality_is_two_or_three (see 5.2.4.52).

5.2.3.2.82 geometric_representation_item

The base definition of the **geometric_representation_item** entity is given in ISO 10303 – 42. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **geometric_representation_item** entity:

– restrict_multi_language_for_geometric_representation_item (see 5.2.4.129).

5.2.3.2.83 geometric_tolerance

The base definition of the **geometric_tolerance** entity is given in ISO 10303 – 47. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **geometric_tolerance** entity:

– restrict_multi_language_for_geometric_tolerance (see 5.2.4.130);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

– restrict_viewing_plane_usage (see 5.2.4.209);

– subtype_exclusiveness_geometric_tolerance (see 5.2.4.229);

– subtype_mandatory_geometric_tolerance (see 5.2.4.262).

5.2.3.2.84 global_uncertainty_assigned_context

The base definition of the **global_uncertainty_assigned_context** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **global_uncertainty_assigned_context** entity:

– consistent_uncertainty (see 5.2.4.6).

5.2.3.2.85 global_unit_assigned_context

The base definition of the **global_unit_assigned_context** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **global_unit_assigned_context** entity:

– global_length_and_angle_units_2d_or_3d (see 5.2.4.63).

5.2.3.2.86 group

The base definition of the **group** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **group** entity:

– restrict_multi_language_for_group (see 5.2.4.131);

– subtype_exclusiveness_group (see 5.2.4.230).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

5.2.3.2.87 group_assignment

The base definition of the **group_assignment** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **group_assignment** entity:

– subtype_exclusiveness_group_assignment (see 5.2.4.231).

5.2.3.2.88 group_relationship

The base definition of the **group_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **group_relationship** entity:

– restrict_group_relationship_for_general_classification_hierarchy (see 5.2.4.102);

– restrict_group_relationship_for_specification_category (see 5.2.4.103);

– restrict_multi_language_for_group_relationship (see 5.2.4.132).

5.2.3.2.89 identification_assignment

The base definition of the **identification_assignment** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **identification_assignment** entity:

– subtype_exclusiveness_identification_assignment (see 5.2.4.232).

5.2.3.2.90 identification_role

The base definition of the **identification_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **identification_role** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

– dependent_instantiable_identification_role (see 5.2.4.29);

– restrict_multi_language_for_identification_role (see 5.2.4.133).

5.2.3.2.91 kinematic_joint

The base definition of the **kinematic_joint** entity is given in ISO 10303 – 105. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **kinematic_joint** entity:

– restrict_name_assignment_for_kinematic_joint (see 5.2.4.172).

5.2.3.2.92 kinematic_link

The base definition of the **kinematic_link** entity is given in ISO 10303 – 105. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **kinematic_link** entity:

– restrict_name_assignment_for_kinematic_link (see 5.2.4.173).

5.2.3.2.93 kinematic_pair

The base definition of the **kinematic_pair** entity is given in ISO 10303 – 105. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **kinematic_pair** entity:

– restrict_multi_language_for_kinematic_pair (see 5.2.4.134).

5.2.3.2.94 kinematic_structure

The base definition of the **kinematic_structure** entity is given in ISO 10303 – 105. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **kinematic_structure** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

– restrict_name_assignment_for_kinematic_structure (see 5.2.4.174).

5.2.3.2.95 mapped_item

The base definition of the **mapped_item** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **mapped_item** entity:

– drawing_sheet_layout_usage (see 5.2.4.55);

– restrict_multi_language_for_mapped_item (see 5.2.4.135);

– subtype_exclusiveness_mapped_item (see 5.2.4.233).

5.2.3.2.96 measure_with_unit

The base definition of the **measure_with_unit** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **measure_with_unit** entity:

– dependent_instantiable_measure_with_unit (see 5.2.4.30).

5.2.3.2.97 mechanical_design_geometric_presentation_representation

The base definition of the **mechanical_design_geometric_presentation_representation** entity is given in ISO 10303 – 517. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **mechanical_design_geometric_presentation_representation** entity:

– restrict_version_assignment_for_mechanical_design_geometric_presentation_representation (see 5.2.4.204).

5.2.3.2.98 name_assignment

The base definition of the **name_assignment** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **name_assignment** entity:

– restrict_multi_language_for_name_assignment (see 5.2.4.136).

5.2.3.2.99 named_unit

The base definition of the **named_unit** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **named_unit** entity:

– dependent_instantiable_named_unit (see 5.2.4.31).

5.2.3.2.100 next_assembly_usage_occurrence

The base definition of the **next_assembly_usage_occurrence** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **next_assembly_usage_occurrence** entity:

– coordinated_assembly_and_shape (see 5.2.4.7).

5.2.3.2.101 object_role

The base definition of the **object_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **object_role** entity:

– dependent_instantiable_object_role (see 5.2.4.32);

– restrict_applied_action_assignment (see 5.2.4.78);

– restrict_applied_action_request_assignment (see 5.2.4.79);

– restrict_applied_organizational_project_assignment (see 5.2.4.82).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

5.2.3.2.102 organization_relationship

The base definition of the **organization_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **organization_relationship** entity:

– restrict_multi_language_for_organization_relationship (see 5.2.4.137).

5.2.3.2.103 organization_role

The base definition of the **organization_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **organization_role** entity:

– dependent_instantiable_organization_role (see 5.2.4.33);

– restrict_multi_language_for_organization_role (see 5.2.4.138).

5.2.3.2.104 organizational_project

The base definition of the **organizational_project** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **organizational_project** entity:

– restrict_multi_language_for_organizational_project (see 5.2.4.139).

5.2.3.2.105 organizational_project_relationship

The base definition of the **organizational_project_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **organizational_project_-relationship** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

– restrict_multi_language_for_organizational_project_relationship (see 5.2.4.140).

5.2.3.2.106 organizational_project_role

The base definition of the **organizational_project_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **organizational_project_role** entity:

– dependent_instantiable_organizational_project_role (see 5.2.4.34).

5.2.3.2.107 pair_actuator

The base definition of the **pair_actuator** entity is given in ISO 10303 – 105. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **pair_actuator** entity:

– restrict_multi_language_for_pair_actuator (see 5.2.4.141).

5.2.3.2.108 person

The base definition of the **person** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **person** entity:

– person_requires_person_and_organization (see 5.2.4.64).

5.2.3.2.109 person_and_organization_role

The base definition of the **person_and_organization_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **person_and_organization_role** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

– dependent_instantiable_person_and_organization_role (see 5.2.4.35);

– restrict_multi_language_for_person_and_organization_role (see 5.2.4.142).

5.2.3.2.110 planar_extent

The base definition of the **planar_extent** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **planar_extent** entity:

– restrict_class_system_assignment_for_planar_extent (see 5.2.4.90).

5.2.3.2.111 pre_defined_colour

The base definition of the **pre_defined_colour** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **pre_defined_colour** entity:

– dependent_instantiable_pre_defined_colour (see 5.2.4.36);

– subtype_mandatory_pre_defined_colour (see 5.2.4.263).

5.2.3.2.112 pre_defined_curve_font

The base definition of the **pre_defined_curve_font** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **pre_defined_curve_font** entity:

– curve_font_usage (see 5.2.4.8);

– subtype_mandatory_pre_defined_curve_font (see 5.2.4.264).

5.2.3.2.113 pre_defined_item

The base definition of the **pre_defined_item** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **pre_defined_item** entity:

– subtype_exclusiveness_pre_defined_item (see 5.2.4.234);

– subtype_mandatory_pre_defined_item (see 5.2.4.265).

5.2.3.2.114 pre_defined_symbol

The base definition of the **pre_defined_symbol** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **pre_defined_symbol** entity:

– dependent_instantiable_pre_defined_symbol (see 5.2.4.37);

– subtype_exclusiveness_pre_defined_symbol (see 5.2.4.235);

– subtype_mandatory_pre_defined_symbol (see 5.2.4.266).

5.2.3.2.115 pre_defined_text_font

The base definition of the **pre_defined_text_font** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **pre_defined_text_font** entity:

– subtype_mandatory_pre_defined_text_font (see 5.2.4.267);

– text_font_usage (see 5.2.4.269).

5.2.3.2.116 precision_qualifier

The base definition of the **precision_qualifier** entity is given in ISO 10303 – 45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **precision_qualifier** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

– dependent_instantiable_precision_qualifier (see 5.2.4.38).

5.2.3.2.117 presentation_area

The base definition of the **presentation_area** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **presentation_area** entity:

– restrict_version_assignment_for_presentation_area (see 5.2.4.205);

– subtype_exclusiveness_presentation_area (see 5.2.4.236).

5.2.3.2.118 presentation_layer_assignment

The base definition of the **presentation_layer_assignment** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **presentation_layer_assignment** entity:

– presentation_layer_assignment_constraint_2d_or_3d (see 5.2.4.69);

– restrict_multi_language_for_presentation_layer_assignment (see 5.2.4.143).

5.2.3.2.119 presentation_representation

The base definition of the **presentation_representation** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **presentation_representation** entity:

– subtype_exclusiveness_presentation_representation (see 5.2.4.237).

5.2.3.2.120 presentation_style_by_context

The base definition of the **presentation_style_by_context** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **presentation_style_by_context** entity:

– dependent_instantiable_presentation_style_by_context (see 5.2.4.39).

5.2.3.2.121 presentation_view

The base definition of the **presentation_view** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **presentation_view** entity:

– drawing_view_annotation_layers (see 5.2.4.56);

– presentation_view_presented_once (see 5.2.4.70);

– restrict_camera_image_in_view (see 5.2.4.84).

5.2.3.2.122 process_product_association

The base definition of the **process_product_association** entity is given in ISO 10303 – 49. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **process_product_association** entity:

– restrict_multi_language_for_process_product_association (see 5.2.4.144);

– restrict_process_product_association (see 5.2.4.177).

5.2.3.2.123 product

The base definition of the **product** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product** entity:

– product_requires_category (see 5.2.4.73);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

– product_requires_person_organization (see 5.2.4.74);

– product_requires_version (see 5.2.4.75);

– restrict_multi_language_for_product (see 5.2.4.145);

– restrict_product_category_for_product (see 5.2.4.179).

5.2.3.2.124 product_concept

The base definition of the **product_concept** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_concept** entity:

– restrict_multi_language_for_product_concept (see 5.2.4.146);

– restrict_version_assignment_for_product_concept (see 5.2.4.206).

5.2.3.2.125 product_concept_feature

The base definition of the **product_concept_feature** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_concept_feature** entity:

– product_concept_feature_requires_category (see 5.2.4.71);

– restrict_multi_language_for_product_concept_feature (see 5.2.4.147);

– restrict_version_assignment_for_product_concept_feature (see 5.2.4.207).

5.2.3.2.126 product_concept_feature_association

The base definition of the **product_concept_feature_association** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_concept_feature_-association** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

– restrict_multi_language_for_product_concept_feature_association (see 5.2.4.148).

5.2.3.2.127 product_concept_relationship

The base definition of the **product_concept_relationship** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_concept_relationship** entity:

– restrict_multi_language_for_product_concept_relationship (see 5.2.4.149).

5.2.3.2.128 product_definition

The base definition of the **product_definition** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_definition** entity:

– complex_product_requires_product_definition (see 5.2.4.4);

– design_constraint_requires_product_definition (see 5.2.4.51);

– physical_instance_requires_product_definition (see 5.2.4.65);

– restrict_alternative_definition (see 5.2.4.77);

– restrict_multi_language_for_product_definition (see 5.2.4.150);

– restrict_part_occurrence (see 5.2.4.176);

– restrict_product_definition_context_for_external_properties (see 5.2.4.180);

– restrict_product_definition_context_for_product (see 5.2.4.181);

– restrict_product_definition_for_mating_tree (see 5.2.4.182);

– restrict_properties_of_document_representation (see 5.2.4.186).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

5.2.3.2.129 product_definition_context

The base definition of the **product_definition_context** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_definition_context** entity:

– restrict_alternative_definition (see 5.2.4.77).

5.2.3.2.130 product_definition_context_role

The base definition of the **product_definition_context_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_definition_context_role** entity:

– dependent_instantiable_product_definition_context_role (see 5.2.4.40).

5.2.3.2.131 product_definition_formation

The base definition of the **product_definition_formation** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_definition_formation** entity:

– complex_product_requires_product_definition (see 5.2.4.4);

– design_constraint_requires_product_definition (see 5.2.4.51);

– physical_instance_requires_product_definition (see 5.2.4.65);

– restrict_multi_language_for_product_definition_formation (see 5.2.4.151).

5.2.3.2.132 product_definition_formation_relationship

The base definition of the **product_definition_formation_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_definition_formation_relationship** entity:

– restrict_multi_language_for_product_definition_formation_relationship (see 5.2.4.152).

5.2.3.2.133 product_definition_occurrence_relationship

The base definition of the **product_definition_occurrence_relationship** entity is given in ISO 10303 – 44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_definition_occurrence_relationship** entity:

– restrict_part_occurrence (see 5.2.4.176).

5.2.3.2.134 product_definition_relationship

The base definition of the **product_definition_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_definition_relationship** entity:

– product_definition_replacement_requires_effectivity_assignment (see 5.2.4.72);

– restrict_multi_language_for_product_definition_relationship (see 5.2.4.153);

– restrict_product_categories_for_tool_part_relationship (see 5.2.4.178);

– restrict_product_definitions_for_product_definition_relationship (see 5.2.4.184).

5.2.3.2.135 product_definition_substitute

The base definition of the **product_definition_substitute** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_definition_substitute** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

– restrict_multi_language_for_product_definition_substitute (see 5.2.4.154);

– restrict_product_definition_substitute (see 5.2.4.183).

5.2.3.2.136 product_related_product_category

The base definition of the **product_related_product_category** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_related_product_-category** entity:

– complex_product_requires_product_definition (see 5.2.4.4);

– design_constraint_requires_product_definition (see 5.2.4.51);

– physical_instance_requires_product_definition (see 5.2.4.65);

– product_requires_category (see 5.2.4.73);

– restrict_multi_language_for_product_related_product_category (see 5.2.4.155);

– restrict_product_definition_context_for_product (see 5.2.4.181).

5.2.3.2.137 property_definition

The base definition of the **property_definition** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **property_definition** entity:

– full_model_change_completeness_for_property_definition (see 5.2.4.62);

– restrict_multi_language_for_property_definition (see 5.2.4.156);

– restrict_representation_for_document_properties (see 5.2.4.190);

– subtype_exclusiveness_property_definition (see 5.2.4.238).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

5.2.3.2.138 property_definition_relationship

The base definition of the **property_definition_relationship** entity is given in ISO 10303 – 45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **property_definition_relationship** entity:

– restrict_multi_language_for_property_definition_relationship (see 5.2.4.157).

5.2.3.2.139 property_definition_representation

The base definition of the **property_definition_representation** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **property_definition_representation** entity:

– subtype_exclusiveness_property_definition_representation (see 5.2.4.239).

5.2.3.2.140 qualified_representation_item

The base definition of the **qualified_representation_item** entity is given in ISO 10303 – 45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **qualified_representation_item** entity:

– consistent_uncertainty (see 5.2.4.6).

5.2.3.2.141 relative_event_occurrence

The base definition of the **relative_event_occurrence** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **relative_event_occurrence** entity:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

– event_occurrence_requires_event_occurrence_assignment (see 5.2.4.57).

5.2.3.2.142 representation

The base definition of the **representation** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **representation** entity:

– restrict_centre_of_mass_representation (see 5.2.4.85);

– restrict_default_settings (see 5.2.4.94);

– restrict_default_thickness (see 5.2.4.95);

– restrict_multi_language_for_representation (see 5.2.4.158);

– restrict_representation_for_document_content_property (see 5.2.4.187);

– restrict_representation_for_document_creation_property (see 5.2.4.188);

– restrict_representation_for_document_format_property (see 5.2.4.189);

– restrict_representation_for_document_properties (see 5.2.4.190);

– restrict_representation_for_document_size_property (see 5.2.4.191);

– restrict_treatment_result (see 5.2.4.193);

– selected_instance_usage_requires_representation (see 5.2.4.213);

– subtype_exclusiveness_representation (see 5.2.4.241).

5.2.3.2.143 representation_context

The base definition of the **representation_context** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **representation_context** entity:

– restrict_representation_for_document_properties (see 5.2.4.190).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

5.2.3.2.144 representation_item

The base definition of the **representation_item** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **representation_item** entity:

– restrict_representation_for_document_content_property (see 5.2.4.187);

– restrict_representation_for_document_creation_property (see 5.2.4.188);

– restrict_representation_for_document_format_property (see 5.2.4.189);

– restrict_representation_for_document_size_property (see 5.2.4.191);

– subtype_exclusiveness_representation_item (see 5.2.4.242).

5.2.3.2.145 representation_map

The base definition of the **representation_map** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **representation_map** entity:

– subtype_exclusiveness_representation_map (see 5.2.4.243).

5.2.3.2.146 representation_relationship

The base definition of the **representation_relationship** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **representation_relationship** entity:

– restrict_multi_language_for_representation_relationship (see 5.2.4.159);

– subtype_exclusiveness_representation_relationship (see 5.2.4.244).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

5.2.3.2.147 representation_relationship_with_transformation

The base definition of the **representation_relationship_with_transformation** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **representation_relationship_with_transformation** entity:

– subtype_exclusiveness_representation_relationship_with_transformation (see 5.2.4.245).

5.2.3.2.148 requirement_for_action_resource

The base definition of the **requirement_for_action_resource** entity is given in ISO 10303 – 49. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **requirement_for_action_resource** entity:

– restrict_multi_language_for_requirement_for_action_resource (see 5.2.4.160).

5.2.3.2.149 resource_property

The base definition of the **resource_property** entity is given in ISO 10303 – 49. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **resource_property** entity:

– restrict_multi_language_for_resource_property (see 5.2.4.161).

5.2.3.2.150 resource_requirement_type

The base definition of the **resource_requirement_type** entity is given in ISO 10303 – 49. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **resource_requirement_type** entity:

– dependent_instantiable_resource_requirement_type (see 5.2.4.41);

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

– restrict_multi_language_for_resource_requirement_type (see 5.2.4.162).

5.2.3.2.151 security_classification

The base definition of the **security_classification** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **security_classification** entity:

– restrict_multi_language_for_security_classification (see 5.2.4.163);

– security_classification_requires_security_classification_assignment (see 5.2.4.212).

5.2.3.2.152 security_classification_level

The base definition of the **security_classification_level** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **security_classification_level** entity:

– restrict_class_system_assignment_for_security_classification_level (see 5.2.4.91).

5.2.3.2.153 shape_aspect

The base definition of the **shape_aspect** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **shape_aspect** entity:

– restrict_multi_language_for_shape_aspect (see 5.2.4.164);

– subtype_exclusiveness_shape_aspect (see 5.2.4.246).

5.2.3.2.154 shape_aspect_relationship

The base definition of the **shape_aspect_relationship** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **shape_aspect_relationship** entity:

– compound_features_of_equal_type (see 5.2.4.5);

– restrict_multi_language_for_shape_aspect_relationship (see 5.2.4.165);

– subtype_exclusiveness_shape_aspect_relationship (see 5.2.4.247).

5.2.3.2.155 shape_representation

The base definition of the **shape_representation** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **shape_representation** entity:

– restrict_representation_item_for_hybrid_geometric_model_3d (see 5.2.4.192);

– restrict_version_assignment_for_shape_representation (see 5.2.4.208);

– subtype_exclusiveness_shape_representation_feature_geometry (see 5.2.4.248);

– subtype_exclusiveness_shape_representation_geometry (see 5.2.4.249).

5.2.3.2.156 standard_uncertainty

The base definition of the **standard_uncertainty** entity is given in ISO 10303 – 45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **standard_uncertainty** entity:

– dependent_instantiable_standard_uncertainty (see 5.2.4.43).

5.2.3.2.157 styled_item

The base definition of the **styled_item** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rules:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

The following global rules defined in this part of ISO 10303 apply to the **styled_item** entity:

– restrict_multi_language_for_styled_item (see 5.2.4.166);

– styled_curve (see 5.2.4.215).

5.2.3.2.158 symbol_colour

The base definition of the **symbol_colour** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **symbol_colour** entity:

– dependent_instantiable_symbol_colour (see 5.2.4.44).

5.2.3.2.159 symbol_representation

The base definition of the **symbol_representation** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **symbol_representation** entity:

– subtype_exclusiveness_symbol_representation (see 5.2.4.250).

5.2.3.2.160 terminator_symbol

The base definition of the **terminator_symbol** entity is given in ISO 10303 – 101. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **terminator_symbol** entity:

– terminator_symbol_constraint (see 5.2.4.268).

5.2.3.2.161 text_style

The base definition of the **text_style** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **text_style** entity:

– dependent_instantiable_text_style (see 5.2.4.45).

5.2.3.2.162 text_style_for_defined_font

The base definition of the **text_style_for_defined_font** entity is given in ISO 10303 – 46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **text_style_for_defined_font** entity:

– dependent_instantiable_text_style_for_defined_font (see 5.2.4.46).

5.2.3.2.163 time_interval_role

The base definition of the **time_interval_role** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **time_interval_role** entity:

– dependent_instantiable_time_interval_role (see 5.2.4.47);

– restrict_multi_language_for_time_interval_role (see 5.2.4.167).

5.2.3.2.164 tolerance_value

The base definition of the **tolerance_value** entity is given in ISO 10303 – 47. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **tolerance_value** entity:

– dependent_instantiable_tolerance_value (see 5.2.4.48).

5.2.3.2.165 tolerance_zone_definition

The base definition of the **tolerance_zone_definition** entity is given in ISO 10303 – 47. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **tolerance_zone_definition** entity:

– restrict_zone_boundary (see 5.2.4.210).

5.2.3.2.166 topological_representation_item

The base definition of the **topological_representation_item** entity is given in ISO 10303 – 42. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **topological_representation_item** entity:

– restrict_multi_language_for_topological_representation_item (see 5.2.4.168).

5.2.3.2.167 type_qualifier

The base definition of the **type_qualifier** entity is given in ISO 10303 – 45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **type_qualifier** entity:

– dependent_instantiable_type_qualifier (see 5.2.4.49).

5.2.3.2.168 uncertainty_assigned_representation

The base definition of the **uncertainty_assigned_representation** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **uncertainty_assigned_representation** entity:

– consistent_uncertainty (see 5.2.4.6).

5.2.3.2.169 uncertainty_measure_with_unit

The base definition of the **uncertainty_measure_with_unit** entity is given in ISO 10303 – 43. The following modifications apply to this part of ISO 10303.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **uncertainty_measure_with_-unit** entity:

– restrict_multi_language_for_uncertainty_measure_with_unit (see 5.2.4.169).

5.2.3.2.170 uncertainty_qualifier

The base definition of the **uncertainty_qualifier** entity is given in ISO 10303 – 45. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **uncertainty_qualifier** entity:

– dependent_instantiable_uncertainty_qualifier (see 5.2.4.50);

– restrict_multi_language_for_uncertainty_qualifier (see 5.2.4.170).

5.2.3.2.171 versioned_action_request

The base definition of the **versioned_action_request** entity is given in ISO 10303 – 41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **versioned_action_request** entity:

– restrict_multi_language_for_versioned_action_request (see 5.2.4.171);

– versioned_action_request_requires_date_and_person_or_organization (see 5.2.4.270);

– versioned_action_request_requires_status (see 5.2.4.271).

5.2.4 automotive_design rule definitions

5.2.4.1 application_protocol_definition_required

The **application_protocol_definition_required** rule ensures that at least one **application_protocol_-definition** is specified that provides the designator 'automotive_design' of this application protocol.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
RULE application_protocol_definition_required FOR
    (application_context);
WHERE
 WR1: SIZEOF ( QUERY ( ac <* application_context | ( SIZEOF (
     QUERY ( apd <* USEDIN ( ac ,
     'AUTOMOTIVE_DESIGN.APPLICATION_PROTOCOL_DEFINITION.APPLICATION'
     ) | apd. application_interpreted_model_schema_name
     ='automotive_design' ) ) >0 ) ) ) >0;
END_RULE;
(*
```

Argument definitions:

application_context: the set of all instances of **application_context**.

Formal propositions:

WR1: At least one instance of **application_context** shall be refered by one instance of **application_protocol_definition** which contains the instance of **application_context** as its application attribute and has a **application_interpreted_model_schema_name** of 'automotive_design'.

5.2.4.2 approval_person_organization_requires_date_time

The **approval_person_organization_requires_date_time** rule specifies that each instance of **approval_person_organization** shall be referenced by exactly one of either **applied_date_assignment** or **applied_date_and_time_assignment** where the assigned date or date and time specifies the sign off date of the approval. This rule enforces the requirement for every Approval, that in case the approving person or organization is specified, also the sign off date of the Approval has to be given.

EXPRESS specification:

```
*)
RULE approval_person_organization_requires_date_time FOR
    (approval_person_organization);
WHERE
 WR1: SIZEOF ( QUERY ( apo <* approval_person_organization |   (
     SIZEOF ( QUERY ( u <* USEDIN ( apo ,
     'AUTOMOTIVE_DESIGN.'+ 'APPLIED_DATE_ASSIGNMENT.'+ 'ITEMS'
     ) |   ( u.role. name = 'sign off' ) ) ) +  SIZEOF ( QUERY (
     u <* USEDIN ( apo ,
     'AUTOMOTIVE_DESIGN.'+ 'APPLIED_DATE_AND_TIME_ASSIGNMENT.'+
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
     'ITEMS' ) |   ( u.role. name = 'sign off' ) )   ) ) <>1 ) )
     =0;
END_RULE;
(*
```

Argument definitions:

approval_person_organization: the set of all instances of **approval_person_organization**.

Formal propositions:

WR1: There shall be exactly one instance of either **applied_date_assignment** or **applied_date_and_-time_assignment** associated to an **approval_person_organization** where the **name** of **date_role** / **date_-time_role** is 'sign off'.

5.2.4.3 approval_requires_approval_assignment

The **approval_requires_approval_assignment** rule specifies that each instance of **approval** is referenced by at least one instance of **approval_assignment** as the **assigned_approval**. This rule enforces the requirement for every approval to be applied at least once.

EXPRESS specification:

```
*)
RULE approval_requires_approval_assignment FOR
    (approval);
WHERE
 WR1: SIZEOF ( QUERY ( a <* approval | SIZEOF ( USEDIN ( a ,
     'AUTOMOTIVE_DESIGN.APPROVAL_ASSIGNMENT.ASSIGNED_APPROVAL' )
     ) =0 ) ) =0;
END_RULE;
(*
```

Argument definitions:

approval: the set of all instances of **approval**.

Formal propositions:

WR1: Each instance of **approval** shall be referenced at least once as the **assigned_approval** by an instance of **approval_assignment**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

5.2.4.4 complex_product_requires_product_definition

The **complex_product_requires_product_definition** rule ensures that each instance of **product_definition_formation** which has an associated **of_product** that is referenced by a **product_related_product_category** with a **name** of 'functionality', 'conceptual product', or 'alternative solution', is referenced as **formation** by exactly one instance of **product_definition** that references as its **frame_of_reference** a **product_definition_context** with a **name** of 'functional definition', 'conceptual definition', or 'alternative definition', respectively.

EXPRESS specification:

```
*)
RULE complex_product_requires_product_definition FOR
    (product_definition,
     product_definition_formation,
     product_related_product_category);
WHERE
 WR1: SIZEOF ( QUERY ( pdf <* product_definition_formation | ( (
     SIZEOF ( QUERY ( prpc <* USEDIN ( pdf. of_product ,
     'AUTOMOTIVE_DESIGN.'+'PRODUCT_RELATED_PRODUCT_CATEGORY.'+
     'PRODUCTS' ) | prpc. name ='functionality' ) ) =1 ) AND (
     SIZEOF ( QUERY ( pd <* USEDIN ( pdf ,
     'AUTOMOTIVE_DESIGN.'+'PRODUCT_DEFINITION.'+ 'FORMATION' ) |
     pd. frame_of_reference.name = 'functional definition' ) )
     <>1 ) ) OR ( ( SIZEOF ( QUERY ( prpc <* USEDIN ( pdf.
     of_product ,
     'AUTOMOTIVE_DESIGN.'+'PRODUCT_RELATED_PRODUCT_CATEGORY.'+
     'PRODUCTS' ) | prpc. name = 'conceptual design' ) ) =1 )
     AND ( SIZEOF ( QUERY ( pd <* USEDIN ( pdf ,
     'AUTOMOTIVE_DESIGN.'+'PRODUCT_DEFINITION.'+ 'FORMATION' ) |
     pd. frame_of_reference.name = 'conceptual definition' ) )
     <>1 ) ) OR ( ( SIZEOF ( QUERY ( prpc <* USEDIN ( pdf.
     of_product ,
     'AUTOMOTIVE_DESIGN.'+'PRODUCT_RELATED_PRODUCT_CATEGORY.'+
     'PRODUCTS' ) | prpc. name = 'alternative solution' ) ) =1 )
     AND ( SIZEOF ( QUERY ( pd <* USEDIN ( pdf ,
     'AUTOMOTIVE_DESIGN.'+'PRODUCT_DEFINITION.'+ 'FORMATION' ) |
     pd. frame_of_reference.name = 'alternative definition' ) )
     <>1 ) ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

product_definition: the set of all instances of **product_definition**.

product_definition_formation: the set of all instances of **product_definition_formation**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

product_related_product_category: the set of all instances of **product_related_product_category**.

Formal propositions:

WR1: Each instance of **product_definition_formation** which has an associated **of_product** that is referenced by a **product_related_product_category** with a **name** of 'functionality', 'conceptual definition', or 'alternative solution', is referenced as **formation** by exactly one instance of **product_definition** that references as its **frame_of_reference** a **product_definition_context** with a **name** of 'functional definition', 'conceptual definition', or 'alternative definition', respectively.

5.2.4.5 compound_features_of_equal_type

The **compound_features_of_equal_type** rule ensures that each instance of **shape_aspect_relationship** relates compound features of equal type, i.e. that panel features and solid features are not mixed.

EXPRESS specification:

```
*)
RULE compound_features_of_equal_type FOR
    (compound_feature,
     shape_aspect_relationship);
WHERE
 WR1: SIZEOF ( QUERY ( sar <* shape_aspect_relationship | ( sar.
     name = 'compound feature ordering' ) AND ( SIZEOF ( QUERY (
     fcr <* USEDIN ( sar. relating_shape_aspect ,
     'AUTOMOTIVE_DESIGN.SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT'
     ) | ( 'AUTOMOTIVE_DESIGN.'+
     'FEATURE_COMPONENT_RELATIONSHIP' IN TYPEOF ( fcr ) ) AND (
     'AUTOMOTIVE_DESIGN.'+ 'COMPOSITE_SHAPE_ASPECT' IN TYPEOF (
     fcr. relating_shape_aspect ) ) AND ( fcr.
     relating_shape_aspect.name IN [ 'compound feature in solid'
     , 'compound feature in panel' ] ) ) ) =0 ) OR ( SIZEOF (
     QUERY ( fcr <* USEDIN ( sar. related_shape_aspect ,
     'AUTOMOTIVE_DESIGN.SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT'
     ) | ( 'AUTOMOTIVE_DESIGN.'+
     'FEATURE_COMPONENT_RELATIONSHIP' IN TYPEOF ( fcr ) ) AND (
     'AUTOMOTIVE_DESIGN.'+ 'COMPOSITE_SHAPE_ASPECT' IN TYPEOF (
     fcr. relating_shape_aspect ) ) AND ( fcr.
     relating_shape_aspect.name IN [ 'compound feature in solid'
     , 'compound feature in panel' ] ) ) ) =0 ) ) ) =0;
END_RULE;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Argument definitions:

compound_feature: the set of all instances of **compound_feature**.

shape_aspect_relationship: the set of all instances of **shape_aspect_relationship**.

Formal propositions:

WR1: For each instance of **shape_aspect_relationship** that has a **name** of 'compound feature ordering', the **relating_shape_aspect** and the **related_shape_aspect** shall be both **related_shape_aspect** in a **feature_component_relationship** that refer as **relating_shape_aspect** to a **composite_shape_aspect** that has a **name** of either 'compound feature in solid' or 'compound feature in panel'.

5.2.4.6 consistent_uncertainty

The **consistent_uncertainty** rule specifies that any instance of **global_uncertainty_assigned_context** or **uncertainty_assigned_representation** shall not contain two instances of **uncertainty_measure_with_unit** with the same **name** in their respective **uncertainty** set. It also specifies that any **qualified_representation_item** shall not have any two instances of **uncertainty_qualifier** with the same **measure_name** in its set of **qualifiers**.

EXPRESS specification:

```
*)
RULE consistent_uncertainty FOR
    (global_uncertainty_assigned_context,
     qualified_representation_item,
     uncertainty_assigned_representation);
WHERE
 WR1: ( SIZEOF ( QUERY ( guac <*
     global_uncertainty_assigned_context | SIZEOF ( QUERY ( u1
     <* guac.uncertainty | SIZEOF ( QUERY ( u2 <*
     guac.uncertainty | u2.name =u1.name ) ) >0 ) ) >0 ) ) =0 )
     OR ( SIZEOF ( global_uncertainty_assigned_context ) =1 ) ;
 WR2: SIZEOF ( QUERY ( uar <*
     uncertainty_assigned_representation | SIZEOF ( QUERY ( u1
     <* uar. uncertainty | SIZEOF ( QUERY ( u2 <* uar.
     uncertainty | u2. name =u1. name ) ) >0 ) ) >0 ) ) =0;
 WR3: SIZEOF ( QUERY ( qri <* qualified_representation_item |
     SIZEOF ( QUERY ( u1 <* qri. qualifiers | (
     'AUTOMOTIVE_DESIGN.'+ 'UNCERTAINTY_QUALIFIER' IN TYPEOF (
     u1 ) ) AND ( SIZEOF ( QUERY ( u2 <* qri. qualifiers | (
     'AUTOMOTIVE_DESIGN.'+ 'UNCERTAINTY_QUALIFIER' IN TYPEOF (
     u2 ) ) AND ( u2\ uncertainty_qualifier.measure_name =u1\
     uncertainty_qualifier.measure_name ) ) ) >0 ) ) ) >0 ) )
     =0;
END_RULE;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
(*
```

Argument definitions:

global_uncertainty_assigned_context: the set of all instances of **global_uncertainty_assigned_context**.

qualified_representation_item: the set of all instances of **qualified_representation_item**.

uncertainty_assigned_representation: the set of all instances of **uncertainty_assigned_representation**.

Formal propositions:

WR1: Each instance of **global_uncertainty_assigned_context** shall not contain two instances of **uncertainty_measure_with_unit** with the same **name** in its **uncertainty** set.

WR2: Each instance of **uncertainty_assigned_representation** shall not contain two instances of **uncertainty_measure_with_unit** with the same **name** in its **uncertainty** set.

WR3: Each instance of **qualified_representation_item** shall not have any two instances of **uncertainty_qualifier** with the same **measure_name** in its set of **qualifiers**.

5.2.4.7 coordinated_assembly_and_shape

The **coordinated_assembly_and_shape** rule specifies that the relationship between two **product_definition** entities which are an assembly and a component in a **next_assembly_usage_occurrence** and the relationship between two **shape_representation** entities which contain the representation of the shapes of the assembly and the component in a **shape_representation_relationship** must be explicitly related through the **context_dependent_shape_representation**. This rule calls the function **assembly_shape_is_defined** which returns true if the assembly relationship and shape relationship are explicitly related.

EXPRESS specification:

```
*)
RULE coordinated_assembly_and_shape FOR
   (next_assembly_usage_occurrence);
WHERE
 WR1: SIZEOF ( QUERY ( nauo <* next_assembly_usage_occurrence |
     NOT ( assembly_shape_is_defined ( nauo ) ) ) ) =0;
END_RULE;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Argument definitions:

next_assembly_usage_occurrence: the set of all instances of **next_assembly_usage_occurrence**.

Formal propositions:

WR1: For each instance of **next_assembly_usage_occurrence**, the **assembly_shape_is_defined** function shall be true.

5.2.4.8 curve_font_usage

The **curve_font_usage** rule ensures that each **curve_style_font**, **pre_defined_curve_font**, and **externally_defined_curve_font** shall define the curve font of at least one **curve_style**.

EXPRESS specification:

```
*)
RULE curve_font_usage FOR
    (curve_style_font,
     externally_defined_curve_font,
     pre_defined_curve_font);
WHERE
 WR1: SIZEOF ( QUERY ( csf <* curve_style_font | ( SIZEOF (
     USEDIN ( csf , 'AUTOMOTIVE_DESIGN.CURVE_STYLE.CURVE_FONT' )
     ) =0 ) ) ) =0;
 WR2: SIZEOF ( QUERY ( pdcf <* pre_defined_curve_font | ( SIZEOF
     ( USEDIN ( pdcf ,
     'AUTOMOTIVE_DESIGN.CURVE_STYLE.CURVE_FONT' ) ) =0 ) ) ) =0;
 WR3: SIZEOF ( QUERY ( edcf <* externally_defined_curve_font |
     NOT ( SIZEOF ( USEDIN ( edcf ,
     'AUTOMOTIVE_DESIGN.'+'CURVE_STYLE.'+ 'CURVE_FONT' ) ) >=1 )
     ) ) =0;
END_RULE;
(*
```

Argument definitions:

curve_style_font: the set of all instances of **curve_style_font**.

externally_defined_curve_font: the set of all instances of **externally_defined_curve_font**.

pre_defined_curve_font: the set of all instances of **pre_defined_curve_font**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Formal propositions:

WR1: Each **curve_style_font** shall participate in the definition of at least one **curve_style**.

WR2: Each **pre_defined_curve_font** shall participate in the definition of at least one **curve_style**.

WR3: Each **externally_defined_curve_font** shall participate in the definition of at least one **curve_style**.

5.2.4.9 dependent_instantiable_action_directive

The **dependent_instantiable_action_directive** rule specifies that each instance of **action_directive** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_action_directive FOR
    (action_directive);
WHERE
 WR1: SIZEOF ( QUERY ( a <* action_directive | NOT ( SIZEOF (
     USEDIN ( a , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

action_directive: identifies the set of all instances of **action_directive**.

Formal propositions:

WR1: For each instance of **action_directive**, there shall be a reference to the **action_directive** instance from an attribute of another entity.

5.2.4.10 dependent_instantiable_action_resource_type

The **dependent_instantiable_action_resource_type** rule specifies that each instance of **action_resource_type** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_action_resource_type FOR
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
    (action_resource_type);
WHERE
 WR1: SIZEOF ( QUERY ( a <* action_resource_type | NOT ( SIZEOF
     ( USEDIN ( a , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

action_resource_type: identifies the set of all instances of **action_resource_type**.

Formal propositions:

WR1: For each instance of **action_resource_type**, there shall be a reference to the **action_resource_type** instance from an attribute of another entity.

5.2.4.11 dependent_instantiable_approval_role

The **dependent_instantiable_approval_role** rule specifies that each instance of **approval_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_approval_role FOR
    (approval_role);
WHERE
 WR1: SIZEOF ( QUERY ( a <* approval_role | NOT ( SIZEOF (
     USEDIN ( a , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

approval_role: identifies the set of all instances of **approval_role**.

Formal propositions:

WR1: For each instance of **approval_role**, there shall be a reference to the **approval_role** instance from an attribute of another entity.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

5.2.4.12 dependent_instantiable_attribute_value_role

The **dependent_instantiable_attribute_value_role** rule specifies that each instance of **attribute_value_-role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_attribute_value_role FOR
    (attribute_value_role);
WHERE
 WR1: SIZEOF ( QUERY ( a <* attribute_value_role | NOT ( SIZEOF
     ( USEDIN ( a , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

attribute_value_role: identifies the set of all instances of **attribute_value_role**.

Formal propositions:

WR1: For each instance of **attribute_value_role**, there shall be a reference to the **attribute_value_role** instance from an attribute of another entity.

5.2.4.13 dependent_instantiable_classification_role

The **dependent_instantiable_classification_role** rule specifies that each instance of **classification_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_classification_role FOR
    (classification_role);
WHERE
 WR1: SIZEOF ( QUERY ( c <* classification_role | NOT ( SIZEOF (
     USEDIN ( c , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Argument definitions:

classification_role: identifies the set of all instances of **classification_role**.

Formal propositions:

WR1: For each instance of **classification_role**, there shall be a reference to the **classification_role** instance from an attribute of another entity.

5.2.4.14 dependent_instantiable_colour_rgb

The **dependent_instantiable_colour_rgb** rule specifies that each instance of **colour_rgb** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_colour_rgb FOR
    (colour_rgb);
WHERE
 WR1: SIZEOF ( QUERY ( c <* colour_rgb | NOT ( SIZEOF ( USEDIN (
     c , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

colour_rgb: identifies the set of all instances of **colour_rgb**.

Formal propositions:

WR1: For each instance of **colour_rgb**, there shall be a reference to the **colour_rgb** instance from an attribute of another entity.

5.2.4.15 dependent_instantiable_contract_type

The **dependent_instantiable_contract_type** rule specifies that each instance of **contract_type** is dependent on the usage to define another entity.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
RULE dependent_instantiable_contract_type FOR
    (contract_type);
WHERE
 WR1: SIZEOF ( QUERY ( c <* contract_type | NOT ( SIZEOF (
     USEDIN ( c , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

contract_type: identifies the set of all instances of **contract_type**.

Formal propositions:

WR1: For each instance of **contract_type**, there shall be a reference to the **contract_type** instance from an attribute of another entity.

5.2.4.16 dependent_instantiable_curve_style

The **dependent_instantiable_curve_style** rule specifies that each instance of **curve_style** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_curve_style FOR
    (curve_style);
WHERE
 WR1: SIZEOF ( QUERY ( c <* curve_style | NOT ( SIZEOF ( USEDIN
     ( c , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

curve_style: identifies the set of all instances of **curve_style**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Formal propositions:

WR1: For each instance of **curve_style**, there shall be a reference to the **curve_style** instance from an attribute of another entity.

5.2.4.17 dependent_instantiable_date

The **dependent_instantiable_date** rule specifies that each instance of **date** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_date FOR
    (date);
WHERE
 WR1: SIZEOF ( QUERY ( d <* date | NOT ( SIZEOF ( USEDIN ( d ,
     '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

date: identifies the set of all instances of **date**.

Formal propositions:

WR1: For each instance of **date**, there shall be a reference to the **date** instance from an attribute of another entity.

5.2.4.18 dependent_instantiable_date_and_time

The **dependent_instantiable_date_and_time** rule specifies that each instance of **date_and_time** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_date_and_time FOR
    (date_and_time);
WHERE
 WR1: SIZEOF ( QUERY ( d <* date_and_time | NOT ( SIZEOF (
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
     USEDIN ( d , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

date_and_time: identifies the set of all instances of **date_and_time**.

Formal propositions:

WR1: For each instance of **date_and_time**, there shall be a reference to the **date_and_time** instance from an attribute of another entity.

5.2.4.19 dependent_instantiable_date_role

The **dependent_instantiable_date_role** rule specifies that each instance of **date_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_date_role FOR
    (date_role);
WHERE
 WR1: SIZEOF ( QUERY ( d <* date_role | NOT ( SIZEOF ( USEDIN (
     d , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

date_role: identifies the set of all instances of **date_role**.

Formal propositions:

WR1: For each instance of **date_role**, there shall be a reference to the **date_role** instance from an attribute of another entity.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

5.2.4.20 dependent_instantiable_date_time_role

The **dependent_instantiable_date_time_role** rule specifies that each instance of **date_time_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_date_time_role FOR
    (date_time_role);
WHERE
 WR1: SIZEOF ( QUERY ( d <* date_time_role | NOT ( SIZEOF (
     USEDIN ( d , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

date_time_role: identifies the set of all instances of **date_time_role**.

Formal propositions:

WR1: For each instance of **date_time_role**, there shall be a reference to the **date_time_role** instance from an attribute of another entity.

5.2.4.21 dependent_instantiable_derived_unit

The **dependent_instantiable_derived_unit** rule specifies that each instance of **derived_unit** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_derived_unit FOR
    (derived_unit);
WHERE
 WR1: SIZEOF ( QUERY ( d <* derived_unit | NOT ( SIZEOF ( USEDIN
     ( d , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Argument definitions:

derived_unit: identifies the set of all instances of **derived_unit**.

Formal propositions:

WR1: For each instance of **derived_unit**, there shall be a reference to the **derived_unit** instance from an attribute of another entity.

5.2.4.22 dependent_instantiable_dimensional_size

The **dependent_instantiable_dimensional_size** rule specifies that each instance of **dimensional_size** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_dimensional_size FOR
    (dimensional_size);
WHERE
 WR1: SIZEOF ( QUERY ( d <* dimensional_size | NOT ( SIZEOF (
     USEDIN ( d , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

dimensional_size: identifies the set of all instances of **dimensional_size**.

Formal propositions:

WR1: For each instance of **dimensional_size**, there shall be a reference to the **dimensional_size** instance from an attribute of another entity.

5.2.4.23 dependent_instantiable_document_usage_role

The **dependent_instantiable_document_usage_role** rule specifies that each instance of **document_usage_role** is dependent on the usage to define another entity.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
RULE dependent_instantiable_document_usage_role FOR
    (document_usage_role);
WHERE
 WR1: SIZEOF ( QUERY ( d <* document_usage_role | NOT ( SIZEOF (
     USEDIN ( d , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

document_usage_role: identifies the set of all instances of **document_usage_role**.

Formal propositions:

WR1: For each instance of **document_usage_role**, there shall be a reference to the **document_usage_role** instance from an attribute of another entity.

5.2.4.24 dependent_instantiable_effectivity_context_role

The **dependent_instantiable_effectivity_context_role** rule specifies that each instance of **effectivity_context_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_effectivity_context_role FOR
    (effectivity_context_role);
WHERE
 WR1: SIZEOF ( QUERY ( e <* effectivity_context_role | NOT (
     SIZEOF ( USEDIN ( e , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

effectivity_context_role: identifies the set of all instances of **effectivity_context_role**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Formal propositions:

WR1: For each instance of **effectivity_context_role**, there shall be a reference to the **effectivity_context_role** instance from an attribute of another entity.

5.2.4.25 dependent_instantiable_event_occurrence_role

The **dependent_instantiable_event_occurrence_role** rule specifies that each instance of **event_occurrence_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_event_occurrence_role FOR
    (event_occurrence_role);
WHERE
 WR1: SIZEOF ( QUERY ( e <* event_occurrence_role | NOT ( SIZEOF
     ( USEDIN ( e , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

event_occurrence_role: identifies the set of all instances of **event_occurrence_role**.

Formal propositions:

WR1: For each instance of **event_occurrence_role**, there shall be a reference to the **event_occurrence_role** instance from an attribute of another entity.

5.2.4.26 dependent_instantiable_externally_defined_symbol

The **dependent_instantiable_externally_defined_symbol** rule specifies that each instance of **externally_defined_symbol** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_externally_defined_symbol FOR
    (externally_defined_symbol);
WHERE
 WR1: SIZEOF ( QUERY ( e <* externally_defined_symbol | NOT (
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
     SIZEOF ( USEDIN ( e , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

externally_defined_symbol: identifies the set of all instances of **externally_defined_symbol**.

Formal propositions:

WR1: For each instance of **externally_defined_symbol**, there shall be a reference to the **externally_-defined_symbol** instance from an attribute of another entity.

5.2.4.27 dependent_instantiable_fill_area_style

The **dependent_instantiable_fill_area_style** rule specifies that each instance of **fill_area_style** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_fill_area_style FOR
    (fill_area_style);
WHERE
 WR1: SIZEOF ( QUERY ( f <* fill_area_style | NOT ( SIZEOF (
     USEDIN ( f , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

fill_area_style: identifies the set of all instances of **fill_area_style**.

Formal propositions:

WR1: For each instance of **fill_area_style**, there shall be a reference to the **fill_area_style** instance from an attribute of another entity.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

5.2.4.28 dependent_instantiable_fill_area_style_colour

The **dependent_instantiable_fill_area_style_colour** rule specifies that each instance of **fill_area_style_colour** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_fill_area_style_colour FOR
    (fill_area_style_colour);
WHERE
 WR1: SIZEOF ( QUERY ( f <* fill_area_style_colour | NOT (
     SIZEOF ( USEDIN ( f , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

fill_area_style_colour: identifies the set of all instances of **fill_area_style_colour**.

Formal propositions:

WR1: For each instance of **fill_area_style_colour**, there shall be a reference to the **fill_area_style_colour** instance from an attribute of another entity.

5.2.4.29 dependent_instantiable_identification_role

The **dependent_instantiable_identification_role** rule specifies that each instance of **identification_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_identification_role FOR
    (identification_role);
WHERE
 WR1: SIZEOF ( QUERY ( i <* identification_role | NOT ( SIZEOF (
     USEDIN ( i , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Argument definitions:

identification_role: identifies the set of all instances of **identification_role**.

Formal propositions:

WR1: For each instance of **identification_role**, there shall be a reference to the **identification_role** instance from an attribute of another entity.

5.2.4.30 dependent_instantiable_measure_with_unit

The **dependent_instantiable_measure_with_unit** rule specifies that each instance of **measure_with_unit** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_measure_with_unit FOR
    (measure_with_unit);
WHERE
 WR1: SIZEOF ( QUERY ( m <* measure_with_unit | NOT ( SIZEOF (
     USEDIN ( m , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

measure_with_unit: identifies the set of all instances of **measure_with_unit**.

Formal propositions:

WR1: For each instance of **measure_with_unit**, there shall be a reference to the **measure_with_unit** instance from an attribute of another entity.

5.2.4.31 dependent_instantiable_named_unit

The **dependent_instantiable_named_unit** rule specifies that each instance of **named_unit** is dependent on the usage to define another entity.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
RULE dependent_instantiable_named_unit FOR
    (named_unit);
WHERE
 WR1: SIZEOF ( QUERY ( n <* named_unit | NOT ( SIZEOF ( USEDIN (
     n , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

named_unit: identifies the set of all instances of **named_unit**.

Formal propositions:

WR1: For each instance of **named_unit**, there shall be a reference to the **named_unit** instance from an attribute of another entity.

5.2.4.32 dependent_instantiable_object_role

The **dependent_instantiable_object_role** rule specifies that each instance of **object_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_object_role FOR
    (object_role);
WHERE
 WR1: SIZEOF ( QUERY ( o <* object_role | NOT ( SIZEOF ( USEDIN
     ( o, '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

object_role: identifies the set of all instances of **object_role**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

Formal propositions:

WR1: For each instance of **object_role**, there shall be a reference to the **object_role** instance from an attribute of another entity.

5.2.4.33 dependent_instantiable_organization_role

The **dependent_instantiable_organization_role** rule specifies that each instance of **organization_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_organization_role FOR
    (organization_role);
WHERE
 WR1: SIZEOF ( QUERY ( o <* organization_role | NOT ( SIZEOF (
     USEDIN ( o , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

organization_role: identifies the set of all instances of **organization_role**.

Formal propositions:

WR1: For each instance of **organization_role**, there shall be a reference to the **organization_role** instance from an attribute of another entity.

5.2.4.34 dependent_instantiable_organizational_project_role

The **dependent_instantiable_organizational_project_role** rule specifies that each instance of **organizational_project_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_organizational_project_role FOR
    (organizational_project_role);
WHERE
 WR1: SIZEOF ( QUERY ( o <* organizational_project_role | NOT (
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
     SIZEOF ( USEDIN ( o , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

organizational_project_role: identifies the set of all instances of **organizational_project_role**.

Formal propositions:

WR1: For each instance of **organizational_project_role**, there shall be a reference to the **organizational_project_role** instance from an attribute of another entity.

5.2.4.35 dependent_instantiable_person_and_organization_role

The **dependent_instantiable_person_and_organization_role** rule specifies that each instance of **person_and_organization_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_person_and_organization_role FOR
    (person_and_organization_role);
WHERE
 WR1: SIZEOF ( QUERY ( p <* person_and_organization_role | NOT (
     SIZEOF ( USEDIN ( p , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

person_and_organization_role: identifies the set of all instances of **person_and_organization_role**.

Formal propositions:

WR1: For each instance of **person_and_organization_role**, there shall be a reference to the **person_and_organization_role** instance from an attribute of another entity.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

5.2.4.36 dependent_instantiable_pre_defined_colour

The **dependent_instantiable_pre_defined_colour** rule specifies that each instance of **pre_defined_-colour** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_pre_defined_colour FOR
    (pre_defined_colour);
WHERE
 WR1: SIZEOF ( QUERY ( p <* pre_defined_colour | NOT ( SIZEOF (
     USEDIN ( p , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

pre_defined_colour: identifies the set of all instances of **pre_defined_colour**.

Formal propositions:

WR1: For each instance of **pre_defined_colour**, there shall be a reference to the **pre_defined_colour** instance from an attribute of another entity.

5.2.4.37 dependent_instantiable_pre_defined_symbol

The **dependent_instantiable_pre_defined_symbol** rule specifies that each instance of **pre_defined_-symbol** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_pre_defined_symbol FOR
    (pre_defined_symbol);
WHERE
 WR1: SIZEOF ( QUERY ( p <* pre_defined_symbol | NOT ( SIZEOF (
     USEDIN ( p , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Argument definitions:

pre_defined_symbol: identifies the set of all instances of **pre_defined_symbol**.

Formal propositions:

WR1: For each instance of **pre_defined_symbol**, there shall be a reference to the **pre_defined_symbol** instance from an attribute of another entity.

5.2.4.38 dependent_instantiable_precision_qualifier

The **dependent_instantiable_precision_qualifier** rule specifies that each instance of **precision_qualifier** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_precision_qualifier FOR
    (precision_qualifier);
WHERE
 WR1: SIZEOF ( QUERY ( p <* precision_qualifier | NOT ( SIZEOF (
     USEDIN ( p , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

precision_qualifier: identifies the set of all instances of **precision_qualifier**.

Formal propositions:

WR1: For each instance of **precision_qualifier**, there shall be a reference to the **precision_qualifier** instance from an attribute of another entity.

5.2.4.39 dependent_instantiable_presentation_style_by_context

The **dependent_instantiable_presentation_style_by_context** rule specifies that each instance of **presentation_style_by_context** is dependent on the usage to define another entity.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
RULE dependent_instantiable_presentation_style_by_context FOR
    (presentation_style_by_context);
WHERE
 WR1: SIZEOF ( QUERY ( p <* presentation_style_by_context | NOT
     ( SIZEOF ( USEDIN ( p , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

presentation_style_by_context: identifies the set of all instances of **presentation_style_by_context**.

Formal propositions:

WR1: For each instance of **presentation_style_by_context**, there shall be a reference to the **presentation_style_by_context** instance from an attribute of another entity.

5.2.4.40 dependent_instantiable_product_definition_context_role

The **dependent_instantiable_product_definition_context_role** rule specifies that each instance of **product_definition_context_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_product_definition_context_role FOR
    (product_definition_context_role);
WHERE
 WR1: SIZEOF ( QUERY ( p <* product_definition_context_role |
     NOT ( SIZEOF ( USEDIN ( p , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

product_definition_context_role: identifies the set of all instances of **product_definition_context_role**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Formal propositions:

WR1: For each instance of **product_definition_context_role**, there shall be a reference to the **product_definition_context_role** instance from an attribute of another entity.

5.2.4.41 dependent_instantiable_resource_requirement_type

The **dependent_instantiable_resource_requirement_type** rule specifies that each instance of **resource_requirement_type** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_resource_requirement_type FOR
    (resource_requirement_type);
WHERE
 WR1: SIZEOF ( QUERY ( r <* resource_requirement_type | NOT (
     SIZEOF ( USEDIN ( r , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

resource_requirement_type: identifies the set of all instances of **resource_requirement_type**.

Formal propositions:

WR1: For each instance of **resource_requirement_type**, there shall be a reference to the **resource_requirement_type** instance from an attribute of another entity.

5.2.4.42 dependent_instantiable_retention

The **dependent_instantiable_retention** rule specifies that each instance of **retention** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_retention FOR
    (retention);
WHERE
 WR1: SIZEOF ( QUERY ( r <* retention | NOT ( SIZEOF ( USEDIN (
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
     r , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

retention: identifies the set of all instances of **retention**.

Formal propositions:

WR1: For each instance of **retention**, there shall be a reference to the **retention** instance from an attribute of another entity.

5.2.4.43 dependent_instantiable_standard_uncertainty

The **dependent_instantiable_standard_uncertainty** rule specifies that each instance of **standard_uncertainty** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_standard_uncertainty FOR
    (standard_uncertainty);
WHERE
 WR1: SIZEOF ( QUERY ( s <* standard_uncertainty | NOT ( SIZEOF
     ( USEDIN ( s , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

standard_uncertainty: identifies the set of all instances of **standard_uncertainty**.

Formal propositions:

WR1: For each instance of **standard_uncertainty**, there shall be a reference to the **standard_uncertainty** instance from an attribute of another entity.

5.2.4.44 dependent_instantiable_symbol_colour

The **dependent_instantiable_symbol_colour** rule specifies that each instance of **symbol_colour** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_symbol_colour FOR
    (symbol_colour);
WHERE
 WR1: SIZEOF ( QUERY ( s <* symbol_colour | NOT ( SIZEOF (
     USEDIN ( s , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

symbol_colour: identifies the set of all instances of **symbol_colour**.

Formal propositions:

WR1: For each instance of **symbol_colour**, there shall be a reference to the **symbol_colour** instance from an attribute of another entity.

5.2.4.45 dependent_instantiable_text_style

The **dependent_instantiable_text_style** rule specifies that each instance of **text_style** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_text_style FOR
    (text_style);
WHERE
 WR1: SIZEOF ( QUERY ( t <* text_style | NOT ( SIZEOF ( USEDIN (
     t , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Argument definitions:

text_style: identifies the set of all instances of **text_style**.

Formal propositions:

WR1: For each instance of **text_style**, there shall be a reference to the **text_style** instance from an attribute of another entity.

5.2.4.46 dependent_instantiable_text_style_for_defined_font

The **dependent_instantiable_text_style_for_defined_font** rule specifies that each instance of **text_style_for_defined_font** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_text_style_for_defined_font FOR
    (text_style_for_defined_font);
WHERE
 WR1: SIZEOF ( QUERY ( t <* text_style_for_defined_font | NOT (
     SIZEOF ( USEDIN ( t , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

text_style_for_defined_font: identifies the set of all instances of **text_style_for_defined_font**.

Formal propositions:

WR1: For each instance of **text_style_for_defined_font**, there shall be a reference to the **text_style_for_defined_font** instance from an attribute of another entity.

5.2.4.47 dependent_instantiable_time_interval_role

The **dependent_instantiable_time_interval_role** rule specifies that each instance of **time_interval_role** is dependent on the usage to define another entity.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
RULE dependent_instantiable_time_interval_role FOR
    (time_interval_role);
WHERE
 WR1: SIZEOF ( QUERY ( t <* time_interval_role | NOT ( SIZEOF (
     USEDIN ( t , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

time_interval_role: identifies the set of all instances of **time_interval_role**.

Formal propositions:

WR1: For each instance of **time_interval_role**, there shall be a reference to the **time_interval_role** instance from an attribute of another entity.

5.2.4.48 dependent_instantiable_tolerance_value

The **dependent_instantiable_tolerance_value** rule specifies that each instance of **tolerance_value** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_tolerance_value FOR
    (tolerance_value);
WHERE
 WR1: SIZEOF ( QUERY ( t <* tolerance_value | NOT ( SIZEOF (
     USEDIN ( t , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

tolerance_value: identifies the set of all instances of **tolerance_value**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Formal propositions:

WR1: For each instance of **tolerance_value**, there shall be a reference to the **tolerance_value** instance from an attribute of another entity.

5.2.4.49 dependent_instantiable_type_qualifier

The **dependent_instantiable_type_qualifier** rule specifies that each instance of **type_qualifier** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_type_qualifier FOR
    (type_qualifier);
WHERE
 WR1: SIZEOF ( QUERY ( t <* type_qualifier | NOT ( SIZEOF (
     USEDIN ( t , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

type_qualifier: identifies the set of all instances of **type_qualifier**.

Formal propositions:

WR1: For each instance of **type_qualifier**, there shall be a reference to the **type_qualifier** instance from an attribute of another entity.

5.2.4.50 dependent_instantiable_uncertainty_qualifier

The **dependent_instantiable_uncertainty_qualifier** rule specifies that each instance of **uncertainty_qualifier** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_uncertainty_qualifier FOR
    (uncertainty_qualifier);
WHERE
 WR1: SIZEOF ( QUERY ( u <* uncertainty_qualifier | NOT ( SIZEOF
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
     ( USEDIN ( u , '' ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

uncertainty_qualifier: identifies the set of all instances of **uncertainty_qualifier**.

Formal propositions:

WR1: For each instance of **uncertainty_qualifier**, there shall be a reference to the **uncertainty_qualifier** instance from an attribute of another entity.

5.2.4.51 design_constraint_requires_product_definition

The **design_constraint_requires_product_definition** rule ensures that each instance of **product_definition_formation** which has an associated **of_product** that is referenced by a **product_related_product_category** with a **name** of 'requirement', is referenced as **formation** by exactly one instance of **product_definition** that references as its **frame_of_reference** a **product_definition_context** with a **name** of 'design constraint definition'.

EXPRESS specification:

```
*)
RULE design_constraint_requires_product_definition FOR
    (product_definition,
     product_definition_formation,
     product_related_product_category);
WHERE
 WR1: SIZEOF ( QUERY ( pdf <* product_definition_formation | (
     SIZEOF ( QUERY ( prpc <* USEDIN ( pdf. of_product ,
     'AUTOMOTIVE_DESIGN.'+'PRODUCT_RELATED_PRODUCT_CATEGORY.'+
     'PRODUCTS' ) | prpc. name ='requirement' ) ) >0 ) AND (
     SIZEOF ( QUERY ( pd <* USEDIN ( pdf ,
     'AUTOMOTIVE_DESIGN.'+'PRODUCT_DEFINITION.'+ 'FORMATION' ) |
     pd. frame_of_reference.name =
     'design constraint definition' ) ) <>1 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

product_definition: the set of all instances of **product_definition**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

product_definition_formation: the set of all instances of **product_definition_formation**.

product_related_product_category: the set of all instances of **product_related_product_category**.

Formal propositions:

WR1: Each instance of **product_definition_formation** which has an associated **of_product** that is referenced by a **product_related_product_category** with a **name** of 'requirement', is referenced as **formation** by exactly one instance of **product_definition** that references as its **frame_of_reference** a **product_definition_context** with a **name** of 'design constraint definition'.

5.2.4.52 dimensionality_is_two_or_three

The **dimensionality_is_two_or_three** rule ensures that all **representations** with a **geometric_representation_context** are defined in a two-dimensional or three-dimensional coordinate system.

EXPRESS specification:

```
*)
RULE dimensionality_is_two_or_three FOR
    (geometric_representation_context);
WHERE
 WR1: SIZEOF ( QUERY ( g <* geometric_representation_context |
     NOT ( ( g.coordinate_space_dimension =2 ) OR (
     g.coordinate_space_dimension =3 ) ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

geometric_representation_context: the set of all instances of **geometric_representation_context**.

Formal propositions:

WR1: Each **geometric_representation_context** shall have a **coordinate_space_dimension** equal to two or three.

5.2.4.53 draughting_subfigure_representation_layers

The **draughting_subfigure_representation_layers** rule ensures that every **annotation_occurrence** that is an item in a **draughting_subfigure_representation** is assigned to at least one layer.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
RULE draughting_subfigure_representation_layers FOR
    (draughting_subfigure_representation);
WHERE
 WR1: SIZEOF ( QUERY ( dsr <*
     draughting_subfigure_representation | NOT ( SIZEOF ( QUERY
     ( item <* dsr\ representation.items | (
     'AUTOMOTIVE_DESIGN.'+ 'ANNOTATION_OCCURRENCE' IN TYPEOF (
     item ) ) AND ( SIZEOF ( USEDIN ( item ,
     'AUTOMOTIVE_DESIGN.'+'PRESENTATION_LAYER_ASSIGNMENT.'+'ASSIGNED_ITEMS'
     ) ) =0 ) ) ) =0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

draughting_subfigure_representation: the set of all instances of **draughting_subfigure_representation**.

Formal propositions:

WR1: Every item of each **draughting_subfigure_representation** that is an **annotation_occurrence** shall be one of the **assigned_items** of at least one **presentation_layer_assignment**.

5.2.4.54 drawing_sheet_annotation_layers

The **drawing_sheet_annotation_layers** rule ensures that every **annotation_occurrence** that is an item in a **drawing_sheet_revision** is assigned to at least one layer.

EXPRESS specification:

```
*)
RULE drawing_sheet_annotation_layers FOR
    (drawing_sheet_revision);
WHERE
 WR1: SIZEOF ( QUERY ( dsr <* drawing_sheet_revision | NOT (
     SIZEOF ( QUERY ( ao <* QUERY ( it <* dsr\
     representation.items | ( 'AUTOMOTIVE_DESIGN.'+
     'ANNOTATION_OCCURRENCE' IN TYPEOF ( it ) ) ) | NOT ( SIZEOF
     ( USEDIN ( ao ,
     'AUTOMOTIVE_DESIGN.'+'PRESENTATION_LAYER_ASSIGNMENT.'+'ASSIGNED_ITEMS'
     ) ) >=1 ) ) ) =0 ) ) ) =0;
END_RULE;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

5.2.4.56 drawing_view_annotation_layers

The **drawing_view_annotation_layers** rule ensures that every **annotation_occurrence** that is an item in a **presentation_view** is assigned to at least one layer.

EXPRESS specification:

```
*)
RULE drawing_view_annotation_layers FOR
    (presentation_view);
WHERE
 WR1: SIZEOF ( QUERY ( pv <* presentation_view | NOT ( SIZEOF (
     QUERY ( ao <* QUERY ( it <* pv\ representation.items |(
     'AUTOMOTIVE_DESIGN.'+'ANNOTATION_OCCURRENCE' IN TYPEOF ( it
     ) ) ) | NOT ( SIZEOF ( USEDIN ( ao ,
     'AUTOMOTIVE_DESIGN.'+'PRESENTATION_LAYER_ASSIGNMENT.'+'ASSIGNED_ITEMS'
     ) ) >=1 ) ) ) =0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

presentation_view: the set of all instances of **presentation_view**.

Formal propositions:

WR1: Every item of each **presentation_view** that is an **annotation_occurrence** shall be one of the **assigned_items** of at least one **presentation_layer_assignment**.

5.2.4.57 event_occurrence_requires_event_occurrence_assignment

The **event_occurrence_requires_event_occurrence_assignment** rule ensures that each instance of **event_occurrence** that serves not as a base for another instance of **event_occurrence** is referenced by at least one instance of **event_occurrence_assignment** as the **assigned_event_occurrence**. This rule enforces the requirement for every **event_reference** to be assigned to product data at least once.

EXPRESS specification:

```
*)
RULE event_occurrence_requires_event_occurrence_assignment FOR
    (event_occurrence,
     event_occurrence_assignment,
     relative_event_occurrence);
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Formal propositions:

WR1: Each instance of **executed_action** shall be referenced by exactly one instance of **action_status** as **assigned_action**.

5.2.4.59 externally_defined_class_with_known_source_requirement

The **externally_defined_class_with_known_source_requirement** rule specifies that each instance of **externally_defined_class** which references as the **source** a **known_source** is contained in the set of **items** of exactly one **applied_organization_assignment** which references as its **role** an **organization_role** with a **name** of 'class supplier'. This rule enforces the requirement for every Plib_class_reference to have a **supplier_bsu**.

EXPRESS specification:

```
*)
RULE externally_defined_class_with_known_source_requirement FOR
    (externally_defined_class);
WHERE
 WR1: SIZEOF ( QUERY ( edc <* externally_defined_class | (
     'AUTOMOTIVE_DESIGN.'+ 'KNOWN_SOURCE' IN TYPEOF ( edc.
     source ) ) AND ( SIZEOF ( QUERY ( aoa <* USEDIN ( edc ,
     'AUTOMOTIVE_DESIGN.APPLIED_ORGANIZATION_ASSIGNMENT.ITEMS' )
     | aoa. role.name = 'class supplier' ) ) =0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

externally_defined_class: the set of all instances of **externally_defined_class**.

Formal propositions:

WR1: Each instance of **externally_defined_class** which references as the **source** a **known_source** shall be member in the set of **items** of an **applied_organization_assignment**. This **organization_assignment** shall reference as its **role** an **organization_role** with a **name** of 'class supplier'.

5.2.4.60 fill_area_style_tile_symbol_constraint

The **fill_area_style_tile_symbol_constraint** rule ensures that a **pre_defined_symbol** does not participate in the definition of a **fill_area_style_tile_symbol_with_style**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
RULE fill_area_style_tile_symbol_constraint FOR
    (fill_area_style_tile_symbol_with_style);
WHERE
 WR1: SIZEOF ( QUERY ( fast <*
     fill_area_style_tile_symbol_with_style | ( (
     'AUTOMOTIVE_DESIGN.'+ 'DEFINED_SYMBOL' IN TYPEOF ( fast.

     'id owner' ) ) =1 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

product: the set of all instances of **product**.

Formal propositions:

WR1: Each instance of **product** that is referenced by an **product_related_product_category** with a **name** of 'part', 'tool', or 'raw material' is contained in the set of **items** of exactly one **applied_person_-and_organization_assignment** which references as its role an **person_and_organization_role** with a **name** of 'id owner'.

5.2.4.75 product_requires_version

The **product_requires_version** rule ensures that each instance of **product** is referenced by at least one instance of **product_definition_formation**. This rule enforces the requirement for every Item to have at least one Item version associated to it.

EXPRESS specification:

```
*)
RULE product_requires_version FOR
    (product);
WHERE
 WR1: SIZEOF ( QUERY ( prod <* product | ( SIZEOF ( USEDIN (
    prod ,
    'AUTOMOTIVE_DESIGN.'+'PRODUCT_DEFINITION_FORMATION.'+
    'OF_PRODUCT' ) ) =0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

product: the set of all instances of **product**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Formal propositions:

WR1: For each instance of **product** there shall be one or more instances of **product_definition_formation** that refers as **of_product** attribute to this instance of **product**.

5.2.4.76 restrict_action_resource_requirement_for_process_operation

The **restrict_action_resource_requirement_for_process_operation** rule specifies that each instance of **action** with a **name** of 'process operation' shall only be referenced by at most one instance of **action_resource_requirement** with a **name** of 'reference tool'. Each instance of **action_resource_requirement** with a **name** of 'reference tool' shall be of type **requirement_for_action_resource** and shall have exactly one item in its set of **resources** that references an instance of **action_resource** which is a **product_definition_resource**. The only **name**s permitted for **action_resource_requirement** shall be 'reference tool' or 'non reference tool'. This rule enforces the requirement for every Process operation to have at most one resource as the reference tool associated to it where the reference tool has to be associated to an Item version.

EXPRESS specification:

```
*)
RULE restrict_action_resource_requirement_for_process_operation FOR
    (action,

```

Argument definitions:

action: the set of all instances of **action**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

action_resource_requirement: the set of all instances of **action_resource_requirement**.

Formal propositions:

WR1: For each instance of **action** with a **name** of 'process operation' there shall be at most one instance of **action_resource_requirement** with a **name** of 'reference tool' that references the action in its set of operations.

WR2: Each instance of **action_resource_requirement** with a **name** of 'reference tool' shall be a **requirement_for_action_resource** and shall have exactly one item in its set of **resources** that references an instance of **action_resource** which is a **product_definition_resource**.

WR3: For each instance of **action_resource_requirement** the value of the **name** attribute shall be either 'reference tool' or 'non reference tool'.

5.2.4.77 restrict_alternative_definition

The **restrict_alternative_definition** rule specifies the restrictions that apply to **product_definition**s which reference as **frame_of_reference** a **product_definition_context** with a **name** of 'alternative definition'.

EXPRESS specification:

```
*)
RULE restrict_alternative_definition FOR
    (product_definition,
     product_definition_context);
WHERE
 WR1: SIZEOF ( QUERY ( pd <* product_definition | ( pd.
     frame_of_reference.name = 'alternative definition' ) AND (
     SIZEOF ( QUERY ( pdr <* USEDIN ( pd ,
     'AUTOMOTIVE_DESIGN.'+'PRODUCT_DEFINITION_RELATIONSHIP.'+
     'RELATED_PRODUCT_DEFINITION' ) | pdr. name =
     'solution alternative definition' ) ) <>1 ) ) ) =0;
 WR2: SIZEOF ( QUERY ( pd <* product_definition | ( pd.
     frame_of_reference.name = 'alternative definition' ) AND
     NOT ( pd. name IN ['technical' , 'supplier' , 'final' ,
     'technical supplier' , 'technical final' , 'supplier final'
     , 'technical supplier final' , ''] ) ) ) =0;
 WR3: SIZEOF ( QUERY ( pd <* product_definition | ( pd.
     frame_of_reference.name = 'alternative definition' ) AND (
     pd. name IN ['supplier' , 'technical supplier' ,
     'supplier final' , 'technical supplier final' ] ) AND (
     SIZEOF ( QUERY ( aoa <* USEDIN ( pd ,
     'AUTOMOTIVE_DESIGN.'+'APPLIED_ORGANIZATION_ASSIGNMENT.'+
     'ITEMS' ) | aoa. role.name ='supplier' ) ) <>1 ) ) ) =0;
 WR4: SIZEOF ( QUERY ( pd <* product_definition | ( pd.
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Argument definitions:

configuration_design: the set of all instances of **configuration_design**.

product_class: the set of all instances of **product_class**.

Formal propositions:

WR1: Each instance of **configuration_design** which has a **name** of 'functionality' shall reference as **design** a **product_definition** which references as its **frame_of_reference** a **product_definition_context** with a **name** of 'functional definition'.

WR2: Each instance of **configuration_design** which has a **name** of 'realization' shall reference as **design** a **product_definition** which references as its **frame_of_reference** a **product_definition_context** with a **name** of 'conceptual definition'.

WR3: Each instance of **configuration_design** which has a **name** of 'functionality' or 'realization' shall reference as **configuration** a **configuration_item** which references as its **item_concept** a **product_class**.

WR4: Each instance of **configuration_design** which has as **design** a **product_definition** which references as its **frame_of_reference** a **product_definition_context** with a **name** of 'design constraint definition' shall reference as **configuration** a **configuration_item** which has a **name** of 'design constraint usage' and which references as its **item_concept** a **product_class**.

WR5: Each instance of **configuration_design** which has a **name** of 'physical instance basis' shall reference as **design** a **product_definition** which references as its **frame_of_reference** a **product_definition_context** with a **name** of 'physical occurrence'.

WR6: Each instance of **configuration_design** which has a **name** of 'physical instance basis' shall reference as **configuration** a **configuration_item** of type **product_identification**.

5.2.4.94 restrict_default_settings

The **restrict_default_settings** rule ensures that the **representation** that represents a General_tolerance (see 4.2.235) is unambiguously defined.

EXPRESS specification:

```
*)
RULE restrict_default_settings FOR
    (applied_document_reference,
     representation);
WHERE
 WR1: ( SIZEOF ( QUERY ( r <* representation | ( r.name =
     'default tolerances' ) AND ( r.context_of_items.
     context_type = 'default setting' ) AND ( SIZEOF ( r.items )
     <>1 ) ) ) =0 ) AND ( SIZEOF ( QUERY ( r <* representation |
     ( r.name = 'default tolerances' ) AND ( r.context_of_items.
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

```
     context_type = 'default setting' ) AND ( SIZEOF ( QUERY ( i
     <* r.items | ( 'AUTOMOTIVE_DESIGN.'+
     'DESCRIPTIVE_REPRESENTATION_ITEM' IN TYPEOF ( i ) ) AND (
     i.name = 'tolerance class' ) ) ) <>1 ) ) ) =0 ) ;
 WR2: SIZEOF ( QUERY ( r <* representation | ( r.name =
     'default tolerances' ) AND ( r.context_of_items.
     context_type = 'default setting' ) AND ( SIZEOF ( QUERY (
     adr <* USEDIN ( r ,
     'AUTOMOTIVE_DESIGN.APPLIED_DOCUMENT_REFERENCE.ITEMS' ) |
     adr. role.name = 'general tolerance definition' ) ) +
     SIZEOF ( QUERY ( rr <* USEDIN ( r ,
     'AUTOMOTIVE_DESIGN.REPRESENTATION_RELATIONSHIP.REP_2' ) | (

WR2: Each **drawing_revision** shall be one of the **items** of no more than one **draughting_title**.

WR3: Each sheet of the **drawing_revision** shall be one of the **items** of no more than one **draughting_-title**.

WR4: The **items** of each sheet of the **drawing_revision** shall be a **styled_item**, a **mapped_item**, an **axis2_placement**, or a **planar_box**.

WR5: The **items** of each sheet of the **drawing_revision** shall include at least one **styled_item** or **mapped_item**.

WR6: Each sheet of the **drawing_revision** shall contain exactly one **planar_box** that is the size of a **presentation_size**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

WR7: If there is a **mapped_item** in a sheet of the **drawing_revision** , the source of the **mapped_item** shall be a **presentation_view**.

WR8: Every **axis2_placement** in a sheet of the **drawing_revision** shall be the **mapping_target** for some **mapped_item**.

WR9: The **representation_context** of a sheet of the **drawing_revision** shall not be the context of any other **representation**.

WR10: Each view in a sheet of the **drawing_revision** shall be the **mapped_representation** for exactly one **mapped_item**.

WR11: The **items** of each view of each sheet of the **drawing_revision** shall be a **styled_item**, a **camera_image**, or an **axis2_placement**.

WR12: Each view of each sheet of the **drawing_revision** shall contain exactly one **axis2_placement** which is the **mapping_origin** for a **mapped_item**.

WR13: The **representation_context** of each view of each sheet of the **drawing_revision** shall not be the context of any other **representation**.

5.2.4.97 restrict_effectivity_assignment_for_class_category_usage

The **restrict_effectivity_assignment_for_class_category_usage** rule restricts the usage of **product_concept_feature_category_usage** objects in an **applied_effectivity_assignment**.

EXPRESS specification:

```
*)
RULE restrict_effectivity_assignment_for_class_category_usage FOR
    (applied_effectivity_assignment,
     product_concept_feature_category_usage);
WHERE
 WR1: SIZEOF ( QUERY ( aea <* applied_effectivity_assignment | (
     ( SIZEOF ( QUERY ( i <* aea. items | (
     'AUTOMOTIVE_DESIGN.'+
     'PRODUCT_CONCEPT_FEATURE_CATEGORY_USAGE' IN TYPEOF ( i ) )
     ) ) >0 ) OR ( SIZEOF ( QUERY ( i <* aea. items | (
     'AUTOMOTIVE_DESIGN.'+
     'PRODUCT_CONCEPT_FEATURE_CATEGORY_USAGE' IN TYPEOF ( i ) )
     ) ) <> SIZEOF ( aea. items ) ) ) AND ( ( SIZEOF ( TYPEOF (
     aea. assigned_effectivity ) ) >1 ) OR ( aea.
     assigned_effectivity.id<> 'class usage' ) OR ( SIZEOF (
     QUERY ( cueca <* USEDIN ( aea ,
     'AUTOMOTIVE_DESIGN.'+'EFFECTIVITY_CONTEXT_ASSIGNMENT.'+
     'ASSIGNED_EFFECTIVITY_ASSIGNMENT' ) | 'AUTOMOTIVE_DESIGN.'+
     'CLASS_USAGE_EFFECTIVITY_CONTEXT_ASSIGNMENT' IN TYPEOF (
     cueca ) ) ) =0 ) ) ) ) =0;
END_RULE;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Argument definitions:

applied_effectivity_assignment: the set of all instances of **applied_effectivity_assignment**.

product_concept_feature_category_usage: the set of all instances of **product_concept_feature_category_usage**.

Formal propositions:

WR1: An **applied_effectivity_assignment** which has a **product_concept_feature_category_usage** in its set of **items** may only have other **product_concept_feature_category_usage** objects in its set of **items**. It shall have an **assigned_effectivity** which is not of an **effectivity** subtype and which has an **id** of 'class usage' and it shall be the **assigned_effectivity_assignment** of a **class_usage_effectivity_context_assignment**.

5.2.4.98 restrict_effectivity_for_effectivity_relationship

The **restrict_effectivity_for_effectivity_relationship** rule restricts the types of **effectivity** that may participate in an **effectivity_relationship**.

EXPRESS specification:

```
*)
RULE restrict_effectivity_for_effectivity_relationship FOR
    (effectivity_relationship);
WHERE
 WR1: SIZEOF ( QUERY ( er <* effectivity_relationship | ( SIZEOF
     ( ['AUTOMOTIVE_DESIGN.'+ 'LOT_EFFECTIVITY' ,
     'AUTOMOTIVE_DESIGN.'+ 'SERIAL_NUMBERED_EFFECTIVITY' ,
     'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION_EFFECTIVITY']*
     TYPEOF ( er. relating_effectivity ) ) >0 ) OR ( SIZEOF (
     ['AUTOMOTIVE_DESIGN.'+ 'LOT_EFFECTIVITY' ,
     'AUTOMOTIVE_DESIGN.'+ 'SERIAL_NUMBERED_EFFECTIVITY' ,
     'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION_EFFECTIVITY']*
     TYPEOF ( er. related_effectivity ) ) >0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

effectivity_relationship: the set of all instances of **effectivity_relationship**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Formal propositions:

WR1: The **relating_effectivity** and the **related_effectivity** of an **effectivity_relationship** may not be of type **lot_effectivity**, **serial_numbered_effectivity**, or **product_definition_effectivity** .

5.2.4.99 restrict_effectivity_usage

The **restrict_effectivity_usage** rule enforces the usage of an **effectivity** that is not a **dated_effectivity** or a **time_interval_based_effectivity** by at least one instance of **applied_effectivity_assignment** or **effectivity_relationship**.

EXPRESS specification:

```
*)
RULE restrict_effectivity_usage FOR
    (configured_effectivity_assignment,
     effectivity);
WHERE
 WR1: SIZEOF ( QUERY ( e <* effectivity | ( SIZEOF (
     ['AUTOMOTIVE_DESIGN.'+ 'DATED_EFFECTIVITY' ,
     'AUTOMOTIVE_DESIGN.'+ 'TIME_INTERVAL_BASED_EFFECTIVITY']*
     TYPEOF ( e ) ) =0 ) AND ( ( SIZEOF ( QUERY ( er <* USEDIN (
     e ,
     'AUTOMOTIVE_DESIGN.EFFECTIVITY_RELATIONSHIP.'+'RELATED_EFFECTIVITY'
     ) | er. name ='inheritance' ) ) =0 ) AND ( ( e.id =
     'configuration validity' ) AND ( SIZEOF ( QUERY ( cea <*
     USEDIN ( e ,
     'AUTOMOTIVE_DESIGN.EFFECTIVITY_ASSIGNMENT.ASSIGNED_EFFECTIVITY'
     ) | 'AUTOMOTIVE_DESIGN.'+
     'CONFIGURED_EFFECTIVITY_ASSIGNMENT' IN TYPEOF ( cea ) ) )
     =0 ) ) AND ( ( e.id = 'class usage' ) AND ( SIZEOF ( QUERY
     ( aea <* USEDIN ( e ,
     'AUTOMOTIVE_DESIGN.'+'EFFECTIVITY_ASSIGNMENT.'+
     'ASSIGNED_EFFECTIVITY' ) | ( 'AUTOMOTIVE_DESIGN.'+
     'APPLIED_EFFECTIVITY_ASSIGNMENT' IN TYPEOF ( aea ) ) AND (
     SIZEOF ( QUERY ( i <* aea. items | 'AUTOMOTIVE_DESIGN.'+
     'PRODUCT_CONCEPT_FEATURE_CATEGORY_USAGE' IN TYPEOF ( i ) )
     ) >0 ) ) ) =0 ) ) ) ) ) =0;
END_RULE;
(*
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

Argument definitions:

configured_effectivity_assignment: the set of all instances of **configured_effectivity_assignment**.

effectivity: the set of all instances of **effectivity**.

 © ISO 2001 – All rights reserved

Formal propositions:

WR1: An **effectivity** that is not a **dated_effectivity** or a **time_interval_based_effectivity**, shall either be used at least once as the **related_effectivity** by an **effectivity_relationship** with a **name** of 'inheritance', or it shall have an **id** of 'configuration validity' and be the **assigned_effectivity** of a **configured_effectivity_assignment** or it shall have an **id** of 'class usage' and be the **assigned_effectivity** of an **applied_effectivity_assignment** which has a **product_concept_feature_category_usage** in its set of **items**.

5.2.4.100 restrict_externally_defined_item_relationship

The **restrict_externally_defined_item_relationship** rule ensures the correct correlation between the **name** of an **externally_defined_item_relationship** and the related **externally_defined_item**s.

EXPRESS specification:

```
*)
RULE restrict_externally_defined_item_relationship FOR
    (externally_defined_item_relationship);
WHERE
 WR1: SIZEOF ( QUERY ( edir <*
     externally_defined_item_relationship | ( edir. name =
     'name scope' ) AND ( NOT ( 'AUTOMOTIVE_DESIGN.'+
     'EXTERNALLY_DEFINED_GENERAL_PROPERTY' IN TYPEOF ( edir.
     relating_item ) ) OR NOT ( 'AUTOMOTIVE_DESIGN.'+

(*
```

Argument definitions:

product_definition: the set of all instances of **product_definition**.

product_definition_occurrence_relationship: the set of all instances of **product_definition_occurrence_relationship**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

Formal propositions:

WR1: Each instance of **product_definition** which references as its **frame_of_reference** a **product_definition_context** with a **name** of 'part occurrence', shall either have a **name** of 'single instance', 'selected instance', 'quantified instance', or 'specified instance'.

WR2: Each instance of **product_definition** which references as its **frame_of_reference** a **product_definition_context** with a **name** of 'part occurrence' shall either participate as the **related_product_definition** in exactly one **product_definition_relationship** with a **name** of 'definition usage', or shall be referenced as **design** by exactly one **configuration_design** which has a **name** of 'occurrence usage definition' and which references as **configuration** a **product_identification**.

WR3: Each instance of **product_definition** which references as its **frame_of_reference** a **product_definition_context** with a **name** of 'part occurrence' shall (at least) participate in a **product_definition_usage** relationship as the **related_product_definition** or in a **product_definition_occurrence_relationship** as **occurrence**.

WR4: Each instance of **product_definition** which references as its **frame_of_reference** a **product_definition_context** with a **name** of 'part occurrence' and which has a **name** of 'selected instance', shall be referenced by a **property_definition** which has a **name** of 'occurrence selection', and which is referenced as **definition** by a **property_definition_representation** which has as **used_representation** a **representation** which has a **name** of 'selection criteria' and which contains exactly two **representation_item**s in its set of **items**. One of these **representation_item**s shall be of type **measure_representation_item** or **value_range** and shall have a **name** of 'selection quantity'. The other one of these **representation_item**s shall be of type **descriptive_representation_item** and shall have a **name** of 'selection control'.

WR5: Each instance of **product_definition** which references as its **frame_of_reference** a **product_definition_context** with a **name** of 'part occurrence' and which has a **name** of 'quantified instance', shall be referenced by a **property_definition** which has a **name** of 'occurrence quantity', and which is referenced as **definition** by a **property_definition_representation** which has as **used_representation** a **representation** which has a **name** of 'quantity' and which contains exactly one **representation_item** in its set of **items**. This **representation_item** is of type **measure_representation_item** and has a **name** of 'quantity measure'.

WR6: Each instance of **product_definition** which references as its **frame_of_reference** a **product_definition_context** with a **name** of 'part occurrence' and which has a **name** of 'specified instance', shall be referenced as **occurrence** by a **product_definition_occurrence_relationship** which references as **occurrence_usage** a **specified_higher_usage_occurrence** .

5.2.4.177 restrict_process_product_association

The **restrict_process_product_association** rule specifies that the only **name**s of **process_product_association** permitted shall be 'input', 'output', or 'produced output'. Each instance of **process_product_association** with a **name** of 'input' or 'output' shall refer to an **action** that plays the role of **related_action** for an **action_relationship** that has a **name** of 'process operation occurrence'. See definition of Process_operation_input_or_output in paragraph 4.2.383 for more information. Each instance of **process_product_association** with a **name** of 'produced output' shall refer to a **product_definition** that

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

refers as **formation** to a **product_definition_formation** that is the formation of a **product** that is either a part, tool, or raw material. See definition for Process_plan in paragraph 4.2.387 and for Item_version in paragraph 4.2.275 for more information.

EXPRESS specification:

```
*)
RULE restrict_process_product_association FOR
    (process_product_association);
WHERE
 WR1: SIZEOF ( QUERY ( ppa <* process_product_association | NOT
     ( ppa. name IN ['input' , 'output' , 'produced output' ] )
     ) ) =0;
 WR2: SIZEOF ( QUERY ( ppa <* process_product_association | NOT
     ( ppa. name IN ['input' , 'output'] ) OR ( SIZEOF ( QUERY (
     ar <* USEDIN ( ppa. process ,
     'AUTOMOTIVE_DESIGN.'+'ACTION_RELATIONSHIP.'+
     'RELATED_ACTION' ) | ar. name =
     'process operation occurrence' ) ) =0 ) ) ) =0;
 WR3: SIZEOF ( QUERY ( ppa <* process_product_association | (
     ppa. name<> 'produced output' ) OR ( (
     'AUTOMOTIVE_DESIGN.'+ 'PRODUCT_DEFINITION' IN TYPEOF ( ppa.
     defined_product ) ) AND ( SIZEOF ( QUERY ( prpc <* USEDIN (

     ) | prpc. name IN ['part' , 'tool' , 'raw material' ] ) )
     =0 ) ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

process_product_association: the set of all instances of **process_product_association**.

Formal propositions:

WR1: For each instance of **process_product_association**, the value of the **name** attribute shall be either 'input', 'output', or 'produced output'.

WR2: If an instance of **process_product_association** has a **name** of 'input' or 'output', it shall refer as **process** to a **product_definition_process** that is refered as **related_action** by an **action_relationship** that has a **name** of 'process operation occurrence'.

WR3: If an instance of **process_product_association** has a **name** of 'produced output', it shall refer to a **product_definition** that refers as **formation** to a **product_definition_formation** that refers as **of_-**

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

product to a **product** that is contained in the set of **products** of a **product_related_product_category** with a **name** of either 'part', 'tool', or 'raw material'.

5.2.4.178 restrict_product_categories_for_tool_part_relationship

For each instance of **product_definition_relationship** that has a **name** of 'tool part relationship', the **product_definition** used as the **relating_product_definition** shall be associated to a **product_definition_formation** referencing a **product** that is referenced by a **product_related_product_category** with a **name** of 'tool', the **product_definition** used as the **related_product_definition** shall be associated to a **product_definition_formation** referencing a **product** that is referenced by a **product_related_product_category** with a **name** of 'part'.

This rule enforces the requirement that an Item_definition_relationship that is a Tool_part_relationship relates an item that is used to create a part to a part.

EXPRESS specification:

```
*)
RULE restrict_product_categories_for_tool_part_relationship FOR
    (product_definition_relationship);
WHERE
 WR1: SIZEOF ( QUERY ( pdr <* product_definition_relationship |
     ( pdr. name = 'tool part relationship' ) AND ( ( SIZEOF (

uct_definition_formation which references as **of_product** a **product** which is in the set of **products** of a **product_related_product_category** with a **name** of 'physically realized product'.

WR7: If the **product_definition** references as its **frame_of_reference** a **product_definition_context** with a **name** of 'physical document definition', 'digital document definition', or 'physical model occurrence', this **product_definition** shall reference as its **formation** a **product_definition_formation** which references as **of_product** a **product** which is in the set of **products** of a **product_related_product_category** with a **name** of 'document'.

5.2.4.182 restrict_product_definition_for_mating_tree

The **restrict_product_definition_for_mating_tree** rule specifies that each instance of **product_definition** with a **product_definition_context** that has a **name** of 'mating definition' associated by a **product_definition_context_association** shall be referenced by exactly two instances of **product_definition_relationship** as the **relating_product_definition**. These two instances of **product_definition_relationship** shall have a **name** of 'mating membership'. Either both or one shall reference as **related_product_definition** each an instance of **product_definition** with a **product_definition_context** that has a **name** of 'part occurrence'. In the later case, the other instance of **product_definition** shall have a **product_definition_context** with a **name** of 'mating definition' specified through a **product_definition_context_association**. This rule ensures that the Mated_item_association is transformed in a binary mating tree. The bottommost node of such a mating tree is a Mating_definition that consists of two Item_instances. Every other node of Mating_definition is created by its subnode and an additional Item_instance that is added to the already mated instances. See definition of Mating_definition in paragraph 4.2.313 and for Mated_item_association in paragraph 4.2.307 for more information.

EXPRESS specification:

     ) <>1 ) ) ) >0 ) ) =0;
```

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

```
END_RULE;
(*
```

Argument definitions:

geometric_tolerance: the set of all instances of **geometric_tolerance**.

Formal propositions:

WR1: The **toleranced_shape_aspect** of each instance of **geometric_tolerance** shall be refered to as **relating_shape_aspect** by at most one **shape_aspect_relationship** that has a **name** of 'affected plane association'.

WR2: The **toleranced_shape_aspect** of an instance of **geometric_tolerance** shall only be refered to as **relating_shape_aspect** by a **shape_aspect_relationship** with a **name** of 'affected plane association' if the **geometric_tolerance** is of typeline_profile_tolerance, **parallelism_tolerance**, **perpendicularity_-tolerance**, **position_tolerance**, **straightness_tolerance**, or **symmetry_tolerance**.

5.2.4.210 restrict_zone_boundary

The **restrict_zone_boundary** rule ensures that a Tolerance_zone_definition (see 4.2.525) is unambigously defined.

EXPRESS specification:

```
*)
RULE restrict_zone_boundary FOR
    (tolerance_zone_definition);
WHERE
 WR1: SIZEOF ( QUERY ( tzd <* tolerance_zone_definition | SIZEOF
     ( tzd. boundaries ) >2 ) ) =0;
END_RULE;
(*
```

Argument definitions:

tolerance_zone_definition: the set of all instances of **tolerance_zone_definition**.

Formal propositions:

WR1: Each instance of **tolerance_zone_definition** shall refer to at most two **shape_aspect**s as **boundaries**.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

5.2.4.211 retention_requires_retention_assignment

The **retention_requires_retention_assignment** rule specifies that each instance of **retention** is referenced by at least one instance of **applied_action_assignment** as the **assigned_action**, where the role of this **applied_action_assignment** is 'retention'.

This rule enforces the requirement for every instance of Retention_period to be applied at least once.

EXPRESS specification:

```
*)
RULE retention_requires_retention_assignment FOR
    (retention);
WHERE
 WR1: SIZEOF ( QUERY ( r <* retention | SIZEOF ( QUERY ( aa <*
     USEDIN ( r , 'AUTOMOTIVE_DESIGN.'+'ACTION_ASSIGNMENT.'+
     'ASSIGNED_ACTION' ) | ( 'AUTOMOTIVE_DESIGN.'+
     'APPLIED_ACTION_ASSIGNMENT' IN TYPEOF ( aa ) ) AND ( aa.
     role.name ='retention' ) ) ) =0 ) ) =0;
END_RULE;
(*
```

Argument definitions:

retention: the set of all instances of **retention**.

Formal propositions:

WR1: Each instance of **retention** shall be referenced at least once as the **assigned_action** by an instance of **applied_action_assignment**, where the **name** of the **object_role** of this **applied_action_assignment** is 'retention'.

5.2.4.212 security_classification_requires_security_classification_assignment

The **security_classification_requires_security_classification_assignment** rule specifies that each instance of **security_classification** is referenced by at least one instance of **security_classification_assignment** as the **assigned_security_classification**. This rule enforces the requirement for every Security_classification to be applied at least once.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

EXPRESS specification:

```
*)
RULE security_classification_requires_security_classification_assignment FOR
    (security_classification);

 WR1: SIZEOF ( QUERY ( sc <* security_classification | SIZEOF (
     USEDIN ( sc ,
     'AUTOMOTIVE_DESIGN.'+'SECURITY_CLASSIFICATION_ASSIGNMENT.'+
     'ASSIGNED_SECURITY_CLASSIFICATION' ) ) =0 ) ) =0;
END_RULE;
(*
```

Argument definitions:

security_classification: the set of all instances of **security_classification**.

Formal propositions:

WR1: Each instance of **security_classification** shall be used at least once as the **assigned_security_classification** by an instance of **security_classification_assignment**.

5.2.4.213 selected_instance_usage_requires_representation

The **selected_instance_usage_requires_representation** rule specifies that each instance of **assembly_component_usage** which has a **name** of 'selected instance usage' shall be represented by a **representation** with a **name** of 'selection criteria' containing two **representation_item**s describing the constraints the quantity of the **related_product_definition** depends on.

EXPRESS specification:

```
*)
RULE selected_instance_usage_requires_representation FOR
    (assembly_component_usage,
     representation);
WHERE
 WR1: SIZEOF ( QUERY ( acr <* assembly_component_usage | ( acr.
     name = 'selected instance usage' ) AND ( SIZEOF ( QUERY (
     pd <* USEDIN ( acr ,
     'AUTOMOTIVE_DESIGN.'+'PROPERTY_DEFINITION.'+ 'DEFINITION' )

```
     used_representation.items ) =2 ) AND ( SIZEOF ( QUERY ( i
     <* pdr. used_representation.items | ( SIZEOF (
     ['AUTOMOTIVE_DESIGN.'+ 'MEASURE_REPRESENTATION_ITEM' ,
     'AUTOMOTIVE_DESIGN.'+ 'VALUE_RANGE']* TYPEOF ( i ) ) =1 )
     AND ( i.name = 'selection quantity' ) ) ) =1 ) AND ( SIZEOF
     ( QUERY ( i <* pdr. used_representation.items | (
     'AUTOMOTIVE_DESIGN.'+ 'DESCRIPTIVE_REPRESENTATION_ITEM' IN
     TYPEOF ( i ) ) AND ( i.name = 'selection control' ) ) ) =1
     ) ) ) >0 ) ) ) =0 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

assembly_component_usage: the set of all instances of **assembly_component_usage**.

representation: the set of all instances of **representation**.

Formal propositions:

WR1: Each instance of **assembly_component_relationship** which has a **name** of 'selected instance usage' shall be referenced by a **property_definition** which has a **name** of 'occurrence selection', and which is referenced as **definition** by a **property_definition_representation** which has as **used_representation** a **representation** which has a **name** of 'selection criteria' and which contains exactly two **representation_item**s in its set of **items**. One of these **representation_item**s shall be of type **measure_representation_item** or **value_range** and shall have a **name** of 'selection quantity'. The other one of these **representation_item**s shall be of type **descriptive_representation_item** and shall have a **name** of 'selection control'.

5.2.4.214 sheets_belong_to_one_drawing

The **sheets_belong_to_one_drawing** rule ensures that each **drawing_sheet_revision** belongs to exactly one **drawing_revision**.

EXPRESS specification:

```
*)
RULE sheets_belong_to_one_drawing FOR
    (drawing_sheet_revision);
WHERE
 WR1: SIZEOF ( QUERY ( dsr <* drawing_sheet_revision | SIZEOF (
     QUERY ( dsru <* USEDIN ( dsr ,

     SIZEOF ( QUERY ( ars <* action_request_status | ar:=:ars.
     assigned_request ) ) =1 ) ) ) =0;
END_RULE;
(*
```

Argument definitions:

action_request_status: the set of all instances of **action_request_status**.

versioned_action_request: the set of all instances of **versioned_action_request**.

Formal propositions:

WR1: For each instance of **versioned_action_request** there shall be exactly one instance of **action_request_status** that contains an **assigned_request** attribute value to this instance of **versioned_action_request**.

5.2.5 automotive_design function definitions

5.2.5.1 assembly_shape_is_defined

The **assembly_shape_is_defined** function accepts a **next_assembly_usage_occurrence** as input and returns a boolean result. The function will return TRUE if the shape is defined for the **product_definition** which is the **related_product_definition** and the shape is defined for the **product_definition** which is the **relating_product_definition** in the **next_assembly_usage_occurrence**, and the two shapes are related through a **shape_representation_relationship**, and the two relationships are related through **context_dependent_shape_representation**. The function will also return TRUE if the shape of the **related_product_definition** or the **relating_product_definition** is not defined.

The only time this function will return false is when the shapes are defined for the **related_product_definition** and the **relating_product_definition** and related through **shape_representation_relationship**, but the **next_assembly_usage_occurrence** and the **shape_representation_relationship** are not explicitly related through **context_dependent_shape_representation**.

NOTE - The definition of this function is identical to the definition in ISO 10303-203.

EXPRESS specification:

END_FUNCTION; -- default_tolerance_table_cell_wr3
(*
```

Argument definitions:

agg: The **agg** identifies the aggregate of instances which are tested.

5.2.5.4 default_tolerance_table_cell_wr4

The **default_tolerance_table_cell_wr4** function accepts an AGGREGATE of **representation_item**s as input and returns a boolean result. The function will return TRUE if the aggregate contains either exactly one **measure_representation_item** a with **name**s of 'plus minus tolerance value', or exactly two **measure_representation_item**s, one with a **name** of 'lower tolerance value', and the other with a **name** of 'upper tolerance value'. Else it will return FALSE.

NOTE - This function realizes the forth local rule of **default_tolerance_table_cell**.

EXPRESS specification:

```
*)
FUNCTION default_tolerance_table_cell_wr4(
    agg: AGGREGATE OF representation_item): BOOLEAN;
  BEGIN
```

6 Conformance requirements

Conformance to this part of ISO 10303 includes satisfying the requirements stated in this part, the requirements of the implementation method(s) supported, and the relevant requirements of the normative references.

An implementation shall support at least one of the following implementation methods: ISO 10303-21, ISO 10303-22.

Requirements with respect to implementation methods-specific requirements are specified in annex C.

The Protocol Information Conformance Statement (PICS) proforma lists the options or the combination of options that may be included in the implementation. The PICS proforma is provided in annex D.

NOTE 1 - An implementation using the method of ISO 10303 – 22 will make use of a specific language binding.

NOTE 2 - ISO 10303 – 314 defines the abstract test suite to be used in the assessment of conformance. ISO 10303 – 32 describes the conformance assessment process.

The conformance classes are specified using combinations of UoFs as given in tables 33, 34, 35, and 36.

NOTE 3 - Since the UoFs have interdependencies specified by the structure defined in clause 4, not every combination of UoFs is appropriate as a conformance class. There are also user requirements that restrict the allowed combinations of UoFs. Figure 85 shows the interdependencies of the UoFs.

Table 37 specifies for each conformance class the set of AIM elements that an implementation of the conformance class shall support.

NOTE 4 - Each of the following conformance classes, with the exception of CC20, makes use of a subset of the constructs specified in the AIM EXPRESS expanded listing given in annex A. The EXPRESS specifications of the conformance classes CC1 to CC19 are included in annex L in digital form.

NOTE 5 - There are totally 20 conformance classes defined for data exchange and sharing in the following application areas:

— conformance classes 1 to 5 for CAD/CAM;

— conformance classes 6 to 10 for product structure and configuration management;

— conformance classes 11 to 13 for process planning;

— conformance classes 14 and 15 for feature based design;

— conformance classes 16 and 17 for simulation and quality control;

— conformance classes 18 and 19 for configuration control of process planning with 3D digital mockup data exchange and sharing;

— conformance class 20 for complete data storage and retrieval.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

The conformance classes are characterized as follows:

6.1 Conformance Class for component design with 3D shape representation (CC1)

The scope of the CC1 is:

— geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_-model, csg_model, and geometrically_bounded_surface_model;

— presentation data: geometric_presentation;

— product_structure data: product_management_data and element_structure.

NOTE 1 - This conformance class supports the following areas:

— component design of car body, power train, chassis, or interior parts;

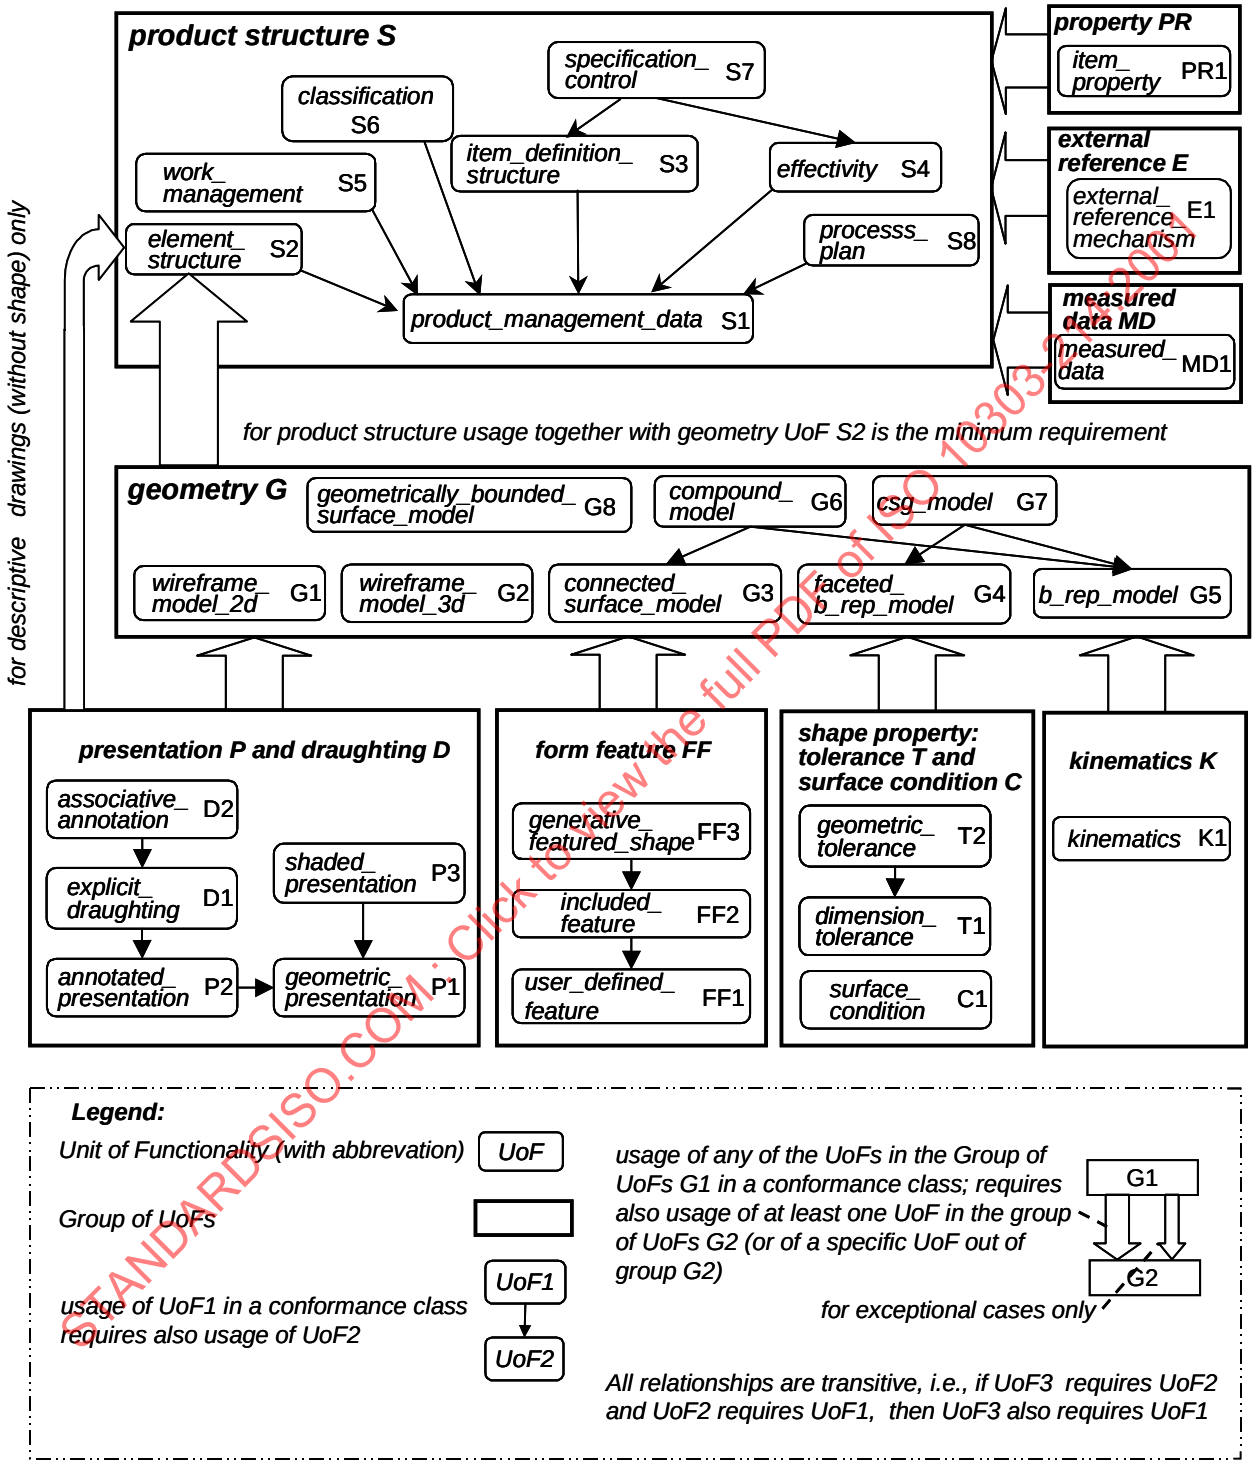
— component design of tools.

NOTE 2 - This conformance class includes requirements that match those defined in the conformance classes 2, 4, 5, and 6 of ISO 10303 – 203, with the additional requirement for geometric_presentation (P1), csg_model (G7), and element_structure (S2). In the area of configuration_control information this conformance class requires product_management_data (S1), which is a subset of conformance class 1 of ISO 10303 – 203.

6.2 Conformance Class for assembly design with 3D shape representation (CC2)

The scope of the CC2 is:

— external_reference data;



— geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_-model, csg_model, and geometrically_bounded_surface_model;

— presentation data: geometric_presentation;

— product_structure data: product_management_data, element_structure, and item_definition_structure.

Figure 85 – Interdependencies among UoFs

© ISO 2001 – All rights reserved

NOTE 1 - This conformance class supports the following areas:

— conceptual design including assembly definitions;

— mountability examination;

— packaging layout.

NOTE 2 - This conformance class includes requirements that match those defined in the conformance classes 2, 4, 5, and 6 of ISO 10303 – 203, with the additional requirement for geometric_presentation (P1), csg_model (G7), element_structure (S2), and external_reference_mechanism (E1). In the area of configuration_control information this conformance class requires product_management_data (S1) and item_definition_structure (S3), which is a subset of conformance class 1 of ISO 10303 – 203.

NOTE 3 - This conformance class includes the requirements as defined for the conformance class 1 of this part of ISO 10303, with the additional requirement for item_definition_structure (S3) and external_reference_mechanism (E1).

6.3 Conformance Class for component drawings with wireframe or surface shape representation (CC3)

The scope of the CC3 is:

— draughting data: explicit_draughting;

— geometry data: wireframe_model_2d, wireframe_model_3d, and connected_surface_model;

— presentation data: geometric_presentation and annotated_presentation;

— product_structure data: product_management_data and element_structure.

NOTE 1 - This conformance class supports the following areas:

— component drawings or sketches for car body or some interior parts;

— component drawings or sketches for tools.

NOTE 2 - This conformance class includes requirements that match those defined in ISO 10303 – 201, with additional requirements for wireframe_model_3d (G2) and connected_surface_model (G3).

6.4 Conformance Class for assembly drawings with wireframe, surface or solid shape representation (CC4)

The scope of the CC4 is:

— draughting data: explicit_draughting and associative_annotation;

— external_reference data;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, csg_model, and geometrically_bounded_surface_model;

— presentation data: geometric_presentation and annotated_presentation;

— product_structure data: product_management_data, element_structure, and item_definition_structure;

— tolerance data: dimension_tolerance.

NOTE 1 - This conformance class is suitable for use in the following areas:

— component or assembly drawings for power train, chassis, or interior parts;

— component or assembly drawings for tools.

NOTE 2 - This conformance class includes requirements that match those defined in the conformance classes 3, 5, 7, 9, and 10 of ISO 10303 – 202, with the additional requirement for item_definition_structure (S3), external_reference_mechanism (E1), and csg_model (G7).

NOTE 3 - This conformance class includes the requirements as defined for the conformance classes 2 and 3 of this part of ISO 10303.

6.5 Conformance Class for styling data (CC5)

The scope of the CC5 is:

— external_reference data;

— geometry data: connected_surface_model, faceted_b_rep_model, b_rep_model, compound_model, and csg_model;

— presentation data: geometric_presentation, annotated_presentation, and shaded_presentation;

— product_structure data: product_management_data, element_structure, and item_definition_structure.

NOTE - This conformance class is suitable for use in the following areas:

— digital mockup;

— styling.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

6.6 Conformance Class for product data management without shape representation (CC6)

The scope of the CC6 is:

— external_reference data;

— property data;

— product_structure data: product_management_data, item_definition_structure, effectivity, work_management, and classification.

NOTE 1 - This conformance class is suitable for use in the following areas:

— product data management systems that manage CAD models as files;

— administrative data of parts, assemblies, documents, and models.

NOTE 2 - This conformance class includes requirements that match those defined in the conformance class 1 of ISO 10303 – 203.

6.7 Conformance Class for product data management with 3D shape representation (CC7)

The scope of the CC7 is:

— external_reference data;

— geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, csg_model, and geometrically_bounded_surface_model;

— property data;

— presentation data: geometric_presentation;

— product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, and classification.

NOTE 1 - This conformance class supports the following areas:

— administrative data of parts, assemblies, documents, and models;

— conceptual design including assembly definitions;

— mountability examination;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— packaging layout;

— data exchange between product data management systems linked to CAD/CAM systems.

NOTE 2 - This conformance class includes requirements that match those defined in the conformance classes 1, 2, 4, 5, and 6 of ISO 10303 – 203, with the additional requirement for geometric_presentation (P1), csg_model (G7), element_structure (S2), and external_reference_mechanism (E1).

NOTE 3 - This conformance class includes the requirements as defined for the conformance classes 2 and 6 of this part of ISO 10303.

6.8 Conformance Class for configuration controlled design without shape representation (CC8)

The scope of the CC8 is:

— external_reference data;

— property data;

— product_structure data: product_management_data, item_definition_structure, effectivity, work_management, classification, and specification_control.

NOTE 1 - This conformance class is suitable for use in the following areas:

— configuration control for power train, chassis, car body, or interior parts;

— configuration control for tools.

NOTE 2 - This conformance class includes the requirements as defined for the conformance class 6 of this part of ISO 10303, with the additional requirement for specification_control (S7).

6.9 Conformance Class for configuration controlled design with 3D shape representation (CC9)

The scope of the CC9 is:

— external_reference data;

— geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, csg_model, and geometrically_bounded_surface_model;

— property data;

— presentation data: geometric_presentation;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, classification, and specification_control.

NOTE 1 - This conformance class supports the following areas:

— configuration control for power train, chassis, car body, or interior parts;

— configuration control for tools;

— administrative and configuration control data of parts, assemblies, documents, and models;

— product data management systems for control of a large number of product variants.

NOTE 2 - This conformance class includes requirements that match those defined in the conformance classes 1, 2, 4, 5, and 6 of ISO 10303 – 203, with the additional requirement for geometric_presentation (P1), csg_model (G7), element_structure (S2), external_reference_mechanism (E1), and specification_control (S7).

NOTE 3 - This conformance class includes the requirements as defined for the conformance classes 7 and 8 of this part of ISO 10303.

6.10 Conformance Class for configuration controlled design with shape representation and draughting data (CC10)

The scope of the CC10 is:

— draughting data: explicit_draughting and associative_annotation;

— external_reference data;

— geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, csg_model, and geometrically_bounded_surface_model;

— property data;

— presentation data: geometric_presentation and annotated_presentation;

— product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, classification, and specification_control;

— tolerance data: dimension_tolerance.

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

NOTE 1 - This conformance class supports the following areas:

— configuration control and assembly drawings for power train, chassis, car body, or interior parts;

— configuration control and assembly drawings for tools;

— administrative and configuration control data of parts, assemblies, documents, and models;

— product data management systems for control of a large number of product variants with links to CAD/CAM systems.

NOTE 2 - This conformance class includes the requirements as defined for the conformance classes 4 and 9 of this part of ISO 10303.

6.11 Conformance Class for process planning of components (CC11)

The scope of the CC11 is:

— draughting data: explicit_draughting and associative_annotation;

— external_reference data;

— geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, compound_model, and csg_model;

— measured_data;

— property data;

— presentation data: geometric_presentation and annotated_presentation;

— product_structure data: product_management_data, element_structure, classification, and process_plan.

NOTE 1 - This conformance class supports process planning for components (piece parts) with shape and draughting data.

NOTE 2 - This conformance class includes the requirements as defined for the conformance class 1 of this part of ISO 10303, without the requirement for geometrically_bounded_surface_model (G8), and the conformance class 3 of this part of ISO 10303.

6.12 Conformance Class for process planning of components with form feature and tolerance data (CC12)

The scope of the CC12 is:

— surface_condition data;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

— draughting data: explicit_draughting and associative_annotation;

— external_reference data;

— form_features data: user_defined_feature, included_feature, and generative_featured_shape;

— geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, compound_model, and csg_model;

— measured_data;

— property data;

— presentation data: geometric_presentation and annotated_presentation;

— product_structure data: product_management_data, element_structure, classification, and process_plan;

— tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 - This conformance class supports process planning data for components (piece parts) with shape, draughting, form_feature, tolerance, and surface_condition data.

NOTE 2 - This conformance class includes the requirements as defined for the conformance class 11 of this part of ISO 10303, with the additional requirement for user_defined_feature (FF1), included_feature (FF2), generative_featured_shape (FF3), surface_condition (C1), dimension_tolerance (T1), and geometric_tolerance (T2).

6.13 Conformance Class for effectivity controlled process planning of assemblies (CC13)

The scope of the CC13 is:

— surface_condition data;

— draughting data: explicit_draughting and associative_annotation;

— external_reference data;

— form_features data: user_defined_feature, included_feature, and generative_featured_shape;

— geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, compound_model, and csg_model;

— measured_data;

— property data;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— presentation data: geometric_presentation and annotated_presentation;

— product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, classification, and process_plan;

— tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 - This conformance class supports process planning with effectivity control for assemblies with shape, draughting, form_feature, tolerance, and surface_condition data.

NOTE 2 - This conformance class includes the requirements as defined for the conformance class 12 of this part of ISO 10303, with the additional requirement for item_definition_structure (S3) and effectivity (S4).

6.14 Conformance Class for feature based design (CC14)

The scope of the CC14 is:

— surface_condition data;

— external_reference data;

— form_features data: user_defined_feature and included_feature;

— geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, and csg_model;

— property data;

— presentation data: geometric_presentation;

— product_structure data: product_management_data, element_structure, and item_definition_structure;

— tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 - This conformance class supports the following areas:

— feature based conceptual design for components and assemblies, including manufacturing information such as tolerance and surface_condition data;

— feature based mountability examination.

NOTE 2 - This conformance class allows for identification of form features on the final shape of a component or of an assembly.

NOTE 3 - This conformance class includes requirements that match those defined in ISO 10303 – 224, with the additional requirement for geometric_presentation (P1), wireframe_model_3d (G2), connected_-

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

surface_model (G3), faceted_b_rep_model (G4), csg_model (G7), external_reference_mechanism (E1), and surface_condition (C1).

NOTE 4 - This conformance class includes the requirements as defined for the conformance class 2 of this part of ISO 10303, without the requirement for geometrically_bounded_surface_model (G8) and with the additional requirement for user_defined_feature (FF1), included_feature (FF2), item_property (PR1), surface_condition (C1), dimension_tolerance (T1), and geometric_tolerance (T2).

6.15 Conformance Class for feature based design with flexible feature placement (CC15)

The scope of the CC15 is:

— surface_condition data;

— external_reference data;

— form_features data: user_defined_feature, included_feature, and generative_featured_shape;

— geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, and csg_model;

— property data;

— presentation data: geometric_presentation;

— product_structure data: product_management_data, element_structure, and item_definition_structure;

— tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 - This conformance class supports the following areas:

— feature based conceptual design for components and assemblies, supporting efficient design changes through flexible feature placement;

— feature based mountability examination.

NOTE 2 - This conformance class allows for an independent feature definition, e.g. in a feature library, and its usage through placement on the shape of a component or of an assembly.

NOTE 3 - This conformance class includes the requirements as defined for the conformance class 14 of this part of ISO 10303, with the additional requirement for generative_featured_shape (FF3).

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

6.16 Conformance Class for kinematic simulations for components and assemblies with 3D shape representation (CC16)

The scope of the CC16 is:

— external_reference data;

— geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_-model, and csg_model;

— kinematics data;

— property data;

— presentation data: geometric_presentation;

— product_structure data: product_management_data, element_structure, and item_definition_structure.

NOTE 1 - This conformance class supports the following areas:

— collision detection;

— support of kinematics modules of CAD systems.

NOTE 2 - This conformance class includes the requirements as defined for the conformance class 2 of this part of ISO 10303, without the requirement for geometrically_bounded_surface_model (G8) and with the additional requirement for kinematics (K1) and item_property (PR1).

6.17 Conformance Class for measured data (CC17)

The scope of the CC17 is:

— external_reference data;

— geometry data: wireframe_model_3d;

— measured_data;

— property data;

— presentation data: geometric_presentation;

— product_structure data: product_management_data and element_structure.

NOTE - This conformance class supports the following areas:

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— exchange of scanned (measured) data from a measuring system to a CAD/CAM system;

— quality control.

6.18 Conformance Class for configuration controlled process planning of components and assemblies with 3D shape representation and kinematic data (CC18)

The scope of the CC18 is:

— external_reference data;

— geometry data: connected_surface_model, faceted_b_rep_model, b_rep_model, compound_model, and csg_model;

— kinematics data;

— property data;

— presentation data: geometric_presentation and shaded_presentation;

— product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, classification, specification_control, and process_plan;

— tolerance data: dimension_tolerance.

NOTE - This conformance class supports process planning for components and assemblies with 3D digital mockup data. The 3D digital mockup may include kinematic data that needs to be considered in the process planning. The tools used for the process planning may also have kinematic data that needs to be considered.

6.19 Conformance Class for configuration controlled process planning of components and assemblies with 3D shape representation including form features and kinematic data (CC19)

The scope of the CC19 is:

— surface_condition data;

— external_reference data;

— form_features data: user_defined_feature, included_feature, and generative_featured_shape;

— geometry data: connected_surface_model, faceted_b_rep_model, b_rep_model, compound_model, and csg_model;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

 © ISO 2001 – All rights reserved

— kinematics data;

— property data;

— presentation data: geometric_presentation and shaded_presentation;

— product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, classification, specification_control, and process_plan;

— tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 - This conformance class supports process planning for components and assemblies with 3D digital mockup data including form features. The 3D digital mockup may include kinematic data that needs to be considered in the process planning. The tools used for the process planning may also have kinematic data that needs to be considered.

NOTE 2 - This conformance class includes the requirements as defined for the conformance class 18 of this part of ISO 10303, with the additional requirement for user_defined_feature (FF1), included_feature (FF2), generative_featured_shape (FF3), surface_condition (C1), and geometric_toleranc (T2).

6.20 Conformance Class for data storage and retrieval systems (CC20)

The scope of the CC20 is:

— surface_condition data;

— draughting data: explicit_draughting and associative_annotation;

— external_reference data;

— form_features data: user_defined_feature, included_feature, and generative_featured_shape;

— geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, compound_model, csg_model, and geometrically_bounded_surface_model;

— kinematics data;

— measured_data;

— property data;

— presentation data: geometric_presentation, annotated_presentation, and shaded_presentation;

— product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, classification, specification_control, and process_plan;

STANDARDSISO.COM : Click to view the full PDF of ISO 10303-214:2001

© ISO 2001 – All rights reserved

— tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 - This conformance class supports database implementations to store, retrieve, or archive all of the data specified in this part of ISO 10303. Data manipulation functionality as performed in application systems is not expected to be implemented within the scope of this conformance class.

NOTE 2 - This conformance class includes all requirements as defined for the conformance classes 1 to 19 of this part of ISO 10303.

Annex A
(normative)

AIM EXPRESS expanded listing

This annex provides a listing of the table of short names and a listing of the EXPRESS specified in the AIM of this part of ISO 10303. No text or annotation is included. This annex is provided only in computer-interpretable form.

NOTE - The information provided on this diskette is informative; the normative text is that contained in the body of this part of ISO 10303.

EXPRESS specification:

```
