| Foreword .....                                                           | xiii     |
| Introduction.....                                                        | xv       |
| <b>1 Scope .....</b>                                                     | <b>1</b> |
| <b>2 Normative references .....</b>                                      | <b>1</b> |
| <b>3 Terms and definitions .....</b>                                     | <b>1</b> |
| <b>4 Technical requirements .....</b>                                    | <b>5</b> |
| 4.1 Overview.....                                                        | 5        |
| 4.2 Operator input and control .....                                     | 7        |
| 4.3 Acoustic alarm .....                                                 | 9        |
| 4.4 Coordinate system .....                                              | 9        |
| 4.5 Display areas .....                                                  | 9        |
| 4.5.1 General .....                                                      | 9        |
| 4.5.2 Data Mask .....                                                    | 9        |
| 4.5.3 Soft Key Mask area and Soft Key designators .....                  | 9        |
| 4.6 Behaviour .....                                                      | 13       |
| 4.6.1 Object pools .....                                                 | 13       |
| 4.6.2 Working Sets.....                                                  | 13       |
| 4.6.3 Multiple Visually Similar Working Sets .....                       | 15       |
| 4.6.4 Displayed Working Set number .....                                 | 16       |
| 4.6.5 Language, formats and measurement units selection .....            | 16       |
| 4.6.6 Initialization .....                                               | 17       |
| 4.6.7 System Shutdown .....                                              | 18       |
| 4.6.8 Working Set object and active masks .....                          | 20       |
| 4.6.9 Connection management.....                                         | 22       |
| 4.6.10 Updating the operator interface .....                             | 25       |
| 4.6.11 Special objects .....                                             | 25       |
| 4.6.12 Relative X/Y positions.....                                       | 30       |
| 4.6.13 Overlaid objects.....                                             | 31       |
| 4.6.14 Alarm handling .....                                              | 32       |
| 4.6.15 Clipping .....                                                    | 33       |
| 4.6.16 Scaling .....                                                     | 34       |
| 4.6.17 Operator input.....                                               | 34       |
| 4.6.18 Soft Key and Button activation .....                              | 37       |
| 4.6.19 Font rendering .....                                              | 38       |
| 4.6.20 Object Rendering Accuracy, Quality and VT Developer Freedom ..... | 47       |
| 4.6.21 Filling output shape objects.....                                 | 48       |
| 4.6.22 Events.....                                                       | 49       |
| 4.6.23 Touch screens and pointing devices .....                          | 50       |
| 4.6.24 Proprietary Means .....                                           | 51       |
| 4.6.25 VT Number .....                                                   | 51       |
| 4.6.26 Packet Padding.....                                               | 51       |
| 4.7 Displaying Data from Multiple Working Sets on One Mask .....         | 51       |
| 4.7.1 General .....                                                      | 51       |
| 4.7.2 User-Layout Data Mask.....                                         | 52       |
| 4.7.3 Window Mask object .....                                           | 53       |
| 4.7.4 Window Mask content.....                                           | 53       |
| 4.7.5 Window Cell Size and Borders.....                                  | 55       |
| 4.7.6 Window Mask Scaling.....                                           | 55       |
| 4.7.7 Using Window Masks Outside of User-Layout Data Masks.....          | 56       |

|         |                                                                     |     |
|---------|---------------------------------------------------------------------|-----|
| 4.7.8   | User-Layout Soft Key Mask .....                                     | 56  |
| 4.7.9   | Key Group Objects .....                                             | 57  |
| 4.7.10  | Key Cell Size and Borders .....                                     | 58  |
| 4.7.11  | Key Group Scaling .....                                             | 58  |
| 4.7.12  | Using Key Group Objects outside of User-Layout Soft Key Masks ..... | 58  |
| 4.7.13  | Operator Inputs .....                                               | 59  |
| 4.7.14  | Refreshing On Screen Data .....                                     | 59  |
| 4.7.15  | Look and Feel .....                                                 | 60  |
| 4.7.16  | Uploading New Window Mask and Key Group objects .....               | 61  |
| Annex A | (normative) Object, event, colour and command codes .....           | 63  |
| A.1     | Object types .....                                                  | 63  |
| A.1.1   | General .....                                                       | 63  |
| A.1.2   | Nomenclature .....                                                  | 65  |
| A.1.3   | Object relationships .....                                          | 66  |
| A.2     | Event types .....                                                   | 68  |
| A.3     | VT standard colour palette .....                                    | 70  |
| A.4     | Command/parameter code summary .....                                | 72  |
| Annex B | (normative) Object definitions .....                                | 78  |
| B.1     | Working Set object .....                                            | 78  |
| B.2     | Data Mask object .....                                              | 81  |
| B.3     | Alarm Mask object .....                                             | 83  |
| B.4     | Container object .....                                              | 86  |
| B.5     | Soft Key Mask object .....                                          | 88  |
| B.6     | Key object .....                                                    | 89  |
| B.7     | Button object .....                                                 | 91  |
| B.8     | Input field objects .....                                           | 95  |
| B.8.1   | General .....                                                       | 95  |
| B.8.2   | Input Boolean object .....                                          | 97  |
| B.8.3   | Input String object .....                                           | 98  |
| B.8.4   | Input Number object .....                                           | 101 |
| B.8.5   | Input List object .....                                             | 104 |
| B.9     | Output field objects .....                                          | 108 |
| B.9.1   | General .....                                                       | 108 |
| B.9.2   | Output String object .....                                          | 109 |
| B.9.3   | Output Number object .....                                          | 110 |
| B.9.4   | Output List object .....                                            | 113 |
| B.10    | Output shape objects .....                                          | 115 |
| B.10.1  | General .....                                                       | 115 |
| B.10.2  | Output Line object .....                                            | 115 |
| B.10.3  | Output Rectangle object .....                                       | 118 |
| B.10.4  | Output Ellipse object .....                                         | 120 |
| B.10.5  | Output Polygon object .....                                         | 123 |
| B.11    | Output graphic objects .....                                        | 125 |
| B.11.1  | General .....                                                       | 125 |
| B.11.2  | Output Meter object .....                                           | 125 |
| B.11.3  | Output Linear Bar Graph object .....                                | 129 |
| B.11.4  | Output Arched Bar Graph object .....                                | 133 |
| B.12    | Picture Graphic object .....                                        | 137 |
| B.12.1  | General .....                                                       | 137 |
| B.12.2  | Picture Graphic object raw data format and compression .....        | 139 |
| B.13    | Variable objects .....                                              | 139 |
| B.13.1  | General .....                                                       | 139 |
| B.13.2  | Number Variable object .....                                        | 140 |
| B.13.3  | String Variable object .....                                        | 140 |
| B.14    | Attribute objects .....                                             | 141 |
| B.14.1  | General .....                                                       | 141 |
| B.14.2  | Font Attributes object .....                                        | 141 |
| B.14.3  | Line Attributes object .....                                        | 143 |

|         |                                                           |     |
|---------|-----------------------------------------------------------|-----|
| B.14.4  | Fill Attributes object .....                              | 145 |
| B.14.5  | Input Attributes object .....                             | 147 |
| B.14.6  | Extended Input Attributes object .....                    | 148 |
| B.15    | Object Pointer object .....                               | 151 |
| B.16    | Macro object .....                                        | 151 |
| B.17    | Colour Map object .....                                   | 152 |
| B.18    | Graphics Context object .....                             | 154 |
| B.19    | Window Mask object .....                                  | 158 |
| B.19.1  | General .....                                             | 158 |
| B.19.2  | Window Mask Window Types .....                            | 163 |
| B.20    | Key Group object .....                                    | 182 |
| B.21    | Object Label Reference List object .....                  | 184 |
| B.22    | External Object Definition object .....                   | 185 |
| B.23    | External Reference NAME object .....                      | 186 |
| B.24    | External Object Pointer object .....                      | 187 |
| B.25    | Animation object .....                                    | 188 |
| Annex C | (normative) Object transport protocol .....               | 192 |
| C.1     | Virtual terminal messages and object transfer .....       | 192 |
| C.2     | Building object pools .....                               | 192 |
| C.2.1   | General .....                                             | 192 |
| C.2.2   | Object pool transfer procedure .....                      | 193 |
| C.2.3   | Object pool transfer message .....                        | 194 |
| C.2.4   | End of Object Pool message .....                          | 194 |
| C.2.5   | End of Object Pool response .....                         | 195 |
| C.2.6   | Updating pools at runtime .....                           | 195 |
| Annex D | (normative) Technical data messages .....                 | 197 |
| D.1     | General .....                                             | 197 |
| D.2     | Get Memory message .....                                  | 197 |
| D.3     | Get Memory response .....                                 | 198 |
| D.4     | Get Number of Soft Keys message .....                     | 199 |
| D.5     | Get Number of Soft Keys response .....                    | 199 |
| D.6     | Get Text Font Data message .....                          | 199 |
| D.7     | Get Text Font Data response .....                         | 200 |
| D.8     | Get Hardware message .....                                | 200 |
| D.9     | Get Hardware response .....                               | 201 |
| D.10    | Get Supported Widechars message .....                     | 201 |
| D.11    | Get Supported WideChars response .....                    | 202 |
| D.12    | Get Window Mask Data message .....                        | 203 |
| D.13    | Get Window Mask Data response .....                       | 203 |
| D.14    | Get Supported Objects message .....                       | 203 |
| D.15    | Get Supported Objects response .....                      | 204 |
| Annex E | (normative) Non-volatile memory operations commands ..... | 205 |
| E.1     | General .....                                             | 205 |
| E.1.1   | Introduction .....                                        | 205 |
| E.1.2   | Version Management – VT version 4 and prior .....         | 206 |
| E.1.3   | Version Management – VT version 5 and later .....         | 206 |
| E.2     | Get Versions message .....                                | 206 |
| E.3     | Get Versions response .....                               | 206 |
| E.4     | Store Version command .....                               | 206 |
| E.5     | Store Version response .....                              | 207 |
| E.6     | Load Version command .....                                | 207 |
| E.7     | Load Version response .....                               | 207 |
| E.8     | Delete Version command .....                              | 208 |
| E.9     | Delete Version response .....                             | 208 |
| E.10    | Extended Get Versions message .....                       | 208 |
| E.11    | Extended Get Versions response .....                      | 209 |
| E.12    | Extended Store Version command .....                      | 209 |

|------------------------------------------------------|-----------------------------------------|-----|
| E.13                                                 | Extended Store Version response .....   | 209 |
| E.14                                                 | Extended Load Version command .....     | 210 |
| E.15                                                 | Extended Load Version response .....    | 210 |
| E.16                                                 | Extended Delete Version command .....   | 211 |
| E.17                                                 | Extended Delete Version response .....  | 211 |
| Annex F (normative) Command and Macro messages ..... |                                         | 212 |
| F.1                                                  | General .....                           | 212 |
| F.2                                                  | Hide/Show Object command .....          | 212 |
| F.3                                                  | Hide/Show Object response .....         | 212 |
| F.4                                                  | Enable/Disable Object command .....     | 213 |
| F.5                                                  | Enable/Disable Object response .....    | 213 |
| F.6                                                  | Select Input Object command .....       | 213 |
| F.7                                                  | Select Input Object response .....      | 214 |
| F.8                                                  | ESC command .....                       | 215 |
| F.9                                                  | ESC response .....                      | 215 |
| F.10                                                 | Control Audio Signal command .....      | 215 |
| F.11                                                 | Control Audio Signal response .....     | 217 |
| F.12                                                 | Set Audio Volume command .....          | 217 |
| F.13                                                 | Set Audio Volume response .....         | 218 |
| F.14                                                 | Change Child Location command .....     | 218 |
| F.15                                                 | Change Child Location response .....    | 219 |
| F.16                                                 | Change Child Position command .....     | 219 |
| F.17                                                 | Change Child Position response .....    | 219 |
| F.18                                                 | Change Size command .....               | 220 |
| F.19                                                 | Change Size response .....              | 220 |
| F.20                                                 | Change Background Colour command .....  | 220 |
| F.21                                                 | Change Background Colour response ..... | 221 |
| F.22                                                 | Change Numeric Value command .....      | 221 |
| F.23                                                 | Change Numeric Value response .....     | 222 |
| F.24                                                 | Change String Value command .....       | 223 |
| F.25                                                 | Change String Value response .....      | 224 |
| F.26                                                 | Change End Point command .....          | 224 |
| F.27                                                 | Change End Point response .....         | 224 |
| F.28                                                 | Change Font Attributes command .....    | 225 |
| F.29                                                 | Change Font Attributes response .....   | 225 |
| F.30                                                 | Change Line Attributes command .....    | 225 |
| F.31                                                 | Change Line Attributes response .....   | 226 |
| F.32                                                 | Change Fill Attributes command .....    | 226 |
| F.33                                                 | Change Fill Attributes response .....   | 227 |
| F.34                                                 | Change Active Mask command .....        | 227 |
| F.35                                                 | Change Active Mask response .....       | 227 |
| F.36                                                 | Change Soft Key Mask command .....      | 228 |
| F.37                                                 | Change Soft Key Mask response .....     | 228 |
| F.38                                                 | Change Attribute command .....          | 228 |
| F.39                                                 | Change Attribute response .....         | 229 |
| F.40                                                 | Change Priority command .....           | 229 |
| F.41                                                 | Change Priority response .....          | 230 |
| F.42                                                 | Change List Item command .....          | 230 |
| F.43                                                 | Change List Item response .....         | 230 |
| F.44                                                 | Delete Object Pool command .....        | 231 |
| F.45                                                 | Delete Object Pool response .....       | 231 |
| F.46                                                 | Lock/Unlock Mask command .....          | 231 |
| F.47                                                 | Lock/Unlock Mask response .....         | 233 |
| F.48                                                 | Execute Macro command .....             | 233 |
| F.49                                                 | Execute Macro response .....            | 233 |
| F.50                                                 | Change Object Label command .....       | 234 |
| F.51                                                 | Change Object Label response .....      | 234 |
| F.52                                                 | Change Polygon Point command .....      | 235 |

|         |                                                          |     |
|---------|----------------------------------------------------------|-----|
| F.53    | Change Polygon Point response .....                      | 235 |
| F.54    | Change Polygon Scale command.....                        | 236 |
| F.55    | Change Polygon Scale response.....                       | 236 |
| F.56    | Graphics Context command .....                           | 237 |

## Table of Tables

|                                                                                                                      |     |
|----------------------------------------------------------------------------------------------------------------------|-----|
| Table 1 — VT Response message behavior.....                                                                          | 15  |
| Table 2 — Working Set state changes (VT Supports only Active Mask) .....                                             | 21  |
| Table 3 — Working Set state changes (VT Supports Multiple Working Sets or Window Masks Visible Simultaneously) ..... | 22  |
| Table 4 — VT behaviour on mask transition .....                                                                      | 33  |
| Table 5 — VT Reaction to navigation and data input events .....                                                      | 35  |
| Table 6 — VT Behavior When New Window Mask or Key Group Object is Uploaded .....                                     | 62  |
| Table A.1 — Virtual terminal objects .....                                                                           | 63  |
| Table A.2 — Allowed hierarchical relationships of objects .....                                                      | 67  |
| Table A.3 — Event summary .....                                                                                      | 69  |
| Table A.4 — Standard VT RGB colour palette .....                                                                     | 70  |
| Table A.5 — Command/parameter summary .....                                                                          | 73  |
| Table B.1 — Working Set events .....                                                                                 | 78  |
| Table B.2 — Working Set attributes and record format .....                                                           | 80  |
| Table B.3 — Data Mask events .....                                                                                   | 81  |
| Table B.4 — Data mask attributes and record format .....                                                             | 82  |
| Table B.5 — Alarm Mask events .....                                                                                  | 83  |
| Table B.6 — Alarm Mask attributes and record format .....                                                            | 85  |
| Table B.7 — Container events .....                                                                                   | 86  |
| Table B.8 — Container attributes and record format .....                                                             | 87  |
| Table B.9 — Soft Key Mask events .....                                                                               | 88  |
| Table B.10 — Soft Key Mask attributes and record format .....                                                        | 88  |
| Table B.11 — Key events .....                                                                                        | 89  |
| Table B.12 — Key attributes and record format .....                                                                  | 90  |
| Table B.13 — Button events .....                                                                                     | 92  |
| Table B.14 — Button attributes and record format .....                                                               | 93  |
| Table B.15 — Input events .....                                                                                      | 96  |
| Table B.16 — Input Boolean attributes and record format .....                                                        | 98  |
| Table B.17 — Input String attributes and record format .....                                                         | 99  |
| Table B.18 — Input Number attributes and record format .....                                                         | 102 |
| Table B.19 — Input List events .....                                                                                 | 105 |
| Table B.20 — Input List attributes and record format .....                                                           | 107 |
| Table B.21 — Output field events .....                                                                               | 108 |
| Table B.22 — Output String attributes and record format .....                                                        | 109 |
| Table B.23 — Output Number attributes and record format .....                                                        | 111 |
| Table B.24 — Output List events .....                                                                                | 113 |
| Table B.25 — Output List attributes and record format .....                                                          | 113 |
| Table B.26 — Output Line events .....                                                                                | 116 |
| Table B.27 — Output Line attributes and record format .....                                                          | 116 |
| Table B.28 — Output Rectangle Events .....                                                                           | 118 |
| Table B.29 — Output Rectangle attributes and record format .....                                                     | 119 |
| Table B.30 — Output Ellipse events .....                                                                             | 121 |
| Table B.31 — Output Ellipse attributes and record format .....                                                       | 121 |
| Table B.32 — Output Polygon events .....                                                                             | 124 |
| Table B.33 — Output Polygon attributes and record format .....                                                       | 124 |
| Table B.34 — Output Meter events .....                                                                               | 127 |
| Table B.35 — Output Meter attributes and record format .....                                                         | 127 |
| Table B.36 — Output Linear Bar Graph events .....                                                                    | 131 |
| Table B.37 — Output Linear Bar Graph attributes and record format .....                                              | 131 |
| Table B.38 — Output Arched Bar Graph events .....                                                                    | 134 |
| Table B.39 — Output Arched Bar Graph attributes and record format .....                                              | 135 |
| Table B.40 — Picture Graphic events .....                                                                            | 137 |
| Table B.41 — Picture Graphic attributes and record format .....                                                      | 137 |

|                                                                                                   |     |
|---------------------------------------------------------------------------------------------------|-----|
| Table B.42 — Variable events .....                                                                | 140 |
| Table B.43 — Number Variable attributes and record format .....                                   | 140 |
| Table B.44 — String Variable attributes and record format .....                                   | 140 |
| Table B.45 — Font Attributes events .....                                                         | 141 |
| Table B.46 — Font Attributes attributes and record format .....                                   | 142 |
| Table B.47 — Line Attributes events .....                                                         | 144 |
| Table B.48 — Line Attributes attributes and record format .....                                   | 144 |
| Table B.49 — Fill Attributes events .....                                                         | 146 |
| Table B.50 — Fill Attributes attributes and record format .....                                   | 146 |
| Table B.51 — Input Attributes events .....                                                        | 147 |
| Table B.52 — Input Attributes attributes and record format .....                                  | 148 |
| Table B.53 — Extended Input Attributes attributes and record format .....                         | 150 |
| Table B.54 — Object Pointer events .....                                                          | 151 |
| Table B.55 — Object Pointer attributes and record format .....                                    | 151 |
| Table B.56 — Macro attributes and record format .....                                             | 152 |
| Table B.57 — Colour Map attributes and record format .....                                        | 153 |
| Table B.58 — Graphics Context events .....                                                        | 156 |
| Table B.59 — Graphics Context attributes and record format .....                                  | 157 |
| Table B.60 — Window Mask events .....                                                             | 159 |
| Table B.61 — Window Mask attributes and record format .....                                       | 160 |
| Table B.62 — Key Group events .....                                                               | 182 |
| Table B.63 — Key Group attributes and record format .....                                         | 182 |

## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: Foreword - Supplementary information

The committee responsible for this document is ISO/TC 23, *Tractors and machinery for agriculture and forestry*, Subcommittee SC 19, *Agricultural electronics*.

This third edition cancels and replaces the second edition (ISO 11783-6:2010) which has been technically revised.

ISO 11783 consists of the following parts, under the general title *Tractors and machinery for agriculture and forestry — Serial control and communications data network*:

- *Part 1: General standard for mobile data communication*
- *Part 2: Physical layer*
- *Part 3: Data link layer*
- *Part 4: Network layer*
- *Part 5: Network management*
- *Part 6: Virtual terminal*
- *Part 7: Implement messages application layer*
- *Part 8: Power train messages*
- *Part 9: Tractor ECU*
- *Part 10: Task controller and management information system data interchange*

- *Part 11: Mobile data element dictionary*
- *Part 12: Diagnostics services*
- *Part 13: File server*
- *Part 14: Sequence control*

STANDARDSISO.COM : Click to view the full PDF of ISO 11783-6:2014

## Introduction

Parts 1 to 14 of ISO 11783 specify a communications system for agricultural equipment based on the ISO 11898 [5] protocol. SAE J 1939 [1] documents, on which parts of ISO 11783 are based, were developed jointly for use in truck and bus applications and for construction and agriculture applications. Joint documents were completed to allow electronic units that meet the truck and bus SAE J 1939 specifications to be used by agricultural and forestry equipment with minimal changes. The specifications for virtual terminals given in this part of ISO 11783 are based on DIN 9684-4 [2]. General information on ISO 11783 is to be found in ISO 11783-1.

The purpose of ISO 11783 is to provide an open, interconnected system for on-board electronic systems. It is intended to enable electronic control units (ECUs) to communicate with each other, providing a standardized system.

All phrases in this document that refer explicitly to a software term for an object or a command shall have the first letter of each object or command word capitalized (e.g. Output Linear Bar Graph object, Change Numeric Value command). This aids in the recognition of these terms as a specific item which has a specific definition in this document.

The International Organization for Standardization (ISO) draws attention to the fact that it is claimed that compliance with this part of ISO 11783 may involve the use of a patent concerning the controller area network (CAN) protocol referred to throughout the document.

ISO takes no position concerning the evidence, validity and scope of this patent.

The holder of this patent has assured ISO that he is willing to negotiate licences under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statement of the holder of this patent right is registered with ISO. Information may be obtained from:

Robert Bosch GmbH  
Wernerstrasse 51  
Postfach 30 02 20  
D-70442 Stuttgart-Feuerbach  
Germany

Attention is drawn to the possibility that some of the elements of this part of ISO 11783 may be the subject of patent rights other than those identified above. ISO shall not be held responsible for identifying any or all such patent rights.

# Tractors and machinery for agriculture and forestry — Serial control and communications data network — Part 6: Virtual terminal

## 1 Scope

ISO 11783 as a whole specifies a serial data network for control and communications on forestry or agricultural tractors, mounted, semi-mounted, towed or self propelled implements. Its purpose is to standardize the method and format of transfer of data between sensor, actuators, control elements, information storage and display units whether mounted or part of the tractor, or any implements.

This part of ISO 11783 describes a universal virtual terminal that can be used by both tractors and implements.

Corrections in the second edition were made to Table L.2 — ISO 8859-15 (Latin 9) character set.

Requirements in the second edition were specified for two versions of the VT and Working Sets. Version 3 VTs and Working Sets meet all the requirements of the first edition, the specific requirements for version 3 of Annex G and the requirements of Annex J and Table L.2 — ISO 8859-15 (Latin 9) character set of the second edition. Version 4 VTs and Working Sets meet all the requirements of the second edition.

New requirements in this third edition are specified as version 5 VT.

## 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 11783-1, *Tractors and machinery for agriculture and forestry — Serial control and communications data network — Part 1: General standard for mobile data communication*

ISO 11783-3, *Tractors and machinery for agriculture and forestry — Serial control and communications data network — Part 3: Data link layer*

ISO 11783-5, *Tractors and machinery for agriculture and forestry — Serial control and communications data network — Part 5: Network management*

ISO 11783-7, *Tractors and machinery for agriculture and forestry — Serial control and communications data network — Part 7: Implement messages application layer*

ISO 15077, *Tractors and self-propelled machinery for agriculture — Operator controls — Actuating forces, displacement, location and method of operation*

## 3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 11783-1 and the following apply.

### 3.1

#### **auxiliary input unit**

autonomous control function (CF) providing Auxiliary Controls for common use that may also be physically located within an electronic control unit (ECU), or on the virtual terminal (VT)

### 3.2

#### **object pool**

collection of objects that completely define the operator interface for an implement or a single Working Set

Note 1 to entry: The complete VT definition will be made up of one or more object pools — one for each Working Set.

### 3.3

#### **Object ID**

numeric value which identifies a specific object within an object pool

Note 1 to entry: Object ID values range from 0 to  $FFFF_{16}$  ( $65535_{10}$ ), with 65535 as the NULL Object ID.

### 3.4

#### **attribute ID**

##### **AID**

numeric value which references a specific object's attribute

Note 1 to entry: AID values range from 0 to  $FF_{16}$  ( $255_{10}$ ), with 255 as the NULL\_AID.

### 3.5

#### **char**

single character where the size is 1 byte

Note 1 to entry: Commonly used for ISO 8859 characters (e.g.  $41_{16}$  in ISO 8859-1 represents 'A') (See Annex L).

### 3.6

#### **character**

single text grapheme or symbol, as in an alphabet

Note 1 to entry: Size is variable based on the encoding scheme (See char and WideChar).

### 3.7

#### **code plane**

group of 65536 possible character codes

Note 1 to entry: Unicode/ISO10464 organizes the characters in 17 code planes numbered 0 to 16.

#### **EXAMPLE**

Code plane 0 covers characters  $000000_{16}$  to  $00FFFF_{16}$ .

Code plane 1 covers characters  $010000_{16}$  to  $01FFFF_{16}$ .

...

Code plane 16 covers characters  $100000_{16}$  to  $10FFFF_{16}$ .

### 3.8

#### **open input object**

state of an input object where the object has focus and it is open for operator input

Note 1 to entry: Open input object is used interchangeably with data input.

### 3.9

#### **selected input object**

state of an input object where the object has focus but it is not open for operator input

Note 1 to entry: Selected input object is used interchangeably with “has focus”.

### 3.10

#### **surrogate pair**

32 bit code for characters composed of a 16 bit high pair and a 16 bit low pair

Note 1 to entry: UTF-16 encoding of characters in code plane 1 to 16 (See Clause 4.6.19.7 String encoding)

Note 2 to entry: UTF-16 Character encoding scheme defined by ISO10646.

### 3.11

#### **WideChar**

single character with a size of 2 bytes encoded in little endian order

EXAMPLE Byte sequence  $41_{16}$ ,  $00_{16}$  represents 'A'. (See Annex L).

Note 1 to entry: Two WideChars can be combined to indicate character codes exceeding 16-bit (See Clause 4.6.19.7 String encoding).

### 3.12

#### **WideString**

zero or more characters composed of the primitive type “WideChar” always preceded by the byte order mark  $FEFF_{16}$

EXAMPLE Byte sequence  $FF_{16}$ ,  $FE_{16}$ ,  $41_{16}$ ,  $00_{16}$ ,  $42_{16}$ ,  $00_{16}$ ,  $43_{16}$ ,  $00_{16}$  represents “ABC”. This WideString has a Length of 8 bytes with the number of characters in the presentation equal to 3.

### 3.13

#### **8-bit string**

zero or more characters composed of the primitive type “char”

Note 1 to entry: String length is variable.

### 3.14

#### **VT Number**

number that is used to uniquely identify each connected VT to the operator

Note 1 to entry: See Clause F.62.

### 3.15

#### **User-Layout Data Mask**

special Data Masks (see Clause 4.1) that are controlled by the VT but layed out by the operator

Note 1 to entry: See Clause 4.7.

### 3.16

#### **Window Cell**

equally sized cell in a grid on a User-Layout Data Mask

Note 1 to entry: See Clause 4.7.

### 3.17

#### **Window Mask object**

supplied by the Working Set for placement by the operator into the area of one or more window cells but not a partial cell

Note 1 to entry: See Clause 4.7.

### 3.18

#### **User-Layout Soft Key Mask**

Soft Key Masks that are controlled by the VT but layed out by the operator

Note 1 to entry: See Clause 4.7.

### 3.19

#### **Key Cell**

cell that is the size of a Soft Key designator in a User-Layout Key Mask

Note 1 to entry: See Clause 4.7.

### 3.20

#### **Key Group object**

area of one or more Key Cells and contains a grouping of one or more Key objects

Note 1 to entry: See Clause 4.7.

### 3.21

#### **Non-VT Screen**

display screen that is not part of the VT application or one in which the layout is controlled by the VT

EXAMPLE A screen that comes from another application within the display. (See Clause 4.7)

### 3.22

#### **Non-VT Area**

visible area outside the normal Data Mask and Soft Key Mask areas

EXAMPLE A display of information related to the vehicle operation. (See Clause 4.7)

### 3.23

#### **Referenced WS**

working set with an object pool containing objects which are shown by another object pool via the External Object Pointer object

Note 1 to entry: See Clause 4.6.11.6.

### 3.24

#### **Referencing WS**

A working set with an object pool which shows object(s) from another object pool via the External Object Pointer object

Note 1 to entry: See Clause 4.6.11.6.

### 3.25

#### **Functionally Identical WS**

Working Set(s) with a NAME that exactly matches other Working Sets, when the Self Configurable, Instance fields, and Identity Number are excluded in the comparison

### 3.26

#### **Line End**

"cursor" or text positioning control intended to locate the following displayable character "font height" pixels downward and at the left-most position in the containing object

Note 1 to entry: See Clause 4.6.19.6.

## 4 Technical requirements

### 4.1 Overview

A virtual terminal (VT) is a control function (CF) within an electronic control unit (ECU), consisting of a graphical display and input functions, connected to an ISO 11783 network that provides the capability for a CF, composing an implement or a group of implements to interact with an operator. The VT provides the capability to display information and to retrieve data from an operator. The CF, as an implement or a group of implements represented by a Working Set Master acquires storage for objects within the VT and on demand displays this stored information to an operator. In this part of ISO 11783, the term *Working Set* will be used for a CF, as an implement or a group of implements either represented by a single ECU or a group of ECUs acting as a Working Set. Working Sets on the network can also acquire the use of input methods of the VT to allow the operator to send signals back to the Working Set.

This part of ISO 11783 describes the VT with the detail and clarity required for VTs built by different manufacturers to be interchangeable with any implement Working Set that uses its services. The interface protocol of this part of ISO 11783 also reduces the run-time ISO 11783 communication bus traffic as much as possible. For these reasons, the requirements of this part of ISO 11783 are organized in an object-oriented manner with specific attributes and behaviour of each object clearly and fully defined. The required behaviour of the VT given certain situations is also detailed.

In general, the functions, not the design, of the user interface of the VT are defined in order to avoid restrictions on possible designs. However, certain limitations are imposed in order to meet the goal of interchangeability between various manufacturers. Specifications regarding physical layout, components, processing power and the number of physical elements comprising a VT have been omitted in order to avoid restricting manufacturer's designs.

The VT shall have a pixel-addressable (graphical) display. Information from connected Working Sets is shown to the operator on the graphical display. This information is shown in display areas that are defined by Data Masks, Alarm Masks and Soft Key Masks. The data for these masks is contained in object definitions that are loaded into a VT via the ISO 11783 CAN bus, or from non-volatile memory. When the information defined by a mask is required on the display, the mask can be made visible by a single Change Active Mask command from the Working Set, and therefore does not require significant additional network traffic.

The physical size, resolution, orientation and methods of implementing the graphical display are at the discretion of the designer of the VT. Figure 1 — Virtual terminal — examples shows examples of some possible VT designs and orientations.

- Key
- |   |                    |   |                     |
|---|--------------------|---|---------------------|
| 1 | Data Mask area     | 4 | Soft Key Designator |
| 2 | Soft Key Mask area | 5 | Physical Soft Key   |
| 3 | Physical Screen    |   |                     |

Figure 1 — Virtual terminal — examples

## 4.2 Operator input and control

The VT shall provide the operator with means for control and input. There are five means associated with a VT that can be used for the input of data, selection of display data, and the control of connected Working Sets.

See Figure 2 — Operator input and control means

### a) Soft

is a means, most likely keys on the VT, using software-changeable designators (labels). “Soft Keys” have their identity changed depending on which Soft Key Mask is visible. The VT shall make the association between a Soft Key and its designator clearly evident to the operator.

### b) Navigation

is a means of selecting an input field or Button within the active Data Mask. If keys are used for “Navigation”, they do not send key activation information to the Working Set and are proprietary to the VT.

### c) Data Input

is a means of entering/editing information in an input field within the active Data Mask. If keys are used for “Data Input”, they do not send key activation information to the Working Set and are proprietary to the VT. A means shall be provided for entering any number or character sequence that is valid for the input field.

During the data input operation, the VT Status message will continue to indicate the active Working Set, and active mask which contains the input object for which the data input operation applies. Data input operation that originates on a User-Layout Data Mask does not affect the VT Status message.

There are two types of Data Input – “editing” and “real time editing”.

#### 1) Editing

is a means of data input where the new value being entered is composed by the operator using a proprietary means within the VT. During the composition of the new value, changes to the original value are not communicated to the Working Set. A means shall also be provided for ESC from or ENTER of information into a data field.

The ENTER means shall be provided to indicate to the Working Set the completion of data entry and communication of the new value, and the ESC means shall be provided to indicate that the data entry was aborted. The ENTER and ESC means may either be a permanent key or may only be available during data entry. (See Table 5 — VT Reaction to navigation and data input events) The VT shall send a VT ESC message to a Working Set for an operator-activated ESC means or an ESC response as a response to receiving an ESC command from a Working Set.

#### 2) Real Time Editing

is a means of data input for an Input Number object and Input List object where the object has focus and it is open for operator input and changes by the operator to the value are periodically transmitted to the Working Set while the object is being changed. The VT Change Numeric Value message is limited to a 5 Hz update rate. Each value change sent to the Working Set is considered a complete transaction, as if the ENTER means was activated, and cannot be reverted by the ESC means. The VT is not required to provide steps in uniform increments, however it shall be possible to set any value (e.g. fast scrolling is allowed to span a wide range of values, with fine adjustment for final setting). If the ESC means is activated during real time editing, the VT shall ensure that the on-screen value is equal to the value last sent to the Working Set. The VT may send a final value to the Working Set prior to sending the VT ESC message, or ESC response message to ensure this synchronization. Real time editing shall meet the operator controls requirement specified in ISO 15077.

d) **Control**

is a means of selecting between Working Sets whenever a Data Mask is available and for acknowledging alarms. Both means are required. Since more than one Working Set can use the services of the VT, the VT shall provide a means for the operator of selecting between connected Working Sets. The Working Set selection means should be indicated by three circular arrows or a similar graphic. Only the ACK means sends key activation information to the Working Set.

e) **Auxiliary Input**

is a means available to the operator for communicating input commands to the Working Set(s) using Auxiliary Controls which are assigned to Auxiliary Functions. (See Annex J)

## Key

- 1 control
- 2 navigation
- 3 Soft Key 1
- 4 Soft Key 2

- 5 Soft Key 6
- 6 data input
- 7 auxiliary input

**Figure 2 — Operator input and control means – example**

### 4.3 Acoustic alarm

The VT shall provide an acoustic alarm. The alarm may be a simple on/off type buzzer or an acoustic component capable of either/or variable frequency and audio level. (See Clause D.9 Get Hardware response)

### 4.4 Coordinate system

Positions and sizes in this part of ISO 11783 are always given in physical pixels unless otherwise stated. A two-dimensional coordinate plane (x, y) is used, where x is the number of units wide (x increases from left to right) and y is the number of units high (y increases from top to bottom). The coordinates are signed values. The origin (0, 0) for any object's coordinate system is located at the top left-hand corner of the parent object.

### 4.5 Display areas

#### 4.5.1 General

This section defines standard Data Mask and Soft Key Mask areas of the display. Alternate usage of this area supports displaying data from multiple working sets. (See Clause 4.7)

#### 4.5.2 Data Mask

The VT shall reserve an area of the display for displaying Data Masks and Alarm Masks. This area is called the Data Mask area (See Figure 1 — Virtual terminal — examples). Recognizing that the physical orientation of the VT display could be different, depending on the manufacturer of the VT, a square data mask aspect ratio is chosen to ensure correct display in either landscape or portrait orientation. The minimum Data Mask area shall be 200 pixels × 200 pixels. This requirement does not limit the physical resolution or size of the display, only the useable Data Mask area. Higher resolution mask areas are permitted, but the square aspect ratio shall be strictly enforced. Examples of Data Mask areas that would meet this requirement are:

- 200 × 200,
- 240 × 240,
- 320 × 320, and
- 480 × 480.

Any other square dimensions would be acceptable.

It is suggested that unused areas of the physical display be used for proprietary information such as vehicle data, VT statistics or other data.

#### 4.5.3 Soft Key Mask area and Soft Key designators

##### 4.5.3.1 Soft Key variants and navigation

The VT shall reserve an area of the display for Soft Key labels, separate from the Data Mask area. This area is called the Soft Key Mask area (See Figure 1 — Virtual terminal — examples). Each Soft Key shall have a reserved display area, called a Soft Key designator, for displaying a label (See Figure 1 — Virtual terminal — examples). The minimum size of the designator field is 60 pixels wide × 32 pixels high regardless of screen orientation. The Soft Key designators may contain text, graphics or both. The Soft Key Mask area may be adjacent to, or physically separate from, the Data Mask area, but shall not be part of the Data Mask area.

The VT shall provide a clearly visible separation between the individual Soft Key designators (for example by drawing a one-pixel line). This visible separation shall be drawn outside of the Soft Key designator area. Only if the minimum size of the designator field cannot be fulfilled due to this requirement, the drawing of a one-pixel line on the border of the Soft Key designator area is acceptable.

The presentation of the Soft Keys can be further described in three groups, with a defined relationship: Navigation Soft Keys < Number of Physical Soft Keys <= Number of Virtual Soft Keys.

- a) VT Version 3 and prior VTs have no requirement on the number of physical Soft Keys.
- b) VT Version 4 and later VTs shall provide at least 6 physical Soft Keys.
- c) VT Version 3 and prior shall support a maximum of 64 virtual Soft Keys per Soft Key Mask and shall support as a minimum the number of reported physical Soft Keys (see Clause 4.5.3.3).
- d) VT Version 4 and later shall support exactly 64 virtual Soft Keys per Soft Key Mask (see Clause 4.5.3.3).
- e) The VT shall provide a means for the operator to navigate and select all defined Soft Keys. For example, if there are six physical keys, some type of paging would be required to allow the operator to navigate to, and select from, any of the 64 virtual Soft Keys using the six physical keys.

#### 4.5.3.2 Physical Soft Keys

Physical Soft Keys is the count of the number of permanently dedicated keys that the VT makes available to active Working Sets. The term “physical Soft Key” does not imply that the VT must provide physical buttons for the Soft Keys. For example on a VT with touch screen, the physical Soft Keys may be located directly on the touch screen as shown in Figure 1 — Virtual terminal — examples.

For VTs with a vertical arrangement of physical Soft Keys, key number 1 shall be on the right and the top-most position. Key number 2 shall be adjacent and below Key 1. Key m shall be at the bottom of the first column. If there are additional physical Soft Keys, the column containing keys m+1 to key n shall be to the left of the first column. Each additional column of physical Soft Keys shall continue to the left.

For VTs with a horizontal arrangement of physical Soft Keys, Key number 1 shall be on the top row and in the left-most position. Key number 2 shall be adjacent and to the right of Key 1. Key m shall be at the far right of the top row. If there are additional physical Soft Keys, the row containing keys m+1 to key n shall be below the first row. Each additional row of physical Soft Keys shall continue below the previous row. Examples of these arrangements are shown in Figure 3 — Physical Soft Key Orientation Examples showing Key Locations.

For VTs without a clear horizontal or vertical arrangement of physical Soft Keys (e.g. physical Soft Keys located in a matrix on the touch screen) the rules for a VT with a vertical arrangement of physical Soft Keys apply.

**Figure 3 — Physical Soft Key Orientation Examples showing Key Locations**

#### **4.5.3.3 Virtual Soft Keys**

Virtual Soft Keys is the count of the number of Soft Keys that the VT supports for each active Working Set's Data Mask. If the physical Soft Keys count is less than the virtual Soft Keys count, the VT shall provide a means for navigation to allow the operator to choose from any of the Working Sets Soft Keys.

#### **4.5.3.4 Navigation Soft Keys**

Navigation Soft Keys is the count of the number of physical Soft Keys that the VT may allocate for the purpose of navigation among the Soft Keys. The number of navigation Soft Keys shall be less than the number of physical Soft Keys. If the VT provides other means of navigation that does not use the physical Soft Keys, this value shall be zero.

#### **4.5.3.5 Navigation among Soft Keys**

If the Working Set provides a number of Soft Keys on a Soft Key Mask equal to or less than the number of physical Soft Keys reported by the VT, then all of the Soft Keys on this Soft Key Mask shall be accessible with the physical Soft Keys. The VT shall not provide any navigation means for this Soft Key Mask.

If the Working Set provides more Soft Keys on a Soft Key Mask than the VT has reported in the number of physical Soft Keys, the VT shall provide navigation for that Soft Key Mask. This navigation among the Soft Keys shall be done by paging through the Soft Keys in groups, not by scrolling. Further, a "group" is defined as the "physical Soft Keys" count minus the "navigation Soft Keys" count. The navigation Soft Keys shall always occupy the same physical Soft Key positions on all pages, although the VT designer may choose to disable (but not remove) the navigation keys on certain pages. The last set of virtual Soft Keys (depending on how many Soft Keys the Working Set provided to the VT) may not completely fill the Soft Key Mask. The remainder of the Soft Key designators shall not be used.

As described in section B.5 Soft Key Mask object and illustrated in Figure 4 — VT virtual Soft Key paging, pointers to the NULL Object ID reserve a Soft Key position. Pointers to NULL Object ID that are at the end of the list of Soft Keys shall not reserve a Soft Key position and shall not be considered for paging or navigation.

**EXAMPLE** As shown in Figure 4 — VT virtual Soft Key paging (a in figure), a VT is designed with 6 physical Soft Keys, 64 virtual Soft Keys, and 1 (a in figure) navigation Soft Key. The Working Set provides 18 Soft Keys to the VT, however there are 3 which are Pointers to the NULL Object ID. To support navigating among the Soft Keys the VT designer alters Soft Key 6 into a “next Soft Key group” button. A navigation group is calculated as sets of 5 Soft Keys (a in figure), starting with the first Soft Key. When the navigation key is pressed, the VT shows the next group of Soft Keys. Another example (b in figure) shows a similar example with 2 navigation Soft Keys. Another example (c in figure) shows an arrangement with two columns of keys and two navigation keys. If the VT provides dedicated navigation keys, the number of navigation Soft Keys reported shall be zero (d in figure).

Figure 4 — VT virtual Soft Key paging

## 4.6 Behaviour

### 4.6.1 Object pools

#### 4.6.1.1 General

The operator interface definition for a device of one or more implements represented by either a single ECU or a Working Set consists of a set of objects (hereafter referred to as the Working Set's *object pool*). These objects are defined in detail in Annex B and Annex J. Each object contains all necessary attributes and child object references for processing the object to completion. The Working Set assigns a unique Object ID to each object in its object pool so that each object is uniquely addressable. Object IDs shall be unique within a single Working Set's object pool but may not be between different Working Sets.

The object pool is transferred to the VT at initialization by using the procedure described in Annex C. The VT is intended to be capable of storing the object pools in a modifiable memory area. VTs may store multiple pools of a Working Set, in non-volatile memory, if they have unique version labels. For example, multiple pools that differ only by language. All objects shall be fully described before they are made active in a mask on the display.

The behaviour of the VT when no object pools are loaded is proprietary.

#### 4.6.1.2 "NULL" Object ID

Object ID FFFF<sub>16</sub> (65535<sub>10</sub>) is reserved for use as the "NULL" Object ID.

#### 4.6.1.3 Processing objects

Objects listed in parent objects may also list child objects, thereby creating a tree hierarchy in the object pool. Objects are always processed in the order listed in the parent object in a "depth-first" manner. In other words, if a reference is made to an object that references other objects, the child references are processed to completion before returning to the parent to continue processing.

VT version 5 and later VTs shall support a minimum hierarchy depth of 30 objects. For VT version 4 and prior VTs, the requirement is unspecified.

The hierarchy depth is computed starting with the following objects; Data Mask object, Alarm Mask object, Window Mask object, Soft Key Mask object, Key Group Objects, and increments by one to reach a child object. For the child objects that have child objects the depth increments again. This process continues to the last child object. For computing the hierarchy depth, the object to which a pointer object references is counted as a child object.

The relationship from the Working Set object to either a Data Mask object or an Alarm Mask object, and the relationship from those to a Soft Key Mask object are not included in the count.

### 4.6.2 Working Sets

The Object Pool supplied by a Working Set Master is associated with all members of that Working Set. This allows object information from one CF or all the CFs that make up a Working Set to be collectively presented as a common object pool. One CF shall be designated as the Working Set Master for each Working Set. As coordinator of the communications of a Working Set, the Working Set Master shall secure the use of the VT and provide the object pool definition. It shall also send Working Set messages that provide the NAMES of the members of said Working Set to the VT. This identifies the members of the Working Set and hence those CFs which can communicate to the VT. Appropriate messages for defining a Working Set are given in ISO 11783-7.

Once members of the Working Set have been identified and after the object pool has been loaded into the VT, any member of the Working Set has the ability to provide data for objects and to change attributes in the object pool during run-time.

The Working Set Master shall provide the initial object pool definition. Any data input by the operator into input field objects is always transmitted to the Working Set Master.

The VT shall never have Working Set Members and shall not transmit the Working Set Master or Working Set Member messages (See ISO 11783-7).

The handling of VT Response messages defined herein supersedes part ISO 11783-1 in reference to responses being directed only to the Working Set Master. See Table 1 for — VT Response message behavior to Working Set messaging.

STANDARDSISO.COM : Click to view the full PDF of ISO 11783-6:2014

**Table 1 — VT Response message behavior**

| Configuration                                                                        | Working Set Version <sup>a</sup> | VT Version <sup>b</sup> | Behaviour                                                |
|--------------------------------------------------------------------------------------|----------------------------------|-------------------------|----------------------------------------------------------|
| 1                                                                                    | 3 and prior                      | 3 and prior             | VT response to any command is directed to the WS Master  |
| 2                                                                                    | 3 and prior                      | 4 and later             | VT response to any command is directed to the WS Master  |
| 3                                                                                    | 4 and later                      | 3 and prior             | VT response to any command is directed to the WS Master  |
| 4                                                                                    | 4 and later                      | 4 and later             | VT response to any command is directed to the originator |
| <sup>a</sup> Working Set Version is reported in the Working Set Maintenance message. |                                  |                         |                                                          |
| <sup>b</sup> VT Version is reported in the Get Memory response message.              |                                  |                         |                                                          |

In configurations types 1 through 3, the Working Set Member has the responsibility to monitor all [destination specific] VT to Working Set Master messages in order to pair its commands with responses. The Working Set Master will receive unsolicited responses from the VT (which were originated by its members), and will not be able to pair these with messages the master originated. The Working Set Members also will not be able to pair the messages correctly when originating from another member or from the master.

In configuration type 4, all responses from the VT are directed to the originating nodes. Responses that are communicated via Transport Protocol are now possible (e.g. Get Supported WideChars response). Further, the Working Set Master no longer receives unsolicited response messages. Working Set Members no longer have an obligation to monitor destination specific messages directed to another address.

In order to maintain backward compatibility, Working Sets shall not send higher version messages to a lower version VT (e.g. a version 4 command sent to a version 2 VT). How a lower version VT would respond in such a case should be considered unpredictable. For example some VT designs might respond with a NACK message, others might ignore the message. In extreme cases this could cause a software crash or reset at the VT.

Conversely, the VT shall not send higher version messages to a lower version Working Set (e.g. a version 4 event sent to a version 2 Working Set). How a lower version Working Set would respond in such a case should be considered unpredictable. For example some Working Set designs might respond with a NACK message, others might ignore the message. In extreme cases this could cause a software crash or reset at the Working Set.

VT version 5 and higher VT's and Working Sets shall support the VT Unsupported VT Function message, and Unsupported VT Function message, respectively. With this message the VT and Working Set respond in a predictable way. VTs and Working Sets, designed for VT version 4 and prior, may implement these messages.

Additional compatibility information is defined in clause 4.6.24.

#### **4.6.3 Multiple Visually Similar Working Sets**

When more than one visually similar Working Set from the same manufacturer becomes part of a network, these Working Sets should be uniquely identified to correlate each instance with a location. This shall be accomplished using an Instance field of the NAME (e.g. 2 sprayers from the same manufacturer, or 2 or more visually similar Auxiliary Input units).

For consistent system configuration, the Working Sets should be arranged with the lowest to highest instance from left to right followed by front to rear followed by bottom to top.

The manufacturer shall provide the operator a means to establish a working configuration, using one or more of the following methods or via some other means not specified here.

The operator can correctly locate the Working Set based on its instance with:

- An indication on the label of the Working Set unit identifying its Instance,
- By physical location, via a wire in the harness of the Working Set that automatically sets its instance in increasing values left to right followed by front to rear followed by bottom to top.

The operator can set the Instance based on its location with:

- An operator accessible “Instance” switch on the Working Set unit,
- An operator accessible “Instance” setting, such as on a Data Mask,
- Use of the commanded name message (See ISO11783-5) with a provided service tool.

#### 4.6.4 Displayed Working Set number

When more than one visually similar Working Set exists on a network, the Working Set shall indicate its working set number on its Working Set object. Additionally, the Working Set should indicate its working set number on visible masks.

The displayed Working Set number shall be defined by the manufacturer. The Working Set number should be related to the Function Instance, the Device Class Instance, and/or the ECU Instance, as defined by the manufacturer (See ISO11783-5). Other factors defined by the manufacturer may also be used to ensure the Working Set is uniquely identifiable. All visually similar equipment from the same manufacturer shall apply the same relationship.

Example 1      working set number = working set Function Instance + 1

Example 2      working set number = working set Device Class Instance + 1

Example 3      working set number = working set ECU Instance + 1

#### 4.6.5 Language, formats and measurement units selection

The VT(s):

- Shall send the standard language, format and measurement units messages defined in ISO 11783-7, hereafter “standard setups”. The Working Set object identifies the languages that the Working Set supports. The VT shall provide a method for the operator to view the list of supported languages and to select an item from the list. If no language has been entered by the operator (as would be the case in a factory-new VT), the VT shall attempt to query the default language from the tractor ECU. Once the operator has set the language, The VT’s language message always takes priority over the tractor ECU’s language.
- Shall also provide a method for the operator to select formats (Time, Date, etc.) and measurement units. The VT shall report selected language, formats and measurement units at power up and any time there is a change. These messages allow the Working Set to modify its object pool to the operator-selected language (.e.g. by updating string fields, selecting units of measure, changing offsets and scales, etc.).
- Shall store the standard setups in non-volatile storage and restore the values during initialization.
- Shall respond to ISO11783-7 “Language Command” requests sent to the global address

- Shall respond to ISO11783-7 “Language Command” requests directed to this VT

The Working Set(s):

- Shall configure their standard setups according to the VT to which they are publishing the pool(s). This can cause different standard setups to be published to different VTs. (e.g. auxiliary objects are published to VT with Function instance 0 and the remainder of the pool to other VTs)

Shall use a proprietary method to select an appropriate (or default) setting if the Working Set does not support the selected language, formats or units.

#### 4.6.6 Initialization

Upon power-up or reinitialization, a specific sequence of events shall occur in order to ensure proper initialization of the VT and Working Sets, as follows.

##### 4.6.6.1 VT initialization

- 1) The VT shall complete the address claim procedure in accordance with ISO 11783-5 and shall also send an address claim request to the global destination address (255).
- 2) The VT shall begin transmission of the VT Status message. In the case of a reset or recovery, the VT shall ensure that greater than 3 seconds have elapsed between this initial VT Status message and the previous VT Status message.
- 3) If language selection has not been entered by an operator, the VT shall attempt to request the default language setting from the tractor ECU.
- 4) The VT shall allow Working Sets to initialize and to load their object pools.

##### 4.6.6.2 Working Set initialization with VT

- 1) The Working Set, if equipped with Auxiliary Functions, shall clear any assignments in volatile memory.
- 2) The Working Set Master (and Working Set Members) shall complete the address claim procedure in accordance with ISO 11783-5.
- 3) The Working Set Master shall wait until the VT begins transmission of the VT Status message.
- 4) The Working Set Master shall identify itself and its members to the VT using messages given in ISO11783-7.

NOTE 1 The Working Set Master may send these messages for other purposes (e.g. Task controller initialization).

NOTE 2 If the Working Set Master has a need to reconfigure the list of Working Set Members after the initialization is complete, the Working Set Master shall send the Working Set Master and Working Set Members messages. The Working Set Master may use this to add or remove members from the set. No Working Set initialization is required.

- 5) The Working Set Master shall transmit the Working Set Maintenance message once with the ‘initiating flag’ set to 1 (when designed for version 3 and later VTs).

If the VT had previously detected a shutdown and was transmitting the NACK in response to the Working Set Maintenance message (See Clause 4.6.9 Connection management), there are two cases where the VT shall stop transmitting the NACK:

- I) In the case of a version 3 or later ECU, identified by Working Set Maintenance message; Byte 3 < 255 and the initiating flag Byte 2 Bit 0 = 1.
  - II) In the case of a version 2 and prior ECUs, identified by Working Set Maintenance message; Byte 2 = FF<sub>16</sub>, and the VT received a Working Set Master message since the prior maintenance message.
- 6) The Working Set Master shall begin transmitting the Working Set Maintenance message with the 'initiating flag' set to 0 (when designed for version 3 and later VTs).
  - 7) The Working Set Master may request the language and format messages from the VT (See ISO 11783-7) if it has not already received this message from the VT and the Working Set has presentation that is language or unit specific.
  - 8) The Working Set Master may query the VT as necessary to determine its capabilities. Based on the VT's responses, the Working Set Master shall adjust its object pool for scaling, available fonts, supported colours, etc.
  - 9) The Working Set Master may query the VT to determine if its object pool already exists in non-volatile memory.
  - 10) Object pool transfer shall commence and be completed. This can be done either by asking for the object pool to be transferred from non-volatile memory (See Annex E) or by using the protocols detailed in Annex C.

#### 4.6.6.3 Working Set initialization on networks with multiple VTs

A Working Set Master shall have a means to perform a "Move to another VT" function on networks with multiple VTs. This function shall allow movement of the Working Set to each of the available VTs in sequence. For example, this function could be accomplished with a "Next VT" Soft Key or Button in the user interface and/or in combination with the Identify VT message. The function behaves as follows:

- 1) "Move to another VT" is enabled if the Working Set Master detects more than one VT on the network.
- 2) When "Move to another VT" is activated, the Working Set Master:
  - I) Puts itself in a safe state, or prevents activation of this feature unless it is in a safe state.
  - II) Shall send the Delete Object Pool command to the VT and wait for the response.
  - III) Shall stop sending the Working Set Maintenance message to the VT.
  - IV) Starts the initialization process with another VT on the network.
  - V) The Working Set Master shall save the new VT as the preferred VT for a next power cycle. If the preferred VT is not available within a certain time period after startup, the Working Set Master may initialize connection to any other VT on the network. The Working Set may provide a means for the operator to set the maximum wait time period or it may be obtained from the boot time specification in the "Get Hardware response" message of the preferred VT.

#### 4.6.7 System Shutdown

##### 4.6.7.1 General

In this context "System Shutdown" is defined as the period of time when the Key Switch state indicates the key is off and yet ECU Power remains on. Actuator Power may or may not remain on concurrent with ECU Power (see ISO 11783-7).

When the Key Switch state indicates the key has been turned off, and while ECU Power has not been terminated, it is expected that systems may transition to a shutdown state that is appropriate for that system. In some devices, this may cause immediate termination of all network communications, where other devices may request power to remain on for a more orderly shutdown. Others still may ignore the Key Switch state and continue normal operation until power is interrupted.

The relevant PGNs defined in ISO 11783-7 for determining the Key Switch state is the Wheel-based speed and distance (PGN 65096) and for requesting power maintenance is the Maintain power (PGN 65095).

The following are recommended practices.

#### 4.6.7.2 VT behavior

The VT can expect that applications on the network may terminate communications without warning.

A recommended behavior of the VT is to monitor the Key Switch state and take the following actions as a result of the transition from "Key switch not Off" to "Key switch Off".

- 1) The VT should disable unexpected shutdown detection logic to avoid unnecessary notification to the operator as a result of one application shutting down immediately while another maintains the ECU Power beyond the normal 3 second timeout (see Clause 4.6.9).
- 2) The VT should maintain services while "Key Switch Off" and for a minimum of 2 seconds following the last "Maintain ECU Power" request from those ECUs which have object pools in the VT volatile memory.
- 3) The VT should continue to monitor the Key Switch state and reinitialize if turned from "Key switch Off" to "Key switch not Off", ensuring that if the VT Status message was discontinued, the standard Initialization process is performed (see Clause 4.6.6).

NOTE VT version 3 and prior did not specify shutdown behavior, therefore, these VTs may discontinue all communications with the network, including discontinuing the VT Status message.

#### 4.6.7.3 Working Set behavior

Working Set behavior may vary significantly depending on the design of the specific set.

One variation of a Working Set design may not monitor the Key Switch state and may continue as normal until power is lost.

A recommended behavior of a Working Set is to monitor the Key Switch state and take the following actions as a result of the transition from "Key switch not Off" to "Key switch Off":

- 1) The Working Set may send a "Maintain Power" message (see ISO11783-7) to inform the system of the state of the Working Set, and optionally as the means to request power be maintained.
- 2) The Working Set may monitor the "Maximum time of tractor power" parameter (see Wheel-based speed and distance message in ISO11783-7) and use this information during any power management processes it may execute.
- 3) The Working Set may send a Delete Object Pool command to the VT to eliminate the possibility of an unexpected shutdown indication (see Clause 4.6.9).
- 4) The Working Set should not consider the lack of the VT Status message or other VT to ECU messages as an unexpected shutdown of the VT, and therefore should not attempt a connection to any other VT as may be available.

- 5) The Working Set should continue to monitor the Key Switch state and reinitialize if turned from "Key switch Off" to "Key switch not Off". (See Clause 4.6.6).

#### 4.6.8 Working Set object and active masks

In the initial object pool definition, each Working Set Master shall provide one, and only one, Working Set object in order to define a descriptor, active mask and supported languages for the Working Set. The descriptor may be graphical; text or both but shall fit inside the area defined by the VT for a Soft Key designator. Any object or part of an object located outside of the Working Set descriptor shall be clipped. The descriptor may be used by the VT any time the Working Set needs to be represented to the operator.

EXAMPLE      Communication alarms, Auxiliary Control setup.

When a Working Set is "active", it has exclusive input focus and is displayed on the VT display. When the Working Set is "inactive", it may also be visible on the VT display but does not have input focus. The VT shall provide some means to allow the operator to select the Working Set that is to be active. Only one Working Set is active at any given time. The Working Set cannot force any of its masks to be visible when the Working Set is not visible, and it cannot force its Working Set to be active when another Working Set is active. However, in some cases, setting the active mask to an Alarm mask may make the Working Set visible, but that is not guaranteed.

For VT version 4 and later, a VT may also display one or more Working Sets which are not active in addition to the Active Working set. (See Figure 5 — Example VT which displays an active and an inactive Working Set simultaneously). The VT uses the VT On User-Layout Hide/Show message to inform the inactive Working Set to update its Data Mask and or Soft Key Mask when it is visible. If a Working Set responds with a NACK or with a hidden state for the corresponding Data Mask or Soft Key Mask then the VT knows that the Working Set does not support this feature. If the Working Set does not support this feature, the VT shall inform the operator that the displayed information may not be updated. The VT may still display the inactive Working Set, because the inactive Working Set may update its data. (See Clause 4.6.10 Updating the operator interface)

## Key

- |                                             |                                               |
|---------------------------------------------|-----------------------------------------------|
| 1 Data Mask area of active Working Set      | 6 Data Mask area of inactive Working Set      |
| 2 Soft Key Mask area of active Working Set  | 7 Soft Key Mask area of inactive Working Set  |
| 3 Physical Screen                           | 8 Soft Key Designator of inactive Working Set |
| 4 Soft Key Designator of active Working Set | 9 Physical Soft Key of inactive Working Set   |
| 5 Physical Soft Key of active Working Set   |                                               |

Send the VT On User-Layout Hide/Show message (state: Hidden) to the Working Set.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                  |
| Hidden to Inactive and Visible                                                                                                                                                                                                                                    | <ol style="list-style-type: none"> <li>1. Send the VT On User-Layout Hide/Show message (state: Shown) to the Working Set.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <sup>1</sup> When the state of a Working Set changes from inactive to active and this causes the state of another Working Set to go from active to inactive, there shall be only one VT Status message (not two), which shall specify the new active Working Set. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

The Working Set can select different Data Masks or activate Alarm Masks by changing the active mask attribute of the Working Set object with the Change Active Mask command. The Working Set can change the active mask even if the Working Set is inactive. This allows the appropriate mask to be displayed when the Working Set becomes visible. When a Working Set is inactive, its active mask may not be visible, but still remains as the active mask for that Working Set.

#### 4.6.9 Connection management

The VT transmits the VT Status message once per second. The Working Set uses the message to ensure the VT is present and to determine the current status of the VT. If a Working Set does not receive this message for a period of 3 s it is determined to be a shutdown of the VT. When this happens the Working Set shall enter a safe state. The safe state is defined as the state in which all functions dependant on the VT operator interface are put into a known state that will not put the operator or machine at risk. The Working Set may re-establish connection to the VT by restarting the initialization procedure.

Each Working Set Master sends the Working Set Maintenance message once per second. The VT uses this message to ensure that each Working Set is still present. If the VT does not receive this message for a period of 3 s it is determined to be an unexpected shutdown of the Working Set Master (See Figure 6 — Initialization, unexpected shutdown, and expected shutdown) and the following rules apply.

The VT shall not alert the operator -

- If the Working Set has commanded the VT to delete the object pool, and the Working Set then stops sending Working Set Maintenance messages. This allows the Working Set to silently remove itself from the VT.
- If the VT can detect the ignition key state and the ignition key is reported as off.
- If there is no pool loaded by the Working Set into the VT volatile memory.

The VT shall alert the operator -

- If the pool has not been commanded to be deleted and the ignition key is not detected as off and the Working Set's object pool is present in the VT. This is detected as an unexpected shutdown of the Working Set and the VT shall alert the operator to this condition after which the VT shall delete the Working Set's object pool from volatile memory to free the memory for other uses. The means to alert the operator is proprietary to the VT. If the Working Set is visible to the operator, the display is cleared and the VT may give control to another connected Working Set and send the VT Status message to the global address. If there is an active alarm for the failed Working Set the VT deselects the Alarm Mask automatically.

When a Working Set's object pool has been deleted and there exists auxiliary assignments mapped to this Working Set, the VT shall remove them.

When the VT receives a Working Set Maintenance message from a Working Set which has unexpectedly shutdown, it shall NACK the message (See ISO 11783-3). The NACK message is sent to the Working Set Master. The Working Set may re-establish connection to the VT by restarting the initialization procedure (See Clause 4.6.6 Initialization).

Key

Solid arrows indicate destination specific messaging, dashed arrows indicate global message.

**Figure 6 — Initialization, unexpected shutdown, and expected shutdown**

#### 4.6.10 Updating the operator interface

##### 4.6.10.1 General

CAN has finite bandwidth available in support of all services (e.g. ISO 11783 part 3 through part 14). Further, the VT has finite bandwidth that is shared by all Working Sets using its services. In order to best manage the system bandwidth, it is recommended that:

- Active Working Sets, or those that are inactive but visible, should issue commands to the VT only when the data has changed in a way which is visible to the operator (e.g. only update objects actively displayed).
- Inactive Working Sets, which have no active Data Mask and Soft Key Mask displayed should reduce the frequency of, or eliminate, updates to the VT.

##### 4.6.10.2 Changing attributes and values

Attributes of objects can be changed during operation by Working Set Masters and Working Set Members using the defined change attribute messages. Certain attributes in each object are assigned an attribute ID. The Change Attribute command allows any attribute with an AID to be changed if not designated as a read-only attribute. In addition, attributes are sometimes grouped together into a single “change” command for efficiency purposes. (e.g. Change Font Attributes command F.28)

Even when the associated Data Mask is not visible, the Working Set may continue to change the attributes (including value) so that when the mask is made active and visible, the necessary output data is current and ready to display.

##### 4.6.10.3 Changing, adding and deleting objects

Working Sets can replace objects at run-time; however the replaced objects shall be of the same type. New objects can be added by initiating a transport protocol session to send one or more objects to the VT. When the VT receives an object with an existing Object ID, the existing object is replaced (the VT can determine the owner from the source address of the message). Resizing objects is permitted but can cause the VT to run out of memory. (See Annex C)

The entire object pool can be deleted from the volatile memory in the VT by the Working Set sending a Delete Object Pool command.

#### 4.6.11 Special objects

##### 4.6.11.1 Container objects

A Container object is a special object used to

- logically group objects in order to identify and reuse the container, or
- hide and show objects.

Figure 7 — Container reuse shows an example of container reuse. Mask 1 and Mask 2 both need the information displayed in Container 1. The Working Set first creates the container, and then inserts the container into Mask 1 and Mask 2 using the Object ID of the container.

Figure 7 — Container reuse

Figure 8 — Container used to hide objects — Example a) shows an example of using a container to hide a group of objects. In the example, Text 1 and Text 2 should be visible at all times. Text 3 and Text 4 should be visible only if a particular feature of an implement is available. Therefore, the Working Set creates a container containing Text 3 and Text 4 to be inserted in the mask. At run-time, the Working Set determines whether or not the particular feature is available. If not, the Working Set hides the container (See b in Figure 8 — Container used to hide objects — Example).

Key

a) Particular feature available

b) Feature not available: container hidden

Figure 8 — Container used to hide objects — Example

4.6.11.2 Attribute objects

There are five types of attribute objects: font, line, fill, input, and extended input. Attribute objects are referenced by other objects. This allows one set of attributes to be shared with many objects to create and maintain a common look across those objects. All objects using a given attribute object are updated when the attribute object is changed.

4.6.11.3 Variable objects

Variable objects can be used to share data between two or more other objects. Changing the value in only one object can reduce bus traffic. For example, it could be desirable to draw a Meter object and also to show its current value as a numeric under the meter. In this case, a Number Variable object could be referenced by

both the Meter object and the output field object. By doing this, a change in the value of the variable will be reflected in both the meter and output field at the same time and the change will require only a single Change Numeric Value command.

#### 4.6.11.4 Macros

Macro objects are used to improve the performance of the operator interface. Macro objects have the following properties:

- a) Macros can only contain the commands listed in Annex F.
- b) If a Macro triggers an event that causes another Macro, the current Macro is completed first before another is started.
- c) Macros are executed in the order they were triggered.
- d) Macros triggered by the execution of a command shall be completed before the next bus command is started.
- e) Macro Object IDs shall be in the range 0 to 255 for VT version 4 and prior. Macro Object IDs may be in the range of 0 to 65534 for VT version 5 and later.
- f) Macros do not trigger response messages. When executing the command messages in a macro, the VT shall not send response messages on the CAN bus for the messages contained in the macro. Therefore macros reduce CAN traffic. For example, a Macro that executes a Change Active Mask command will trigger a VT Status message, but will not trigger a Change Active Mask response.

**CAUTION: Objects that are altered by both a Working Set and a Macro may be susceptible to a race condition and should be evaluated for predictable behavior.**

#### EXAMPLE 1 An

Input String object has a Macro to clear the

Input String object - On Input Field Deselection. The "Enter" means on an

Input String object of length greater than 3 characters causes the VT to send the data using Transport Protocol (TP) to the Working Set (WS). The operator quickly navigates away from the

Input String object. "On Input Field Deselection" causes the VT to notify the WS with a VT Select Input Object message (Deselect). An On Input Field Deselection Macro alters the

Input String object value. The WS receives the TP data asynchronous to the VT Select Input Object message (Deselect). The outcome is based on the asynchronous processes in the VT, the message processing methods in the VT, including TP processing and potential latencies, and the WS implementation.

**EXAMPLE 2** An On Key Press Macro associated with a Button object changes the active Data Mask. An On Show Macro attached to the new Data Mask changes the numeric value in an Input List object on this new Data Mask to initialize it to a known setting. The operator presses the Button, which causes a Button Activation message to be sent to the WS. The WS sends a Change Numeric Value command to the Input List object. The Input List object may end up with either value, due to the asynchronous processes.

Circular references are not permitted since they create infinite Macro loops inside the VT and could render the VT inoperable for all Working Sets.

**EXAMPLE** When a Macro triggers an event that references the same Macro, a circular reference is created.

#### 4.6.11.5 Object pointer

The Object Pointer object allows run-time modification of included objects. By changing the value of the Object Pointer object, a different object can be drawn at the same location. The type of object that the Object Pointer is allowed to reference is limited and depends on the parent object. Refer to valid parent objects of the Object Pointer for a list of objects that can be referenced. An Object Pointer can always point to another Object Pointer. An Object Pointer can point to the NULL Object ID and in this case nothing shall be drawn.

When an Object Pointer is modified at run-time, resulting in an invalid object reference, the VT is not required to detect this object pool error immediately but may delay error detection until the Data Mask object or Alarm Mask object which contains the Object Pointer is activated. At activation of a data or Alarm Mask containing the invalid object reference the VT sends the F.35 "Change Active Mask response" or H.14 "VT Change Active Mask message" to inform the Working Set and may delete the object pool.

The VT may also detect the error immediately upon Object Pointer value modification, and in this case shall send an F.23 Change Numeric Value response with "invalid value" indicated in the error codes. The VT may also delete the object pool.

#### 4.6.11.6 External Object Pointer

The External Object Pointer object allows a WS to display objects from an object pool of another WS.

To ensure that the external references are valid even after software updates of the participating WS, the referenced WS and the referencing WS shall exchange information about the referenced objects before enabling the external references. The information exchange shall be repeated every time either the referencing WS or the referenced WS is restarted. As a minimum the object identifiers shall be transferred from the referenced WS to the referencing WS.

Note: Some devices (e.g. the SCC/SCM – ISO11783-14) have a standardized method for exchanging object information. If a standardized method does not exist, then a proprietary method shall be agreed between the manufacturers of the referencing and the referenced WS.

To protect against unsolicited references the referenced WS shall use the External Object Definition object to list the objects which are allowed to be referenced by another WS. The External Object Definition object is assigned to one and only one referencing WS. If a referenced WS will allow multiple WS to reference objects it shall have multiple External Object Definition objects.

The referencing WS shall use the External Reference NAME object to identify the WS it plans to reference.

The attribute values of the External Object Definition object, the External Object Pointer object and the External Reference NAME object shall all be valid before the external object can be displayed. Some of the information in the objects depends on the exchange of object information and therefore the objects shall be in the reset state until the object information is complete.

Reset state is defined by:

- External Object Pointer object : External Object Id attribute is the NULL object id
- External Object Definition object : Enable bit in the Options attribute is cleared
- External Reference NAME object : Enable bit in the Options attribute is cleared

When the object pool is loaded from non-volatile storage in the VT there is no guarantee that the attribute values are valid, and therefore the VT shall set all occurrences of the External Object Pointer, the External Object Definition and the External Reference NAME to the reset state.

When the object pool is uploaded from the WS master, the VT shall not set the objects to the reset state. If the information exchange between the referenced and the referencing WS is not completed before the object pool is uploaded, the WS master shall set the objects to the reset state before uploading the pool.

Before displaying an external object the VT shall check the validity of the external reference. The external reference is considered to be valid when all of the following are fulfilled:

- The External Reference NAME ID attribute of the External Object Pointer object identifies an enabled External Reference NAME object.
- The referenced WS has an object pool in volatile memory on the VT (referenced object pool).
- The referenced object pool contains an enabled External Object Definition object where the NAME attributes identifies the referencing WS.
- External Object Id is listed in the object list in the above mentioned External Object Definition object.

If the referenced object is NULL or not valid the VT shall draw the object identified in the Default Object ID attribute of the External Object Pointer object.

**Note** There can be multiple instances of the External Object Definition object in an object pool. If multiple External Object Definition objects are assigned to the same NAME, then an external reference shall be considered valid if made valid by one or more External Object Definition objects.

#### Key

- 1 VT presentation from Working Set 1
- 2 VT presentation from Working Set 2
- 3 External Object Pointer with reference to object in Working Set 2 Object Pool
- 4 Referenced object in Working Set 2 (container that contains several objects), all of which are valid
- 5 Number Variable on Working Set 2 object pool
- 6 External Object Pointer with reference to object in Working Set 2 Object Pool
- 7 Default Object to be shown when External Objects are invalid
- 8 VT presentation from Working Set 1 after references are established, enabled and resolved

**Figure 9 — External Object References — VT Example**

| 21 Referencing Working Set in VT memory                                                                                                 | 32 External Object Definition object                                          |
| 22 External Reference NAME Object, including NAME attribute that references ECU 2s                                                      | 33 Object Pool Object that can be referenced from an external Working Set     |
| 23 External Object Pointer Object                                                                                                       | 34 Reference to the Object Pool object that can be referenced.                |
| 24 Reference to the External Reference NAME object                                                                                      | 35 Virtual reference established that allows ECU 2 to reference ECU 3 objects |
| 25 Virtual reference established by External Object Pointer object that informs VT to the Working Set containing the referenced objects |                                                                               |
| 26 Virtual reference established to the External Object of interest.                                                                    |                                                                               |

**Figure 10 — External Object References — Relationship Example**

**Example 1** Two External Object Definition objects have the same value in the NAME attributes. Both objects are enabled, only one of the objects includes 1234 in the Object ID list. Object Id 1234 can be referenced.

**Example 2** Two External Object Definition objects have the same value in the NAME attributes. Both objects include 1234 in the Object ID list, only one of the objects is enabled. Object Id 1234 can be referenced.

#### 4.6.12 Relative X/Y positions

The X, Y position attribute determines where an object is drawn on the display. This position is always relative to the upper left corner of the parent object. The X,Y position is always found in the parent object. Figure 11 — Relative and absolute location of objects shows an example Data Mask with the relative locations of several objects.

Figure 11 — Relative and absolute location of objects

#### 4.6.13 Overlaid objects

A mask can be built such that two objects will occupy the same or overlapping space on the display. This can require extra processing in the VT, but could be necessary in some cases and shall be supported by the VT. For this reason, the hierarchy or layering of objects shall be understood. Some objects have a list of contained objects. Objects listed first are considered to be lower in the hierarchy than objects listed later. In this case, the objects shall be drawn such that objects listed later appear to overlay objects listed earlier, so that the entire image of the object listed last is visible, while only those areas of the object listed earlier that do not coincide with areas of the object listed last will be visible. When an object is changed, all objects that overlay it and which have been corrupted shall be redrawn (this is called a refresh event). All objects defined by this part of ISO 11783 have a rectangular size either defined or implied to simplify the VT's task of finding overlaid objects.

When an object is changed or hidden, the VT shall update the display accordingly.

**EXAMPLE** Referring to Figure 12 — Object changed or hidden — Display update, where (a) shows the initial presentation before any command is received. The Working Set then commands object 1 to be hidden. As an intermediate step shown in (b), the VT deletes object 1 and all child objects by filling the object's area with the background colour of the parent mask. The VT then redraws the object along with all child objects. The VT then refreshes any other object (e.g. object 2) that could have been visually altered in the deletion process as shown in (c). The VT may implement this refresh in a manner where the intermediate display is never seen by the operator.

Key

- a) Initial presentation
- b) Intermediate operation

- c) Final presentation

**Figure 12 — Object changed or hidden — Display update**

#### 4.6.14 Alarm handling

Alarms allow a Working Set to display alarm information at any time. If several Working Sets have an Alarm Mask activated, the VT shall display the masks in order of priority. Priority is determined, first, by the priority attribute defined in the Alarm Mask object and, second, by chronological order of activation. The highest priority alarm is always displayed until the owner Working Set changes the active mask. When more than one Working Set has asserted an Alarm Mask with the same priority attribute, the first of these, as processed by the VT, shall become the active mask. When the active Working Set changes to a lower priority alarm or Data Mask, the next in turn highest priority Alarm Mask is processed.

Operator input disturbed by the activation of an Alarm Mask may be left intact for resumption once all Alarm Masks have been acknowledged. A Soft Key Mask is associated with the Alarm Mask via an attribute in the Alarm Mask object. Whenever the alarm is displayed, the associated Soft Key Mask is also displayed. The following describes the protocol requirements between the VT and the Working Set raising the alarm.

- a) The Working Set Master activates an Alarm Mask by using the Change Active Mask command on the Working Set object. Only one Alarm Mask can be active per Working Set.
- b) The VT responds with a Change Active Mask response.
- c) Based on priorities, at some point, the VT displays the Alarm Mask and the Soft Key Mask associated with the Alarm Mask. When a mask change occurs that causes an Alarm Mask to appear or reappear, the acoustic signal associated with the Alarm Mask shall be activated. The VT shall terminate any acoustic signal from a lower priority Alarm Mask that can be in process. The VT shall terminate any acoustic signal from a control audio command that can be in process (version 4 and later VTs shall send the VT Control Audio Signal Termination message to indicate the termination). If the Alarm Mask acoustic signal completes, or if it is set to none for silent signal, then control audio commands from ECUs shall be accepted as defined in the Control Audio Signal command. (See Table 2 — Working Set state changes (VT Supports only Active Mask) and Table 3 — Working Set state changes (VT Supports Multiple Working Sets or Window Masks Visible Simultaneously))
- d) The VT notifies the Working Set with a VT Status message sent to the global address.
- e) At some point the operator may acknowledge the alarm with the proprietary ACK means on the VT. The VT sends a Soft Key Activation message to the Working Set with key code set to zero (0) based on the

operator action (See Clause 4.6.18). Alternately, the Working Set may deassert the Alarm Mask based on its internal logic.

- f) The Working Set may choose to ignore the ACK means if the ACK is not allowed or the Working Set may change the active mask to either an Alarm Mask or a Data Mask by using the Change Active Mask command on the Working Set.
- g) The VT responds with the Change Active Mask response.
- h) The VT displays a new mask. (See Table 4 — VT behaviour on mask transition)

**Table 4 — VT behaviour on mask transition**

| Working Set's active mask attribute<br>From/To | Is requester the Current active Working Set? | VT behaviour                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Data to data                                   | Yes                                          | Hide current Data Mask, show new Data Mask.                                                                                                                                                                                                                                                                                                                     |
| Data to data                                   | No                                           | If the VT design supports only one visible Data Mask, then no visual change.<br>If the VT design supports multiple visible Data Masks and this Working Set is currently visible, then hide the current Data Mask, show new Data Mask.                                                                                                                           |
| Data to alarm                                  | Yes                                          | Hide Data Mask, show Alarm Mask.                                                                                                                                                                                                                                                                                                                                |
| Data to alarm                                  | No                                           | If this is the highest priority alarm, deactivate the current Working Set and activate this Working Set.                                                                                                                                                                                                                                                        |
| Alarm to alarm                                 | Yes                                          | If this is the highest priority alarm, hide current Alarm Mask, show new Alarm Mask.<br>Otherwise, deactivate this Working Set and activate the Working Set of the highest priority alarm.                                                                                                                                                                      |
| Alarm to alarm                                 | No                                           | If this is the highest priority alarm, deactivate the current Working Set and activate this Working Set.                                                                                                                                                                                                                                                        |
| Alarm to data                                  | Yes                                          | If an alarm exists in another Working Set, deactivate this Working Set and activate the Working Set with the highest priority alarm.<br>Otherwise, if this Working Set had the last visible Data Mask, hide the Alarm Mask and show the Data Mask.<br>Otherwise, deactivate this Working Set and activate the Working Set which had the last visible Data Mask. |
| Alarm to data                                  | No                                           | No visual change.                                                                                                                                                                                                                                                                                                                                               |

#### 4.6.15 Clipping

Most objects defined in this part of ISO 11783 have a given or implied size. The VT shall clip anything drawn outside the defined size of the object. Clipping is always done on a graphical (i.e. pixel) basis.

These clipping rules also apply to text and numeric objects. When the text does not completely fit inside the defined object area, in both wrapping and non-wrapping cases, the graphical clipping rules apply and the presentation is clipped on a graphical (i.e. pixel) basis. (See Figure 13)

Figure 13 — Clipping examples

#### 4.6.16 Scaling

##### 4.6.16.1 General

The Working Set shall determine the size of the VT's Data Mask area and Soft Key designator and make appropriate adjustments to its object definitions. These adjustments may be applied either before or after transmission of its object pool to the VT, as long as the transmitted pool is not invalid for the VT (e.g. cannot transmit colour objects to a black and white VT and then change object to black and white). This gives complete control of the appearance of the masks to the Working Set.

##### 4.6.16.2 Positions and sizes

The Working Set shall scale positions and object sizes to adapt to the VT's Data Mask area and Soft Key designator(s).

##### 4.6.16.3 Fonts

The Working Set shall apply a best-fit algorithm to determine and select the best font for the defined area. The Working Set shall also ensure that the VT supports the selected fonts and font styles. The smallest font size is  $6 \times 8$ . If the scaled height and width of the original font is less than  $6 \times 8$ , the  $6 \times 8$  font shall be used. This could result in clipping if the text is near the edge of the field object, or in text overlap if two occurrences of text are too close together after scaling the object size independently of the font size. Working Set designers shall be aware of this limitation and shall take the necessary steps. (See Clauses 4.6.19.3 Non-proportional fonts, and 4.6.19.4 Proportional fonts)

##### 4.6.16.4 Picture graphic objects

Bitmap graphics are automatically scaled by the VT according to the width attribute in the Picture Graphic object.

#### 4.6.17 Operator input

Whenever the VT displays a Data Mask that contains one or more enabled visible input objects or Buttons, it can be in one of the following states:

- a) Navigating
- b) Data input

When determining the visibility of an input object, the object shall be considered visible even under the following conditions:

- the object's width or height equals zero
- the object is covered in its entirety by another object
- the object is wholly outside the clipping limits of the parent object hierarchy as defined by the width and height attributes of all the parents in the hierarchy

Objects with width or height of zero, and objects that are wholly outside the clipping limits of the parent object hierarchy are discouraged as activation may not be possible (e.g. touch screen). The Working Set designer may consider enabling and disabling these objects as needed so the Working Set navigation is more predictable in operation.

When a new active data-mask is selected the state is reset to 'Navigating'. If an Alarm Mask is selected then the VT may remember the state and if the Working Set returns to the same data-mask after showing the alarms then the state can be restored. If this approach is implemented and the ECU returns to a different Data Mask after showing alarms, the VT shall consider it as a normal Data Mask change and send the appropriate messages. (See Table 5 — VT Reaction to navigation and data input events)

The initial focus point, if any, and the tab order for navigating to the various input fields or buttons is VT proprietary, but the ECU shall be aware that the tab order may be defined by the definition order of the input objects in the parent object.

The VT may choose not to send the VT Select Input Object message for every object that the operator passes through while navigating. E.g. if the navigation means is a rotary control, the focus will change rapidly while the operator is spinning the control. In such a case the VT may choose only to send the VT Select Input Object message to the input object which loses focus and the one which eventually gets focus.

In the 'Navigating' state the VT shall indicate to the operator which (if any) input is selected (has focus). The method of indication is proprietary to the VT. The VT may open an input object for data input as soon as the object gets focus, and it may remove focus when input is done. This is common, but not required, behaviour for touch screens.

Examples of focus-indicators include (but is not limited to) adding a frame around the input field, changing the background colour of the input field, or momentarily highlighting the input field on a touch screen VT.

The VT designer should be aware that the use of the Select Input Object command by the Working Set can be a means by which the Working Set designer intends to focus the operator attention to an input field (e.g. a setup wizard where the recommended action is highlighted).

The VT shall indicate the disabled input objects. The means to represent disabled input objects is VT proprietary. Visual changes to disabled objects to indicate the disabled state shall not extend beyond the width/height of the object and the object shall remain legible.

Working Sets may apply a frame around, or distinct background colour to, input objects as an aid to the operator in identifying input fields.

In the 'data input' state the VT behaviour is proprietary, and the VT may cover part or all of the Data Mask while the object is open for data input. Changes to the attributes of an input object during the data input process shall not affect the value currently being input (e.g. changes to an Input Number Scale shall not alter the apparent value being input).

The VT reacts to navigation related events. (See Table 5 — VT Reaction to navigation and data input events)

**Table 5 — VT Reaction to navigation and data input events**

| Current state | Command/Event       | New state  | Response frames<br>(shall be sent in the indicated sequence) |
|---------------|---------------------|------------|--------------------------------------------------------------|
| Navigating    | Select Input Object | Navigating | Select Input Object response                                 |

| Current state | Command/Event                                                                                                                                                 | New state  | Response frames<br>(shall be sent in the indicated sequence)                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | command<br>(byte 4 = FF <sub>16</sub> )                                                                                                                       |            |                                                                                                                                                                                                                                                                      |
| Navigating    | Enable/Disable Object command (to disable the object which has focus)                                                                                         | Navigating | (The object becomes disabled and loses focus - VT may move focus to the next input object)<br>Enable/Disable Object response<br>VT Select Input Object message (on object which loses focus)<br>VT Select Input Object message (on object which gets focus – if any) |
| Navigating    | Change Active Mask command (only if new mask is a new Data Mask, or if the new mask is an Alarm Mask and the VT does not store the state of the input object) | Navigating | VT Select Input Object message (on object which loses focus – if any)<br>Change Active Mask response<br>VT Status message (with new Data Mask)<br>VT Select Input Object message (on object which gets focus – if any)                                               |
| Navigating    | ESC command                                                                                                                                                   | Navigating | ESC response (with error code indicating that no input is open for input )                                                                                                                                                                                           |
| Navigating    | Operator activates a selected Button object                                                                                                                   | Navigating | Button Activation message                                                                                                                                                                                                                                            |
| Navigating    | Operator navigates to a new object                                                                                                                            | Navigating | VT Select Input Object message (on object which loses focus – if any)<br>VT Select Input Object message (on object which gets focus – if any)                                                                                                                        |
| Navigating    | Operator opens the object for data input                                                                                                                      | Data input | VT Select Input Object message (on object which has/gets focus)                                                                                                                                                                                                      |
| Navigating    | Select Input Object command<br>(byte 4 = 00 <sub>16</sub> )                                                                                                   | Data input | Select Input Object response                                                                                                                                                                                                                                         |
| Data input    | Select Input Object command (Selecting an object that does not currently have focus)                                                                          | Data input | Select Input Object response (with error code indicating that another input field is currently being entered)                                                                                                                                                        |
| Data input    | Enable/Disable Object command (to disable the object which has focus)                                                                                         | Data input | (the object stays enabled and maintains focus)<br>Enable/Disable Object response (with error code indicating that operator input is active)                                                                                                                          |
| Data input    | Change Numeric Value command (on the object that has focus)                                                                                                   | Data input | Change Numeric Value response (with error code indicating that the object is in use)                                                                                                                                                                                 |
| Data input    | Change String Value command (on the object that has focus)                                                                                                    | Data input | Change String Value response (with error code indicating that the object is in use)                                                                                                                                                                                  |
| Data input    | Change Active Mask command (only if new mask is a new Data Mask, or if the new mask is an Alarm Mask and the VT does not store the state of the input         | Navigating | VT ESC message<br>VT Select Input Object message (on object which loses focus – if any)<br>Change Active Mask response<br>VT Status message (with new Data Mask)<br>VT Select Input Object message (on object which gets focus – if any)                             |

#### 4.6.18 Soft Key and Button activation

Whenever a Key object or Button object or ACK key is pressed, released, or latched, the VT sends a Soft Key Activation message or Button Activation message to the working Set Master. If a Macro is associated with the key press, the VT executes it. Performance of the operator interface can be improved by associating a Macro with the key press event to cause another event, such as activating a different mask. See Table B.11 — Key events and Table B.13 — Button events.

Note For VT version 5 and later, the ACK key shall send messages (pressed, held, released) consistent with Key and Button objects. In VT version 4 and prior, this was not well defined and led to variations in implementation.

If a Key object or non latchable Button object is erased from the screen (e.g. due to a Change Active Mask command, Change Soft Key Mask command, Hide/Show Object command, etc) while it is activated, the VT shall send a Soft Key Activation message or Button Activation message indicating released to the erased object on its parent Data Mask. The VT shall then ignore the physical key until the operator has released it. If a Button object is moved to a new location on the active mask, while it is still pressed, the behavior depends on the method of activation. If the Button object was activated by a physical key, then the Button object stays pressed. If the Button object was activated by touch screen, pointing device or similar, and the object is moved to a location that is no longer under the touch point, the VT shall send a Button Activation message indicating released and shall then ignore the touch until the operator physically releases.

For example, when changing the visible Data Mask, the VT shall send the Soft Key Activation message indicating released for the activated object for the previous mask. It shall not send a Soft Key Activation message for the new mask.

When the “VT supports simultaneous activation of all combinations of Physical Soft Keys” bit (See Clause D.9 Get Hardware response) is zero, the VT shall only support the activation of a single Soft Key at a time and only in the prescribed sequence of <no Keys pressed> : <Key pressed> : [<Key held>] : <Key released> : <no Keys pressed>. If a second Soft Key is pressed while a first Soft Key has already been detected as pressed/held, it shall be ignored. When simultaneous activation is supported, the VT sends overlapping messages (e.g. <no Keys pressed> : <Key 1 pressed> : [<Key 1 held>] : <Key 2 pressed> : <Key 1 released> : <Key 2 released> : <no Keys pressed>).

When the “VT supports simultaneous activation of all combinations of Buttons” bit (See Clause D.9 Get Hardware response) is zero, the VT shall only support the activation of a single Button at a time and only in the prescribed sequence of <no Buttons pressed> : <Button pressed> : [<Button held>] : <Button released> : <no Button pressed>. If a second Button is pressed while a first Button has already been detected as pressed/held, it shall be ignored. When simultaneous activation is supported, the VT sends overlapping messages (e.g. <no Buttons pressed> : <Button 1 pressed> : [<Button 1 held>] : <Button 2 pressed> : <Button 1 released> : <Button 2 released> : <no Buttons pressed>).

If a Key or Button is found to be pressed at power on, it shall not be reported as held; however this can be cause for VT to report a diagnostic message to the operator.

#### **4.6.19 Font rendering**

##### **4.6.19.1 General**

##### **4.6.19.2 Text justification**

Text based objects have a justification attribute. Field justification indicates how a text string is positioned horizontally and vertically within the field defined by the width and height attributes. In version 3 and prior VTs, text justification was done on a character basis but was not precisely defined. In version 4 and later VTs, text justification is always done on a graphical (i.e. pixel) basis.

The extents of a text character (See Figure 14) shall be graphically justified as described in the following sections but some white space is permissible if the VT's font rendering engine reserves space for ascenders and descenders or for the character itself.

## Key

- 1 Graphical extents of the character.
- 2 Ascender area may create white space depending on VT design
- 3 Character rendering itself may create white space depending on VT design
- 4 Descender area may create white space depending on VT design

**Figure 14 — Graphical Extents of a Character**

During data input of a text based object, the VT designer may choose to suppress justification until the field is closed after data input.

NOTE These modifications shall be done for visual justification – the stored value is not modified.

#### 4.6.19.2.1 Horizontal left justification

When left justified, the VT shall not remove any leading spaces and the first character in the string is positioned and visible at the left side of the text field area. If auto-wrapping is enabled, the rules of auto-wrapping overrule and leading spaces on subsequent lines are trimmed before justification. If the string does not fit in the defined text field area, and auto-wrapping is not enabled, the string shall be graphically clipped on the right side. If auto-wrapping, justification rules apply to each new line. Blank lines are not removed.

In the examples below, the box represents the extents of the defined text field area.

EXAMPLE 1 Left justification, no auto-wrap, no leading spaces, "Left Justified"

Left Justified

EXAMPLE 2 Left justification, no auto-wrap, one leading space, " Left Justified"

Left Justified

EXAMPLE 3 Left justification, no auto-wrap, clipping on the right, "Left Justified Text"

Left Justified Tex

EXAMPLE 4 Left justification, auto-wrap, no leading spaces

This is left  
justified,  
wrapped text

EXAMPLE 5 Left justification, auto-wrap, one leading space

This is left  
justified,  
wrapped text

#### 4.6.19.2.2 Horizontal middle justification

When middle justified, the VT shall remove all leading and trailing spaces before justifying the string. The string shall be centered in the text field on a pixel basis. If the string does not fit in the defined text field area, and auto-wrapping is not enabled, the string shall be graphically clipped on the left and right sides. If auto-wrapping, justification rules apply to each new line. Blank lines are not removed.

In the examples below, the box represents the extents of the defined text field area.

EXAMPLE 1 Middle justification, no auto-wrap, no leading or trailing spaces, "Middle Justified"

Middle Justified

EXAMPLE 2 Middle justification, no auto-wrap, five leading and one trailing space (leading and trailing spaces are removed), " Middle Justified "

Middle Justified

EXAMPLE 3 Middle justification, no auto-wrap, clipping on the left and right, "Middle Justified"

iddle Justifie

EXAMPLE 4 Middle justification, auto-wrap, no leading or trailing spaces, "This is middle justified, wrapped text!"

This is middle  
justified,  
wrapped text!

EXAMPLE 5 Middle justification, auto-wrap, one leading and one trailing space (leading and trailing spaces are removed), " This is middle justified, wrapped text! "

This is middle  
justified,  
wrapped text!

#### 4.6.19.2.3 Horizontal right justification

When right justified, the VT shall remove any trailing spaces before justification and the last character in the string is positioned and visible at the right side of the text field area. If the string does not fit in the defined text field area, and auto-wrapping is not enabled, the string shall be graphically clipped on the left side. If auto-wrapping, justification rules apply to each new line. Blank lines are not removed.

In the examples below, the box represents the extents of the defined text field area.

EXAMPLE 1 Right justification, no auto-wrap, no trailing spaces, "Right Justified"

**Right Justified**

EXAMPLE 2 Right justification, no auto-wrap, one trailing space (space is removed) , "Right Justified "

**Right Justified**

EXAMPLE 3 Right justification, no auto-wrap, clipping on the left, "Right Justified Text"

**ht Justified Text**

EXAMPLE 4 Right justification, auto-wrap, no trailing spaces, "This is right justified, wrapped text"

**This is right  
justified,  
wrapped text**

EXAMPLE 5 Right justification, auto-wrap, one trailing space (space is removed) , "This is right justified, wrapped text "

**This is right  
justified,  
wrapped text**

#### 4.6.19.2.4 Vertical top justification

Vertical top justification is available in VT version 4 and later. When vertical top justification is enabled, the VT shall display the text string starting at the extreme top of the defined text field area. This rule applies regardless of the auto-wrapping attribute. Blank lines are not removed.

In the examples below, the box represents the extents of the defined text field area and in all examples the text is also left justified.

EXAMPLE 1 Top justification, no auto-wrap, "Vertical Top"

**Vertical Top**

EXAMPLE 2 Top justification, auto-wrap, "Vertically Top Justified Text"

Vertically  
Top  
Justified  
Text

A rectangular box containing the text "Vertically Top Justified Text" arranged in four lines. The text is left-aligned and top-justified within the box.

EXAMPLE 3 Top justification, auto-wrap, "Vertically<CR><CR>Top Justified Text"

Vertically  
  
Top  
Justified  
Text

A rectangular box containing the text "Vertically" on the first line, a blank line on the second line, and "Top Justified Text" on the third line. The text is left-aligned and top-justified within the box.

#### 4.6.19.2.5 Vertical middle justification

Vertical middle justification is available in VT version 4 and later. When vertical middle justification is enabled, the VT shall display the text string graphically centered vertically in the defined text field area. This rule applies regardless of the auto-wrapping attribute. Blank lines are not removed.

In the examples below, the box represents the extents of the defined text field area and in all examples the text is also left justified.

EXAMPLE 1 Vertical middle justification, no auto-wrap, "Vertical Middle"

Vertical Middle

A rectangular box containing the text "Vertical Middle" on a single line. The text is left-aligned and vertically centered within the box.

EXAMPLE 2 Vertically middle justification, auto-wrap, "Vertically Middle Justified Text"

Vertically  
Middle  
Justified  
Text

EXAMPLE 3 Vertically middle justification, auto-wrap, "Vertically Middle<CR><CR>Justified Text"

Vertically  
Middle  
  
Justified  
Text

#### 4.6.19.2.6 Vertical bottom justification

Vertical bottom justification is available in VT version 4 and later. When vertical bottom justification is enabled, the VT shall display the text string with the bottom edge of the text block along the bottom edge of the defined text field area. This rule applies regardless of the auto-wrapping attribute. Blank lines are not removed.

In the examples below, the box represents the extents of the defined text field area and in all examples the text is also left justified.

EXAMPLE 1 Bottom justification, no auto-wrap, "Vertical Bottom"

Vertical Bottom

EXAMPLE 2 Bottom justification, auto-wrap, "Vertically Bottom Justified Text"

Vertically  
Bottom  
Justified  
Text

EXAMPLE 3 Bottom justification, auto-wrap, "Vertically Bottom<CR><CR>Justified Text"

4.6.19.3 Non-proportional fonts

The VT shall support non-proportional block fonts. Sizes are always given in X-Y pairs. For example, 8 × 10 indicates a character size of 8 pixels wide by 10 pixels high. Characters shall not exceed the size of the box defined by the font size, regardless of style. For example, an 8 × 10 font set to bold and italics shall still fit inside the 8 × 10 pixel area. It is suggested that space be left on the bottom and right sides on the inside of the box to accommodate characters placed side by side or row by row. (See Figure 15 — 8 × 10 fonts — Example)

Dimensions in pixels

Figure 15 — 8 × 10 fonts — Example

The VT designer may choose the font sizes and styles to be made available but the default 6 × 8 font, normal (upright) style, is a minimum requirement. The Get Text Font Data message can be used by a Working Set to determine the VT's font capabilities. Characters can be rendered transparent (background shows through) or opaque (solid background colour) depending on the options attribute of the applicable object.

4.6.19.4 Proportional fonts

In version 4 and later VTs, as an option, the VT design may allow for proportional font rendering. In this case the width of each character is variable and the height attribute is fully scalable in the range from 8 pixels up to and including the largest supported font height as identified in D.7 Get Text Font Data response. As a result, only the height attribute of the font size applies and the width attribute is ignored. Therefore, the rendered characters shall not exceed the height of the chosen font size.

For example, if the VT responds to a Get Text Font Data message with Byte 6 = 10<sub>16</sub>, and Byte 7 = 02<sub>16</sub>, then the largest reported non-proportional font size is 48 pixels wide by 64 pixels in height. If the VT has indicated support for proportional font rendering (Byte 8 bit 7 = 1), then the VT supports a proportional font height from 8 up to and including the value 64, in 1 pixel resolution. Due to characteristics of the implemented font rendering

engine, and the shape of the characters, 1 pixel resolution may not be detectable for every character, even though it is supported.

Normal clipping rules still apply and Working Set designers have to be aware of the variable nature of the font width and therefore assign sufficient width to the text field. Implements can query the VT's font capabilities, including the support of proportional font rendering, via the Get Text Font Data message and may choose the proportional rendering option in the font style attribute of the Font Attributes object. If the implement requests a proportional font rendering and the VT does not support this option, the VT shall respond in one of two ways:

- if a Font Attributes object indicates proportional font during the validation of an object pool, the object pool shall be rejected
- if a Change Font Attributes command is received with invalid size and/or font type, a Change Font Attributes response shall be sent indicating an error in the size and/or type

The following general rules apply for the support of Proportional font rendering:

- a VT that indicates support for proportional fonts shall support the full height scaling range of 8 to the largest supported font size as identified in Get Text Font Data response. Character width is recognized to be variable.

Before using proportional fonts, Working Sets shall query the VT to determine if proportional font rendering is supported by the VT. If not supported, only non-proportional fonts shall be used in the pool upload and subsequent Change Font Attributes commands.

#### 4.6.19.5 Auto-wrap

If the amount of text to display is longer than the width of the text object, and auto-wrap is enabled, then regardless of non-proportional or proportional rendering, the VT shall format and wrap the text into the next line(s). The text shall not exceed the boundaries defined by the width of the text object. Wrapping shall occur under these conditions:

- Space (20<sub>16</sub>) between words.
- Soft Hyphen (AD<sub>16</sub>). When wrapping occurs on the soft hyphen, the soft hyphen shall be shown before the line break; otherwise the soft hyphen is not shown.
- Hyphen (2D<sub>16</sub>). Wrapping can occur between a hyphen (2D<sub>16</sub>) and the following character, when the Wrap on Hyphen option bit in text objects is TRUE.
- If, after applying the above rules, there is no breaking point in the line, then wrap on the last wholly visible character in the line (see Figure 13).
- At line end (See Clause 4.6.19.6 Non-printing characters in strings)

Leading space characters on the next line shall be suppressed and not considered in additional auto-wrap decisions.

#### 4.6.19.6 Non-printing characters in strings

VT version 3 and prior allowed CR, LF, and BS control characters in strings. The rendered presentation was not precisely defined.

The following clarification applies to VT version 4 and later.

- BS (Back Space) is ignored as are other characters denoted with scissors in Annex L.
- Single CR (Carriage Return) is interpreted as a line end
- Single LF (Line Feed) is interpreted as a line end

- Sequence CRLF is interpreted as a line end
- 00<sub>16</sub>, or 0000<sub>16</sub> (WideChar) shall terminate the presentation even if this occurs before the defined string length. All characters following the terminating zero shall be ignored, both for data input and presentation. Editing may increase the apparent string length up to the defined string length, but shall not limit the editing of strings, which is controlled by the length attribute.

Based on these definitions

- Sequence LFCR is interpreted as two line ends

Other non-displayable characters shall not advance the cursor during drawing or alignment decision-making. The VT can remove these characters from the string to facilitate more efficient processing.

| String Data                                                                         | VT Presentation       |                       |                       |
|-------------------------------------------------------------------------------------|-----------------------|-----------------------|-----------------------|
|                                                                                     | Left Alignment        | Middle Alignment      | Right Alignment       |
| String 1:<br>ABCDEFcRGHIJKL<br>or<br>ABCDEFcLFcRGHIJKL<br>or<br>ABCDEFcRcLFcRGHIJKL | ABCDEF<br>GHIJKL      | ABCDEF<br>GHIJKL      | ABCDEF<br>GHIJKL      |
| String 4:<br>MNOPQRLfcrSTUVWX                                                       | MNOPQR<br>¶<br>STUVWX | MNOPQR<br>¶<br>STUVWX | MNOPQR<br>¶<br>STUVWX |

Figure 16 — CR and LF application to test strings

#### 4.6.19.7 String encoding

Text strings can be encoded with either 8-bit characters (chars) or Unicode/ISO10646 characters (WideChars).

VT Version 3 and prior supported Font types are shown in "Table L.1 — ISO 8859-1 (Latin 1) character set" and "Table L.2 — ISO 8859-15 (Latin 9) character set".

VT Version 4 and later supported Font types are shown in "Table L.1 — ISO 8859-1 (Latin 1) character set" through "Table L.6 — ISO 8859-7 (Greek) character set" and "Table L.7 — WideString minimum character set".

The character set is indicated by the Font type attribute of the Font Attributes object.

WideStrings shall be encoded according to UTF-16 (Unicode Transformation Format - 16 bit) and therefore they always start with the Byte Order Mark (BOM) character FEFF<sub>16</sub>. BOM is not a displayable character and is not considered part of the text string.

UTF-16 allows both big- and little-endian encoding, but WideStrings in ISO11783-6 shall always be encoded as little-endian.

BOM is used to distinguish between 8-bit strings and WideStrings.

If the first two bytes are FF<sub>16</sub>, FE<sub>16</sub> it is a WideString, otherwise it is an 8-bit string.

The length attribute of an object or message always indicates the number of bytes in the text string, therefore the number of characters in a WideString shall be found as:

$$\text{number of WideChar} = \text{length}/2 - (\text{number of surrogate pairs}) - 1$$

e.g. FF,FE,41,00,42,00,08,D8,AC,DC => "AB€", [length = 10, number of surrogate pairs = 1, number of WideChar = 3]

If the length attribute does not indicate an even number of bytes the last byte is ignored.

The VT may support any character defined by Unicode/ISO10646, but as a minimum it shall support the characters listed in Table L.7 — WideString minimum character set.

The Font type attribute of the Font Attributes object is ignored for WideStrings.

The VT shall display WideStrings even if the WideStrings contain characters which are not supported by the VT.

The VT shall substitute unsupported characters by a displayable character. The displayable character may be VT proprietary (e.g. '□').

The encoding of

Input String object values shall not be changed by the VT, i.e. if an

Input String object contains (or references) a WideString, the VT Change String Value message sent by the VT shall also contain a WideString.

Characters above FFFF<sub>16</sub> are represented by a 32 bit 'surrogate pair', which consists of a high surrogate followed by a low surrogate.

The surrogate pair is constructed as follows:

- a) S = character - 10000<sub>16</sub>
- b) High surrogate = D800<sub>16</sub> + (S shifted 10 bits to the right)
- c) Low surrogate = DC00<sub>16</sub> + (10 least significant bits of S)

The highest character defined by Unicode and ISO10646 is 10FFFF<sub>16</sub>, corresponding to the surrogate pair DBFF<sub>16</sub>, DFFF<sub>16</sub>.

#### 4.6.20 Object Rendering Accuracy, Quality and VT Developer Freedom

It is in the intent of this standard to enable interoperability among equipment from different manufacturers, and to do so in a manner that successfully conveys the original design accurately enough for proper interpretation by the operator.

Many of the VT objects in this standard do not have all elements of their presentation explicitly defined. The implementation chosen by the developer may be one that favors computing performance, visual style, or other factors that are outside the definitions in this standard. The Output Meter object is an example where the developer defines some elements of the presentation. For example, even though the bounding width, height, and values are clearly defined, the developer can define the size and shape of the needle. Other examples

include the Output Linear Bar Graph object (e.g. fill, set point mark, tic mark size and position), and Output Line objects not conforming to a strict 0, 45, or 90-degree orientation. Drawing algorithms as may be used to render these types of objects can produce similar but varying results (e.g. two diagonal lines drawn with slightly different line drawing algorithms). Pixel level accuracy in this case may not be possible. Where pixel level accuracy is required, the designer should consider a Picture Graphic object, while also ensuring that the VT does not scale this object (e.g. the Width attribute is equal to the Actual width attribute).

#### 4.6.21 Filling output shape objects

When solid-filling output shape objects on the VT, flood-fill or boundary-fill type algorithms are not suitable, since objects can be overlaid and interrupt the fill. There are also performance problems with this type of approach. Scan-line type fills shall be implemented. In addition, only the interior area of the object, not including any pixel that is/would be part of the border, shall be included in the fill. Incorrect filling would be particularly visible when line art is used on the border or when the border is completely or partially suppressed (i.e. rectangles).

NOTE All rectangles width = 10, height = 8, line width = 2, filltype = solid grey

<sup>a</sup> rectangle width = 10, height = 8, line width = 2, filltype = solid grey, line art 1010 ..

<sup>b</sup> rectangle width = 10, height = 8, line width = 1, filltype = solid grey, line art 1010 ..

Figure 17 — Rectangle line suppression and filling examples

Pattern fills of Output Shape objects shall be done according to the following rules:

- The pattern shall be a Picture Graphic object whose width is integer divisible by 8. The raw data is used for the pattern and the object is not scaled regardless of the attributes of the object.

- The upper left corner of the pattern buffer is anchored to the upper left corner of the VT's physical Data Mask, individual designator, or user-layout window mask and repeats across and also down. This rule ensures that the pattern matches between objects in the Data Mask Area and that the pattern fill looks the same on all VT designs.
- Transparency and flashing option attributes shall be ignored for fill patterns.

Filling and line suppression examples are shown in Figure 17 — Rectangle line suppression and filling examples to Figure 19 — Polygon filling examples (Without and with border line art).

Figure 18 — Ellipse filling examples (Without and with border line art)

Figure 19 — Polygon filling examples (Without and with border line art)

#### 4.6.22 Events

##### 4.6.22.1 General

Manipulation of objects in an object pool by a Working Set or by the VT causes certain events to occur. Events can be caused by commands or by VT actions in response to a command or by other events. Many objects defined by this part of ISO 11783 have an optional list of event and Macro groupings.

If the occurring event has one or more Macros associated with it, the Macro or set of Macros is executed by the VT when the command has been accepted by the VT as a valid command. Macros are executed in the order they are encountered in the event/Macro list. Using events and Macros can make the VT operator interface more responsive, since the Working Set Master does not need to be directly involved in responding to the event.

EXAMPLE 1 A Soft Key press event could cause an appropriate Data Mask to be made active.

EXAMPLE 2 A Soft Key press event could cause two separate Macros to execute, one to make a new Data Mask active and one to control the audio signal.

**EXAMPLE 3** A Change Numeric Value command with an invalid value causes rejection of the command and an associated Macro is not executed. A Change Numeric Value command with a valid value, even if the value is the same as already in the value field, will cause the associated Macro to execute.

**EXAMPLE 4** A container with an On Hide Macro is already hidden. A Hide Show command with the parameter set to hide the container is valid and will cause the associated Macro to execute.

**NOTE** The same event id may be listed more than once in the event/Macro list of any given object.

#### 4.6.22.2 Macro references – VT version 4 and prior

Version 4 and prior VTs provide 2 bytes for each event and Macro grouping within the object definition. This means one byte for the Event ID and one byte for the Macro ID, limiting the Object IDs for Macro objects to the range of 0 to 255.

A VT version 4 single Macro reference has the following structure:

- First byte: Event ID (in the range of 0 to 254<sub>10</sub>)
- Second byte: Macro ID (in the range of 0 to 255<sub>10</sub>)

#### 4.6.22.3 Macro references – VT version 5 and later

Version 5 and later VTs, in addition to the 8-bit Macro Object IDs, shall support Macros with an Object ID in the range of 0 to 65534, requiring the use of 16-bit Object IDs for Macros. To maintain backwards compatibility, Macro references within objects are based on the same structure with 2 bytes per grouping, but two of these groupings are used to reference a macro with 16-bit Object ID. An Event ID of 255 in the first byte of the Macro reference indicates that two groupings shall be concatenated to a single grouping with a 16-bit Macro Object ID reference.

A VT version 5 single 8-bit Macro reference has the following structure:

- First byte: Event ID (in the range of 0 to 254<sub>10</sub>)
- Second byte: Macro ID (in the range of 0 to 255<sub>10</sub>)

**EXAMPLE** A Container object references a Macro with 8-bit Object ID 7<sub>10</sub> (07<sub>16</sub>) that shall be executed when the container is hidden. The event and Macro grouping within the definition of the Container object is as follows:

First byte: Event ID = 04<sub>16</sub> (on hide)  
Second byte: Macro ID = 07<sub>16</sub>

A VT version 5 single 16-bit Macro reference has the following structure:

- First byte: Event ID 255<sub>10</sub> (Use Extended Macro Reference)
- Second byte: Low byte of Macro ID (Macro ID in the range of 0 to 65534<sub>10</sub>)
- Third byte: Event ID (in the range of 0 to 254<sub>10</sub>)
- Fourth byte: High byte of Macro ID (Macro ID in the range of 0 to 65534<sub>10</sub>)

**EXAMPLE** A Container object references a Macro with 16-bit Object ID 7000<sub>10</sub> (1B58<sub>16</sub>) that shall be executed when the container is hidden. The event and Macro grouping within the definition of the Container object is as follows:

First byte: Event ID = FF<sub>16</sub> (Use Extended Macro Reference)  
Second byte: Macro ID = 58<sub>16</sub>  
Third byte: Event ID = 04<sub>16</sub> (on hide)  
Fourth byte: Macro ID = 1B<sub>16</sub>

#### 4.6.23 Touch screens and pointing devices

The VT design can optionally support a touch screen or a pointing method such as a mouse or joystick. The Working Set can determine the VT's capabilities in this regard by using a Get Hardware message and then make necessary adjustments to its object pool. A Button object is defined to allow touchable or clickable buttons to be included in a Data Mask. A Pointing Event message is defined to allow the VT to notify the

active Working Set that an area of the Data Mask (or Alarm Mask) *not associated* with a button or other input object has been touched or clicked on.

#### 4.6.24 Proprietary Means

There are various proprietary means supported by the VT (Proprietary Objects, Proprietary Events, Proprietary Colours, Proprietary Commands, and Proprietary Fonts). Use of these proprietary means where the Working Set is provided by a different manufacturer than that which provides the VT is not recommended in order to provide maximum ISO compatibility. As these items are proprietary, the Working Set or VT manufacturer may change their proprietary means without disclosure.

Further, and in the context of the Proprietary Objects, it is not possible to parse an object for which the definition is not known, and attempting to do so may cause the VT to reject the pool.

Additionally, Working Sets and VTs may exchange, and support, higher version messages and objects without violating this standard as long as those features do not contradict the requirements defined for the lower version (e.g. a version 2 VT may support Font type 5 – Cyrillic, even though not part of the standard until version 4). Even as this mechanism leverages the standard, it shall be considered a proprietary means as it is not defined in the lower version. Therefore, a proprietary means is required to determine if the connected VT or Working Set supports the newer features, and the ECU should not assume that the new features are supported to avoid undefined behavior.

#### 4.6.25 VT Number

By default, VT's shall be factory set to function instance zero (0), but will retain the function instance as configured by the operator. A mechanism is required in order to conveniently resolve conflicts in the case where there are multiple VT's with the same function instance and in the case where there is no VT with function instance zero. The VT shall be responsible for providing a proprietary means for setting the function instance from the display itself. This means shall ensure that duplicate function instances between VT's are not created. The new function instance shall not be used until a re-initialization of the VT is performed (see clause 4.6.6). The VT with function instance zero (0) is defined as the "primary VT".

The proprietary means to set the function instance shall represent to the operator a VT Number (See Clause 3 Terms and definitions). In this way, VTs from all manufacturers will present a consistent numbering scheme for the operator to choose the primary (and secondary) VT(s). To facilitate easy VT identification, the Identify VT message may be used.

#### 4.6.26 Packet Padding

All VT to ECU and ECU to VT messages that are not explicitly defined to contain exactly 8 data bytes shall be padded to the 8 byte boundary with FF<sub>16</sub>.

### 4.7 Displaying Data from Multiple Working Sets on One Mask

#### 4.7.1 General

Clause 4.7 and all subordinate clauses apply to VT version 4 and later.

##### 4.7.1.1 Displaying Data on one screen

The VT may provide a means where data from multiple Working Sets can be made available on one screen. Depending upon the VT design, it is also possible that data from multiple Working Sets can be made available simultaneous to the VTs standard Data Mask and Soft Key Mask. See example in Figure 20.

- Key
- 1 Key Group Objects in non-VT area (shaded regions indicate independent Key Groups)
  - 2 Window Mask Objects in non-VT area
  - 3 VT area (presenting standard VT screen or User-Layout Data Mask and User-Layout Soft Key Mask)

Figure 20 — Displaying data from multiple Working Sets - Example

4.7.1.2 Minimal Requirements

This is an optional feature. However, as a minimum, the VT shall be required to parse the Window Mask and Key Group objects even if not supported. This allows Working Sets to upload these objects to all version 4 and later VTs without modification of the object pool. If this feature is supported, the VT shall support the 'free form' (type 0) window mask type of the Window Mask object as a minimum. Any number of the other non-zero window mask types may also be supported as desired. Working Set designs may desire the use of any of the window mask types so implementation, by the VT design, of all window mask types is encouraged. If the Working Set uploads a Window Mask object with an unsupported window mask type, the VT shall parse, but ignore, this object and no errors shall be raised. Unsupported window mask types would not be presented to an operator for selection.

If the Working Set chooses to participate in this feature, it shall upload Window Mask and Key Group objects as part of the object pool. Since the VT shall parse but ignore any Window Mask objects with unsupported window mask type, no modification of the object pool is necessary.

4.7.2 User-Layout Data Mask

The VT may support any number of User-Layout Data Masks. User-Layout Data Masks are special Data Mask objects that are owned by the VT. The VT shall provide a mechanism to allow the operator to access the available User-Layout Data Masks.

Each User-Layout Data Mask is the same size as a standard Data Mask object but is divided into a grid of Window Cells with exactly two columns and six rows (See Figure 21).

## Key

1 User-Layout Data Mask showing 12 Window Cells

**Figure 21 — User-Layout Data Mask**

#### 4.7.3 Window Mask object

Window Mask objects, optionally supplied in the object pools of Working Sets, are placed into a specific User-Layout Data Mask grid as desired by the operator of the VT. An individual Window Mask object may take up more than one Window Cell, and may take up the entire 2x6 grid. 1x1 Window Masks are recommended where possible to allow the operator to select from a wide range of Window Mask objects to display in each User-Layout Data Mask. (See example in Figure 22).

NOTE Window Mask objects are not limited to the sizes shown in Figure 22.

#### 4.7.4 Window Mask content

##### 4.7.4.1 Presentations

A Window Mask object can display content using two different types of presentations. This is controlled by the Working Set, using a Window Type attribute. More details are available in Clause 4.7.16 Uploading New Window Mask and Key Group objects.

##### 4.7.4.2 Working Set defined presentation

If the Window Mask object has a Window Type of zero, the Window Mask object behaves very similar to a Data Mask object (other than the “size” of the Window Mask object). As with a Data Mask object, all content and presentation is defined by the Working Set.

##### 4.7.4.3 VT defined presentation

If the Window Mask object has a Window Type in the allowed set of non-zero values, the Working Set provides references to a specific set of objects, and the VT then controls the presentation of those objects. The VT is free to ignore any visual formatting attributes in the referenced objects. This capability allows information from different manufacturers to have a consistent look and feel and interaction with the operator when combined into the VT.

- Key
- |   |                     |   |                     |
|---|---------------------|---|---------------------|
| 1 | Window Mask (2 x 1) | 4 | Window Mask (1 x 2) |
| 2 | Window Mask (2 x 2) | 5 | Window Mask (1 x 3) |
| 3 | Window Mask (1 x 1) |   |                     |

Figure 22 — Window Mask objects - Example

If User-Layout Data Masks are supported, the VT shall provide a proprietary mapping mechanism to allow the operator to select which Window Mask objects are placed in which Window Cells in each of the User-Layout Data Masks. The VT shall prevent the operator from choosing a Window Mask object that does not fit in the selected Window Cell(s). When a Window Cell is selected in the mapping screen by the operator, the VT shall present the list of all Window Mask objects that can fit in the cell(s), provided the Window Mask object is available (see options attribute in the Window Mask object). The VT shall store the operator selected layout of each of the User-Layout Data Masks in non-volatile memory for recall on next power up. If the Working Set that provided the Window Cell is not present, the Window Cell shall be blanked (i.e. filled with the background colour).

If a Window Mask object's options attribute indicates that the mask is not available, the VT shall blank (i.e. fill with the background colour) the associated Window Cell so that the Window Mask is not visible. A change in state of the availability option may occur at runtime.

If the VT is Version 4 or later but does not support User-Layout Data Masks, the Working Set may still include these objects in the object pool transfer. The VT shall parse the Window Mask object and may then discard it.

The Window Mask object width shall be equal to the width of the Window Cell(s) that it occupies. The Window Mask object height shall be equal to the height of the Window Cell(s) that it occupies.

NOTE: Working Set designs are encouraged to participate in the User-Layout Data Mask by uploading Window Mask objects since this can be a feature requested by users.

#### 4.7.5 Window Cell Size and Borders

The size of a single Window Cell is based on the 2x6 grid in the User-Layout Data Mask. The size of each Window Cell shall be rounded down. Therefore, the size of a Window Cell is defined as follows:

$$\text{Window Cell Width} = \text{Data Mask Width} / 2 \quad (\text{rounded down})$$

$$\text{Window Cell Height} = \text{Data Mask Height} / 6 \quad (\text{rounded down})$$

The VT may draw a border around each Window Mask object. Whether the borders or any particular part of the borders are actually drawn or not, is proprietary to the VT design. Border drawing is recommended but may be based on an operator choice. The border area shall occupy the outside 1 pixel around the entire Window Mask object and shall be drawn inside the Window Mask object's region. Working Set designs shall be aware of this and therefore it is recommended that no child object be placed on or touching the border area when the free form (type 0) window type is used. See Clause B.19.2 Window Mask Window Type. See Figure 23 for an example of the border.

EXAMPLE:

Key

- 1 Window Mask Region
- 2 1-pixel border drawn around inside perimeter of Window Mask

**Figure 23 — Window Mask Border - Example**

The VT shall clip any pixel in the Window Mask object (and its children) that falls outside the Window Mask region.

#### 4.7.6 Window Mask Scaling

Depending on the type of Window Mask, the VT and the Working Set shall cooperate in terms of scaling. If the window type is type 0 (free form), then as with other objects in the object pool, scaling of the Window Mask object and its children is solely the responsibility of the Working Set. Regardless of the resolution of the VT in use, the aspect ratio is known since the User-Layout Data Mask always has a 2x6 grid and the Data Mask area is always square. Object pool designers should design the Window Mask object to an appropriate aspect ratio which makes the scaling easier.

**EXAMPLE 1** If the object pool is designed for a default 200x200 Data Mask Area, using the equations in Clause 4.7.5, the size of each Window Cell would be:

$$\text{Window Cell Width} = 200 / 2 = 100 \text{ pixels}$$

$$\text{Window Cell Height} = 200 / 6 = 33 \text{ pixels}$$

**EXAMPLE 2** Using the Window Cell sizes above when using a VT with a default 200x200 Data Mask Area, a 2x2 Window Mask would use:

Window Mask Width = 100 x 2 = 200 pixels

Window Mask Height = 33 x 2 = 66 pixels

The VT controls most of the layout, formatting and scaling of objects when the Window Mask type is not the Free Form Window (0). The exception to this rule is the Window Icon and Button attributes that are pre-scaled by the Working Set. The VT may further scale the Window Icon and Buttons if necessary. More information is contained in the sections that describe the window types greater than type zero (See Clause B.19.2 Window Mask Window Type).

4.7.7 Using Window Masks Outside of User-Layout Data Masks

The VT may optionally use Window Mask objects in Non-VT Screens and Non-VT Areas, if supported by the manufacturer's design (see Figure 20). Soft Keys may or may not be supported when used in non-VT screens and non-VT areas. Working Sets shall be aware that Window Mask object may be used outside of User-Layout Data Mask and therefore shall monitor the VT On User-Layout Hide/Show message and refresh Window Mask objects and keys that are visible regardless of the source address specified in the VT Status message.

4.7.8 User-Layout Soft Key Mask

If the VT supports User-Layout Data Masks, it shall also support one and only one User-Layout Soft Key Mask per User-Layout Data Mask. User-Layout Soft Key Masks are special Soft Key Mask objects that are owned by the VT. Each User-Layout Soft Key Mask is divided into Key Cells (one cell per physical key if Physical Soft Keys are used). The number of Key Cells supported by the User-Layout Data Mask is proprietary to the VT design. Each Key Cell is sized to a normal Soft Key designator. The User-Layout Soft Key Mask is divided into Key Cells as shown in Figure 24.

The VT designer shall decide how many keys per User-Layout Soft Key Mask are supported up to a maximum of 64. If the number of keys supported exceeds the number of physical Soft Keys, the VT shall provide a paging mechanism (identical to the Soft Key Mask object) to allow for proper mapping and operation.

- Key
- 1 Key Cells (same size as Soft Key designator)
  - 2 User-Layout Soft Key Mask

Figure 24 — Key Cell layout - Examples

#### 4.7.9 Key Group Objects

Key Group objects (see Clause B.20), optionally supplied in the object pools of Working Sets, are placed into a User-Layout Soft Key Mask by the operator of the VT. A Key Group object may contain one to four Key objects (although one is typical) and therefore may occupy one or more Key Cells. If User-Layout Data Masks and User-Layout Soft Key Masks are supported, the VT shall provide a proprietary mapping mechanism to allow the operator to select which Key Group objects are placed in which Key Cells in each of the User-Layout Soft Key Masks. When Key Cell(s) are selected in the mapping screen by the operator, the VT shall present the list of all Key Group objects from all Working Sets that provide them, provided the Key Group is available (see options attribute in the Key Group object). The VT shall store the operator selected layout of each of the User-Layout Soft Key Masks, in non-volatile memory, for recall on the next power up. If the Working Set that provided the Key Group Objects is not present, the assigned Key Cell(s) shall be blanked (i.e. filled with the background colour).

If a Key Group object's options attribute indicates that the Key Group is not available, the VT shall blank (i.e. fill with the background colour) the associated Key Cells so that the Key objects are not visible and cannot be activated by the operator. A change in state of the availability option may occur at runtime.

Working Set designers shall be aware that Keys may or may not be available and since the operator is in control of what is mapped on each User-Layout Data Mask, Window Mask objects shall not depend on the presence of a particular, or set of particular, Key Groups.

Key

- 1 Key Group containing 1 Key
- 2 Key Group containing 2 Keys
- 3 Key Group containing 3 Keys

**Figure 25 — User-Layout Data Mask with 6 Key Cells - Example**

Working Set designers should ensure that Keys can be recognized to be part of a specific Working Set (e.g. displaying just a text string "STOP" on a Key might lead to confusion by the operator if a particular configuration uses 3 "STOP" Keys in the same User-Layout Soft Key Mask). To create a consistent look and feel, the key layout shown in Figure 26 — Key object in a Key Group indicating Working Set - Example is recommended.

Key

- 1 Implement identifier (sized to 60% of the height of a standard Soft Key designator (rounded down) and width equal to height) and anchored in the bottom left corner of the designator area.
- 2 Key object in a Key Group is the size of a Soft Key designator (uses all remaining pixels in the standard designator area)

**Figure 26 — Key object in a Key Group indicating Working Set - Example**

#### 4.7.10 Key Cell Size and Borders

The same drawing rules that apply to Soft Key Mask objects also apply to User-Layout Soft Key Mask objects. A Key Cell size is the same size as a normal Soft Key designator.

#### 4.7.11 Key Group Scaling

Similar to other objects in the Object Pool, scaling of the Key Group object's children is the responsibility of the Working Set.

#### 4.7.12 Using Key Group Objects outside of User-Layout Soft Key Masks

The VT may optionally use Key Group objects outside of User-Layout Soft Key Mask, if supported by the manufacturer's VT display design. Working Sets shall be aware that Key Group objects can be used outside of User-Layout Soft Key Mask and therefore shall monitor the VT On User-Layout Hide/Show message and refresh keys that are visible regardless of the source address specified in the VT Status message.

Key

1 3 Key Group Objects outside of User-Layout Soft Key Masks

**Figure 27 — Key Group Objects outside of User-Layout Data Mask - Example**

#### 4.7.13 Operator Inputs

It is possible that input objects from several Working Sets can be on screen at the same time. The usual navigation and data input rules apply with the following exceptions:

- a) Select Input Object commands from any Working Set are not acted upon when a User-Layout Data Mask is displayed because the VT is the owner of the Data Mask. In this case, the VT shall send a Select Input Object response with an error indicated.
- b) Navigation order is VT-proprietary.
- c) Macros associated with input object events shall be executed but Working Set designers must be aware that there may be no visible effect since the Working Set is not the active Working Set. For example, objects acted upon or made visible by the macro may not be on screen and Change Active Mask commands selecting a Data Mask will have no effect because the Working Set is not the active Working Set.
- d) When an input object in a Window Mask is activated by the operator, the VT becomes the active Working Set in the VT Status message. If Working Set Data Mask(s) are also visible, the indicator of the active Data Mask shall be removed since the VT is now the active Working Set. Whether or not an "active working set" indicator is displayed around the Window Mask is proprietary to the VT design. The VT shall also use the VT On user-Layout Hide/Show message to inform the Working Set about this change. See 4.6.8 Working Set object and active masks.

#### 4.7.14 Refreshing On Screen Data

Whenever a Window Mask object or Key Group object is on screen, it shall be the responsibility of the Working Set to refresh values and objects as required. If a Working Set times out, the connection management rules apply and the VT shall remove from the screen, any Window Mask objects and Key Group objects that belong to the affected Working Set.

In order to refresh on screen objects, the Working Sets need to be made aware of what Window Mask objects and Key Group objects are visible. This is accomplished by the VT On User-Layout Hide/Show message (see Clause H.20). This message shall be sent by the VT for each Window Mask and Key Group object that has been displayed or removed from the display.

NOTE The VT Status message is not used to determine when to update Window Mask or Key Group objects.

#### 4.7.15 Look and Feel

##### 4.7.15.1 User-Layout Data Mask Look and Feel

When mixing Window Mask objects from several Working Sets, general look and feel can quickly become a problem for the operator since objects may not line up vertically and horizontally and may use different colour schemes and fonts. Therefore restrictions are required for the design of the windows represented by the Window Mask objects and their children. In addition, the VT controls the look and feel on its User-Layout Data Masks. The strategy is that the Working Set supplies the superset of attributes that the VT may need to render the Window Mask objects but the VT decides what is displayed and where it is displayed in the Window Mask object assuming the window type is greater than zero. The following rules and guidelines shall apply:

- a) When the Window Type is not the Free Form Window, the VT determines the background color and transparency of the window. If required the Working Set designer can query the VT's background colour with the Get Window Mask Data message.
- b) Window contents should be designed as described in the following clauses.
- c) The VT may ignore any visual formatting attributes in the Working Set's supplied object references where the Window Type is not the Free Form Window.

##### 4.7.15.2 Window Title and Window Title Font Attributes

The VT may optionally use this string for a title inside the Window Mask. Formatting is proprietary to the VT designer. The VT shall always display either or both of the Window Title and Window Icon as these elements are considered to be functionally equivalent and describe the contents of this window.

##### 4.7.15.3 Window Icon size and shape

The VT may optionally use the Window Icon attribute inside the Window Mask. The Window Icon attribute in the Window Mask object shall reference a Picture Graphic object. Positioning is proprietary to the VT designer, subject to the rules below. The Window Icon Area shall be square and shall be 90% of the height of a single Window Cell, rounded down.

EXAMPLE In a 200x200 Data Mask Area, the Window Cell size is 100 pixels wide by 33 pixels high. The standard Window Icon Area is then:

$$\text{Icon Height} = 33 \times 0.90 = 29 \text{ pixels}$$

$$\text{Icon Width} = \text{Icon Height} = 29 \text{ pixels}$$

This provides for room for a window border and some white space outside the Window Icon Area. Using the above information, Working Set designers may pre-scale the Window Mask Icon Picture Graphic object at design time or set the scale, via the width attribute, at run-time. It is permissible for the Working Set to supply an icon that is smaller or larger than the Window Icon Area. It is also permissible to provide an icon in an aspect ratio different from the square aspect ratio of the Window Icon Area. The VT may position the icon as desired if the icon dimension (X or Y) is smaller than the Window Icon Area. The VT shall center and clip the icon if the icon dimension (X or Y) is larger than the Window Icon Area. These rules apply independently to the X and Y dimensions.

Working Set designers should supply an icon that clearly represents not only the specific function being displayed but also a representation of the Working Set so that the source of the data is evident to the operator.

#### 4.7.15.4 Formatting

For window types greater than zero, the VT look and feel design shall ensure that at least the minimum number of characters are displayed for numeric and string value fields and shall obey the numeric scaling and numeric formatting attributes supplied by the Working Set. Specifically, this includes the options (bits 1, 2 and 3), variable reference, value, offset, scale, number of decimals and format attributes. Look and feel attributes such as justification, colour and other formatting attributes may be ignored by the VT to achieve its desired look and feel. More information on field lengths is given in the section on Window Mask Window Type (See Clause B.19.2).

#### 4.7.16 Uploading New Window Mask and Key Group objects

Uploading completely new objects (as long as the object type does not change) at run-time is permitted by Annex C of this standard. In terms of Window Mask and Key Group objects, there are several cases that shall be considered and managed properly by the VT design as identified in Table 6 — VT Behavior When New Window Mask or Key Group Object is Uploaded.

Table 6 — VT Behavior When New Window Mask or Key Group Object is Uploaded

| Event                                                                                                                                                | VT Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A new Window Mask or Window Mask child is uploaded that creates a simple change in appearance (background colour, option change, child change etc.). | If the object is visible, the VT shall refresh it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| A new Window Mask is uploaded that changes its availability from available to not available                                                          | If the object is visible, the VT shall blank (i.e. fill with the background colour) the area occupied by the object so that it is removed from the screen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| A new Window Mask is uploaded that changes its size                                                                                                  | <p>If the size decreases and the Window Mask is visible, the VT shall refresh the object and all window cells that it originally occupied. It shall also blank (i.e. fill with the background colour), all window cells that are no longer used by this object. The VT shall adjust the stored mapping to reflect the new unused window cells.</p> <p>If the size increases, the VT shall determine if the object still fits on screen in its current position in the grid and whether or not empty window cells are available in the extended positions to accommodate the new object. If yes, the VT shall refresh the object and adjust the stored mapping (for occupied window cells). If no, the VT shall automatically remove the window from the stored mapping and, if visible, shall blank (i.e. fill with the background colour) the window cells that it originally occupied.</p>                                                                                                                  |
| A new Window Mask is uploaded that changes its window type                                                                                           | If the object is visible, the VT shall refresh it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| A new Key Group object is uploaded that creates a simple change in appearance (option change, child change etc.)                                     | If the object is visible, the VT shall refresh it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| A new Key Group object is uploaded that changes its availability from available to not available                                                     | If the object is visible, the VT shall blank (i.e. fill with the background colour) the area occupied by the object so that it is removed from the screen. The positions of other mapped Key Group objects shall not be effected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| A new Key Group object is uploaded that changes the number of keys in the group                                                                      | <p>If the number of keys in the group decreases, and the object is visible, the VT shall refresh the object and blank (i.e. fill with the background colour) and key positions that are no longer used. The VT shall adjust the stored mapping to reflect the new unused key positions. The positions of other mapped Key Group objects shall not be effected.</p> <p>If the number of keys in the group increases, the VT shall determine if there are enough empty key positions on the same page to accommodate the new object, without changing the position of the Key Group object. If yes, the VT shall extend the mapping of the object (for occupied key positions) and refresh the Key Group object if visible. If no, the VT shall automatically remove the Key Group from the mapping and, if the object is visible, shall blank (i.e. fill with the background colour) the key positions that it originally occupied. The positions of other mapped Key Group objects shall not be effected.</p> |

## Annex A (normative)

### Object, event, colour and command codes

#### A.1 Object types

##### A.1.1 General

This part of ISO 11783 takes an object-oriented approach. The VT shall be capable of managing the set of objects given in Table A.1 — Virtual terminal objects, which includes the requirement to parse the objects, even if the object is not functionally supported. Each Working Set using the services of the VT defines an object pool that is a collection of the objects given. Each object has a specific, well-defined behaviour and a specific set of attributes.

**Table A.1 — Virtual terminal objects**

| Object                          | Type ID          | Description                                                                                                                                                      |
|---------------------------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Top level objects</b>        |                  |                                                                                                                                                                  |
| Working Set object              | 0 <sub>10</sub>  | Top level object that describes an implement's ECU or group of ECUs (Working Set). Each Working Set is required to define one, and only one, Working Set object. |
| Data Mask object                | 1 <sub>10</sub>  | Top level object that contains other objects. A Data Mask is activated by a Working Set to become the active set of objects on the VT display.                   |
| Alarm Mask object               | 2 <sub>10</sub>  | Top level object that contains other objects. Describes an alarm display.                                                                                        |
| Container object                | 3 <sub>10</sub>  | Used to group objects.                                                                                                                                           |
| Window Mask object <sup>e</sup> | 34 <sub>10</sub> | Top level object that contains other objects. The Window Mask is activated by the VT.                                                                            |
| <b>Key objects</b>              |                  |                                                                                                                                                                  |

### A.1.2 Nomenclature

The following data types and nomenclature are used in the object definitions in Annex B.

- []** When surrounding an AID number this indicates that it is a read-only attribute and is accessible with the Get Attribute Value message. AIDs that are explicitly defined without square brackets are writable with the Change Attribute command.
- Array** A sequence of 1 byte unsigned integer values of a defined length.
- Bitmask** A set of logical bit values. Size is 1 byte. Bitmasks always have Bit 0 defined as the least significant bit. (See Figure A.1 — Bit positions in a bitmask)
- Boolean** Logical TRUE (1) or FALSE (0). Size is 1 byte.
- Byte** Signed or unsigned integer numeric value with a size of exactly 1 byte.
- Float** IEEE 754-1985 standard 32-bit floating point numeric value. Size is 4 bytes.

- Integer

Signed or unsigned integer numeric value. Possible sizes are 1, 2 or 4 bytes.
- String

Zero or more characters composed of either the primitive type “Char” or the primitive type WideChar. String length is variable.
- Length

The size of an object, always expressed as a count of the Bytes required to hold the object.

Key  
1 most significant  
2 least significant

Figure A.1 — Bit positions in a bitmask

A.1.3 Object relationships

The visible objects of an object pool are arranged in a hierarchy, where parent objects contain child objects.

Some of the child objects can also contain objects, and then they can become parent objects to their own child-objects. Table A.2 — Allowed hierarchical relationships of objects shows the containment rules of objects within the object pool hierarchy.

Table A.2 — Allowed hierarchical relationships of objects

|               |                                | Parent Object      |                  |                   |                  |                    |                      |            |               |                  |                   |                    |                                  |                               |                                  |                               |                                     |

| NOTE: The numbers in the table above denote Child Objects that can be contained within a Parent Object in the indicated VT version including later versions. |                                                    |                    |                  |                   |                  |                    |                      |            |               |                  |                   |                    |                                  |                               |                                  |                               |                                     |
| NOTE: Containment rules of the parent override containment rules of the child                                                                                |                                                    |                    |                  |                   |                  |                    |                      |            |               |                  |                   |                    |                                  |                               |                                  |                               |                                     |
| NOTE: Object pointed to by Object Pointer cannot violate the containment rules of the parent hierarchy                                                       |                                                    |                    |                  |                   |                  |                    |                      |            |               |                  |                   |                    |                                  |                               |                                  |                               |                                     |

## A.2 Event types

Table A.3 — Event summary presents the events defined by this part of ISO 11783. An event ID is assigned to each so that events can be uniquely associated with a Macro object to execute when the event occurs. VT behaviour specific to each object is defined in event tables given with each object.

Table A.3 — Event summary

| Event name                  | Event ID<br>8-bit Macro or<br>16-bit Macro <sup>c</sup> | Event occurs when:                                                                                                                                          |
|-----------------------------|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reserved                    | 0 <sub>10</sub>                                         | Reserved                                                                                                                                                    |
| On activate                 | 1 <sub>10</sub>                                         | Working Set is made active.                                                                                                                                 |
| On deactivate               | 2 <sub>10</sub>                                         | Working Set is made inactive.                                                                                                                               |
| On show                     | 3 <sub>10</sub>                                         | For Container objects, triggered by the hide/show command, with “show” indicated; for mask objects, when the mask is made visible on the display.           |
| On hide                     | 4 <sub>10</sub>                                         | For Container objects, triggered by the hide/show command, with “hide” indicated; for mask objects, when the mask is removed from the display.              |
| On refresh                  | N/A                                                     | An object that is already on display is redrawn (Macros cannot be associated with this event so no event ID is defined).                                    |
| On enable                   | 5 <sub>10</sub>                                         | Input object is enabled (only enabled input objects can be navigated to). An Animation object is enabled for animation.                                     |
| On disable                  | 6 <sub>10</sub>                                         | Input object is disabled (only enabled input objects can be navigated to). An Animation object is disabled for animation.                                   |
| On Change Active Mask       | 7 <sub>10</sub>                                         | Change Active Mask command.                                                                                                                                 |
| On Change Soft Key Mask     | 8 <sub>10</sub>                                         | Change Soft Key Mask command.                                                                                                                               |
| On Change Attribute         | 9 <sub>10</sub>                                         | Change Attribute command.                                                                                                                                   |
| On Change Background Colour | 10 <sub>10</sub>                                        | Change Background Colour command.                                                                                                                           |
| On Change Font Attributes   | 11 <sub>10</sub>                                        | Change Font Attributes command.                                                                                                                             |
| On Change Line Attributes   | 12 <sub>10</sub>                                        | Change Line Attributes command.                                                                                                                             |
| On Change Fill Attributes   | 13 <sub>10</sub>                                        | Change Fill Attributes command.                                                                                                                             |
| On Change Child Location    | 14 <sub>10</sub>                                        | Change Child Location command.                                                                                                                              |
| On Change Size              | 15 <sub>10</sub>                                        | Change Size command.                                                                                                                                        |
| On Change Value             | 16 <sub>10</sub>                                        | Change Numeric Value command or Change String Value command.                                                                                                |
| On Change Priority          | 17 <sub>10</sub>                                        | Change Priority command.                                                                                                                                    |
| On Change End Point         | 18 <sub>10</sub>                                        | Change End Point command.                                                                                                                                   |
| On Input Field Selection    | 19 <sub>10</sub>                                        | The input field or Button has received focus, operator has navigated onto the input field or Button or the VT has received the Select Input Object command. |
| On Input Field Deselection  | 20 <sub>10</sub>                                        | The input field or Button has lost focus, operator has navigated off of the input field or Button or the VT has received the Select Input Object command.   |
| On ESC                      | 21 <sub>10</sub>                                        | Input aborted on an input field either by the operator or the Working Set.                                                                                  |
| On entry of a value         | 22 <sub>10</sub> <sup>a</sup>                           | Operator completes entry by activating the ENTER means — value does not have to change.                                                                     |
| On entry of a new value     | 23 <sub>10</sub> <sup>a</sup>                           | Operator completes entry by activating the ENTER means — value has changed.                                                                                 |

| Event name                                                                                                                                                                                                                                                                                                                                                             | Event ID<br>8-bit Macro or<br>16-bit Macro <sup>c</sup>                                                | Event occurs when:                                                                                                                                                                                     |

| <sup>a</sup> Monochrome (0 and 1).<br><sup>b</sup> 16-colour mode (0 to 15). |             |       |             |       |             |       |             |

The VT colour palette is based on the standard 216 colour “web browser safe” palette used by Internet browsers. Hexadecimal RGB values of 00, 33, 66, 99, CC and FF are used giving a  $6 \times 6 \times 6 = 216$  colour cube. The colour palette is organized as follows. The first two colours at indices 0 and 1 are used in monochrome mode. The first 16 colours are used in 16 colour mode. In order to reduce search time during palette mapping on an object development tool, colours 16 to 231 are organized in sorted, ascending order. Colours 232 to 255 are proprietary to the VT design to extend the colour palette. VT designers choosing a grey-scale implementation can map the 16 or 256 colour modes to shades of grey.

NOTE 256 colour mode does not actually give 256 unique colours because the first 16 colours are repeated elsewhere in the palette.

Colour and pixel values given in object attributes and bitmap data are an index into this palette table.

There are three defined colour modes. VT designs supporting higher modes shall also support lower modes, as follows:

- a) monochrome only (black and some other colour, usually white) (valid colour codes 0 to 1);
- b) 16-colour mode (VT shall support 16 colour and monochrome) (valid colour codes 0 to 15);
- c) 256-colour mode (VT shall support all colours of the palette) (valid colour codes 0 to 255).

#### A.4 Command/parameter code summary

Table A.5 — Command/parameter summary lists all defined messages with the corresponding function code.

Table A.5 — Command/parameter summary

| Clause/<br>subclause | Message                          | Direction | Function<br>(Decimal) | Function<br>(Hex) | Allowed<br>in<br>Macro | VT<br>version <sup>c</sup> |

## Annex B (normative)

### Object definitions

#### B.1 Working Set object

This object describes a Working Set. Each Working Set shall provide one, and only one, of this object in its object pool. This object shall include one or more objects that fit inside a Soft Key designator for use as an identification of the Working Set. The VT may optionally use the identifier in communication alarms, Auxiliary Control setup, in Soft Keys and any other place where an identifier for the Working Set is required. Only the VT can activate this object. When this object is activated, the associated Working Set “owns” the VT. (See Table B.1 — Working Set events and Table B.2 — Working Set attributes and record format).

##### Allowed Commands:

- Change Active Mask command;
- Change Background Colour command;
- Change Child Location command;
- Change Child Position command;
- Get Attribute Value message (VT version 4 and later).

**Table B.1 — Working Set events**

| Event                       | Caused by                                                | VT behaviour                                                                                                                                                                          | Message                                                                    |
|-----------------------------|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| On Activate                 | Operator selection of this Working Set via the VT        | Deactivate event on current Working Set object. Show event on the active Data Mask of this Working Set object (assuming no alarms).                                                   | VT Status message                                                          |
| On Deactivate               | Operator selection of a different Working Set via the VT | Hide event on active Data Mask of this Working Set.                                                                                                                                   | VT Status message                                                          |
| On Change Active Mask       | Change Active Mask command                               | Change the active mask attribute. If this Working Set is active, then perform a hide event on the current active mask and a show event on the new active mask.                        | Change Active Mask response. VT Status message if the Active Mask changed. |
| On Change Background Colour | Change Background Colour command                         | If the Working Set designator is visible, fill area with background colour and draw child objects in the order they are listed.                                                       | Change Background Colour response                                          |
| On Change Child Location    | Change Child Location command                            | If the Working Set designator is visible, draw child object at current location in background colour to erase it. Refresh Working Set designator (to redraw child object or objects). | Change Child Location response                                             |
| On Change Child Position    | Change Child Position command                            | If the Working Set designator is visible, draw child object at current location in background                                                                                         | Change Child Position response                                             |

|  |  |                                                                                            |  |

Table B.2 — Working Set attributes and record format

| Attribute Name                | AID | Type           | Size (bytes) | Range or Value          | Record byte                   | Description                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-----|----------------|--------------|-------------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID                     |     | Integer        | 2            | 0-65534                 | 1-2                           | Object identifier. Shall be unique within the object pool.                                                                                                                                                                                                                                                                                                |
| Type                          | [0] | Integer        | 1            | =0                      | 3                             | Object Type = Working Set                                                                                                                                                                                                                                                                                                                                 |
| Background colour             | [1] | Integer        | 1            | 0-255                   | 4                             | Background colour.                                                                                                                                                                                                                                                                                                                                        |
| Selectable                    | [2] | Boolean        | 1            | 0 or 1                  | 5                             | 0 = FALSE, 1 = TRUE. Indicates whether or not this Working Set can be selected by the operator (e.g. an alarm system that does not have any Data Masks may not be selectable.)                                                                                                                                                                            |
| Active mask                   | [3] | Integer        | 2            | 0-65534                 | 6-7                           | The Object ID of the Data or Alarm Mask to display whenever the Working Set is active (or visible, in the case of a VT that supports multiple Working Sets on screen simultaneously).<br>If the selectable attribute value = 0, then this attribute is ignored.                                                                                           |
| Number of objects to follow   |     | Integer        | 1            | 1-255                   | 8                             | The objects that follow are used as the Working Set identifier. Although the identifier may be used anywhere, the set of objects shall fit inside a Soft Key designator. The VT clips anything located outside the area of a Soft Key designator.                                                                                                         |
| Number of macros to follow    |     | Integer        | 1            | 0-255                   | 9                             | Number of Macro references included even if zero. Each Macro reference consists of 2 bytes: one for event ID and one for Macro ID. Whenever the indicated event occurs, the associated Macro is executed.<br>VT version 5 and later: A reference to a Macro with 16-bit Object ID shall count as 2 macro references within the context of this attribute. |
| Number of languages to follow |     | Integer        | 1            | 0-255                   | 10                            | The number of language codes to follow. Each two-letter code represents a language that the Working Set can support.                                                                                                                                                                                                                                      |
| <b>Repeat:</b><br>{Object ID} |     | Integer        | 2            | 0-65534                 | 11+<br>object*6               | Object ID of an object contained in the designator (See Clause A.1.3 Object relationships)<br>List all objects before listing macros.                                                                                                                                                                                                                     |

| <b>Repeat:</b><br>{Language Code} |  | String  | 2 |       | Record Position Depends on above | (List these after all objects and macros have been listed.)<br>Two-letter code of a supported language. For language codes, See ISO 639, however all combinations of a-z and A-Z shall be accepted to guard against changes to ISO 639. |

## B.2 Data Mask object

The Data Mask describes the objects that will appear in the Data Mask area of the physical display. The size of the Data Mask is defined by the VT and accessible to the Working Set with the Get Hardware message. (See Table B.3 — Data Mask events and Table B.4 — Data mask attributes and record format)

### Allowed commands:

- Change Background Colour command;
- Change Child Location command;
- Change Child Position command;
- Change Soft Key Mask command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

**Table B.3 — Data Mask events**

| Event                | Caused by                                                                               | VT behaviour                                                                                                                                  | Message                           |
|----------------------|-----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| On Show              | Both the Data Mask and its Working Set becoming active                                  | Fill area with background colour. Draw child objects in the order they are listed in the Data Mask object. Show the associated Soft Key Mask. | VT Status message                 |
| On Hide              | Either the active mask changed for the Working Set or the Working Set being deactivated | Hide associated Soft Key Mask of this Data Mask.                                                                                              | —                                 |
| On Refresh           | Any action that causes a visible change on a child, grandchild, object, etc.            | Redraw objects in the Data Mask that have become corrupted.                                                                                   | —                                 |
| On Change Background | Change Background Colour                                                                | If the Data Mask is visible, fill area with background colour and draw child objects in the                                                   | Change Background Colour response |

| Event                     | Caused by                     | VT behaviour                                                                                                                   | Message                                                                        |
|---------------------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| Colour                    | command                       | order they are listed.                                                                                                         |                                                                                |
| On Change Child Location  | Change Child Location command | Draw child object at current location in background colour to erase it. Refresh Data Mask (to redraw child object or objects). | Change Child Location response                                                 |
| On Change Child Position  | Change Child Position command | Draw child object at current location in background colour to erase it. Refresh Data Mask (to redraw child object or objects). | Change Child Position response                                                 |
| On Change Soft Key Mask   | Change Soft Key Mask command  | If the Data Mask is visible, hide event on the current Soft Key Mask and a show event on the new Soft Key Mask.                | Change Soft Key Mask response. If this mask is visible, VT Status message.     |
| On Change Attribute       | Change Attribute command      | See Change Background Colour command and Change Soft Key Mask command behaviour above.                                         | Change Attribute response. If change affects visible masks, VT Status message. |
| On Pointing Event press   | Operator touches data mask    | —                                                                                                                              | Pointing Event message                                                         |
| On Pointing Event release | Operator touch is released    | —                                                                                                                              | Pointing Event message                                                         |

Table B.4 — Data mask attributes and record format

| Attribute Name                | AID | Type           | Size (bytes) | Range or Value | Record byte     | Description                                                                                                                                                                                                                                                                                                                                               |

| <b>Repeat:</b><br>{Event ID} |     | Integer        | 1            | 0-255            | 9+ (No. objects *6)...  | (List these after all objects have been listed.)<br>8-bit Macro Object ID reference: Event ID of event type that causes this Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Event ID of event type that causes this Macro to execute or 0xFF (see Clause 4.6.22.3) |
| {Macro ID}                   |     | Integer        | 1            | 0-255            | 10+ (No. objects *6)... | 8-bit Macro Object ID reference: Macro ID of the Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Low byte or high byte of Macro ID of the Macro to execute (see Clause 4.6.22.3)                                                                                    |

### B.3 Alarm Mask object

For information on Alarm Mask behaviour, See Clause 4.6.14 Alarm handling. See Table B.5 — Alarm Mask events and Table B.6 — Alarm Mask attributes and record format.

#### Allowed commands:

- Change Background Colour command;
- Change Child Location command;
- Change Child Position command;
- Change Priority command;
- Change Soft Key Mask command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

**Table B.5 — Alarm Mask events**

| Event   | Caused by                                                                   | VT behaviour                                                                                                                                   | Message           |
|---------|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| On Show | Both the Alarm Mask and its Working Set become active.                      | Fill area with background colour. Draw child objects in the order they are listed in the Alarm Mask object. Show the associated Soft Key Mask. | VT Status message |
| On Hide | Either the active mask is changed for the Working Set or the Working Set is | Hide associated Soft Key Mask of this Alarm Mask.                                                                                              | —                 |

| Event                       | Caused by                                                                | VT behaviour                                                                                                                                                                                                                                                                                                                                                                                                        | Message                                                                        |
|-----------------------------|--------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|

|                |     |      |              |                | *6)...      | 16-bit Macro Object ID reference (only for VT version 5 and later): Low byte or high byte of Macro ID of the Macro to execute (see Clause 4.6.22.3) |

## B.4 Container object

The Container object is used to group objects for the purpose of moving, hiding or sharing the group. A container is not a visible object, only a logical grouping of other objects. Unlike masks, containers can be hidden and shown at run-time under Working Set control. The Container object has defined size limits to assist in determining when other objects are overlaid with the container. See Table B.7 — Container events and Table B.8 — Container attributes and record format.

### Allowed Commands:

- Hide/Show Object command;
- Change Child Location command;
- Change Child Position command;
- Change Size command;
- Get Attribute Value message (VT version 4 and later).

**Table B.7 — Container events**

| Event                    | Caused by                                                                | VT behaviour                                                                                                                      | Message                                                       |
|--------------------------|--------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| On Show                  | Show command on this object.                                             | Draw the contained objects in the order listed. Refresh parent mask.                                                              | Hide/Show Response but only if triggered by Hide/Show command |
| On Hide                  | Hide command on this object.                                             | Redraw the object with the mask's background colour. Refresh parent mask.                                                         | Hide/Show Response but only if triggered by Hide/Show command |
| On Refresh               | Any action that causes a show or hide on a child, grandchild etc object. | Redraw objects in the container that have become corrupted.                                                                       | —                                                             |
| On Change Child Location | Change Child Location command                                            | Draw child object at current location in background colour to erase it. Refresh container (to redraw child object or objects).    | Change Child Location response                                |
| On Change Child Position | Change Child Position command                                            | Draw child object at current location in background colour to erase it. Refresh container (to redraw child object or objects).    | Change Child Position response                                |
| On Change Size           | Change Size command                                                      | Draw child objects at current location in background colour to erase them. Refresh container (to redraw child object or objects). | Change Size response                                          |

Table B.8 — Container attributes and record format

| Attribute Name                | AID | Type           | Size (bytes) | Range or Value         | Record byte                   | Description                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-----|----------------|--------------|------------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID                     |     | Integer        | 2            | 0-65534                | 1-2                           | Object identifier. Shall be unique within the object pool.                                                                                                                                                                                                                                                                                                |
| Type                          | [0] | Integer        | 1            | =3                     | 3                             | Object Type = Container                                                                                                                                                                                                                                                                                                                                   |
| Width                         | [1] | Integer        | 2            | 0-65535                | 4 - 5                         | Maximum width of the container's area in pixels. Objects or portions of objects outside the defined area are clipped.                                                                                                                                                                                                                                     |
| Height                        | [2] | Integer        | 2            | 0-65535                | 6-7                           | Maximum height of the container's area in pixels. Objects or portions of objects outside the defined area are clipped.                                                                                                                                                                                                                                    |
| Hidden                        | [3] | Boolean        | 1            | 0 or 1                 | 8                             | 0 = FALSE, 1 = TRUE Indicates whether or not this container and its child objects are hidden (not displayed). (TRUE = Hidden)                                                                                                                                                                                                                             |
| Number of objects to follow   |     | Integer        | 1            | 0-255                  | 9                             | Number of objects to follow even if zero. Each of these objects is "contained" in this object. Each object consists of 6 bytes: two (2) for Object ID and four (4) for location.                                                                                                                                                                          |
| Number of macros to follow    |     | Integer        | 1            | 0-255                  | 10                            | Number of Macro references included even if zero. Each Macro reference consists of 2 bytes: one for event ID and one for Macro ID. Whenever the indicated event occurs, the associated Macro is executed.<br>VT version 5 and later: A reference to a Macro with 16-bit Object ID shall count as 2 macro references within the context of this attribute. |
| <b>Repeat:</b><br>{Object ID} |     | Integer        | 2            | 0-65534                | 11+<br>object*6               | Object ID of an object contained in this container (See Clause A.1.3 Object relationships). List all objects before listing macros.                                                                                                                                                                                                                       |
| {X Location}                  |     | Signed integer | 2            | -32768<br>to<br>+32767 | 13+<br>object*6               | Relative X location of the top left corner of the object (relative to the top left corner the Container object).                                                                                                                                                                                                                                          |

| {Macro ID}                    |     | Integer        | 1            | 0-255                  | 12+ (No.<br>objects<br>*6)... | 8-bit Macro Object ID reference: Macro ID of the Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Low byte or high byte of Macro ID of the Macro to execute (see Clause 4.6.22.3)                                                                                                                                 |

## B.5 Soft Key Mask object

The Soft Key Mask is a Container object that contains Key objects, Object Pointer objects, or External Object Pointer objects. The pointer objects (see Clause 4.6.11.5, 4.6.11.6) can only resolve to a NULL object or a Key object. Keys are assigned to physical Soft Keys in the order listed. It is allowable for a Soft Key Mask to contain no Keys in order that all Soft Keys are effectively disabled when this mask is activated. See Table B.9 — Soft Key Mask events and Table B.10 — Soft Key Mask attributes and record format.

A common implementation, which was not clearly defined until VT version 4 and later, is that pointers to the NULL Object ID reserve a Soft Key position (the remaining Soft Keys do not move up and the trailing Soft Keys can be navigated to). Pointers to NULL that are at the end of the list of Soft Keys shall not be displayed. They should not be considered for paging. The paging requirements may be dynamic at run-time based if pointer values are changed to and from NULL. (See Clause 4.5.3.5 Navigation among Soft Keys)

### Allowed Commands:

- Change Background Colour command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

**Table B.9 — Soft Key Mask events**

| Event                       | Caused by                                                      | VT behaviour                                                                                                           | Message                           |
|-----------------------------|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| On Show                     | Show parent Alarm/Data Mask or Change Soft Key Mask command    | Draw child objects in the order they are listed in the Soft Key Mask.                                                  | —                                 |
| On Hide                     | Hide on parent Alarm/Data Mask or Change Soft Key Mask command | —                                                                                                                      | —                                 |
| On Change Background Colour | Change Background Colour command                               | If the Soft Key Mask is visible, fill area with background colour and draw child objects in the order they are listed. | Change Background Colour response |
| On Change Attribute         | Change Attribute command                                       | For behaviour, see Change Background Colour command.                                                                   | Change Attribute response         |

**Table B.10 — Soft Key Mask attributes and record format**

| Attribute Name              | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                              |
|-----------------------------|-----|---------|--------------|----------------|-------------|----------------------------------------------------------------------------------------------------------|
| Object ID                   |     | Integer | 2            | 0-65534        | 1-2         | Object identifier. Shall be unique within the object pool.                                               |
| Type                        | [0] | Integer | 1            | =4             | 3           | Object Type = Soft Key Mask                                                                              |
| Background colour           | 1   | Integer | 1            | 0-255          | 4           | Background colour. The Key object has its own background colour attribute that overrides this attribute. |
| Number of objects to follow |     | Integer | 1            | 0-255          | 5           | Number of objects to follow even if zero. Each of these objects is “contained” in this Soft Key Mask.    |

## B.6 Key object

The Key object defines the designator and key code for a Soft Key. Any object located outside of a Soft Key designator is clipped. See Table B.11 — Key events and Table B.12 — Key attributes and record format.

### Allowed Commands:

- Select Input Object command (VT version 4 and later);
- Change Background Colour command;
- Change Child Location command;
- Change Child Position command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

**Table B.11 — Key events**

| Event          | Caused by                       | VT behaviour | Message                     |
|----------------|---------------------------------|--------------|-----------------------------|
| On Key Press   | Operator pressing the Soft Key  | —            | Soft Key Activation message |
| On Key Release | Operator releasing the Soft Key | —            | Soft Key Activation message |

| Event                       | Caused by                                                        | VT behaviour                                                                                                                        | Message                                                        |
|-----------------------------|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| On Change Background Colour | Change Background Colour command                                 | If the key is visible, fill area with background colour and draw child objects in the order they are listed.                        | Change Background Colour response                              |
| On Change Child Location    | Change Child Location command                                    | Draw child object at current location in background colour to erase it. Refresh Key Designator (to redraw child object or objects). | Change Child Location response                                 |
| On Change Child Position    | Change Child Position command                                    | Draw child object at current location in background colour to erase it. Refresh Key Designator (to redraw child object or objects). | Change Child Position response                                 |
| On Change Attribute         | Change Attribute command                                         | For behaviour see other change commands above.                                                                                      | Change Attribute response                                      |
| On Input Field Selection    | Select Input Object command or operator navigates to Key object  | The VT shall provide some way for the operator to recognize that the Key object is selected (has focus).                            | Select Input Object response or VT Select Input Object message |
| On Input Field De-selection | Select Input Object command or operator navigates off Key object | —                                                                                                                                   | Select Input Object response or VT Select Input Object         |

Table B.12 — Key attributes and record format

| Attribute Name                | AID | Type           | Size (bytes) | Range or Value           | Record byte     | Description                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-----|----------------|--------------|--------------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID                     |     | Integer        | 2            | 0-65534                  | 1-2             | Object identifier. Shall be unique within the object pool.                                                                                                                                                                                                                                                                                                |
| Type                          | [0] | Integer        | 1            | =5                       | 3               | Object type = key                                                                                                                                                                                                                                                                                                                                         |
| Background colour             | 1   | Integer        | 1            | 0-255                    | 4               | Background colour.                                                                                                                                                                                                                                                                                                                                        |
| Key code                      | 2   | Integer        | 1            | 1-255                    | 5               | Key code assigned by ECU. VT reports this code in the Soft Key Activation message.<br>NOTE: Key code zero (0) is reserved for use for the ACK means.                                                                                                                                                                                                      |
| Number of objects to follow   |     | Integer        | 1            | 0-255                    | 6               | Number of objects to follow even if zero. Each of these objects is “contained” in this object. Each object consists of 6 bytes: two (2) for object id and four (4) for location.                                                                                                                                                                          |
| Number of macros to follow    |     | Integer        | 1            | 0-255                    | 7               | Number of Macro references included even if zero. Each Macro reference consists of 2 bytes: one for event ID and one for Macro ID. Whenever the indicated event occurs, the associated Macro is executed.<br>VT version 5 and later: A reference to a Macro with 16-bit Object ID shall count as 2 macro references within the context of this attribute. |
| <b>Repeat:</b><br>{Object ID} |     | Integer        | 2            | 0-65534                  | 8+<br>object*6  | Object ID of an object contained in this key (See Clause A.1.3 Object relationships). List all objects before listing macros.                                                                                                                                                                                                                             |
| {X Location}                  |     | Signed integer | 2            | – 32768<br>to<br>+ 32767 | 10+<br>object*6 | Relative X location of the top left corner of the object in VT pixels (relative to the top left corner of the Soft Key designator).                                                                                                                                                                                                                       |

| Attribute Name               | AID | Type           | Size (bytes) | Range or Value   | Record byte            | Description                                                                                                                                                                                                                                                                                                  |

| <b>Repeat:</b><br>{Event ID} |     | Integer        | 1            | 0-255            | 8+ (No. objects *6)... | (List these after all objects have been listed.)<br>8-bit Macro Object ID reference: Event ID of event type that causes this Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Event ID of event type that causes this Macro to execute or 0xFF (see Clause 4.6.22.3) |
| {Macro ID}                   |     | Integer        | 1            | 0-255            | 9+ (No. objects *6)... | 8-bit Macro Object ID reference: Macro ID of the Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Low byte or high byte of Macro ID of the Macro to execute (see Clause 4.6.22.3)                                                                                    |

## B.7 Button object

The Button object defines a button control. This object is intended mainly for VTs with touch screens or a pointing method but shall be supported by all VTs. Alternatively, if a touch screen or a pointing method is not supported, the VT shall provide a means for navigating to the Button object (or objects). (See Clause 4.6.17 Operator input). The Working Set can determine if the VT supports touch screen or pointing devices by using a Get Hardware message. When the Button object is activated, the VT sends a Button Activation message to the Working Set Master.

The VT shall indicate when a Button is selected (has focus), pressed or latched depending on the options attribute.

The Button consists of the Button Area, the Button Face, and the Button Border.

- The Button Area is the area which is defined by the Button object width and height attributes.
- The Button Face is the area which contains the Background colour and into which the designer may implement child objects. Child objects are clipped to the width and height of the Button Face (see Figure B.1 — Button examples with border (Options – Bit 5 = FALSE)). The Button Face is 8 pixels smaller (in both width and height) than the Button Area, unless the Options - No border bit is set to TRUE, in which case the Button Face is extended to be equal to the Button Area.
- The Button Border is the area which contains the border colour. Presentation of the border is VT proprietary (see Figure B.1 — Button examples with border (Options – Bit 5 = FALSE)). As a result, the position of the button face is VT proprietary. The Button Border may be hidden by setting the Options – Suppress border bit to TRUE. The Button Border may be eliminated by setting the Options – No border bit to TRUE. See Table B.13 — Button events and Table B.14 — Button attributes and record format.

Figure B.1 — Button examples with border (Options – Bit 5 = FALSE)

Figure B.2 — Button examples no border (Options – Bit 5 = TRUE)

Allowed commands:

- Enable/Disable Object command (VT version 4 and later);
- Select Input Object command (VT version 4 and later);
- Change Background Colour command;
- Change Size command;
- Change Child Location command;
- Change Child Position command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

Table B.13 — Button events

| Event     | Caused by      | VT behaviour                                  | Message                        |
|-----------|----------------|-----------------------------------------------|--------------------------------|
| On Enable | Enable/Disable | Mark the Button object enabled. If displayed, | Enable/Disable Object response |

| Event                       | Caused by                                                                                             | VT behaviour                                                                                                                                                           | Message                                                        |
|-----------------------------|-------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
|                             | command                                                                                               | operator can navigate to it.                                                                                                                                           |                                                                |
| On Disable                  | Enable/Disable command                                                                                | Mark the Button object disabled. Even if displayed, the operator cannot select this object. VT shall make it clear to the operator that the Button object is disabled. | Enable/Disable Object response                                 |
| On Input Field Selection    | Select Input Object command or operator navigates to Button object                                    | The VT shall provide some way for the operator to recognize that the Button object is selected (has focus).                                                            | Select Input Object response or VT Select Input Object message |
| On input Field De-selection | Select Input Object command or operator navigates off Button object or as a result of a disable event | —                                                                                                                                                                      | Select Input Object response or VT Select Input Object         |
| On Key Press                | Operator activating the Button                                                                        | —                                                                                                                                                                      | Button Activation                                              |
| On Key Release              | Operator releasing the Button                                                                         | —                                                                                                                                                                      | Button Activation                                              |
| On Change Background Colour | Change Background Colour command                                                                      | If the Button is visible, fill area with background colour and draw child objects in the order they are listed.                                                        | Change Background Colour response                              |
| On Change Size              | Change Size command                                                                                   | Draw child objects at current location in background colour to erase them. Refresh parent mask.                                                                        | Change Size response                                           |
| On Change Child Location    | Change Child Location command                                                                         | Draw child object at current location in background colour to erase it. Refresh Button (to redraw child object or objects).                                            | Change Child Location response                                 |
| On Change Child Position    | Change Child Position command                                                                         | Draw child object at current location in background colour to erase it. Refresh Button (to redraw child object or objects).                                            | Change Child Position response                                 |
| On Change Attribute         | Change Attribute command                                                                              | For behaviour, see other change commands above.                                                                                                                        | Change Attribute response                                      |

Table B.14 — Button attributes and record format

| Attribute Name    | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                      |
|-------------------|-----|---------|--------------|----------------|-------------|----------------------------------------------------------------------------------|
| Object ID         |     | Integer | 2            | 0-65534        | 1-2         | Object identifier. Shall be unique within the object pool.                       |
| Type              | [0] | Integer | 1            | =6             | 3           | Object Type = Button                                                             |
| Width             | 1   | Integer | 2            | 0-65535        | 4 - 5       | Maximum width of the Button's area in pixels.                                    |
| Height            | 2   | Integer | 2            | 0-65535        | 6-7         | Maximum height of the Button's area in pixels.                                   |
| Background colour | 3   | Integer | 1            | 0-255          | 8           | Background colour.                                                               |
| Border colour     | 4   | Integer | 1            | 0-255          | 9           | Border colour.                                                                   |
| Key Code          | 5   | Integer | 1            | 0-255          | 10          | Key code assigned by ECU. VT reports this code in the Button Activation message. |

| Attribute Name              | AID            | Type    | Size (bytes) | Range or Value                          | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|----------------|---------|--------------|-----------------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Options                     | 6 <sup>c</sup> | Bitmask | 1            | 0,1,3 <sup>a</sup><br>0-63 <sup>b</sup> | 11          | <p>TRUE (1) or FALSE (0).</p> <p>Bit 0 = If TRUE, the Button is "latchable" and remains pressed until the next activation. If FALSE, the Button is momentary.</p> <p>Bit 1 = Current Button state for latchable Buttons. 0=released, 1=latched. This attribute is ignored for momentary Buttons.</p> <p>Bit 2 = Suppress border. If FALSE, VT draws the proprietary border. If TRUE, no border is ever drawn (even when pressed momentarily or latched) and the area normally occupied by the border is always transparent.<sup>b</sup></p> <p>Bit 3 = Transparent Background. If FALSE, the Button's interior background is filled using the background colour attribute. If TRUE, the Button's background is always transparent and the background colour attribute is not used.<sup>b</sup></p> <p>Bit 4 = Disabled. If FALSE, the Button is enabled and can be selected and activated by the operator. If TRUE, the Button is drawn disabled (method proprietary to VT) and it cannot be selected or activated by the operator.<sup>b</sup></p> <p>Bit 5 = No border. If FALSE, the Button Border area is used by the VT as described in Bit 2. If TRUE, Bit 2 is ignored therefore no border is ever drawn (even when pressed momentarily or latched) and the Button Face extends to the full Button Area.<sup>b</sup></p> <p>Bits 6-7 = reserved, set to 0</p> <p>NOTE: By using a momentary Button, in combination with bits 2, 3, and 5 and by modifying the Button appearance in real time, a Working Set can create "radio button" type behaviour between several Button objects.</p> |
| Number of objects to follow |                | Integer | 1            | 0-255                                   | 12          | <p>Number of objects to follow even if zero. Each of these objects is "contained" in this object. Each object consists of 6 bytes: two (2) for Object ID and four (4) for location.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Number of macros to follow  |                | Integer | 1            | 0-255                                   | 13          | <p>Number of Macro references included even if zero. Each Macro reference consists of 2 bytes: one for event ID and one for Macro ID. Whenever the indicated event occurs, the associated Macro is executed.</p> <p>VT version 5 and later: A reference to a Macro with 16-bit Object ID shall count as</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## B.8 Input field objects

### B.8.1 General

There are four types of input field: Boolean, String, Number, and List. No border shall be drawn around any input field by the VT.

Input Boolean,

Input String object, Input Number and Input List objects have similar relationships, commands and events and they are listed here. The attributes for each object differ.

Input objects have three states:

- a) hidden (not displayed)

- b) shown and enabled (displayed and able to accept input)
- c) shown and disabled (displayed but not able to accept input)

Input field objects do not have a show/hide attribute. In order to hide an input field object, it can be contained by a Container object or Object Pointer object. See Table B.15 — Input events to Table B.20 — Input List attributes and record format.

**Allowed Commands** (See Clause B.8.5 for Input List object allowed commands):

- Enable/Disable Object command;
- Select Input Object command;
- ESC command;
- Change Background Colour command (excluding Input List object);
- Change Numeric Value command (excluding
- Input String object);
- Change String Value command (
- Input String object only);
- Change Attribute command;
- Change Size command;
- Get Attribute Value message (VT version 4 and later).

**Table B.15 — Input events**

| Event                       | Caused by                                                                                     | VT Behaviour                                                                                                                                                                  | Message                                                        |
|-----------------------------|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| On Refresh                  | See Data Mask refresh for caused by conditions                                                | Redraw this object.                                                                                                                                                           | —                                                              |
| On Enable                   | Enable/Disable Object command                                                                 | Mark the input object enabled. If displayed, operator can navigate to it.                                                                                                     | Enable/Disable Object Response                                 |
| On Disable                  | Enable/Disable Object command                                                                 | Mark the input object disabled. Even if displayed, the operator cannot select this object for input. VT shall make it clear to the operator that the input field is disabled. | Enable/Disable Object Response                                 |
| On Input Field Selection    | Select Input Object command or operator navigates to input field                              | The VT shall provide some way for the operator to recognize that the input field is selected (has focus).                                                                     | Select Input Object response or VT Select Input Object message |
| On Input Field De-selection | Select Input Object command or operator navigates off input field or as a result of a disable | —                                                                                                                                                                             | Select Input Object response or VT Select Input Object message |

| Event                       | Caused by                                                                                        | VT Behaviour                                                                                                                                                                                                                               | Message                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
|                             | event                                                                                            |                                                                                                                                                                                                                                            |                                                                      |
| On ESC                      | Operator aborts input using ESC key or Working Set sends an ESC command                          | If the input object is not enabled for real time editing, then revert the value of the object to the value before operator began the input . (See Clause 4.2, data input, real time editing)<br>Redraw this object. Refresh parent object. | VT ESC message or ESC response<br>(See Clause 4.6.17 Operator input) |
| On Change Background Colour | Change Background Colour command                                                                 | If the input field is visible, fill area with background colour and redraw the object with the new background colour.                                                                                                                      | Change Background Colour Response                                    |
| On Change Value             | Change Numeric Value command or Change String Value command                                      | If input object is displayed, redraw object with new value. Refresh parent object.                                                                                                                                                         | Change Numeric Value response or Change String Value response        |
| On Entry of Value           | Operator saving changes by use of the ENTER means regardless of whether or not the value changed | VT updates the Working Set with new value.                                                                                                                                                                                                 | VT Change Numeric Value message or VT Change String Value message    |

## B.8.2 Input Boolean object

The Input Boolean object is used to input a TRUE/FALSE type indication from the operator. This is a graphical object and the appearance of the indicator when the value is > 0 is left to the VT, but it shall fit in the square area specified by the width attribute. An example of a Boolean input is a checkbox.

When the value is 0, the object area is the background colour.

When the value is > 0, the VT draws the indicator using the foreground colour on the background colour.

NOTE VT Version 3 and prior have a Value range in the set {0, 1} but do not clarify the presentation when the value is not in the set {0, 1}, which is possible when using a variable reference. In VT version 4 and later, the TRUE indication is shown for any value > 0, and the FALSE indication for the value = 0. When the Input Boolean value is changed, the VT shall indicate the state of the Input Boolean to the Working Set with a value in the set {0, 1}.

| Value 0                                                                             | Value 1                                                                              |

### B.8.3 Input String object

This object is used to input a character string from the operator. Displayable characters are shown in Table L.1 — ISO 8859-1 (Latin 1) character set to Table L.7 — WideString minimum character set. Several special formatting characters are permitted in the

Input String object value and shall be properly interpreted by the VT, as specified. (See Clause 4.6.19.6 Non-printing characters in strings)

**Table B.17 — Input String attributes and record format**

| Attribute Name     | AID | Type    | Size (bytes) | Range or Value                       | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Number of macros to follow |                  | Integer | 1            | 0-255                                 | Depends on size of value attribute | Number of Macro references included even if zero. Each Macro reference consists of 2 bytes: one for event ID and one for Macro ID. Whenever the indicated event occurs, the associated Macro is executed.<br>VT version 5 and later: A reference to a Macro with 16-bit Object ID shall count as 2 macro references within the context of this attribute.                                                                                                                                                                                                                         |

#### B.8.4 Input Number object

This object is used to format, display and change a numeric value based on a supplied integer value. The VT shall use the following equation to format the displayed value:

$$\text{Displayed value} = (\text{value attribute} + \text{Offset}) * \text{Scaling Factor}$$

Depending on the 'Options' attribute in Table B.18 — Input Number attributes and record format, displayed values are either truncated or rounded to the number of decimals specified in the 'Number of decimals' attribute.

NOTE: The displayed value shall be formatted according to the above equation even if the value is outside the min/max value range.

NOTE: The VT should implement double precision operations to minimize rounding errors.

When the operator presses the Enter means, to close the input object after data input, the VT shall only accept the new value if the following equations are true:

$$\text{Scaled max value} = (\text{Max value} + \text{Offset}) * \text{Scaling Factor}$$

$$\text{Scaled min value} = (\text{Min value} + \text{Offset}) * \text{Scaling Factor}$$

$$\text{Scaled min value} \leq \text{new value} \leq \text{Scaled max value}$$

If the above equations are not true the VT shall ignore the Enter means and keep the input object open for data input.

If the above equations are true the VT sets the value attribute of the input number object or the referenced numeric value object according to the following equation:

$$\text{Value attribute} = (\text{new value} / \text{Scaling Factor}) - \text{Offset}$$

NOTE While the operator is not allowed to enter values outside the min/max range, the ECU is allowed to set any value either by pool upload or by the Change Numeric Value command.

Table B.18 — Input Number attributes and record format

| Attribute Name     | AID  | Type    | Size (bytes) | Range or Value                        | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### B.8.5 Input List object

The Input List object is used to show one object out of a set of objects, and to allow operator selection of one object from the set. The object to show is determined by the Value attribute or a Variable reference.

The exact implementation and appearance of the Input List object is proprietary to the VT. For example, a simple implementation of the Input List object could be to display values as the operator moves through the list using +/- keys. A more complex implementation could be to draw a graphical pop-up list box with a scroll bar for moving through the allowable values. In either case, only the current value shall be displayed when this object is not open for edit. The width and height attributes define the width and height of the displayed value only.

This object is used to select an item from a list of objects. The value transmitted to the Working Set Master is the list index chosen (range 0-254).

**NOTE** In VT version 3 and prior, the behavior with the value 255 was not defined. The value 255 is used to indicate that no item is chosen. The CF may set the value to 255 for this purpose. The operator, in the process of selecting a list item, shall not be allowed to set the value to 255.

The operator also shall not be allowed to set the value to an invalid index (an index which is greater than the number of items in the list minus 1). However, if the list references a number variable, then it is possible for that number variable to be set by the Working Set or by the operator (by using a different input object) to a value which is not a valid index for the list.

When a list item is an Object Pointer with a value of NULL or is a Container, and the Container is in the hidden state, it is considered an empty object. It will still occupy a position in the displayed list, so it can still be selected by the operator, even though its contents will not be visible.

When a list item has an Object ID of NULL it is considered an invisible object. It does not occupy a position in the displayed list and cannot be selected by the operator. However, it is still counted when determining list indexes and maintains its position in the list even though it is not visible to the operator.

The VT shall not display anything for the selected item in the following cases:

- index value is 255 which means “no item is chosen”
- index value is invalid (greater than the number of items in the list minus 1)
- selected list item is a no-item placeholder (NULL)
- selected list item is an Object Pointer with a value of NULL
- selected list item is a Container, and the container is in the hidden state

#### Allowed Commands:

- Enable/Disable Object command;

- Select Input Object command;
- ESC command;
- Change Numeric Value command;
- Change Attribute command;
- Change List Item command;
- Change Size command;
- Get Attribute Value message (VT version 4 and later).

Table B.19 — Input List events

| Event                       | Caused by                                                                                                     | VT behaviour                                                                                                                                                                                                                          | Message                                                              |
|-----------------------------|---------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| On Refresh                  | See Data Mask Refresh for caused by conditions                                                                | Redraw this object.                                                                                                                                                                                                                   | —                                                                    |
| On Enable                   | Enable/Disable Object command                                                                                 | Mark the input object enabled. If displayed, operator can navigate to it.                                                                                                                                                             | Enable/Disable Object Response                                       |
| On Disable                  | Enable/Disable Object command                                                                                 | Mark the input object disabled. Even if displayed, the operator cannot select this object for input. VT shall make it clear to the operator that the input field is disabled.                                                         | Enable/Disable Object Response                                       |
| On Input Field Selection    | Select Input Object command or operator navigates to input object                                             | The VT shall provide some way for the operator to recognize that the input object is selected (has focus).                                                                                                                            | VT Select Input Object message                                       |
| On Input Field De-selection | Select Input Object command or operator navigates off input object or as a result of a disable event          | —                                                                                                                                                                                                                                     | VT Select Input Object message                                       |
| On ESC                      | Operator aborts input using ESC key or Working Set sends an ESC command                                       | If the input object is not enabled for real time editing, then revert the value of the object to the value before operator began the input . (See Clause 4.2 section <b>Real Time</b> )<br>Redraw this object. Refresh parent object. | VT ESC message or ESC response<br>(See Clause 4.6.17 Operator input) |
| On Change Value             | Change Numeric Value command (to change the list index)                                                       | If input object is displayed, redraw object with new value. Refresh parent object.                                                                                                                                                    | Change Numeric Value response                                        |
| On Entry of Value           | Operator saving changes by use of the ENTER means regardless of whether or not the value (list index) changed | VT updates the Working Set with new value                                                                                                                                                                                             | VT Change Numeric Value message                                      |
| On Entry of New             | Operator saving                                                                                               | Working Set is notified by the "On Entry of value"                                                                                                                                                                                    | —                                                                    |

| Event               | Caused by                                                             | VT behaviour                                                                           | Message                    |
|---------------------|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------|----------------------------|
| Value               | changes by use of the ENTER means when value (list index) has changed | event so no additional notification is required on this event.                         |                            |
| On Change Attribute | Change Attribute command                                              | If object is visible, refresh.                                                         | Change Attribute response. |
| On Change Size      | Change Size command                                                   | Draw object at current location in background colour to erase it. Refresh parent mask. | Change Size response       |

Table B.20 — Input List attributes and record format

| Attribute Name                | AID              | Type    | Size (bytes) | Range or Value                          | Record byte                 | Description                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|------------------|---------|--------------|-----------------------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID                     |                  | Integer | 2            | 0-65534                                 | 1-2                         | Object identifier. Shall be unique within the object pool.                                                                                                                                                                                                                                                                                                |
| Type                          | [0]              | Integer | 1            | =10                                     | 3                           | Object Type = Input List                                                                                                                                                                                                                                                                                                                                  |
| Width                         | 1                | Integer | 2            | 0-65535                                 | 4 - 5                       | Maximum width of the input field in pixels. Objects or portions of objects outside the defined area are clipped.                                                                                                                                                                                                                                          |
| Height                        | 2                | Integer | 2            | 0-65535                                 | 6-7                         | Maximum height of the input field in pixels. Objects or portions of objects outside the defined area are clipped.                                                                                                                                                                                                                                         |
| Variable reference            | 3                | Integer | 2            | 0-65534, 65535                          | 8-9                         | Object ID of a Number Variable object in which to store or retrieve the object's value. If this attribute is set to NULL, the value is stored directly in the value attribute instead.                                                                                                                                                                    |
| Value                         | [4]              | Integer | 1            | 0-254, 255                              | 10                          | Selected list index of this object. Used only if variable reference attribute is NULL. The current list item chosen or 255 to indicate no item is chosen. The first item is at index zero (0).                                                                                                                                                            |
| Number of list items          |                  | Integer | 1            | 0-255                                   | 11                          | Number of object references to follow. The size of the list can never exceed this number and this attribute cannot be changed.                                                                                                                                                                                                                            |
| Options                       | [5] <sup>b</sup> | Integer | 1            | 0, 1 <sup>a</sup><br>0 - 3 <sup>b</sup> | 12                          | Logical bits to indicate options. 1 = TRUE. Bit 0 = Enabled. If TRUE the object shall be enabled. If FALSE, the object is disabled. Bit 1 = real time editing. <sup>b</sup> If TRUE the value shall be transmitted to the ECU as it is being changed. (See Real Time in Clause 4.2)                                                                       |
| Number of macros to follow    |                  | Integer | 1            | 0-255                                   | 13                          | Number of Macro references included even if zero. Each Macro reference consists of 2 bytes: one for event ID and one for Macro ID. Whenever the indicated event occurs, the associated Macro is executed.<br>VT version 5 and later: A reference to a Macro with 16-bit Object ID shall count as 2 macro references within the context of this attribute. |
| <b>Repeat:</b><br>{Object ID} |                  | Integer | 2            | 0-65534, 65535                          | 14+ object*2                | These objects make up the list. NULL is a no-item placeholder (invisible object). (See Clause A.1.3 Object relationships). The Change List Item command allows objects to be replaced or removed.                                                                                                                                                         |
| <b>Repeat:</b><br>{Event ID}  |                  | Integer | 1            | 0-255                                   | 14+ (No. List Items * 2)... | (List these after all objects have been listed.)<br>8-bit Macro Object ID reference: Event ID of event type that causes this Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Event ID of event type that causes this Macro to execute or 0xFF (see Clause 4.6.22.3)                                              |
| {Macro ID}                    |                  | Integer | 1            | 0-255                                   | 15+ (No. List Items * 2)... | 8-bit Macro Object ID reference: Macro ID of the Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Low byte or high byte of                                                                                                                                                                                        |

| Attribute Name                       | AID | Type | Size (bytes) | Range or Value | Record byte | Description                                            |

|                                      |     |      |              |                |             | Macro ID of the Macro to execute (see Clause 4.6.22.3) |
| <sup>a</sup> VT Version 3 and prior. |     |      |              |                |             |                                                        |
| <sup>b</sup> VT Version 4 and later. |     |      |              |                |             |                                                        |

## B.9 Output field objects

### B.9.1 General

There are three types of output field: string, number, and list. They have similar relationships and behaviour, but have different attributes. See Table B.21 — Output field events to Table B.25 — Output List attributes and record format.

**Allowed Commands** (See Clause B.9.4 for Output List object allowed commands):

- Change Background Colour command;
- Change Numeric Value command (excluding Output String object);
- Change String Value command (Output String object only);
- Change Attribute command;
- Change Size command;
- Get Attribute Value message (VT version 4 and later).

**Table B.21 — Output field events**

| Event                       | Caused by                                                   | VT behaviour                                                                                                           | Message                                                       |
|-----------------------------|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| On Refresh                  | See Data Mask Refresh for caused by conditions              | Redraw this object.                                                                                                    | —                                                             |
| On Change Background Colour | Change Background Colour command                            | If the output field is visible, fill area with background colour and redraw the object with the new background colour. | Change Background Colour Response                             |
| On Change Value             | Change Numeric Value command or Change String Value command | If output object is displayed, redraw object with new value. Refresh parent object.                                    | Change Numeric Value response or Change String Value response |
| On Change Attribute         | Change Attribute command                                    | If output object is displayed, redraw object with new value. Refresh parent object.                                    | Change Attribute response                                     |
| On Change Size              | Change Size command                                         | Draw object at current location in background colour to erase it. Refresh parent mask.                                 | Change Size response                                          |

## B.9.2 Output String object

This object is used to output a string of text. Displayable characters are given in Table L.1 — ISO 8859-1 (Latin 1) character set to Table L.7 — WideString minimum character set. Several special formatting characters are permitted in the Output String value and shall be properly interpreted by the VT as specified in Clause 4.6.19.6 Non-printing characters in strings.

**Table B.22 — Output String attributes and record format**

| Attribute Name     | AID | Type    | Size (bytes) | Range or Value                        | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|-----|---------|--------------|---------------------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID          |     | Integer | 2            | 0-65534                               | 1-2         | Object identifier. Shall be unique within the object pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### B.9.3 Output Number object

This object is used to format and output a numeric value based on a supplied integer value. The VT shall use the following equation to format the displayed value:

$$\text{Displayed value} = (\text{value attribute} + \text{Offset}) * \text{Scaling Factor}$$

Depending on the 'Options' attribute presented in Table B.23 — Output Number attributes and record format, displayed values are either truncated or rounded to the number of decimals specified in the 'Number of decimals' attribute.

NOTE The VT should implement double precision operations to minimize rounding errors.

**Table B.23 — Output Number attributes and record format**

| Attribute Name     | AID  | Type    | Size (bytes) | Range or Value                        | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### B.9.4 Output List object

The Output List object, available in VT version 4 and later, is used to show one object out of a set of objects. The object to shown is determined by the Value attribute or a Variable reference.

The VT shall not display anything for the selected item in the following cases:

- index value is 255 which means “no item is chosen”
- index value is invalid (greater than the number of items in the list minus 1)
- selected list item is a no-item placeholder (NULL)
- selected list item is an Object Pointer with a value of NULL
- selected list item is a Container, and the container is in the hidden state
- the object is enabled and the numeric relationships shown below have been violated

#### Allowed Commands:

- Change Numeric Value command;
- Change Attribute command;
- Change List Item command;
- Change Size command;
- Get Attribute Value message (VT version 4 and later).

**Table B.24 — Output List events**

| Event               | Caused by                                               | VT behaviour                                                                           | Message                       |
|---------------------|---------------------------------------------------------|----------------------------------------------------------------------------------------|-------------------------------|
| On Refresh          | See Data Mask Refresh for caused by conditions          | Redraw this object.                                                                    | —                             |
| On Change Value     | Change Numeric Value command (to change the list index) | If object is displayed, redraw object with new value. Refresh parent object.           | Change Numeric Value response |
| On Change Attribute | Change Attribute command                                | If object is visible, refresh.                                                         | Change Attribute response     |
| On Change Size      | Change Size command                                     | Draw object at current location in background colour to erase it. Refresh parent mask. | Change Size response          |

**Table B.25 — Output List attributes and record format**

| Attribute name | AID | Type | Size Bytes | Range or value | Record byte | Description |
|----------------|-----|------|------------|----------------|-------------|-------------|
|----------------|-----|------|------------|----------------|-------------|-------------|

| Attribute name             | AID | Type    | Size Bytes | Range or value | Record byte                 | Description                                                                                                                                                                                                                                                                                                                                               |

Each Macro reference consists of 2 bytes: one for event ID and one for Macro ID. Whenever the indicated event occurs, the associated Macro is executed.<br>VT version 5 and later: A reference to a Macro with 16-bit Object ID shall count as 2 macro references within the context of this attribute. |
| Repeat: {Object ID}        |     | Integer | 2          | 0-65534, 65535 | 13+ object* 2               | These objects make up the list. NULL is a no-item placeholder (invisible object). (See Clause A.1.3 Object relationships)<br>The Change List Item command allows objects to be replaced or removed.                                                                                                                                                       |
| Repeat: {Event ID}         |     | Integer | 1          | 0-255          | 13+ (No. List Items * 2)... | (List these after all objects have been listed.)<br>8-bit Macro Object ID reference: Event ID of event type that causes this Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Event ID of event type that causes this Macro to execute or 0xFF (see Clause 4.6.22.3)                                              |
| {Macro ID}                 |     | Integer | 1          | 0-255          | 14+ (No. List Items * 2)... | 8-bit Macro Object ID reference: Macro ID of the Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Low byte or high byte of Macro ID of the Macro to execute (see Clause 4.6.22.3)                                                                                                                                 |

## B.10 Output shape objects

### B.10.1 General

There are four types of output shape object: line, rectangle, ellipse, and polygon. They have similar relationships and behaviour, but different attributes. Points contained by these objects are always drawn using a square “paintbrush”, with the actual point being in the upper left corner of the paintbrush. The width of the paintbrush is given by the line width attribute. The endpoint is relative to the X-Y start location attributes in the parent object. See Figure B.4 — Output Line object showing start and end points using different brush sizes to Figure B.8 — Output Polygon types and Table B.26 — Output Line events to Table B.32 — Output Polygon events

### B.10.2 Output Line object

This object outputs a line shape. The starting point for the line is found in the parent object

#### Allowed Commands:

- Change End Point command;
- Change Attribute command;
- Change Size command;
- Get Attribute Value message (VT version 4 and later).

| Symbol | Width | Height | Direction | Attribute: Line Width |
|--------|-------|--------|-----------|-----------------------|
| a      | 8     | 8      | 0         | 1                     |
| b      | 9     | 9      | 0         | 2                     |
| c      | 9     | 9      | 1         | 2                     |
| d      | 2     | 9      | 0         | 2                     |
| e      | 1     | 10     | 0         | 3                     |
| f      | 1     | 1      | Any       | $\geq 1$              |
| g      | 2     | 2      | Any       | $\geq 2$              |
| h      | 9     | 2      | 0         | 2                     |
| i      | 10    | 2      | 0         | 3                     |

Figure B.4 — Output Line object showing start and end points using different brush sizes

Table B.26 — Output Line events

| Event               | Caused by                                      | VT behaviour                                                                           | Message                   |
|---------------------|------------------------------------------------|----------------------------------------------------------------------------------------|---------------------------|
| On Refresh          | See Data Mask Refresh for caused by conditions | Redraw this object.                                                                    | —                         |
| On Change End Point | Change End Point command                       | Redraw this object. Refresh parent mask.                                               | Change End Point Response |
| On Change Attribute | Change Attribute command                       | Redraw this object. Refresh parent mask.                                               | Change Attribute response |
| On Change Size      | Change Size command                            | Draw object at current location in background colour to erase it. Refresh parent mask. | Change Size response      |

Table B.27 — Output Line attributes and record format

| Attribute Name  | Aid | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

B.10.3 Output Rectangle object

This object outputs a rectangle shape. See Figure B.5 — Output Rectangle object showing end points using different brush sizes.

Allowed Commands:

- Change Size command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

Figure B.5 — Output Rectangle object showing end points using different brush sizes

Table B.28 — Output Rectangle Events

| Event               | Caused by                                      | VT behaviour                                                                           | Message                   |

#### B.10.4 Output Ellipse object

This object outputs an ellipse or circle shape. Several options are available for modifying the appearance (See Figure B.6 — Output Ellipse object).

a) Type = 0: Closed ellipse (Fillable)

b) Type = 1: Open ellipse (Non-Fillable)

c) Type = 2: Closed ellipse segment (Fillable)

d) Type = 3: Closed ellipse section (Fillable)

Key

- 1 start angle
- 2 end angle

Figure B.6 — Output Ellipse object

#### Allowed Commands:

- Change Size command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

**Figure B.7 — Output Ellipse object – correct and incorrect rendering**

Special care should be used when drawing an ellipse which is not a circle. The drawn angle between the start and end angles shall be measured to be accurate. For example, in Figure B.7 — Output Ellipse object – correct and incorrect rendering, the attributes start angle, end angle, and width of all three ellipses are the same. The ellipse on the left is a circle with the height equal to the width, and the ellipses in the centre and on the right both have the height equal to half the width. The angle of the opening should be 90° on all three ellipses. However, the ellipse on the right, was drawn incorrectly using a popular ellipse rendering algorithm that simply scales the full circle to half height. The result is that the angle of the opening is less than 90°.

**NOTE** Commonly available displays may not have a square aspect ratio for the pixels. The drawing method is not required to compensate for the physical display characteristics.

**Table B.30 — Output Ellipse events**

| Event               | Caused by                                      | VT behaviour                                                                           | Message                   |

### B.10.5 Output Polygon object

This object outputs a polygon. Four types of polygon are possible: convex, non-convex, complex and open. If the type is not open, the Working Set shall specify the type of polygon as this could affect the efficiency of the fill algorithm. If the type is not known, the type should be set to *complex* since fill algorithms on complex polygons will work on all three fillable types. The VT designer may also choose to implement only the complex fill algorithm and ignore the polygon type attribute. The VT shall use the "even-odd" fill rule. The "non-zero winding" fill rule is not supported.

The start point for the polygon is the first point listed. Polygon is drawn using the points in the list in the order given. At least three points are required for a polygon. The point positions are relative to the upper left-hand corner of the Output Polygon object and the upper left-hand corner of the Output Polygon object is relative to the parent object.

If the polygon type is not "OPEN" and the Working Set does not close the polygon, the VT shall automatically close the polygon by joining the first and last points given.

See Figure B.8 — Output Polygon types

Figure B.8 — Output Polygon types

#### Allowed Commands:

- Change Attribute command;
- Change Size command;
- Change Polygon Point command;
- Change Polygon Scale command;

— Get Attribute Value message (VT version 4 and later).

Table B.32 — Output Polygon events

| Event               | Caused by                                                                                                            | VT behaviour                                                                           | Message                                                        |

## B.11 Output graphic objects

### B.11.1 General

There are three types of output graphic object: Output Meter object, Output Linear Bar Graph object and Output Arched Bar Graph object.

In VT Version 4 and later, if the minimum value is not less than the maximum value, then the object shall be drawn as if the value (or target value) is equal to the minimum value and without regard to the maximum value. Additionally, if the value (or target value) is less than the minimum, the object shall be drawn as if the value (or target value) is equal to the minimum. Likewise, if the value (or target value) is greater than the maximum, the object shall be drawn as if the value (or target value) is equal to the maximum.

In VT Version 3 and prior, the constraints of minimum, value, target, and maximum were not defined.

### B.11.2 Output Meter object

This object is a meter. General appearance is left to the VT but the meter is drawn about a circle enclosed within a defined square. The indicated angle attributes are computed from the positive X axis in a mathematically positive direction (anticlockwise). As with all objects, the VT shall take appropriate action when objects are overlaid so that moving the needle does not corrupt other objects underneath the meter. The position attribute of the meter (in the parent object) always refers to the upper left corner of the enclosing square regardless of orientation. This object is drawn transparent so that objects can be placed underneath to

enhance the appearance. See Figure B.9 — Output Meter object and Figure B.10 — Output Meter object — examples and Table B.34 — Output Meter events and Table B.35 — Output Meter attributes and record format.

**NOTE** It is recommended that the length of any visible tick marks are 10% of the width of the meter, with a minimum of 1 pixel (e.g. if the meter is less than 10 pixels in width).

**Key**

- 1 start angle
- 2 end angle
- 3 needle
- 4 arc
- 5 ticks (only 2 ticks are shown for what would be equally spaced from the start angle to the end angle)
- a Meter object cannot exceed boundaries of enclosing square.

**Figure B.9 — Output Meter object**

**Allowed Commands:**

- Change Numeric Value command;
- Change Attribute command;
- Change Size command;
- Get Attribute Value message (VT version 4 and later).

Table B.34 — Output Meter events

| Event               | Caused by                                      | VT behaviour                                                                           | Message                       |
|---------------------|------------------------------------------------|----------------------------------------------------------------------------------------|-------------------------------|
| On Refresh          | See Data Mask Refresh for caused by conditions | Redraw this object.                                                                    | —                             |
| On Change Value     | Change Numeric Value command                   | Redraw this object, refresh parent mask.                                               | Change Numeric Value response |
| On Change Attribute | Change Attribute command                       | Redraw this object, refresh parent mask.                                               | Change Attribute response     |
| On Change Size      | Change Size command                            | Draw object at current location in background colour to erase it. Refresh parent mask. | Change Size response          |

Table B.35 — Output Meter attributes and record format

| Attribute Name      | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                      |
|---------------------|-----|---------|--------------|----------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Key

- a Needle only.
- b Appearance of the Meter object is at the discretion of the VT designer.

**Figure B.10 — Output Meter object — examples**

### B.11.3 Output Linear Bar Graph object

This object is a linear bar graph or thermometer. Linear bar graphs are defined by an enclosing rectangle in any one of four orientations. A target value can be optionally marked on the bar graph. The position attribute of the bar graph (in the parent object) always refers to the upper left corner of the enclosing rectangle regardless of orientation.

a) Bargraph cannot exceed the boundary of the enclosing rectangle

b) Bargraph can be in any one of four orientations

**Key**

- 1 value
- 2 target value
- 3 minimum value
- 4 maximum value

**Figure B.11 — Output Linear Bar Graph — examples**

This object is drawn transparent so that objects can be placed underneath to enhance the appearance. See Figure B.11 — Output Linear Bar Graph — examples and Table B.36 — Output Linear Bar Graph events and Table B.37 — Output Linear Bar Graph attributes and record format.

**Allowed Commands:**

— Change Numeric Value command;

- Change Attribute command;
- Change Size command;
- Get Attribute Value message (VT version 4 and later).

Table B.36 — Output Linear Bar Graph events

| Event               | Caused by                                      | VT behaviour                                                                           | Message                       |
|---------------------|------------------------------------------------|----------------------------------------------------------------------------------------|-------------------------------|
| On Refresh          | See Data Mask Refresh for caused by conditions | Redraw this object.                                                                    | —                             |
| On Change Value     | Change Numeric Value command                   | Redraw this object, refresh parent mask.                                               | Change Numeric Value response |
| On Change Attribute | Change Attribute command                       | Redraw this object, refresh parent mask.                                               | Change Attribute response     |
| On Change Size      | Change Size command                            | Draw object at current location in background colour to erase it. Refresh parent mask. | Change Size response          |

Table B.37 — Output Linear Bar Graph attributes and record format

| Attribute Name     | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

#### B.11.4 Output Arched Bar Graph object

This object is similar in concept to a linear bar graph but appears arched. Arched bar graphs are drawn about an Output Ellipse object enclosed within a defined rectangle. The indicated angles are computed from the positive X axis in a mathematically positive direction (anticlockwise). The position attribute of the bar graph (in the parent object) always refers to the upper left-hand corner of the enclosing rectangle regardless of orientation. This object is drawn transparent so that objects can be placed underneath to enhance the appearance.

A Change Size command can cause the “bar graph width” attribute to equal or exceed one half the width or height of the object, however this shall not be cause for pool rejection. The VT may reduce the “bar graph width” value for the purpose of drawing this object. The reduced value is only to supporting drawing the object and shall not be stored in the object.

See Figure B.12 — Output Arched Bar Graph object — example and Table B.38 — Output Arched Bar Graph events and Table B.39 — Output Arched Bar Graph attributes and record format.

- Key**
- 1 start angle
  - 2 end angle
  - 3 value
  - 4 maximum value
  - 5 minimum value
  - 6 border
  - 7 bar graph width
  - a Enclosing rectangle. Bar graph cannot exceed boundaries of this rectangle.
  - b In this example, bar graph deflection is clockwise
  - c Visual elements outside the range of start angle to end angle are shown for clarity, but would not be drawn

Figure B.12 — Output Arched Bar Graph object — example

Allowed Commands:

- Change Numeric Value command;
- Change Attribute command;
- Change Size command;
- Get Attribute Value message (VT version 4 and later).

Table B.38 — Output Arched Bar Graph events

| Event      | Caused by                                      | VT behaviour        | Message |
|------------|------------------------------------------------|---------------------|---------|
| On Refresh | See Data Mask Refresh for caused by conditions | Redraw this object. | —       |

| Event               | Caused by                    | VT behaviour                                                                           | Message                       |
|---------------------|------------------------------|----------------------------------------------------------------------------------------|-------------------------------|
| On Change Value     | Change Numeric Value command | Redraw this object, refresh parent mask.                                               | Change Numeric Value response |
| On Change Attribute | Change Attribute command     | Redraw this object, refresh parent mask.                                               | Change Attribute response     |
| On Change Size      | Change Size command          | Draw object at current location in background colour to erase it. Refresh parent mask. | Change Size response          |

Table B.39 — Output Arched Bar Graph attributes and record format

| Attribute Name     | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Target line colour | 4   | Integer | 1            | 0-255          | 9           | Target line colour (if drawn).                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Options            | 5   | Bitmask | 1            | 0-31           | 10          | Logical bits to indicate which parts to draw.<br>1 = TRUE.<br>Bit 0 = Draw border<br>Bit 1 = Draw a target line<br>Bit 2 = Undefined, set to 0 recommended<br>Bit 3 = bar graph type. If this bit is FALSE (0), bar graph is filled. If this bit is TRUE (1), the bar graph is not filled but rather shows the current value as a single line at the proper position within the bar graph.<br>Bit 4 = Deflection of the bar graph around the arc. 0 = anticlockwise and 1 = clockwise |
| Start angle        | 6   | Integer | 1            | 0-180          | 11          | Start angle/2 (in degrees) from positive X axis anticlockwise (90° is straight up). Start and end angles define the arc. If the start and end angles are the same, the bar graph's arc is closed (360°).                                                                                                                                                                                                                                                                              |
| End angle          | 7   | Integer | 1            | 0-180          | 12          | End angle/2 (in degrees) from positive X axis anticlockwise (90° is straight up). Start and end angles define the arc. If the start and end angles are the same, the bar graph's arc is closed (360°).                                                                                                                                                                                                                                                                                |
| Bar graph width    | 8   | Integer | 2            | 0-65535        | 13-14       | Bar graph width in pixels. Bar graph width should be less than half the total width, or less than half the total height, whichever is least. (See Figure B.12 — Output Arched Bar Graph object — example)                                                                                                                                                                                                                                                                             |
| Min value          | 9   | Integer | 2            | 0-65535        | 15-16       | Minimum value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Attribute Name                  | AID  | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|------|---------|--------------|----------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max value                       | 10   | Integer | 2            | 0-65535        | 17-18       | Maximum value.                                                                                                                                                                                                                                                                                                                                            |
| Variable reference              | 11   | Integer | 2            | 0-65534, 65535 | 19-20       | Object ID of a Number Variable object in which to retrieve the bar graph's value. If this attribute is set to NULL, the value is retrieved directly from the value attribute instead.<br>The referenced Number Variable's value shall be in the range 0-65535.                                                                                            |
| Value                           | [14] | Integer | 2            | 0-65535        | 21-22       | Current value. Used only if variable Reference attribute is NULL. Bar graph fills or moves, depending on bar graph type, to a point calculated from this value and min/max values. If value > Max value or value < Min value, the bar graph is filled or shown empty and no error is generated by the VT.                                                 |
| Target value variable reference | 12   | Integer | 2            | 0-65534, 65535 | 23-24       | Object ID of a Number Variable object in which to retrieve the bar graph's target value. If this attribute is set to NULL, the target value is retrieved directly from the Target value attribute instead.<br>The referenced Number Variable's value shall be in the range 0-65535.                                                                       |
| Target value                    | 13   | Integer | 2            | 0-65535        | 25-26       | Current target value. Used only if target value variable Reference attribute is NULL. Target value is displayed as a line on the bar graph to indicate some target or warning level. If Target value > Max value or Target value < Min value, the target line is shown on one of the ends of the bar graph and no error is generated by the VT.           |
| Number of macros to follow      |      | Integer | 1            | 0-255          | 27          | Number of Macro references included even if zero. Each Macro reference consists of 2 bytes: one for event ID and one for Macro ID. Whenever the indicated event occurs, the associated Macro is executed.<br>VT version 5 and later: A reference to a Macro with 16-bit Object ID shall count as 2 macro references within the context of this attribute. |
| <b>Repeat:</b><br>{Event ID}    |      | Integer | 1            | 0-255          | 28...       | (List these after all objects have been listed.)<br>8-bit Macro Object ID reference: Event ID of event type that causes this Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Event ID of event type that causes this Macro to execute or 0xFF (see Clause 4.6.22.3)                                              |
| {Macro ID}                      |      | Integer | 1            | 0-255          | 29...       | 8-bit Macro Object ID reference: Macro ID of the Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Low byte or high byte of Macro ID of the Macro to execute (see Clause 4.6.22.3)                                                                                                                                 |

## B.12 Picture Graphic object

### B.12.1 General

This object displays a picture graphic (bitmap). The VT shall scale the picture graphic from the actual width and height to the target width and calculated target height. See Table B.40 — Picture Graphic events and Table B.41 — Picture Graphic attributes and record format.

#### Allowed Command:

- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

Table B.40 — Picture Graphic events

| Event               | Caused by                                                                                                             | VT behaviour                             | Message                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|------------------------------------------|---------------------------|
| On Refresh          | A change in the Opaque/Transparent or the Flashing Option bits<br>Also see Data Mask Refresh for caused by conditions | Redraw this object.                      | —                         |
| On Change Attribute | Change Attribute command                                                                                              | Redraw this object, refresh parent mask. | Change Attribute response |

Table B.41 — Picture Graphic attributes and record format

| Attribute Name | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                                                                                                 |
|----------------|-----|---------|--------------|----------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID      |     | Integer | 2            | 0-65534        | 1-2         | Object identifier. Shall be unique within the object pool.                                                                                                                                                                                                                                                                                  |
| Type           | [0] | Integer | 1            | =20            | 3           | Object Type = Picture Graphic                                                                                                                                                                                                                                                                                                               |
| Width          | 1   | Integer | 2            | 0-65535        | 4 - 5       | Target width in pixels of the picture graphic. The height of the picture graphic is calculated from the Actual width/Height and this attribute to keep the same aspect and avoid distortion.                                                                                                                                                |
| Actual width   | [4] | Integer | 2            | 0-65535        | 6-7         | Actual width in pixels of the picture graphic raw data. VT shall scale the graphic to the size given by the width attribute.                                                                                                                                                                                                                |
| Actual height  | [5] | Integer | 2            | 0-65535        | 8-9         | Actual height in pixels of the picture graphic raw data. VT shall scale the graphic to the size given by the width attribute.                                                                                                                                                                                                               |
| Format         | [6] | Integer | 1            | 0-2            | 10          | Picture graphic type:<br>0 = Monochrome; 8 pixels per byte. Each bit represents a colour palette index of 0 or 1. ("White" colour can vary with display hardware)<br>1 = 4 bit colour; 2 colour pixels per byte. Each nibble (4 bits) represents a colour palette index of 0 through 15.<br>2 = 8 bit colour; 1 colour pixel per byte. Each |

### B.12.2 Picture Graphic object raw data format and compression

The raw data attribute of the Picture Graphic object contains pixel information line by line, left to right and downwards. If the width of the object is such that the data does not end evenly at the end of a byte, the unused portion of the byte at the end of each line is filled with pixel values equal to zero (0). The VT ignores unused parts of a byte at the end of a line.

**Example** If the size of the object is 10 pixels wide by two lines high, the format is monochrome and each line is filled with white coloured pixels. The unused 6 bits in the second byte of each line would be filled with zero and the raw data would be FF<sub>16</sub>,C0<sub>16</sub>,FF<sub>16</sub>,C0<sub>16</sub>. Similar logic is applied for four-bit colour graphics where, if the width is odd, the least significant nibble of the last byte on each line is set to zero.

If the data is longer than expected after all of the rows and columns of pixels have been defined, then the VT shall ignore all extra data bytes. However, if the data is shorter than expected leaving some pixels undefined, then the VT shall report an error to the Working Set. This error shall be reported with either the End of Object Pool response (See Clause C.2.5) or the VT Change Active Mask message (See Clause H.14).

In order to reduce the amount of data transmitted by the Working Set and maintained by the VT it is recommended that the smallest version of a picture graphic be transmitted. Therefore, a run-length encoding scheme may be used to compress the picture graphic data. Care should be taken by Working Set designers as this algorithm can actually increase the size of the picture graphic data when the object is complex. In this case, it is recommended that raw data be transmitted instead and Bit 2 of the options attribute should be cleared.

The compression algorithm is simple and works as follows. Data is transmitted in two-byte pairs with the first byte representing the number of times the value byte repeats and the second byte representing the value to repeat. For example, for a raw data sequence of 0,0,0,0,0,3,3,3,1,1,2, the compressed data would be transmitted as 6,0,3,3,2,1,1,2. This example gives a compression of 33 %. If the first byte in a pair has the value zero, the second byte is ignored.

The run-length algorithm is chosen because picture graphic data can be easily compressed and uncompressed in real time without the need for a buffer in the VT.

## B.13 Variable objects

### B.13.1 General

Variables are used to store a value that can be referenced and used by other objects. There are two types of variable object: number and string. Variables are referenced only, never directly included as a child in a parent object. See Table B.42 — Variable events.

Table B.42 — Variable events

| Event           | Caused by                                                   | VT behaviour                                                                                      | Message                                                       |
|-----------------|-------------------------------------------------------------|---------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| On Change Value | Change Numeric Value command or Change String Value command | Redraw all objects that are currently displayed and reference this object. Refresh parent object. | Change Numeric Value response or Change String Value response |

### B.13.2 Number Variable object

A number variable holds a 32-bit unsigned integer value. See Table B.43 — Number Variable attributes and record format.

#### Allowed Commands:

- Change Numeric Value command (Number Variable object only);
- Get Attribute Value message (VT version 4 and later).

Table B.43 — Number Variable attributes and record format

| Attribute Name | AID | Type    | Size (bytes) | Range or Value  | Record byte | Description                                                |
|----------------|-----|---------|--------------|-----------------|-------------|------------------------------------------------------------|
| Object ID      |     | Integer | 2            | 0-65534         | 1-2         | Object identifier. Shall be unique within the object pool. |
| Type           | [0] | Integer | 1            | =21             | 3           | Object Type = Number Variable                              |
| Value          | [1] | Integer | 4            | 0 to $2^{32}-1$ | 4-7         | 32-bit unsigned integer value.                             |

### B.13.3 String Variable object

A String Variable holds a fixed length string. Strings shorter than the length attribute should be padded with space characters. The maximum length attribute cannot be changed once the variable has been defined. See Table B.44 — String Variable attributes and record format.

#### Allowed Commands:

- Change String Value command (String Variable object only) ;
- Get Attribute Value message (VT version 4 and later).

Table B.44 — String Variable attributes and record format

| Attribute Name | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                |
|----------------|-----|---------|--------------|----------------|-------------|------------------------------------------------------------|
| Object ID      |     | Integer | 2            | 0-65534        | 1-2         | Object identifier. Shall be unique within the object pool. |

| Attribute Name | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                              |
|----------------|-----|---------|--------------|----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type           | [0] | Integer | 1            | =22            | 3           | Object Type = String Variable                                                                                                                                                                                                                                            |
| Length         |     | Integer | 2            | 0-65535        | 4 - 5       | Maximum fixed length of the string value in bytes.                                                                                                                                                                                                                       |
| Value          |     | String  |              |                | 6...        | String of characters. Pad with spaces as necessary to satisfy length attribute.<br>The text string can be 8-bit or WideString (See Clause 4.6.19.7 String encoding).<br>The Working Set can cause the type to change from an 8-bit String to a WideString or vice versa. |

## B.14 Attribute objects

### B.14.1 General

Attribute objects are used to hold common attributes for other objects. Attribute objects are referenced only, never directly included as a child in a parent object. There are four types of attribute object: font, line, fill and input. See Table B.45 — Font Attributes events and Table B.46 — Font Attributes attributes and record format.

### B.14.2 Font Attributes object

This object holds attributes related to fonts.

The Working Set designer can change the Font Attributes using either the Change Font Attributes command, the Change Attribute command, or by transferring a new object. The designer should be aware that some uses of the Change Attribute command may cause the object pool to become invalid (e.g. if the Font size and Font style attributes are changed to a combination that the VT does not support). The Change Font Attributes command may be used to achieve the desired results without the invalid pool condition.

#### Allowed Commands:

- Change Font Attributes command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

Table B.45 — Font Attributes events

| Event                     | Caused by                      | VT behaviour                                                                                      | Message                         |
|---------------------------|--------------------------------|---------------------------------------------------------------------------------------------------|---------------------------------|
| On Change Font Attributes | Change Font Attributes command | Redraw all objects that are currently displayed and reference this object. Refresh parent object. | Change Font Attributes response |
| On Change Attribute       | Change Attribute command       | Redraw all objects that are currently displayed and reference this object. Refresh parent object. | Change Attribute response       |

Table B.46 — Font Attributes attributes and record format

### B.14.3 Line Attributes object

This object holds Line Attributes related to output shape objects. See Table B.47 — Line Attributes events and Table B.48 — Line Attributes attributes and record format and Figure B.14 — Effect of Line Attribute — example pattern: 1010....

NOTE The end point of a line can be calculated, but may not be drawn when the Line Attribute is applied.

#### Allowed Commands:

- Change Line Attributes command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

Table B.47 — Line Attributes events

| Event                     | Caused by                      | VT behaviour                                                                                      | Message                         |
|---------------------------|--------------------------------|---------------------------------------------------------------------------------------------------|---------------------------------|
| On Change Line Attributes | Change Line Attributes command | Redraw all objects that are currently displayed and reference this object. Refresh parent object. | Change Line Attributes response |
| On Change Attribute       | Change Attribute command       | Redraw all objects that are currently displayed and reference this object. Refresh parent object. | Change Attribute response       |

Table B.48 — Line Attributes attributes and record format

| Attribute Name               | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|-----|---------|--------------|----------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID                    |     | Integer | 2            | 0-65534        | 1-2         | Object identifier. Shall be unique within the object pool.                                                                                                                                                                                                                                                                                                                                               |
| Type                         | [0] | Integer | 1            | =24            | 3           | Object Type = Line Attributes                                                                                                                                                                                                                                                                                                                                                                            |
| Line colour                  | 1   | Integer | 1            | 0-255          | 4           | Pen colour.                                                                                                                                                                                                                                                                                                                                                                                              |
| Line width                   | 2   | Integer | 1            | 0-255          | 5           | Pen thickness in pixels. Lines are drawn with a square paintbrush of this size. See Figure B.13 — Effect of Line Attribute - example of same line art with different width                                                                                                                                                                                                                               |
| Line art                     | 3   | Bitmask | 2            | 0-65535        | 6-7         | Bit pattern art for line. Each bit represents a paintbrush spot. Zero (0) bits are skipped (background colour) and one (1) bits are drawn in the line colour. Each bit is the size of the current paintbrush. For example, 00110011 would represent two skipped paintbrush spots followed by two paintbrush spots drawn and so on. See Figure B.14 — Effect of Line Attribute — example pattern: 1010... |
| Number of macros to follow   |     | Integer | 1            | 0-255          | 8           | Number of Macro references included even if zero. Each Macro reference consists of 2 bytes: one for event ID and one for Macro ID. Whenever the indicated event occurs, the associated Macro is executed.<br>VT version 5 and later: A reference to a Macro with 16-bit Object ID shall count as 2 macro references within the context of this attribute.                                                |
| <b>Repeat:</b><br>{Event ID} |     | Integer | 1            | 0-255          | 9...        | (List these after all objects have been listed.)<br>8-bit Macro Object ID reference: Event ID of event type that causes this Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Event ID of event type that causes this Macro to execute or 0xFF (see Clause 4.6.22.3)                                                                                             |
| {Macro ID}                   |     | Integer | 1            | 0-255          | 10...       | 8-bit Macro Object ID reference: Macro ID of the Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Low byte or high byte of Macro ID of the Macro to execute (see Clause 4.6.22.3)                                                                                                                                                                                |

Key:

- a Output Line object (width=16, height=1, line attribute: line width=1, line attribute: line art=DC53<sub>16</sub>)
- b Line Attribute binary value superimposed above the rendered Output Line object to show relationship
- c Most significant bit of line attribute
- d Least significant bit of line attribute
- e Output Line object (width=32, height=2, line attribute: line width=2, line attribute: line art=DC53<sub>16</sub>)

**Figure B.13 — Effect of Line Attribute - example of same line art with different width**

**Figure B.14 — Effect of Line Attribute — example pattern: 1010...**

#### B.14.4 Fill Attributes object

This object holds attributes related to filling output shape objects. See Table B.49 — Fill Attributes events and Table B.50 — Fill Attributes attributes and record format.

##### Allowed Commands:

- Change Fill Attributes command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

Table B.49 — Fill Attributes events

| Event                     | Caused by                      | VT behaviour                                                                                      | Message                         |
|---------------------------|--------------------------------|---------------------------------------------------------------------------------------------------|---------------------------------|
| On Change Fill Attributes | Change Fill Attributes command | Redraw all objects that are currently displayed and reference this object. Refresh parent object. | Change Fill Attributes response |
| On Change Attribute       | Change Attribute command       | Redraw all objects that are currently displayed and reference this object. Refresh parent object. | Change Attribute response       |

Table B.50 — Fill Attributes attributes and record format

| Attribute Name               | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### B.14.5 Input Attributes object

This object defines the valid or invalid characters for an

Input String object. The VT shall check this object for valid characters and not permit operator entry of invalid characters into the input field. This object is referenced by an

Input String object. See Table B.51 — Input Attributes events and Table B.52 — Input Attributes attributes and record format.

If the

Input String object which references this object does not contain an 8-bit string, or the

Input String object references a String Variable that does not contain an 8-bit string, then no validation shall be performed.

#### Allowed Commands:

- Change String Value command;
- Get Attribute Value message (VT version 4 and later).

**Table B.51 — Input Attributes events**

| Event           | Caused by                   | VT behaviour                                                                                      | Message                      |
|-----------------|-----------------------------|---------------------------------------------------------------------------------------------------|------------------------------|
| On Change Value | Change String Value command | Redraw all objects that are currently displayed and reference this object. Refresh parent object. | Change String Value response |

Table B.52 — Input Attributes attributes and record format

#### B.14.6 Extended Input Attributes object

The Extended Input Attributes object, available in VT version 4 and later, defines the valid or invalid characters for an

Input String object. The VT shall check this object for valid characters and not permit operator entry of invalid characters into the input field. This object is referenced by an

Input String object. See Table B.53 — Extended Input Attributes attributes and record format.

If the

Input String object which references this object does not contain a WideString, or the

Input String object references a String Variable object that does not contain a WideString, then no validation shall be performed.

The character ranges defined in this object may include characters which are not supported by the VT. The VT shall ignore the unsupported characters but still validate against the remaining characters.

**Allowed Command:**

- Get Attribute Value message (VT version 4 and later).

| Number of code planes to follow        |     | Integer | 1            | 1-17           | 5           | Number of code planes with valid/invalid characters.<br>For each code plane the plane number and an array of character ranges are listed.                                                                                                                    |
| <b>Repeat:</b><br>{Code plane number}  |     | Integer | 1            | 0-16           | 6...        | Code plane to which the character ranges belong.<br>0 : characters 00000 <sub>16</sub> ..0FFFF <sub>16</sub><br>1 : characters 10000 <sub>16</sub> ..1FFFF <sub>16</sub><br>2 : characters 20000 <sub>16</sub> ..2FFFF <sub>16</sub><br>etc.                 |
| {Number of character ranges to follow} |     | integer | 1            | 1-255          | 7..         | Number of character ranges. Each character range consists of two WideChars (first character and last character where the first character ≤ last character).<br>Depending on validation type (byte 4) the ranges indicate either valid or invalid characters. |
| <b>Repeat:</b><br>{{First character}}  |     | integer | 2            | 0-65535        | 8..         | First character in the range.                                                                                                                                                                                                                                |
| {{Last character}}                     |     | integer | 2            | 0-65535        | 10..        | Last character in the range.                                                                                                                                                                                                                                 |

Example An Extended Input Attribute object (object id 1234<sub>16</sub>) limiting the input characters to the following ranges:

0004<sub>16</sub>-0004F<sub>16</sub> ; Code plane 0  
 0006<sub>16</sub>-0006F<sub>16</sub> ; Code plane 0  
 1AB12<sub>16</sub>-1AB1F<sub>16</sub> ; Code plane 1

The object shall be encoded as follows:

34<sub>16</sub>, 12<sub>16</sub>, ; object id  
 26<sub>16</sub>, ; Type  
 00<sub>16</sub>, ; validation type  
 02<sub>16</sub>, ; Two code planes  
 00<sub>16</sub>, ; Code plane 0  
 02<sub>16</sub>, ; Two character ranges  
 41<sub>16</sub>, 00<sub>16</sub>, 4F<sub>16</sub>, 00<sub>16</sub>, ; Range 1  
 61<sub>16</sub>, 00<sub>16</sub>, 6F<sub>16</sub>, 00<sub>16</sub>, ; Range 2  
 01<sub>16</sub>, ; Code plane 1  
 01<sub>16</sub>, ; One character range  
 12<sub>16</sub>, AB<sub>16</sub>, 1F<sub>16</sub>, AB<sub>16</sub>, ; Range 1

## B.15 Object Pointer object

Refer to clause 4.6.11.5 Object pointer for information on this object. See Table B.54 — Object Pointer events and Table B.55 — Object Pointer attributes and record format.

### Allowed Commands:

- Change Numeric Value command;
- Get Attribute Value message (VT version 4 and later).

**Table B.54 — Object Pointer events**

| Event           | Caused by                    | VT behaviour                                                             | Message                       |
|-----------------|------------------------------|--------------------------------------------------------------------------|-------------------------------|
| On Change Value | Change Numeric Value command | Hide the prior object and show the new one.<br>Refresh the parent object | Change Numeric Value response |

**Table B.55 — Object Pointer attributes and record format**

| Attribute Name | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                |
|----------------|-----|---------|--------------|----------------|-------------|------------------------------------------------------------|
| Object ID      |     | Integer | 2            | 0-65534        | 1-2         | Object identifier. Shall be unique within the object pool. |
| Type           | [0] | Integer | 1            | =27            | 3           | Object Type = Object Pointer object                        |
| Value          | [1] | Integer | 2            | 0-65534, 65535 | 4 - 5       | Object ID of a referenced object or the NULL Object ID.    |

## B.16 Macro object

Macros are used to define a list of commands that can be referenced by an event or executed using the Execute Macro command (on version 4 or later VTs) or the Execute Extended Macro command (on version 5 and later VTs). A Macro is defined by a series of one or more command packets. (See Clause 4.6.11.4 Macros)

It is the Working Set responsibility to ensure that the macros, prior to execution, are consistent with the object pool (e.g. cannot reference missing objects).

NOTE Command packets are defined in Annex F but not all commands are allowed in a Macro.

See Table B.56 — Macro attributes and record format.

### Allowed Commands:

- Execute Macro command (VT version 4 and later);
- Execute Extended Macro command (VT version 5 and later);
- Get Attribute Value message (VT version 4 and later).

Table B.56 — Macro attributes and record format

| Attribute Name                      | AID | Type    | Size (bytes) | Range or Value                             | Record byte | Description                                                                                                                                                                                                                                       |
|-------------------------------------|-----|---------|--------------|--------------------------------------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## B.17 Colour Map object

The Colour Map object, optionally available in VT version 4 and later, allows the Working Set designer to alter the transformation of the VT colour index values to the defined RGB value. This provides a mechanism where the colours table can be changed at run-time. A Working Set in using a few colour objects for various backgrounds and borders can then easily alter the presentation.

The object pool may contain more than one Colour Map object. After the pool is loaded the VT uses the default Colour Map. Upon receipt of a valid Select Colour Map command the VT changes the active palette for this Working Set. Every object of a Working Set's pool shall be displayed with that Working Set's Colour Map.

The Colour Map object contains the definitions for each of the valid colour index values. Upon selection of a Colour Map, the resulting Colour Map values shall be valid for the VT's capabilities or the VT will indicate the failure in the Select Colour Map response message. Therefore, a monochrome VT maintains two entries in the Colour Map object, where a 256 colour VT maintains 256 entries in the Colour Map object. The Colour Map object may have capabilities beyond the VT (e.g. a 256 entry Colour Map object may be uploaded for a 2-colour VT, which will only access indices 0 and 1), but the Colour Map object shall not have fewer colour indices than the VT capabilities.

A typical VT implementation defines the default palette as shown in Table A.4 — Standard VT RGB colour palette. The subscript into this array of values is the colour index. The Colour Map object provides one level of indirection to the RGB table. Figure B.15 — Colour Map object reverses colours – example shows a sample presentation before and after colours 0 and 1 have been reversed by selecting a Colour Map object with the values [1, 0, ...].

### Allowed Command:

— Get Attribute Value message (VT version 4 and later).

Figure B.15 — Colour Map object reverses colours – example

## B.18 Graphics Context object

The Graphics Context Object, optionally available in VT version 4 and later, is a bitmap with a canvas and a viewport that can be manipulated by the Working Set at run time. The canvas of the object (the drawing area) can be changed and is remembered by the object even when it is not physically on the screen. In other words, this object has a memory and the pixels of the canvas persist even when the object is removed from the display or another mask is selected. This allows a Working Set to do run-time drawing to the VT screen. This would be useful for precision farming applications, where, for example, the designer could draw a swath behind the moving implement image.

The memory required for the object's bitmapped contents can be directly calculated from the canvas size. Changes to the canvas size are not permitted unless an entirely new object is uploaded. The "viewport" defines the portion of the canvas that is visible and thus the display size of the VT object (i.e. on a Data Mask). By anchoring the viewport as a child object in the parent mask or container, it is possible to easily and efficiently pan the underlying object contents within the viewport. The size of the viewport can be modified at run-time.

The contents of this object are never stored by the Store Version command. Working Sets may copy the canvas to a Picture Graphic before storing a version of the object pool if it is desired to store what was drawn.

A single Graphics Context command with several sub-commands is defined to allow simple, consistent and efficient modification of the contents of the graphics Context. The Graphics Context commands can also be contained within a Macro to permit even more efficient updates. Most commands can be carried by one CAN packet.

The current drawing Context, or attributes of the Graphics Context object are always remembered. Therefore it is only necessary to set an attribute once when it is intended to be used more than once (refer to example below). A graphics cursor is defined to indicate the next X/Y location at which to start drawing. Graphics commands can move the graphics cursor to a new location. Therefore drawing can be thought of as a set of procedural commands as shown in Figure B.16 — Example drawing with Graphics Context object.

| Instructions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Graph Result                                                                       |

**Figure B.16 — Example drawing with Graphics Context object**

The Graphics Context object has a transparency option, similar to the Picture Graphic object. Therefore it is possible to create graphics 'layers' by overlaying two or more Graphics Context Objects. This allows easy removal or erasure of certain groups of pixels in the object(s). For example, swath lines could be reset without affected the underlying map image. However, Working Set designers should be cautioned that the Graphics Context object will likely allocate significant memory in the VT (Canvas Width times Canvas Height or more bytes on a 256 colour VT) and should therefore be used sparingly and kept small to avoid rejection of the pool due to memory constraints.

- Key
- 1 Picture graphic object
  - 2 Viewport
  - 3 Graphics context object (entire graphics context referred to as the 'canvas')

Figure B.17 — Example application of the Graphics Context object and viewport

Allowed Commands

- Graphics Context command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

Table B.58 — Graphics Context events

| Event                       | Caused by                        | VT behaviour                               | Message                           |
|-----------------------------|----------------------------------|--------------------------------------------|-----------------------------------|
| On Change Attribute         | Change Attribute command         | If field is visible, refresh.              | Change Attribute response         |
| On Change Background Colour | Change Background Colour command | Fill the object with the background colour | Change Background Colour response |

Table B.59 — Graphics Context attributes and record format

| Attribute Name         | AID | Type    | Size (bytes) | Range or Value   | Record Byte | Description                                                                                                                                                                                                                              |

If transparent, pixels in the bitmap that have the transparency colour should show the colour of the background or objects underneath this object instead.<br>Bit 1: Colour<br>0 = Use Foreground and Background Colours of this object when drawing.<br>1 = Use Line Colour, Font colour, and Fill Colour, specified in the Line, Font, and Fill attributes when drawing.<br>Bits 2-7 = reserved, set to 0 |
| Transparency Colour | 17  | Integer | 1            | 0-255          | 34          | Pixels in the bitmap that have this colour index are transparent (background shows through). If opaque, this attribute is ignored.                                                                                                                                                                                                                                                                                                                                                                                                                             |

## B.19 Window Mask object

### B.19.1 General

The Window Mask object, available in VT version 4 and later, is a parent and special mask object that is used by the VT only in its User-Layout Data Masks. For details, refer to Clause 4.7.1.2 User-Layout Data Mask.

If the Window Mask Window Type is free form (type 0), the Working Set shall scale this object, just as any other object, to the dimensions of the VT's Window Cell. The aspect ratio of a Window Cell is predictable since there are always 12 window cells (2 columns by 6 rows) on each of the VT's User-Layout Data Masks which, in turn, are always full mask resolution and square. Therefore, the window Cell Size can be calculated from the Data Mask size reported by the VT in the Get Hardware response.

Working Sets can participate in the VT's User-Layout Data Masks, if supported, by placing Window Mask objects in the object pool.

#### Allowed Commands:

- Change Background Colour command;
- Change Child Location command;

- Change Child Position command;
- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

Table B.60 — Window Mask events

| Event                       | Caused by                                                                             | VT behaviour                                                                                                                                      | Message                                                 |
|-----------------------------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| On Show                     | A User-Layout Data Mask containing this Window Mask object is displayed on screen     | Fill area with the User-Layout Data Mask background colour. Draw child objects in the order they are listed in the Window Mask object.            | VT On User-Layout Hide/Show message with Show indicated |
| On Hide                     | A User-Layout Data Mask containing this Window Mask object is removed from the screen |                                                                                                                                                   | VT On User-Layout Hide/Show message with Hide indicated |
| On Refresh                  | Any action that causes a show or hide on a child, grandchild, object, etc.            | Redraw objects in the Window Mask that have become corrupted.                                                                                     | —                                                       |
| On Change Background Colour | Change Background Colour command                                                      | If the Window Mask is visible and not transparent, fill area with background colour and draw child objects in the order they are listed.          | Change Background Colour response                       |
| On Change Child Location    | Change Child Location command                                                         | Draw child object at current location in User-Layout mask background colour to erase it. Refresh Window Mask (to redraw child object or objects). | Change Child Location response                          |
| On Change Child Position    | Change Child Position command                                                         | Draw child object at current location in User-Layout mask background colour to erase it. Refresh Window Mask (to redraw child object or objects). | Change Child Position response                          |
| On Change Attribute         | Change Attribute command                                                              | For behaviour see other change commands above.                                                                                                    | Change Attribute response                               |

Table B.61 — Window Mask attributes and record format

| Attribute Name    | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|---------------------------------------|-----|---------|--------------|----------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                       |     |         |              |                |             | information and do its own formatting of the text. The VT shall use this name in its proprietary mapping screen. The VT shall be capable of displaying at least 20 characters.                                                                                                                                                                                                                                                                                                                       |
| Window Title                          |     | Integer | 2            | 0-65534, 65535 | 11-12       | Object ID of an Output String object or an Object Pointer object that points to an Output String object that contains the string that supplies window title text. This attribute shall be required for window types above zero. For window type zero, this attribute shall be set to the NULL Object ID. For window types above zero, the VT may choose to ignore colour and font information and do its own formatting of the text.                                                                 |
| Window Icon                           |     | Integer | 2            | 0-65534, 65535 | 13-14       | Object ID of an output object (as specified in Table A.2 — Allowed hierarchical relationships of objects, 'Object Label Graphic Representation' column) that contains an icon for the window. The VT may use this when formatting window types above type zero and may also use it in the proprietary mapping screen to represent the window. This attribute shall only be the NULL if the window type is zero (0). In all other window types, a window icon object shall be supplied.               |
| Number of object references to follow |     | Integer | 1            | 0-2            | 15          | The number of objects needed in a Window Mask is variable and dependent upon the window type. This attribute, though redundant with the window type attribute, allows for future expansion of this object definition and helps with parsing.<br>If the window type is zero (free form) this attribute shall be set to 0. For all other window types, refer to the tables that follow in Clause B.19.2.<br>Each attribute that follows is a two-byte reference to an object id or the NULL Object ID. |
| Number of objects to follow           |     | Integer | 1            | 0-255          | 16          | Number of objects to follow even if zero. If the Window Type attribute is not zero, this attribute shall be set to 0. Child objects are only necessary if the Window Type is Free Form (0). Each of these objects is "contained" in this object. Each object consists of 6 bytes: two (2) for Object ID and four (4) for location.                                                                                                                                                                   |
| Number of macros to follow            |     | Integer | 1            | 0-255          | 17          | Number of Macro references included even if zero. Each Macro reference consists of 2 bytes: one for event ID and one for Macro ID. Whenever the indicated event occurs, the associated Macro is executed.<br>VT version 5 and later: A reference to a Macro with 16-bit Object ID shall count as 2                                                                                                                                                                                                   |

| Attribute Name                | AID | Type           | Size (bytes) | Range or Value         | Record byte                                                                | Description                                                                                                                                                                                                                                                                                                  |

## B.19.2 Window Mask Window Types

The Window Mask Type attribute in the Window Mask, along with the object component references in the object allow the VT to create a uniform look and feel for standardized windows from all Working Sets. In addition, when the attribute is zero (0 = Free Form) the Working Set may create completely custom presentation.

### B.19.2.1 Free Form Window (0)

When the attribute is 0, the Working Set supplies and positions all child objects contained inside the window. In this case the Working Set has complete control over the look and feel of the window and the VT shall render the Window Mask exactly as specified by the child objects, position, size, and transparency attributes of the Window Mask object and all other formatting attributes.

## B.19.2.2 1x1 Numeric Output Value Window With Units

|                                           |                                                                                                                                                                                                                                                  |

| <b>VT Field Lengths</b>                   | Window Title: 11 characters                                                                                                                                                                                                                                                                                                 |
| <b>VT Formatting and Scaling</b>          | The VT may format the window as desired, and may ignore colour and Font Attributes in the referenced objects. Field length shall conform to the above requirements. The VT may scale objects, excluding the Window Icon, if required or desired.                                                                            |
| <b>Working Set Formatting and Scaling</b> | The Working Set has no control over formatting or layout. The Working Set shall scale the Window Icon object according to Clause 4.7.15.3. The Working Set shall supply a Output Linear Bar Graph object in the horizontal position. The bar graph should increase from left to right but may increase in either direction. |
| <b>Example Layout</b>                     |  <p>This figure is an example that shows all components of the window. VT designs control the formatting and layout of this window.</p>                                                                                                  |

| <b>VT Field Lengths</b>                   | Window Title: 11 characters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>VT Formatting and Scaling</b>          | The VT design is free to format the window as desired, and may ignore colour and Font Attributes in the referenced Button object. Field length requirements above shall be met. The VT is free to scale objects, excluding the Window Icon, if needed or desired but in the case of the Button object shall only maintain or increase it's size to avoid clipping child objects.                                                                                                                                                                                        |
| <b>Working Set Formatting and Scaling</b> | <p>The Working Set has no control over formatting or layout. The Working Set shall scale the Window Icon object according to Clause 4.7.15.3. The Working Set shall also scale the Button object and its children according to these equations:</p> <p>Button Width = Window Cell Width * 65% (rounded down)</p> <p>Button Height = Window Cell Height * 57% (rounded down)</p> <p>Child objects shall be similarly scaled. Due to these requirements, the same Button object in a Data Mask cannot be used in a Window Mask since the scale factors are different.</p> |
| <b>Example Layout</b>                     |  <p>This figure is an example that shows all components of the window. VT designs control the formatting and layout of this window.</p>                                                                                                                                                                                                                                                                                                                                              |

## B.19.2.10 1x1 Double Button Window

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>VT Field Lengths</b>                   | Window Title: 11 characters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>VT Formatting and Scaling</b>          | The VT design is free to format the window as desired, and may ignore colour and Font Attributes in the referenced Button objects. Field length requirements above shall be met. The VT is free to scale objects, excluding the Window Icon, if needed or desired but in the case of the Button objects shall only maintain or increase their size to avoid clipping child objects.                                                                                                                                                                                             |
| <b>Working Set Formatting and Scaling</b> | <p>The Working Set has no control over formatting or layout. The Working Set shall scale the Window Icon object according to Clause 4.7.15.3. The Working Set shall also scale the Button objects and their children according to these equations:</p> <p>Button Width = Window Cell Width x 30% (rounded down)</p> <p>Button Height = Window Cell Height x 57% (rounded down)</p> <p>Child objects shall also be similarly scaled. Due to these requirements, the same Button object in a Data Mask cannot be used in a Window Mask since the scale factors are different.</p> |
| <b>Example Layout</b>                     |  <p>This figure is an example that shows all components of the window. VT designs control the formatting and layout of this window.</p>                                                                                                                                                                                                                                                                                                                                                      |

| <b>VT Field Lengths</b>                   | Window Title: 20 characters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>VT Formatting and Scaling</b>          | The VT design is free to format the window as desired, and may ignore colour and Font Attributes in the referenced Button object. Field length requirements above shall be met. The VT is free to scale objects, excluding the Window Icon, if needed or desired but in the case of the Button object shall only maintain or increase its size to avoid clipping child objects.                                                                                                                                                                                                            |
| <b>Working Set Formatting and Scaling</b> | <p>The Working Set has no control over formatting or layout. The Working Set shall scale the Window Icon object according to Clause 4.7.15.3. The Working Set shall also scale the Button object and its children according to these equations:</p> <p>Button Width = Window Cell Width * 80% (rounded down)</p> <p>Button Height = Window Cell Height * 57% (rounded down)</p> <p>Child objects shall also be scaled accordingly. Due to these rules, it is likely not possible to use the same Button object in a Data Mask and a Window Mask since the scale factors are different.</p> |
| <b>Example Layout</b>                     |  <p>This figure is provided for example only and shows all components of the window. VT designs control the formatting and layout of this window.</p>                                                                                                                                                                                                                                                                                                                                                  |

| <b>VT Field Lengths</b>                   | Window Title: 20 characters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>VT Formatting and Scaling</b>          | The VT design is free to format the window as desired, and may ignore colour and Font Attributes in the referenced Button objects. Field length requirements above shall be met. The VT is free to scale objects, excluding the Window Icon, if needed or desired but in the case of the Button objects shall only maintain or increase their size to avoid clipping child objects.                                                                                                                                                                                                           |
| <b>Working Set Formatting and Scaling</b> | <p>The Working Set has no control over formatting or layout. The Working Set shall scale the Window Icon object according to Clause 4.7.15.3. The Working Set shall also scale the Button objects and their children according to these equations:</p> <p>Button Width = Window Cell Width x 40% (rounded down)</p> <p>Button Height = Window Cell Height x 57% (rounded down)</p> <p>Child objects shall also be scaled accordingly. Due to these rules, it is likely not possible to use the same Button object in a Data Mask and a Window Mask since the scale factors are different.</p> |
| <b>Example Layout</b>                     |  <p>This figure is provided for example only and shows all components of the window. VT designs control the formatting and layout of this window.</p>                                                                                                                                                                                                                                                                                                                                                     |

## B.20 Key Group object

The Key Group object, available in VT version 4 and later, is a parent object that is used by the VT only in its User-Layout Soft Key Mask. For details, refer to Clause 4.7.8. The Key Group object contains Key objects and Object Pointer objects. An Object Pointer object shall point only to a Key object, another Object Pointer object, or the NULL object.

The Key objects contained in this object shall be a grouping of Key objects, or Object Pointers to Key objects. The VT shall not allow the operator to break up, even across visible Soft Key page boundaries, this grouping when mapping the Key layouts and shall require the operator to map the entire group together. This also means that several Key Cells can be required to represent this object.

Working Sets can participate in the VT's User-Layout Soft Key Mask, if supported, by placing Key Group objects in the object pool.

Working Set designers should make the Key Group object transparent. This allows the VT to set the background colour of each child Key object so that all Keys have the same background colour. If required, the Working Set can determine the VT's background colour using the Get Window Mask Data message.

Object Pointer objects pointing to the NULL Object ID reserve a Key object position (the remaining Key objects do not move up and the trailing Key object can be navigated to).

### Allowed Commands:

- Change Attribute command;
- Get Attribute Value message (VT version 4 and later).

**Table B.62 — Key Group events**

| Event               | Caused by                | VT behaviour                      | Message                   |

| <b>Repeat:</b><br>{Event ID}  |     | Integer | 1            | 0-255          | 11+ (No. objects *2)... | (List these after all objects have been listed.)<br>8-bit Macro Object ID reference: Event ID of event type that causes this Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Event ID of event type that causes this Macro to execute or 0xFF (see Clause 4.6.22.3)                                                                                                                                                                               |
| {Macro ID}                    |     | Integer | 1            | 0-255          | 12+ (No. objects *2)... | 8-bit Macro Object ID reference: Macro ID of the Macro to execute.<br>16-bit Macro Object ID reference (only for VT version 5 and later): Low byte or high byte of Macro ID of the Macro to execute (see Clause 4.6.22.3)                                                                                                                                                                                                                                                                  |

## B.21 Object Label Reference List object

The Object Label Reference List object, available in VT version 4 and later, provides a mechanism to assign a String Variable and / or a graphical designator as a label to other objects. An Object Pool shall not contain more than one Object Label Reference List object.

An object label is only intended for use by the VT in various proprietary screens and popup messages or editors, and recommended for use in new Working Set designs. Object Labels are useful in two specific cases, though not limited to these two:

- It is recommended that Working Set designs provide an object label with a text name for the Working Set object. This text may be used by the VT to identify the Working Set in proprietary screens and alarms (e.g. “Planter” could be used to differentiate one Working Set from others).
- It is recommended that Working Set designs provide an Object Label for all input objects. Since popup editor windows in the VT may cover the focused input object, it is also recommended that VT designs display the Object Label in the popup editor window so that the operator can recall what is being edited. An example of such a label could be “Section 1 Width (meters)” and/or an appropriate designator graphic.

Strings in excess of 32 characters may be clipped to 32 characters by the VT. Referenced designator graphics shall fit within a Soft Key designator area (See Clause 4.5.3 Soft Key Mask area and Soft Key designators). The referenced designator object may contain objects as listed in Object Label graphic representation (See Table A.2 — Allowed hierarchical relationships of objects). It is not possible to assign more than one label to an object. When an Object ID, of an object to label, appears more than one time in the Object Label Reference List, the Object Pool shall be rejected. When an object is used as a label, and this object also has a label, this latter label shall not be displayed.

To permit disabling an Object Label, both the String Variable reference and the Graphical Reference could be set to NULL and the VT should be designed to not show an Object Label.

### Allowed Commands:

- Change Object Label command;
- Get Attribute Value message.

**Table B.64 — Object Label Reference List attributes and record format**

| Attribute Name              | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                              |
|-----------------------------|-----|---------|--------------|----------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID                   |     | Integer | 2            | 0-65534        | 1-2         | Object identifier. Shall be unique within the object pool.                                                                                               |
| Type                        | [0] | Integer | 1            | =40            | 3           | Object Type = Object Label Reference List                                                                                                                |
| Number of Labeled objects   | [1] | Integer | 2            | 0-65535        | 4-5         | Number of labeled objects to follow. One labeled object consumes 7 bytes.                                                                                |
| Repeat: {Object ID}         |     | Integer | 2            | 0-65534        | 6-7..       | Object ID of object to label.                                                                                                                            |
| {String Variable reference} |     | Integer | 2            | 0-65535        | 8-9..       | Object ID of a String Variable object that contains the label string or FFFF <sub>16</sub> if no text is supplied                                        |
| {Font type}                 |     | Integer | 1            | 0-255          | 10..        | Font type (See Annex L) (ignored if String Variable object reference is NULL or the string contains a WideString (See Clause 4.6.19.7 String encoding)). |

| Attribute Name                        | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|-----|---------|--------------|----------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {Object Label graphic representation} |     | Integer | 2            | 0-65535        | 11-12..     | Object ID of an object to be used as a graphic representation of the object label or FFFF <sub>16</sub> if no designator supplied. When the VT draws this object it shall be clipped to the size of a Soft Key designator. See Table A.2 — Allowed hierarchical relationships of objects for allowed objects. |

## B.22 External Object Definition object

The External Object Definition object, available in VT version 5 and later, lists the objects which another WS is allowed to reference through the External Object Pointer.

When an object pool is loaded from non-volatile memory the VT shall clear the Enable bit in the Options attribute of all External Object Definition objects. See Clause 4.6.11.6, Table B.65 — External Object Definition events and Table B.66 — External Object Definition attributes and record format.

### Allowed Commands:

- Change Attribute command;
- Change List Item command;
- Get Attribute Value message.

**Table B.65 — External Object Definition events**

| Event               | Caused by                | VT behaviour                                                                                                                 | Message                   |
|---------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| On Change Attribute | Change Attribute command | Reevaluate all currently displayed External Object Pointer objects which reference objects in the WS which owns this object. | Change Attribute response |

**Table B.66 — External Object Definition attributes and record format**

| Attribute Name | AID            | Type    | Size (bytes) | Range or Value          | Record byte | Description                                                                                                                                                                                                                                                            |
|----------------|----------------|---------|--------------|-------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID      |                | Integer | 2            | 0-65534                 | 1-2         | Object identifier. Shall be unique within the object pool.                                                                                                                                                                                                             |
| Type           | [0]            | Integer | 1            | =41                     | 3           | Object Type = External Object Definition                                                                                                                                                                                                                               |
| Options        | 1              | Integer | 1            | 0-1                     | 4           | Logical bits to indicate options. 1 = TRUE. Bit 0 = Enabled. If TRUE the object is enabled and the WS identified by the NAME attributes is allowed to reference objects via the External Object Pointer object. If FALSE this object is disabled and shall be ignored. |
| NAME 0         | 2 <sup>a</sup> | Integer | 4            | 0 to 2 <sup>32</sup> -1 | 5 – 8       | Byte 1-4 of the NAME of the WS Master of the WS which shall be allowed to reference the objects in the object list.                                                                                                                                                    |

| Attribute Name                                                                                                                  | AID            | Type    | Size (bytes) | Range or Value          | Record byte  | Description                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------|----------------|---------|--------------|-------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME 1                                                                                                                          | 3 <sup>a</sup> | Integer | 4            | 0 to 2 <sup>32</sup> -1 | 9- 12        | Byte 5-8 of the NAME of the WS Master of the WS which shall be allowed to reference the objects in the object list.                                                        |
| Number of object to follow                                                                                                      |                | Integer | 1            | 0-255                   | 13           | Number of objects to follow even if zero. Each object consists of 2 bytes.                                                                                                 |
| Repeat: {Object ID}                                                                                                             |                | Integer | 2            | 0-65534, 65535          | 14+ object*2 | These objects make up the list of objects which can be externally referenced. NULL is a "no item" placeholder. The Change List Item command allows objects to be replaced. |
| <sup>a</sup> It is recommended that the WS clears the Enabled bit in the Options attribute before updating the NAME attributes. |                |         |              |                         |              |                                                                                                                                                                            |

## B.23 External Reference NAME object

The External Reference NAME object, available in VT version 5 and later, identifies the WS master of a WS which can be referenced through the External Object Pointer.

When an object pool is loaded from non-volatile memory the VT shall clear the Enable bit in the Options attribute of all External Reference NAME objects.

See Table B.67 — External Reference NAME events and Table B.68 — External Reference NAME attributes and record format.

### Allowed Commands:

- Change Attribute command;
- Get Attribute Value message.

**Table B.67 — External Reference NAME events**

| Event               | Caused by                | VT behaviour                                                                                    | Message                   |
|---------------------|--------------------------|-------------------------------------------------------------------------------------------------|---------------------------|
| On Change Attribute | Change Attribute command | Reevaluate all currently displayed External Object Pointer objects which reference this object. | Change Attribute response |

**Table B.68 — External Reference NAME attributes and record format**

| Attribute Name | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                                                                                                                                                                                                                 |
|----------------|-----|---------|--------------|----------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID      |     | Integer | 2            | 0-65534        | 1-2         | Object identifier. Shall be unique within the object pool.                                                                                                                                                                                                                                                                  |
| Type           | [0] | Integer | 1            | =42            | 3           | Object Type = External Reference NAME                                                                                                                                                                                                                                                                                       |
| Options        | 1   | Integer | 1            | 0-1            | 4           | Logical bits to indicate options. 1 = TRUE. Bit 0 = Enabled. If TRUE the object is enabled and the WS identified by the NAME attributes can be referenced by an External Object Pointer object. If FALSE the object is disabled and any External Object Pointer object referencing this object shall be considered invalid. |

| Attribute Name                                                                                                                  | AID            | Type    | Size (bytes) | Range or Value          | Record byte | Description                                       |
|---------------------------------------------------------------------------------------------------------------------------------|----------------|---------|--------------|-------------------------|-------------|---------------------------------------------------|
| NAME 0                                                                                                                          | 2 <sup>a</sup> | Integer | 4            | 0 to 2 <sup>32</sup> -1 | 5 - 8       | Byte 1-4 of the NAME of the referenced WS Master. |
| NAME 1                                                                                                                          | 3 <sup>a</sup> | Integer | 4            | 0 to 2 <sup>32</sup> -1 | 9 - 12      | Byte 5-8 of the NAME of the referenced WS Master. |
| <sup>a</sup> It is recommended that the WS clears the Enabled bit in the Options attribute before updating the NAME attributes. |                |         |              |                         |             |                                                   |

## B.24 External Object Pointer object

The External Object Pointer object, available in VT version 5 and later, allows a Working Set to display objects that exist in another Working Set's object pool. By changing the value of the pointer object, a different object can be referenced to the same location. An External Object Pointer can point to the NULL Object ID and in this case the Default Object shall be drawn.

The Default Object is drawn under the following conditions:

- The External Object Pointer, or any directly followed Object Pointer, points to the NULL Object ID,
- If any child object of the External Object Pointer is invalid based on the object hierarchy (See Table A.2 — Allowed hierarchical relationships of objects).

When an object pool is loaded from non-volatile memory the VT shall set the External Object Id attribute of all External Object Pointer objects to the NULL object id. This forces the WS to renew the External Object ID.

See Table B.69 — External Object Pointer events and Table B.70 — External Object Pointer attributes and record format.

### Allowed Commands:

- Change Numeric Value command;
- Change Attribute command;
- Get Attribute Value message.

**Table B.69 — External Object Pointer events**

| Event               | Caused by                | VT behaviour                                                          | Message                   |
|---------------------|--------------------------|-----------------------------------------------------------------------|---------------------------|
| On Change Attribute | Change Attribute command | Reevaluate the External Object Pointer object and redraw if required. | Change Attribute response |

**Table B.70 — External Object Pointer attributes and record format**

| Attribute Name | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                |

| External Reference NAME ID | 2   | Integer | 2            | 0-65534, 65535 | 6-7         | Object id of an External Reference NAME object or the NULL Object Id.                                                                                                                                                                                         |
| External Object ID         | 3   | Integer | 2            | 0-65534, 65535 | 8-9         | Object ID of a referenced object or the NULL Object ID. The referenced object is found in the object pool of the Working Set Master identified by the External Reference NAME ID attribute and listed in the corresponding External Object Definition object. |

## B.25 Animation object

The Animation object, available in VT version 5 and later, is used to display animations. This object consists of a list of object ids, one of which is drawn determined by the Value attribute.

Working Set designers should be aware that the performance of the VT cannot be predicted, so the size of the individual objects should be small and the refresh rate kept reasonable (200 ms or slower is recommended). The refresh rate attribute is a suggestion only and cannot be guaranteed by the VT design. The VT may limit or modify the refresh interval.

The VT shall increment the index Value when this object is enabled and the refresh interval is non-zero and is a visible member of an active mask and the specified Refresh Interval has expired. When not visible, the animation timer is suspended, so the index Value shall not be incremented. If multiple instances of this object are visible, the same referenced object shall be visible in each instance. Further, the Refresh Interval is based on the object, and shall not be affected by the number of visible instances.

When the VT prepares to increment the index Value, it shall be range checked against the 'First Child Index' and the 'Last Child Index'. If the index Value < First Child index, it shall be set to the value of the First Child Index and then incremented (in this case, the object referenced by the First Child Index is not shown). If the index Value > Last Child Index, it shall be set to Last Child Index and then the behavior is controlled by the Animation Sequence value in the Options attribute.

The VT shall not display anything for the selected item in the following cases:

- index value is 255 which means "no item is chosen"
- index value is invalid (greater than the number of items in the list minus 1)
- selected list item is a no-item placeholder (NULL)
- selected list item is an Object Pointer with a value of NULL
- selected list item is a Container, and the Container is in the hidden state
- the object is enabled and any of the following numeric relationships are not true:
  - o  $0 \leq \text{First Child Index} \leq \text{Last Child Index}$
  - o  $0 \leq \text{Last Child Index} < \text{number of items in the list}$

- o  $0 \leq \text{Default Child Index} < \text{number of items in the list}$

Note that this object can contain more child objects than are defined by the range 'First Child Index' to 'Last Child Index'. This allows the working set to change the animation by changing the values of the 'First Child Index' and 'Last Child Index' attributes without the need to upload a new child object list.

The Animation object animation sequence may be configured in either Single Shot or Loop modes.

- Single Shot mode: In Single Shot mode, the animation sequence is played only once starting with the List Index being initialized to the 'First Child Index' value, and ending with the List Index being equal to the 'Last Child Index' value. Once complete, the animation stops and the last child object remains displayed as long as the object is enabled. The single-shot animation sequence can be altered or replayed by changing the index Value or by disabling and then re-enabling the object which resets the index Value to the 'First Child Index'. If this object is initially enabled in the object pool, then the animation is played starting with the child referenced by the Index value the first time this object is displayed.
- Loop mode: In Loop mode, the animation is repeated as long as the object is enabled. After the child object at the 'Last Child Index' is displayed, the index Value is reset to the 'First Child Index' attribute value and the child object at that index is displayed. This cycle repeats until the object is disabled.

If the Working Set changes the index Value at runtime, the current refresh interval is restarted and the selected object is drawn.

When the Animation object is disabled, the presentation is defined by one of four modes.

- Pause mode: The index Value is unchanged and the child at this index is shown. This mode allows animations to be enabled and disabled without skipping child objects in the animation.
- Reset to First mode: The index Value is reset to the 'First Child Index' when disabled, and the child at this index is drawn.
- Default Object mode: The index Value is unchanged, however the child at the 'Default Child Index' is drawn.
- Blank mode: The index Value is unchanged, and no object is drawn.

#### Allowed Commands:

- Enable/Disable Object command;
- Change Numeric Value command;
- Change Attribute command;
- Change List Item command;
- Change Size command;
- Get Attribute Value message.

Table B.71 — Animation events

| Event      | Caused by                           | VT behaviour        | Message |
|------------|-------------------------------------|---------------------|---------|
| On Refresh | See Data Mask<br>Refresh for caused | Redraw this object. | —       |

| Event               | Caused by                                               | VT behaviour                                                                                                        | Message                        |
|---------------------|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|--------------------------------|
|                     | by conditions                                           |                                                                                                                     |                                |
| On Enable           | Enable/Disable Object command                           | Mark the object enabled. Set Enabled attribute to 1 (animating)                                                     | Enable/Disable Object Response |
| On Disable          | Enable/Disable Object command                           | Mark the object disabled. Set Enabled attribute to 0 (stopped, behaviour according to the Disabled Behavior option) | Enable/Disable Object Response |
| On Change Value     | Change Numeric Value command (to change the list index) | If object is displayed, redraw object with new value. Refresh parent object.                                        | Change Numeric Value response  |
| On Change Attribute | Change Attribute command                                | For behaviour, see Change Background Colour command.                                                                | Change Attribute response      |
| On Change Size      | Change Size command                                     | Draw object at current location in background colour to erase it. Refresh parent mask.                              | Change Size response           |

Table B.72 — Animation attributes and record format

| Attribute Name      | AID | Type    | Size (bytes) | Range or Value | Record byte | Description                                                                                                                           |
|---------------------|-----|---------|--------------|----------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Object ID           |     | Integer | 2            | 0-65534        | 1-2         | Object identifier. Shall be unique within the object pool.                                                                            |
| Type                | [0] | Integer | 1            | =44            | 3           | Object Type = Animation object                                                                                                        |
| Width               | 1   | Integer | 2            | 0-65535        | 4-5         | Maximum width of the Animation object's area in pixels. Objects or portions of objects outside the defined area are clipped.          |
| Height              | 2   | Integer | 2            | 0-65535        | 6-7         | Maximum height of the Animation object's area in pixels. Objects or portions of objects outside the defined area are clipped.         |
| Refresh Interval    | 3   | Integer | 2            | 0-65535        | 8-9         | Desired time in ms between refreshes of this object. The value zero stops the timer but is not equivalent to enabled = 0.             |
| Value               | 4   | Integer | 1            | 0-254, 255     | 10          | List Index of the object to be shown. The first item is at index zero (0).                                                            |
| Enabled             | 5   | Integer | 1            | 0 or 1         | 11          | When set to 1, this object is enabled (animating). When set to 0, this object is disabled (stopped).                                  |
| First Child Index   | 6   | Integer | 1            | 0-254          | 12          | This attribute represents the index of the first child object in the animation sequence.                                              |
| Last Child Index    | 7   | Integer | 1            | 0-254          | 13          | This attribute represents the index of the last child object in the animation sequence.                                               |
| Default Child Index | 8   | Integer | 1            | 0-254          | 14          | This attribute represents the index of the default child object in the animation sequence. See Options attribute, Disabled Behavior.  |
| Options             | 9   | Integer | 1            | 0-7            | 15          | Options:<br><br>Bit 0 = Animation Sequence<br>0 = Single Shot mode<br>1 = Loop mode<br>Bits 1-2 = Disabled Behavior<br>0 = Pause mode |

| Attribute Name                | AID | Type           | Size (bytes) | Range or Value   | Record byte             | Description                                                                                                                                                                                                                                                                                                                       |

| PDU specific field:           | Destination address           |
| Default priority:             | 7                             |
| Parameter group number:       | 59136 (00E700 <sub>16</sub> ) |

Before a Working Set Master builds an object pool in a VT, it may obtain information about the VT's capabilities by using the Get Technical Data messages. Annex D defines messages using the above PGNs to obtain information about the VT's characteristics and thus allow each Working Set Master to configure its object pool to meet the VT's capabilities.

All VT to ECU and ECU to VT messages where the computed data length is less than 8 bytes shall be padded to 8 bytes with FF<sub>16</sub>.

The VT to ECU and the ECU to VT PGN's are Group Function messages. If a CF receives one of those PGN's but with an unknown or reserved command / parameter defined in the first byte it shall respond with a NACK by using the message Unsupported VT Function message (see Clause F.66) or VT Unsupported VT Function message (see Clause F.67).

#### C.2 Building object pools

##### C.2.1 General

This clause specifies the transfer of the object pool via an ISO 11783 network. The PGNs listed above are used to transfer the object pool to the VT utilizing single packets (not recommended), the transport and extended transport protocol specified in ISO 11783-3. Destination specific messages shall be used and Connection Management shall be implemented.

The object pool is considered as one large block of data with each object and its attributes making up a single

variable length record, as shown in Figure C.1 — Object pool variable length record format. If the total size of this transfer exceeds the 1 785 byte limit of normal transport protocol, the extended transport protocol specified in ISO 11783-3 shall be used. The VT design shall be able to support all the transport protocol functions.

The VT shall receive, parse and store the received objects. If, during parsing, the VT encounters a new object with an ID matching a previously parsed object (regardless of the object's type), the new object will be considered a replacement for the old object. The VT designer determines the method of storage. The format of the object records was detailed earlier.

Data items and attributes of size greater than 1 byte shall always be transmitted in little endian order (least significant byte first).

|              |           |      |                     |
|--------------|-----------|------|---------------------|
| Object No. 1 | Object ID | Type | Attributes and data |
| Object No. 2 | Object ID | Type | Attributes and data |
| Object No. 3 | Object ID | Type | Attributes and data |

**Figure C.1 — Object pool variable length record format**

The Working Set Master shall transfer a “clean” object pool, adjusted accordingly for the VT hardware connected and also adapted to the VT version being reported. Sending an invalid pool with objects or macros that do not parse properly (e.g. invalid colours) and then altering those objects later with change commands is not permitted, since this can cause parsing errors and error displays at the VT and could cause the VT to ignore those objects or macros with errors or to delete the object pool from volatile storage and suspend the Working Set.

The VT shall identify invalid pools and shall notify the operator about the issue within the object pool.

Error Codes in the End of Object Pool response or errors in the VT Change Active Mask message indicate that the VT has identified an invalid object pool.

Even if the VT decides to continue with an invalid object pool, the Working Set Master may decide to go to a safe state when it receives the error indication from the VT.

## C.2.2 Object pool transfer procedure

The following procedure is used to transfer an object pool.

- a) The Working Set Master shall determine if the VT has available memory by transmitting a Get Memory message (See Clause D.2). The VT shall acknowledge this message with a Get Memory response (See Clause D.3). VTs which are designed to do so may use this request to allocate memory for the pool. The Working Set Master shall check the error codes returned. If no error is reported, the Working Set Master may proceed.
- b) The Working Set Master uses single packet (not recommended), transport protocol, or extended transport protocol (specified in ISO 11783-3), or combinations of these, to move the object pool to the VT using the object pool transfer message. (See Clause C.2.3 Object pool transfer message). Normal handshaking, error checking and re-transmission, in accordance with ISO 11783-3, shall be implemented. Working Set designers should recognize that the VT can send CTS with number of packets set to zero (0) while other object pools are being loaded and that this could continue for a significant amount of time.
- c) The following rules govern the transfer of the object pool:
  - 1) The Working Set Master may send several single packet, TP or ETP sessions or a combination of any of these to transfer the entire pool. This can be required depending on the size of buffers

designed into the Working Set Master. Any number of sessions may be sent before the End of Object Pool message is sent. Multiple TP and/or ETP sessions can also be required if scaling or pool adjustments or both have to be made before sending the object pool to the VT.

- 2) Object records in each session shall be complete and shall not be "split" between sessions of TP or ETP. Single packet transfers shall contain a complete object.
- 3) Transfer sessions containing no object records are not permitted.
- d) Upon completion, the Working Set Master shall transmit an End of Object Pool message (See Clause C.2.4) to the VT to indicate that the object pool is now complete and ready for use.
- e) When the VT receives the End of Object Pool message, it shall set the "parsing" bit in the VT Status message to 1 until it has finished parsing the object pool and sends the End of Object Pool response.
- f) After sending the End of Object Pool message, the Working Set Master shall wait for an End of Object Pool response. The Working Set Master shall wait for the End of Object Pool response message until three consecutive VT Status messages have been received where the "parsing" bit is set to 0. Three messages are waited for to avoid race conditions created by a VT Status message that may already be in a transmit queue, which does not correctly identify the parsing state. If the End of Object Pool response is not received by the Working Set Master, then it shall assume that the End of Object Pool message was not received by the VT. Under these conditions the Working Set Master may retry the End of Object Pool message up to three times before it assumes an unexpected shutdown of the VT after which the Working Set Master shall obey the requirements of Clause 4.6.9 (Connection management) (Updating pools at runtime).
- g) Commands are sent from a Working Set to the VT using the PGNs given in Annex C. Only Working Set Masters (not Members) are allowed to send any of the commands in this annex. The originating master shall wait for a response before sending another command from this Annex.

### C.2.3 Object pool transfer message

The following message is sent by a Working Set Master to transfer part of an object pool to the VT.

|                               |                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------|
| Transmission repetition rate: | As required                                                                      |
| Data length:                  | Variable                                                                         |
| Parameter group number:       | ECU to VT, Destination-Specific                                                  |
| Byte 1                        | VT function = 17 <sub>10</sub>                                                   |
| Bits 7 - 4                    | 0001                                                                             |
| Bits 3 - 0                    | 0001                                                                             |
| Bytes 2 - n                   | Command                                                                          |
|                               | Parameter                                                                        |
|                               | Object pool records (See Figure C.1 — Object pool variable length record format) |
|                               | Object Pool Transfer                                                             |
|                               | Object Pool Transfer                                                             |

NOTE Since there is no response to this message, it is recommended to not send single objects that fit within a single packet.

### C.2.4 End of Object Pool message

The following message is sent by a Working Set Master to indicate that the object pool is complete and ready for use. It is sent after the initial object pool definition and also after any object is redefined or added to the pool during operation.

|                               |                                         |           |                      |
|-------------------------------|-----------------------------------------|-----------|----------------------|
| Transmission repetition rate: | Upon completion of object pool transfer |           |                      |
| Data length:                  | 8 bytes                                 |           |                      |
| Parameter group number:       | ECU to VT, Destination-Specific         |           |                      |
| Byte 1                        | VT function = 18 <sub>10</sub>          |           |                      |
| Bits 7 - 4                    | 0001                                    | Command   | Object Pool Transfer |
| Bits 3 - 0                    | 0010                                    | Parameter | Object Pool Ready    |
| Bytes 2 – 8                   | Reserved, set to FF <sub>16</sub>       |           |                      |

### C.2.5 End of Object Pool response

This message is sent by the VT to a Working Set Master to acknowledge the End of Object Pool message. When the VT replies with an error of any type, the VT should delete the object pool from volatile memory storage and inform the operator by an alarm type method of the suspension of the Working Set and indicate the reason for the deletion. On reception of this message, the responsible ECU(s) should enter a fail-safe operation mode providing a safe shutdown procedure of the whole device.

NOTE A VT can take a long time to parse a pool. The End of Object Pool response shall be delayed until this activity completes. The VT Status message shall reflect the current state of the VT (is busy parsing a pool).

|                               |                                                                                                         |           |                      |
|-------------------------------|---------------------------------------------------------------------------------------------------------|-----------|----------------------|
| Transmission repetition rate: | In response to End of Object Pool message                                                               |           |                      |
| Data length:                  | 8 bytes                                                                                                 |           |                      |
| Parameter group number:       | VT to ECU, destination specific                                                                         |           |                      |
| Byte 1                        | VT function = 18 <sub>10</sub>                                                                          |           |                      |
| Bits 7 - 4                    | 0001                                                                                                    | Command   | Object Pool Transfer |
| Bits 3 - 0                    | 0010                                                                                                    | Parameter | Object Pool Ready    |
| Byte 2                        | Error Codes (0 = no errors)                                                                             |           |                      |
|                               | Bit 0 = 1 = There are errors in the Object Pool, refer to Bytes 3 to 8 for additional error information |           |                      |
|                               | Bit 1 = 1 = VT ran out of memory during transfer                                                        |           |                      |
|                               | Bit 2, 3 = Reserved, set to 0                                                                           |           |                      |
|                               | Bit 4 = 1 = any other error                                                                             |           |                      |
|                               | Bit 5-7 = Reserved, set to 0                                                                            |           |                      |
| Bytes 3, 4                    | Parent Object ID of faulty object, set to NULL Object ID if there are no object pool errors             |           |                      |
| Bytes 5, 6                    | Object ID of faulty object, set to NULL Object ID if there are no object pool errors                    |           |                      |
| Byte 7                        | Object Pool Error Codes (0 = no errors)                                                                 |           |                      |
|                               | Bit 0 = 1 = method or attribute not supported by the VT                                                 |           |                      |
|                               | Bit 1 = 1 = unknown object reference (missing object)                                                   |           |                      |
|                               | Bit 2 = 1 = any other error                                                                             |           |                      |
|                               | Bit 3 = 1 = object pool was deleted from volatile memory                                                |           |                      |
|                               | Bit 4-7 = Reserved, set to 0                                                                            |           |                      |
| Byte 8                        | Reserved, set to FF <sub>16</sub>                                                                       |           |                      |

### C.2.6 Updating pools at runtime

If the Working Set needs to modify or add one or more objects, then the Working Set may update its pool at runtime. For example, if the Working Set needs to change the size of an object (e.g. increase the length of a string object) it may send the replacement object with the revised record format. (See Clause 4.6.10.3) This is accomplished by using the same messages and procedures used to upload the pool at initialization as follows.

- The Working Set Master shall determine if the VT has available memory by transmitting a Get Memory message (See Clause D.2 Get Memory message). The Memory Required parameter shall be based on the size of this update to the pool, and not based on the size of the original pool plus the update. The VT acknowledges this message with a Get Memory response (See Clause D.3). The Working Set Master shall check the error codes returned. If no error is reported, the Working Set Master may proceed.

- b) The Working Set Master uses single packet transfer (not recommended), extended transport protocol, or transport protocol, to move the object or objects to the VT. Normal handshaking, error checking and retransmission, in accordance with ISO 11783-3, shall be implemented. (See Clause C.2.2.b Object pool transfer procedure)
- c) Upon completion, the Working Set Master shall transmit an End of Object Pool message (See Clause C.2.4) to the VT to indicate that the update is now complete and ready for use.
- d) The VT responds with the End of Object Pool response (See Clause C.2.5)

Only those objects that need to be changed should be transmitted during the update; all other objects will remain in VT memory following the update.

In the case of errors in the update to the object pool, the VT indicates the errors with the End of Object Pool response. The VT deletes the entire object pool from volatile memory, (including the object pool as it existed prior to the object pool update) and informs the operator by an alarm type method of the suspension of the Working Set and indicates the reason for the deletion. On reception of this message, the responsible ECU(s) shall behave as described (See Clause C.2.5 End of Object Pool response) when an End of Object Pool response is received indicating errors in the object pool.

The VT shall handle commands and macros from a Working Set even while that Working Set is updating its object pool.

Example: The operator presses a Soft Key while the pool is being updated by the Working Set. The VT shall immediately execute the macros triggered and commands sent from that Working Set without waiting for the completion of the pool update.

The VT shall keep the new/updated objects separate from the original pool, until reception of the End of Object Pool message. The objects shall be merged into the original pool before the VT sends the End of Object Pool response. Working Set designers shall be aware that behavior is unpredictable for commands acting on the new/updated objects if these commands are sent after the End of Object Pool message and before reception of End of Object Pool response. Such commands will be applied to either the original pool or the updated pool. Changes to objects shall take effect immediately.

It is recommended that Working Sets do not transmit commands which act upon these new objects until the End of Object Pool response is received from the VT.

NOTE Changes to objects should utilise Annex F commands when possible rather than performing a pool update due to the processing time of the pool update process (e.g. Change Size command performs faster than reloading an object with a new size).

## Annex D (normative)

### Technical data messages

#### D.1 General

The technical data messages are used to request the characteristics of the VT. They consist of the request for data by the Working Set and the response by the VT. The following messages are not allowed in macros. Working Set masters or members may send any command in this Annex.

The VT shall respond to these commands even if the requesting ECU is not part of a Working Set, thus permitting ECUs to acquire the VT metrics before connecting.

#### D.2 Get Memory message

The Get Memory message allows the Working Set to determine if the VT is out of memory and/or to determine the VT version.

In version 3 and prior VTs, the “Memory Required” parameter represents the number of bytes in the object pool (see Clause C.2.1) to be transferred. In version 4 and later VTs, the “memory required” parameter is the sum of the number of bytes in the object pool to be transferred and the estimated storage of all Graphics Context objects that are defined in the object pool to be transferred. The Working Set may send less than the amount communicated in the Memory Required parameter.

The storage space required for a single Object Pool object (OPO) can be determined from the definition of the specific object.

The storage space required for a single Graphics Context object (GCO) shall be estimated as follows:

**Size of a GCO =**

$$\text{RoundUp}\left(\frac{\text{GCO.width}}{\text{VT.PixelsPerByte}}\right) \text{GCO.height}$$

where RoundUp is a function that will round the value up to the nearest integer, width and height are measured in pixels, and the VT.PixelsPerByte is based on the VT capabilities and is defined as follows:

| VT Capability | Graphic Type | VT.PixelsPerByte |
|---------------|--------------|------------------|
| Monochrome    | 0            | 8                |
| 16 colour     | 1            | 2                |
| 256 colour    | 2            | 1                |

The Memory Required parameter can then be estimated as follows:

**Memory Required =**

$$\left(\sum_{i=1}^{\text{Number of OPO}} \text{size of (OPO[i])}\right) + \left(\sum_{j=1}^{\text{Number of GCO}} \text{size of (GCO[j])}\right)$$

where the second parenthesized term is only used for VT version 4 and later.

For more details on the use of the Memory Required parameter, see Clause C.2.2 for Object pool transfer procedure and Clause C.2.6 for Updating pools at runtime.

The Working Set should send the Get Memory message with the Memory Required set to zero in order to receive the response indicating the VT version number. This information may be used to calculate the actual Memory Required parameter. If the VT design allocates memory based on this message, it should not allocate any storage for this special case request.

|                               |                                 |                                   |
|-------------------------------|---------------------------------|-----------------------------------|
| Transmission repetition rate: | On request                      |                                   |
| Data length:                  | 8 bytes                         |                                   |

### D.3 Get Memory response

If the VT responds with status code one (1), the Working Set Master shall not transmit its object pool.

|                               |                                   |                                                                                                                                  |

|                               |                                   | 0 = There can be enough memory. <sup>1</sup>                                                                                     |
|                               |                                   | 1 = There is not enough memory available. Do not transmit Object Pool.                                                           |
| Byte 4 - 8                    |                                   | Reserved, set to FF <sub>16</sub>                                                                                                |

<sup>1</sup> Because there is overhead associated with object storage it is impossible to predict whether there is enough memory available without having prior knowledge of the exact content of the object pool.

#### D.4 Get Number of Soft Keys message

The Get Number of Soft Keys message is used by the Working Set to request the available divisions of the X and Y axes for Soft Key descriptors, the available virtual Soft Keys and the number of physical Soft Keys. VT Version 4 and later provides the number of physical Soft Keys that are used by the VT for navigation among the virtual Soft Keys.

## D.8 Get Hardware message

The Working Set sends the Get Hardware message to request the hardware design of the VT.

|                               |  |                                 |  |
|-------------------------------|--|---------------------------------|--|
| Transmission repetition rate: |  | On request                      |  |
| Data length:                  |  | 8 bytes                         |  |

|      |      |                                 | Get Hardware       |

Bytes 2 - 8

Reserved, set to FF<sub>16</sub>

## D.9 Get Hardware response

Transmission repetition rate:

In response to Get Hardware message

Data length:

8 bytes

Parameter group number:

VT to ECU, destination specific

Byte 1 VT function = 199<sub>10</sub>

Bits 7 - 4 1100

Bits 3 - 0 0111

Byte 2 Boot time

Command

Get Technical Data

Parameter

Get Hardware Response

Maximum number of seconds from a VT power startup or reset cycle to the transmission of the first "VT Status message" (See Clause 4.6.4 and G.2). Set to FF<sub>16</sub> when this information is not available.<sup>1</sup>

Byte 3 Graphic Type

Supported graphic modes

0 = Monochrome (VT supports colour codes 0 and 1 and monochrome Picture Graphic objects only)

1 = 16 Colour (VT supports colour codes 0 through 15 and monochrome and 16 colour Picture Graphic objects).

2 = 256 Colour (VT supports colour codes 0 through 255 and all formats of Picture Graphic objects).

Byte 4 Hardware

Supported hardware features

Bit 0 = 1 = VT has a touch screen and supports Pointing Event message.

Bit 1 = 1 = VT has a pointing device and supports Pointing Event message.

Bit 2 = 1 = VT has multiple frequency audio output

Bit 3 = 1 = VT has adjustable volume audio output

Bit 4 = 1 = VT supports simultaneous activations of all combinations of Physical Soft Keys (See Clause 4.6.18 Soft Key and Button activation)<sup>2</sup>

Bit 5 = 1 = VT supports simultaneous activations of all combinations of Buttons (See Clause 4.6.18 Soft Key and Button activation)<sup>2</sup>

Bit 6 = 1 = VT reports drag operation via Pointing Event message (Bit 0 or Bit 1 shall be set to 1)<sup>2</sup>

Bit 7 = 1 = VT supports intermediate coordinates during a drag operation (Bit 6 shall be set to a 1)<sup>2</sup>

Bytes 5,6 X - Pixels

Number of divisions on the horizontal axis (X dots) (16 bit unsigned integer) in the Data Mask Area

Bytes 7,8 Y - Pixels

Number of divisions on the vertical axis (Y dots) (16 bit unsigned integer) in the Data Mask Area. Since the Data Mask is square, this value is always the same as the X Value.

<sup>1</sup> VT version 4 and later.

<sup>2</sup> These bits exist in VT version 4 and later.

## D.10 Get Supported Widechars message

This message only applies to version 4 and later VTs.

The Get Supported Widechars message is used by the Working Set to determine the WideChars supported by the VT.

The message only requests characters from a single code plane. If the ECU requires information about multiple code planes multiple messages shall be sent.

The request contains First WideChar and Last WideChar as a range, where First WideChar ≤ Last WideChar.

The ECU can reduce the size of the response frame by sending multiple requests with small inquiry ranges instead of one request with a large inquiry range.

| Bytes 9-n                     | WideChar range array                                                                                                                                                                                                                                      |
|                               | Each entry in the array consists of two WideChars:<br>first WideChar, last WideChar.                                                                                                                                                                      |

**NOTE** The ECU does not have to request this message because the VT shall display WideStrings even if they contain unsupported characters (See Clause 4.6.19.7 String encoding). The VT shall include the characters from the WideChar minimum character set when responding to a Code Plane 0 request (See Table L.7 — WideString minimum character set).

**Example** Response from a VT supporting only the WideChar Minimum Character Set. The ECU has requested information about characters 0000<sub>16</sub> to 3FFF<sub>16</sub> in code plane 0.

## D.12 Get Window Mask Data message

This message applies to version 4 and later VTs.

The Working Set sends the Get Window Mask Data message to request the background colour of User-Layout Data Mask and the background colour of the Key Cells on a User-Layout Soft Key Mask.

|                               |                                   |

## D.15 Get Supported Objects response

This message is available in VT version 4 and later.

The VT uses this message to respond to a Get Supported Objects message.

The VT shall return a list of all supported object types including (see Table A.1 — Virtual terminal objects)

- All object types that are mandatory for the VT to support.
- All optional object types that the VT supports.
- Proprietary object types that the VT supports, which may vary depending on the connected WS, or may not be listed at all.

The VT and WS may decide by another means which proprietary objects may be supported.

In either case whether the VT lists the proprietary objects in this message or not, the VT may still decide to reject the object pool from the WS because it included proprietary objects.

The WS may also decide by another means that it does not want to include the proprietary objects listed by the VT in its object pool.

VTs shall not list Auxiliary Input Type 1 and Auxiliary Function Type 1 objects in the list of supported objects.

Non-proprietary objects that are not listed as supported by the VT shall still be parsed, but they shall not be functionally supported by the VT. In this way, some Working Sets may choose to use the same object pool in both cases.

|                               |                                                                                                                                                                                                                                                                                                   |                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| Transmission repetition rate: | In response to Get Supported Objects message                                                                                                                                                                                                                                                      |                                             |

| Bytes 2                       | Number of bytes to follow<br>(NOTE: For future compatibility, this is NOT necessarily the number of Object Types)                                                                                                                                                                                 |                                             |
| Byte 3-n                      | Numerically ascending sorted list of all Object Types supported by the VT. Each Object Type is an unsigned integer occupying a single byte. If the special value FF <sub>16</sub> is found by the WS during parsing, it indicates the end of the list, and all following bytes should be ignored. |                                             |

## Annex E (normative)

### Non-volatile memory operations commands

#### E.1 General

##### E.1.1 Introduction

The VT provides functions to store and to restore a complete Working Set-specific object pool. When connecting to the VT, the Working Set can send a message to get its object pool copied from non-volatile storage into volatile storage. The availability and organization of the non-volatile storage area is VT-specific. Storing and restoring an object pool includes all object definitions. There shall be a method inside the VT to assign a stored object pool uniquely to a specific Working Set. Dependant on the VT design, either only a single object pool or an arbitrary number of pools can be managed for each Working Set. Each pool should be identified by a version label.

Version labels may be displayed to an operator and may be used as a file name. As such the Working Set shall apply the following rules. Version labels shall be constructed of visible characters from font type zero (See Table L.1 — ISO 8859-1 (Latin 1) character set). Version labels shall be padded with trailing blanks to the defined version label size. In addition, the following characters shall not be used in a version label string:

|   |                                                   |
|---|---------------------------------------------------|
| \ | [5C <sub>16</sub> ] Reverse Solidus (Back slash)  |
| " | [22 <sub>16</sub> ] Quotation mark (Double quote) |
| ' | [27 <sub>16</sub> ] Apostrophe (Single quote)     |
| ` | [60 <sub>16</sub> ] Grave Accent (Back tic)       |
| / | [2F <sub>16</sub> ] Solidus (Forward slash)       |
| : | [3A <sub>16</sub> ] Colon                         |
| * | [2A <sub>16</sub> ] Asterisk                      |
| < | [3C <sub>16</sub> ] Less-than sign                |
| > | [3E <sub>16</sub> ] Greater-than sign             |
|   | [7C <sub>16</sub> ] Vertical line                 |
| ? | [3F <sub>16</sub> ] Question mark                 |

In order to maintain different versions of object pools in the non-volatile storage of the VT, the Working Set needs to detect those versions currently stored by the VT. It shall also determine if any of the available versions are suitable for the Working Sets current software version before an object pool is copied into the object buffer of the VT.

The Working Set should acquire the VT technical data to ensure the stored version is compatible with the current characteristics. This allows the Working Set to account for changes in the VT characteristics from one power cycle to another.

The Working Set shall be identified by the entire ISO NAME of the Working Set Master. Each Working Set Master shall only be allowed to manipulate its own versions of object pools and shall not perform any of the commands in this Annex on versions of object pools created by other Working Sets. Only Working Set Masters (not Members) are allowed to send any of the commands in this annex.

**NOTE** Because non-volatile operations may take an indefinite amount of time to complete, the response message may be delayed accordingly. Therefore the VT Status message shall reflect the current state of the VT (i.e. is busy). Only when the VT has completed the non-volatile operations shall it send the response message.

The messages in this annex are not allowed in macros.

### E.1.2 Version Management – VT version 4 and prior

Version labels are defined as a seven character 8-bit string. The permissible messages do not include the extended versions of the messages in this annex.

### E.1.3 Version Management – VT version 5 and later

Version labels are defined as either a seven character 8-bit string, or a thirty-two character 8-bit string, and the appropriate messages in this annex shall be used accordingly.

## E.2 Get Versions message

The Get Versions message allows the Working Set to query the VT for existing seven-character version labels associated with the requesting Working Set.

## E.3 Get Versions response

The VT sends all version labels contained in the non-volatile storage associated with the requesting Working Set. If there is no version stored, the number of version strings is set to 0 and the remaining bytes in the packet shall be set to FF<sub>16</sub>. Extended Transport Protocol and Transport Protocol are used when necessary.

## E.4 Store Version command

The Store Version command allows a Working Set to store the copy of the actual object pool into the non-volatile storage of the VT. This message can be sent at any time. The copy is stored as the version indicated by version label. If a copy with the same version label already exists in the non-volatile storage area, it is overwritten. All objects are stored as they are (with current attributes, input values etc.). If the version label contains no string (all blanks) the last stored version in non-volatile storage shall be overwritten; alternatively, if there is no version stored up to that point, an error shall be indicated by the VT.

## E.6 Load Version command

The Load Version command allows a Working Set to load a copy of a object pool from the non-volatile storage of the VT. If an object pool is already loaded it is overwritten. If the message is acknowledged positive by the VT, the Working Set may proceed as if all objects had been transmitted normally. If the version label contains no string (all blanks), the last stored version in non-volatile storage shall be loaded.

When the VT receives the Load Version command, it shall set the "parsing" bit in the VT Status message to 1 until it has finished parsing the object pool and sends the Load Version Response message.

The Working Set Master shall wait for the Load Version response until three consecutive VT Status messages have been received where the "parsing" bit is set to 0. At that time, if the Load Version response has not been received by the Working Set Master, then it shall assume that the Load Version command was not received by the VT. Three messages are waited for to avoid race conditions created by a VT Status message that may already be in a transmit queue, which does not correctly identify the parsing state.

<sup>1</sup> This bit exists in VT version 4 and later.

## E.8 Delete Version command

The Delete Version command allows a Working Set to delete a version of an object pool in the non-volatile storage of the VT. If a copy of this version is in the volatile memory at the same time it is preserved there — this message affects non-volatile storage only. If the version label contains no string (all blanks) the last stored version in non-volatile storage is to be deleted.

NOTE To delete the object pool from volatile memory, see Clause F.44 Delete Object Pool command.

| Bytes | 2 - 8 |                                 | Reserved, set to FF <sub>16</sub> |                       |

NOTE This message is available in VT version 5 and later.

### E.11 Extended Get Versions response

The VT sends all extended version labels contained in the non-volatile storage associated with the requesting Working Set. If there is no version stored, the number of version strings is set to 0 and the remaining bytes in the packet shall be set to FF<sub>16</sub>. Extended Transport Protocol and Transport Protocol are used when necessary.

NOTE This message is available in VT version 5 and later.

### E.12 Extended Store Version command

The Extended Store Version command allows a Working Set to store the copy of the actual object pool into the non-volatile storage of the VT. This message can be sent at any time. The copy is stored as the version indicated by an extended version label. If a copy with the same version label already exists in the non-volatile storage area, it is overwritten. All objects are stored as they are (with current attributes, input values etc.). If the version label contains no string (all blanks) the last stored version in non-volatile storage shall be overwritten; alternatively, if there is no version stored up to that point, an error shall be indicated by the VT.

|                               |                                 |                                 |                                                                                                        |                        |

NOTE This message is available in VT version 5 and later.

### E.14 Extended Load Version command

The Extended Load Version command allows a Working Set to load a copy of an object pool from the non-volatile storage of the VT. If an object pool is already loaded it is overwritten. If the message is acknowledged positive by the VT, the Working Set may proceed as if all objects had been transmitted normally. If the version label contains no string (all blanks), the last stored version in non-volatile storage shall be loaded.

When the VT receives the Extended Load Version command, it shall set the "parsing" bit in the VT Status message to 1 until it has finished parsing the object pool and sends the Extended Load Version Response message.

The Working Set Master shall wait for the Extended Load Version response until three consecutive VT Status messages have been received where the "parsing" bit is set to 0. At that time, if the Extended Load Version response has not been received by the Working Set Master, then it shall assume that the Extended Load Version command was not received by the VT. Three messages are waited for to avoid race conditions created by a VT Status message that may already be in a transmit queue, which does not correctly identify the parsing state.

## E.16 Extended Delete Version command

The Extended Delete Version command allows a Working Set to delete a version of an object pool in the non-volatile storage of the VT. If a copy of this version is in the volatile memory at the same time it is preserved there — this message affects non-volatile storage only. If the version label contains no string (all blanks) the last stored version in non-volatile storage is to be deleted.

NOTE To delete the object pool from volatile memory, see Clause F.44 Delete Object Pool command.

NOTE This message is available in VT version 5 and later.

## Annex F (normative)

### Command and Macro messages

#### F.1 General

Commands are sent from a Working Set to the VT using the PGNs given in Annex C. Working Set Masters or members may send any command in this Annex. Additionally, the Identify VT message may be sent from one VT to other VTs. The originator shall wait for a response up to a maximum of 1,5 s before sending another command, unless stated otherwise. Each of the commands in the present annex can also be used in a Macro unless otherwise noted. Working Set designers should recognize that the VT can take a significant amount of time to respond to a command, especially if the command causes a display refresh (refer to the busy codes in the VT Status message, in Clause G.2).

Unless otherwise noted any attribute in a response message which also exists in the command message shall be set to the same value as in the command message, i.e. the response frame reflects the command but not necessarily the state of the object.

Example: An Enable/Disable Object command is sent with Object Id = 11000 and Byte 4 = 0 (disable). The object is currently in a state where it cannot be disabled, and therefore it stays enabled. The response frame is sent with Object Id = 11000 and Byte 4 = 0 (disable) and Error Code indicating the cause of the error.

#### F.2 Hide/Show Object command

The Hide/Show Object command is used to hide or show a Container object. This pertains to the visibility of the object as well as its remembered state. If the object cannot be displayed due to references to missing objects, the VT generates an error in the response.

#### F.4 Enable/Disable Object command

This command is used to enable or disable an input field object or a Button object and pertains to the accessibility of an input field object or Button object. This command is also used to enable or disable an Animation object.

It is allowed to enable already enabled objects and to disable already disabled objects. If this happens the response frame shall indicate 'no errors' and macros shall be executed.

#### F.6 Select Input Object command

This command is used to force the selection of an input field, Button, or Key object. The VT shall provide a way for the operator to recognize a selected object. If the object is disabled or not visible, an error code is

returned. Depending on byte 4, the object is either selected (has focus) or opened for input (not valid for Button objects or Key objects).

If the object to be selected is included multiple times on the same mask, it is proprietary to the VT which of the object instances will be selected (has focus).

NOTE Even if the input field is activated for data input, the value shall not be changed by this command (e.g. Input Boolean is not toggled).

NOTE This command originates in the Working Set and is a command to the VT. In the situation where the change originates with the operator, the VT indicates the selected input object with the VT Select Input Object message (see Clause H.8).

NOTE VT version 3 and prior do not support selection of a Button object or a Key object.

Byte 5

Error Codes (0 = no errors)

Bit 0 = 1 = Object is disabled

Bit 1 = 1 = Invalid Object ID

Bit 2 = 1 = Object is not on the active mask or object is in a hidden container

Bit 3 = 1 = Could not complete. Another Input field is currently being modified, or a Button or Soft Key is currently being held.

Bit 4 = 1 = Any other error

Bit 5 = 1 = Invalid Option value <sup>1</sup>

NOTE: An object that is off-screen or zero width or zero height, and is enabled and not within a hidden container, is both selectable and able to be opened for edit. This is not an error condition.

Bytes 6 - 8

Reserved, set to FF<sub>16</sub><sup>1</sup> These bits/values exist in VT version 4 and later.

## F.8 ESC command

This command is used to abort operator input.

Transmission repetition rate:

On request

Data length:

8 bytes

Parameter group number:

ECU to VT, Destination-Specific

Allowed in a Macro:

No

Byte 1 VT function = 146<sub>10</sub>

Bits 7 - 4 1001

Bits 3 - 0 0010

Command

Command

Parameter

ESC

Byte 2 - 8

Reserved, set to FF<sub>16</sub>

## F.9 ESC response

The VT uses this message to respond to the ESC command.

Transmission repetition rate:

In response to ESC command

Data length:

8 bytes

Parameter group number:

VT to ECU, Destination-Specific

Allowed in a Macro:

No

Byte 1 VT function = 146<sub>10</sub>

Bits 7 - 4 1001

Bits 3 - 0 0010

Command

Command

Parameter

ESC

Byte 2,3

Object ID where input was aborted if no error code

Byte 4

Error Codes (0 = no errors)

Bit 0 = 1 = No input field is open for input, ESC ignored.

Bits 1-3 = Undefined, set to 0 recommended

Bit 4 = 1 = Any other error

Bytes 5 - 8

Reserved, set to FF<sub>16</sub>

## F.10 Control Audio Signal command

This command may be used to control the audio on the VT. When received this message shall terminate any audio in process from the originating ECU and replace the previous command with the new command. The previous rule does not apply to an acoustic signal associated with an Alarm Mask. There may be a momentary interruption in the tone while the VT terminates the previous command.

Continuous tones are not recommended, however it is recognized that 255 activations of 65,535 ms each produces 278 minutes of continuous tone. If this is insufficient, the originating ECU may issue an additional Control Audio Signal command to the VT prior to the expiration of the tone.

If the VT is capable of supporting the Control Audio Signal command for only a single ECU at a time, then the Control Audio Signal response shall indicate that the Audio Device is busy. The audio produced by a control audio command shall never be queued or delayed beyond normal VT message processing. See Figure F.1 — Acoustic signal termination

- Key
- 1 Working Set 1 sends Control Audio Device command with a total time of 10 seconds.
  - 2 Working Set 2 alarm becomes visible and has acoustic signal other than "none". VT terminates Working Set 1 audio and informs Working Set 1. VT proprietary acoustic requires 4 seconds.

**Figure F.1 — Acoustic signal termination**

If the VT is capable of supporting the Control Audio Signal command for more than a single ECU at a time, then the audio for each Working Set is not interrupted. See Figure F.2 — Acoustic signal with multisound

- Key
- 1 Working Set 1 sends Control Audio Device command with a total time of 10 seconds.
  - 2 Working Set 2 alarm becomes visible and has acoustic signal other than "none". VT proprietary acoustic requires 4 seconds.

**Figure F.2 — Acoustic signal with multisound**

**NOTE** The Control Audio Signal command is independent of the currently active Working Set, therefore audio tones can be commanded whether the originating ECU is the active Working Set, or not. (See Clause 4.6.14 Alarm handling)

### F.12 Set Audio Volume command

This command can be used to control the audio on the VT.

This command applies to subsequent Control Audio Signal commands (See Clause F.10) of the issuing Working Set. This command should also affect the currently playing tone, if any. VTs that are not able to modify the volume of the currently playing tone shall set the Audio device is busy bit in the response. This command should not affect in any way the volume settings of other Working Sets and shall not affect the volume of Alarm Masks.

In VT version 4 and prior, the default audio volume was undefined.

In VT version 5 and later, the default audio volume is 100% of maximum volume set by the operator.

### F.14 Change Child Location command

The Change Child Location command is used to change the position of an object. The new position is set relative to the object's current position. Since the object can be included in many parent objects, the parent Object ID is also included. If a parent object includes the child object multiple times, then each instance will be moved. When the object is moved, the parent object shall be refreshed. The position attributes given in the message have an offset of -127 (i.e. value of 0 = a -127 pixel move, 255 = a +128 pixel move). Positive values indicate a position change down (Y) or to the right (X). Negative values indicate a position change up (Y) or to the left (X).

Because of the possibility of lost messages, when a guaranteed position is required, the Change Child Position command should be used instead of specifying relative coordinates with the Change Child Location command.

### F.16 Change Child Position command

The Change Child Position command is used to change the position of an object. The new position is set relative to the parent object's position. Since the object can be included in many parent objects, the parent Object ID is also included. If a parent object includes the child object multiples times, then each instance will be moved to the same location (the designer may want to use Change Child Location command to move all instances in a relative motion). When the object is moved, the parent object shall be refreshed. The position attributes given in the message are signed integer. Positive values indicate a position below (Y) or to the right of (X) the top left corner of the parent object. Negative values indicate a position above (Y) or to the left of (X) the top left corner of the parent object.

## F.18 Change Size command

The Change Size command is used to change the size of an object. A value of 0 for width or height or both means that the object size is 0 and the object is not drawn.

## F.20 Change Background Colour command

This command is used to change the background colour of an object.

NOTE Version 4 and later VTs may support a means to transform the colour table into alternate mapping. (See Clause B.17 Colour Map object)

## F.22 Change Numeric Value command

This command is used to change the value of an object. It applies only to objects that have a numeric "value" attribute. The size of the object shall not be changed by this command. Only the object indicated in the command is to be changed, variables referenced by the object are not changed.

<sup>1</sup> VT version 4 and later.

<sup>2</sup> VT version 5 and later.

<sup>3</sup> This bit is only set when the Change Numeric Value command is used to change a pointer value to an invalid object.

## F.24 Change String Value command

This command is used to change the value of an object. It applies only to objects that have a string "value" attribute. The size of the object shall not be changed by this command. Only the object indicated in the command is to be changed, variables referenced by the object are not changed.

If the message contents fit in a single packet, transport protocol shall not be used. If the transferred string has a length of 3 bytes or less, the remaining bytes in the single packet message shall be set to FF<sub>16</sub>.

The transferred string is allowed to be smaller than the length of the value attribute of the target object and in this case the VT shall pad the value attribute with space characters. The number of bytes in the transfer string (Bytes 4,5) shall be less than or equal to the length attribute of the target object (i.e. string length shall not be increased).

Transmission repetition rate:  
Data length:  
Parameter group number:  
Allowed in a Macro:

On request  
Variable  
ECU to VT, Destination-Specific  
Yes

Byte 1 VT function = 179<sub>10</sub>  
Bits 7 - 4 1011  
Bits 3 - 0 0011  
Bytes 2,3  
Bytes 4,5  
Bytes 6 - n

Command  
Parameter  
Object ID of the object to change  
Total number of bytes in the string to transfer (bytes to follow)  
New string value

Command  
Change String Value

## F.25 Change String Value response

This message is sent by the VT in response to the Change String Value message.

|                                      |                                                             |

| Bytes 5 - 8                   | Reserved, set to FF <sub>16</sub>             |
|                               | Command                                       |
|                               | Change Fill Attributes                        |

### F.34 Change Active Mask command

This command is used to change the active mask of a Working Set to either a Data Mask object or an Alarm Mask object.

|                               |                                   |
|-------------------------------|-----------------------------------|
| Transmission repetition rate: | On request                        |
| Data length:                  | 8 bytes                           |
| Parameter group number:       | ECU to VT, Destination-Specific   |
| Allowed in a Macro:           | Yes                               |
| Byte 1                        | VT function = 173 <sub>10</sub>   |
| Bits 7 - 4                    | 1010                              |
| Bits 3 - 0                    | 1101                              |
| Bytes 2,3                     | Command                           |
| Byte 4,5                      | Parameter                         |
| Byte 6 - 8                    | Working Set Object ID             |
|                               | New Active Mask Object ID         |
|                               | Reserved, set to FF <sub>16</sub> |
|                               | Command                           |
|                               | Change Active Mask                |

### F.35 Change Active Mask response

The VT uses this message to respond to the Change Active Mask command. (See Clause H.14 VT Change Active Mask)

|                               |                                           |
|-------------------------------|-------------------------------------------|
| Transmission repetition rate: | In response to Change Active Mask command |
| Data length:                  | 8 bytes                                   |
| Parameter group number:       | VT to ECU, Destination-Specific           |
| Allowed in a Macro:           | No                                        |
| Byte 1                        | VT function = 173 <sub>10</sub>           |
| Bits 7 - 4                    | 1010                                      |
| Bits 3 - 0                    | 1101                                      |
| Byte 2,3                      | Command                                   |
| Byte 4                        | Parameter                                 |
|                               | New Active Mask Object ID                 |
|                               | Error Codes (0=no error)                  |
|                               | Bit 0 = 1 = Invalid Working Set Object ID |
|                               | Bit 1 = 1 = Invalid Mask Object ID        |
|                               | Bit 2 = Undefined, set to 0 recommended   |
|                               | Bit 3 = Undefined, set to 0 recommended   |
|                               | Bit 4 = 1 = Any other error               |
|                               | Command                                   |
|                               | Change Active Mask                        |

Bytes 5 - 8

Reserved, set to FF<sub>16</sub>

### F.36 Change Soft Key Mask command

This command is used to change the Soft Key Mask associated with a Data Mask object or an Alarm Mask object.

Transmission repetition rate: On request  
 Data length: 8 bytes  
 Parameter group number: ECU to VT, Destination-Specific  
 Allowed in a Macro: Yes

Byte 1 VT function = 174<sub>10</sub>  
 Bits 7 - 4 1010  
 Bits 3 - 0 1110

Byte 2 Mask Type (1=Data, 2 = Alarm)  
 Bytes 3,4 Data or Alarm Mask Object ID  
 Byte 5,6 New Soft Key Mask Object ID  
 Bytes 7,8 Reserved, set to FF<sub>16</sub>

Command  
 Parameter  
 Command  
 Change Soft Key Mask

### F.37 Change Soft Key Mask response

The VT uses this message to respond to the Change Soft Key Mask command. (See also Clause H.16 VT Change Soft Key Mask)

Transmission repetition rate: In response to Change Soft Key Mask command  
 Data length: 8 bytes  
 Parameter group number: VT to ECU, Destination-Specific  
 Allowed in a Macro: No

Byte 1 VT function = 174<sub>10</sub>  
 Bits 7 - 4 1010  
 Bits 3 - 0 1110

Bytes 2,3 Data or Alarm Mask Object ID  
 Bytes 4,5 New Soft Key Mask Object ID  
 Byte 6 Error Codes (0=no error)

Bit 0 = 1 = Invalid Data or Alarm Mask Object ID  
 Bit 1 = 1 = Invalid Soft Key Mask Object ID  
 Bit 2 = 1 = Missing Objects  
 Bit 3 = 1 = Mask or child object has errors  
 Bit 4 = 1 = Any other error

Bytes 7,8

Reserved, set to FF<sub>16</sub>

Command  
 Parameter  
 Command  
 Change Soft Key Mask

### F.38 Change Attribute command

This command is used to change any attribute with an assigned AID. This message cannot be used to change strings.

Transmission repetition rate: On request  
 Data length: 8 bytes  
 Parameter group number: ECU to VT, Destination-Specific  
 Allowed in a Macro: Yes

Byte 1 VT function = 175<sub>10</sub>  
 Bits 7 - 4 1010  
 Bits 3 - 0 1111

Bytes 2,3 Object ID of object to change  
 Byte 4 Attribute ID (AID)

Command  
 Parameter  
 Command  
 Change Attribute

Bytes 5 - 8

New value for attribute. Size depends on attribute data type.  
 Values greater than 1 byte are transmitted little endian (LSB first). Unused bytes should be set to zero:  
 Boolean: 1 byte for TRUE/FALSE  
 Integer: 1, 2 or 4 bytes as defined in object tables  
 Float: 4 bytes  
 Bitmask: 1 byte

### F.39 Change Attribute response

The VT uses this message to respond to the Change Attribute command.

Transmission repetition rate:  
 Data length:  
 Parameter group number:  
 Allowed in a Macro:

In response to Change Attribute command  
 8 bytes  
 VT to ECU, Destination-Specific  
 No

Byte 1 VT function = 175<sub>10</sub>  
 Bits 7 - 4 1010  
 Bits 3 - 0 1111  
 Bytes 2,3  
 Byte 4  
 Byte 5

Command  
 Parameter  
 Object ID  
 Attribute ID (AID)  
 Error Codes (0=no error)  
 Bit 0 = 1 = Invalid Object ID  
 Bit 1 = 1 = Invalid Attribute ID  
 Bit 2 = 1 = Invalid value  
 Bit 3 = 1 = Value in use (e.g. open for input) <sup>1</sup>  
 Bit 4 = 1 = Any other error  
 Reserved, set to FF<sub>16</sub>

<sup>1</sup> Bytes 6 - 8  
 VT version 4 and later.

### F.40 Change Priority command

This command is used to change the priority of an Alarm Mask. This command causes the VT to evaluate the priority of all active masks and may cause a change to a different mask if the Alarm Mask being changed should either become the active Working Set and mask, or should no longer be the active Working Set and mask.

Transmission repetition rate:  
 Data length:  
 Parameter group number:  
 Allowed in a Macro:

On request  
 8 bytes  
 ECU to VT, Destination-Specific  
 Yes

Byte 1 VT function = 176<sub>10</sub>  
 Bits 7 - 4 1011  
 Bits 3 - 0 0000  
 Bytes 2,3  
 Byte 4  
 Bytes 5 - 8

Command  
 Parameter  
 Object ID of Alarm Mask  
 New priority  
 Reserved, set to FF<sub>16</sub>  
 Command  
 Change Priority

## F.41 Change Priority response

The VT uses this message to respond to the Change Priority command.

|                               |                                            |

## F.44 Delete Object Pool command

This command is used to delete the entire object pool of this Working Set from volatile storage. This command may be used by an implement when it wants to move its object pool to another VT, or when it is shutting down or during the development of object pools.

NOTE To delete an object pool from non-volatile storage in the VT, See Clause E.8 Delete Version command

## F.46 Lock/Unlock Mask command

This command is used by a Working Set to disallow or allow screen refreshes at the VT for the visible Data Mask or User-Layout Data Mask owned by the requesting Working Set. This message would be used when a series of changes need to be synchronized or made visually atomic (for example during animation). A Lock command does not imply that drawing stops, only that changes to the visible mask are not made visible to an operator until one of the unlock mechanisms listed below occurs:

- An Unlock command is received and the visible mask has been refreshed
- A timeout occurs based on the timeout attribute of the Lock message
- Navigation to, or activation of input objects or Buttons on the Data Mask
- A change from visible to hidden mask occurs
- The pool is deleted
- A proprietary reason (e.g. an input dialog closes)

When a mask is locked, the on screen presentation of the mask is not updated for any reason. This includes flashing objects and any animation object that is on the mask. If the Animation object is a timed animation, the timer will continue to run normally in the background, the animation object will be updated on the non-visible copy of the mask, but the on screen presentation is not updated until the mask is unlocked.

While locked, CAN messages/commands, key and button presses, events and macros are still processed normally. When one of the unlock mechanisms occurs, a response message is sent and normal periodic screen refreshes resume. The lock state does not apply to Soft Key Masks and Alarm Masks which shall be displayed regardless.

If an Alarm Mask from any Working Set is active when the lock command is received, the lock command is rejected if the active Alarm Mask is in the same display area.

The VT shall respond as soon as possible to a Lock Mask command. The VT's response to the Unlock command depends on whether or not a Data Mask or User-Layout Data Mask is visible. If a Data Mask or User-Layout Data Mask is hidden (e.g. VT is displaying a home page, setup screen etc), the VT shall respond to the Unlock command immediately and indicate that the command was ignored. However, if a Data Mask or User-Layout Data Mask is visible, the VT shall not respond to the Unlock Mask command until the Data Mask or User-Layout Data Mask has been completely refreshed (all changes during lock made visible to the operator). If a timeout occurs or a change causing the current Data Mask or User-Layout Data Mask to be hidden, the VT shall send an unsolicited Lock/Unlock Mask Response message with appropriate error codes set.

Typically the Working Set would lock the mask, send any necessary change commands, unlock the mask and then wait for the Lock/Unlock Mask Response message. This will allow mask changes to be synchronized and made visually atomic. To avoid operator interface lags, navigation problems and timing fluctuations in flashing objects, it is recommended that locks be applied for very short periods of time, likely measured in (but not limited to) milliseconds.

NOTE This message is available in VT version 4 and later.

|                               | 1 = Lock Data Mask or User-Layout Data Mask                                                                                                                                                              |                           |
| Bytes 3, 4                    | Object ID of the Data Mask or User-Layout Data Mask to Lock or Unlock. If this does not match the visible mask, the command fails with a response code.                                                  |                           |
| Bytes 5, 6                    | Lock timeout in ms or zero for no timeout. Once this period expires, the VT shall automatically release the lock if the Working Set has not done so. This attribute does not apply to an Unlock command. |                           |
| Bytes 7, 8                    | Reserved, set to FF <sub>16</sub>                                                                                                                                                                        |                           |

## F.47 Lock/Unlock Mask response

The VT uses this message to respond to the Lock/Unlock Mask command or to send an unsolicited message with the reasons given in the Lock/Unlock Mask command (See F.46).

NOTE This message is available in VT version 4 and later.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## F.50 Change Object Label command

This command is used by an ECU to change a label of an object. See also B.21 Object Label Reference List object.

NOTE This message is available in VT version 4 and later.

## F.52 Change Polygon Point command

This command is used by a Working Set to modify a point in an Output Polygon object.

NOTE This message is available in VT version 4 and later.

NOTE To avoid repetitive polygon draws in the case where several points need to be changed, Working Sets could use the Lock/Unlock Mask command before changing the points.

## F.54 Change Polygon Scale command

This command is used by a Working Set to change the scale of a complete Output Polygon object. This message causes the value of the polygon points to be changed. For consistent implementation, the following algorithm shall be used to calculate the new points.

It is similar to the Change Size command except that it also causes the VT to rescale the polygon points. When the VT receives this message, it shall change the enclosing area of the polygon (i.e. width and height attributes) and shall adjust all polygon point positions using the following 32 bit signed integer algorithm:

Using signed 32 bit integer math:

```

if ( old_x < 0 ) then
    new_x = ((old_x * new_width) - (old_width / 2)) / old_width
else
    new_x = ((old_x * new_width) + (old_width / 2)) / old_width
endif

if ( old_y < 0 ) then
    new_y = ((old_y * new_height) - (old_height / 2)) / old_height
else
    new_y = ((old_y * new_height) + (old_height / 2)) / old_height
endif

```

NOTE This message is available in VT version 4 and later.

Bits 1-3 = Undefined, set to 0 recommended

Bit 4 = 1 = Any other error

## F.56 Graphics Context command

This command is used to manipulate a graphics Context object (only on version 4 or later VTs). For messages larger than 8 bytes, Transport Protocol is used. Commands smaller than 8 bytes shall be padded to 8 bytes with FF<sub>16</sub>. The graphics drawn by this command shall be clipped to the size of the canvas. If drawing commands place the graphics cursor outside the defined area of the object, the VT shall clip the drawing to the defined edges of the object but shall move the graphics cursor to the new end position outside the bounds of the object. The drawing rules for these graphics commands are the same as the drawing rules for normal VT Objects as specified in Clause B.10 (for example always using a 'square' brush).

For drawing, the foreground colour specified is either the foreground colour attribute of the Graphics Context Object, or the Line Colour specified in the Line Attributes object. Which one is used is determined by the state of Options bit 1.

For drawing, the background colour specified is either the background colour attribute of the Graphics Context Object, or the Fill Colour specified in the Fill Attributes object. Which one is used is determined by the state of Options bit 1.

For drawing text, the foreground colour specified is either the foreground colour attribute of the Graphics Context Object, or the Font colour specified in the Font Attributes object. Which one is used is determined by the state of Options bit 1.

For zooming, a zoom value of 1.0 means no magnification or a 1:1 mapping of pixels of the viewport to the canvas. A zoom value of 2.0 means 2:1 magnification (or zoom in), 3.0 means 3:1 magnification etc. A zoom value of 0.5 means 1:2 demagnification (or zoom out), 0.25 means 1:4 demagnification etc.

When zooming in, for example, a zoom value of 3.0 for 3:1 magnification, each pixel of the canvas is displayed in the viewport as 3 pixels wide and 3 pixels high.

When zooming out, for example, a zoom value of 0.25 for 1:4 demagnification, each block of 4 pixels wide by 4 pixels high of the canvas are displayed in the viewport as a single pixel. The exact zooming algorithm is VT proprietary. A closest colour match may be used by the VT when merging or stretching pixels.

Only the viewport is zoomed – not the canvas. The Viewport X and Viewport Y positions are in reference to the unzoomed canvas. This means that the zoom anchor point is the upper left corner of the viewport. Zooming without moving the Viewport X and Viewport Y positions, gives the appearance of stretching the image from the top left towards the bottom right.

NOTE This message is available in VT version 4 and later.

| 10             | <b>Draw Rectangle:</b><br>Draws a rectangle at the graphics cursor. The Rectangle Object drawing rules apply. If a Line Attributes object is currently defined, the border is drawn. If a fill attribute object is currently defined, the rectangle is filled. The graphics cursor is moved to the bottom right pixel inside of the rectangle.                                                                                                                                                                                                                                                                                                                                                                                                       | Bytes 5 - 6 = Width                                                                                          | 0 to 65535       |
|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Bytes 7 - 8 = Height                                                                                         | 0 to 65535       |
| 11             | <b>Draw Closed Ellipse:</b><br>Draws a closed ellipse bounded by the rectangle defined by the current graphics cursor location and the width and height given. The Output Ellipse object drawing rules apply. If a Line Attributes object is currently defined, the border is drawn. If a fill attribute object is currently defined, the ellipse is filled. The graphics cursor is moved to the bottom right pixel inside of the bounding rectangle.                                                                                                                                                                                                                                                                                                | Bytes 5 - 6 = Width                                                                                          | 0 to 65535       |
|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Bytes 7 - 8 = Height                                                                                         | 0 to 65535       |
| 12             | <b>Draw Polygon:</b><br>Draws a polygon from the graphics cursor to the first point, then to the second point and so on. The polygon is closed if the last point has the offset 0,0. This is because offset 0,0 gives the coordinates of the original graphics cursor which was used as the first point in the polygon. If the data does not close the polygon, no automatic closing is performed and filling is ignored. Foreground colour is used for the border colour. The Output Polygon object drawing rules apply. If a Line Attributes object is currently defined, the border is drawn. If a fill object is currently defined and the polygon is closed, the polygon is filled. The graphics cursor is moved to the last point in the list. | Byte 5 = Number of polygon points to follow                                                                  | 0 to 255         |

| 17             | Change Viewport Size:<br>This command changes the size of the viewport and can be compared to the normal Change Size command. The graphics cursor is not moved.<br><br>NOTE: The size of the object (i.e. the memory used) cannot be changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Bytes 5 - 6 = New width                                      | 0 to 65535       |
|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Bytes 7 - 8 = New height                                     | 0 to 65535       |
| 18             | Draw VT Object:<br>This command draws the VT Object specified by the Object ID in bytes 5 - 6 at the current graphics cursor location (top left corner). Any drawable object may be specified with the exception of the Graphics Context object specified in bytes 2 - 3 or any object that contains this Graphics Context object (circular references are not allowed). The object shall be drawn using the current value and state of that object at the time the command was specified (for instance, enabled or disabled), except flashing bitmaps which are drawn regardless of their flashing state. A focus indicator, however, shall not be drawn even if the specified object (or any child object) has focus at that time. Also, if the object is being edited by the operator, it shall be drawn as if it is not being edited, using the last accepted value of the object (not a temporary value that the operator is still entering). The graphics cursor is moved to the bottom right corner of the object that was drawn. Normal VT Object transparency rules apply when drawing the VT Object onto the canvas.<br><br>Any colours outside of the colours allowed by this Graphics Context Object (Table B.41 — Picture Graphic attributes and record format) shall be treated as transparent. | Bytes 5 - 6 = Object ID of object to draw                    | 0 to 65534       |
| 19             | Copy Canvas to Picture Graphic:<br>This command copies the current canvas of the Graphics Context Object into the Picture Graphic Object specified by the Object ID in bytes 5 - 6. If the Picture Graphic is smaller than the canvas, then it shall be clipped to fit within the Picture Graphic. If the Picture Graphic is larger than the canvas, then the extra pixels in the Picture Graphic are not changed. Colours in the Canvas that are set to the transparency colour in the Graphics Context Object are not copied and the corresponding pixels in the Picture Graphic are not changed. The picture graphic shall have at least the same number of colours as the Graphics Context Object.<br><br>Any colours outside of the colours allowed by this Picture Graphic Object (Table B.41 — Picture Graphic attributes and record format) shall be treated as                                                                                                                                                                                                                                                                                                                                                                                                                                       | Bytes 5 - 6 = Object ID of Picture Graphic object to copy to | 0 to 65534       |
