Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 45, *Rubber and rubber products*, Subcommittee SC 2, *Testing and analysis*.

This fourth edition cancels and replaces the third edition (ISO 13226:2011), which has been revised to incorporate the actual used ingredients, and their relevant influences on the test results.

Introduction

The materials covered by this document are specified in [Annexes A](#) to [N](#).

The compounding and preparation ensure that the property profile agrees sufficiently with that of the material group represented, while the simple formulation ensures reliable reproducibility.

Rubber — Standard reference elastomers (SREs) for characterizing the effect of liquids on vulcanized rubbers

WARNING 1 — Persons using this document should be familiar with normal laboratory practice. This document does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user to establish appropriate safety and health practices and to determine the applicability of any national regulatory conditions.

WARNING 2 — Certain procedures specified in this document might involve the use or generation of substances, or the generation of waste, that could constitute a local environmental hazard. Reference should be made to appropriate documentation on safe handling and disposal after use.

1 Scope

This document specifies requirements for vulcanized rubbers in sheet form for use as standards in characterizing the effect of test liquids and service fluids.

This document is not designed to provide formulations of elastomeric-product compositions for actual service.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 23529, *Rubber — General procedures for preparing and conditioning test pieces for physical test methods*

3 Terms and definitions

No terms and definitions are listed in this document.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <https://www.iso.org/obp>

4 Composition

The materials covered by this document are specified in [Annexes A](#) to [N](#), which are all normative.

The following standard reference elastomers are included:

- a) Acrylic rubbers:
 - SRE-ACM/1 and SRE-ACM/1X
- b) Acrylonitrile-butadiene rubbers:
 - SRE-NBR 28/P and SRE-NBR 28/PX
 - SRE-NBR 28/S, SRE-NBR 28/SX, SRE-NBR 34/S and SRE-NBR 34/SX
 - SRE-NBR/M
 - SRE-NBR/L
- c) Chlorobutyl rubbers:
 - SRE-CIIR/1
- d) Chloroprene rubbers:
 - SRE-CR/1
- e) Ethylene-propylene rubbers:
 - SRE-EPM/1
- f) Fluoropolymer rubbers:
 - SRE-FKM/1
 - SRE-FKM/2X
- g) Hydrogenated acrylonitrile-butadiene rubbers:
 - SRE-HNBR/1 and SRE-HNBR/1X
- h) Natural rubbers:
 - SRE-NR/1
- i) Silicone rubbers:
 - SRE-MQ/1
 - SRE-VMQ/1 and SRE-VMQ/1X

The materials shall be homogeneous mixes of the ingredients shown in the relevant annex, in the proportions shown, weighed to the accuracy required in ISO 2393.

All ingredients shall be of recognized rubber quality.

The identification of proprietary materials as suitable ingredients does not exclude the use of other materials that can be shown to meet the requirements of the standard.

If necessary, the quantity of carbon black or silica may be adjusted from one consignment of rubber to another to give properties within the limits specified in the annexes. If the filler content is adjusted, the details shall be declared.

5 Preparation

The mixing of compounds and the vulcanization of test sheets shall be carried out in accordance with ISO 2393 and, where appropriate, as modified by detailed conditions and procedures given in the annexes. If a mould release agent is needed, dry PTFE mould lubricant shall be used.

6 Description

The vulcanized test sheets shall be $2 \text{ mm} \pm 0,2 \text{ mm}$ thick when measured in accordance with ISO 23529, and free from surface defects and internal voids when viewed with normally corrected vision.

A “lot” of sheets is those sheets made from a single batch of rubber mix vulcanized under the same conditions. A “pressing” is the quantity of sheets produced at the same time in a single moulding operation.

7 Test sheet properties

The test sheets shall be characterized by one or more physical properties in accordance with the relevant ISO standard test method. Properties and tolerances for individual materials are given in the annexes.

All sheets shall be tested for compliance with the requirements of [Clause 6](#). A sample sheet from each lot shall be tested for the properties of interest for compliance with the tolerances given in the appropriate annex. The actual values obtained shall be reported.

The test pieces necessary for determining material properties shall be taken from the test sheets in such a way that a minimum distance from the edge of the sheets is maintained. Dumb-bell test pieces shall be taken with their longitudinal axis parallel to the direction of milling of the moulding blank.

8 Designation

Each elastomer shall be designated as ISO 13226 SRE-A/B where ISO 13226 is this document, SRE is the abbreviation for standard reference elastomer and, after the hyphen, A is a set of code-letters designating the polymer type and B is a descriptor identifying the particular compound. Some designations end with the letter X to signify that additional test requirements apply.

9 Storage

Test sheets shall be stored in accordance with ISO 2230. After one year, they shall be retested or disposed of. If the sheets still meet the test requirements, they may be stored and used for a further year.

NOTE The yearly tests apply irrespective of the type of rubber used.

Annex A (normative)

Acrylic rubbers: SRE-ACM/1 and SRE-ACM/1X

A.1 Purpose

These SREs are representative of ACM materials such as the ones that are used, for instance, for parts in contact with petroleum products in the mechanical-engineering and automobile sectors.

They are used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized acrylic rubbers.

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

A.2 Composition

The composition of the SREs for acrylic rubbers (SRE-ACM/1 and SRE-ACM/1X) is given in [Table A.1](#)¹⁾.

Table A.1 — Composition of the SREs

Ingredients	Parts by mass
Acrylic rubber ^a	100,0
Stearic acid	1,0
Pentaerythrite stearate ^b	2,0
Octylated diphenylamine (ODPA) ^c	2,0
Carbon black, N550	65,0
Sodium stearate	4,0
Quaternary ammonium salts ^d	2,0
Total	176,0
^a HyTemp 4051® from Zeon Chemicals L.P., or equivalent. ^b Struktol WB 222® from Schill & Seilacher, or equivalent. ^c Vulkanox OCD/SG® from Lanxess AG, or equivalent. ^d HyTemp NPC-50® from Zeon Chemicals L.P., or equivalent.	

A.3 Recommended mixing procedure

Mix on a two-roll mill (see [A.6](#)).

A.4 Vulcanization

Condition the sheeted compound at ambient temperature for 12 h to 48 h.

Press-cure at 180 °C ± 2 °C for 10 min ± 1 min.

1) Examples of products available commercially. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO of these products.

Post-cure at $175\text{ °C} \pm 2\text{ °C}$ for $4\text{ h} \pm 0,5\text{ h}$.

A.5 Test sheet properties

SRE-ACM/1 material shall fulfil the basic property given in [Table A.2](#). Additional properties may be specified (see [Table A.3](#)).

SRE-ACM/1X material shall fulfil both the basic and the additional properties.

Table A.2 — Basic property

Property	Unit	Requirement	Test method
Increase in mass in test liquid B for fuels, as in ISO 1817	%	26 to 29	ISO 1817, three type 2 dumb-bell test pieces ^a immersed for $22\text{ h} \pm 0,5\text{ h}$ at $23\text{ °C} \pm 2\text{ °C}$ Test piece/test liquid volume ratio: $1/(30 \pm 5)$
^a As specified in ISO 37.			

Table A.3 — Additional properties in the initial state

Property	Unit	Requirement	Test method
Tensile strength	MPa	12 to 16	ISO 37, five type 2 dumb-bell test pieces
Elongation at break	%	140 to 220	
Hardness	Shore A	69 to 74	ISO 7619-1, three type 2 dumb-bell test pieces ^a , three plies
	IRHD	69 to 74	ISO 48, three type 2 dumb-bell test pieces ^a , three plies
Density	Mg/m ³	1,30 to 1,34	ISO 2781:2008, method A, three test pieces
^a As specified in ISO 37.			

A.6 Mixing procedures

The mixing procedure given in [Table A.4](#) can be used to produce SRE-ACM/1X material using a two-roll mill.

Table A.4 — Mixing on a two-roll mill

Roll diameter: 200 mm Working width: 395 mm Speed of rolls: 18/22 min ⁻¹ Surface temperature of rolls: 70 °C ± 5 °C Mass of rubber: 650 g		
Mixing step	Elapsed time min	Nip opening mm
Band rubber	0	2,0 ± 0,5
Add stearic acid, pentaerythrite stearate, ODPA and carbon black	1	2,2 ± 0,5
Make 3/4 cuts (four from each side)	11	
Add sodium stearate and quaternary ammonium salts ^a	13	
Make 3/4 cuts (six from each side)	17	
Turn the rolled sheet (three times)	19	
Sheet off	21	
Final temperature of sheet: Approximately 75 °C		
^a It is recommended that some of the final cuts be made during the addition of the sodium stearate to finalize the mixing procedure so that the sheet is taken off not later than 6 min ± 1 min after the accelerator has been added.		

Annex B (normative)

Acrylonitrile-butadiene rubbers: SRE-NBR 28/P and SRE-NBR 28/PX

B.1 Purpose

These SREs are representative of peroxide-cured NBR materials such as are used, for instance, for parts in contact with petroleum products in the mechanical-engineering and automobile sectors.

They are used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized nitrile rubbers.

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

B.2 Composition

The composition of SREs for acrylonitrile-butadiene rubbers (SRE-NBR 28/P and SRE-NBR 28/PX) is given in [Table B.1](#)²⁾.

Table B.1 — Composition of the SREs

Ingredients	Parts by mass
NBR with $(28 \pm 0,5)$ % by mass of acrylonitrile ^a	100,0
<i>N</i> -(1,3-dimethylbutyl)- <i>N'</i> -phenyl- <i>p</i> -phenylenediamine (6PPD) ^b	0,5
Zinc oxide, precipitated ^c	5,0
Carbon black, N550	70,0
Dicumyl peroxide (40 % by mass) ^d	3,0
Total	178,5
^a Perbunan NT 2845® from Lanxess AG, or equivalent. ^b Vulkanox 4020® from Lanxess AG, or equivalent. ^c Zinkoxyd aktiv® from Lanxess AG, or equivalent. ^d Perkadox BC 40® from Akzo Nobel Chemicals B.V., or equivalent.	

B.3 Recommended mixing procedure

Prepare a masterbatch without the peroxide in an internal mixer followed by homogenizing and addition of peroxide on a two-roll mill (see [B.6.2](#)).

Alternatively, mix completely on a two-roll mill (see [B.6.3](#)).

2) Examples of products available commercially. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO of these products.

B.4 Vulcanization

Condition the sheeted compound at ambient temperature for 20 h to 24 h.

Press-cure at $170\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$ for $20\text{ min} \pm 1\text{ min}$.

B.5 Test sheet properties

SRE-NBR 28/P material shall fulfil the basic property given in [Table B.2](#). Additional properties may be specified (see [Table B.3](#)).

SRE-NBR 28/PX material shall fulfil both the basic and the additional properties.

Table B.2 — Basic property

Property	Unit	Requirement	Test method
Increase in mass in test liquid B for fuels, as in ISO 1817	%	25 to 28	ISO 1817, three type 2 dumb-bell test pieces ^a immersed for $22\text{ h} \pm 0,5\text{ h}$ at $23\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$ Test piece/test liquid volume ratio: $1/(30 \pm 5)$
^a As specified in ISO 37.			

Table B.3 — Additional properties in the initial state

Property	Unit	Requirement	Test method
Tensile strength	MPa	20 to 25	ISO 37, five type 2 dumb-bell test pieces
Elongation at break	%	170 to 220	
Hardness	Shore A	79 to 84	ISO 7619-1, three type 2 dumb-bell test pieces ^a , three plies
	IRHD	79 to 84	ISO 48, three type 2 dumb-bell test pieces ^a , three plies
Density	Mg/m ³	1,21 to 1,25	ISO 2781:2008, method A, three test pieces
^a As specified in ISO 37.			

B.6 Mixing procedures

B.6.1 General

The following mixing procedures can be used to produce SRE-NBR 28/PX material.

B.6.2 Internal mixer and subsequent two-roll mill

[Table B.4](#) gives an example of a mixing procedure for preparation of a masterbatch without peroxide, using an internal mixer fitted with intermeshing blades.

Table B.4 — Mixing on an internal mixer

Mixing-chamber volume ^a : 4,6 dm ³ Chamber filled to: (65 ± 5) % ^b Speed ^c : 30 min ⁻¹ Mass of rubber: 2 000 g	
Mixing step	Elapsed time min
Add rubber	0
Add zinc oxide and 6PPD	2
Add carbon black	3
Dump	8
Final temperature of masterbatch: Approximately 120 °C	
^a Determined by means of wheat grains. ^b When using a mixer fitted with non-intermeshing blades, fill the chamber to (80 ± 5) %. ^c With cooling fully operative.	

[Table B.5](#) gives an example of a mixing procedure for homogenization of the masterbatch and addition of peroxide, using a two-roll mill.

Table B.5 — Homogenization on a two-roll mill

Roll diameter: 250 mm Working width: 410 mm Speed of rolls: 0 min to 13 min: 12/18 min ⁻¹ 14 min to 25 min: 12/12 min ⁻¹ Surface temperature of rolls: 50 °C ± 5 °C		
Mixing step	Elapsed time min	Nip opening mm
Band hot masterbatch	0	3,0 ± 0,5
Make 3/4 cuts (14 from each side)	1	
Turn the rolled sheet (eight times)	8	
Make 3/4 cuts (two from each side)	13	
Add peroxide	14	
Make 3/4 cuts (five from each side)	16	
Turn the rolled sheet (four times)	19	
Make 3/4 cuts (five from each side)	21	
Turn the rolled sheet (four times)	23	
Sheet off	25	1,5 ± 0,5
Final temperature of sheet: Approximately 75 °C		

B.6.3 Mixing using a two-roll mill

[Table B.6](#) gives an example of a mixing procedure using a two-roll mill.

Table B.6 — Mixing on a two-roll mill

Roll diameter: 200 mm Working width: 395 mm Speed of rolls: 20/24 min ⁻¹ Surface temperature of rolls: 50 °C ± 5 °C Mass of rubber: 1 000 g		
Mixing step	Elapsed time min	Nip opening mm
Band rubber	0	2,0 ± 0,5
Add zinc oxide and 6PPD	3	
Make 3/4 cuts (three from each side)	4	
Add carbon black	6	Set stepwise to 3,2 ± 0,5
Add peroxide	17	
Make 3/4 cuts (six from each side)	19	3,2 ± 0,5
Turn the rolled sheet (four times)	23	
Sheet off	26	1,5 ± 0,5
Final temperature of sheet: Approximately 90 °C		

Annex C (normative)

Acrylonitrile-butadiene rubbers: SRE-NBR 28/S, SRE-NBR 28/SX, SRE-NBR 34/S and SRE NBR 34/SX

C.1 Purpose

These SREs are representative of low-sulfur-cured NBR materials such as are used, for instance, for parts in contact with petroleum products in the mechanical-engineering and automobile sectors.

They are used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized nitrile rubbers.

In order to cover a wide range of service fluids, two different acrylonitrile (ACN) contents and thus a different swelling behaviour of the SREs are specified as follows:

- ISO 13226 SRE-NBR 28/S and SRE-NBR 28/SX (ACN content 28 %);
- ISO 13226 SRE-NBR 34/S and SRE-NBR 34/SX (ACN content 34 %).

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

C.2 Composition

The composition of SREs for acrylonitrile-butadiene rubbers (SRE-NBR 28/S, SRE-NBR 28/SX, SRE-NBR 34/S and SRE NBR 34/SX) is given in [Table C.1](#)³⁾.

3) Examples of products available commercially. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO of these products.

Table C.1 — Composition of the SRE

Ingredients	Parts by mass	
	28/S 28/SX	34/S 34/SX
NBR (ACN content 28 %) ^a	100,0	—
NBR (ACN content 34 %) ^b	—	100,0
Polymerized 2,2,4-trimethyl-1,2-dihydroquinoline (TMQ) ^c	2,0	2,0
Zinc oxide, precipitated ^d	5,0	5,0
Stearic acid	1,0	1,0
Carbon black, N550	65,0	65,0
Tetrabenzylthiuram disulfide (TBzTD) ^e	2,5	2,5
<i>N</i> -cyclohexylbenzothiazole-2-sulfenamide (CBS) ^f	1,5	1,5
Sulfur	0,2	0,2
Total	177,2	177,2
^a Perbunan® 2845 F from ARLANXEO GmbH, or equivalent. ^b Perbunan® 3445 F from ARLANXEO GmbH, or equivalent. ^c Vulkanox HS/LG® from Lanxess AG, or equivalent. ^d Zinkoxyd aktiv® from Lanxess AG, or equivalent. ^e ACCELERATOR TBzTD from DALIAN RICHON CHEM CO., LTD., or equivalent. ^f Vulkacit CZ/C® from Lanxess AG, or equivalent.		

C.3 Recommended mixing procedures

Prepare a masterbatch without the TBzTD, CBS and sulfur in an internal mixer followed by homogenizing and addition of vulcanizing ingredients on a two-roll mill (see [C.6.2](#)).

To obtain good sulfur dispersion, use about 10 % of the rubber to make a sulfur masterbatch.

Alternatively, mix completely on a two-roll mill. Prepare a sulfur masterbatch and store it for between 30 min and 24 h before proceeding with the main mix (see [C.6.3](#)).

C.4 Vulcanization

Condition the sheeted compound at ambient temperature for 2 h to 24 h.

Press-cure at 160 °C ± 2 °C for 20 min ± 1 min.

C.5 Test sheet properties

SRE-NBR 28/S and SRE-NBR 34/S materials shall fulfil the basic property given in [Table C.2](#). Additional properties may be specified (see [Table C.3](#)).

SRE-NBR 28/SX and SRE-NBR 34/SX materials shall fulfil both the basic and the additional properties.

Table C.2 — Basic property

Property	Unit	Requirement		Test method
		28/S 28/SX	34/S 34/SX	
Increase in mass in test liquid B for fuels, as in ISO 1817	%	26 to 29	17 to 20	ISO 1817, three type 2 dumb-bell test pieces ^a immersed for 22 h ± 0,5 h at 23 °C ± 2 °C Test piece/test liquid volume ratio: 1/(30 ± 5)
^a As specified in ISO 37.				

Table C.3 — Additional properties in the initial state

Property	Unit	Requirement		Test method
		28/SX	34/SX	
Tensile strength	MPa	20 to 25	20 to 25	ISO 37, five type 2 dumb-bell test pieces
Elongation at break	%	300 to 400	300 to 400	
Hardness	Shore A	76 to 81	77 to 82	ISO 7619-1, three type 2 dumb-bell test pieces ^a , three plies
	IRHD	76 to 81	77 to 82	ISO 48, three type 2 dumb-bell test pieces ^a , three plies
Density	Mg/m ³	1,19 to 1,23	1,20 to 1,24	ISO 2781:2008, method A, three test pieces
^a As specified in ISO 37.				

C.6 Mixing procedures

C.6.1 General

The following mixing procedures can be used to produce SRE-NBR 28/SX and SRE-NBR 34/SX materials.

C.6.2 Internal mixer and subsequent two-roll mill

Use an internal mixer to prepare a masterbatch, without the vulcanizing ingredients, e.g. as specified in [Table C.4](#).

Homogenize using a two-roll mill and add the vulcanizing ingredients, e.g. as specified in [Table C.5](#).

To achieve good sulfur dispersion, which is essential for good tensile characteristics, take about 10 % of the rubber and mix a sulfur batch, e.g. as specified in [Table C.6](#) (with properly adjusted working width and/or nip opening). Add this batch on the two-roll mill during step 5 (i.e. the addition of sulfur, TBzDT and CBS) in [Table C.5](#).

Table C.4 — Mixing procedure for preparation of a masterbatch without vulcanizing ingredients, using an internal mixer fitted with intermeshing blades (example)

Mixing-chamber volume ^a : 4,6 dm ³ Chamber filled to: (65 ± 5) % ^b Speed ^c : 30 min ⁻¹ Mass of rubber: 2 000 g	
Mixing step	Elapsed time min
Add rubber	0
Add zinc oxide and TMQ	2
Add carbon black and stearic acid	3
Dump	8
Final temperature of masterbatch: Approximately 120 °C	
^a Determined by means of wheat grains. ^b When using a mixer fitted with non-intermeshing blades, fill the chamber to (80 ± 5) %. ^c With cooling fully operative.	

Table C.5 — Mixing procedure for homogenization of masterbatch and addition of vulcanizing ingredients, using a two-roll mill (example)

Roll diameter: 250 mm		
Working width: 410 mm		
Speed of rolls:		
0 min to 13 min: 12/18 min-1		
14 min to 25 min: 12/12 min-1		
Surface temperature of rolls: 50 °C ± 5 °C		
Mixing step	Elapsed time min	Nip opening mm
Band hot masterbatch	0	3,0 ± 0,5
Make 3/4 cuts (14 from each side)	1	
Turn the rolled sheet (eight times)	8	
Make 3/4 cuts (two from each side)	13	
Add sulfur, TBzTD and CBS	14	
Make 3/4 cuts (five from each side)	16	
Turn the rolled sheet (four times)	19	
Make 3/4 cuts (five from each side)	21	
Turn the rolled sheet (four times)	23	
Sheet off	25	1,5 ± 0,5
Final temperature of sheet: Approximately 90 °C. To ensure homogeneous sulfur distribution, the final temperature shall not be less than 90 °C. Increase the surface temperature of the rolls if necessary.		

C.6.3 Mixing using a two-roll mill

To ensure good sulfur distribution, prepare a sulfur batch (masterbatch) at a roll surface temperature of 80 °C ± 5 °C, e.g. as specified in [Table C.6](#).

Store the sulfur batch for at least 30 min, but no longer than 24 h.

Continue the preparation of the mix at a roll surface temperature of 50 °C ± 5 °C, e.g. as specified in [Table C.7](#).

Table C.6 — Mixing procedure for preparation of a sulfur batch (example)

Roll diameter: 200 mm		
Working width: 395 mm		
Speed of rolls: 20/24 min ⁻¹		
Surface temperature of rolls: 80 °C ± 5 °C		
Mass of rubber: 1 000 g		
Mixing step	Elapsed time min	Nip opening mm
Pass the rubber twice	0	≤ 1
Band rubber	1	2,5 ± 0,5
Add sulfur	2	
Make 3/4 cuts (three from each side)	4	
Sheet off	7	
Final temperature of sheet: Approximately 90 °C. To ensure homogeneous sulfur distribution, the final temperature shall not be less than 90 °C. Increase the surface temperature of the rolls if necessary.		

Table C.7 — Mixing procedure for preparation of mix with sulfur batch (see Table C.6) (example)

Roll diameter: 200 mm Working width: 395 mm Speed of rolls: 20/24 min ⁻¹ Surface temperature of rolls: 50 °C ± 5 °C		
Mixing step	Elapsed time min	Nip opening mm
Pass sulfur batch between rolls	0	2,5 ± 0,5
Add antioxidant	1	
Make 3/4 cuts (two from each side)	2,5	
Add zinc oxide	3	
Make 3/4 cuts (two from each side)	5	
Add carbon black and stearic acid	6	Set stepwise to 3,2 ± 0,5
Make 3/4 cuts (four from each side)	24	3,2 ± 0,5
Add TBzTD and CBS	26	
Make 3/4 cuts (six from each side)	28	
Turn the rolled sheet (four times)	30	
Sheet off	31	1,5 ± 0,5
Final temperature of sheet: Approximately 90 °C		

Annex D (normative)

Acrylonitrile-butadiene rubbers: SRE-NBR/M

D.1 Purpose

This SRE is representative of a medium-nitrile-content acrylonitrile-butadiene rubber such as are used, for instance, for parts in contact with petroleum products in the mechanical engineering and automobile sectors.

It is used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized nitrile rubbers.

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

D.2 Composition

The composition of the SRE for acrylonitrile-butadiene rubbers (SRE-NBR/M) is given in [Table D.1](#).

Table D.1 — Composition of the SRE

Ingredients	Parts by mass
Medium-acrylonitrile-butadiene rubber (ACN content 33 %) ^a	100
Stearic acid	1,5
Zinc oxide	5,0
Carbon black, N550	55 (nominal)
Sulfur masterbatch ^b	1,9
Dibenzothiazyl disulfide (MBTS) masterbatch ^c	2,0
Total	165,4
^a Medium-nitrile-content, hot-polymerized Nipol 1042 from Zeon Corporation has been found to be suitable. ^b Masterbatch containing 80 % sulfur and 20 % of an ethylene-propylene rubber. ^c Masterbatch containing 75 % active accelerator and 25 % of an ethylene-propylene rubber.	

D.3 Vulcanization

Press-cure at 155 °C ± 2 °C for 20 min ± 15 s.

D.4 Test sheet properties

SRE-NBR/M material shall fulfil the basic property given in [Table D.2](#).

Table D.2 — Basic property

Property	Unit	Requirement	Test method
Increase in volume in test liquid 101, as in ISO 1817	%	19 to 22	ISO 1817, three test pieces immersed for $\left(48 \begin{smallmatrix} 0 \\ -1 \end{smallmatrix}\right)$ h at $100\text{ °C} \pm 1\text{ °C}$ Test piece/test liquid volume ratio: 1/(30 $\pm$ 5)

No additional properties are specified.

Annex E (normative)

Acrylonitrile-butadiene rubbers: SRE-NBR/L

E.1 Purpose

This SRE is representative of a low-nitrile-content acrylonitrile-butadiene rubber such as are used, for instance, for parts in contact with petroleum products in the mechanical-engineering and automobile sectors.

It is used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized nitrile rubbers.

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

E.2 Composition

The composition of the SRE for acrylonitrile-butadiene rubbers (SRE-NBR /L) is given in [Table E.1](#).

Table E.1 — Composition of the SRE

Ingredients	Parts by mass
Low-acrylonitrile-butadiene rubber (ACN content 18 %) ^a	100
Stearic acid	1,5
Zinc oxide	5,0
Carbon black, N550	67 (nominal)
Sulfur masterbatch ^b	1,9
Dibenzothiazyl disulfide (MBTS) masterbatch ^c	2,0
Total	177,4
^a Low-nitrile-content Paracril 18.80 from Uniroyal Chemical has been found to be suitable.	
^b Masterbatch containing 80 % sulfur and 20 % of an ethylene-propylene rubber.	
^c Masterbatch containing 75 % active accelerator and 25 % of an ethylene-propylene rubber.	

E.3 Vulcanization

Press-cure at 155 °C ± 2 °C for 30 min ± 15 s.

E.4 Test sheet properties

SRE-NBR/L material shall fulfil the basic property given in [Table E.2](#).

Table E.2 — Basic property

Property	Unit	Requirement	Test method
Increase in volume in test liquid B, as in ISO 1817	%	53 to 59	ISO 1817, three test pieces immersed for $\left(48_{-1}^0\right)$ h at $40\text{ °C} \pm 1\text{ °C}$ Test piece/test liquid volume ratio: 1/(30 ± 5)

No additional properties are specified.

STANDARDSISO.COM : Click to view the full PDF of ISO 13226:2018

Annex F (normative)

Chlorobutyl rubbers: SRE-CIIR/1

F.1 Purpose

This SRE is representative of a chlorobutyl rubber such as are used, for instance, for parts in contact with petroleum products in the mechanical-engineering and automobile sectors.

It is used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized nitrile rubbers.

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

F.2 Composition

The composition of the SRE for chlorobutyl rubbers (SRE-CIIR/1) is given in [Table F.1](#)⁴⁾.

Table F.1 — Composition of the SRE

Ingredients	Parts by mass
Chlorobutyl rubber ^a	100
Stearic acid	1,5
Zinc oxide	5,0
Carbon black, N550	25 (nominal)
Carbon black, N990 ^b	120 (nominal)
Sulfur masterbatch ^c	0,94
Petroleum jelly	3,0
Mineral oil ^d	3,0
Dibenzothiazyl disulfide (MBTS) masterbatch ^e	2,0
Total	260,44
^a Chlorobutyl 1066 from Exxon has been found to be suitable. ^b Thermax MT N990® from Evonik Carbon Black GmbH, or equivalent. ^c Masterbatch containing 80 % sulfur and 20 % of an ethylene-propylene rubber. ^d UK DEF STAN 91-44, or equivalent. ^e Masterbatch containing 75 % active accelerator and 25 % of an ethylene-propylene rubber.	

F.3 Vulcanization

Press-cure at 155 °C ± 2 °C for 25 min ± 15 s.

4) Examples of products available commercially. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO of these products.

F.4 Test sheet properties

SRE-CIIR/1 material shall fulfil the basic property given in [Table F.2](#).

Table F.2 — Basic property

Property	Unit	Requirement	Test method
Increase in volume in test liquid B, as in ISO 1817	%	93 to 100	ISO 1817, three test pieces immersed for $\left(48_{-1}^0\right)$ h at $40\text{ °C} \pm 1\text{ °C}$ Test piece/test liquid volume ratio: $1/(30 \pm 5)$

No additional properties are specified.

STANDARDSISO.COM : Click to view the full PDF of ISO 13226:2018

Annex G (normative)

Chloroprene rubbers: SRE-CR/1

G.1 Purpose

This SRE is representative of a general-purpose chloroprene rubber such as are used, for instance, for parts in contact with petroleum products in the mechanical-engineering and automobile sectors.

It is used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized nitrile rubbers.

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

G.2 Composition

The composition of the SRE for chloroprene rubbers (SRE-CR/1) is given in [Table G.1](#)⁵⁾.

Table G.1 — Composition of the SRE

Ingredients	Parts by mass
Chloroprene rubber ^a	100
Stearic acid	0,5
Lightly calcined magnesia	4,0
Zinc oxide	5,0
Carbon black, N550	17 (nominal)
Organic accelerator ^b	0,75 to 1,0
Antioxidant ^c	2,0
Total	129,25 to 129,5
^a A slow-crystallizing form of a non-sulfur-modified polymer is required. Polychloroprene WRT from DuPont Performance Elastomers has been found to be suitable. ^b Vulkacit CRV® from Lanxess AG has been found to be suitable. ^c Octamine from Uniroyal Chemical has been found to be suitable.	

G.3 Vulcanization

Press-cure at 160 °C ± 2 °C for 25 min ± 15 s.

G.4 Test sheet properties

SRE-CR/1 material shall fulfil the basic property given in [Table G.2](#).

5) Examples of products available commercially. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO of these products.

Table G.2 — Basic property

Property	Unit	Requirement	Test method
Increase in volume in test liquid B, as in ISO 1817	%	76 to 84	ISO 1817, three test pieces immersed for $\left(48_{-1}^0\right)$ h at $40\text{ °C} \pm 1\text{ °C}$ Test piece/test liquid volume ratio: $1/(30 \pm 5)$

No additional properties are specified.

STANDARDSISO.COM : Click to view the full PDF of ISO 13226:2018

Annex H (normative)

Ethylene-propylene rubbers: SRE-EPM/1

H.1 Purpose

This SRE is representative of a general-purpose ethylene-propylene rubber such as are used, for instance, for parts in contact with petroleum products in the mechanical-engineering and automobile sectors.

It is used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized nitrile rubbers.

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

H.2 Composition

The composition of the SRE for ethylene-propylene rubbers (SRE-EPM/1) is given in [Table H.1](#).

Table H.1 — Composition of the SRE

Ingredients	Parts by mass
Ethylene-propylene copolymer rubber ^a	100
Stearic acid	0,5
Carbon black, N550	55 (nominal)
Sulfur masterbatch ^b	0,44
1,1-dibutylperoxy-3,3,5-trimethylcyclohexane (40 % active powder) ^c	7,5
Total	163,44
^a Keltan 3300 A ethylene-propylene copolymer from DSM Elastomers has been found to be suitable.	
^b Masterbatch containing 80 % sulfur and 20 % of an ethylene-propylene rubber.	
^c Trigonox 29-40 BPD from Akzo Nobel Chemicals B.V. has been found to be suitable.	

H.3 Vulcanization

Press-cure at 140 °C ± 2 °C for 10 min ± 15 s.

H.4 Test sheet properties

SRE-EPM/1 material shall fulfil the basic property given in [Table H.2](#).

Table H.2 — Basic property

Property	Unit	Requirement	Test method
Increase in volume in test liquid 103 (tri- <i>n</i> -butyl phosphate: density at 20 °C 0,975 Mg/m ³ to 0,976 Mg/m ³), as in ISO 1817	%	20 to 23	ISO 1817, three test pieces immersed for 22 h ± 0,25 h at 100 °C ± 1 °C Test piece/test liquid volume ratio: 1/(30 ± 5)

No additional properties are specified.

STANDARDSISO.COM : Click to view the full PDF of ISO 13226:2018

Annex I (normative)

Fluoropolymer rubbers: SRE-FKM/1

I.1 Purpose

This SRE is representative of a fluoropolymer rubber such as are used, for instance, for parts in contact with petroleum products in the mechanical-engineering and automobile sectors.

It is used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized nitrile rubbers.

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

I.2 Composition

The composition of the SRE for fluoropolymer rubbers (SRE-FKM/1) is given in [Table I.1](#)⁶⁾.

Table I.1 — Composition of the SRE

Ingredients	Parts by mass
Fluoropolymer rubber ^a	100
Lightly calcined magnesia ^b	3,0
Carbon black, N990 ^c	30 (nominal)
2,5-di(<i>t</i> -butylperoxy)-2,5-dimethylhexane (50 % active powder)	3,0
Coagent ^d	3,0
Total	139,0
^a Viton type GF from DuPont Performance Elastomers has been found to be suitable. ^b Maglite D from Elastochem has been found to be suitable. ^c Thermax MT N990® from Evonik Carbon Black GmbH, or equivalent. ^d Triallyl isocyanurate has been found to be suitable for use with Viton type GF.	

I.3 Vulcanization

Press-cure at 175 °C ± 2 °C for 8 min ± 15 s.

Post-cure at 230 °C ± 5 °C for (24_{-2}^{+0}) h.

I.4 Test sheet properties

SRE-FKM/1 material shall fulfil the basic property given in [Table I.2](#).

6) Examples of products available commercially. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO of these products.

Table I.2 — Basic property

Property	Unit	Requirement	Test method
Increase in volume in test liquid E (toluene), as in ISO 1817	%	8 to 11	ISO 1817, three test pieces immersed for 168 h $\pm$ 2 h at 40 °C $\pm$ 1 °C Test piece/test liquid volume ratio: 1/(30 $\pm$ 5)

No additional properties are specified.

STANDARDSISO.COM : Click to view the full PDF of ISO 13226:2018

Annex J (normative)

Fluoropolymer rubbers: SRE-FKM/2X

J.1 Purpose

This SRE is representative of FKM materials such as are used, for instance, for parts in contact with petroleum products in the mechanical-engineering and automobile sectors.

It is used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized fluoropolymer rubbers.

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

J.2 Composition

The composition of the SRE for fluoropolymer rubbers (SRE-FKM/2X) is given in [Table J.1](#)⁷⁾.

Table J.1 — Composition of the SRE

Ingredients	Parts by mass
Vinylidene fluoride-hexafluoropropylene copolymer ^a	100,0
Magnesium oxide, high activity ^b	3,0
Calcium hydroxide, small particle size ^c	2,0
Carbon black, N990 ^d	25,0
Accelerator: Organic phosphonium salt, e.g. triphenylbenzyl-phosphonium chloride ^e	0,44
Crosslinking agent: 2,2-bis(4-hydroxyphenyl)-hexafluoropropane (bisphenol AF) ^f	1,35
Total	131,79
The following brands have been found to be suitable: ^a Tecnoflon N935® from Solvay, or Viton A 500® from DuPont Performance Elastomers or Fluorel FC 2230® from Dyneon. ^b Elastomag 170® from Nordmann, Rassmann GmbH & Co. ^c Calcium hydroxide from Boehringer AG. ^d Thermax MT N990® from Evonik Carbon Black GmbH. ^e Intercure 2® from Interbusiness, Milan, or an equivalent accelerator such as Tecnoflon FOR M2 from Ausimont. In the latter case, take 1,45 phr of Tecnoflon FOR M2 and reduce the amount of rubber by 1 g per 100 g of rubber. ^f 2,2-Bis(4-hydroxyphenyl)-hexafluoropropane from Hoechst, or an equivalent crosslinking agent such as Tecnoflon FOR M1 from Ausimont or Viton Curative No. 30 from DuPont Performance Elastomers. The bisphenol content of both of the last two agents is 50 %, so take 2,76 phr and reduce the amount of rubber by 1 g per 100 g of rubber.	

J.3 Recommended mixing procedure

A two-roll mill can be used (see [J.6](#)).

7) Examples of products available commercially. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO of these products.

J.4 Vulcanization

Condition the sheeted compound at ambient temperature for about 24 h. Prepare samples for cure. The direction of milling shall be marked on the slabs.

Press-cure at $180\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$ for $7\text{ min} \pm 1\text{ min}$.

Post-cure at $220\text{ }^{\circ}\text{C} \pm 5\text{ }^{\circ}\text{C}$ for $16\text{ h} \pm 2\text{ h}$ in an air-circulating oven with air exchange.

J.5 Test sheet properties

SRE-FKM/2X material shall fulfil both the basic and the additional properties given in [Tables J.2 and J.3](#).

Table J.2 — Basic property

Property	Unit	Requirement	Test method
Increase in mass in test liquid C for fuels, as in ISO 1817	%	6 to 9	ISO 1817, three type 2 dumb-bell test pieces ^a immersed for $\left(24 \pm 2\right)\text{ h}$ at $60\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$ Test piece/test liquid volume ratio: $1/(30 \pm 5)$
^a As specified in ISO 37.			

Table J.3 — Additional properties in the initial state

Property	Unit	Requirement	Test method
Tensile strength	MPa	12 to 18	ISO 37, five type 2 dumb-bell test pieces
Elongation at break	%	250 to 330	
Hardness	IRHD	67 to 73	ISO 48, microtest, three test pieces
Density	Mg/m ³	1,83 to 1,87	ISO 2781:2008, method A, three test pieces

J.6 Test sheet properties

The mixing procedure given in [Table J.4](#) can be used to produce SRE-FKM/2X material using a two-roll mill.

Table J.4 — Mixing on a two-roll mill

Roll diameter: 150 mm Working width: 350 mm Speed of rolls: $18/22\text{ min}^{-1}$ Surface temperature: $50\text{ }^{\circ}\text{C} \pm 5\text{ }^{\circ}\text{C}$ Mass of rubber: 1 000 g		
Mixing step	Elapsed time min	Nip opening mm
Band rubber (first ingredient in Table J.1)	0	$2,0 \pm 0,5$
Blend the other ingredients (2 to 6) together and add evenly across the rolls at a constant rate Make 3/4 cuts (four from each side)	2	$3,0 \pm 1,0$
Turn the rolled sheet (six times)	12	$0,5 \pm 0,2$
Sheet off	18	$2,2 \pm 0,5$
Final temperature of sheet: $60\text{ }^{\circ}\text{C}$ to $70\text{ }^{\circ}\text{C}$		
Refine mixed stock after about 24 h storage on the mill under the same conditions, as follows:		

Table J.4 *(continued)*

Band batch	0	$3,0 \pm 1,0$
Make 3/4 cuts (three from each side) Turn the rolled sheet (six times)	2	$0,5 \pm 0,2$
Sheet off	8	$2,2 \pm 0,5$

STANDARDSISO.COM : Click to view the full PDF of ISO 13226:2018

Annex K (normative)

Hydrogenated acrylonitrile-butadiene rubbers: SRE-HNBR/1 and SRE-HNBR/1X

K.1 Purpose

These SREs are representative of saturated HNBR materials such as are used, for instance, for parts in contact with petroleum products in the mechanical-engineering and automobile sectors.

They are used for the characterization of service fluids such as mineral oils, fuels, lubricants, hydraulic fluids, coolants and refrigerants with regard to their effect on vulcanized fully hydrogenated nitrile rubbers.

The changes in mass, volume, hardness, tensile strength and elongation at break of the SRE when in contact with the service fluid under specified conditions may be included as supplementary data in specifications for the fluid concerned.

K.2 Composition

The composition of the SREs for hydrogenated acrylonitrile-butadiene rubbers (SRE-HNBR/1 and SRE-HNBR/1X) is given in [Table K.1](#).

Table K.1 — Composition of the SREs

Ingredients	Parts by mass
HNBR (ACN content 39 %)a	100,0
Zinc oxide, precipitatedb	2,0
Magnesium oxidec	2,0
Styrenated diphenylamine (SDPA)d	1,0
Carbon black, N550	50,0
Triallyl isocyanurate (TAIC)e	1,5
1,3-bis(<i>t</i> -butylperoxyisopropyl)-benzene (40 % by mass)f	7,5
Total	164,0
a Therban A 3907® from Lanxess AG, or equivalent. b Zinkoxyd aktiv® from Lanxess AG, or equivalent. c Maglite DE® from Merck and Co, or equivalent. d Vulkanox DDA® from Lanxess AG, or equivalent. e Perkalink 301® from Akzo Nobel Chemicals B.V., or equivalent. f Perkadox 14-40® from Akzo Nobel Chemicals B.V., or equivalent.	

K.3 Recommended mixing procedure

Prepare a masterbatch without the peroxide in an internal mixer followed by homogenizing and addition of peroxide on a two-roll mill (see [K.6.2](#)).

Alternatively, sheet off the masterbatch on a two-roll mill, cut into strips, cool and re-introduce into the internal mixer and add peroxide (see [K.6.3](#)).
