Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 10, *Technical product documentation*, Subcommittee SC 6, *Mechanical engineering documentation*.

This third edition cancels and replaces the second edition (ISO 13715:2000), which has been technically revised with the following changes:

- title changed from *Technical drawings — Edges of undefined shape — Vocabulary and indications to Technical product documentation — Edges of undefined shape — Indication and dimensioning*;
- Normative references updated;
- text rearranged in [Clause 4](#);
- figure titles changed;
- figures added and improved;
- [4.4.2](#) “Asymmetrical indications” added;
- Clause 5 deleted and Table 2 “Examples” is moved to [Annex B](#), explanations have been improved;
- [Annex B](#) “Recommended edge size” has been deleted, definition of sharp edge is deleted.

Introduction

In technical drawings, the ideal geometric shape is represented without any deviation and, in general, without consideration of the conditions of the edges. Nevertheless, for many purposes (the functioning of a part or out of safety considerations, for example) particular conditions of edges need to be indicated. Such conditions include those of external edges free from burr or those with a burr of limited size, and internal edges with a passing.

This document provides a symbology for the indication of the desired edge.

Technical product documentation — Edges of undefined shape — Indication and dimensioning

1 Scope

This document specifies rules for the indication and dimensioning of undefined edges in technical product and dimensions. The proportions and dimensions of the graphical symbols to be used are also specified.

In cases where the geometrically defined shape of an edge (for example, $1 \times 45^\circ$) is required, the general dimensioning principles given in ISO 129-1 apply.

2 Normative references

There are no normative references cited in this document.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1

edge of undefined shape

transition line, included in an intersection plane, which is not defined on the nominal model and which exists between two adjacent integral surfaces

3.2

undercut

deviation inside the ideal geometrical shape of an edge defined by two tangent outside straight lines to the adjacent feature of the zone of the undefined edge

Note 1 to entry: The explanation of the definition is given in [Figures 1](#) and [3](#). In order to simplify the illustration, only the undercut and the two tangents outside straight lines are represented.

Note 2 to entry: Examples are presented in [Figures 2](#) and [4](#).

3.3

passing

deviation outside the ideal geometrical shape of an edge defined by two tangent outside straight lines to the adjacent feature of the zone of the undefined edge

Note 1 to entry: The explanation of the definition is given in [Figures 5](#) and [7](#). In order to simplify the illustration, only the passing and the two tangents outside straight lines are represented.

Note 2 to entry: A burr or a flash (see [Figure 5](#)) can be considered to be a special case of external passing.

Note 3 to entry: Examples are presented in [Figures 6](#) and [8](#).

4 Indications on drawings

4.1 Basic indication

The requirements for an edge of a part shall be indicated by the basic graphical indication shown in [Figure 9](#). If all edges of a part are to be specified as undefined, the basic general indication is used (see [Figure 10](#)).

The graphical symbol and the specification shall be represented in such a way that they can be read from the bottom of the drawing.

The proportions of this symbol are given in [Annex A](#). Additional indications can be placed in the areas a_1 , a_2 or a_3 , see [Figure A.1](#).

Undefined edges cannot be described by the basic element alone. As a minimum indication, the type of undefined edge shall be specified.

Figure 9 — Basic indication

Figure 10 — Basic general indication

4.2 Types of undefined edge

The type of an undefined edge shall be indicated in the area a_1 (see Figure A.1), inside the basic symbol. The symbol element + (plus), - (minus) or $\pm$ (plus or minus) is used in accordance with Table 1.

The symbol element + (plus) indicates permitted excess material, i.e. passing.

The symbol element - (minus) indicates required material removal, i.e. undercut.

The symbol element $\pm$ (plus or minus) indicates permitted excess material or material removed, i.e. an undercut or a passing. This can only be used with an indication of size (see 4.3).

The deviation from ideal nominal shape can be controlled by indicating the size of passing and undercut (see 4.3) and the direction (see 4.4).

Table 1 — Symbols for the shapes of edges

Symbol	Meaning			
	External edge		Internal edge	
	Passing	Undercut	Passing	Undercut
	Permitted	Not permitted	Permitted	Not permitted
	Not permitted	Required	Not permitted	Required
 Can only be used with an indication of size.	Permitted	Permitted	Permitted	Permitted

4.3 Size

The maximum deviation of the undercut or passing shall be controlled by indication of the dimensions (size). The value is placed after the symbol element +, - or $\pm$ in the area a_1 (see Figure A.1).

When a single limit for the size of an edge is specified with a positive value, the second limit deviation is the value zero; undercut is not permitted (see Figures 11 and 12).

When a single limit for the size of an edge is specified with a negative value, the second limit deviation is the value zero; passing is not permitted (see Figures 11 and 12).

Whenever the specification of an upper and lower limit deviation for the size of an edge is necessary, both values shall be indicated. The upper limit deviation is placed above the lower limit deviation (see Figure 13). The indicated limit deviations correspond to the maximum and minimum dimensions, respectively.

When a particular direction of passing or undercut is required, the indication shall be positioned accordingly (see 4.4).

NOTE The thickness of passing on external edges and the thickness of undercuts on internal edges cannot be specified according to this document.

Figure 11 — Size of an external edges

Figure 12 — Size of internal edges

Figure 13 — Examples of indications of size

4.4 Direction of passing or undercut

4.4.1 Indication in one direction

Wherever indication of one direction of passing on an external edge or undercut on an internal edge is needed, the indication of size shall be given in the area a_2 or a_3 (see [Figure A.1](#)), accordingly (see [Figures 14, 15 and 16](#)).

Indication in one direction cannot be used for undercut on external edges and passing on internal edges.

For angles other than 90° , the direction cannot be specified.

Figure 14 — Direction of the passing on an external edge

Figure 15 — Direction of the undercut on an internal edge

Figure 16 — Examples of indications of direction

4.4.2 Asymmetrical indication

Wherever asymmetrical indication of directions of undercut on an external edge or passing on an internal edge is needed, the indication of size shall be given in the area a_2 and a_3 (see [Figure A.1](#)), accordingly (see [Figures 17, 18 and 19](#)).

Asymmetrical indications cannot be used for passing on external edges and undercut on internal edges.

For angles other than 90° , the direction cannot be specified.

Figure 17 — Direction of undercut on an external edge

Figure 18 — Direction of the passing on an internal edge

Figure 19 — Examples of asymmetrical indications of direction

4.5 Location of the basic symbol

4.5.1 General

Edges of undefined shape shall be indicated by

- an individual indication for a single edge or for all edges around the represented profile of a part,
- limited areas of the edges of the represented profile of a part, and
- general indications to not specified edges of a part.

Individual indications shall be assigned to a line (e.g. visible outlines, areas with specific treatment or extension lines), or to a point representing an edge parallel with, or vertical to, the projection plane (see [Figures 20, 21 and 22](#)).

General indications shall be indicated only once for all the edges and shall be located near the title block or in a notes area (see [Figures 25 to 29](#) and [Annex B](#)).

4.5.2 Individual indication of edges

The following features maybe indicated:

- edges vertical to the projection plane (see [Figure 20](#), front view);
- edges of a feature, such as a hole (see [Figure 20](#), section);
- edges of the front and the back, if only one view is represented and the outlines of both front and back are the same (see [Figure 21](#)). If other edges exist between front and back they will be included, unless otherwise specified. Specify the quantity of edges if there is any doubt (see [Figure 22](#)) or make it clear in a separate view.
- all edges around the profile of a part represented on the drawing, if the symbol “all around” is added to the basic symbol (see [Figures 21](#) and [22](#)). The “all around” symbol shall not be used in sectional representations. For further information concerning the application of this symbol element, see ISO 128-22:1999, Annex B.

Figure 20 — Edges vertical to the projection plane

Figure 21 — Edges around the profile of a part, both sides

Figure 22 — Edges around a profile of a part, both sides clearly defined

4.5.3 Indication of limited areas

If the specification for the condition of an edge is valid only for a part of the length of that edge, this shall be indicated with the corresponding dimension. The limited area shall be represented by a long-dashed dotted wide line, see ISO 128-24, line type 04,2 (see [Figure 23](#)), or with the between symbol according to ISO 1101 (see [Figure 24](#)).

Figure 23 — Limited areas of an edge represented by long-dashed-dotted lines

Figure 24 — Limited areas of an edge represented by between symbols

4.5.4 General indication of edges

If the specification for the condition of edges is referring to all edges of a part, one general indication at the appropriate position on the drawing, near the title block or in a notes area (see [Figure 25](#)) will suffice. General indications of conditions common to only external or internal edges shall be indicated in accordance with [Figures 26](#) and [27](#), respectively.

Key

1 title block

Figure 25 — Condition for all edges

Key

1 title block

Figure 26 — Condition for all external edges

Figure 27 — Condition for all internal edges

4.5.5 Exceptions from general indications of edges

To emphasize in a general indication that another condition for some edges is required elsewhere on the drawing, an additional indication in parentheses shall be placed to the right of the general indication (see [Figure 28](#)).

Key

1 title block

Figure 28 — External and internal edges with exception

If more than one additional requirement, only the basic symbol shall appear in parentheses to the right of the general indication (see [Figure 29](#)).

Figure 29 — Condition for all edges with more than one exception

4.6 Reference to this document

This document is to be referenced to on the drawing. The following indication as shown in [Figure 30](#), shall be stated in or near the title block or in a notes area.

Figure 30 — Reference to this document

Annex A (normative)

Proportions and dimensions of graphical symbols

A.1 General requirements

In order to harmonize the size of the graphical symbols specified in this document with that of the other indications on the drawing (dimensions, tolerances, etc.), observe the rules prescribed in ISO 81714-1.

Lettering shall be of the same height and line width as that used for dimensioning. The distance between lines should be twice the line width.

A.2 Proportions

The graphical symbols and the additional indications in the areas a_1 to a_3 shall be draughted in accordance with [Figure A.1](#).

The use of the all-around symbol element is optional; the angle of the leader line will depend on the case of application. The length of the leader line should be equal to, or greater than $1,5 \times h$. If appropriate, the reference line may be extended.

A.3 Dimensions

The dimensional requirements of the graphical symbols and additional indications are specified in [Table A.1](#).

Figure A.1 — Proportions

Table A.1 — Dimensions

Dimensions in millimetres

Lettering height, h	3,5	5	7	10	14
Line width for symbols and lettering type B ISO 3098-1, d	0,35	0,5	0,7	1	1,4
Symbol height, H	5	7	10	14	20

Annex B (informative)

Examples of indication of undefined edges

For examples of indication of edges, see [Table B.1](#).

Table B.1 — Indication and associated meaning for undefined edges

No.	Indication	Meaning	Explanation
B.1			External edge Passing permitted Size undefined Direction undefined
B.2			External edge Passing permitted Size 0 mm to 0,1 mm Direction undefined
B.3			External edge Passing permitted Size 0 mm to 0,3 mm Direction defined
B.4			External edge Passing permitted Size 0 mm to 0,3 mm Direction defined
B.5			External edge Undercut required Size undefined Direction undefined
B.6			External edge Undercut required Size 0 mm to 0,3 mm Direction undefined
