Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 61, *Plastics*, Subcommittee SC 9, *Thermoplastic materials*.

This first edition of ISO 20029-2 cancels and replaces ISO 14910-2:2013, which has been technically revised.

A list of all parts in the ISO 20029 series can be found on the ISO website.

Introduction

The structure of thermoplastic elastomer material standards is based on the following considerations.

For each type of thermoplastic elastomer, reference is made to the relevant material standard.

Thermoplastic-elastomer materials are classified into three classes according to the primary elastomeric property, hardness, as shown in [Figure 1](#) below. This classification on the basis of hardness reflects the special position of thermoplastic elastomers between rubber materials on the one hand and plastics on the other.

Each class is subdivided into standard properties and special properties. The classes have many standard properties and many special properties in common. Furthermore, a standard property in one class can be a special property in another class and vice versa.

Special properties are those properties which are in wide use or of particular significance in the practical characterization of a specific material.

Figure 1 — Classification of thermoplastic elastomers on the basis of their hardness

Plastics — Thermoplastic polyester/ester and polyether/ester elastomers for moulding and extrusion —

Part 2: Preparation of test specimens and determination of properties

1 Scope

This document specifies the methods of preparation of test specimens and the standard test methods to be used in determining the properties of thermoplastic polyester/ester and polyether/ester elastomer moulding and extrusion materials. Requirements for handling test material and/or conditioning both the test material before moulding and the specimens before testing are given.

Procedures and conditions for the preparation of test specimens in a specified state and procedures for measuring properties of the materials from which these specimens are made are given. Properties and test methods which are suitable and necessary to characterize thermoplastic polyester/ester and polyether/ester moulding and extrusion materials are listed.

The properties have been selected from the general test methods in ISO 10350-1. Other test methods in wide use for or of particular significance to these moulding and extrusion materials are also included in this document, as are the designatory properties specified in ISO 20029-1 (hardness, melting temperature and tensile/flexural modulus).

In order to obtain reproducible and comparable test results, it is intended to use the methods of preparation and conditioning, the specimen dimensions and the test procedures specified in this document. Values determined will not necessarily be identical to those obtained using specimens of different dimensions or prepared using different procedures.

This document has been developed on the basis of ISO 10350-1, as at the moment, no standard exists for the acquisition and presentation of comparable single-point data for thermoplastic elastomers. After publication of this document and the analogous document for polyurethanes (ISO 16365-2), it is the intention to develop ISO 10350-3 for the acquisition and presentation of comparable single-point data for thermoplastic elastomers, based on this document and ISO 16365-2, as the basis for the development of thermoplastic elastomer material standards.

3 Terms and definitions

No terms and definitions are listed in this document.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

4 Preparation of test specimens

4.1 Treatment of the material before moulding

Before processing, the material sample shall have reached room temperature and the moisture content of the material sample shall not exceed 0,05 % (by mass).

The material shall be dried as specified in [Table 1](#), preferably using a vacuum oven with a dry N₂ purge and a maximum pressure of 0,01 MPa.

Table 1 — Drying conditions

Dryer type	Temperature
Vacuum oven with N ₂ purge; $p \leq 0,01$ MPa	80 °C to 135 °C
Vacuum oven	80 °C to 120 °C
Desiccant dryer, pre-dried-air dryer	80 °C to 120 °C
Hot-air oven	80 °C to 135 °C

Drying at temperatures higher than those in [Table 1](#) might change the molecular mass and hence, the properties of the material. The drying temperature recommended by the supplier should preferably be used.

The moisture content of filled or reinforced materials shall be expressed as a percentage of the total mass of the compound. The moisture content shall be determined in accordance with ISO 15512.

To ensure that the moisture content remains low, it is recommended that the sample material in the feed hopper of the injection-moulding machine be blanketed with a suitable gas (dried air, nitrogen or argon, for example). Better results might be obtained using a dehumidifier hopper drier.

4.2 Injection moulding

Injection-moulded specimens shall be prepared in accordance with ISO 294-1, using the conditions specified in [Table 2](#). The moulding conditions recommended by the supplier should preferably be used. The specimens shall be prepared by injection moulding from dry granules. It is essential that specimens are always prepared by the same procedure using the same processing conditions. The material shall be kept in moisture-proof containers until it is required for use.

Table 2 — Conditions for injection moulding of test specimens

Mould temperature °C	Melt temperature °C	Nozzle temperature °C	Heating-zone temperature		
			Front °C	Centre °C	Rear °C
20 to 50	Melting temperature + 30 °C	230 to 250	200 to 240	200 to 240	200 to 240
Injection pressure: 10 MPa to 100 MPa, holding pressure: 10 MPa to 100 MPa, back pressure 0,5 MPa to 2 MPa, injection velocity: 100 mm/s to 300 mm/s.					

5 Conditioning of test specimens

Test specimens for the determination of mechanical properties, electrical properties and density shall be conditioned for at least 16 h at (23 ± 2) °C and (50 ± 10) % relative humidity.

6 Determination of properties

6.1 General

In order to obtain reproducible and comparable test results, it is necessary to use the methods of specimen preparation and conditioning, the specimen dimensions and the test procedures specified in this document. Values determined will not necessarily be identical to those obtained using specimens of different dimensions or prepared using different procedures.

For all ISO test methods applied in this document (see [Tables 3](#) to [9](#)), which refer to the ISO 294 series and/or ISO 3167 for the designation and dimensions of the test specimen, ISO 20753 shall be used instead.

All tests shall be carried out in the standard atmosphere of (23 ± 2) °C and (50 ± 10) % relative humidity unless specifically stated otherwise in [Tables 4](#) to [9](#).

[Table 3](#) is compiled from ISO 10350-1 (see [Clause 1](#)) and gives an overview of the standard properties and special properties which are appropriate to thermoplastic polyester/ester and polyether/ester moulding and extrusion materials. These properties are those considered useful for comparisons of data generated for different thermoplastic elastomers.

[Tables 4](#), [6](#) and [8](#) contain those properties that are considered to be standard properties for the relevant hardness class. [Tables 5](#), [7](#) and [9](#) contain those properties that are considered to be special properties for the relevant hardness class, i.e. in wide use and/or of particular significance in the practical characterization of thermoplastic polyester/ester and polyether/ester moulding and extrusion materials.

^c From 60 % strain onwards, switch to nominal strain, see Annex A .					

6.3.2 Special properties and test conditions

Table 7 — Special properties and test conditions — 25 < Shore D hardness ≤ 65

Property	Unit	Standard ^a	Specimen type ^a (dimensions in mm)	Specimen preparation ^b	Test conditions and supplementary instructions
Mechanical properties					
Stress at break ^c	MPa	ISO 527-2	ISO 37 type 1 or 1A	M	500 mm/min
Strain at break ^c	%				500 mm/min
Tensile stress at 5 % and 10 % elongation ^c	MPa	ISO 527-2	ISO 20753 type A12, ISO 37 type 1, 1A or 2	M	500 mm/min
^a For all test methods which refer to the ISO 294 series and/or ISO 3167 for the designation and dimensions of test specimen, ISO 20753 shall be used. ^b M = injection moulding. ^c From 60 % strain onwards, switch to nominal strain, see Annex A .					

Table 7 (continued)

Property	Unit	Standard ^a	Specimen type ^a (dimensions in mm)	Specimen preparation ^b	Test conditions and supplementary instructions
Tensile stress at > 50 % elongation ^c	MPa				200 % or 300 % elongation at 500 mm/min
Nominal strain at break	%				500 mm/min
Yield stress ^c	MPa				500 mm/min
Strain at yield ^c	%				500 mm/min
Tensile creep modulus	MPa	ISO 899-1	ISO 20753 type A12	M	1 h, 1 000 h
Flexural modulus	MPa	ISO 178	80 × 10 × 4	M	23 °C and –40 °C or 23 °C and 100 °C
Tensile-impact strength	kJ/m ²	ISO 8256	80 × 10 × 4 Machined double V-notch r = 1	M	Only to be quoted if fracture cannot be obtained with notched Charpy test
Charpy unnotched impact strength	kJ/m ²	ISO 179-1 or ISO 179-2	80 × 10 × 4	M	Method 1eU edgewise impact, –30 °C Also record type failure
Charpy notched impact strength	kJ/m ²		80 × 10 × 4 machined V-notch r = 1	M	Method 1eA edgewise impact, –30 °C Also record type failure
Brittleness temperature	°C	ISO 974	20 × 0,25, 2,50 × 0,05, 2,0 × 0,1	M	
Compression set	%	ISO 815-1	Ø 13 × 6	M	23 °C for 72 h, 70 °C for 24 h
Thermal properties					
Specific heat capacity	J K ⁻¹	ISO 11357-4	Moulding compound		
Thermal conductivity	W/m.K	ISO 22007-2, ISO 22007-3 or ISO 22007-4	As per relevant part of ISO 22007	M	
Temperature of heat deflection under load	°C	ISO 75-2	80 × 10 × 4	M	0,45 MPa
Coefficient of linear thermal expansion from –40 °C to 23 °C	°C ⁻¹	ISO 11359-2:1999, method A	ISO 20753, prepared from type A1	M	Transverse and longitudinal
Coefficient of linear thermal expansion from 55 °C to T °C	°C ⁻¹	ISO 11359-2:1999, method A	ISO 20753, prepared from type A1	M	Transverse and longitudinal end temperature T in accordance with manufacturer's instructions
Vicat softening temperature	°C	ISO 306	10 × 10 × > 3	M	
Oxygen index	%	ISO 4589-2	80 × 10 × 4	M	Use procedure A (top surface ignition)
Burning behaviour		IEC 60695-11-10	125 × 13 × d	M	d = 1,5 mm or 3,0 mm
Electrical properties					
Relative permittivity		IEC 60250	≥ 60 × ≥ 60 × 2	M	Frequency 100 Hz and 1 MHz (compensate for electrode edge effects)
Dissipation factor					
Volume resistivity	Ω m	IEC 60093		M	
Surface resistivity	Ω				
Dielectrical strength	kV/mm	IEC 60243-1	≥ 60 × ≥ 60 × 1	M	
Comparative tracking index (CTI)	V	IEC 60112	≥ 20 × ≥ 20 × 4	M	
^a For all test methods which refer to the ISO 294 series and/or ISO 3167 for the designation and dimensions of test specimen, ISO 20753 shall be used. ^b M = injection moulding. ^c From 60 % strain onwards, switch to nominal strain, see Annex A.					

Table 7 (continued)

Property	Unit	Standard ^a	Specimen type ^a (dimensions in mm)	Specimen preparation ^b	Test conditions and supplementary instructions
Other properties					
Moisture content	%	ISO 15512	Moulding compound	M	Coulometric method
Water vapour transmission	g/m ² h	ASTM E96	As specified in ASTM E96		
^a For all test methods which refer to the ISO 294 series and/or ISO 3167 for the designation and dimensions of test specimen, ISO 20753 shall be used. ^b M = injection moulding. ^c From 60 % strain onwards, switch to nominal strain, see Annex A .					

6.4 Shore D hardness > 65

6.4.1 Standard properties and test conditions

Table 8 — Standard properties and test conditions — Shore D hardness > 65

Property	Unit	Standard ^a	Specimen type ^a	Specimen preparation ^b	Test conditions and supplementary conditions	
Rheological properties						
MVR or MFR	cm ³ /10 min or g/10 min	ISO 1133-2	Moulding compound	Dried	Load 2,16 kg, 5 kg or 10 kg	
					Melting temperature	Test temperature
					≤ 175 °C	190 °C
					> 175 °C but ≤ 210 °C	230 °C
					> 210 °C, blow moulding materials	250 °C
Mechanical properties						
Hardness	Shore D	ISO 868	≥ 80 × ≥ 10 × ≥ 6	M	Shore D - 15s Five measurements ≥ 9 mm from any edge, ≥ 6mm apart. Specimens may be stacked to obtain minimum thickness.	
Tensile modulus	MPa	ISO 527-2	ISO 20753 type A12	M	1 mm/min	
Tensile stress at 5 % and 10 % elongation ^c	MPa		ISO 20753 type A12 or ISO 37 type 2		500 mm/min	
Stress at break ^c	MPa				500 mm/min	
Yield stress ^c	MPa				500 mm/min	
Strain at break ^c	%				500 mm/min	
Flexural modulus	MPa	ISO 178	80 × 10 × 4	M	23 °C and –40 °C or 23 °C and 100 °C at 2 mm/min	
Charpy unnotched impact strength	kJ/m ²	ISO 179-1 or ISO 179-2	80 × 10 × 4	M	Method 1eU, edgewise impact –40 °C. Also record type failure.	
Charpy notched impact strength	kJ/m ²		80 × 10 × 4 machined V-notch r = 1	M	Method 1eA, edgewise impact –40 °C. Also record type failure. If fracture cannot be obtained use ISO 8256 tensile impact	
^a For all test methods which refer to the ISO 294 series and/or ISO 3167 for the designation and dimensions of test specimen, ISO 20753 shall be used.						
^b M = injection moulding.						
^c From 60 % strain onwards, switch to nominal strain, see Annex A .						

Table 8 (continued)

Property	Unit	Standard ^a	Specimen type ^a	Specimen preparation ^b	Test conditions and supplementary conditions
Thermal properties					
Melting temperature	°C	ISO 11357-3	Moulding compound	M	Record peak melting temperature Use 10 °C/min
Temperature of deflection under load	°C	ISO 75-2	80 × 10 × 4	M	0,45 MPa
Coefficient of linear thermal expansion	°C ⁻¹	ISO 11359-2:1999, method A	ISO 20753, prepared from type A1	M	Transverse and longitudinal Determine the secant value over the temperature range 23 °C to 55 °C
Vicat softening temperature	°C	ISO 306	10 × 10 × > 3	M	
Other properties					
Density	g/cm ³	ISO 1183-1, ISO 1183-2 or ISO 1183-3	ISO 20753, prepared from type A12	M	
Water absorption	%	ISO 62	60 × 60 × 1	M	Saturation value in water at 23 °C
Mould shrinkage	%	ISO 294-4, ISO 20753	60 × 60 × 2	M	
^a For all test methods which refer to the ISO 294 series and/or ISO 3167 for the designation and dimensions of test specimen, ISO 20753 shall be used. ^b M = injection moulding. ^c From 60 % strain onwards, switch to nominal strain, see Annex A .					

6.4.2 Special properties and test conditions

Table 9 — Special properties and test conditions conditions — Shore D hardness > 65

Property	Unit	Standard ^a	Specimen type ^a (dimensions in mm)	Specimen preparation ^b	Test conditions and supplementary instructions
Mechanical properties					
Tensile stress at 5 % and 10 % elongation ^c	MPa	ISO 527-2	ISO 37 type 1 or 1A	M	500 mm/min
Stress at break ^c	MPa				500 mm/min
Yield stress ^c	MPa				500 mm/min
Strain at break ^c	%				500 mm/min
Tensile stress at 200 % elongation	MPa	ISO 527-2	ISO 20753 type A12 or ISO 37 type 1, 1A or 2	M	500 mm/min
Nominal strain at break ^c	%				500 mm/min
Strain at yield ^c	%				500 mm/min
Tensile creep modulus	MPa	ISO 899-1	ISO 20753 type A12 or ISO 37 type 1, 1A or 2	M	1 h, 1 000 h
Brittleness temperature	°C	ISO 974	20 × 0,25, 2,50 × 0,05, 2,0 × 0,1	M	
Tear strength	kN/m	ISO 34-1:2015, method B, procedure (a)	Angle test piece, 2 mm thick	M	Test speed 500 mm/min
Compression set	%	ISO 815-1	Ø 13 × 6	M	23 °C for 72 h, 70 °C for 24 h
^a For all test methods which refer to the ISO 294 series and/or ISO 3167 for the designation and dimensions of test specimen, ISO 20753 shall be used. ^b M = injection moulding. ^c From 60 % strain onwards, switch to nominal strain, see Annex A .					

Table 9 (continued)

Property	Unit	Standard ^a	Specimen type ^a (dimensions in mm)	Specimen preparation ^b	Test conditions and supplementary instructions
Thermal properties					
Specific heat capacity	J K ⁻¹	ISO 11357-4	Moulding compound	M	
Thermal conductivity	W/m.K	ISO 22007-2, ISO 22007-3 or ISO 22007-4	As per relevant part of ISO 22007	M	
Coefficient of linear thermal expansion from -40 °C to 23 °C	°C ⁻¹	ISO 11359-2: 1999, method A	ISO 20753, prepared from type A1	M	Transverse and longitudinal
Coefficient of linear thermal expansion from 55 °C to T °C	°C ⁻¹	ISO 11359-2: 1999, method A	ISO 20753, prepared from type A1	M	Transverse and longitudinal end temperature T in accordance with manufacturer's instructions
Oxygen index	%	ISO 4589-2	80 × 10 × 4	M	Use procedure A (top surface ignition)
Burning behaviour		IEC 60695-11-10	125 × 13 × d	M	d = 1,5 mm or 3,0 mm
Electrical properties					
Relative permittivity		IEC 60250	≥ 60 × ≥ 60 × 2	M	Frequency 100 Hz and 1 MHz (compensate for electrode effects)
Dissipation factor					
Volume resistivity	Ω cm	IEC 60093	≥ 60 × ≥ 60 × 1	M	
Surface resistivity	Ω				
Dielectrical strength	kV/mm	IEC 60243-1	≥ 60 × ≥ 60 × 1	M	
Comparative tracking index (CTI)	V	IEC 60112	≥ 20 × ≥ 20 × 4	M	
Other properties					
Water vapour transmission	g/m ² h	ASTM E96	As specified in ASTM E96		
Moisture content	%	ISO 15512	Moulding compound		Coulometric method
^a For all test methods which refer to the ISO 294 series and/or ISO 3167 for the designation and dimensions of test specimen, ISO 20753 shall be used. ^b M = injection moulding. ^c From 60 % strain onwards, switch to nominal strain, see Annex A .
