FOREWORD

ISO (the International Organization for Standardization) is a worldwide federation of national standards institutes (ISO Member Bodies). The work of developing International Standards is carried out through ISO Technical Committees. Every Member Body interested in a subject for which a Technical Committee has been set up has the right to be represented on that Committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work.

Draft International Standards adopted by the Technical Committees are circulated to the Member Bodies for approval before their acceptance as International Standards by the ISO Council.

International Standard ISO 3324/1 was drawn up by Technical Committee ISO/TC 31, *Tyres, rims and valves*, and circulated to the Member Bodies in July 1974.

It has been approved by the Member Bodies of the following countries :

Australia	Israel	Switzerland
Austria	Italy	Turkey
Canada	Poland	United Kingdom
Czechoslovakia	Romania	U.S.A.
France	Sweden	Yugoslavia

No Member Body expressed disapproval of the document.

Aircraft tyres and rims — Part I : Specifications

SECTION ONE : TYRES

1 SCOPE AND FIELD OF APPLICATION¹⁾

Section One of this International Standard sets out, for civil aircraft tyres,

- a) definitions;
- b) tyre size designation;
- c) tyre markings;
- d) new tyre dimensional tolerances;
- e) a method for determining growth allowances;
- f) a method for determining clearance allowances.

2 DEFINITIONS

For definitions relating to aircraft tyres, ISO 4223/1, *Definitions of some terms used in the tyre industry — Part 1 : Tyres*²⁾, should be consulted.

Meanwhile, for the purposes of Section One of this International Standard, the following definitions apply.

2.1 new tyre : A tyre which has been neither used nor subjected to a retreading operation.

2.2 grown tyre : Any tyre which has been used or subjected to a retreading operation.

2.3 ply rating : A term used to identify a given tyre with its maximum load when used in a specific type of service. It is an index of relative tyre strength.

3 TYRE SIZE DESIGNATION

3.1 Tyre size designation

A tyre size designation in accordance with this International Standard shall consist of a three-part size marking as follows :

Overall diameter X Overall section width — Rim diameter

3.2 Tyre size dimensions

3.2.1 The overall diameter and overall section width are the maximum permitted new inflated tyre dimensions when the tyre is mounted on the specified rim, inflated to its rated inflation pressure, and allowed to stand for a minimum of 12 h at normal room temperature and the inflation pressure readjusted to the original value.

3.2.2 Dimensions are to be expressed as follows :

Tyre, Overall diameter : millimetres (mm) or [inches (in)]

Tyre, Overall section width : millimetres (mm) or [inches (in)]

Rim diameter : inches (in) or millimetres (mm)

4 TYRE MARKINGS

4.1 The marking of tyres shall include the following :

- a) tyre size designation;
- b) ply rating;
- c) maximum speed rating expressed in "knots" or "mph" (miles per hour) on tyres for 140 knots (161 mph) and over;

1) ISO 3324/II, *Aircraft tyres and rims — Part II : Test procedures for aircraft tyres*, is in preparation.

2) In preparation.

d) date of manufacture expressed numerically by year and day of the year using a system of date marking based on the Julian calendar (for example 12 March 1975 becomes 5071). Tyres currently in production may be marked numerically by month and year;

NOTE — The numerical date of manufacture may be the first four digits of the manufacturer's unique serial number.

- e) the word "Tubeless" if applicable;
- f) manufacturer's name;
- g) balance marker.

5 NEW TYRE DIMENSIONAL TOLERANCES

New inflated tyre dimensional tolerances shall be calculated using the factors shown in figure 1 or 2. The size designation determines the maximum permitted new inflated tyre outside diameter and width of section, and therefore tolerances must be calculated as a minus from the permitted maximum dimensions.

6 DETERMINATION OF GROWTH ALLOWANCES

6.1 General

Growth allowances provide for the increase in tyre dimensions over the maximum new inflated tyre dimensions to allow for growth or stretch of the tyre during service.

6.2 Dimensions and symbols

	Inflated new tyre	Inflated grown tyre
Maximum section width ¹⁾	W	W_G
Maximum shoulder width	W_S^*	W_{SG}
Maximum overall diameter	D_O	D_G
Maximum shoulder diameter	D_S	D_{SG}
Maximum section height	H	—
Maximum shoulder height	H_S^*	—
Rim ledge diameter		D
Minimum lateral distance re- quired from wheel centre line to adjacent structure		W_x

- $W_S = 0,88 W$
 $H_S = 0,82 H$

Minimum radial distance re-
quired from axle centre line to
adjacent structure

R_x

Minimum lateral clearance²⁾

C_W

Minimum radial clearance²⁾

C_R

Minimum shoulder clearance²⁾

S_x
(radial distance)

6.3 Calculations

6.3.1 Determine "grown" dimensions as follows, using the appropriate growth factor :

$W_G = G_W W$

$D_G = D + 2G_H H$

$W_{SG} = G_W W_S$

$D_{SG} = D + 2G_H H_S$

$H = \frac{D_O - D}{2}$

$H_S = \frac{D_S - D}{2}$

Section width growth factor, $G_W = 1,04$

* Aspect ratio (AR) is the ratio of mean section height to mean section width.

6.3.2 Obtain the new tyre dimensions, D_O , D_S , W and W_S , as shown in tyre tables; such dimensions should be considered maxima.

1) Maximum section width includes protective side ribs, lettering bars and decorations, but does not include chines (water deflectors) present on certain types of nose wheel (or auxiliary gear) tyres.
2) These are minimum clearance allowances between the maximum grown tyre and the adjacent structure.

NOTE — Radii $\frac{W_S}{2}$ and $\frac{W_{SG}}{2}$ are drawn through their respective shoulder points tangent to D_O and D_G respectively.

Radii below the shoulder points pass through the shoulder points and are tangent to W and W_G respectively.

Dimensions W and W_G include all protective side ribs, lettering, bars, and decorations.

7 DETERMINATION OF CLEARANCE ALLOWANCES

7.1 Clearance around individual tyres

Clearance allowances between the tyre and the adjacent parts of the aircraft should be based on the maximum overall tyre dimensions plus growth allowance due to service, plus the increase in diameter due to centrifugal force. Minimum distances to adjacent parts of the aircraft are determined as follows :

a) Determine the maximum grown tyre envelope as instructed. (This is the dotted line labelled "grown (used) inflated tyre" on the figure above)

b) Obtain the radial clearance C_R and lateral clearance C_W from figure 3 or 4 (mm or in).

c) Determine the distance to adjacent parts as follows :

$$R_{X \min} = \text{Radial distance from axle centre line to adjacent part} = \frac{D_G}{2} + C_R$$

$$W_{X \min} = \text{Lateral distance from the wheel centre line to adjacent part} = \frac{W_G}{2} + C_W$$

$$S_{X \min} \text{ Radius} = \text{Clearance allowed between tyre shoulder area and adjacent part} = \frac{C_W + C_R}{2}$$

NOTE — The above radial clearance includes allowances for increase in tyre diameter due to centrifugal force at speeds up to 220 knots (250 mph).

7.2 Spacing between twin tyres

The minimum distance between the tyre tread centre lines shall be $1,18 \times W_G$, where W_G is the maximum grown width of the tyre.

7.3 Spacing between tyres in tandem

The minimum distance between axle centres shall be $D_G + 2C_R$, where D_G is the maximum grown tyre diameter and C_R is the tyre radial clearance allowance for the maximum aircraft ground speed.

FIGURE 4 — Chart to be used for calculating radial C_R and lateral C_W clearances

SECTION TWO : RIMS

8 SCOPE AND FIELD OF APPLICATION

Section Two of this International Standard sets out, for civil aircraft,

- fundamental rim standards;
- inspection tolerances for aircraft rims;
- method of dimensioning and inspection tolerances for rim diameters;
- design guide for rim flange height;
- design guide for width between rim flanges;
- valve hole and fusible plug hole locations

9 FUNDAMENTAL RIM STANDARDS

9.1 Symbols

$I_{\min}$ must be maintained between the points where the 5° taper bead seat surfaces intersect a horizontal line located at $I_{\min}$ below the bead seat diameter (D)

$$\text{Well depth} = I_{\min} = 0,0875 (G - R_h) + 0,005 D$$

where G = minimum ledge width

NOTE — Relevant rim dimensions are shown in annex A.

A = width between flanges

B = flange width

D = nominal rim diameter

G = minimum ledge width

H_F = flange height

I = well depth (minimum)

R_F = flange radius

R_h = heel radius

R_r = flange edge radius

9.2 Metric dimensions

Flange height (H_F)

- to be in 3 mm increments up to 50 mm flange height; above 50 mm, increments to be 6 mm.

Flange radius (R_F)

- to be equal to 50 % of flange height.

Flange width (B)

- to be $1,30 \times$ flange radius, to nearest 1 mm.

Flange edge radius (R_r)

- to be 1,5 mm minimum.

Heel radius (R_h)

- to be equal to 25 % of flange height for flanges up to and including 30 mm in height and 22,5 % of flange height for flanges over 30 mm in height. In all cases, adjust flange height to nearest 1 mm.

9.3 Inch dimensions

Flange height (H_F)

- to be in 0.125 in increments up to 2 in flange height; above 2 in, increments to be 0.250 in.

Flange radius (R_F)

- to be equal to 50 % of the flange height.

Flange width (B)

- to be $1,30 \times$ flange radius, to nearest $1/32$ in.

Flange edge radius (R_r)

- to be 0.062 in minimum.

Heel radius (R_h)

- to be equal to 25 % of flange height for flanges up to and including 1.25 in in height and 22,5 % of flange height for flanges over 1.25 in in height. In all cases, adjust flange height to nearest $1/32$ in.

10 INSPECTION TOLERANCES

10.1 Metric dimensions (millimetres)

Dimension	Tolerance	
	Plus	Minus
A	1,6	1,6
B	Minimum	
D	See 10.3.1	
G	Minimum	
R _h	0,25	0,25
R _F	0,40	0,40
H _F	0,25	0,25
5° Taper bead seat	30'	30'

10.2 Inch dimensions

Dimension	Tolerance	
	Plus	Minus
A	0.063	0.063
B	Minimum	
D	See 10.3.2	
G	Minimum	
R _h	0.010	0.010
R _F	0.016	0.016
H _F	0.010	0.010
5° Taper bead seat	30'	30'

10.3 Method of dimensioning and inspection tolerances for rim diameters, dimension D

10.3.1 Metric dimensions (millimetres)

Diameter D	Tolerance	
	minus	plus
Up to 109	0	0,25
110 to 509	0	0,40
510 to 620	0	0,50
Over 620	0	0,60

10.3.2 Inch dimensions

Diameter D	Tolerance	
	Minus	Plus
Up to 4	0	0.010
5 to 20	0	0.015
21 to 24	0	0.019
Over 24	0	0.023

10.4 Design guide for rim flange height

For metric dimensions refer to figure 5; for inch dimensions refer to figure 6.

10.5 Design guide for width between rim flanges

Refer to figure 7.

10.6 Valve hole and fusible plug hole locations (or connections to valve or plug hole location) ($V_{\min}$) for tubeless tyres.

G = Minimum ledge width

$V_{\min} = 1,20 G + 0,10 G$ [$0,10 G$ is not less than 5 mm (0,20 in)]

NOTE — Where V exceeds half the width between the flanges, the valve hole or connection to the valve hole must be located on the centre line of the wheel.

- NOTES
- 1 Base flange height on the required PR plus 4 — to allow for increased aircraft weight.
 - 2 When calculated value falls above a given curve, apply value applicable to the next higher curve.

FIGURE 5 — Rim flange height — Design guide — Metric units

NOTES

- 1 Base flange height on the required PR plus 4 – to allow for increased aircraft weight.
- 2 When calculated value falls above a given curve, apply value applicable to the next higher curve.

FIGURE 6 – Rim flange height – Design guide – Inch units

FIGURE 7 – Width between rim flanges (A) – Design guide

ANNEX A
(For information)

AIRCRAFT TYRE AND RIM DATA

Annex A sets forth as an information item the data on aircraft tyres and rims as contained in European Tyre Rim Technical Organization (ETRTO) and Tire and Rim Association (TRA) documents.

Table 1 – Type III aircraft tyres – Sizes 5.00-4 to 17.00-20

Table 2 – Type III aircraft tyres (ETRTO) – Size 3.50-6 to 22.50-20

Table 3 – Type VII aircraft tyres – Sizes 16 X 4.4 to 49 X 17

Table 4 – Type VII aircraft tyres (ETRTO) – Size 12 X 5-3 to 50 X 18

Table 5 – Type Heli aircraft tyres – Sizes 5.00-5 to 11.00-12

Table 6 – Aircraft tyres – Metric (ETRTO) – Sizes 500 X 180 to 960 X 340-14

Table 7 – Type (New design) aircraft tyres – Sizes 15 X 6.0-6 to 29 X 11.0-10

Table 8 – Type (New) aircraft tyres – Sizes 21 X 7.25-10 to 56 X 20.0-20

ANNEX B
(For information)

TYRE SIZE DATA FOR TYPES OF AIRCRAFT

Annex B sets forth data on tyre size and ply rating as follows :

Table 9 — For commercial airline aircraft

Table 10 — For commercial light aircraft

Table 11 — For other miscellaneous aircraft

The tyre data are based on aircraft used in France, Germany, the United Kingdom and the U.S.A.

STANDARDSISO.COM : Click to view the full PDF of ISO 3324-1:1976
