FOREWORD

ISO (the International Organization for Standardization) is a worldwide federation of national standards institutes (ISO Member Bodies). The work of developing International Standards is carried out through ISO Technical Committees. Every Member Body interested in a subject for which a Technical Committee has been set up has the right to be represented on that Committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work.

Draft International Standards adopted by the Technical Committees are circulated to the Member Bodies for approval before their acceptance as International Standards by the ISO Council.

International Standard ISO 3706 was drawn up by Technical Committee ISO/TC 47, *Chemistry*, and was circulated to the Member Bodies in February 1975.

It has been approved by the Member Bodies of the following countries:

Austria	Israel	Romania
Belgium	Italy	South Africa, Rep. of
Brazil	Netherlands	Switzerland
France	New Zealand	Turkey
Germany	Poland	United Kingdom
Hungary	Portugal	Yugoslavia

No Member Body expressed disapproval of the document.

Phosphoric acid for industrial use (including foodstuffs) — Determination of total phosphorus(V) oxide content — Quinoline phosphomolybdate gravimetric method

1 SCOPE

This International Standard specifies a gravimetric method using quinoline phosphomolybdate for the determination of the total phosphorus(V) oxide content of phosphoric acid for industrial use (including foodstuffs).

2 FIELD OF APPLICATION

The method is applicable to phosphoric acids, whether or not they are homogeneous and whether or not they contain polyphosphoric acids.

3 PRINCIPLE

Preliminary hydrolysis of the polyphosphoric acids by boiling in the presence of hydrochloric acid. Precipitation of the phosphoric acid in the form of quinoline phosphomolybdate in the presence of acetone. Filtration, washing, drying and weighing of the precipitate.

4 REAGENTS

During the analysis, use only reagents of recognized analytical grade and only distilled water or water of equivalent purity.

4.1 Hydrochloric acid, ρ approximately 1,19 g/ml, about 38 % (m/m) or approximately 12 N solution.

4.2 Citromolybdate reagent.

4.2.1 Dissolve 70 g of sodium molybdate dihydrate ($\text{Na}_2\text{MoO}_4 \cdot 2\text{H}_2\text{O}$) in 150 ml of water.

4.2.2 Dissolve 60 g of citric acid monohydrate ($\text{C}_6\text{H}_8\text{O}_7 \cdot \text{H}_2\text{O}$) in 150 ml of water and add 85 ml of nitric acid solution, ρ approximately 1,40 g/ml, about 68 % (m/m) or approximately 14 N solution.

4.2.3 Add, while stirring, solution 4.2.1 to solution 4.2.2.

4.2.4 Add 35 ml of nitric acid solution, ρ approximately 1,40 g/ml, about 68 % (m/m) or approximately 14 N solution, then 5 ml of recently distilled quinoline to 100 ml of water.

4.2.5 Add solution (4.2.4) to solution (4.2.3) and mix.

Allow to stand for at least 12 h and filter through the filter crucible (5.1).

Store this solution protected from light, in a well-stoppered flask.

4.2.6 Add 280 ml of acetone to solution (4.2.5) and dilute to 1 000 ml with water.

Do not keep this solution for more than 1 week. Store under the same conditions as solution (4.2.5).

5 APPARATUS

Ordinary laboratory apparatus and

5.1 Filter crucible, with sintered glass disk, of porosity P10 (pore size index between 4 and 10 μm).

5.2 Electric oven, capable of being controlled at $250 \pm 10^\circ\text{C}$.

6 PROCEDURE

6.1 Test portion and preparation of the test solution

6.1.1 Homogeneous phosphoric acid (or phosphoric acid containing a precipitate which readily forms a suspension)

Weigh by difference, to the nearest 0,000 2 g, $5 \pm 0,2$ g of the test sample, in such a way that there is no gain or loss of moisture.

Transfer the test portion to a flask of about 250 ml capacity, add 10 ml of the hydrochloric acid solution (4.1), cover with a clock-glass and boil for about 10 min. Cool, add about 100 ml of water and 10 ml of the hydrochloric acid solution (4.1). Transfer the solution quantitatively to a 500 ml one-mark volumetric flask, dilute to the mark and mix.

Transfer 50,0 ml of this solution to a 500 ml one-mark volumetric flask, dilute to the mark and mix (solution A).

Prepare this dilution at the time of use.

6.1.2 Non-homogeneous phosphoric acid, containing a precipitate which does not readily form a suspension

Weigh by difference, to the nearest 0,05 %, the whole of the assay sample¹⁾, in such a way that there is no gain or loss of moisture.

Transfer the sample to a polyethylene or polypropylene flask of suitable capacity, and homogenize by dilution or any other method which does not involve any loss of the constituents.

After homogenizing, weigh by difference, to the nearest 0,05 %, a test portion containing about 5 g of the original phosphoric acid, place in a 250 ml beaker and add 10 ml of the hydrochloric acid solution (4.1) cover with a clock-glass and boil for about 10 min. Cool, add about 100 ml of water and 10 ml of the hydrochloric acid solution (4.1). Transfer the solution quantitatively to a 500 ml one-mark volumetric flask, dilute to the mark and mix.

Transfer 50,0 ml of this solution to a 500 ml one-mark volumetric flask, dilute to the mark and mix (solution A).

Prepare this dilution at the time of use and filter if necessary.

NOTE – Homogenization may generally be achieved by simple dilution with water (or dilute hydrochloric acid solution), with prolonged stirring in a stoppered flask, the quantity of liquid added being weighed to the nearest 0,05 %.

When this treatment is insufficient, a more effective treatment should be carried out depending on the particular case (treatment with hot water with stirring in a stoppered flask, for example).

Finally, in the case where an insoluble deposit remains which adheres to the walls of the vessel containing the assay sample or which cannot be dispersed, it should be recovered, weighed and analysed separately.

6.2 Blank test

Carry out a blank test at the same time as the determination, following the same procedure and using the same quantities of all the reagents as used in the determination.

6.3 Determination

Depending on the expected phosphorus(V) oxide content, transfer to a 400 ml beaker the aliquot portion of solution A (6.1) shown in the following table.

Expected P ₂ O ₅ content	Aliquot part of solution A (6.1) to be taken
% (m/m)	ml
Less than 30	50
From 30 to 50	25
Greater than 50	20

Dilute to about 100 ml and add 100 ml of the citromolybdate reagent (4.2). Cover the beaker with a clock-glass and warm, inside a fume cupboard, on a hot-plate, until its contents reach 75 ± 5 °C and maintain at this temperature for about 30 s. (Do not use a flame and do not mix, either during the addition of the reagent or during the heating, so as to avoid the formation of clots.) Allow to cool to ambient temperature, stirring three or four times with a glass rod during cooling.

Heat the filter crucible (5.1) in the oven (5.2) controlled at 250 ± 10 °C, and leave for 15 min starting from the stabilization of the temperature. Allow to cool in a desiccator containing silica gel in good condition and weigh to the nearest 0,000 1 g.

Decant the liquid through the filter crucible (5.1) and wash the precipitate six times, by decantation, using about 30 ml of water each time. Transfer the precipitate quantitatively to the filter crucible (5.1) with the aid of a jet of water from a wash-bottle. Then wash the precipitate four times, removing each portion of wash water by suction.

Place the filter crucible in the oven (5.2) maintained at 250 ± 10 °C and leave for 15 min starting from the stabilization of the temperature. Allow to cool for not more than 30 min in a desiccator containing silica gel in good condition and weigh to the nearest 0,000 1 g.

7 EXPRESSION OF RESULTS

7.1 Method of calculation and formulae

The total phosphorus(V) oxide content, expressed as a percentage by mass of P₂O₅, is given by the formulae :

7.1.1 Homogeneous phosphoric acid (see 6.1.1)

$$(m_1 - m_2) \times 0,032\,07 \times \frac{500}{50} \times D \times \frac{100}{m_0} =$$

$$= \frac{32,07 \times D \times (m_1 - m_2)}{m_0}$$

7.1.2 Non-homogeneous phosphoric acid (see 6.1.2)

$$(m_1 - m_2) \times 0,032\,07 \times \frac{500}{50} \times D \times \frac{100}{m_0 \times \frac{m_4}{m_0 + m_3}} =$$

$$= \frac{32,07 \times D \times (m_1 - m_2) \times (m_0 + m_3)}{m_0 \times m_4}$$

where

m_0 is the mass, in grams, of the test portion (6.1);

m_1 is the mass, in grams, of precipitate obtained with the aliquot portion of the test solution (6.3);

¹⁾ The definition of the term "assay sample" will be given in ISO 4285, *Phosphoric acid for industrial use – Sampling technique*. (At present at the stage of draft.)

If the assay sample is not available, a test sample may be taken from the laboratory sample, which must first be thoroughly mixed so as to render it completely homogeneous. In this case, weigh, to the nearest 0,05 %, about 25 g and treat it as described for the assay sample.

m_2 is the mass, in grams, of precipitate obtained with the corresponding aliquot portion of the blank test solution (6.2);

m_3 is the total mass, in grams, of water or other reagents added for the homogenization (see 6.1.2, note);

m_4 is the mass, in grams, of homogenized assay sample taken (see 6.1.2);

D is the ratio of the volume of the test solution (solution A) (6.1) to the volume of the aliquot portion taken for the determination (6.3);

0,032 07 is the factor for conversion of quinoline phosphomolybdate to phosphorus(V) oxide.

8 TEST REPORT

The test report shall include the following particulars :

- a) the reference of the method used;
- b) the results and the method of expression used;
- c) any unusual features noted during the determination;
- d) any operation not included in this International Standard or regarded as optional.
