Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 153, *Valves*.

This second edition cancels and replaces the first edition (ISO 5210:1991), which has been technically revised with the following changes:

- a) extension of flange sizes;
- b) introduction of groups C and D for assemblies capable of transmitting torque, in [7.4](#) and [7.5](#);
- c) introduction of linear actuator in [7.6](#).

Introduction

The purpose of this document is to establish certain basic requirements for the attachment of multi-turn actuators, in order to define the interface between actuator and valve.

This document has, in general, to be considered in conjunction with the specific requirements which may be agreed between the parties concerned.

Industrial valves — Multi-turn valve actuator attachments

1 Scope

This document specifies the requirements for the attachment of multi-turn actuators to valves.

Throughout this document, “actuator” may be understood as “actuator and/or gearbox” providing a multi-turn and/or linear output.

It specifies:

- flange dimensions necessary for the attachment of actuators to industrial valves [see [Figure 1 a](#)] or to intermediate supports [see [Figure 1 b](#)];
- those driving component dimensions of actuators which are necessary to attach them to the driven components;
- reference values for torque and thrust for flanges having the dimensions specified in this document.

NOTE 1 In this document, the term “valve” may also be understood to include “valve with an intermediate support” [see [Figure 1 b](#)].

NOTE 2 When a combination of a multi-turn actuator and separate multi-turn/linear gearbox is coupled to form an actuator, the multi-turn attachment to the gearbox is in accordance with this document [see [Figures 1 c](#) and [1 d](#)]. A combination of a multi-turn actuator with integral multi-turn/linear gearbox supplied as an actuator is in accordance with [Figures 1 a](#)) and [1 b](#)).

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 273, *Fasteners — Clearance holes for bolts and screws*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1**actuator**

any device designed for attachment to a general purpose industrial valve in order to provide for the operation of the valve

Note 1 to entry: The device is designed to operate using motive energy which may be electrical, pneumatic, hydraulic, manual, etc., or a combination of these. Movement is limited by travel, torque and/or thrust.

3.2**multi-turn actuator**

actuator which transmits torque to the valve for at least one revolution and may be capable of withstanding thrust

Note 1 to entry: An actuator may be a combination of a multi-turn actuator and multi-turn gearbox.

3.3**linear actuator**

actuator which transmits thrust to the valve for a defined linear stroke

Note 1 to entry: An actuator may be a combination of a multi-turn actuator and linear gearbox.

3.4**torque**

turning moment transmitted through the mounting flanges and couplings

Note 1 to entry: Torque is expressed in newton-metres.

3.5**thrust**

axial force transmitted through the mounting flanges and couplings

Note 1 to entry: Thrust is expressed in kilonewtons.

4 Maximum torques and thrusts

The torque and thrust shall comply with the values listed in [Table 1](#) which represent the maximum torques and thrusts which can be transmitted simultaneously through the mounting flanges and couplings. They are based upon specified criteria.

Table 1 — Maximum torque and thrust values

Flange type	Torque Nm	Thrust kN
F05	20	10
F07	40	20
F10	100	40
F12	250	70
F14	400	100
F16	700	150
F25	1 200	200
F30	2 500	325
F35	5 000	700
F40	10 000	1 100
F48	20 000	2 000
F60	40 000	4 000

The values specified in [Table 1](#) have been defined on the basis of bolts in tension at a stress of 290 MPa and a coefficient of friction of 0,2 between the mounting interface. All variations in these defined parameters lead to variations of the transmittable torque and/or thrust values. See [Annex A](#) for an explanation on the calculation method.

The selection of flange size for a particular application should take account of additional torques and/or thrust that may be generated at the valve stem because of sizing, safety factors, inertia or other similar factors. Specifically, the torque and thrust generated at the maximum output torque and/or thrust of the selected actuator shall be calculated and considered in the selection of the flange along with the ability of the valve and actuator to withstand such torque and thrust forces.

5 Flange dimensions

Flanges for actuator attachment shall comply with the dimensions shown in [Figure 2](#) and given in [Table 2](#). The method of attachment shall be by means of studs or through bolting. When through bolting is used, the diameter of the clearance holes shall permit the use of bolts of a size given by the corresponding dimension d_4 in [Table 2](#).

Holes for the studs/bolts shall be positioned off-centre (see [Figure 3](#) and [Table 3](#)), shall be equi-spaced and shall conform to the requirements of ISO 273.

The interface on the valve shall have a recess corresponding to the diameter d_2 . A spigot on the actuator is optional.

The minimum values for dimension h_2 shown in [Table 2](#) apply to flanges having material of proof stress $R_e \geq 200$ MPa. The minimum values for dimension h_2 applied to flanges having materials of proof stress $R_e \leq 200$ MPa shall be agreed between manufacturer and purchaser. The minimum values for dimension h_3 shall be at least $1 \times d_4$.

Dimension d_1 has been based on providing sufficient landing for the nuts and bolt heads where applicable. Such landing is defined as a radius from the bolt hole centre with the dimension $(d_1 - d_3) / 2$, and is a minimum. The flange shape of both valve and actuator outside these areas of landing is left to the option of the manufacturer.

The dimensions and bolting material are based on bolts in tension at a maximum stress of 290 MPa. On agreement, between the manufacturer/supplier and purchaser, bolting material with different tensile strength can be used, with no dimensional changes but with potential variation of the transmittable torque and thrust value.

F25 to F40	22,5°
F48	15°
F60	9°

6 Designation

Flanges are designated by flange type according to [Table 1](#).

7 Dimensions of driving and driven components

7.1 General

The dimensions of the driving and driven components shall comply with the dimensions given in [Tables 4](#) to [8](#).

The depth of engagement of the valve-driven component into the actuator drive component and the surface area of contact between the faces of the actuator drive component and the faces of the valve-driven component, should be considered to ensure that the stresses caused by contact do not exceed the capability of the component materials. In some cases it may be necessary to use materials with superior mechanical properties and/or to reduce the output torque of the actuator.

7.2 Dimensions for assemblies capable of transmitting both torque and thrust: Group A

Dimensions for assemblies of group A shall be as shown in [Figures 4](#) and [5](#), and given in [Table 4](#).

Figure 4 — Driving component, group A

a) Example for rising stem

b) Example for rising stem with limit stop

c) Example for non-rising stem

Figure 5 — Examples for rising and non-rising stem — Driven component, group A

For rising stem dimension d_5 permits clearance for the rising and non-rotating stem and for any device to restrict the downward travel of the valve stem.

For non-rising stem dimension d_5 permits the clearance of the stem-locking and thrust-taking components of the non-rising and rotating stem.

Table 4 — Dimensions for group A drive components

F48	Ø120	Ø175	180	350
F60	Ø120	Ø180	180	400

^a The driving component is capable of accepting a diameter up to and including the values d_6 min. shown in Figure 4. Without being a requirement, the driving component may accept larger diameters up to the values of d_6 max.

7.3 Dimensions for assemblies capable of transmitting torque only: Group B

Dimensions for assemblies of group B shall be as shown in Figures 6 and 7, and given in Table 5.

Group B is divided into four sub-groups, where the diameter d of the output drive is defined as follows:

- Type B1: $d = d_7$ H9;
- Type B2: $d \leq d_7$;
- Type B3: $d = d_{10}$ H9;
- Type B4: $d \leq d_{10}$ max.

Key

F60	Ø180	Ø280	—	—	8	310

^a The driving component shall be capable of accepting a diameter up to and including the values d_{10} shown in Figure 6. Without being a requirement, the driving component may accept larger diameters up to the values of d_{10} max.

^b d_7 and d_{10} shall be manufactured within the diameter tolerance H9.

7.4 Dimensions for assemblies capable of transmitting torque only: Group C

Dimensions for assemblies of group C shall be as shown in Figure 8 and given in Table 6.

Figure 8 — Driving components, group C

^a d_8 shall be manufactured within the diameter tolerance g8. ^b b_3 shall be manufactured within the linear tolerance h9.					

7.6 Dimensions for assemblies capable of transmitting thrust only: Group Linear actuators

For linear actuators, unless otherwise agreed between the manufacturer/supplier and the purchaser, the dimensions of the attachment shall comply with those given in [Figure 10](#) and [Table 8](#).

Dimensions d_1 , d_2 , d_3 , h_1 and h_3 shall be according to [Clause 5](#). The through hole d_5 shall be chosen according to the bolt diameter d_4 corresponding to [Figure 2](#) and [Table 2](#).
