Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 5751-2 was prepared by Technical Committee ISO/TC 31, *Tyres, rims and valves*, Subcommittee SC 10, *Cycle, moped, motorcycle tyres and rims*.

This sixth edition cancels and replaces the fifth edition (ISO 5751-2:2004), which has been technically revised.

ISO 5751 consists of the following parts, under the general title *Motorcycle tyres and rims (metric series)*:

- *Part 1: Design guides*
- *Part 2: Tyre dimensions and load-carrying capacities*
- *Part 3: Range of approved rim contours*

Motorcycle tyres and rims (metric series) —

Part 2:

Tyre dimensions and load-carrying capacities

1 Scope

This part of ISO 5751 specifies the tyre size designation, dimensions and load-carrying capacities of metric series motorcycle tyres. It is applicable to such tyres with a height-to-width ratio of 100 % and below.

NOTE See ISO 4249 for motorcycle tyres and rims (code-designated series) of rim diameter codes 13 and above, and ISO 6054 for those of codes 12 and below.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 4223-1, *Definitions of some terms used in the tyre industry — Part 1: Pneumatic tyres*

ISO 5751-1, *Motorcycle tyres and rims (metric series) — Part 1: Design guides*

ISO 5751-3, *Motorcycle tyres and rims (metric series) — Part 3: Range of approved rim contours*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 4223-1 apply.

4 Tyre designation

4.1 General

The tyre designation shall be as specified in ISO 5751-1, completed by the addition of the service description, i.e. load index and speed symbol.

4.2 Tyre construction code

The tables in this part of ISO 5751 show, as examples, tyre size designations for tyres in diagonal construction. However, a motorcycle tyre having, for example, a

- nominal section width of 100 mm,
- nominal aspect ratio of 90,
- nominal rim diameter code of 18 M/C,

- load-carrying capacity of 224 kg (corresponding to load index 56), and
 - reference speed of 150 km/h (corresponding to speed symbol “P”),
- shall be marked, depending on its construction characteristics, as follows.

Diagonal-ply construction:	100/90 – 18M/C 56 P
Bias-belted construction:	100/90 B 18M/C 56 P
Radial-ply construction:	100/90 R 18M/C 56 P

NOTE For tyres suitable for speeds greater than 240 km/h, see ISO 5751-1.

4.3 Other markings

For tyres having a nominal rim diameter code of 16 M/C or higher, the suffix M/C is not required if the tyre was manufactured before May 2003.

Extra-load version tyres shall be additionally marked either “Extra Load” or “REINF” (for *reinforced*).

5 Tyre dimensions

5.1 General

Tables 1 to 14 present the

- a) tyre size designation,
- b) measuring rim width code,
- c) design tyre dimensions, i.e. section width and overall diameter, and
- d) maximum tyre dimensions in service, i.e. overall width and diameter for the various types of tread configuration (see Clause 6) to be considered by vehicle manufacturers in designing for tyre clearances.

NOTE The maximum dimensions in service do not include the values of the centrifugal radius (see ISO 5751-1).

5.2 Measuring procedure

Mount the tyre on a chosen rim according to ISO 5751-3, approved for the respective tyre size and ready for fitting. Inflate as follows.

- a) For normal-load version tyres:
 - 225 kPa for speed symbols “S” and lower;
 - 280 kPa for speed symbols “T” and higher.
- b) For extra-load version tyres:
 - 280 kPa for speed symbols “P” and lower;
 - 330 kPa for speed symbols “Q” and higher.
- c) For light-load version tyres: 175 kPa.

Allow the tyre to stand for 24 h at normal room temperature, then readjust the inflation pressures to those specified in a), b) and c), before performing the measurements.

When measuring on rims having a rim width code that differs from that of the measuring rim width code given in the tables of this part of ISO 5751, the section-width and overall-width values of the tyre used for comparison with the data given in Tables 1 to 14 shall be adjusted as follows:

$$W = W_m + 0,4 (R - R_m)$$

where

W_m is the value measured;

R_m is the width, expressed in millimetres, of the rim used for the measurements;

R is the width, expressed in millimetres, of the measuring rim width code given in the tables.

6 Tread configurations

ISO 5751-1:—, Figure 1, shows various tread configurations. The following attributions of tread-type configurations to the type of service are to be considered as examples only. The choice of a given tread-type configuration for a given tyre is at the discretion of the tyre manufacturer alone.

- Tread type A is commonly adopted for highway-service low-speed tyres;
- tread type B is commonly adopted for highway-service high-speed tyres;
- tread type C is commonly adopted for tyres used in both on- and off-road service;
- tread type D is commonly adopted for tyres exclusively in off-road service.

7 Load ratings

7.1 General

Tables 15 to 29 show the standardized maximum tyre load-carrying capacity for each given tyre size designation.

7.2 Load capacity at reduced speeds

Subject to acceptance by the tyre manufacturer and taking into account the conditions of use of the motorcycle, the load capacities corresponding to the load indices indicated in Tables 15 to 29 may be modified by the percentages given in Table 30. This modification is possible when the maximum speed of motorcycle is different from the one associated with the speed symbol.

7.3 Load capacity at speeds higher than 210 km/h

For the load-carrying capacities of tyres marked with speed symbols “V” or “W” operating at speeds higher than 210 km/h, see ISO 5751-1.

8 Inflation pressures

The following inflation pressures are given as guidelines only. Inflation pressures used in practice are subject to agreement between the tyre and vehicle manufacturers and should take into account not only the load, but also the tyre construction, road holding, maximum speed, location of the tyre, operating conditions and mechanical characteristics of the vehicle.

The maximum load-carrying capacity corresponds to the following inflation pressures.

a) For nominal rim diameter codes up to and including 12 (for series 80 and above):

- 1) light-load version: 175 kPa
- 2) normal-load version: 250 kPa
- 3) extra-load version: 300 kPa

b) For nominal rim diameter codes 13 and above (for series 70 and below, and also for nominal rim diameter codes 12 and below):

- 1) light-load version: 175 kPa
- 2) normal-load version:
 - for tyres marked with a speed symbol up to and including "P" 225 kPa
 - for tyres marked with a speed symbol "Q", "R" or "S" 250 kPa
 - for tyres marked with a speed symbol "T", "U" or "H" 280 kPa
 - for tyres marked with a speed symbol "V" or "W" 290 kPa
- 3) extra-load version: increase the inflation pressure for the normal-load version by 50 kPa.

Table 29 — Maximum tyre load ratings — 30 series tyres

Tyre size designation ^a	Load index	Maximum load capacity ^b kg
330/30 – 17 M/C	87	545
360/30 – 18 M/C	92	630
^a The full designation shall be as given in Clause 4.		
^b See Clause 7. Normal-load version.		

Table 30 — Variation of maximum load capacities of tyres according to maximum speed of motorcycle (see 7.2)

Maximum speed (km/h)	Maximum load variation (%) at various maximum speeds for tyres with speed symbol:					
	J	K	L	M	N	P and above
50	+30	+30	+30			
60	+23	+23	+23			
70	+16	+16	+16			
80	+10	+10	+10			+14
90	+5	+5	+7,5			+12
100	[0]	0	+5			+10
110	N/A	[0]	+2,5			+8
120	N/A	N/A	[0]	0	0	+6
130	N/A	N/A	N/A	[0]	0	+4
140	N/A	N/A	N/A	N/A	[0]	0
Square brackets identify the maximum speed for the speed symbol.						
N/A Not applicable.						

Annex A (informative)

Harmonized load indices

The following load indices (Tables A.1 to A.12) are given for reference purposes and refer to standard load tyres. They conform to the load indices given in Tables 15 to 29.

The reference pressure is 225 kPa, except for 80 series and above tyres with rim diameter codes 12 and below for which the reference pressure is 250 kPa.

Table A.1 — Harmonized load indices — 30 series tyres

Nominal section width S_N	Nominal rim diameter code				
	16 M/C	17 M/C	18 M/C	19 M/C	21 M/C
330		87			
360			92		

Table A.2 — Harmonized load indices — 35 series tyres

Nominal section width S_N	Nominal rim diameter code				
	16 M/C	17 M/C	18 M/C	19 M/C	21 M/C
260					83
280			84		
300			87		

Table A.3 — Harmonized load indices — 40 series tyres

Nominal section width S_N	Nominal rim diameter code					
	16 M/C	17 M/C	18 M/C	19 M/C	20 M/C	21 M/C
210			73			
240			79			
250			81			
260			84			
280					89	
300		90
