Sintered metal materials — Specifications

Matériaux métalliques frittés — Spécifications

Reference number
ISO 5755:1996(E)

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 5755 was prepared by Technical Committee ISO/TC 119, *Powder metallurgy*, Subcommittee SC 5, *Specifications for powder metallurgical materials (excluding hardmetals)*.

This first edition of ISO 5755 cancels and replaces ISO 5755-1:1987, ISO 5755-2:1987 and ISO 5755-3:1987, which have been technically revised.

Sintered metal materials — Specifications

1 Scope

This International Standard specifies the requirements for the chemical composition and the mechanical and physical properties of sintered metal materials used for bearings and structural parts.

When selecting powder metallurgical materials, it should be taken into account that the properties depend not only on the chemical composition and density, but also on the production methods. The properties of sintered materials giving satisfactory service in particular applications may not necessarily be the same as those of wrought or cast materials that might otherwise be used. Therefore, liaison with prospective suppliers is recommended.

2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this International Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 2738:—¹⁾, *Permeable sintered metal materials — Determination of density, oil content and open porosity.*

ISO 2739:1973, *Sintered metal bushes — Determination of radial crushing strength.*

ISO 2740:—²⁾, *Sintered metal materials, excluding hardmetals — Tensile test pieces.*

ISO 2795:1991, *Plain bearings — Sintered bushes — Dimensions and tolerances.*

ISO 4498-1:1990, *Sintered metal materials, excluding hardmetals — Determination of apparent hardness — Part 1: Materials of essentially uniform section hardness.*

ISO 6892:—³⁾, *Metallic materials — Tensile testing at ambient temperature.*

1) To be published. (Revision of ISO 2738:1987)

2) To be published. (Revision of ISO 2740:1986)

3) To be published. (Revision of ISO 6892:1984)

3 Sampling

Sampling shall be carried out in accordance with the relevant International Standards.

4 Test methods

The following test methods shall be used to determine the normative properties given in tables 1 to 9.

4.1 Chemical analysis

Whenever possible, and always in the case of dispute, the methods of chemical analysis shall be those specified in the relevant International Standards. If no International Standard is available, the method may be agreed upon and specified at the time of enquiry and order.

4.2 Open porosity

The open porosity shall be determined in accordance with ISO 2738.

4.3 Liquid-lubricant content

The liquid-lubricant content shall be determined in accordance with ISO 2738.

4.4 Ultimate tensile strength

The ultimate tensile strength shall be determined in accordance with ISO 2740 and ISO 6892.

4.5 Apparent hardness

The apparent hardness shall be determined in accordance with ISO 4498.

4.6 Mechanical properties

4.6.1 General

The values given in tables 1 to 9 shall be determined on pressed and sintered test pieces at mean chemical composition and are intended as a guide to initial selection of materials (see also clause 1). They may also be used as a basis for specifying any special tests which may be indicated on the drawing.

The mechanical properties shall neither be calculated from hardness values, nor be determined on tensile test pieces taken from a component, and used for verifying the values given in tables 1 to 9. If the customer requires that a specified level of mechanical properties shall be obtained by tests on the component, these shall be agreed with the supplier and shall be stated on the drawing and/or any specified technical documentation of the customer referred to on the drawing.

4.6.2 Tensile properties

The normative values for tensile strength shall be determined in accordance with ISO 6892, using pressed and sintered test pieces, or in the case of heat treated materials, machined test pieces, made in accordance with ISO 2740.

4.6.3 Apparent hardness

The normative values for apparent hardness (Vickers and Rockwell) shall be determined in accordance with ISO 4498-1.

If hardness values are specified in an agreed acceptance test (see 4.6.1), the hardness requirements shall be stated on the drawing of the component, together with the surface or surfaces to be subjected to the test.

4.6.4 Radial crushing strength

The radial crushing strength shall be determined in accordance with ISO 2739. The wall thicknesses of test pieces to be used shall be in the range covered by ISO 2795. For test pieces with wall thicknesses outside this range, the specified radial crushing strength values are different and shall be agreed between customer and supplier.

5 Specifications

The chemical composition and mechanical properties are given in tables 1 to 9.

The liquid-lubricant content of materials for bearings, impregnated with liquid lubricant, shall be not less than 90 % of the measured open porosity.

For the purpose of specifying a material, the grade designation shall consist of six characters, the sixth (printed in the tables as a dash) being N or Z. N shall be used when the material has received no after-treatment and Z shall be used to indicate an after-treatment such as heat treatment, phosphating or steam treatment.

n.m. = not measurable												
NOTE — These materials may be supplied with additives to increase machinability, the properties given remain unchanged.												
1) Grades 1022 and 1023 and 2022 and 2023 have the same chemical composition and the same density as grades 1012Z and 1013Z and 2012Z and 2013Z, respectively, in table 1.												
2) The hardness values are obtainable from materials that have undergone a suitable hardening process. The values of all other properties with the exception of density and copper content will not then apply.
