Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 17, *Steel*, Subcommittee SC 10, *Steel for pressure purposes*.

This third edition cancels and replaces the second edition (ISO 9328-7:2011), which has been technically revised. The following changes have been made:

- the term “product thickness” has been replaced with “nominal thickness”;
- new steel grades X1CrNiSI18-5-4, X2CrCuNbTiV22-1, X2CrNiMoN21-9-1, X2CrMnNiN21-5-1 and X2CrNiMnMoCuN24-4-3-2 and all their technical data have been added;
- the technical data in [Table 5](#) have been revised;
- the technical data in [Table 9](#) have been aligned with EN 10028-7.

A list of all the parts in the ISO 9328 series can be found on the ISO website.

Introduction

The International Organization for Standardization (ISO) draws attention to the fact that it is claimed that compliance with this document may involve the use of patents concerning eight steel grades.

ISO takes no position concerning the evidence, validity and scope of this patent right. The holder of this patent right has assured ISO that he/she is willing to negotiate licences under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statement of the holder of this patent right is registered with ISO. Information may be obtained from the following sources.

For steel grades 1.4162 (but also consider footnote ^c in [Table 4](#)) and 1.4662 from:

Outokumpu Stainless AB

SE-77480 AVESTA, Sweden

For steel grades 1.4420 and 1.4622 from:

Outokumpu Oyj

FI-02200 Espoo, Finland

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights other than those identified above. ISO shall not be held responsible for identifying any or all such patent rights.

Steel flat products for pressure purposes — Technical delivery conditions —

Part 7: Stainless steels

1 Scope

This document specifies requirements for flat products for pressure purposes made of stainless steels, including austenitic creep-resisting steels, in thicknesses as specified in [Tables 7 to 10](#).

The requirements and definitions of ISO 9328-1 also apply to this document.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 3651-2, *Determination of resistance to intergranular corrosion of stainless steels — Part 2: Ferritic, austenitic and ferritic-austenitic (duplex) stainless steels — Corrosion test in media containing sulfuric acid*

ISO 9328-1:2018, *Steel flat products for pressure purposes — Technical delivery conditions — Part 1: General requirements*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 9328-1 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <https://www.iso.org/obp>

3.1

cryogenic temperature

temperature lower than $-75\text{ }^{\circ}\text{C}$ used in the liquefaction of gases

4 Classification and designation

Shall be in accordance with ISO 9328-1.

NOTE 1 Information on the designation of comparable steel grades in national or regional standards is given in [Annex A](#).

NOTE 2 Information on numbering of steel grades is in accordance with ISO 15510.

5 Information to be supplied by the purchaser

5.1 Mandatory information

Shall be in accordance with ISO 9328-1.

5.2 Options

The relevant options of ISO 9328-1 apply.

5.3 Example for ordering

An order of 10 plates made of a steel grade with the name X5CrNi18-10 as specified in this document with nominal dimensions thickness = 8 mm, width = 2 000 mm, length = 5 000 mm and tolerances on dimensions, shape and mass as specified in ISO 18286, with “normal” flatness tolerance in process route 1D (see [Table 6](#)), and with inspection certificate 3.1 as specified in ISO 10474 is designated as follows:

10 plates ISO 18286 – 8 × 2 000 × 5 000 N – Steel ISO 9328-7 – X5 CrNi18-10 + 1D – Inspection certificate 3.1

6 Requirements

6.1 Steelmaking process

Shall be in accordance with ISO 9328-1.

6.2 Delivery condition

The products shall be supplied in the delivery condition specified in the order by reference to the process route given in [Table 6](#) and, where alternatives exist, to the treatment conditions given in [Tables 7](#) to [10](#). Guidelines for further treatment, including heat treatment, are given in [Annex B](#).

6.3 Chemical composition and chemical corrosion properties

6.3.1 The chemical composition requirements given in [Tables 1](#) to [4](#) apply in respect of the chemical composition according to the cast analysis.

6.3.2 The product analysis may deviate from the limiting values for the cast analysis given in [Tables 1](#) to [4](#) by the values listed in [Table 5](#).

6.3.3 Referring to resistance to intergranular corrosion as defined in ISO 3651-2, for ferritic, austenitic and austenitic-ferritic steels, the specifications in [Tables 7](#), [9](#) and [10](#) apply.

NOTE 1 ISO 3651-2 is not applicable for testing martensitic steels.

NOTE 2 The corrosion resistance of stainless steels is very dependent on the type of environment and can therefore not always be clearly ascertained through laboratory tests. It is therefore advisable to draw on the available experience of the use of the steels.

6.4 Mechanical properties

6.4.1 The tensile properties at room temperature and the impact energy at room temperature and at low temperature, as specified in [Tables 7](#) to [10](#), apply for the relevant specified heat treatment condition.

NOTE Austenitic steels are insensitive to brittle fracture in the solution annealed condition. Because they do not have a pronounced transition temperature, which is characteristic of other steels, they are also useful for application at cryogenic temperatures.

6.4.2 The values in [Tables 11](#) to [14](#) apply for the 0,2 % and 1,0 % proof strength at elevated temperatures. Additionally, the values in [Table 15](#) apply for the tensile strength at elevated temperatures of austenitic steels.

Tensile strength values at elevated temperatures for austenitic-ferritic steels are given for guidance in [Annex D](#).

6.4.3 [Annex E](#) provides for the purchaser mean values as preliminary data on the strength for 1 % (plastic) creep strain and creep rupture. These data apply for the solution annealed condition only.

6.4.4 In [Annex F](#), preliminary data on mechanical properties at low temperatures of austenitic steels are listed.

6.5 Surface condition

Shall be in accordance with ISO 9328-1 and [Table 6](#).

6.6 Internal soundness

Shall be in accordance with ISO 9328-1.

6.7 Post-weld heat treatment

Guidelines for the purchaser on post-weld heat treatment are given in [Annex C](#).

6.8 Dimensions and tolerances

Shall be in accordance with ISO 9328-1.

6.9 Calculation of mass

For density of steels, see [Annex G](#).

6.10 Physical properties

Reference data on some physical properties are given in [Annex G](#).

7 Inspection

7.1 Types of inspection and inspection documents

Shall be in accordance with ISO 9328-1.

7.2 Tests to be carried out

Shall be in accordance with [Table 16](#) and ISO 9328-1.

7.3 Re-tests

Shall be in accordance with ISO 9328-1.

8 Sampling

8.1 Frequency of testing

Shall be in accordance with [Table 16](#) and ISO 9328-1.

8.2 Selection and preparation of samples and test pieces

Shall be in accordance with ISO 9328-1.

9 Test methods

Shall be in accordance with ISO 9328-1.

10 Marking

Shall be in accordance with ISO 9328-1.

X2CrTi17	0,025	0,50	0,50	0,040	0,015	0,015	16,0 to 18,0	—	—	—	0,30 to 0,60
X3CrTi17	0,05	1,00	1,00	0,040	0,015	—	16,0 to 18,0	—	—	—	[4 × (C + N) + 0,15] to 0,80 ^c
X2CrMoTi17-1	0,025	1,00	1,00	0,040	0,015	0,030	16,0 to 18,0	0,80 to 1,40	—	—	0,30 to 0,60
X2CrMoTi18-2	0,025	1,00	1,00	0,040	0,015	0,030	17,0 to 20,0	1,80 to 2,50	—	—	[4 × (C + N) + 0,15] to 0,80 ^c
X6CrMoNb17-1	0,08	1,00	1,00	0,040	0,015	0,040	16,0 to 18,0	0,80 to 1,40	[7 × (C + N) + 0,10] to 1,00	—	—
X2CrTiNb18	0,030	1,00	1,00	0,040	0,015	—	17,5 to 18,5	—	[3 × C + 0,30] to 1,00	—	0,10 to 0,60
X2CrCuNbTiV22-1 _{d,e}	0,030	1,00	0,80	0,040	0,015	0,030	20,0 to 24,0	—	0,10 to 0,70	—	0,10 to 0,70

^a Elements not listed in this table may not be intentionally added to the steel without agreement of the purchaser, except for finishing of the cast. All appropriate precautions are to be taken to avoid the addition of such elements from scrap and other materials used in production, which would impair mechanical properties and the suitability of the steel.

^b Information concerning ISO steel numbers and designations according to other regional or national standards is given in [Annex A](#).

^c The stabilization may be made by use of titanium and/or niobium and/or zirconium. According to the atomic number of these elements and the content of carbon and nitrogen, the equivalence shall, if additional stabilizing with niobium or zirconium is used, be the following:

$$\text{Nb} = \text{Zr} = \frac{7}{4} \text{Ti}.$$

^d Patented steel.

^e Other elements: V: 0,03 to 0,50 %; Cu: 0,30 to 0,80 %; Ti + Nb: 8x(C+N) to 0,80 %.

Table 2 — Chemical composition (cast analysis)^a of martensitic steels

^a Elements not listed in this table may not be intentionally added to the steel without the agreement of the purchaser, except for finishing of the cast. All appropriate precautions are to be taken to avoid the addition of such elements from scrap and other materials used in production, which would impair mechanical properties and the suitability of the steel.

^b Information concerning ISO steel numbers and designations according to other regional or national standards is given in [Annex A](#).

^c Patented steel.

^d Steel grade 1.4162 is patented steel up to a max. limit of Ni of 1,70 %.

^e This steel grade is patented steel up to a max. limit of Ni of 1,70 %.

Table 5 — Permissible product analysis tolerances on the limiting values given in Tables 1 to 4 for the cast analysis

Element	Specified value in the cast analysis in Tables 1 to 4 % by mass	Permissible deviation ^a of the product analysis % by mass
C	≤ 0,030	+0,005
	> 0,030 to ≤ 0,10	±0,01
Si	≤ 1,00	+0,05
	> 1,00 to ≤ 3,00	±0,10
	> 3,00 to ≤ 4,50	±0,15
Mn	≤ 1,00	+0,03
	> 1,00 to ≤ 2,50	+0,04
P	≤ 0,045	+0,005
	> 0,045 to ≤ 0,070	+0,010
S	≤ 0,015	+0,003
N	≤ 0,35	±0,01
Al	≤ 0,65	±0,10
Cr	≥ 10,5 to < 15,0	±0,15
	≥ 15,0 to ≤ 20,0	±0,20
	> 20,0 to ≤ 28,0	±0,25
Cu	≤ 1,00	±0,07
	> 1,00 to ≤ 2,50	±0,10
Mo	≤ 0,60	±0,03
	> 0,60 to ≤ 1,75	±0,05
	≥ 1,75 to < 7,0	±0,10
Nb	≤ 1,00	±0,05
Ni	≤ 1,00	±0,03
	> 1,00 to ≤ 5,0	±0,07
	> 5,0 to ≤ 10,0	±0,10
	> 10,0 to ≤ 20,0	±0,15
	> 20,0 to ≤ 34,0	±0,20
B	≥ 0,001 5 to ≤ 0,005 0	±0,000 3
Co	≤ 0,50	±0,05
Ti	≤ 0,08	±0,05
W	≤ 1,00	±0,05

^a If several product analyses are carried out on one cast, and the contents of an individual element determined lie outside the permissible range of the chemical composition specified for the cast analysis, then it is only allowed to exceed the permissible maximum value or to fall short of the permissible minimum value, but not both for one cast.

Table 6 — Type of process route of sheet, plate and strip^a

	Abbreviation ^b	Type of treatment	Surface finish	Notes
Hot rolled	1C	Hot rolled, heat treated, not descaled	Covered with the rolling scale	Suitable for parts which will be descaled or machined in subsequent production or for certain heat-resisting applications.
	1E	Hot rolled, heat treated, mechanically descaled	Free of scale	The type of mechanical descaling, e.g. coarse grinding or shot blasting, depends on the steel grade and the product, and is left to the manufacturer's discretion, unless otherwise agreed.
	1D	Hot rolled, heat treated, pickled	Free of scale	Usually standard for most steel types to ensure good corrosion resistance; also common finish for further processing. It is permissible for grinding marks to be present. Not as smooth as 2D or 2B.
Cold rolled	2C	Cold rolled, heat treated, not descaled	Smooth with scale from heat treatment	Suitable for parts which will be descaled or machined in subsequent production or for certain heat-resisting applications.
	2E	Cold rolled, heat treated, mechanically descaled	Rough and dull	Usually applied to steels with a scale which is very resistant to pickling solutions. May be followed by pickling.
	2D	Cold rolled, heat treated, pickled	Smooth	Finish for good ductility, but not as smooth as 2B or 2R.
	2B	Cold rolled, heat treated, pickled, skin passed	Smoother than 2D	Most common finish for most steel types to ensure good corrosion resistance, smoothness and flatness. Also a common finish for further processing. Skin passing may be by tension levelling.
	2R	Cold rolled, bright annealed ^c	Smooth, bright, reflective	Smoother and brighter than 2B. Also a common finish for further processing.
Special finishes	1G or 2G	Ground ^d	See footnote ^e .	Grade of grit or surface roughness can be specified. Unidirectional texture, not very reflective.
	1J or 2J	Brushed ^d or dull polished ^d	Smoother than ground. See footnote ^e .	Grade of brush or surface roughness can be specified. Unidirectional texture, not very reflective.

^a Not all process routes and surface finishes are available for all steels.

^b First digit: 1 = hot rolled, 2 = cold rolled.

^c May be skin passed.

^d One surface only, unless otherwise agreed at the time of enquiry and order.

^e Within each finish description, the surface characteristics can vary, and more specific requirements may need to be agreed between the manufacturer and purchaser (e.g. grade of grit or surface roughness).

Table 6 (continued)

	Abbreviation ^b	Type of treatment	Surface finish	Notes
Special finishes	1K or 2K	Satin polished ^d	See footnote ^e .	Additional specific requirements to a "J" type finish, in order to achieve adequate corrosion resistance for marine and external architectural applications. Transverse $R_a < 0,5 \mu\text{m}$ with clean cut surface finish.
	1P or 2P	Bright polished ^d	See footnote ^e .	Mechanical polishing. Process or surface roughness can be specified. Non-directional finish, reflective with high degree of image clarity.
	2F	Cold rolled, heat treated, skin passed on roughened rolls	Uniform non-reflective matt surface	Heat treatment by bright annealing or by annealing and pickling.
^a Not all process routes and surface finishes are available for all steels. ^b First digit: 1 = hot rolled, 2 = cold rolled. ^c May be skin passed. ^d One surface only, unless otherwise agreed at the time of enquiry and order. ^e Within each finish description, the surface characteristics can vary, and more specific requirements may need to be agreed between the manufacturer and purchaser (e.g. grade of grit or surface roughness).				

Table 7 — Mechanical properties at room temperature for ferritic steels in the annealed condition (see Table B.1) and resistance to intergranular corrosion

Steel grade	Product form ^a	Thickness mm max.	0,2 % proof strength $R_{p0,2}$		Tensile strength R_m MPa	Elongation after fracture		Resistance to intergranular corrosion ^d		Impact energy (ISO-V) KV_2 J min. (tr.)

a The solution treatment may be omitted if the conditions for hot working and subsequent cooling are such that the requirements for the mechanical properties of the product and the resistance to intergranular corrosion as defined in ISO 3651-2 are obtained.

b C = cold-rolled strip; H = hot-rolled strip; P = hot-rolled plate.

c If, in the case of strip in rolling widths < 300 mm, longitudinal test pieces are taken, the minimum values are reduced as follows:

- proof strength: minus 15 MPa;
- elongation for constant gauge length: minus 5 %;
- elongation for proportional gauge length: minus 2 %.

d The values are related to test pieces with a gauge length of 80 mm and a width of 20 mm; test pieces with a gauge length of 50 mm and a width of 12,5 mm may also be used.

e The values are related to test pieces with a gauge length of $5,65\sqrt{S_0}$.

f When tested in accordance with ISO 3651-2.

g For stretcher-levelled material, the minimum value is 5 % lower.

h Normally for thicknesses up to 6 mm.

i Resistance to intergranular corrosion is given for thicknesses up to 6 mm in the welded condition.

j +RA = recrystallizing annealed condition.

Table 10 — Tensile properties at room temperature and impact energy at 20 °C and at –40 °C of austenitic-ferritic steels in the solution annealed condition (see Table B.4) and resistance to intergranular corrosion

Table 16 — Tests to be carried out, test units and extent of testing

Test	Test status ^a	Test unit	Product form		Number of test pieces per test sample
			Strip and sheet cut from strip in rolling width (C,H)	Rolled plate (P)	
Chemical analysis	m	Cast	Cast analysis ^b		
Tensile test at room temperature	m	Cast, thickness ±10 %, heat treatment batch	1 test sample from each coil	a) Plates ≤ 20 mm (≤ 15 mm) ^c thickness: Plates processed under identical conditions may be collected in a batch comprising not more than 20 plates. One test sample per batch shall be taken from heat-treated plates up to 15 m in length. One test sample shall be taken from each end of the longest plate in the batch where heat-treated plates are longer than 15 m. However, see ISO 9328-1:2018, Table 2, footnote a. b) Plates >20 mm (>15 mm) ^c thickness: Each single plate; one test sample shall be taken from heat-treated plates up to 15 m long and one sample shall be taken from each end of heat-treated plates longer than 15 m. However, see ISO 9328-1:2018, Table 2, footnote a.	1
Tensile test at elevated temperature ^d	o		To be agreed at the time of enquiry and order.		1
Impact test at room temperature	m ^e		To be agreed at the time of enquiry and order.		3
Impact test at low temperature	o		To be agreed at the time of enquiry and order.		3
Resistance to intergranular corrosion	o		To be agreed at the time of enquiry and order.		1
Other tests	o	See ISO 9328-1.			

^a Tests marked with an “m” (mandatory) shall be carried out as acceptance tests. In all cases, those marked with an “o” (optional) shall be carried out as acceptance tests only if agreed at the time of enquiry and order.

^b A product analysis may be agreed at the time of enquiry and order; the extent of testing shall be specified at the same time.

^c Limit value for martensitic, ferritic and austenitic-ferritic steels.

^d See ISO 9328-1:2018, 9.3.

^e For ferritic, martensitic and austenitic-ferritic grades > 6 mm thickness, and for austenitic grades for cryogenic service > 20 mm thickness; optional for austenitic grades for other applications (see ISO 9328-1:2018, Table 1).

Annex B (informative)

Guidelines for further treatment (including heat treatment) in fabrication

B.1 The guidelines given in [Tables B.1](#) to [B.4](#) are intended for hot forming and heat treatment.

B.2 Thermal cutting may adversely affect edge areas; they should be machined.

B.3 Scale and annealing colours produced during hot forming, heat treatment or welding may adversely affect the corrosion resistance. They should be removed as far as possible before use, e.g. by pickling or grinding.

B.4 For further information, see appropriate documents, e.g. EN 1011-3.

Table B.1 — Guidelines on the temperature for hot forming and heat treatment^a of ferritic stainless steels

Steel grade	Hot forming		Heat treatment symbol ^b	Annealing	
	Temperature °C	Type of cooling		Temperature ^c °C	Type of cooling
X2CrNi12	1 100 to 800	air	+A	700 to 750	air, water
X6CrNiTi12				790 to 850	
X2CrTi17				820 to 880	
X3CrTi17				770 to 830	
X2CrMoTi17-1				790 to 850	
X2CrMoTi18-2				820 to 880	
X6CrMoNb17-1				800 to 860	
X2CrTiNb18				870 to 930	
X2CrCuNbTiV22-1				870 to 930	

^a The temperatures of annealing should be agreed for simulated heat-treated test pieces.

^b +A = annealed.

^c If heat treatment is carried out in a continuous furnace, the upper part of the range specified is usually preferred, or even exceeded.

Table B.2 — Guidelines on the temperature for hot forming and heat treatment^a of martensitic stainless steels

Steel grade	Hot forming		Heat treatment symbol ^b	Quenching		Tempering Temperature °C
	Temperature °C	Type of cooling		Temperature °C	Type of cooling	
X3CrNiMo13-4	1 150 to 900	air	+QT	950 to 1 050	oil, air, water	560 to 640
X4CrNiMo16-5-1			+QT	900 to 1 000		570 to 650

^a The temperatures of quenching and tempering should be agreed for simulated heat-treated test pieces.

^b +QT = Quenched and tempered.

^c If heat treatment is carried out in a continuous furnace, the upper part of the range specified is usually preferred, or even exceeded.

Table B.3 — Guidelines on the temperature for hot forming and heat treatment^a of austenitic stainless steels

Steel grade	Hot forming		Heat treatment ^b symbol	Solution annealing ^c (but see footnote g)	
	Temperature °C	Type of cooling		Temperature ^{d,e} °C	Type of cooling
Austenitic corrosion-resisting grades					
X2CrNiN18-7	1 150 to 850	air	+AT	1 020 to 1 100	
X2CrNi18-9				1 000 to 1 100	
X2CrNi19-11				1 000 to 1 100	
X5CrNiN19-9				1 000 to 1 100	
X2CrNiN18-10				1 000 to 1 100	
X5CrNi18-10				1 000 to 1 100	
X6CrNiTi18-10				1 000 to 1 100	
X6CrNiNb18-10				1 020 to 1 120	
X1CrNi25-21				1 030 to 1 110	
X2CrNiMo17-12-2				1 030 to 1 110	
X2CrNiMoN17-11-2				1 030 to 1 110	
X1CrNiMoN25-22-2				1 070 to 1 150	
X5CrNiMo17-12-2				1 030 to 1 110	
X6CrNiMoTi17-12-2				1 030 to 1 110	
X6CrNiMoNb17-12-2				1 030 to 1 110	

^a The temperatures of annealing should be agreed for simulated heat-treated test pieces.

^b +AT = solution annealed, +RA = recrystallizing annealed.

^c The solution treatment may be omitted if the conditions for hot working and subsequent cooling are such that the requirements for mechanical properties of the product and the resistance to intergranular corrosion, as defined in ISO 3651-2, are obtained and provided these requirements are met, even after appropriate subsequent solution annealing.

^d If heat treatment is carried out in a continuous furnace, the upper part of the range specified is usually preferred, or even exceeded.

^e The lower end of the range specified for solution annealing should be aimed at for heat treatment as part of further processing, because otherwise the mechanical properties might be affected. If the temperature of hot forming does not drop below the lower temperature for solution annealing, a temperature of 980 °C is adequate as a lower limit for Mo-free steels, a temperature of 1 000 °C for steels with Mo contents up to 3 % and a temperature of 1 020 °C for steels with Mo contents exceeding 3 %.

^f Cooling is sufficiently rapid.

^g Recrystallizing annealing.

^h After solution annealing, the grain size in accordance with ISO 643 shall be 1 to 5.

Table B.3 (continued)

Steel grade	Hot forming		Heat treatment ^b symbol	Solution annealing ^c (but see footnote g)	
	Temperature °C	Type of cooling		Temperature ^{d,e} °C	Type of cooling

X8NiCrAlTi32-21			+AT	1 100 to 1 200 ^h	
X8CrNiNb16-13				1 050 to 1 110	
^a The temperatures of annealing should be agreed for simulated heat-treated test pieces. ^b +AT = solution annealed, +RA = recrystallizing annealed. ^c The solution treatment may be omitted if the conditions for hot working and subsequent cooling are such that the requirements for mechanical properties of the product and the resistance to intergranular corrosion, as defined in ISO 3651-2, are obtained and provided these requirements are met, even after appropriate subsequent solution annealing. ^d If heat treatment is carried out in a continuous furnace, the upper part of the range specified is usually preferred, or even exceeded. ^e The lower end of the range specified for solution annealing should be aimed at for heat treatment as part of further processing, because otherwise the mechanical properties might be affected. If the temperature of hot forming does not drop below the lower temperature for solution annealing, a temperature of 980 °C is adequate as a lower limit for Mo-free steels, a temperature of 1 000 °C for steels with Mo contents up to 3 % and a temperature of 1 020 °C for steels with Mo contents exceeding 3 %. ^f Cooling is sufficiently rapid. ^g Recrystallizing annealing. ^h After solution annealing, the grain size in accordance with ISO 643 shall be 1 to 5.					

Table B.4 — Guidelines on the temperature for hot forming and heat treatment^a of austenitic-ferritic steels

Steel grade	Hot forming		Heat treatment	Solution annealing ^c	
	Temperature °C	Type of cooling	Symbol ^b	Temperature ^d °C	Type of cooling
Standard grades					
X2CrNiN23-4	1 150 to 950	air	+AT	1 000 ± 50	water, air
X2CrNiMoN22-5-3				1 060 ± 40	
X2CrNiN22-2	1 100 to 950			1 040 ± 60	
X2CrMnNiN21-5-1	1 100 to 900			1 050 ± 30	
X2CrNiMnMoCuN24-4-3-2	1 150 to 900			1 060 ± 60	
Special grades					
X2CrNiMoCuN25-6-3	1 150 to 1 000	air	+AT	1 080 ± 40	water, air
X2CrNiMoN25-7-4					
X2CrNiMoCuWN25-7-4					
^a The temperatures of annealing should be agreed for simulated heat-treated test pieces. ^b +AT = solution annealed. ^c Solution annealing in the range specified, followed by sufficiently rapid cooling to avoid precipitation of deleterious phases, is essential after hot forming these steels. ^d If heat treatment is carried out in a continuous furnace, the upper part of the range specified is usually preferred, or even exceeded.					

Annex C (informative)

Post-weld heat treatment

C.1 In general, welded assemblies of stainless steels covered by this document are not subjected to any heat treatment with the following exceptions:

- martensitic grades are retempered;
- ferritic grades are reannealed if there is any risk of residual martensitic in the heat-affected zones; for appropriate temperatures see [Tables B.1](#) and [B.2](#).

C.2 During heating of high chromium and molybdenum austenitic-ferritic or austenitic steel weldments containing some ferrite, intermetallic phases may be formed which should be re-dissolved during post-weld heat treatment. As most filler metals are overalloyed in comparison with the equivalent basic grades, minimum solution temperatures higher than those in [Tables B.3](#) and [B.4](#) may be necessary.

In the case of fully austenitic weld structures, it should be verified that mechanical properties of heat-treated weldments conform to this document.

Oxidation of surfaces which necessitates pickling and possible distortion of the welded construction may raise further difficulties.

Consequently, post-weld heat treatment of duplex and austenitic steels should be avoided, and therefore welding should be planned carefully.

C.3 In special cases, e.g. for parts with a greater wall thickness, requirements concerning stress-relief and resistance to intergranular corrosion, in order to avoid failure by stress corrosion cracking or corrosion fatigue, may prove the necessity for post-weld heat treatment. This should be carried out according to [Table C.1](#) by holding at an intermediate stage below the usual solution temperature (see [Table B.3](#)) and is defined as stabilizing annealing for the niobium- or titanium-bearing grades and as stress-relieving for the unstabilized low-carbon grades.

In some cases, post-weld heat treatment may also be performed as solution annealing according to [Table B.3](#) or at a temperature below the precipitation range of carbides and intermetallic phases; however, the latter reduces only peak stresses.

C.4 Preheating of austenitic-ferritic steels is a very effective precaution against excessive stress increase caused by shrinkage of thicker welded cross-sections, because temperatures of 200 °C to 250 °C bring down room-temperature yield strength by about 50 %. Thus preheating is often more appropriate to avoid high stress levels in those weldments than any post-weld heat treatment. Preheating temperature between 120 °C and 200 °C according to the particular steel and thickness may be applied. Excessive preheating or excess weld heat input may promote the formation of undesirable intermetallic phases.

Table C.1 — Guidelines on post-weld heat treatment of austenitic steels

Steel grade	Temperature ^a in °C	Type of cooling
Stabilized steels		
X6CrNiTi18-10	900 to 940	air

Annex E

(informative)

Reference data on strength values for 1 % (plastic) creep strain and creep rupture

The values given in [Tables E.1](#) and [E.2](#) and taken from EN 10028-7 are mean values of the scatter band considered to date. According to experience with long-time creep-testing it seems apparent that scattering of data is about ± 20 % in the long-range endurance of about 10^5 h up to 700 °C to 800 °C. Above that temperature, scattering may be gradually more or less enlarged and be summarized with about 35 % to 40 % at a 1 000 °C testing temperature. However, individual deviations must be presumed.

The strength values for 1 % (plastic) creep strain and creep rupture given up to the elevated temperatures listed in [Tables E.1](#) and [E.2](#) do not mean that the steels can be used in continuous duty up to these temperatures. The governing factor is the total stressing during operation. Where relevant, it is important that the oxidation conditions also be taken into account.

Table E.1 — Strength for 1 % (plastic) creep strain of austenitic creep-resisting steels in the solution annealed condition (see [Table B.3](#))

Steel grade	Temperature °C	Strength for 1 % (plastic) creep strain ^a (MPa) for
