Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

International Standard ISO/IEC 10165-5 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, in collaboration with ITU-T. The identical text is published as ITU-T Recommendation X.723.

ISO/IEC 10165 consists of the following parts, under the general title *Information technology — Open Systems Interconnection — Structure of management information*:

- *Part 1: Management information model*
- *Part 2: Definition of management information*
- *Part 4: Guidelines for the definition of managed objects*
- *Part 5: Generic management information*
- *Part 6: Requirements and guidelines for implementation conformance statement proformas associated with management information*

Introduction

ISO/IEC 10165 is a multipart standard developed according to ISO 7498 and ISO/IEC 7498-4. ISO/IEC 10165 is related to the following International Standards:

- ISO/IEC 9595:1990, *Information technology – Open Systems Interconnection – Common management information service definition*;
- ISO/IEC 9596:1990, *Information technology – Open Systems Interconnection – Common management information protocol*;
- ISO/IEC 10040:1992, *Information technology – Open Systems Interconnection – Systems management overview*;
- ISO/IEC 10164:1992, *Information technology – Open Systems Interconnection – Systems Management*.

INTERNATIONAL STANDARD

ITU-T RECOMMENDATION

INFORMATION TECHNOLOGY – OPEN SYSTEMS INTERCONNECTION – STRUCTURE OF MANAGEMENT INFORMATION: GENERIC MANAGEMENT INFORMATION

1 Scope

This Recommendation | International Standard provides developers of OSI Recommendations | International Standards that contain managed object definitions with generic definitions of managed object classes that will

- provide common superclass definitions from which layer- or resource- specific object class definitions may be derived;
- assist with the development of common elements of object class definitions across multiple layers or components of layers;
- reduce duplication of effort in other working groups by identifying commonly useful definitions.

To this end, this Recommendation | International Standard defines managed object classes which may be used as superclasses, using the template notation defined in CCITT Rec. X.722 | ISO/IEC 10165-4, including the definition of any packages, attributes, attribute groups, behaviour, actions, notifications and parameters that may be associated with the superclasses. It also defines functional units required by layer- or resource-specific management standards which are not defined in the CCITT Rec. X.73X | ISO/IEC 10164 series of systems management function standards.

This Recommendation | International Standard is applicable to the development of any OSI Recommendation | International Standard which defines managed object classes that may be refined from the managed object classes defined in this Recommendation | International Standard.

This Recommendation | International Standard does not specify or imply any constraints on the development of managed object definitions in terms of their inheritance relationships. Developers of managed object class definitions are encouraged to use the definitions contained in this Recommendation | International Standard to promote consistency between similar managed object classes; however, use of these definitions is not mandated.

2 Normative references

The following Recommendations and International Standards contain provisions which, through reference in this text, constitute provisions of this Recommendation | International Standard. At the time of publication, the editions indicated were valid. All Recommendations and International Standards are subject to revision, and parties to agreements based on this Recommendation | International Standard are encouraged to investigate the possibility of applying the most recent edition of the Recommendations and International Standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards. The ITU-T maintains a list of the currently valid Recommendations.

2.1 Identical Recommendations | International Standards

- CCITT Recommendation X.701 (1992) | ISO/IEC 10040:1992, *Information technology – Open Systems Interconnection – Systems Management Overview*.
- CCITT Recommendation X.720 (1992) | ISO/IEC 10165-1:1992, *Information technology – Open Systems Interconnection – Structure of Management Information: Management Information Model*.
- CCITT Recommendation X.721 (1992) | ISO/IEC 10165-2:1992, *Information technology – Open Systems Interconnection – Structure of Management Information: Definition of Management Information*.

- CCITT Recommendation X.722 (1992) | ISO/IEC 10165-4:1992, *Information technology – Open Systems Interconnection – Structure of Management Information: Guidelines for the Definition of Managed Objects*.
- CCITT Recommendation X.731 (1992) | ISO/IEC 10164-2:1992, *Information technology – Open Systems Interconnection – Systems Management: State Management Function*.

2.2 Paired Recommendations | International Standards equivalent in technical content

- CCITT Recommendation X.200 (1989), *Reference Model of Open Systems Interconnection for CCITT Applications*.
ISO 7498:1984, *Information processing systems – Open Systems Interconnection – Basic Reference Model*.
- CCITT Recommendation X.208 (1989), *Specification of abstract syntax notation one (ASN.1)*.
ISO/IEC 8824:1990, *Information technology – Open Systems Interconnection – Specification of Abstract Syntax Notation One (ASN.1)*.
- CCITT Recommendation X.700 (1992), *Management Framework Definition for Open Systems Interconnection (OSI) for CCITT Applications*.
ISO 7498-4:1989, *Information processing systems – Open Systems Interconnection – Basic Reference Model – Part 4: Management Framework*.
- CCITT Recommendation X.710 (1991), *Common Management Information Service Definition for CCITT Applications*.
ISO/IEC 9595:1991, *Information technology – Open Systems Interconnection – Common management information service definition*.

3 Definitions

For the purposes of this Recommendation | International Standard, the following definitions apply.

3.1 Basic reference model definitions

This Recommendation | International Standard uses the following terms defined in CCITT Rec. X.200 | ISO 7498:

- a) (N)-SAP;
- b) open system;
- c) systems management;
- d) application process.

3.2 Management framework definitions

This Recommendation | International Standard uses the following terms defined in CCITT Rec. X.700 | ISO/IEC 7498-4:
managed object.

3.3 Systems management overview definitions

This Recommendation | International Standard uses the following terms defined in CCITT Rec. X.701 | ISO/IEC 10040:

- a) generic definitions;
- b) managed object class;
- c) management information;
- d) notification.

3.4 Management information model definitions

This Recommendation | International Standard uses the following terms defined in CCITT Rec. X.720 | ISO/IEC 10165-1:

- a) allomorphy;
- b) attribute type;
- c) behaviour;
- d) containment;

- e) name binding;
- f) package;
- g) specialization;
- h) subordinate object;
- i) superclass;
- j) superior object.

3.5 CMIS definitions

This Recommendation | International Standard uses the following terms defined in CCITT Rec. X.710 | ISO/IEC 9595: attribute.

3.6 ASN.1 definitions

This Recommendation | International Standard uses the following terms defined in CCITT Rec. X.208 | ISO/IEC 8824:

- a) object identifier;
- b) sequence-of type;
- c) sequence type;
- d) set-of type;
- e) set type;
- f) type.

3.7 GDMO definitions

This Recommendation | International Standard uses the following terms defined in CCITT Rec. X.722 | ISO/IEC 10165-4:

- a) managed object class definition;
- b) template.

4 Abbreviations

ASN.1	Abstract Syntax Notation One
CL	Connectionless
CMIS	Common Management Information Service
CO	Connection Oriented
GDMO	Guidelines for the Definition of Managed Objects
GMI	Generic Management Information
OSI	Open Systems Interconnection
PDU	Protocol Data Unit
SAP	Service Access Point
SMI	Structure of Management Information

5 Conventions

This Recommendation | International Standard uses the template notation defined in CCITT Rec. X.722 | ISO/IEC 10165-4 as the notation for defining managed object classes and the abstract syntax notation defined in CCITT Rec. X.208 | ISO/IEC 8824 as the means of defining ASN.1 data types associated with the use of the template notation.

Text based on these notational conventions is printed in a distinctive typeface.

6 Overview

The purpose of this Recommendation | International Standard is to document structures for managed object classes and management information types that are common to more than one open system resource, by defining those common structures as generic definitions of management information. Other work items, such as those concerned with the

management of individual OSI layers, may specialize these generic definitions in ways that are appropriate for the requirements of the layer or resource concerned. In the process of specialization, the generic managed object classes defined in this Recommendation | International Standard may be defined as superclasses of allomorphic classes where appropriate. The use of generic managed object classes in this way will help to ensure the consistency and completeness of managed object class definitions for such resources as layer entities, SAPs, connections, etc., and also take account of relationships between them. Similar advantages may be gained by defining managed object classes corresponding to components of OSI layers, such as subnetworks.

Definers of management information are also encouraged to use the definitions contained in CCITT Rec. X.721 | ISO/IEC 10165-2 where they are applicable to the managed object classes or other information types being defined.

7 Generic managed object class definitions

This clause contains managed object class definitions for generic managed object classes, along with their mandatory and conditional packages and behaviour definitions. The definitions have been documented "in-line" with the exception of the attribute definitions which are to be found in clause 9.

7.1 Application process

The applicationProcess managed object class is used to represent an element within a system which performs the information processing for a particular application. The supportEntityNames attribute contains a set of distinguished names of supporting entities which provide communication services to the application process.

The semantics and syntax of the operationalState attribute are defined in CCITT Rec. X.731 | ISO/IEC 10164-2 and CCITT Rec. X.721 | ISO/IEC 10165-2.

7.2 Communications entity

The communications entity managed object class is used to represent an active functional element which performs communication processing functions within a system, e.g. Network Entity, Transport Entity, etc. The localSapNames attribute contains a set of distinguished names of layer (N-1) SAPs or ports at which services are provided to the entity.

NOTE 1 – Although the localSapNames attribute is for generality defined as a set valued attribute and may therefore contain zero or more SAP names, the set membership is, in most cases, limited to a single SAP name.

The semantics and syntax of the operationalState attribute are defined in CCITT Rec. X.731 (1992) | ISO/IEC 10164-2:1992 and CCITT Rec. X.721 (1992) | ISO/IEC 10165-2:1992.

NOTE 2 – In circumstances where both connection oriented and connectionless services are available at a particular layer, the further refinement of the communications entity managed object class to distinguish between connection oriented and connectionless entities is discouraged, as it becomes unclear under some circumstances (particularly under error conditions) as to what belongs to the CO entity and what belongs to the CL entity (e.g. If a corrupted PDU is received, is it the CO counter of corrupted PDUs that is incremented, or is it the CL counter, or both?).

7.3 Communications information record

The communicationsInformationRecord managed object class is used to define the information stored in a log as a result of receiving event reports or potential event reports with a communication information event type. The semantics of the managed object class, namely its attributes and behaviour, are derived from the communicationsInformation notification.

7.6 Sap 1

The sap1 managed object class is used to represent a service access point at which services are provided by an entity to the user entity, where the SAP address is dependent on the SAP address of the underlying layer.

The sap1Address attribute contains the selector which is contributed to the address of the SAP by this layer.

The userEntityNames attribute contains the distinguished names of the managed objects that represent the user entities that are using the SAP.

sap1 MANAGED OBJECT CLASS

7.7 Sap 2

The sap2 managed object class is used to represent a service access point, the address of which is independent of the SAP address of the underlying layer.

The sap2Address attribute contains the address of the SAP.

The userEntityNames attribute contains the distinguished names of the managed objects that represent the user entities that are using the SAP.

The providerEntityNames attribute contains the distinguished names of the managed objects that represent the provider entities that are supporting the SAP.

7.9 Subsystem

The subsystem managed object class may be used as a common containment point for managed objects in a system that relate to the operation of a given layer. The choice of structuring within a system is dependent on what structure the system designer wishes to present externally for management purposes. The subsystemId attribute is used to identify the subsystem concerned.

subsystem MANAGED OBJECT CLASS

9 Attributes

This clause defines attribute types that are referenced by the managed object class definitions contained in this Recommendation | International Standard.

9.1 ApplicationProcessId

The applicationProcessId attribute type is used in naming instances of the applicationProcess managed object class.

applicationProcessId ATTRIBUTE

WITH ATTRIBUTE SYNTAX	GMI-AttributeModule.ApplicationProcessId ;
MATCHES FOR	EQUALITY ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) applicationProcessId(16)} ;

9.2 ApplicationProcessTitle

The applicationProcessTitle attribute type is used to specify the object identifier name form or directory name form of an application process. If not known, the value of this attribute is set to null.

applicationProcessTitle ATTRIBUTE

WITH ATTRIBUTE SYNTAX	GMI-AttributeModule.ApplicationProcessTitle ;
MATCHES FOR	EQUALITY ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) applicationProcessTitle(17)} ;

9.3 CommunicationsEntityId

The communicationsEntityId attribute type is used in naming instances of the communicationsEntity managed object class.

communicationsEntityId ATTRIBUTE

WITH ATTRIBUTE SYNTAX	GMI-AttributeModule.CommunicationsEntityId ;
MATCHES FOR	EQUALITY ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) communicationsEntityId(0)} ;

9.4 ConnectionId

The connectionId attribute type is used in naming instances of the connection managed object class.

connectionId ATTRIBUTE

WITH ATTRIBUTE SYNTAX	GMI-AttributeModule.ConnectionId ;
MATCHES FOR	EQUALITY ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) connectionId(1)} ;

9.5 Connectionless-mode protocol machine Id

The clProtocolMachineId attribute type is used in naming instances of the connectionless-mode protocol machine managed object class.

clProtocolMachineId ATTRIBUTE

WITH ATTRIBUTE SYNTAX	GMI-AttributeModule.ProtocolMachineId ;
MATCHES FOR	EQUALITY ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) clProtocolMachineId(2)} ;

9.6 Connection-mode protocol machine Id

The coProtocolMachineId attribute type is used in naming instances of the connection-mode protocol machine managed object class.

coProtocolMachineId ATTRIBUTE

WITH ATTRIBUTE SYNTAX	GMI-AttributeModule.ProtocolMachineId ;
MATCHES FOR	EQUALITY ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) coProtocolMachineId(3)} ;

9.7 GenericNonWrappingCounter

This is a non-instantiable generic counter definition from which non-wrapping counters with specific characteristics may be derived.

genericNonWrappingCounter ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.GenericCounter;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR

genericNonWrappingCounterB BEHAVIOUR

DEFINED AS

!The counter shall have a mandatory initial value of zero and places an upper bound on the attribute value. The value of the counter shall be incremented by an amount as specified in other behaviour definitions associated with this attribute definition. When the counter value reaches the upper bound, its value is held at the value of the upper bound. This does not require the system to maintain a counter large enough to accommodate this maximum value if the characteristics of the implementation are such that all achievable count values are less than this maximum value.!

; -- NOTE – Since this attribute is never instantiated, there is no REGISTERED AS construct.

9.8 GenericWrappingCounter

This is a non-instantiable generic counter definition from which wrapping counters with specific characteristics may be derived.

genericWrappingCounter ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.GenericCounter;
MATCHES FOR EQUALITY ;
BEHAVIOUR

genericWrappingCounterB BEHAVIOUR

DEFINED AS

!The counter shall have a mandatory initial value of zero and places an upper bound on the attribute value. The value of the counter shall be incremented by an amount as specified in other behaviour definitions associated with this attribute definition. When the counter value reaches the upper bound, a further increment causes the counter value to wrap. This does not require the system to maintain a counter large enough to accommodate this maximum value if the characteristics of the implementation are such that all achievable count values are less than this maximum value.!

; -- NOTE – Since this attribute is never instantiated, there is no REGISTERED AS construct.

9.9 InformationData

This attribute represents the structure of the information to be held in a communicationsInformationRecord managed object.

informationData ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.InformationData;
REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) informationData(4)};

9.10 InformationType

This attribute represents the type of information to be held in a communicationsInformationRecord managed object.

informationType ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.InformationType;
MATCHES FOR EQUALITY;
REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) informationType(5)};

9.11 LocalSapNames

The semantics of the localSapNames attribute type are defined in 7.2.

localSapNames ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.GroupObjects ;
MATCHES FOR EQUALITY, SET-COMPARISON, SET-INTERSECTION ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) localSapNames(6)} ;

9.12 NonWrapping64BitCounter

This is a non-wrapping counter which has an upper bound of $2^{64}-1$.

nonWrapping64BitCounter ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.Generic64BitCounter ;
 MATCHES FOR EQUALITY, ORDERING ;
 BEHAVIOUR genericNonWrappingCounterB ;

9.13 ProviderEntityNames

The semantics of the ProviderEntityNames attribute type are defined in 7.7.

providerEntityNames ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.GroupObjects ;
 MATCHES FOR EQUALITY, SET-COMPARISON, SET-INTERSECTION ;
 BEHAVIOUR
 providerEntityNamesB BEHAVIOUR
 DEFINED AS !The distinguished names of the (N-1) layer entities which provide services to this SAP!
 ;
 ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) providerEntityNames(7)} ;

9.14 Sap1Address

The semantics of the sap1Address attribute type are defined in 7.6.

sap1Address ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.Sap1Address ;
 MATCHES FOR EQUALITY ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) sap1Address(8)} ;

9.15 Sap2Address

The semantics of the sap2Address attribute type are defined in 7.7.

sap2Address ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.Sap2Address ;
 MATCHES FOR EQUALITY, SET-COMPARISON, SET-INTERSECTION ;
 BEHAVIOUR
 sap2AddressB BEHAVIOUR
 DEFINED AS !The set of addresses associated with an (N) SAP!
 ;
 ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) sap2Address(9)} ;

9.16 SapId

The sapId attribute type is used in naming instances of the sap1 and sap2 managed object classes.

sapId ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.SapId ;
MATCHES FOR EQUALITY ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) sapId(10)} ;

9.17 SubsystemId

The subsystemId attribute type is used in naming instances of the subsystem managed object class.

subsystemId ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.SubsystemId ;
MATCHES FOR EQUALITY ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) subsystemId(11)} ;

9.18 SupportedConnectionNames

supportedConnectionNames ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.GroupObjects ;
MATCHES FOR EQUALITY, SET-COMPARISON, SET-INTERSECTION ;
BEHAVIOUR

supportedConnectionNamesB BEHAVIOUR
DEFINED AS

!This attribute contains the distinguished names of managed objects that represent connections that are supported by the connection that has this attribute.!

;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) supportedConnectionNames(12)} ;

9.19 SupportEntityNames

The semantics of the supportEntityNames attribute type are defined in .

supportEntityNames ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.GroupObjects ;
MATCHES FOR EQUALITY, SET-COMPARISON, SET-INTERSECTION ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) supportEntityNames(18)} ;

9.20 Timer

The timer is a generic definition of an attribute designed to hold an interval timer value.

timer ATTRIBUTE

WITH ATTRIBUTE SYNTAX GMI-AttributeModule.Timer;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR

timerB BEHAVIOUR
DEFINED AS

!A timer whose value may be set and read to the precision implied by the syntax definition, but whose effect on the precision with which the protocol events controlled by this timer are generated is determined by the implementation. The details of this precision shall be stated in the MOCS. The value of the timer consists of two integer values, exponent and mantissa, and shall be interpreted as representing the value mantissa*10^{exponent}.!

;

; -- Since this attribute is never instantiated, there is no REGISTERED AS construct. Timers derived from this definition
-- shall specify the units of time that the timer value represents.

9.21 TotalRemoteSAPs

This attribute provides a count of the number of remote SAPs that a `clProtocolMachine` has communicated with during its lifetime.

```
totalRemoteSAPs ATTRIBUTE
  DERIVED FROM wrapping64BitCounter ;
  BEHAVIOUR
    totalRemoteSAPsB BEHAVIOUR
      DEFINED AS
        !Counts the number of remote (N) SAPs that the containing clProtocolMachine has communicated with.
        Incremented by 1 every time communication with a remote (N) SAP is achieved.!
;
REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) totalRemoteSAPs(13)} ;
```

9.22 UnderlyingConnectionNames

The semantics of the `underlyingConnectionNames` attribute type are defined in 7.8.

```
underlyingConnectionNames ATTRIBUTE

  WITH ATTRIBUTE SYNTAX GMI-AttributeModule.GroupObjects ;
  MATCHES FOR EQUALITY, SET-COMPARISON, SET-INTERSECTION ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) underlyingConnectionNames(14)} ;
```

9.23 UserEntityNames

The semantics of the `userEntityNames` attribute type are defined in 7.6 and 7.7.

```
userEntityNames ATTRIBUTE

  WITH ATTRIBUTE SYNTAX GMI-AttributeModule.GroupObjects ;
  MATCHES FOR EQUALITY, SET-COMPARISON, SET-INTERSECTION ;

REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attribute(7) userEntityNames(15)} ;
```

9.24 Wrapping64BitCounter

This is a wrapping counter which has an upper bound of $2^{64}-1$.

```
wrapping64BitCounter ATTRIBUTE

  WITH ATTRIBUTE SYNTAX GMI-AttributeModule.Generic64BitCounter ;
  MATCHES FOR EQUALITY ;
  BEHAVIOUR genericWrappingCounterB ;
; -- As this attribute is never instantiated, there is no REGISTERED AS construct. Instantiable attribute definitions
  -- derived from this definition shall specify the circumstances under which the attribute value is incremented.
```

10 Attribute Groups

This clause provides definitions of attribute groups.

10.1 Counters

This is an empty, extensible attribute group consisting of all counters that are part of a managed object class definition. Attributes are added to the group in the package definition(s) for the managed object class.

```
counters ATTRIBUTE GROUP
  DESCRIPTION
    !The group of all counter attributes.!
;
REGISTERED AS {joint-iso-ccitt ms(9) smi(3) part5(5) attributeGroup(8) counters(0)} ;
```
