Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 3.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

International Standard ISO/IEC 14651 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 22, *Programming languages, their environments and system software interfaces*.

Annex A forms a normative part of this International Standard. Annexes B, C and D are for information only.

Introduction

This International Standard provides a method, applicable around the world, for ordering text data, and provides a Common Template Table which, when tailored, can meet a given language's ordering requirements while retaining reasonable ordering for other scripts.

The Common Template Table requires some tailoring in different local environments. Conformance to this International Standard requires that all deviations from the Template, called "deltas", be declared to document resultant discrepancies.

This International Standard describes a method to order text data independently of context.

The Draft Technical Report ISO/IEC DTR 14652 (under development) has specifications for ordering that informatively complements the specifications in this International Standard, and where additional information may be sought on ordering keywords defined in this International Standard.

Information technology — International string ordering and comparison — Method for comparing character strings and description of the common template tailorable ordering

1. Scope

This International Standard defines:

- A reference comparison method. This method is applicable to two character strings to determine their relative order. The method can be applied to strings containing characters from the full repertoire of ISO/IEC 10646-1. This method is also applicable to subsets of that repertoire, such as those of the different ISO/IEC 8-bit standard character sets, or any other character set, standardised or not, to produce ordering results valid (after tailoring) for a given set of languages for each script. This method uses collation tables derived either from the Common Template Table defined in this International Standard or from one of its tailorings.
- A reference format. The format is described using the Backus-Naur Form (BNF). This format is used to describe the Common Template Table. The format is used normatively *within* this International Standard.
- A Common Template Table. A given tailoring of the Common Template Table is used by the reference comparison method. The Common Template Table describes an order for all characters encoded in the first edition of ISO/IEC 10646-1 up to Amendment 7. It allows for a specification of a fully deterministic ordering. This table enables the specification of a string ordering adapted to local ordering rules, without requiring an implementer to have knowledge of all the different scripts already encoded in the UCS.

NOTE 1: This Common Template Table is to be modified to suit the needs of a local environment. The main benefit, worldwide, is that for other scripts, often no modification may be required and that the order will remain as consistent as possible and predictable from an international point of view.

NOTE 2: The character repertoire used in this International Standard is equivalent to that of the Unicode Standard version 2.1.

- A reference name. The reference name refers to this particular version of the Common Template Table, for use as a reference when tailoring. In particular, this name implies that the table is linked to a particular stage of development of the ISO/IEC 10646 Universal multiple-octet coded character set.
- Requirements for a declaration of the differences (delta) between the collation table and the Common Template Table.

This International Standard does *not* mandate:

- A specific comparison method; any equivalent method giving the same results is acceptable.
- A specific format for describing or tailoring tables in a given implementation.
- Specific symbols to be used by implementations except for the name of the Common Template Table.
- Any specific user interface for choosing options.
- Any specific internal format for intermediate keys used when comparing, nor for the table used. The use of numeric keys is not mandated either.

ISO/IEC 14651:2001 (E)

- A context-dependent ordering.
- Any particular preparation of character strings prior to comparison.

NOTE 1: It is normally necessary to do preparation of character strings prior to comparison even if it is not prescribed by this International standard (see informative Annex C).

NOTE 2: Although no user interface is required to choose options or to specify tailoring of the Common Template Table, conformance requires always declaring the applicable delta, a declaration of differences with this table. It is recommended that processes present available tailoring options to users.

2. Conformance

A process is conformant to this International Standard if it meets the requirements prescribed in subclauses 6.2 to 6.5.

A declaration of conformity to this International Standard shall be accompanied by a statement, either directly or by reference, of the following:

- The number of levels that the process supports; this number shall be at least three.
- Whether the process supports the forward, position processing parameter.
- Whether the process supports the backward processing parameter and at which level.
- The tailoring *delta* described in clause 6.4 and how many levels are defined in the delta.

It is the responsibility of implementers to show how their delta declaration is related to the table syntax described in 6.3, and how the comparison method they use, if different from the one mentioned in clause 6, can be considered as giving the same results as those prescribed by the method specified in clause 6.

3. Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this International Standard. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

NOTE: Only the EURO SIGN and the OBJECT REPLACEMENT CHARACTER from Amendment 18 are accounted for in Annex A of this International Standard at this time.

4. Terms and definitions

For the purposes of this International Standard, the following terms and definitions apply:

- | | |
|---|--|
| 4.1 character string | a sequence of characters |
| 4.2 collation | equivalent to the term "ordering" |
| 4.3 collating symbol | a symbol used to specify weights assigned to a collating element |
| 4.4 collation (weighting) table | a mapping from collating elements to weighting elements |
| 4.5 collating element | a sequence of one or more characters that are considered a single element for ordering |
| 4.6 delta | differences from a given collation table. The given collation table, together with a given delta, forms a new collation table. Unless otherwise specified in this International Standard, the term "delta" always refers to differences from the Common Template Table as defined in this International Standard |
| 4.7 (collation) level | the sequence number for a subkey |
| 4.8 ordering | a process by which two strings are determined to be in exactly one of the relationships of less than , greater than , or equal to one another |
| 4.9 ordering key | a sequence of subkeys used to determine an order |
| 4.10 (collation) preparation | a process in which given character strings are mapped to (other) character strings logically before the calculation of the ordering key for each of the strings |
| 4.11 reference comparison method | the method for establishing an order between two ordering keys (see clause 6) |

ISO/IEC 14651:2001 (E)

- 4.12 subkey** a sequence of weights computed for a character string for a particular level.
- 4.13 symbol** collating element
- 4.14 (collation) weight** a positive integer value, used in subkeys, reflecting the relative order of collating elements
- 4.15 weighting element** a list of a given number of weights sequentially ordered by level

5. Symbols and abbreviations

Following ISO/IEC 10646-1:1993, Amendment 9, characters are referenced as UXXXX where X stands for any hexadecimal digit (using upper case letters where applicable) and refers to the value of that character in ISO/IEC 10646-1. This convention is used throughout this International Standard.

In the Common Template Table arbitrary symbols representing weights are used according to the BNF notation description in clause 6.3.1.

6. String comparison

6.1. Preparation of character strings prior to comparison

It may be necessary to transform character strings before the reference comparison method is applied to them (see annex C for an example of such preparation). Although not part of the scope of this International Standard, preparation may be an important part of the ordering process. See Annex C for some examples of preparation.

Where applicable, it can be an important part of the preparation phase to map characters from a non-UCS encoding scheme to the UCS for input to the comparison method. This task can amongst other things encompass the correct handling of escape sequences in the originating encoding scheme, the mapping of characters without an allocated UCS codepoint to an application-defined codepoint in the private zone area and change the sequence of characters in strings that are not stored in logical order. For example, for visual order Arabic code sets, input strings must be put into logical order; and for some bibliographic code sets, strings with combining accents stored before their respective base character require that the combining accents be put after their base character. The resulting string sequence may then have to be remapped into its original encoding scheme.

NOTE 1: *The Common Template Table is designed so that combining sequences and corresponding single characters (precomposed) will have precisely the same ordering. To avoid inadvertently breaking this invariant (and in the process breaking Unicode conformance), tailoring should reorder combining sequences when corresponding characters are reordered. For example, if Å is reordered after Z, then the sequence <A>+<combining diaeresis> should also be reordered. To avoid exposing encoding differences that may be invisible to the end-user, it is recommended that strings be normalized according to Unicode normalization to achieve this equivalence – see Bibliography, Unicode Technical Report no. 15.*

NOTE 2: *Escape sequences and control characters constitute very sensitive data to interpret, and it is highly recommended that preparation should filter out or transform these sequences.*

NOTE 3: *Since the reference method is a logical statement for the mechanism for string comparison, it does not preclude an implementation from using a non-UCS character encoding only, as long as it produces results as if it were using the reference comparison method.*

6.2. Key building and comparison

6.2.1. Preliminary considerations

6.2.1.1. Assumptions

The collation table is a mapping from collating elements to weighting elements. In each weighting element, four levels are described in the Common Template Table. This number of levels can be extended or reduced, but not below 3 levels, in tailoring.

NOTE: In the Common Template Table, levels generally have the following characteristics, although the purpose of each level is not absolute:

Level 1: This level generally corresponds to the set of common letters of the alphabets for that script, if the script is alphabetic, and to the set of common characters of the script if the script is ideographic or syllabic.

Level 2: This level generally corresponds to diacritical marks affecting each basic character of the script. For some languages, letters with diacritics are always considered an integral part of the basic letters of the alphabet, and are not considered at this second level, but rather at the first. For example, in Spanish, N TILDE is considered a basic letter of the Latin script. Therefore, tailoring for Spanish will change the definition of N TILDE from "the weight of an N in the first level and the weight of a TILDE in the second level" to "the weight of an N TILDE (placed after N and before O) in the first level, and indication of the absence of a diacritic in the second level". For some characters, variant letter shapes are also dealt with on level 2. An example of this is ß, the LATIN LETTER SHARP S, which is treated as equivalent to ss on level 1, but traditionally distinguished from it on level 2.

Level 3: This level generally corresponds to case distinctions or to distinctions based on variant letter shapes (like the distinction between Hiragana and Katakana).

Level 4: This level generally corresponds to weighting differences that are less significant than those at the other levels. Often the last level (level 4 in the Common Template Table) is intended to specify additional weighting for "special" characters, i.e., characters normally not part of the spelling of words of a language (such as dingbats, punctuation, etc.), sometimes called "ignorable" characters in the context of computerized ordering.

6.2.1.2. Processing properties

A given tailored table has specific scanning and ordering properties. These properties may have been changed by the tailoring.

A scanning direction (forward or backward) for each level is used to indicate how to process the string. The scanning direction is a global property of each level defined in the tailored table.

An optional property of the last level of comparison, if that level is greater than three, is that before comparing weights of each "ignorable" character, a comparison on the numeric position of each such character in the two strings may be effected. This processing property is known as the 'position' option. In other words, for two strings equivalent at all levels except the last one, the string having an ignorable in the lowest position comes before the other one. In case corresponding "ignorables" are at the same position, then their weights are considered, until a difference is found. Support for this kind of processing is *optional* and is not necessary to claim conformance.

NOTE: The scanning direction (forward or backward) is not normally related to the natural writing direction of scripts. The scanning direction applies to the logical sequence of the coded character string.

According to ISO/IEC 10646, for scripts written right to left, such as Arabic, the lowest positions in the logical sequence of characters correspond to the rightmost characters of a string (from the point of view of their natural presentation sequence). Conversely, for the Latin script, written left to right, the lowest positions in the logical sequence of characters correspond to the leftmost characters of the string (from the point of view of their natural presentation sequence).

Scanning forward starts with the lowest position in the logical sequence, while scanning backward starts from the highest position, independently of the presentation sequence. The scanning direction for ordering purposes is a global property of each level described in the table.

In ISO/IEC 10646-1, the Arabic script is artificially separated into two pseudo-scripts: 1) the logical, intrinsic Arabic, coded independently of shapes, and 2) the Arabic presentation forms. Both allow the complete coding of Arabic, but intrinsic Arabic is normally preferred for better processing, while presentation-form Arabic is preferred by some presentation-oriented applications. ISO/IEC 10646-1 does not prescribe that the presentation forms be stored in any specific order, and in some implementations, the storage order for the latter is the reverse of the storage order used for intrinsic Arabic. It is therefore advisable that prehandling be used to make sure that Arabic presentation forms and other Arabic characters be fed to the comparison method in logical order.

A tailored table may be separated into sections for ease of tailoring. Each section is then assigned a name consistent with the specification in subclause 6.3.1. One of the tailoring possibilities is to assign a given order to each section and to change the relative order of an entire section relative to other sections.

6.2.2. Reference ordering key formation

When two strings are to be compared to determine their relative order, the two strings are first broken up into a sequence of collating elements taking into account the multi-character “collating-element” statements declared and used in a tailored table (if the syntax of clause 6.3.1 is used). For the syntax used for expressing the Common Template Table, the name of a collating element consisting of a single character, is formed by the UCS value of the character, expressed as a hexadecimal string, prefixed with “U”. For multi-character collating elements, the name and association to characters can be found via the collating elements declarations.

Then a sequence of m intermediary subkeys is formed out of a character string, where m is the number of levels described in a tailored collation weighting table.

Each ordering key is a sequence of subkeys. Each subkey is a list of numeric weights. A subkey is formed by successively appending the list of the weights assigned, at the level of the subkey, to each collating element of the string. The keyword “IGNORE” in the Common Template Table at the place of a sequence of collating symbols at a level, indicates that the sequence of weights at that level for that collating element is an empty sequence of weights.

There are three ways of forming subkeys: subkeys formed using the “forward” processing parameter; subkeys formed using the “backward” processing parameter; and subkeys formed using the “forward, position” processing parameter. Subkeys that use the “position” option can only occur at the last level, and only if that level is greater than three. Support of the “position” option is not required for conformance. If the processing parameter “forward, position” is not supported, “forward, position” shall be interpreted as if the processing parameter had been “forward”.

If there is no entry in the tailored table for a character of the input string, then the character’s weights are undefined. Characters with undefined weights should be ordered, with respect to characters that have defined weights, as if the undefined ones were given the weight named “UNDEFINED” at the first level. If there is no weight assignment to the symbol “UNDEFINED” before the symbol <SFFFF>’s weight assignment in a given tailored table, then the table shall be interpreted as if “UNDEFINED” was weighted just before <SFFFF> (the maximal level 1 weight). The ordering of characters with undefined weights with respect to other characters with undefined weights is not specified in this standard.

NOTE: A possible way to order characters with undefined weights is as if there were tailoring lines like this one added to the table, in UCS code point order (call the maximal level 4 weight <PLAIN> here):

<UXXXX> "<UNDEFINED><UXXXX>";<BASE>;<MIN>;<PLAIN>

6.2.2.1. Formation of a subkey with the “forward” level processing parameter

Subkeys, at a particular level, formed with the “forward” level processing parameter, are built in the following way:

During forward scanning of each collating element of the input character string, one or more weights are obtained. These weights are obtained by matching the collating element in the given tailored collation weighting table, obtaining the list of weights assigned to the collating element at the particular level. The obtained weight list is appended to the end of the subkey.

6.2.2.2. Formation of a subkey with the “backward” level processing parameter

Subkeys, at a particular level, formed with the “backward” level processing parameter are built by forming a subkey as with the “forward” parameter, then reversing that subkey weight by weight.

6.2.2.3. Formation of a subkey with the “forward, position” level processing parameter

Subkeys, at the last level, formed with the “forward, position” level processing parameter are formed by forming a subkey as with the “forward” parameter, but for collating elements that are not “IGNORE”d at all levels but the last one, their last level weighting (list of weights) is replaced by a single weight (call it <PLAIN> here) that is larger than all other weights at the last level in the given tailored table. Collating elements that are “IGNORE”d at all levels but the last one, retain their weighting according to the given tailored table. Finally, any trailing sequence of the maximal weight (<PLAIN>) is removed from the subkey, effectively replacing each trailing maximal weight with a zero weight.

NOTE: For any level, implementations are allowed to apply an order-preserving reduction of all subkeys at that level. Such an order-preserving subkey reduction is useful for levels 2, 3, and 4. Level 2 often has long stretches of the weight named <BASE> in Annex A. Level 3 often has long stretches of the weight named <MIN> in Annex A. Level 4 often has long stretches of the weight named <PLAIN> here. One such ordering preserving subkey reduction technique effectively encodes, in the last level subkey, the (relative) position, as single number each, of each otherwise ignored character; hence the name of the “position” option.

6.2.3. Reference comparison method for ordering character strings

The reference comparison method for ordering two given character strings (*after* collation preparation, which is not part of the reference comparison method itself) is to compare ordering keys generated by the reference key formation method described in subclause 6.2.2 of this International Standard:

- Begin by building an ordering key, using a given tailored collation weighting table, for each of the two given character strings being compared.
- Then compare the resulting keys according to the key ordering definition below in this subclause. Keys can be compared either up to a given level, or up to the last level of the given tailored collation weighting table.

NOTE 1: The comparison may be made while generating the ordering keys for two strings to be compared, stopping the key generation when the order of the strings can be determined. Such a technique is sometimes termed *lazy evaluation*, and some systems support it by default. This avoids generating the full ordering key, when an ordering difference may be found early in the keys. When a bigger set of strings are to be ordered, it may be advisable to generate the ordering keys, and store each key or an initial segment of each, before comparing the keys.

Weights for different levels should not be compared, which implies that subkeys at different levels should not be compared. Nor should keys generated from different tailored tables be compared.

NOTE 2: This allows implementations to assign weightings at each level independently of the other levels, and independently of other tailorings.

m is the maximal level of a given tailored table. Recall that a key is a list, of length m , of subkeys; a subkey is a list of weights; and a weight is a positive integer. Other notations used below are:

- L_z is the length of the subkey z , i.e., the number of weights in the subkey.
- $z_{wt(a)}$, where $1 \leq a \leq L_z$, is the weight at index position a (an integer > 0) of the subkey z .
- $u_{sk(b)}$, where $1 \leq b \leq m$, is the subkey at level b (an integer > 0) of the key u .

The orderings of weights, subkeys, and ordering keys (up to a given level, or up to the last level) are total orders, defined for a given tailored collation table as follows:

1. Weights are positive integer values (in the reference method), and are compared as such for the purposes of collation.
2. A subkey v is *less than* a subkey w (written $v < w$) **if and only if** there exists an integer i , where $1 \leq i \leq L_v+1$ and $i \leq L_w$, such that for all integers j , where $1 \leq j < i$, the equality $v_{wt(j)} = w_{wt(j)}$ holds; and either $i \leq L_v$ and $v_{wt(i)} < w_{wt(i)}$, or $i = L_v+1$ and $0 < w_{wt(i)}$.

A subkey v is *greater than* a subkey w (written $v > w$) **if and only if** w is less than v . A subkey v is *equal to* a subkey w (written $v = w$) **if and only if** neither v is less than w , nor w is less than v .

3. An ordering key x is *less than* an ordering key y at level s (written $x <_s y$) **if and only if** there exists an integer i , where $1 \leq i \leq s$ and $i \leq m$, such that for all integers j , where $1 \leq j < i$, the equality $x_{sk(j)} = y_{sk(j)}$ holds; and $x_{sk(i)} < y_{sk(i)}$.

An ordering key x is *greater than* an ordering key y at level s (written $x >_s y$) **if and only if** y is less than x at level s . An ordering key x is *equal to* an ordering key y at level s (written $x =_s y$) **if and only if** neither x is less than y at level s , nor y is less than x at level s .

4. For ordering keys, $<$, $>$, and $=$ are defined as $<_m$, $>_m$, and $=_m$ respectively.

NOTE 3: For ordering keys, $x <_t y$ implies $x <_{t+1} y$, $x >_t y$ implies $x >_{t+1} y$, $x =_t y$ implies $x =_{t+1} y$, $x <_0 y$ is false, $x >_0 y$ is false, and $x =_0 y$ is true. Above level m , for a given tailored table, there are no further ordering distinctions. Note that this definition implies that if two ordering keys are in the 'less than' relationship at level 1, they will also be in the 'less than' relationship at levels 2, 3, 4, etc. In general, whenever two ordering keys are less than at a given level, they will also automatically be less than at all subsequent, higher levels. Conversely, if two ordering keys are equal at a given level, they will also automatically be equal at all preceding, lower levels.

6.3. Common Template Table: formation and interpretation

This clause specifies:

- The syntax used to form the Common Template Table in Annex A of this International Standard or a tailored table based upon the Common Template Table as expressed in Annex A.
- Conditions of well-formedness of a table using this syntax.
- Interpretation of tailoring statements in deltas for tables formed using this syntax.
- Evaluation from symbols to weights of tailored tables formed using this syntax.
- Conditions for considering two tables as equivalent.

- Conditions for considering comparison results as equivalent.

6.3.1. BNF syntax rules for the Common Template Table in Annex A

Definitions between <angle brackets> make use of terms not defined in this BNF syntax, and assume general English usage.

Other conventions:

- * indicates 0 or more repetitions of a token or a group of tokens;
- + indicates 1 or more repetitions of a token or a group of tokens;
- ? indicates optional occurrence of a token or a group of tokens (0 or 1 occurrences);
- parentheses are used to group tokens;
- production rules are terminated by a semicolon;

Define collation tables as sequences of lines:

```
weight_table = common_template_table | tailored_table ;

common_template_table =
    simple_line+ ;

tailored_table = table_line+ ;
```

Define the line types:

```
simple_line = (symbol_definition | collating_element |
              weight_assignment | order_end)? line_completion ;

table_line = simple_line | tailoring_line ;

tailoring_line = (reorder_after | order_start | reorder_end |
                  section_definition | reorder_section_after)
                  line_completion ;
```

Define the basic syntax for collation weighting:

```
symbol_definition = 'collating-symbol' space+ symbol_element ;

symbol_element = symbol | symbol_range ;

symbol_range = symbol '..' symbol ;

symbol = simple_symbol | ucs_symbol ;

ucs_symbol = ('<U' four_digit_hex_string '>') |
              ('<U-' eight_digit_hex_string '>') ;

simple_symbol = '<' identifier '>' ;

collating_element =
    'collating-element' space+ symbol space+
    'from' space+ quoted_symbol_sequence ;

quoted_symbol_sequence =
    '"' symbol+ '"' ;

weight_assignment =
    simple_weight | symbol_weight ;
```

ISO/IEC 14651:2001 (E)

```
simple_weight = symbol_element | 'UNDEFINED' ;
symbol_weight = symbol_element space+ weight_list ;
weight_list = level_token (semicolon level_token)* ;
level_token = symbol_group | 'IGNORE' ;
symbol_group = symbol_element | quoted_symbol_sequence ;
order_end = 'order_end' ;
```

Define the tailoring syntax:

```
reorder_after = 'reorder-after' space+ target_symbol ;
target_symbol = symbol ;
order_start = 'order_start' space+ multiple_level_direction ;
multiple_level_direction =
    (direction semicolon)* direction ('position')? ;
direction = 'forward' | 'backward' ;
reorder_end = 'reorder-end' ;
section_definition =
    section_definition_simple |
    section_definition_list ;
section_definition_simple =
    'section' space+ section_identifier ;
section_identifier =
    identifier ;
section_definition_list =
    'section' space+ section_identifier space+
    symbol_list ;
symbol_list = symbol_element (semicolon symbol_element)* ;
reorder_section_after =
    'reorder-section-after' space+ section_identifier
    space+ target_symbol ;
```

Define low-level tokens used by the rest of the syntax:

```
identifier = (letter | digit) id_part* ;
id_part = letter | digit | '-' | '_' ;
line_completion =
    space* comment? EOL ;
comment = comment_char character* ;
four_digit_hex_string =
    hex_upper hex_upper hex_upper hex_upper ;
```

```

eight_digit_hex_string =
    hex_upper hex_upper hex_upper hex_upper
    hex_upper hex_upper hex_upper hex_upper ;

hex_numeric_string =
    hex_upper+ ;

space =
    ' ' | <TAB> ;

semicolon =
    ';' ;

comment_char =
    '%' ;

digit =
    '0' | '1' | '2' | '3' | '4' |
    '5' | '6' | '7' | '8' | '9' ;

hex_upper =
    digit | 'A' | 'B' | 'C' | 'D' | 'E' | 'F' ;

letter =
    'a' | 'b' | 'c' | 'd' | 'e' | 'f' | 'g' |
    'h' | 'i' | 'j' | 'k' | 'l' | 'm' | 'n' |
    'o' | 'p' | 'q' | 'r' | 's' | 't' | 'u' |
    'v' | 'w' | 'x' | 'y' | 'z' |
    'A' | 'B' | 'C' | 'D' | 'E' | 'F' | 'G' |
    'H' | 'I' | 'J' | 'K' | 'L' | 'M' | 'N' |
    'O' | 'P' | 'Q' | 'R' | 'S' | 'T' | 'U' |
    'V' | 'W' | 'X' | 'Y' | 'Z' ;

EOL =
    <end-of-line in the text conventions in use> ;

character =
    <any member of the repertoire of the encoded
    character set in use, not including any
    characters used to delimit the end of lines> ;

```

6.3.1.1 Keyword usage

The usage of the following locale syntax keywords is as follows:

collating-symbol	Define a collating symbol representing a weight.
collating-element	Define a collating element symbol representing a multi-character collating element. This keyword is optional.
order_start	Define collation rules. This statement is (after reordering is done) followed by one or more collation order statements, assigning multi-level collation weightings to collating elements. A collating element is either a character or a defined substring.
order_end	Specify the end of the collation-order statements.
reorder-after	Redefine collating rules. Specify after which collating symbol weighting the lines between the reorder-after and the next (or reorder-end) are to be moved. This statement is followed by one or more collation table lines. The result is to reassign collating symbol's values or collating elements's weightings.
reorder-end	Specify the end of the "reorder-after" collating order statements.
section	Define a section of the table. A section can be moved as a whole by reorder-section-after.

reorder-section-after Redefine the order of sections. This statement is followed by a section symbol and a target symbol. The result is to reassign collating symbol's values or collating elements's weightings.

6.3.2. Well-formedness conditions

WF 1. Any *simple_symbol* occurring in a *weight_list* shall also occur in the initial *symbol_element* of the *symbol_weight* in which that *weight_list* occurs, or in a *symbol_definition* that occurs earlier in the sequence of lines that constitute a *weight_table*.

NOTE: All *simple_symbols* must be "defined" before they are "used".

WF 2. No *symbol* that occurs in a *symbol_definition* in a *weight_table* that contains no *tailoring_lines* may occur in another *symbol_definition* in the same *weight_table*.

NOTE: Duplication of collation weighting symbols is prohibited. This is true for the Common Template Table itself. It must remain true for a tailored_table after all reordering of lines has been applied.

WF 3. All *weight_lists* in a *tailored_table* shall contain the same number of *level_tokens*. An empty *level_token* shall be interpreted as the *collating_element* itself.

NOTE: A tailorable table must be consistent in its use of levels throughout.

WF 4. A *tailored_table* shall contain one *order_start* statement. This statement shall appear after the *symbol_definition* entries and before the *symbol_weight* entries after all reordering of lines has been applied.

WF 5. A *multiple_level_direction* in a *tailored_table* shall contain the same number of *directions* as the number of *level_tokens* of any *weight_list* in that *tailored_table*.

NOTE: Any *order_start* must have the same number of levels as is generally used in the table.

WF 6. If a *level_token* in a *weight_list* consists of a *symbol_group*, all successive *level_tokens* in that *weight_list* shall also consist of a *symbol_group*.

NOTE: IGNORE must not be used at a level after an explicit symbol for a weighting.

WF 7. Any *section_identifier* occurring in a *reorder_section_after* shall occur in a *section_definition* that occurs earlier in the sequence of *table_lines* that constitutes a *tailored_table*.

NOTE: All *section_identifiers* must be "defined" before they are "used".

WF 8. No two *section_definitions* in a *tailored_table* shall contain the same values in their *section_identifiers*.

NOTE: Multiple definitions of sections are prohibited; *section_identifiers* must be unique.

WF 9. Each *reorder_after* in a *tailored_table* shall be followed at a later point in that tailored table by a *reorder_end* or another *reorder_after*.

WF 10. A *tailored_table* shall contain one *order_start* and one *order_end*.

WF 11. No *reorder_section_after* shall contain a *target_symbol* whose value is the same as any *symbol* in the *section_definition_list* whose *section_identifier* is the same as the *section_identifier* in that *reorder_section_after*.

NOTE: A section must not be reordered after a line which the section itself contains; attempts at recursive relocation of lines are prohibited.

- WF 12. Any *symbol_range* shall contain two *symbols* which meet the following conditions: 1) Each of the two *symbols* shall contain a common prefix. 2) The portions of *identifier* of each of the two *symbols* following the common prefix shall be a *hex_numeric_string*. 3) When interpreted as numeric values, the *hex_numeric_string* of the first *symbol* shall be less than the *hex_numeric_string* of the second *symbol*. One plus the positive integral difference between the *hex_numeric_string* of the second *symbol*, interpreted as a numeric value, and the *hex_numeric_string* of the first *symbol*, interpreted as a numeric value, constitutes the range of values of the *symbol_range*.

NOTE: A well-formed *symbol_range* is of a form such as <S4E00>..<>S9FA5>, where the common prefix is "S", and the rest of the identifier portion of each symbol is a *hex_numeric_string*.

- WF 13. Any *symbol_weight* that contains more than one *symbol_range* shall contain only *symbol_ranges* that meet the following requirement: Each *symbol_range* following the first *symbol_range* shall have the same number of values in its *range* as that of the first *symbol_range*.

NOTE: This condition guarantees that all expanded ranges will be well-formed, since for any one *symbol_weight*, all of the range expansions will have the same number of values.

6.3.3. Interpretation of tailored tables

- I 1. A section consists either 1) of the list of *simple_lines* which contain a *symbol_definition* whose value is equal to any *symbol* contained in the *symbol_list* in a *section_definition_list*, or 2) of the list of *simple_lines* following a *section_definition_simple* in a *tailored_table*.

NOTE: A section is defined 1) by a specific *symbol_list*, or 2) by taking all the lines following the *section_definition* until another tailoring line such as an *order_start*, a *reorder_section_after*, another *section_definition*, or the end of the entire table is encountered.

- I 2. A *simple_line* consisting of a *symbol_definition* containing a *symbol_range* is equivalent to a sequence of *simple_lines*, where each of those lines contain a *symbol* in place of the *symbol_range*. The *symbol* for each successive *simple_line* is generated by concatenating a *hex_numeric_string* to the common prefix of the *symbol_range*, in numeric order, starting with the hex value associated with the *hex_numeric_string* of the first *symbol* the range, and ending with the hex value associated with the *hex_numeric_string* of the second *symbol*. The *hex_numeric_string* concatenated to the common prefixes must contain the same number of digits as the *hex_numeric_string* of the first *symbol*. The number of *simple_lines* thus generated is equal to the number of *symbols* in the *symbol_range*.

NOTE: A *symbol_definition* of the form "collating-symbol <S0301>..<>S0303>" is equivalent to the three lines:

collating-symbol <S0301>
collating-symbol <S0302>
collating-symbol <S0303>

- I 3. A *simple_line* consisting of a *symbol_weight* containing one or more *symbol_ranges* is equivalent to a sequence of *simple_lines*, where each *symbol_range* has been expanded into a sequence of *symbols*, as described in I 2 for *symbol_definitions*.

NOTE: A *symbol_weight* of the form "<U2000>..<>U2002> <S0301>..<>S0303>;<BLANK>;<MIN>;<U2000>..<>U2002>" is equivalent to the three lines:
<U2000> <S0301>;<BLANK>;<MIN>;<U2000>
<U2001> <S0302>;<BLANK>;<MIN>;<U2001>
<U2002> <S0303>;<BLANK>;<MIN>;<U2002>

I 4a. A *tailored_table* containing a *reorder_after* is equivalent to the *tailored_table* where:

1. all *table_lines* that were ahead of the *reorder_after* and that contained *symbol_definitions* whose *symbol* matches the *symbol* of any *symbol_definition* in the *table_lines* between the *reorder_after* and *reorder_end* have been removed,
2. the *table_lines* between that *reorder_after* and the first subsequent *reorder_end* to immediately follow the first *table_line* in the *tailored_table* containing a *symbol_definition* whose *symbol* is the same as the *target_symbol* in the *reorder_after* have been reordered, and
3. that *reorder_after* and that *reorder_end* have been removed.

NOTE: Move the block of lines between the *reorder_after* and the *reorder_end* to follow the *target_symbol*, delete any prior lines that duplicate the *symbol_definitions* of the reordered lines, and remove the *reorder_after* and *reorder_end* themselves.

I 4b. When a *tailored_table* contains multiple groups of lines to be reordered, the table is interpreted by processing each *reorder_after* sequentially, starting from the first line of the table.

NOTE: Subsequent line reorderings may impact lines that themselves were reordered by prior reorderings.

I 5. A *tailored_table* containing a *reorder_section_after* is equivalent to the *tailored_table* with the *section* associated with that *section-reorder_after* reordered (in the same relative order as the *table_lines* have in that *section*) to immediately follow the last *table_line* in the *tailored_table* containing a *symbol_definition* whose *symbol* is the same as the *target_symbol* in the *reorder_section_after*, and with that *reorder_section_after* removed.

I 6. A *weight_table* is said to be in normal form when it contains no *reorder_afters* or *reorder_section_afters*.

NOTE: A *tailored_table* can be put into normal form by the operations implied by I 4 and I 5.

6.3.4. Evaluation of weight tables

E 1. A *weight_table* in normal form is said to be evaluated when each *weight_assignment* in the *weight_table* is mapped to a positive integer value (a weight) such that those values increase monotonically by the order in which the *weight_assignments* occur in the *weight_table*.

NOTE 1: The *table_lines* of the *weight_table* can first be mapped to the set of positive integers, by sequential order in the table. This mapping defines an ordered set of line numbers. The *weight_assignments* are then mapped to a set of positive integers (weights) that varies monotonically with the set of line numbers.

NOTE 2: This does not restrict the starting number for the weight of the first *weight_assignment* (other than it must be positive) nor does it require that the numbers for these weights be immediately consecutive.

E 2. An evaluated *weight_table* is said to be collation-element-weighted when each *simple_symbol* occurring in each *weight_list* in that evaluated *weight_table* has been mapped to the weight that corresponds to the *weight_assignment* that contains the same *simple_symbol*.

NOTE 3: Each *weight_list* can be interpreted as containing either *symbol's* mapped to integral weight values or as instances of the string 'IGNORE', which denotes the empty sequence of weights. At this point, the mathematical injection of strings can be defined using the *weight_table*.

NOTE 4: In a tailored table the value of any hex_numeric_string associated with a symbol typically does not reflect the numeric weighting of the symbol.

6.3.5. Conditions for considering specific table equivalences

A *weight_table* TBL1 and a *weight_table* TBL2 are said to be equivalent at a particular level if any comparison of strings using those tables up to that level results in the same ordering.

NOTE: If one takes two strings, builds keys for each based on TBL1 and compares them, one should always get the same results as when one builds keys for those strings based on TBL2 and compares them, if those two tables are claimed to be equivalent.

6.3.6. Conditions for results to be considered equivalent

An implementation of international string ordering is conformant with this International Standard if, for any set of strings *S* defined on a repertoire *R*, the implementation can duplicate the same comparisons as those resulting from comparison of the numbers from an injection constructed according to the rules of clause 6.2.3 of this International Standard.

6.4. Declaration of a delta

Tailoring shall be based upon the Common Template Table described in annex A. Tailoring may be accomplished using any syntax that is equivalent to the one described in this International Standard.

NOTE 1: For example, ISO/IEC DTR 14652, uses a compatible extension of the syntax used in this International Standard for tailoring. A tailoring delta can also be expressed using the syntax of the Unicode collation algorithm (see Bibliography - Unicode Technical Report no. 10). It has also been demonstrated that a tailoring delta can also be expressed using an XML-conformant mark-up scheme.

Any declaration of conformance to this International Standard shall be accompanied with a declaration of the differences between the collation weighting table and the Common Template Table. A delta shall contain the equivalent of:

1. At least one valid *order_start* entry described in clause 6.3.1; an unlimited number of sections containing an *order_start* entry and an *order_end* entry may be declared.
2. The number of levels used for comparison.
3. The list of *symbol_definition* weights (as defined in 6.2.1) added and after which *symbol_definition* entry each insertion is made.
4. The list of *simple_line* entries (as defined in 6.2.1) deleted or inserted, referencing after which *simple_line* entry in the Common Template Table the insertions are made

NOTE 2: It is recommended that a delta should not be bigger than necessary.

In cases where a process has provision to allow the end-user to tailor the table himself or herself, a statement of conformance shall indicate which of the 4 elements of the previous list are tailorable and which of those 4 elements are not tailorable. For those which are not tailorable, the delta of fixed elements relative to the Common Template Table shall be declared.

NOTE 3: The declaration may use a different syntax from the one specified in 6.3 provided that the relationship with this syntax can be reasonably established. For example, the following declarations are valid:

"Collate U+00E5 after U+00FE at the primary level.
Collate U+00E4 after U+00E5 at the primary level. "

or

"The primary alphabet order is modified so that in all cases $z < \mathfrak{z} < \text{á} < \text{ä}$ ".

Note that the letters á and ä are sorted after Icelandic letter thorn (þ), itself already coming after all the variants of the letter z, i.e. they have a weight value higher at level 1 than the one for thorn (þ), which itself comes after the ones for all variants of the letter z.

The above two informal expressions can reasonably be considered to be equivalent to the following more precise expression (which also give weights at levels 2 and 3 and explicitly take care of accented á's, accented ä's and the Ångström sign):

reorder-after <S00FE> % Weighting for THORN (after z; and unlike z, THORN has no variants).

% Declare new collation symbols (weight names):

collation-symbol <S00E5> % for á

collation-symbol <S00E4> % for ä

% Declare new collating elements for the decompositions (substring names):
collation-element <U0061_030A> **from** "<U0061><U030A>" *% decomposition of å*
collation-element <U0041_030A> **from** "<U0041><U030A>" *% decomposition of Å*
collation-element <U0061_0308> **from** "<U0061><U0308>" *% decomposition of ä*
collation-element <U0041_0308> **from** "<U0041><U0308>" *% decomposition of Ä*

% Assign weights to the new collation symbols (after THORN):

<S00E5> **% for å**

<S00E4> **% for ä**

reorder-end

reorder-after <SFFFF> *% The only place where we can put the order_start line.*

order_start forward;forward;forward;forward

% Use the new weighted collation symbols and collating elements to tailor the collation rules:

% The letter Å:

<U00E5> <S00E5>;<BASE>;<MIN>;<U00E5> *% LATIN SMALL LETTER A WITH RING ABOVE*

<U0061_030A> <S00E5>;<BASE>;<MIN>;"<U0061_030A>" *% decomposition of å*

<U00C5> <S00E5>;<BASE>;<CAP>;<U00C5> *% LATIN CAPITAL LETTER A WITH RING ABOVE*

<U0041_030A> <S00E5>;<BASE>;<CAP>;"<U0041_030A>" *% decomposition of Å*

<U212B> <S00E5>;<BASE>;<CAP>;<U212B> *% ÅNGSTRÖM SIGN (the letter Å really)*

<U01FB> <S00E5>;"<BASE><AIGUT>";"<MIN><MIN>";<U01FB> *% LATIN SMALL LETTER A WITH RING ABOVE AND ACUTE*

<U01FA> <S00E5>;"<BASE><AIGUT>";"<CAP><MIN>";<U01FA> *% LATIN CAPITAL LETTER A WITH RING ABOVE AND ACUTE*

% The letter Ä:

<U00E4> <S00E4>;<BASE>;<MIN>;<U00E5> *% LATIN SMALL LETTER A WITH DIAERESIS*

<U0061_0308> <S00E4>;<BASE>;<MIN>;"<U0061_0308>" *% decomposition of ä*

<U00C4> <S00E4>;<BASE>;<CAP>;<U00C4> *% LATIN CAPITAL LETTER A WITH DIAERESIS*

<U0041_0308> <S00E4>;<BASE>;<CAP>;"<U0041_0308>" *% decomposition of Ä*

<U01DF> <S00E4>;"<BASE><MACRO>";"<MIN><MIN>";<U01DF> *% LATIN SMALL LETTER A WITH DIAERESIS AND MACRON*

<U01DE> <S00E4>;"<BASE><MACRO>";"<CAP><MIN>";<U01DE> *% LATIN CAPITAL LETTER A WITH DIAERESIS AND MACRON*

reorder-end

6.5. Name of the Common Template Table and name declaration

Whenever the Common Template Table is referred externally as a base point in a given context, whether in a process, contract, or procurement requirement, it shall be referenced using the name ISO14651_2000_TABLE1. If another name is used due to practical constraints, a declaration of conformance shall indicate how the correspondence between this other name and the name ISO14651_2000_TABLE1 is taken care of.

The use of a defined name is necessary to manage the different stages of development of this table. This follows from the nature of the reference character repertoire, for which development will be ongoing for a number of years or even decades.

Annex A (normative) Common Template Table

In order to minimize formatting problems and the risk of bad reproduction, the common template table is provided separately in a machine-readable file as a normative component of this International standard under the name ISO14651_2000_TABLE1.txt and it can be retrieved on the ISO web site at the following URL: http://www.iso.ch/ittf/ISO14651_2000_TABLE1.htm

NOTE. the htm link is redirected to the actual txt file on the ISO site.

The current Common Template Table reflects the repertoire of characters as defined in ISO/IEC 10646-1:1993 including Amendments 1-9.

When ordering data applicable to ISO/IEC 10646-1:2000 becomes available, this International standard and specifically its Common Template Table will be amended accordingly to cover the ordering of the additional characters and scripts. To meet cultural requirements of specific communities, delta declarations will have to be applied to the amended table as defined in this International standard.

ISO14651_2000_TABLE1 is the name that is used for referring to this table in this version of this International standard.

Annex B (informative) Example tailoring deltas

B.1. Example 1 – Minimal tailoring

The following is a minimal tailoring of the Common Template Table:

```
reorder_after <SFFFF>
order_start forward;forward;forward;forward
reorder-end
```

B.2. Example 2 – Reversing the order of lowercase and uppercase letters

The following is a simple tailoring example to show how to reverse the order of uppercase versus lowercase from the order specified in the Common Template Table.

```
% Make uppercase letters sort before lowercase
% and scanning of accents done forward at level 2.

% The entire range of tertiary weight symbols
% <MIN>..<CIRCLE> are moved after <CIRCLECAP>, so that they order after
% <CAP> <WIDECAP> <COMPATCAP> <FONTCAP> <CIRCLECAP> in the same
% relative order with respect to themselves. This has the effect of
% also making all the compatibility uppercase letters sort before
% their respective compatibility lowercase letters. (For example,
% U+24B6 CIRCLED LATIN CAPITAL LETTER A will sort before
% U+24D0 CIRCLED LATIN SMALL LETTER A.

% To do this correctly, an order_start is
% inserted to make the delta conformant.

reorder-after <CIRCLECAP>
<MIN>
<WIDE>
<COMPAT>
<FONT>
<CIRCLE>

reorder_after <SFFFF>
order_start forward;forward;forward;forward,position
reorder-end

% End of the uppercase/lowercase tailoring
```

B.3. Example 3 – Canadian delta and benchmark

This annex describes benchmark 1, based on Canadian standard CAN/CSA Z243.4.1-1998 (and 1992). The delta that precedes the benchmark *has been simplified* for illustration here; a larger delta is required, mainly for special characters, for full conformance to this Canadian standard, and is given here as an example only, limited to what is required for the benchmark. For complete information, the Canadian standard CAN/CSA Z243.4.1 should be consulted. The example tailoring is to be applied to the Common Template Table of annex A, with the following delta:

1. Level processing properties:

forward; backward; forward; forward,position

2. Number of levels: 4 (unchanged).

3. No symbol changes.

4. The following ordering changes are done:

- æ sorted as if it were separate letters "ae" at level 1. The letters "ae" are distinguished at level 2 from the character "æ" and is ordered before it.
- ð sorted as if it were the letter "d" at level 1. The letter "ð" is distinguished at level 2 from the letter "d" and is ordered after it.
- þ sorted as if it were separate letters "th" at level 1. The letters "th" is distinguished at level 2 from the letter "þ" and is ordered before it.

A Canadian tailoring expressed in the tailoring syntax for this International Standard (normative only for Annex A) can be:

```
% copy ISO14651_2000_TABLE1
```

```
reorder-after <SFFFF>
```

```
order_start forward;backward;forward;forward,position
```

```
<U00E6> "<S0061><S0065>";"<BASE><VRNT1><BASE>";"<MIN><COMPAT><MIN>";<U00E6> % æ
<U00C6> "<S0061><S0065>";"<BASE><VRNT1><BASE>";"<CAP><COMPAT><CAP>";<U00C6> % Æ
```

```
<U01E3> "<S0061><S0065>";"<BASE><VRNT1><BASE><MACRO>";"<MIN><COMPAT><MIN><MIN>";<U01E3>
% æ WITH MACRON
```

```
<U01E2> "<S0061><S0065>";"<BASE><VRNT1><BASE><MACRO>";"<CAP><COMPAT><CAP><MIN>";<U01E2>
% Æ WITH MACRON
```

```
<U01FD> "<S0061><S0065>";"<BASE><VRNT1><BASE><AIGUT>";"<MIN><COMPAT><MIN><MIN>";<U01FD> % æ̆
<U01FC> "<S0061><S0065>";"<BASE><VRNT1><BASE><AIGUT>";"<CAP><COMPAT><CAP><MIN>";<U01FC> % Æ̆
```

```
<U00F0> <S0064>;<VRNT1>;<MIN>;<U00F0> % ð
<U00D0> <S0064>;<VRNT1>;<CAP>;<U00D0> % Ð
```

```
<U00FE> "<S0074><S0068>";"<BASE><VRNT1><BASE>";"<MIN><COMPAT><MIN>";<U00FE> % þ
<U00DE> "<S0074><S0068>";"<BASE><VRNT1><BASE>";"<CAP><COMPAT><CAP>";<U00DE> % Þ
```

```
reorder-end
```

B.4. Example 4 – Danish delta and benchmark

The following is a Danish example tailoring delta. This formal specification corresponds to Danish standard DS 377 and to "Retskrivningsordbogen", the Danish orthography specification.

% This tailoring is in accordance with Danish Standard DS 377 (1980)
 % and the Danish Orthography Dictionary (Retskrivningsordbogen par 4, 1986).
 % It is also in accordance with Greenlandic orthography.

collating-symbol <LIGHT> % Symbolic weight for lighter than <BASE>

% Define collating elements for <AA> - LETTER A WITH RING ABOVE
 % and combinations with combining accents

collating-symbol <A-A> % symbolic weight for <AA>

% A list of reweighting statements to deal with specific collation
 % behaviour for Danish. All of these define or redefine weight_list's,
 % and so the entire block could simply be reordered after the
 % order-start entry in the table. However, for clarity here and for
 % stability, each separate set of weightings is reordered locally in
 % the table around the first entry for that set of weightings.

% Actually a number of other reweighting statements should be specified
 % with respect to the ISO/IEC 14651 table so that all accents be
 % ignored on the first level, while the 14651 table distinguish
 % for example between different accented versions of <l> and a number
 % of other latin letters. This is considered less important
 % and too elaborate for this example.

% Also this example delta does not include specifications for reordering
 % of special characters like the currency denominators DOLLAR SIGN,
 % CENT SIGN, and POUND SIGN, and unit denominators like the
 % ANGSTROM SIGN, which have first-level weights in the CTT, while
 % rules in DS 377 prescribe that special characters are ignored.

ISO/IEC 14651:2001 (E)

(ḡ ḡḡ ḡ ḡḡ are vowels and ligatures, but put in the order according to the sounds they represent.)

- Vowels are also ordered by written forms, not by sounds. Vowels order is:

୧ ୨ ୩ ୪ ୫ ୬ ୭ ୮ ୯ ୧୦ ୧୧ ୧୨ ୧୩ ୧୪ ୧୫ ୧୬ ୧୭ ୧୮ ୧୯ ୨୦ ୨୧ ୨୨ ୨୩ ୨୪ ୨୫ ୨୬ ୨୭ ୨୮ ୨୯ ୩୦ ୩୧ ୩୨ ୩୩ ୩୪ ୩୫ ୩୬ ୩୭ ୩୮ ୩୯ ୪୦ ୪୧ ୪୨ ୪୩ ୪୪ ୪୫ ୪୬ ୪୭ ୪୮ ୪୯ ୫୦ ୫୧ ୫୨ ୫୩ ୫୪ ୫୫ ୫୬ ୫୭ ୫୮ ୫୯ ୬୦ ୬୧ ୬୨ ୬୩ ୬୪ ୬୫ ୬୬ ୬୭ ୬୮ ୬୯ ୭୦ ୭୧ ୭୨ ୭୩ ୭୪ ୭୫ ୭୬ ୭୭ ୭୮ ୭୯ ୮୦ ୮୧ ୮୨ ୮୩ ୮୪ ୮୫ ୮୬ ୮୭ ୮୮ ୮୯ ୯୦ ୯୧ ୯୨ ୯୩ ୯୪ ୯୫ ୯୬ ୯୭ ୯୮ ୯୯ ୧୦୦

(ə ɜ ɪ are always ordered as consonants, although they sometimes act as vowels.)

- String comparison is performed from left to right, but considering initial consonants before vowels in the same syllable.
- Tones and diacritics are ignored at level 1, at level 2 the order is:

৯	১	২	৩	৪
—	—	—	—	—

Here is an ordering example:

Example for Thai (sorted order)			
กก	โกน	แข่งขัน	ผิด
กรรม	โกรน	แขน	ฯพณฯ
กรรม	ไกล	กรรม-	พนิชย์
-กระแ่ง	ไก่อ	กรรม	ย่อง
กราบ	ไกล	จุมพล	รอง
กะเกณฑ์	ขึ้น	จุฬ	ฤทธิ์
กัก	ขนาบ	ชาย	ฤๅ
กาว	ข้าง	เฒ่า	ฤๅ
กำ	ข้างๆ	เณร	ลลิตา
กิน	ข้างกระดาน	ตลาด	ภาษา
กั	ข้างขึ้น	ทูลเกล้า	วก
กิน	ข้างควาย	ทูลเกล้าฯ	ศาล
กุน	ข้างๆ คูๆ	ทูลเกล้าทูลกระหม่อม	หริภุชชัย
กูด	ข้างเงิน	น้ำ	หฤทัย
เก้ง	ข้างออก	น้ำ	หลง
เกล้า	แขน	นี้	แห่ง
เกลียว	เข็น	บุญหลง	แห่ง
เก้า	เข็น	บุญ-หลง	แหนม
เกาะ	เข็ด	ป่า	แหนหวง
เกี้ยว	แข็ง	ป่า	แหบ
เกียะ	แข็ง	ป่า	แหม
เกือก	แข็ง	ป่า	อาน
แกง	แขงขวา	ป่า	ฮา
แกะ	แข็งขึ้น	ปาน	

C.2.2 Algorithmic Aspect

These are the only two mandatory requirements for Thai string collation algorithms.

- Leading vowels (เ- แ- โ- ใ- ใ-, corresponding to characters U+0E40-U+0E44), which are written before consonants, must be considered after the initial consonant. Therefore, the rearrangement is needed before comparison.
- Diacritics and tone marks (ะ ั ิ ุ ิ ุ ุ ุ) must be ignored in the first pass, and be considered at later pass if the first pass yields equality.

No syllable structure or word boundary analysis is required, as Thai lexicons are ordered alphabetically, not phonetically.

C.2.2.1. Leading Vowel Rearrangement

To fulfill this requirement, either a collation preparation or collating-element grouping is required. The collation preparation scans the string once and swaps every leading vowel with its succeeding letter. The prepared string is then passed to the normal weight calculation process. Another way to manage this is by means of collating-element formation. Every possible pair of leading vowel and consonant is defined as a collating-element, whose weight equals to that of the rearranged substring.

Note that the rearrangement of each leading vowel is simply performed with its immediate succeeding consonant. No consonant cluster analysis is needed. Indeed, doing so would result in ambiguities or yield a different order than that specified in the Royal Institute Dictionary. For example:

1. Ambiguities: The problem with ambiguity is illustrated by the word “เพลลา”. It has two potential pronunciations: either as a two-syllable word, “phe-la” (meaning “time”), or as a one-syllable word, “phlao” (meaning “axle” or “abate”). A rearrangement algorithm which follows the distinct pronunciation of the potential cluster ‘พล’ in this string would result in distinct keys, “เพลลา” and “พลเลา”, and therefore different weights, which are equally legal. Both words need to have the same weight to be sortable, however.
2. Non-conforming ordering: To illustrate the difference in ordering caused by the treatment of consonant clusters, consider these words, shown in conforming order: “เพล, เพลง, เพล”. The correct rearrangement ignores any clusters and results in the following: “เพล, เพลง, เพล”, which sorts in the order shown.

If, however, pairs of consonants that form legal clusters were grouped as single collation elements (regardless of actual pronunciation where the potential pronunciation is ambiguous), then the results of rearrangement would be “<พล>เ, <พล>ง, เพล”, which would yield the (non-conforming) ordering “เพล, เพล, เพลง”.

Again, if actual clusters were grouped as single collation elements (with some disambiguation effort), then the results of rearrangement would be “เพล, <พล>ง, เพล”, which would yield the (non-conforming) ordering “เพล, เพล, เพลง”.

C.2.2.2. The Multiple Levels of Character Weights

The second requirement of the algorithm, relating to the treatment of diacritics and tone marks, implies multiple levels of weights. Tone marks and diacritics must be ignored in the first level, and weigh more than consonants and vowels in the second level.

There are ten Thai decimal digits (๐ ๑ ๒ ๓ ๔ ๕ ๖ ๗ ๘ ๙), each semantically equivalent to Arabic digit 0-9, respectively. Their weights are then equal to their corresponding Arabic digits in the first level, and are different in the second level, to distinguish languages.

When punctuation marks (ฯ ๑ ๒ ๓ ๔ ๕ ๖ ๗ ๘ ๙) are concerned, another level of weights is required for them. This corresponds to the fourth level in the Common Template Table. In string ordering, punctuation marks are less significant than any tone marks and diacritics, and must be ignored in all the first three levels.

For example, “ข้างๆ, ข้างกบ, ข้างๆ ๑๑, ข้างจัน” is a valid order in the Royal Institute Dictionary. In the first level, the considered weights are ข้าง, ข้างกบ, ข้าง๑๑, ข้างจัน respectively.

The third level is not needed for Thai string ordering, but is reserved for tailoring.

C.3. Handling of numeral substrings in collation

A numeral is a string representing a number. The examples here deal with numerals that represent values in R , the real numbers, or, really, subsets of R , as these have a predetermined order. Only decimal numerals are dealt with in the examples given here.

The presentation below will first give positional system decimal numerals for natural numbers using the digits 0-9. It will progress to numerals for whole numbers, numerals with a fraction part, a fraction part and an exponent. There is also a brief discussion on numerals with digits from other scripts, scripts that sometimes uses another syntax with digits for numerals (such as Hân numerals), and Roman numerals. There are circumstances where digits do not represent numerical values, such as in part numbers and telephone numbers. The preparations described below have undesirable consequences in cases where *apparent* numerals do not represent numerical values, such as when the ordering telephone numbers or part ‘numbers’, and should be avoided in those cases.

C.3.1. Handling of ‘ordinary’ numerals for natural numbers

The Common Template Table has no means of ordering strings with numbers in such a way that the resulting order reflects the number values represented by the numerals. For example, given the following randomly-arranged strings:

Release 1
Release 20
Release 12
Release 2
Release 9

the method described in the this International Standard yields the following order for these strings:

Release 1
Release 12
Release 2
Release 20
Release 9

(It is sufficient simply to look positionally at just the first digit in each numeral to see why this ordering results.) A more acceptable ordering is:

Release 1
Release 2
Release 9
Release 12
Release 20

The Common Template Table defined in this International Standard cannot be tailored to give this result. However, preparation can be done prior to the basic collation step to achieve the desired results when numeric value order is desired. The prepared strings are normally not presented to the user; only the original strings are. The prepared strings are normally only used for the collation key construction. A simple, but not very general, way of preparing numerals for natural ordering is to pad them with zeroes to a given number of digits. If one pads the numerals in our original example strings up to three digits, the following will result:

Release 001
Release 020

Release 012
Release 002
Release 009

Using the Common Template Table defined in this International Standard one then obtains the strings in a better order (here showing the strings as they are after preparation, which are normally not shown in the result):

Release 001
Release 002
Release 009
Release 012
Release 020

However, there are two problems with this approach:

- One must determine beforehand a (usually small) number of digits to pad up to. If the number of digits to pad up to is too large, the strings after preparation can become rather long, especially if there are several numerals in each string. If the number of digits to pad up to is too small, however, the risk is greater that there are actually occurring numerals with more digits than one has padded up to, which results in partially getting back to the original situation, where the numerals' values are not taken entirely into account.
- Determinacy is lost, if some of the original numerals were already partially zero-padded. For example, if the original strings were:

Release 01
Release 1

the strings after preparation are identical, and the end result (as the user would normally see it) could be either

Release 01
Release 1

or

Release 1
Release 01

and the relative order may come out differently for different occurrences of numerals, or different runs of the collation process applying the same rules. This kind of indeterminacy is undesirable.

There are many ways to deal with these problems. The following is one such way.

To each maximal digit subsequence prepend a fixed-number-of-digits numeral which represents the original number of digits in the numeral. For most cases a two-digit count would suffice (allowing up to 99 digits in the original integer numerals). For example, given the original strings:

Release 1
Release 01
Release 20
Release 12
Release 2
Release 09
Release 9

one obtains after this preparation the following strings:

Release 011
Release 0201
Release 0220

Release 0212
 Release 012
 Release 0209
 Release 019

which would be ordered by the basic mechanism of this International Standard to:

Release 011
 Release 012
 Release 019
 Release 0201
 Release 0209
 Release 0212
 Release 0220

and are normally presented to the user as:

Release 1
 Release 2
 Release 9
 Release 01
 Release 09
 Release 12
 Release 20

This particular method puts numerals with a like original number of digits close to each other, even if the actual value represented is smaller due to the original zero-padding. If the represented *values* should be kept close together, one should instead duplicate the numeral: first a count of digits for the leading-zero-stripped numeral, the leading-zero-stripped numeral itself, followed by the original numeral. The duplication is needed to get determinacy relative to the original strings. For example, using the same original strings as above:

Release 011 1
 Release 011 01
 Release 0220 20
 Release 0212 12
 Release 012 2
 Release 019 09
 Release 019 9

which would be ordered by the basic mechanism of this standard to:

Release 011 01
 Release 011 1
 Release 012 2
 Release 019 09
 Release 019 9
 Release 0212 12
 Release 0220 20

and normally be presented to the user as:

Release 01
 Release 1
 Release 2
 Release 09
 Release 9
 Release 12
 Release 20

The originally zero-padded numerals consistently come before the numeral without (or with less) original zero-padding. The preparation processing could move the original numerals (in order of

occurrence) to the very end of each string, if one wants to give the original zero-padding lesser significance than the text following the numerals.

The presence of several natural numerals in each string causes no additional problem.

Taking care of the natural number numerals is in most cases sufficient, and it is recommended that it be included as part of the usual preparation of strings to be collated. However, such preparation is not required by this International Standard.

C.3.2. Handling of positional numerals in other scripts

ISO/IEC 10646 encodes decimal digits for a number of scripts. In most cases these are used in a positional system, just like 0-9 usually are. However, one should not regard a sequence of numerals mixed from different scripts as a single numeral; rather, one should consider each maximal substring of digits of the same script to be a numeral.

C.3.3. Handling of other non-pure positional system numerals or non-positional system numerals (e.g. Roman numerals)

Chinese and some other languages can use decimal digits (in the Han script, for instance) interspersed with ideographs for “one thousand”, “ten”, etc. If such numerals are to be collated according to the value they represent, one can proceed as above, adding a step just after the initial duplication: convert the copy to the corresponding positional system numeral in the syntax used here for whole numerals.

Roman numerals, if handled, can be handled in a similar fashion to that described above. Duplicate, and replace the first copy with the same natural number expressed in the decimal positional system. E.g. “Louis V”, where the V is determined to be a Roman numeral, can be modified to “Louis 5 V”.

Caveat: In this case human interactive intervention or an expert system may be required, as in the following example involving the French language: CHAPITRE DIX might mean CHAPTER 10 or CHAPTER 509 (“dix” is the French word for 10, it is also the Roman numeral for 509).

C.3.4. Handling of numerals for whole numbers

If numerals for negative whole numbers are also to be ordered according to their value, there are a number of issues to be considered. Most frequently, negative whole values are given numerals that begin with a negation sign. The negation sign may be HYPHEN-MINUS U+002D (but this character may often represent a true hyphen, rather than a negation), or MINUS SIGN U+2212. However, there are other conventions also, like using a SOLIDUS U+002F or a PERCENT SIGN U+0025 to indicate negativeness; or the negation indicator can come *after* the digits rather than before; or negativeness can be indicated by putting the digits between parenthesis, and/or putting the digits in a contrasting colour (often red). In the examples here, only the case that negativeness is indicated by an immediately prepended MINUS SIGN is dealt with. Positiveness is indicated by either the absence of a MINUS SIGN, or the presence of a PLUS SIGN U+002B.

Example strings:

Temperature: –9 °C
Temperature: 0 °C
Temperature: –14 °C
Temperature: 05 °C
Temperature: +5 °C
Temperature: –0 °C
Temperature: –09 °C
Temperature: 105 °C

Temperature: +05 °C

Temperature: 5 °C

One preparation to get an acceptable and determinate order for numerals (in this syntax) for whole numbers is as follows (actual implementations should do something equivalent, but more efficient):

1. Duplicate the numerals in the string (including sign indications), putting the 'original' ones (not to be touched by the following steps) in order of original occurrence at the end of the string, leaving the copies to be modified at the original positions. This step ensures determinacy.
2. Ensure that all of the copies have an explicit initial sign indicator.
3. Remove leading zeroes in the copies of the numerals (systematically either leaving one zero digit for zero or representing 0 by the empty string of digits); alternatively, let all numeral copies have exactly one leading zero.
4. Between the sign indicator and the digits in the copies of the numerals, insert a (two-digit) count of how many digits there were (after removing the leading zeroes).
5. Do 9's complement on each digit in each copy of a negated numeral. 9's complement of a digit that individually represents the value x , is $9-x$. That is, 9's complement of 0 is 9, of 9 is 0, of 5 is 4, etc.

For the basic collation step, use a tailoring of the template given in this standard, namely, a tailoring where the PLUS SIGN and the MINUS SIGN are significant at the same level as the digits, and where the MINUS SIGN has less weight than the PLUS SIGN. (In the example below, it is assumed that the weight of PLUS SIGN is less than the weight of 0, but this is not a prerequisite for getting an acceptable ordering.)

Our example strings after this preparation:

Temperature: -980 °C -9
 Temperature: +00 °C 0
 Temperature: -9785 °C -14
 Temperature: +015 °C 05
 Temperature: +015 °C +5
 Temperature: -99 °C 0
 Temperature: -980 °C -09
 Temperature: +03105 °C 105
 Temperature: +015 °C +05
 Temperature: +015 °C 5

The ordering for these, using the basic mechanism of this standard, is:

Temperature: -9785 °C -14
 Temperature: -980 °C -09
 Temperature: -980 °C -9
 Temperature: -99 °C 0
 Temperature: +00 °C 0
 Temperature: +015 °C +05
 Temperature: +015 °C +5
 Temperature: +015 °C 05
 Temperature: +015 °C 5
 Temperature: +03105 °C 105

and normally presented to the user as:

Temperature: -14 °C
 Temperature: -09 °C

Temperature: -9 °C
Temperature: -0 °C
Temperature: 0 °C
Temperature: +05 °C
Temperature: +5 °C
Temperature: 05 °C
Temperature: 5 °C
Temperature: 105 °C

This preparation results in a determinate ordering of strings that have zero or more numerals for whole numbers in them, such that the numerals are ordered according to the integer value they represent.

The process for other syntaxes for whole numbers can be similar. Just add a step to convert the copies to the syntax used here for whole numbers.

This technique for handling negative numerals can be used also for numerals with a fractional part, and so on (see below).

C.3.5. Handling of positive positional numerals with fractional parts

The method presented above can easily be adapted to the case where fraction parts may occur and are to be taken into account. A problem is, however, that the characters often used to delimit the integer part from the fraction part are also used for other purposes. The separator character is generally either FULL STOP U+002E, or COMMA U+002C. These characters also have other uses, also in conjunction with digits.

For the examples here, assume that FULL STOP is used (only) as a fraction part delimiter.

Do as above, but count only the digits in the integer part of the numeral for the count of digits to be prepended. The fraction part delimiter character (here: FULL STOP) can be removed.

For example:

-12.34
12.34
3.1415
3.14

After preparation:

-978765 -12.34
+021234 12.34
+0131415 3.1415
+01314 3.14

Ordered:

-978765 -12.34
+01314 3.14
+0131415 3.1415
+021234 12.34

As presented to the user:

-12.34
3.14
3.1415
12.34
