Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents) or the IEC list of patent declarations received (see <https://patents.iec.ch>).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by INCITS (as INCITS 572-2021) and drafted in accordance with its editorial rules. It was assigned to Joint Technical Committee ISO/IEC JTC 1, *Information technology*, and adopted under the “fast-track procedure”.

A list of all parts in the ISO/IEC 14776 series can be found on the ISO and IEC websites.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 14776-253:2023

Foreword (This foreword is not part of American National Standard INCITS 572-2021.)

The purpose of this standard is to define requirements for the transmission of SCSI commands, in a manner compliant with SAM-6, across a USB physical interface.

Requests for interpretation, suggestions for improvement and addenda, or defect reports are welcome. They should be sent to the INCITS Secretariat, National Committee for Information Technology Standards, Information Technology Institute, 700 K Street, NW, Suite 600, Washington, DC 20001.

This standard was processed and approved for submittal to ANSI by the InterNational Committee for Information Technology Standards (INCITS). Committee approval of the standard does not necessarily imply that all committee members voted for approval. At the time of it approved this standard, INCITS had the following members:

Laura Lindsay, Chair
Donald Deutsch, Vice-Chair
Jennifer Garner, Secretary

<i>Organization Represented</i>	<i>Name of Representative</i>
Adobe Systems, Inc.....	Scott Foshee

Introduction

The USB Attached SCSI standard (UAS) is divided into the following clauses:

Clause 1 describes the scope.

Clause 2 provides normative references for the entire standard.

Clause 3 provides definitions, abbreviations, and conventions used within the entire standard.

Clause 4 describes the model.

Clause 5 describes USB requirements.

Clause 6 describes transport requirements (e.g., IUs).

Clause 7 describes the SCSI Application Layer Transport Protocol Services.

Bibliography lists a bibliography for this standard.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 14776-253:2023

Figure 0 – SCSI document relationships

SCSI standards family

Figure 0 shows the relationship of this standard to the other standards and related projects in the SCSI family of standards as of the publication of this standard.

The SCSI document structure in figure 0 is intended to show the general applicability of the documents to one another. Figure 0 is not intended to imply any hierarchy, protocol stack, or system architecture relationship.

The functional areas identified in figure 0 characterize the scope of standards within a group as follows:

SCSI Architecture Model: Defines the SCSI systems model, the functional partitioning of the SCSI standard set and requirements applicable to all SCSI implementations and implementation standards.

Device-Type Specific Command Sets: Implementation standards that define specific device types including a device model for each device type. These standards specify the required commands and behaviors that are specific to a given device type and prescribe the requirements to be followed by a SCSI initiator device when sending commands to a SCSI target device having the specific device type. The commands and behaviors for a specific device type may include by reference commands and behaviors that are defined by other command sets.

Primary Command Set: An implementation standard that defines a model for all SCSI device types. This standard specifies the required commands and behavior that is common to all SCSI devices, regardless of device type, and prescribes the requirements to be followed by a SCSI initiator device when sending commands to any SCSI target device.

SCSI Transport Protocols: Implementation standards that define the requirements for exchanging information so that different SCSI devices are capable of communicating.

Interconnects: Implementation standards that define the communications mechanism employed by the SCSI transport protocols. These standards may describe the electrical and signaling requirements essential for SCSI devices to interoperate over a given interconnect. Interconnect standards may allow the interconnection of devices other than SCSI devices in ways that are outside the scope of this standard.

The term SCSI is used to refer to the family of standards described in this subclause.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 14776-253:2023

USB Attached SCSI - 3 (UAS-3)

1 Scope

This standard describes a SCSI transport protocol (see SAM-6) for USB-2 and USB-3 with the following properties:

- a) a mechanism to send commands associated with any T10 command standard to a USB device;
- b) compliance with SCSI Architecture Model - 6 (e.g., autosense and command queuing); and
- c) other capabilities.

2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this American National Standard. All standards are subject to revision, and parties to agreements based on this American National Standard are encouraged to investigate the possibility of applying the most recent editions of the following standards:

INCITS 546, *Information technology - SCSI Architecture Model - 6 (SAM-6)* (under development)

INCITS 566, *Information technology - SCSI Primary Commands - 6 (SPC-6)* (under development)

*Universal Serial Bus Specification Revision 2.0 (USB-2)*¹

*Universal Serial Bus 3.2 Specification Revision 1.0 (USB-3)*¹

*Universal Serial Bus Mass Storage Class Specification Overview Rev 1.4 (MSC)*¹

1. For information on the current status of USB documents, see the USB Implementors Forum at <http://www.usb.org>.

3 Definitions, symbols, abbreviations, and conventions

3.1 Definitions

3.1.1 application client

object that is the source of SCSI commands

Note 1 to entry: See SAM-6.

3.1.2 Bulk-in Endpoint Descriptor

USB Endpoint Descriptor with the BM ATTRIBUTES field set to 02h and bit 7 of the bEndPoint address field set to one

3.1.3 Bulk-in pipe

USB pipe used to transfer data and status from the UAS target port to the UAS initiator port

3.1.4 Bulk-out Endpoint Descriptor

USB Endpoint Descriptor with the BM ATTRIBUTES field set to 02h and bit 7 of the bEndPoint address field set to zero

3.1.5 Bulk-out pipe

USB pipe used to transfer data and commands from the UAS initiator port to the UAS target port

3.1.6 default pipe

USB message pipe created by the USB System Software to pass control and status information between the host and a USB device's endpoint zero

Note 1 to entry: See USB-2.

3.1.7 information unit (IU)

formatted collection of data that carries command information, task management function command information, sense command information, response command information, read ready command information, or write ready command information

Note 1 to entry: See 6.2.

3.1.8 logical unit number (LUN)

64-bit identifier for a logical unit

Note 1 to entry: See SAM-6.

3.1.9 pipe

logical abstraction using USB endpoints representing an association between a function (see USB-2 and USB-3) of a USB device and an application client

3.1.10 read data

data transferred to the SCSI application client's data-in buffer from the SCSI device server

Note 1 to entry: Read data is requested by the Send Data-In transport protocol service (see 7.2.6).

3.1.11 service delivery subsystem

part of the USB I/O system (see USB-3) that transmits information between the UAS initiator port and the UAS target port

Note 1 to entry: USB hubs and USB cables are examples of parts of the USB I/O system that are contained in the service delivery subsystem.

3.1.12 task manager

object that controls the sequencing of commands and processes task management functions

Note 1 to entry: See SAM-6.

3.1.13 transaction packet

header packet used to communicate information between a UAS target device and a UAS initiator device

Note 1 to entry: See USB-3.

3.1.14 UAS domain

one UAS initiator port and one or more UAS target ports

Note 1 to entry: See 4.5.

3.1.15 UAS initiator device

USB host (see USB-2 and USB-3) that contains one or more UAS initiator ports

3.1.16 UAS initiator port

USB host (see USB-2 and USB-3) and USB host port components (see USB-2 and USB-3)

3.1.17 UAS target device

USB device that contains one or more UAS target ports

3.1.18 UAS target port

USB interface that contains two USB Bulk-in endpoints (see USB-3), two USB Bulk-out endpoints (see USB-3), and the default USB control endpoint (see USB-3)

3.1.19 USB device

one or more USB interfaces and the default control endpoint

Note 1 to entry: See USB-2 and USB-3.

3.1.20 USB endpoint

collection of characteristics describing the USB device implementation of a pipe

Note 1 to entry: See USB-2 and USB-3.

3.1.21 USB interface

description of one or more USB endpoints

Note 1 to entry: See USB-2 and USB-3.

3.1.22 USB packet

unit of data formatted for transmission over Super-Speed USB or High-Speed USB

3.1.23 write data

data transferred from the SCSI application client's data-out buffer to the SCSI device server

Note 1 to entry: Write data is requested by the Receive Data-Out transport protocol service (see 7.2.8).

3.2 Symbols and abbreviations

3.2.1 Abbreviations

Abbreviations used in this standard:

Abbreviation	Meaning
IU	Information Unit
LSB	Least significant bit
LUN	Logical unit number
MSB	Most significant bit
MSC	Mass Storage Class (see clause 2)
SAM-6	SCSI Architecture Model - 6
SCSI	Small Computer System Interface
SPC-6	SCSI Primary Commands - 6
UAS	USB Attached SCSI (this standard)
USB	Universal Serial Bus (see USB-2 and USB-3)
USB-2	Universal Serial Bus Revision 2.0 (see clause 2)
USB-3	Universal Serial Bus 3.0 Revision 1.0 (see clause 2)

3.2.2 Units

Units used in this standard:

Units	Meaning
μs	microsecond (i.e., 10^{-6} seconds)
ms	millisecond (i.e., 10^{-3} seconds)
ns	nanosecond (i.e., 10^{-9} seconds)

3.2.3 Mathematical operators

Mathematical operators used in this standard:

Mathematical Operators	Meaning
x	multiplication
/	division
$\neq$ or NE	not equal
$\leq$ or LE	less than or equal to
$\pm$	plus or minus
$\approx$	approximately
+	add
-	subtract
< or LT	less than
= or EQ	equal
> or GT	greater than
$\geq$ or GE	greater than or equal to

3.3 Keywords

3.3.1 invalid

keyword used to describe an illegal or unsupported bit, byte, word, field or code value

Note 1 to entry: Receipt by a device server of an invalid bit, byte, word, field or code value shall be reported as error.

3.3.2 mandatory

keyword indicating an item that is required to be implemented as defined in this standard

3.3.3 may

keyword that indicates flexibility of choice with no implied preference

Note 1 to entry: May is synonymous with the phrase “may or may not”.

3.3.4 may not

keyword that indicates flexibility of choice with no implied preference

Note 1 to entry: May not is synonymous with the phrase “may or may not”.

3.3.5 obsolete

keyword indicating that an item was defined in prior SCSI standards but has been removed from this standard

3.3.6 option, optional

keywords that describe features that are not required to be implemented by this standard

Note 1 to entry: If any optional feature defined by this standard is implemented, then it shall be implemented as defined in this standard.

3.3.7 reserved

keyword referring to bits, bytes, words, fields, and code values that are set aside for future standardization

Note 1 to entry: A reserved bit, byte, word, or field shall be set to zero, or in accordance with a future extension to this standard.

Note 2 to entry: Recipients are not required to check reserved bits, bytes, words, or fields for zero values. Receipt of reserved code values in defined fields shall be reported as error.

3.3.8 shall

keyword indicating a mandatory requirement

Note 1 to entry: Designers are required to implement all such mandatory requirements to ensure interoperability with other products that conform to this standard.

3.3.9 should

keyword indicating flexibility of choice with a strongly preferred alternative

Note 1 to entry: Should is synonymous with the phrase “it is strongly recommended”.

3.3.10 vendor specific

something (e.g., a bit, field, code value) that is not defined by this standard

Note 1 to entry: Specification of the referenced item is determined by the SCSI device vendor and may be used differently in various implementations.

3.4 Editorial conventions

Certain words and terms used in this standard have a specific meaning beyond the normal English meaning. These words and terms are defined either in 3.1 or in the text where they first appear.

Upper case is used when referring to the name of a numeric value defined in this specification or a formal attribute possessed by an entity. When necessary for clarity, names of objects, procedure calls, arguments or discrete states are capitalized or set in bold type. Names of fields are identified using small capital letters (e.g., NACA bit).

Names of procedure calls are identified by a name in bold type (e.g., **Execute Command**). Names of arguments are denoted by capitalizing each word in the name (e.g., Sense Data is the name of an argument in the **Execute Command** procedure call).

Quantities having a defined numeric value are identified by large capital letters (e.g., CHECK CONDITION). Quantities having a discrete but unspecified value are identified using small capital letters. (e.g., TASK COMPLETE, indicates a quantity returned by the **Execute Command** procedure call). Such quantities are associated with an event or indication whose observable behavior or value is specific to a given implementation standard.

Lists sequenced by letters (e.g., a-red, b-blue, c-green) show no priority relationship between the listed items. Numbered lists (e.g., 1-red, 2-blue, 3-green) show a priority ordering between the listed items.

If a conflict arises between text, tables, or figures, the order of precedence to resolve the conflicts is text; then tables; and finally figures. Not all tables or figures are fully described in the text. Tables show data format and values.

Notes and examples do not constitute any requirements for implementors.

3.5 Numeric and character conventions

3.5.1 Numeric conventions

A binary number is represented in this standard by any sequence of digits comprised of only the Arabic numerals 0 and 1 immediately followed by a lower-case b (e.g., 0101b). Underscores or spaces may be included in binary number representations to increase readability or delineate field boundaries (e.g., 0 0101 1010b or 0_0101_1010b).

A hexadecimal number is represented in this standard by any sequence of digits comprised of only the Arabic numerals 0 through 9 and/or the upper-case English letters A through F immediately followed by a lower-case h (e.g., FA23h). Underscores or spaces may be included in hexadecimal number representations to increase readability or delineate field boundaries (e.g., B FD8C FA23h or B_FD8C_FA23h).

A decimal number is represented in this standard by any sequence of digits comprised of only the Arabic numerals 0 through 9 not immediately followed by a lower-case b or lower-case h (e.g., 25).

This standard uses the following conventions for representing decimal numbers:

- the decimal separator (i.e., separating the integer and fractional portions of the number) is a period;
- the thousands separator (i.e., separating groups of three digits in a portion of the number) is a space; and
- the thousands separator is used in both the integer portion and the fraction portion of a number.

Table 1 shows some examples of decimal numbers using various numbering conventions.

Table 1 – Numbering conventions

French	English	This standard
0,6	0.6	0.6
3,141 592 65	3.14159265	3.141 592 65
1 000	1,000	1 000
1 323 462,95	1,323,462.95	1 323 462.95

A decimal number represented in this standard with an overline over one or more digits following the decimal point is a number where the overlined digits are infinitely repeating (e.g., $666.\overline{6}$ means $666.666\ 666\dots$ or $666\ 2/3$, and $12.\overline{142\ 857}$ means $12.142\ 857\ 142\ 857\dots$ or $12\ 1/7$).

3.5.2 Byte encoded character strings conventions

When this standard requires one or more bytes to contain specific encoded characters, the specific characters are enclosed in single quotation marks. The single quotation marks identify the start and end of the characters that are required to be encoded but are not themselves to be encoded. The characters that are to be encoded are shown in the case that is to be encoded.

An ASCII space character (i.e., 20h) may be represented in a string by the character '↵' (e.g., 'SCSI↵device').

The encoded characters and the single quotation marks that enclose them are preceded by text that specifies the character encoding methodology and the number of characters required to be encoded.

EXAMPLE - Using the notation described in this subclause, stating that eleven ASCII characters 'SCSI device' are to be encoded would be the same writing out the following sequence of byte values: 53h 43h 53h 49h 20h 64h 65h 76h 69h 63h 65h.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 14776-253:2023

3.6 Sequence figure notation

A sequence figure describes sequences of communication between a requestor and a responder. Figure 1 is an example sequence figure. A line with an arrowhead that points to the responder represents a communication from the requestor to the responder. A line with an arrowhead that points to the requestor represents a communication from the responder to the requestor.

Each line with an arrowhead has a label. The label describes the communication between the requestor and the responder.

Communications that appear near the top of a sequence figure occur earlier in time than communications that appear below them.

Figure 1 – Example Sequence figure

3.7 Notation for procedures and functions

In this standard, the model for functional interfaces between objects is the callable procedure. Such interfaces are specified using the following notation:

[Result =] Procedure Name (IN ([input-1] [,input-2] ...), OUT ([output-1] [,output-2] ...))

Where:

Result: A single value representing the outcome of the procedure or function.

Procedure Name: descriptive name for the function to be performed.

IN (Input-1, Input-2, ...) A comma-separated list of names identifying caller-supplied input data objects.

OUT (Output-1, Output-2, ...) A comma-separated list of names identifying output data objects to be returned by the procedure.

[...] Brackets enclose optional or conditional parameters and arguments.

This notation allows data objects to be specified as inputs and outputs.

In this standard, the notation Procedure Name () is used to indicate the name of a procedure without specifying the input data objects or output data objects.

4 Model

4.1 Model overview

A UAS target port shall support a single I_T nexus. The minimum configuration for a UAS target port (see figure 2) consists of:

- a) the Default pipe (see USB-2);
- b) two Bulk-in pipes:
 - A) Status pipe; and
 - B) Data-in pipe;
 and
- c) two Bulk-out pipes:
 - A) Command pipe; and
 - B) Data-out pipe.

Figure 2 – USB Model

The Default pipe is required by both USB-2 and USB-3, and is not defined in this standard.

The UAS target port receives IUs from the UAS initiator port using the Command pipe and responds with IUs using the Status pipe.

The Data-in pipe transmits read data (i.e., data to the application client's data-in buffer). The Data-out pipe transmits write data (i.e., data from the application client's data-out buffer).

Upon the USB device entering the USB configured state (see USB-2 or USB-3):

- a) the UAS target port, if any, shall have sufficient buffering or other resources available to receive commands; and
- b) the UAS initiator port, if any, should have sufficient buffering available to receive status from the UAS target port.

If the UAS target port is unable to send status to the UAS initiator port when that status is available, then the target port may abort all commands in the task set and all commands that the target port receives until the UAS target port is able to terminate a command with CHECK CONDITION status with the sense key set to UNIT ATTENTION with the additional sense code set to COMMANDS CLEARED BY DEVICE SERVER. If:

- a) the CREDIT_HP_TIMER (see USB-3) has been started and has not expired;
- b) the CREDIT_HP_TIMER (see USB-3) has not been started and less than 5 ms has elapsed since the last transmission of an ACK packet from the UAS initiator port; or
- c) less than 5 ms has elapsed since the last transmission of an IN packet (see USB-2) from the UAS initiator port for a High Speed device,

then the UAS target port shall not take any action to abort commands resulting from a failure to be able to send status to the UAS initiator.

4.2 Tag handling and command identifiers

4.2.1 Tag handling and command identifiers overview

Every IU defined by the standard (see 6.2) contains a TAG field (i.e., a command identifier (see SAM-6)) in which the value is a unique identifier that the UAS initiator device establishes or has established for:

- a) a command (e.g., as specified by a COMMAND IU (see 6.2.2) or a SENSE IU (see 6.2.5)) that the UAS target device is requested to process or is processing; or
- b) a task management function (e.g., as specified by a TASK MANAGEMENT IU (see 6.2.7) or a RESPONSE IU (see 6.2.6)) that the UAS target device is requested to process or is processing.

The values that the UAS initiator device specifies in TAG fields are required to be unique across:

- a) all logical units in the UAS target device; and
- b) all:
 - A) commands; and
 - B) task management functions,for which the UAS initiator device requests concurrent processing.

The UAS target device may perform tag checking as described in 4.2.3 to validate the unique tag values sent by the UAS initiator device.

The TAG field in a COMMAND IU contains the command identifier as defined in SAM-6. The TAG field in a TASK MANAGEMENT IU (see 6.2.7) is an association between a SAM-6 Received Task Management Function Executed transport protocol service (see 7.2.15) and the preceding SAM-6 Send Task Management Request (see 7.2.12).

4.2.2 LUN determination without a LOGICAL UNIT NUMBER field

Not all IUs contain a LOGICAL UNIT NUMBER field.

The COMMAND IU (see 6.2.2) and TASK MANAGEMENT IU (see 6.2.7) contain a LOGICAL UNIT NUMBER field and a TAG field.

In those cases where a LOGICAL UNIT NUMBER field is not present, the contents of the TAG field are used to determine the logical unit number:

- a) by the UAS target device for the ERDY transaction packet (see 4.4), the READ_READY_IU (see 6.2.3), and the WRITE_READY_IU (see 6.2.4); and
- b) by the UAS initiator device for the SENSE_IU (see 6.2.5) and the RESPONSE_IU (see 6.2.6).

4.2.3 Tag checking

If a UAS target device performs tag checking and a UAS target port calls SCSI Command Received () (see 7.2.3) with a tag already in use by another command (i.e., an overlapped command) in any logical unit, then the task router and task manager(s) shall:

- a) abort all task management functions received on that I_T nexus; and
- b) respond to the overlapped command as defined in SAM-6.

If a UAS target device performs tag checking and:

- a) a UAS target port calls SCSI Command Received () with a tag already in use by a task management function in any logical unit; or
- b) a UAS target port calls Task Management Request Received () (see 7.2.13) with a tag already in use by a command or task management function in any logical unit,

then the task router and task manager(s) shall:

- a) abort all commands received on that I_T nexus;
- b) abort all task management functions received on that I_T nexus; and
- c) call Task Management Function Executed () (see 7.2.14) with:
 - A) the Nexus argument set to I_T nexus;
 - B) the Management Identifier argument set to zero; and
 - C) the Service Response argument set to SERVICE DELIVERY OR TARGET FAILURE - Overlapped Tag (see table 39).

4.3 Data transfers

The UAS model described in 4.1 enables a UAS target port to process commands and return status at the same time that data is being transferred for other commands. The UAS target port should be able to perform the following in a contemporaneous manner:

- a) transfer data;
- b) accept COMMAND IUs (see 6.2.2) and TASK MANAGEMENT IUs (see 6.2.7) using the Command pipe;
- c) process the commands and task management functions; and
- d) return status for commands and task management functions on the Status pipe.

See 6.3.8 for an example of the concurrent command operation and task management operation described in this subclause.

If the task set is full and the UAS target port receives a command, then the UAS target port shall return a SENSE IU (see 6.2.5) with a status of TASK SET FULL. The SENSE IU is returned on the Status pipe and may be returned while data is transferred on the Data-out pipe or Data-in pipe for a different command.

If the UAS target device returns a READ READY IU (see 6.2.3) or a WRITE READY IU (see 6.2.4) on the Status pipe, then that UAS target device shall be ready to send or receive all the data for the indicated I_T_L nexus and command identifier. Until processing of the Data-In Delivery transport protocol service (see 7.2.7) or the Data-Out Received transport protocol service (see 7.2.9) is completed, the UAS target device shall not use the associated Data-out pipe or Data-in pipe to transfer data for any other I_T_L nexus and command identifier.

After the last byte of data has been transferred and achieved a USB acknowledgment (see 7.2.16), the UAS target device shall return a SENSE IU on the Status pipe to indicate command completion.

The UAS target device may use the associated Data-out pipe to transfer data for a different command upon:

- 1) receipt of the USB acknowledgement for the transfer of the last byte of data for an I_T_L nexus and command identifier; and
- 2) sending a WRITE READY IU for the I_T_L nexus and command identifier associated with the data to be transferred on that Data-out pipe.

The UAS target device may use the associated Data-in pipe to transfer data for a different command upon:

- 1) receipt of the USB acknowledgement for the transfer of the last byte of data for an I_T_L nexus and command identifier; and
- 2) sending a READ READY IU for the I_T_L nexus and command identifier associated with the data to be transferred on that Data-in pipe.

4.4 USB-3 ERDY transaction packet considerations

As a part of USB-3 SuperSpeed operation, the ERDY transaction packet is used by UAS target ports to notify UAS initiator ports that the UAS target device is ready to transfer IUs or user data for the indicated tag (see 4.2). The tag for the command or task management function that is being processed shall be placed in the stream id of the ERDY being sent.

UAS target ports that connect via USB-3 SuperSpeed shall send an ERDY transaction packet on:

- a) the Status pipe to indicate that a SENSE IU (see 6.2.5) or RESPONSE IU (see 6.2.6) is about to be transferred;
- b) the Data-in pipe to indicate that read data is about to be transferred (see 4.3); and
- c) the Data-out pipe to request that the UAS initiator device transfer write data (see 4.3).

If an ERDY transaction packet is sent on:

- a) a Data-in pipe, then a READ READY IU (see 6.2.3) shall not be sent for the indicated tag; and
- b) a Data-out pipe, then a WRITE READY IU (see 6.2.4) shall not be sent for the indicated tag.

4.5 UAS domain

Figure 3 shows an example of a simple UAS domain that contains:

- a) one UAS initiator; and
- b) one USB device.

Figure 3 – Example Simple UAS domain

Figure 4 shows an example of a UAS domain that contains:

- a) one UAS initiator; and
- b) several USB devices.

Figure 4 – Example Complex UAS Domain

4.6 Names and identifiers

Table 2 describes the definitions of SCSI architecture object name attributes and identifier attributes for this standard.

Table 2 – SCSI architecture model object name attributes and identifier attributes

Attribute	Definition	Usage in this standard	Reference
SCSI device name	Not specified ^a		
Initiator port name	None ^b		
Target port name	None ^b		
Initiator port identifier	None ^c		
Target port identifier	Device address and interface number	Reported in the Device Identification VPD page (see SPC-6)	USB-2 and USB-3
^a This standard does not specify a format for this attribute. ^b SCSI ports compliant with this standard do not implement this attribute. ^c There is exactly one SCSI initiator port in a UAS domain.			

4.7 Resets

A UAS target device shall perform the operations for all reset conditions resulting from SCSI events as defined in SAM-6 with the additions in this subclause.

A USB bus reset (see USB-2 or USB-3) shall be treated as a hard reset event (see SAM-6).

4.8 I_T Nexus loss

If the UAS target port and UAS initiator port are disconnected, then the device shall perform the actions for I_T Nexus Loss as defined in SAM-6. A UAS target port is disconnected from the UAS initiator port when loss of signal is detected or the UAS initiator port fails to respond within the USB-3 or USB-2 timeouts.

4.9 Target power loss expected

If the UAS target device detects that it may lose power (e.g., a battery is running low on power), then the USB target port should establish a unit attention condition with additional sense code set to WARNING - POWER LOSS EXPECTED.

4.10 USB error handling

In USB-2 the W MAX PACKET SIZE field is 512 bytes and in USB-3 the W MAX PACKET SIZE field is 1 024 bytes (see 5.2.3.4). Communication on any pipe may consist of short packets (i.e., packets that are less than the contents of the W MAX PACKET SIZE field). All packets on the Status pipe and Command pipe may be short packets, this is not an error.

No condition defined in this standard results in a stall (see USB-2) on any pipe.

5 USB

5.1 USB overview

This clause describes information associated with USB to support this standard (e.g., USB descriptors).

5.2 USB resource requirements

5.2.1 Overview

This standard requires a minimum of:

- a) one Device Descriptor (see 5.2.3.1);
- b) one Configuration Descriptor (see 5.2.3.2);
- c) one Interface Descriptor (see 5.2.3.3); and
- d) four Endpoint Descriptors (see 5.2.3.4).

The USB Get Descriptor request (see USB-2 and USB-3) returns the descriptors defined in 5.2.3.

5.2.2 USB class specific requests

There are no USB Class Specific Requests defined in this standard.

5.2.3 USB descriptors

5.2.3.1 Device descriptor

Table 3 describes the Device descriptor format.

Table 3 – Device descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	B LENGTH (12h)							
1	B DESCRIPTOR TYPE (01h)							
2	(LSB)							
3	(MSB)	BCD USB						
4	B DEVICE CLASS (00h)							
5	B DEVICE SUBCLASS (00h)							
6	B DEVICE PROTOCOL (00h)							
7	B MAX PACKET SIZE							
8	(LSB)							
9	(MSB)	ID VENDOR						
10	(LSB)							
11	(MSB)	ID PRODUCT						
12	(LSB)							
13	(MSB)	BCD DEVICE						
14	I MANUFACTURER							
15	I PRODUCT							
16	I SERIAL NUMBER							
17	B NUM CONFIGURATIONS							

The:

- a) B LENGTH field;
- b) B DESCRIPTOR TYPE field;

- c) B DEVICE CLASS field;
- d) B DEVICE SUBCLASS field; and
- e) B DEVICE PROTOCOL field,

shall be set to the value defined in table 3 (see USB-2 and USB-3).

See USB-2 and USB-3 for the description of the:

- a) BCD USB field;
- b) B MAX PACKET SIZE field;
- c) ID VENDOR field;
- d) ID PRODUCT field;
- e) BCD DEVICE field;
- f) I MANUFACTURE field;
- g) I PRODUCT field;
- h) I SERIAL NUMBER field; and
- i) B NUM CONFIGURATIONS field.

5.2.3.2 Configuration descriptor

Table 4 describes the Configuration descriptor format.

Table 4 – Configuration descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	B LENGTH (09h)							
1	B DESCRIPTOR TYPE (02h)							
2	(LSB)							
3	(MSB)	W TOTAL LENGTH						
4	B NUM INTERFACES							
5	B CONFIGURATION VALUE							
6	I CONFIGURATION							
7	Reserved	SELF POWERED	REMOTE WAKEUP	Reserved				
8	MAX POWER							

The:

- a) B LENGTH field; and
- b) B DESCRIPTOR TYPE field,

shall be set to the value defined in table 4 (see USB-2 and USB-3).

See USB-2 and USB-3 for the description of the:

- a) W TOTAL LENGTH field;
- b) B NUM INTERFACES field;
- c) B CONFIGURATION VALUE field;
- d) I CONFIGURATION field;
- e) SELF POWERED field;
- f) REMOTE WAKEUP field; and
- g) MAX POWER field.

5.2.3.3 Interface descriptor

Table 5 describes the Interface descriptor format.

Table 5 – Interface Descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	B LENGTH (09h)							
1	B DESCRIPTOR TYPE (04h)							
2	B INTERFACE NUMBER							
3	B ALTERNATE SETTING							
4	B NUM ENDPOINTS							
5	B INTERFACE CLASS (08h)							
6	B INTERFACE SUBCLASS (06h)							
7	B INTERFACE PROTOCOL (62h)							
8	I INTERFACE							

The:

- a) B LENGTH field;
- b) B DESCRIPTOR TYPE field;
- c) B INTERFACE CLASS field;
- d) B INTERFACE SUBCLASS field; and
- e) B INTERFACE PROTOCOL field,

shall be set to the value defined in table 5 (see USB-2, USB-3, and MSC).

See USB-2 and USB-3 for the description of the:

- a) B INTERFACE NUMBER field;
- b) B ALTERNATE SETTING field;
- c) B NUM ENDPOINTS field; and
- d) I INTERFACE field.

5.2.3.4 Endpoint descriptors

Table 6 describes the Bulk-in endpoint descriptor format.

Table 6 – Bulk-in endpoint descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	B LENGTH (07h)							
1	B DESCRIPTOR TYPE (05h)							
2	DIR (1b)	Reserved			ENDPOINT NUMBER			
3	BM ATTRIBUTES (02h)							
4								(LSB)
5	(MSB)	W MAX PACKET SIZE						
6	Reserved							

The:

- a) B LENGTH field;
- b) B DESCRIPTOR TYPE field;
- c) DIR field; and

d) BM ATTRIBUTES field,

shall be set to the value defined in table 6 (see USB-2 and USB-3).

See USB-2 and USB-3 for the description of the ENDPOINT NUMBER field.

The W MAX PACKET SIZE field shall be set to 512 bytes for high speed devices (see USB-2). The W MAX PACKET SIZE field shall be set to 1 024 bytes for Super Speed devices (see USB-3).

Table 7 describes the Bulk-out endpoint descriptor format.

Table 7 – Bulk-out endpoint descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	B LENGTH (07h)							
1	B DESCRIPTOR TYPE (05h)							
2	DIR (0b)	Reserved			ENDPOINT NUMBER			
3	BM ATTRIBUTES (02h)							
4	W MAX PACKET SIZE							(LSB)
5	(MSB)							
6	Reserved							

The:

- a) B LENGTH field;
- b) B DESCRIPTOR TYPE field;
- c) DIR field; and
- d) BM ATTRIBUTES field,

shall be set to the value defined in table 6 (see USB-2 and USB-3).

See USB-2 and USB-3 for the description of the:

- a) ENDPOINT NUMBER field; and
- b) W MAX PACKET SIZE field.

5.3.3.5 Pipe Usage class specific descriptor

A Pipe Usage class specific descriptor shall be the first descriptor following each endpoint descriptor referenced by the Interface descriptor (see 5.2.3.3). Table 8 describes the format of the Pipe Usage class specific descriptor.

Table 8 – Pipe Usage descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	B LENGTH (04h)							
1	B DESCRIPTOR TYPE (24h)							
2	B PIPE ID							
3	Reserved							

The B LENGTH field shall be set to the value defined in table 8.

The B DESCRIPTOR TYPE field shall be set to the value defined in table 8 (see MSC).

The B PIPE ID field identifies the pipe associated with the endpoint descriptor (see table 9).

Table 9 – Pipe ID

Value	Description
00h	Reserved
01h	Command pipe
02h	Status pipe
03h	Data-in pipe
04h	Data-out pipe
05h to DFh	Reserved
E0h to EFh	Vendor specific
F0h to FFh	Reserved

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 14776-253:2023

6 Transport

6.1 Transport overview

This clause describes the transport protocol. This includes IUs, data transfer sequences, and transport management.

6.2 IUs

6.2.1 IUs Overview

Table 10 is a summary of the Information Units (IUs) and the associated IU ID field.

Table 10 – IU ID field summary

IU ID	Description	Reference
00h	Reserved	
01h	COMMAND IU	6.2.2
02h	Reserved	
03h	SENSE IU	6.2.5
04h	RESPONSE IU	6.2.6
05h	TASK MANAGEMENT IU	6.2.7
06h	READ READY IU	6.2.3
07h	WRITE READY IU	6.2.4
08h to FFh	Reserved	

All IUs include the header defined in table 11 as the first bytes of the IU.

Table 11 – IU Header

Bit Byte	7	6	5	4	3	2	1	0
0	IU ID							
1	Reserved							
2	(MSB)	TAG						
3								(LSB)

The IU ID field identifies the type of IU (see table 10).

The TAG field is described in 4.2.

If a UAS target port processes an IU with an IU ID field containing a reserved value, then the UAS target port shall call Task Management Function Executed () (see 7.2.14) with:

- the Nexus argument set to I_T nexus;
- the Management Identifier argument set to the value in the TAG field; and
- the Service Response argument set to SERVICE DELIVERY OR TARGET FAILURE - Invalid IU (see table 39).

6.2.2 COMMAND IU

The COMMAND IU shall be contained in a single USB packet and shall not share a USB packet with any other IU. Table 12 defines the COMMAND IU.

Table 12 – COMMAND IU

Bit Byte	7	6	5	4	3	2	1	0
0	IU ID (01h)							
1	Reserved							
2	(MSB)	TAG						
3								
4	Reserved	COMMAND PRIORITY				TASK ATTRIBUTE		
5	Reserved							
6	ADDITIONAL CDB LENGTH (n dwords)						Reserved	
7	Reserved							
8	(MSB)	LOGICAL UNIT NUMBER						
...								
15								
16	CDB							
31								
32	(MSB)	ADDITIONAL CDB BYTES						
...								
31 + n x 4								

The IU ID field shall be set to the value defined in table 12.

The TAG field is described in 4.2.

The COMMAND PRIORITY field specifies the relative scheduling of this command as defined in SAM-6.

Table 13 defines the TASK ATTRIBUTE field.

Table 13 – TASK ATTRIBUTE field

Code	Task Attribute	Description
000b	SIMPLE	Specifies that the command be managed according to the rules for a simple task attribute (see SAM-6).
001b	HEAD OF QUEUE	Specifies that the command be managed according to the rules for a head of queue task attribute (see SAM-6).
010b	ORDERED	Specifies that the command be managed according to the rules for an ordered task attribute (see SAM-6).
011b	Reserved	
100b	ACA	Specifies that the command be managed according to the rules for an automatic contingent allegiance task attribute (see SAM-6).
101b to 111b	Reserved	

The ADDITIONAL CDB LENGTH field contains the length in dwords (i.e., four bytes) of the ADDITIONAL CDB BYTES field.

The LOGICAL UNIT NUMBER field specifies the identifier of the logical unit. The structure of the LOGICAL UNIT NUMBER field shall be as defined in SAM-6. If the addressed logical unit does not exist, the task manager shall call Task Management Function Executed () (see 7.2.14) with:

- a) the Nexus argument set to I_T nexus;
- b) the Management Identifier argument set to the value in the TAG field; and
- c) the Service Response argument set to INCORRECT LOGICAL UNIT NUMBER (see table 39).

The CDB and ADDITIONAL CDB BYTES fields together contain the CDB to be interpreted by the addressed logical unit. Any bytes after the end of the actual CDB within the two fields shall be ignored (e.g., a six-byte CDB occupies the first six bytes of the CDB field, the remaining ten bytes of the CDB field are ignored, and the ADDITIONAL CDB BYTES field is not present).

The contents of the CDB are defined in the SCSI command standards (e.g., SPC-6).

6.2.3 READ READY IU

The READ READY IU is sent by a UAS target port to inform the UAS initiator port that the UAS target port is ready to send data for a data-in command (see 6.3.5) or a bi-directional command (see 6.3.7). UAS target devices that connect via SuperSpeed (see USB-3) shall transmit an ERDY transaction packet (see 4.4) on the Data-in pipe using the tag as the stream ID instead of the READ READY IU on the Status pipe. The READ READY IU shall be contained in a single USB packet and shall not share a USB packet with any other Information Unit. Table 14 describes the READ READY IU.

Table 14 – READ READY IU

Bit Byte	7	6	5	4	3	2	1	0
0	IU ID (06h)							
1	Reserved							
2	(MSB)							
3	TAG (LSB)							

The IU ID field shall be set to the value defined in table 14.

The TAG field (see 4.2) shall be set to the tag of the command to which the IU pertains.

6.2.4 WRITE READY IU

The WRITE READY IU is sent by a UAS target port to request write data from the UAS initiator port during a data-out command (see 6.3.4) or a bi-directional command (see 6.3.7). UAS target devices that connect via SuperSpeed (see USB-3) shall transmit an ERDY transaction packet (see 4.4) on the Data-out pipe using the tag as the stream ID instead of the WRITE READY IU on the Status pipe. The WRITE READY IU shall be contained in a single USB packet and shall not share a USB packet with any other Information Unit. Table 15 defines the WRITE READY IU.

Table 15 – WRITE READY IU

Bit Byte	7	6	5	4	3	2	1	0
0	IU ID (07h)							
1	Reserved							
2	(MSB)							
3	TAG (LSB)							

The IU ID field shall be set to the value defined in table 15.

The TAG field (see 4.2) shall be set to the tag of the command to which the IU pertains.

6.2.5 SENSE IU

The SENSE IU is sent by the UAS target port to deliver SCSI status. The SENSE IU shall be contained in a single USB packet and shall not share a USB packet with any other Information Unit. Table 16 defines the SENSE IU.

Table 16 – SENSE IU

Bit Byte	7	6	5	4	3	2	1	0
0	IU ID (03h)							
1	Reserved							
2	(MSB)	TAG						
3								
4	STATUS QUALIFIER							
5								
6	STATUS							
7	Reserved							
...								
13								
14	LENGTH (n-15)							
15								
16	(MSB)	SENSE DATA						
...								
n								

The IU ID field shall be set to the value defined in table 16.

The TAG field (see 4.2) shall be set to the tag of the command to which the IU pertains.

The STATUS QUALIFIER field shall be set to the status qualifier for the command (see SAM-6);

The STATUS field shall be set to the status code (see SAM-6) for the command that has completed.

The LENGTH field contains the number of bytes that follow in the SENSE IU. If no sense data is available, then the LENGTH field shall be set to 0000h.

The SENSE DATA field shall be set to the sense data, if any, for the command associated with the tag (see SAM-6).

6.2.6 RESPONSE IU

The RESPONSE IU is used to pass task management status information from the UAS target port to the UAS initiator port. The RESPONSE IU may be returned in response to a COMMAND IU as a means to report an error condition detected by the transport. Each RESPONSE IU shall be sent in a single USB packet. The RESPONSE IU shall be contained in a single USB packet and shall not share a USB packet with any other Information Unit.

Table 17 defines the RESPONSE IU.

Table 17 – RESPONSE IU

Bit Byte	7	6	5	4	3	2	1	0
0	IU ID (04h)							
1	Reserved							
2	(MSB) TAG (LSB)							
3								
4	(MSB) ADDITIONAL RESPONSE INFORMATION (LSB)							
...								
6								
7	RESPONSE CODE							

The IU ID field shall be set to the value defined in table 17.

The TAG field (see 4.2) shall be set to the tag of the command to which the IU pertains.

The ADDITIONAL RESPONSE INFORMATION field contains additional response information for certain task management functions (e.g., QUERY ASYNCHRONOUS EVENT) as defined in SAM-6. ADDITIONAL RESPONSE INFORMATION shall be set to zero if the task management function does not define ADDITIONAL RESPONSE INFORMATION or the logical unit does not support response information.

The RESPONSE CODE field (see table 18) indicates the status of a task management function.

Table 18 – RESPONSE CODE field

Code	Description	Task ^a	Command ^b
00h	TASK MANAGEMENT FUNCTION COMPLETE	Valid	Invalid
01h	Reserved	Invalid	Invalid
02h	INVALID INFORMATION UNIT	Valid	Valid
03h	Reserved	Invalid	Invalid
04h	TASK MANAGEMENT FUNCTION NOT SUPPORTED	Valid	Invalid
05h	TASK MANAGEMENT FUNCTION FAILED	Valid	Invalid
06h to 07h	Reserved	Invalid	Invalid
08h	TASK MANAGEMENT FUNCTION SUCCEEDED	Valid	Invalid
09h	INCORRECT LOGICAL UNIT NUMBER	Valid	Invalid
0Ah	OVERLAPPED TAG ATTEMPTED ^c	Valid	Valid
0Bh to FFh	Reserved	Invalid	Invalid
^a The Task column indicates the valid and invalid response codes returned by the UAS target device in response to a TASK MANAGEMENT IU. ^b The Command column indicates the valid and invalid response codes returned by the UAS target device in response to a COMMAND IU. ^c Returned in case of command/task management function or task management function/task management function tag conflicts.			

6.2.7 TASK MANAGEMENT IU

The TASK MANAGEMENT IU is sent by a UAS initiator port to request that a task management function be processed by the task manager in a logical unit. The TASK MANAGEMENT IU shall be contained in a single USB packet and shall not share a USB packet with any other Information Unit. Table 19 defines the TASK MANAGEMENT IU format.

Table 19 – TASK MANAGEMENT IU

Bit Byte	7	6	5	4	3	2	1	0
0	IU ID (05h)							
1	Reserved							
2	(MSB)	TAG						(LSB)
3								
4	TASK MANAGEMENT FUNCTION							
5	Reserved							
6	(MSB)	TAG OF TASK TO BE MANAGED						(LSB)
7								
8	(MSB)	LOGICAL UNIT NUMBER						(LSB)
...								
15								

The IU ID field shall be set to the value defined in table 19.

The TAG field is described in 4.2.

Table 20 defines the TASK MANAGEMENT FUNCTION field. Support for task management functions not listed in table 20 is outside the scope of this standard.

If the TASK MANAGEMENT FUNCTION field is set to 01h (i.e., ABORT TASK) or 80h (i.e., QUERY TASK), then the TAG OF TASK TO BE MANAGED field specifies the tag from the COMMAND IU that contained the command to be aborted or queried. For all other task management functions, the TAG OF TASK TO BE MANAGED field is reserved.

Table 20 – TASK MANAGEMENT FUNCTION field

Code	Task management function	Uses the		Description
		LUN ^a	TOTTBM ^b	
00h	Reserved			
01	ABORT TASK	yes	yes	The task manager shall perform the ABORT TASK task management function using the value of the LOGICAL UNIT NUMBER field and the value of the TAG OF TASK TO BE MANAGED field to determine the task to be aborted (see SAM-6). ^c
02h	ABORT TASK SET	yes	no	The task manager shall perform the ABORT TASK SET task management function using the value of the LOGICAL UNIT NUMBER field to determine the task set to be aborted (see SAM-6). ^c
03h	Reserved			
04h	CLEAR TASK SET	yes	no	The task manager shall perform the CLEAR TASK SET task management function using the value of the LOGICAL UNIT NUMBER field to determine the task set to be cleared (see SAM-6). ^c
05h to 07h	Reserved			
08h	LOGICAL UNIT RESET	yes	no	The task manager shall perform the LOGICAL UNIT RESET task management function using the value of the LOGICAL UNIT NUMBER field to determine the logical unit to be reset (see SAM-6). ^c
09h to 0Fh	Reserved			
10h	I_T NEXUS RESET	no	no	The task manager shall perform the I_T NEXUS RESET task management function (see SAM-6). ^c
11h to 3Fh	Reserved			
40h	CLEAR ACA	yes	no	The task manager shall perform the CLEAR ACA task management function using the value of the LOGICAL UNIT NUMBER field (see SAM-6). ^c
41h to 7Fh	Reserved			
80h	QUERY TASK	yes	yes	The task manager shall perform the QUERY TASK task management function using the value of the LOGICAL UNIT NUMBER field and the value of the TAG OF TASK TO BE MANAGED field to determine the task to be queried (see SAM-6). ^c
81h	QUERY TASK SET	yes	no	The task manager shall perform the QUERY TASK SET task management function using the value of the LOGICAL UNIT NUMBER field to determine the task set to be queried (see SAM-6). ^c
82h	QUERY ASYNCHRONOUS EVENT	yes	no	The task manager shall perform the QUERY ASYNCHRONOUS EVENT task management function using the value of the LOGICAL UNIT NUMBER field (see SAM-6). ^c
83h to FFh	Reserved			
^a LUN is the LOGICAL UNIT NUMBER field.				
^b TOTTBM is the TAG OF TASK TO BE MANAGED field.				
^c The task manager shall perform the specified task management function on the I_T nexus of the UAS initiator port and the UAS target port involved in the connection used to deliver the TASK MANAGEMENT IU.				

If the TASK MANAGEMENT FUNCTION field contains a reserved or unsupported value, then the task manager shall call Task Management Function Executed () (see 7.2.14) with:

- a) the Nexus argument set to I_T nexus;
- b) the Management Identifier argument set to the value in the TAG field; and
- c) the Service Response argument set to FUNCTION REJECTED (see table 39).

The LOGICAL UNIT NUMBER field contains the address of the logical unit. The structure of the LOGICAL UNIT NUMBER field shall be as defined in SAM-6. If the addressed logical unit does not exist, the task manager shall call Task Management Function Executed () (see 7.2.14) with:

- a) the Nexus argument set to I_T nexus;
- b) the Management Identifier argument set to the value in the TAG field; and
- c) the Service Response argument set to INCORRECT LOGICAL UNIT NUMBER (see table 39).

6.3 Information unit sequences

6.3.1 Overview

The sequence figures in 6.3 describe communication between a UAS initiator port and a UAS target port. Figure 5 is an example UAS Sequence figure. Lines with an arrow that points to the UAS target port represents a communication from the UAS initiator port to the UAS target port. Lines with an arrow that points to the UAS initiator port represents a communication from the UAS target port to the UAS initiator port. Each arrow has the following:

- a) a pipe name that is the name of a USB pipe (see 4.1);
- b) an IU that is an optional parameter that indicates the IU (see 6.2) transferred on the pipe; and
- c) a TAG_x that is an optional parameter that provides information regarding a field in an IU.

Only the Command pipe (see 4.1) and the Status pipe (see 4.1) use the IU and TAG_x parameters. The Data-in pipe (see 4.1) and Data-out pipe (see 4.1) transfer data associated with commands.

Figure 5 – UAS sequence figure notation

6.3.2 Non-data command/sense sequence

Figure 6 describes the sequence of communication between the UAS initiator port and UAS target port for a command that does not require data transfer.

Figure 6 – Non-data transfer with Sense

6.3.3 Non-data command/response sequence

Figure 7 describes the sequence of communication between the UAS initiator port and UAS target port for a command that returns a RESPONSE IU (e.g., the UAS target port indicates a Service Response argument of SERVICE DELIVERY OR TARGET FAILURE - Overlapped Tag (see table 39)).

Figure 7 – Non-data Transfer with Response

6.3.4 Data-out command sequence

Figure 8 describes the sequence of communication between the UAS initiator port and UAS target port for a data-out command sequence (i.e., command that requires data transfer from the UAS initiator port to the UAS target port).

Figure 8 – Write Data Transfer

6.3.5 Data-in command sequence

Figure 9 describes the sequence of communication between the UAS initiator port and UAS target port for a Data-in command sequence (i.e., command that requires data transfer from the UAS target port to the UAS initiator port).

Figure 9 – Read Data Transfer

6.3.6 Task management function sequence

Figure 10 describes the sequence of communication between the UAS initiator port and UAS target port for a task management function.

Figure 10 – Task Management

6.3.7 Bi-directional command sequence

Figure 11 describes the sequence of communication between the UAS initiator port and UAS target port for a command that requires data transfer both directions between the UAS target port and the UAS initiator port. Once the READ READY IU and WRITE READY IU are received by the UAS initiator port, both data-in and data-out transfer may occur asynchronously. The UAS target port may send the READ READY IU and wait for the data-in transfer to complete and then send the WRITE READY IU and then wait for data-out transfer to complete, or vice-versa.

Figure 11 – Bi-directional Data Transfer

The order of the data-in and data-out phases of a bidirectional command may be influenced by both the definition of the bidirectional command and the capabilities of the USB target.

6.3.8 Multiple command example

Figure 12 describes the sequence of communication between a UAS initiator port and a UAS target port for several commands using task set management (see SAM-6) as follows:

- 1) the UAS initiator port transfers a read command with TAG 1;
- 2) the UAS initiator port transfers a read command with TAG 2;
- 3) the UAS initiator port transfers a write command with TAG 3;
- 4) the UAS initiator port transfers a write command with TAG 4;
- 5) the UAS target port requests to transfer the read data for TAG 2;
- 6) the UAS target port requests to transfer the write data for TAG 4;
- 7) data transfer begins for both TAG 2 and TAG 4;
- 8) the UAS initiator port transfers a task management request (using TAG 5) to abort the command with TAG 3;
- 9) the UAS target port reports that the command with TAG 3 was successfully aborted;
- 10) the UAS initiator port transfers a write command with TAG 5;
- 11) the UAS target port reports command completion for TAG 2;
- 12) the UAS target port requests to transfer the read data for TAG 1;
- 13) the UAS target port begins transferring data for TAG 1;
- 14) the UAS target port reports command completion for TAG 4;
- 15) the UAS initiator port transfers a write command with TAG 6;
- 16) the UAS target port requests the write data for TAG 6;
- 17) the UAS initiator port begins transferring data for TAG 6;
- 18) the UAS initiator port transfers a command that does not require data transfer with TAG 3;
- 19) the UAS target port reports command completion for TAG 3;
- 20) the UAS target port reports command completion for TAG 6;
- 21) the UAS target port reports command completion for TAG 1;
- 22) the UAS target port requests the write data for TAG 5;
- 23) the UAS initiator port begins transferring data for TAG 5;
- 24) the UAS target port reports command completion for TAG 5; and
- 25) the UAS target port is idle.

In figure 12, step numbers in circles have been inserted in front of the pipe names to match the step numbers in this subclause (i.e., 6.3.8).

Figure 12 – Multiple Command Example

7 SCSI Application Layer

7.1 Device Identification VPD page

In the Device Identification VPD page returned in response to an INQUIRY command (see SPC-6), each logical unit in a UAS target device shall include the designation descriptors for the target port identifier (see 4.6) and the relative target port identifier (see SAM-6 and SPC-6) listed in table 21.

Table 21 – Device Identification VPD page designation descriptors for the UAS target port

Field in designation descriptor	Designation descriptor	
	Target port identifier	Relative target port identifier
DESIGNATOR TYPE	9h (i.e., USB target port identifier)	4h (i.e., relative target port identifier)
ASSOCIATION	01b (i.e., SCSI target port)	01b (i.e., SCSI target port)
CODE SET	1h (i.e., binary)	1h (i.e., binary)
DESIGNATOR LENGTH	4	4
PIV (protocol identifier valid)	1	1
PROTOCOL IDENTIFIER	9h (i.e., UAS)	9h (i.e., UAS)
DESIGNATOR	USB device address and USB interface number ^a (see 4.6)	Relative port identifier ^b as described in SAM-6 and SPC-6
^a The DESIGNATOR field contains the USB device address of the UAS target port through which the INQUIRY command was received. ^b The DESIGNATOR field contains the relative port identifier of the UAS target port through which the INQUIRY command was received.		

The Device Identification VPD page (see SPC-6) shall contain at least one designation descriptor with the DESIGNATOR TYPE field set to 03h (i.e., NAA) and the ASSOCIATION field set to 00b (i.e., logical unit) for each logical unit accessible through that UAS target port.

7.2 Transport Protocol Services

7.2.1 SCSI transport protocol services overview

An application client requests the processing of a SCSI command by invoking SCSI transport protocol services, the collective operation of which is conceptually modeled in the following procedure call (see SAM-6):

Service response = Execute Command (IN (I_T_L Nexus, Command Identifier, CDB, Task Attribute, [Data-in Buffer Size], [Data-out Buffer], [Data-out Buffer Size], [Command Priority]), OUT ([Data-in Buffer], [Sense Data], [Sense Data Length], Status, [Status Qualifier]))

This standard defines the transport protocol services required by SAM-6 in support of these procedure calls. Table 22 describes the mapping of the Execute Command procedure call to transport protocol services and the UAS implementation of each transport protocol service.

Table 22 – Execute Command procedure call transport protocol services

Transport protocol service	I/T ^a	Implementation	Reference
Request/Confirmation			
Send SCSI Command request	I	COMMAND IU	7.2.2
SCSI Command Received indication	T	Receipt of the COMMAND IU	7.2.3
Send Command Complete response	T	SENSE IU	7.2.4
Command Complete Received confirmation	I	Receipt of the SENSE IU or problem transmitting the SENSE IU	7.2.5
Data-in Transfer ^b			
Send Data-in request	T	READ READY IU or ERDY	7.2.6
Data-in Delivered confirmation	T	Receipt of link layer acknowledgement of the last byte of data transferred	7.2.7
Data-out Transfer ^b			
Receive Data-out request	T	WRITE READY IU or ERDY	7.2.8
Data-out Received confirmation	T	Receipt of link layer acknowledgement of the last byte of data transferred	7.2.9
Terminate Data Transfer ^b			
Terminate Data Transfer request	T		7.2.10
Data Transfer Terminated confirmation	T		7.2.11
^a I/T indicates whether the UAS initiator port (I) or the UAS target port (T) implements the transport protocol service. ^b Data transfer transport protocol services for SCSI initiator ports are not specified by SAM-6.			

An application client requests the processing of a SCSI task management function by invoking SCSI transport protocol services, the collective operation of which is conceptually modeled in the following procedure calls see SAM-6):

- Service Response = ABORT TASK (IN (Nexus));
- Service Response = ABORT TASK SET (IN (Nexus));
- Service Response = CLEAR ACA (IN (Nexus));
- Service Response = CLEAR TASK SET (IN (Nexus));
- Service Response = I_T NEXUS RESET (IN (Nexus));
- Service Response = LOGICAL UNIT RESET (IN (Nexus));
- Service Response = QUERY TASK (IN (Nexus));
- Service Response = QUERY TASK SET (IN (Nexus)); and
- Service Response = QUERY ASYNCHRONOUS EVENT (IN (Nexus), OUT ([Additional Response Information])).

This standard defines the task management function transport protocol services required by SAM-6 in support of the task management function procedure calls. Table 23 describes the mapping of these procedure calls to transport protocol services and the UAS implementation of each transport protocol service.

Table 23 – Task management function procedure call transport protocol services

Transport protocol service	I/T ^a	Implementation	Reference
Request/Confirmation			
Send Task Management Request request	I	TASK MANAGEMENT IU	7.2.12
Task Management Request Received indication	T	Receipt of the TASK MANAGEMENT IU	7.2.13
Task Management Function Executed response	T	RESPONSE IU	7.2.14
Received Task Management Function Executed confirmation	I	Receipt of the RESPONSE IU or problem transmitting the COMMAND IU	7.2.15 and 7.2.5
^a I/T indicates whether the UAS initiator port (I) or the UAS target port (T) implements the transport protocol service.			

7.2.2 Send SCSI Command transport protocol service

An application client uses the Send SCSI Command transport protocol service to request that a UAS initiator port send a COMMAND IU (see 6.2.2) on the Command pipe.

Send SCSI Command (IN (I_T_L Nexus, Command Identifier, CDB, Task Attribute, [Data-in Buffer Size], [Data-out Buffer], [Data-out Buffer Size], [CRN], [Command Priority], [First Burst Enabled]))

Table 24 shows how the arguments to the Send SCSI Command transport protocol service are used.

Table 24 – Send SCSI Command transport protocol service arguments

Argument	Implementation
I_T_L nexus	I_T_L nexus, where: a) I specifies the initiator port used to send the COMMAND IU; b) T specifies the target port to which the COMMAND IU is to be sent; and c) L specifies the value used to set the LOGICAL UNIT NUMBER field in the COMMAND IU.
Command Identifier	Specifies the value used to set the TAG field in the COMMAND IU.
CDB	Specifies the CDB field in the COMMAND IU.
Task Attribute	Specifies the value used to set the TASK ATTRIBUTE field in the COMMAND IU.
[Data-in Buffer Size]	Maximum of 2^{32} bytes
[Data-out Buffer]	Internal to the UAS initiator port
[Data-out Buffer Size]	Maximum of 2^{32} bytes
[CRN]	Ignored
[Command Priority]	Specifies the value used to set the COMMAND PRIORITY field in the COMMAND IU.
[First Burst Enabled]	Ignored
