Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

ISO/IEC 18045 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 27, *IT Security techniques*. The identical text of ISO/IEC 18045 is published by the Common Criteria Project Sponsoring Organisations as *Common Methodology for Information Technology Security Evaluation*. The common XML source for both publications can be found at <http://www.oc.ccn.cni.es/xml>.

This second edition cancels and replaces the first edition (ISO/IEC 18045:2005), which has been technically revised.

Legal Notice

The governmental organizations listed below contributed to the development of this version of the Common Methodology for Information Technology Security Evaluations. As the joint holders of the copyright in the Common Methodology for Information Technology Security Evaluations, version 3.1 (called CEM 3.1), they hereby grant non-exclusive license to ISO/IEC to use CEM 3.1 in the continued development/maintenance of the ISO/IEC 18045 international standard. However, these governmental organizations retain the right to use, copy, distribute, translate or modify CEM 3.1 as they see fit.

Introduction

The target audience for this International Standard is primarily evaluators applying ISO/IEC 15408 and certifiers confirming evaluator actions; evaluation sponsors, developers, PP/ST authors and other parties interested in IT security are a secondary audience.

This International Standard recognises that not all questions concerning IT security evaluation will be answered herein and that further interpretations will be needed. Individual schemes will determine how to handle such interpretations, although these can be subject to mutual recognition agreements. A list of methodology-related activities that can be handled by individual schemes can be found in Annex A.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 18045:2008

Information technology — Security techniques — Methodology for IT security evaluation

1 Scope

This International Standard is a companion document to the evaluation criteria for IT security defined in ISO/IEC 15408. It defines the minimum actions to be performed by an evaluator in order to conduct an ISO/IEC 15408 evaluation, using the criteria and evaluation evidence defined in ISO/IEC 15408.

This International Standard does not define evaluator actions for certain high-assurance ISO/IEC 15408 components, where there is as yet no generally agreed guidance.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO/IEC 15408 (all parts), *Information technology — Security techniques — Evaluation criteria for IT security*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

NOTE Terms which are presented in bold-faced type are themselves defined in this clause.

3.1

action

evaluator action element of ISO/IEC 15408-3

NOTE These actions are either explicitly stated as evaluator actions or implicitly derived from developer actions (implied evaluator actions) within ISO/IEC 15408-3 assurance components.

3.2

activity

application of an assurance class of ISO/IEC 15408-3

3.3

check

generate a **verdict** by a simple comparison

NOTE Evaluator expertise is not required. The statement that uses this verb describes what is mapped.

3.4

evaluation deliverable

any resource required from the sponsor or developer by the evaluator or evaluation authority to perform one or more evaluation or evaluation oversight activities

3.5

evaluation evidence

tangible **evaluation deliverable**

3.6

evaluation technical report

report that documents the **overall verdict** and its justification, produced by the evaluator and submitted to an evaluation authority

3.7

examine

generate a **verdict** by analysis using evaluator expertise

NOTE The statement that uses this verb identifies what is analysed and the properties for which it is analysed.

3.8

interpretation

clarification or amplification of an ISO/IEC 15408, ISO/IEC 18045 or **scheme** requirement

3.9

methodology

system of principles, procedures and processes applied to IT security evaluations

3.10

observation report

report written by the evaluator requesting a clarification or identifying a problem during the evaluation

3.11

overall verdict

pass or fail statement issued by an evaluator with respect to the result of an evaluation

3.12

oversight verdict

statement issued by an evaluation authority confirming or rejecting an *overall verdict* based on the results of evaluation oversight activities

3.13

record

retain a written description of procedures, events, observations, insights and results in sufficient detail to enable the work performed during the evaluation to be reconstructed at a later time

3.14

report

include evaluation results and supporting material in the **evaluation technical report** or an **observation report**

3.15

scheme

set of rules, established by an evaluation authority, defining the evaluation environment, including criteria and **methodology** required to conduct IT security evaluations

3.16

sub-activity

application of an assurance component of ISO/IEC 15408-3

NOTE Assurance families are not explicitly addressed in this International Standard because evaluations are conducted on a single assurance component from an assurance family.

3.17

tracing

simple directional relation between two sets of entities, which shows which entities in the first set correspond to which entities in the second

3.18**verdict**

pass, fail or inconclusive statement issued by an evaluator with respect to an ISO/IEC 15408 evaluator action element, assurance component, or class

NOTE Also see **overall verdict**.

3.19**work unit**

most granular level of evaluation work

NOTE Each evaluation methodology action comprises one or more work units, which are grouped within the evaluation methodology action by ISO/IEC 15408 content and presentation of evidence or developer action element. The work units are presented in this International Standard in the same order as ISO/IEC 15408 elements from which they are derived. Work units are identified in the left margin by a symbol such as ALC_TAT.1-2. In this symbol, the string ALC_TAT.1 indicates ISO/IEC 15408 component (i.e. this International Standard sub-activity), and the final digit (2) indicates that this is the second work unit in the ALC_TAT.1 sub-activity.

4 Symbols and abbreviated terms

ETR Evaluation Technical Report

OR Observation Report

5 Overview**5.1 Organisation of this International Standard**

Clause 6 defines the conventions used in this International Standard.

Clause 7 describes general evaluation tasks with no verdicts associated with them as they do not map to ISO/IEC 15408 evaluator action elements.

Clause 8 addresses the work necessary for reaching an evaluation result on a PP.

Clauses 9 to 15 define the evaluation activities, organised by Assurance Classes.

Annex A covers the basic evaluation techniques used to provide technical evidence of evaluation results.

Annex B provides an explanation of the Vulnerability Analysis criteria and examples of their application

6 Document Conventions**6.1 Terminology**

Unlike ISO/IEC 15408, where each element maintains the last digit of its identifying symbol for all components within the family, this International Standard may introduce new work units when an ISO/IEC 15408 evaluator action element changes from sub-activity to sub-activity; as a result, the last digit of the work unit's identifying symbol may change although the work unit remains unchanged.

Any methodology-specific evaluation work required that is not derived directly from ISO/IEC 15408 requirements is termed *task* or *sub-task*.

6.2 Verb usage

The auxiliary verb *shall* is used only when the provided text is mandatory and therefore only within the work units and sub-tasks. The work units and sub-tasks contain mandatory activities that the evaluator must perform in order to assign verdicts.

Guidance text accompanying work units and sub-tasks gives further explanation on how to apply ISO/IEC 15408 words in an evaluation. The verb usage is in accordance with ISO definitions for these verbs. The auxiliary verb *should* is used when the described method is strongly preferred. All other auxiliary verbs, including *may*, are used where the described method(s) is allowed but is neither recommended nor strongly preferred; it is merely explanation.

The verbs *check*, *examine*, *report* and *record* are used with a precise meaning within this part of this International Standard and the Clause 3 should be referenced for their definitions.

6.3 General evaluation guidance

Material that has applicability to more than one sub-activity is collected in one place. Guidance whose applicability is widespread (across activities and EALs) has been collected into Annex A. Guidance that pertains to multiple sub-activities within a single activity has been provided in the introduction to that activity. If guidance pertains to only a single sub-activity, it is presented within that sub-activity.

6.4 Relationship between ISO/IEC 15408 and ISO/IEC 18045 structures

There are direct relationships between ISO/IEC 15408 structure (i.e. class, family, component and element) and the structure of this International Standard. Figure 1 illustrates the correspondence between ISO/IEC 15408 constructs of class, family and evaluator action elements and evaluation methodology activities, sub-activities and actions. However, several evaluation methodology work units may result from the requirements noted in ISO/IEC 15408 developer action and content and presentation elements.

Figure 1 - Mapping of ISO/IEC 15408 and ISO/IEC 18045 structures

7 Evaluation process and related tasks

7.1 Introduction

This clause provides an overview of the evaluation process and defines the tasks an evaluator is intended to perform when conducting an evaluation.

Each evaluation, whether of a PP or TOE (including ST), follows the same process, and has four evaluator tasks in common: the input task, the output task, the evaluation sub-activities, and the demonstration of the technical competence to the evaluation authority task.

The input task and the output tasks, which are related to management of evaluation evidence and to report generation, are entirely described in this clause. Each task has associated sub-tasks that apply to, and are normative for all ISO/IEC 15408 evaluations (evaluation of a PP or a TOE).

The evaluation sub-activities are only introduced in this clause, and fully described in the following clauses.

In contrast to the evaluation sub-activities, input and output tasks have no verdicts associated with them as they do not map to ISO/IEC 15408 evaluator action elements; they are performed in order to ensure conformance with the universal principles and to comply with this International Standard.

The demonstration of the technical competence to the evaluation authority task may be fulfilled by the evaluation authority analysis of the output tasks results, or may include the demonstration by the evaluators of their understanding of the inputs for the evaluation sub-activities. This task has no associated evaluator verdict, but has an evaluator authority verdict. The detailed criteria to pass this task are left to the discretion of the evaluation authority, as noted in Annex A.5.

7.2 Evaluation process overview

7.2.1 Objectives

This subclause presents the general model of the methodology and identifies:

- a) roles and responsibilities of the parties involved in the evaluation process;
- b) the general evaluation model.

7.2.2 Responsibilities of the roles

The general model defines the following roles: sponsor, developer, evaluator and evaluation authority.

The sponsor is responsible for requesting and supporting an evaluation. This means that the sponsor establishes the different agreements for the evaluation (e.g. commissioning the evaluation). Moreover, the sponsor is responsible for ensuring that the evaluator is provided with the evaluation evidence.

The developer produces the TOE and is responsible for providing the evidence required for the evaluation (e.g. training, design information), on behalf of the sponsor.

The evaluator performs the evaluation tasks required in the context of an evaluation: the evaluator receives the evaluation evidence from the developer on behalf of the sponsor or directly from the sponsor, performs the evaluation sub-activities and provides the results of the evaluation assessment to the evaluation authority.

The evaluation authority establishes and maintains the scheme, monitors the evaluation conducted by the evaluator, and issues certification/validation reports as well as certificates based on the evaluation results provided by the evaluator.

7.2.3 Relationship of roles

To prevent undue influence from improperly affecting an evaluation, some separation of roles is required. This implies that the roles described above are fulfilled by different entities, except that the roles of developer and sponsor may be satisfied by a single entity.

Moreover, some evaluations (e.g. EAL1 evaluation) may not require the developer to be involved in the project. In this case, it is the sponsor who provides the TOE to the evaluator and who generates the evaluation evidence.

7.2.4 General evaluation model

The evaluation process consists of the evaluator performing the evaluation input task, the evaluation output task and the evaluation sub-activities. Figure 2 provides an overview of the relationship between these tasks and sub-activities.

Figure 2 - Generic evaluation model

The evaluation process may be preceded by a preparation phase where initial contact is made between the sponsor and the evaluator. The work that is performed and the involvement of the different roles during this phase may vary. It is typically during this step that the evaluator performs a feasibility analysis to assess the likelihood of a successful evaluation.

7.2.5 Evaluator verdicts

The evaluator assigns verdicts to the requirements of ISO/IEC 15408 and not to those of this International Standard. The most granular ISO/IEC 15408 structure to which a verdict is assigned is the evaluator action element (explicit or implied). A verdict is assigned to an applicable ISO/IEC 15408 evaluator action element as a result of performing the corresponding evaluation methodology action and its constituent work units. Finally, an evaluation result is assigned, as described in ISO/IEC 15408-1, Clause 9, Evaluation results.

Figure 3 - Example of the verdict assignment rule

This International Standard recognises three mutually exclusive verdict states:

- a) Conditions for a *pass* verdict are defined as an evaluator completion of ISO/IEC 15408 evaluator action element and determination that the requirements for the PP, ST or TOE under evaluation are met. The conditions for passing the element are defined as:
 - 1) the constituent work units of the related evaluation methodology action, and;
 - 2) all evaluation evidence required for performing these work units is coherent, that is it can be fully and completely understood by the evaluator, and
 - 3) all evaluation evidence required for performing these work units does not have any obvious internal inconsistencies or inconsistencies with other evaluation evidence. Note that obvious means here that the evaluator discovers this inconsistency while performing the work units: the evaluator should not undertake a full consistency analysis across the entire evaluation evidence every time a work unit is performed.
- b) Conditions for a *fail* verdict are defined as an evaluator completion of ISO/IEC 15408 evaluator action element and determination that the requirements for the PP, ST, or TOE under evaluation are not met, or that the evidence is incoherent, or an obvious inconsistency in the evaluation evidence has been found;
- c) All verdicts are initially *inconclusive* and remain so until either a *pass* or *fail* verdict is assigned.

The overall verdict is *pass* if and only if all the constituent verdicts are also *pass*. In the example illustrated in Figure 3, if the verdict for one evaluator action element is *fail* then the verdicts for the corresponding assurance component, assurance class, and overall verdict are also *fail*.

7.3 Evaluation input task

7.3.1 Objectives

The objective of this task is to ensure that the evaluator has available the correct version of the evaluation evidence necessary for the evaluation and that it is adequately protected. Otherwise, the technical accuracy of the evaluation cannot be assured, nor can it be assured that the evaluation is being conducted in a way to provide repeatable and reproducible results.

7.3.2 Application notes

The responsibility to provide all the required evaluation evidence lies with the sponsor. However, most of the evaluation evidence is likely to be produced and supplied by the developer, on behalf of the sponsor.

Since the assurance requirements apply to the entire TOE, all evaluation evidence pertaining to all parts of the TOE is to be made available to the evaluator. The scope and required content of such evaluation evidence is independent of the level of control that the developer has over each of the parts of the TOE. For example, if design is required, then the TOE design (ADV_TDS) requirements will apply to all subsystems that are part of the TSF. In addition, assurance requirements that call for procedures to be in place (for example, CM capabilities (ALC_CMC) and Delivery (ALC_DEL)) will also apply to the entire TOE (including any part produced by another developer).

It is recommended that the evaluator, in conjunction with the sponsor, produce an index to required evaluation evidence. This index may be a set of references to the documentation. This index should contain enough information (e.g. a brief summary of each document, or at least an explicit title, indication of the subclauses of interest) to help the evaluator to find easily the required evidence.

It is the information contained in the evaluation evidence that is required, not any particular document structure. Evaluation evidence for a sub-activity may be provided by separate documents, or a single document may satisfy several of the input requirements of a sub-activity.

The evaluator requires stable and formally-issued versions of evaluation evidence. However, draft evaluation evidence may be provided during an evaluation, for example, to help an evaluator make an early, informal assessment, but is not used as the basis for verdicts. It may be helpful for the evaluator to see draft versions of particular appropriate evaluation evidence, such as:

- a) test documentation, to allow the evaluator to make an early assessment of tests and test procedures;
- b) design documents, to provide the evaluator with background for understanding the TOE design;
- c) source code or hardware drawings, to allow the evaluator to assess the application of the developer's standards.

Draft evaluation evidence is more likely to be encountered where the evaluation of a TOE is performed concurrently with its development. However, it may also be encountered during the evaluation of an already-developed TOE where the developer has had to perform additional work to address a problem identified by the evaluator (e.g. to correct an error in design or implementation) or to provide evaluation evidence of security that is not provided in the existing documentation (e.g. in the case of a TOE not originally developed to meet the requirements of ISO/IEC 15408).

7.3.3 Management of evaluation evidence sub-task

7.3.3.1 Configuration control

The evaluator shall perform configuration control of the evaluation evidence.

ISO/IEC 15408 implies that the evaluator is able to identify and locate each item of evaluation evidence after it has been received and is able to determine whether a specific version of a document is in the evaluator's possession.

The evaluator shall protect the evaluation evidence from alteration or loss while it is in the evaluator's possession.

7.3.3.2 Disposal

Schemes may wish to control the disposal of evaluation evidence at the conclusion of an evaluation. The disposal of the evaluation evidence should be achieved by one or more of:

- a) returning the evaluation evidence;
- b) archiving the evaluation evidence;
- c) destroying the evaluation evidence.

7.3.3.3 Confidentiality

An evaluator may have access to sponsor and developer commercially-sensitive information (e.g. TOE design information, specialist tools), and may have access to nationally-sensitive information during the course of an evaluation. Schemes may wish to impose requirements for the evaluator to maintain the confidentiality of the evaluation evidence. The sponsor and evaluator may mutually agree to additional requirements as long as these are consistent with the scheme.

Confidentiality requirements affect many aspects of evaluation work, including the receipt, handling, storage and disposal of evaluation evidence.

7.4 Evaluation sub-activities

The evaluation sub-activities vary depending whether it is a PP or a TOE evaluation. Moreover, in the case of a TOE evaluation, the sub-activities depend upon the selected assurance requirements.

7.5 Evaluation output task

7.5.1 Objectives

The objective of this Subclause is to describe the Observation Report (OR) and the Evaluation Technical Report (ETR). Schemes may require additional evaluator reports such as reports on individual units of work, or may require additional information to be contained in the OR and the ETR. This International Standard does not preclude the addition of information into these reports as this International Standard specifies only the minimum information content.

Consistent reporting of evaluation results facilitates the achievement of the universal principle of repeatability and reproducibility of results. The consistency covers the type and the amount of information reported in the ETR and OR. ETR and OR consistency among different evaluations is the responsibility of the evaluation authority.

The evaluator performs the two following sub-tasks in order to achieve this International Standard requirements for the information content of reports:

- a) write OR sub-task (if needed in the context of the evaluation);
- b) write ETR sub-task.

7.5.2 Management of evaluation outputs

The evaluator delivers the ETR to the evaluation authority, as well as any ORs as they become available. Requirements for controls on handling the ETR and ORs are established by the scheme which may include delivery to the sponsor or developer. The ETR and ORs may include sensitive or proprietary information and may need to be sanitised before they are given to the sponsor.

7.5.3 Application notes

In this version of this International Standard, the requirements for the provision of evaluator evidence to support re-evaluation and re-use have not been explicitly stated. Where information for re-evaluation or re-use is required by the sponsor, the scheme under which the evaluation is being performed should be consulted.

7.5.4 Write OR sub-task

ORs provide the evaluator with a mechanism to request a clarification (e.g. from the evaluation authority on the application of a requirement) or to identify a problem with an aspect of the evaluation.

In the case of a fail verdict, the evaluator shall provide an OR to reflect the evaluation result. Otherwise, the evaluator may use ORs as one way of expressing clarification needs.

For each OR, the evaluator shall report the following:

- a) the identifier of the PP or TOE evaluated;
- b) the evaluation task/sub-activity during which the observation was generated;
- c) the observation;
- d) the assessment of its severity (e.g. implies a fail verdict, holds up progress on the evaluation, requires a resolution prior to evaluation being completed);
- e) the identification of the organisation responsible for resolving the issue;
- f) the recommended timetable for resolution;
- g) the assessment of the impact on the evaluation of failure to resolve the observation.

The intended audience of an OR and procedures for handling the report depend on the nature of the report's content and on the scheme. Schemes may distinguish different types of ORs or define additional types, with associated differences in required information and distribution (e.g. evaluation ORs to evaluation authorities and sponsors).

7.5.5 Write ETR sub-task

7.5.5.1 Objectives

The evaluator shall provide an ETR to present technical justification of the verdicts.

This International Standard defines the ETR's minimum content requirement; however, schemes may specify additional content and specific presentational and structural requirements. For instance, schemes may require that certain introductory material (e.g. disclaimers and copyright Clauses) be reported in the ETR.

The reader of the ETR is assumed to be familiar with general concepts of information security, ISO/IEC 15408, this International Standard, evaluation approaches and IT.

The ETR supports the evaluation authority to confirm that the evaluation was done to the required standard, but it is anticipated that the documented results may not provide all of the necessary information, so additional information specifically requested by the scheme may be necessary. This aspect is outside the scope of this International Standard.

7.5.5.2 ETR for a PP Evaluation

This Subclause describes the minimum content of the ETR for a PP evaluation. The contents of the ETR are portrayed in Figure 4; this figure may be used as a guide when constructing the structural outline of the ETR document.

Figure 4 - ETR information content for a PP evaluation

7.5.5.2.1 Introduction

The evaluator shall report evaluation scheme identifiers.

Evaluation scheme identifiers (e.g. logos) are the information required to unambiguously identify the scheme responsible for the evaluation oversight.

The evaluator shall report ETR configuration control identifiers.

The ETR configuration control identifiers contain information that identifies the ETR (e.g. name, date and version number).

The evaluator shall report PP configuration control identifiers.

PP configuration control identifiers (e.g. name, date and version number) are required to identify what is being evaluated in order for the evaluation authority to verify that the verdicts have been assigned correctly by the evaluator.

The evaluator shall report the identity of the developer.

The identity of the PP developer is required to identify the party responsible for producing the PP.

The evaluator shall report the identity of the sponsor.

The identity of the sponsor is required to identify the party responsible for providing evaluation evidence to the evaluator.

The evaluator shall report the identity of the evaluator.

The identity of the evaluator is required to identify the party performing the evaluation and responsible for the evaluation verdicts.

7.5.5.2.2 Evaluation

The evaluator shall report the evaluation methods, techniques, tools and standards used.

The evaluator references the evaluation criteria, methodology and interpretations used to evaluate the PP.

The evaluator shall report any constraints on the evaluation, constraints on the handling of evaluation results and assumptions made during the evaluation that have an impact on the evaluation results.

The evaluator may include information in relation to legal or statutory aspects, organisation, confidentiality, etc.

7.5.5.2.3 Results of the evaluation

The evaluator shall report a verdict and a supporting rationale for each assurance component that constitutes an APE activity, as a result of performing the corresponding evaluation methodology action and its constituent work units.

The rationale justifies the verdict using ISO/IEC 15408, this International Standard, any interpretations and the evaluation evidence examined and shows how the evaluation evidence does or does not meet each aspect of the criteria. It contains a description of the work performed, the method used, and any derivation of results. The rationale may provide detail to the level of a evaluation methodology work unit.

7.5.5.2.4 Conclusions and recommendations

The evaluator shall report the conclusions of the evaluation, in particular the overall verdict as defined in ISO/IEC 15408-1 Clause 9, Evaluation results, and determined by application of the verdict assignment described in 7.2.5.

The evaluator provides recommendations that may be useful for the evaluation authority. These recommendations may include shortcomings of the PP discovered during the evaluation or mention of features which are particularly useful.

7.5.5.2.5 List of evaluation evidence

The evaluator shall report for each item of evaluation evidence the following information:

- the issuing body (e.g. the developer, the sponsor);
- the title;
- the unique reference (e.g. issue date and version number).

7.5.5.2.6 List of acronyms/Glossary of terms

The evaluator shall report any acronyms or abbreviations used in the ETR.

Glossary definitions already defined by ISO/IEC 15408 or by this International Standard need not be repeated in the ETR.

7.5.5.2.7 Observation reports

The evaluator shall report a complete list that uniquely identifies the ORs raised during the evaluation and their status.

For each OR, the list should contain its identifier as well as its title or a brief summary of its content.

7.5.5.3 ETR for a TOE Evaluation

This Subclause describes the minimum content of the ETR for a TOE evaluation. The contents of the ETR are portrayed in Figure 5; this figure may be used as a guide when constructing the structural outline of the ETR document.

Figure 5 - ETR information content for a TOE evaluation

7.5.5.3.1 Introduction

The evaluator shall report evaluation scheme identifiers.

Evaluation scheme identifiers (e.g. logos) are the information required to unambiguously identify the scheme responsible for the evaluation oversight.

The evaluator shall report ETR configuration control identifiers.

The ETR configuration control identifiers contain information that identifies the ETR (e.g. name, date and version number).

The evaluator shall report ST and TOE configuration control identifiers.

ST and TOE configuration control identifiers identify what is being evaluated in order for the evaluation authority to verify that the verdicts have been assigned correctly by the evaluator.

If the ST claims that the TOE conforms to the requirements of one or more PPs, the ETR shall report the reference of the corresponding PPs.

The PPs reference contains information that uniquely identifies the PPs (e.g. title, date, and version number).

The evaluator shall report the identity of the developer.

The identity of the TOE developer is required to identify the party responsible for producing the TOE.

The evaluator shall report the identity of the sponsor.

The identity of the sponsor is required to identify the party responsible for providing evaluation evidence to the evaluator.

The evaluator shall report the identity of the evaluator.

The identity of the evaluator is required to identify the party performing the evaluation and responsible for the evaluation verdicts.

7.5.5.3.2 Architectural description of the TOE

The evaluator shall report a high level description of the TOE and its major components based on the evaluation evidence described in ISO/IEC 15408 assurance family entitled TOE design (ADV_TDS), where applicable.

The intent of this Subclause is to characterise the degree of architectural separation of the major components. If there is no TOE design (ADV_TDS) requirement in the ST, this is not applicable and is considered to be satisfied.

7.5.5.3.3 Evaluation

The evaluator shall report the evaluation methods, techniques, tools and standards used.

The evaluator may reference the evaluation criteria, methodology and interpretations used to evaluate the TOE or the devices used to perform the tests.

The evaluator shall report any constraints on the evaluation, constraints on the distribution of evaluation results and assumptions made during the evaluation that have an impact on the evaluation results.

The evaluator may include information in relation to legal or statutory aspects, organisation, confidentiality, etc.

7.5.5.3.4 Results of the evaluation

For each activity on which the TOE is evaluated, the evaluator shall report:

- the title of the activity considered;
- a verdict and a supporting rationale for each assurance component that constitutes this activity, as a result of performing the corresponding evaluation methodology action and its constituent work units.

The rationale justifies the verdict using ISO/IEC 15408, this International Standard, any interpretations and the evaluation evidence examined and shows how the evaluation evidence does or does not meet each aspect of the criteria. It contains a description of the work performed, the method used, and any derivation of results. The rationale may provide detail to the level of a evaluation methodology work unit.

The evaluator shall report all information specifically required by a work unit.

For the AVA and ATE activities, work units that identify information to be reported in the ETR have been defined.

7.5.5.3.5 Conclusions and recommendations

The evaluator shall report the conclusions of the evaluation, which will relate to whether the TOE has satisfied its associated ST, in particular the overall verdict as defined in ISO/IEC 15408-1 Clause 9, Evaluation results, and determined by application of the verdict assignment described in 7.2.5.

The evaluator provides recommendations that may be useful for the evaluation authority. These recommendations may include shortcomings of the IT product discovered during the evaluation or mention of features which are particularly useful.

7.5.5.3.6 List of evaluation evidence

The evaluator shall report for each item of evaluation evidence the following information:

- the issuing body (e.g. the developer, the sponsor);
- the title;
- the unique reference (e.g. issue date and version number).

7.5.5.3.7 List of acronyms/Glossary of terms

The evaluator shall report any acronyms or abbreviations used in the ETR.

Glossary definitions already defined by ISO/IEC 15408 or by this International Standard need not be repeated in the ETR.

7.5.5.3.8 Observation reports

The evaluator shall report a complete list that uniquely identifies the ORs raised during the evaluation and their status.

For each OR, the list should contain its identifier as well as its title or a brief summary of its content.

8 Class APE: Protection Profile evaluation

8.1 Introduction

This Clause describes the evaluation of a PP. The requirements and methodology for PP evaluation are identical for each PP evaluation, regardless of the EAL (or other set of assurance requirements) that is claimed in the PP. The evaluation methodology in this Clause is based on the requirements on the PP as specified in ISO/IEC 15408-3 class APE.

This Clause should be used in conjunction with Annexes A, B and C in ISO/IEC 15408-1, as these Annexes clarify the concepts here and provide many examples.

8.2 Application notes

8.2.1 Re-using the evaluation results of certified PPs

While evaluating a PP that is based on one or more certified PPs, it may be possible to re-use the fact that these PPs were certified. The potential for re-use of the result of a certified PP is greater if the PP under evaluation does not add threats, OSPs, security objectives and/or security requirements to those of the PP that conformance is being claimed to. If the PP under evaluation contains much more than the certified PP, re-use may not be useful at all.

The evaluator is allowed to re-use the PP evaluation results by doing certain analyses only partially or not at all if these analyses or parts thereof were already done as part of the PP evaluation. While doing this, the evaluator should assume that the analyses in the PP were performed correctly.

An example would be where the PP that conformance is being claimed to contains a set of security requirements, and these were determined to be internally consistent during its evaluation. If the PP under evaluation uses the exact same requirements, the consistency analysis does not have to be repeated during the PP evaluation. If the PP under evaluation adds one or more requirements, or performs operations on these requirements, the analysis will have to be repeated. However, it may be possible to save work in this consistency analysis by using the fact that the original requirements are internally consistent. If the original requirements are internally consistent, the evaluator only has to determine that:

- a) the set of all new and/or changed requirements is internally consistent, and
- b) the set of all new and/or changed requirements is consistent with the original requirements.

The evaluator notes in the ETR each case where analyses are not done or only partially done for this reason.

8.3 PP introduction (APE_INT)

8.3.1 Evaluation of sub-activity (APE_INT.1)

8.3.1.1 Objectives

The objective of this sub-activity is to determine whether the PP is correctly identified, and whether the PP reference and TOE overview are consistent with each other.

8.3.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the PP.

8.3.1.3 Action APE_INT.1.1E

ISO/IEC 15408-3 APE_INT.1.1C: *The PP introduction shall contain a PP reference and a TOE overview.*

8.3.1.3.1 Work unit APE_INT.1.1-1

The evaluator shall check that the PP introduction contains a PP reference and a TOE overview.

ISO/IEC 15408-3 APE_INT.1.2C: *The PP reference shall uniquely identify the PP.*

8.3.1.3.2 Work unit APE_INT.1-2

The evaluator shall examine the PP reference to determine that it uniquely identifies the PP.

The evaluator determines that the PP reference identifies the PP itself, so that it may be easily distinguished from other PPs, and that it also uniquely identifies each version of the PP, e.g. by including a version number and/or a date of publication.

The PP should have some referencing system that is capable of supporting unique references (e.g. use of numbers, letters or dates).

ISO/IEC 15408-3 APE_INT.1.3C: *The TOE overview shall summarise the usage and major security features of the TOE.*

8.3.1.3.3 Work unit APE_INT.1-3

The evaluator shall examine the TOE overview to determine that it describes the usage and major security features of the TOE.

The TOE overview should briefly (i.e. several paragraphs) describe the usage and major security features expected of the TOE. The TOE overview should enable consumers and potential TOE developers to quickly determine whether the PP is of interest to them.

The evaluator determines that the overview is clear enough for TOE developers and consumers, and sufficient to give them a general understanding of the intended usage and major security features of the TOE.

ISO/IEC 15408-3 APE_INT.1.4C: *The TOE overview shall identify the TOE type.*

8.3.1.3.4 Work unit APE_INT.1-4

The evaluator shall check that the TOE overview identifies the TOE type.

ISO/IEC 15408-3 APE_INT.1.5C: *The TOE overview shall identify any non-TOE hardware/software/firmware available to the TOE.*

8.3.1.3.5 Work unit APE_INT.1-5

The evaluator shall examine the TOE overview to determine that it identifies any non-TOE hardware/software/firmware available to the TOE.

While some TOEs may run stand-alone, other TOEs (notably software TOEs) need additional hardware, software or firmware to operate. In this subclause of the PP, the PP author lists all hardware, software, and/or firmware that will be available for the TOE to run on.

This identification should be detailed enough for potential consumers and TOE developers to determine whether their TOE may operate with the listed hardware, software and firmware.

8.4 Conformance claims (APE_CCL)**8.4.1 Evaluation of sub-activity (APE_CCL.1)****8.4.1.1 Objectives**

The objective of this sub-activity is to determine the validity of various conformance claims. These describe how the PP conforms to ISO/IEC 15408, other PPs and packages.

8.4.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the PP;
- b) the PP(s) that the PP claims conformance to;
- c) the package(s) that the PP claims conformance to.

8.4.1.3 Action APE_CCL.1.1E

ISO/IEC 15408-3 APE_CCL.1.1C: *The conformance claim shall contain an ISO/IEC 15408 conformance claim that identifies the version of ISO/IEC 15408 to which the PP claims conformance.*

8.4.1.3.1 Work unit APE_CCL.1-1

The evaluator shall check that the conformance claim contains an ISO/IEC 15408 conformance claim that identifies the version of ISO/IEC 15408 to which the PP claims conformance.

The evaluator determines that ISO/IEC 15408 conformance claim identifies the version of ISO/IEC 15408 that was used to develop this PP. This should include the version number of ISO/IEC 15408 and, unless the International English version of ISO/IEC 15408 was used, the language of the version of ISO/IEC 15408 that was used.

ISO/IEC 15408-3 APE_CCL.1.2C: *ISO/IEC 15408 conformance claim shall describe the conformance of the PP to ISO/IEC 15408-2 as either ISO/IEC 15408-2 conformant or ISO/IEC 15408-2 extended.*

8.4.1.3.2 Work unit APE_CCL.1-2

The evaluator shall check that ISO/IEC 15408 conformance claim states a claim of either ISO/IEC 15408-2 conformant or ISO/IEC 15408-2 extended for the PP.

ISO/IEC 15408-3 APE_CCL.1.3C: *ISO/IEC 15408 conformance claim shall describe the conformance of the PP to ISO/IEC 15408-3 as either ISO/IEC 15408-3 conformant or ISO/IEC 15408-3 extended.*

8.4.1.3.3 Work unit APE_CCL.1-3

The evaluator shall check that ISO/IEC 15408 conformance claim states a claim of either ISO/IEC 15408-3 conformant or ISO/IEC 15408-3 extended for the PP.

ISO/IEC 15408-3 APE_CCL.1.4C: *ISO/IEC 15408 conformance claim shall be consistent with the extended components definition.*

8.4.1.3.4 Work unit APE_CCL.1-4

The evaluator shall examine ISO/IEC 15408 conformance claim for ISO/IEC 15408-2 to determine that it is consistent with the extended components definition.

If ISO/IEC 15408 conformance claim contains ISO/IEC 15408-2 conformant, the evaluator determines that the extended components definition does not define functional components.

If ISO/IEC 15408 conformance claim contains ISO/IEC 15408-2 extended, the evaluator determines that the extended components definition defines at least one extended functional component.

8.4.1.3.5 Work unit APE_CCL.1-5

The evaluator shall examine ISO/IEC 15408 conformance claim for ISO/IEC 15408-3 to determine that it is consistent with the extended components definition.

If ISO/IEC 15408 conformance claim contains ISO/IEC 15408-3 conformant, the evaluator determines that the extended components definition does not define assurance components.

If ISO/IEC 15408 conformance claim contains ISO/IEC 15408-3 extended, the evaluator determines that the extended components definition defines at least one extended assurance component.

ISO/IEC 15408-3 APE_CCL.1.5C: *The conformance claim shall identify all PPs and security requirement packages to which the PP claims conformance.*

8.4.1.3.6 Work unit APE_CCL.1-6

The evaluator shall check that the conformance claim contains a PP claim that identifies all PPs for which the PP claims conformance.

If the PP does not claim conformance to another PP, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that any referenced PPs are unambiguously identified (e.g. by title and version number, or by the identification included in the introduction of that PP).

The evaluator is reminded that claims of partial conformance to a PP are not permitted.

8.4.1.3.7 Work unit APE_CCL.1-7

The evaluator shall check that the conformance claim contains a package claim that identifies all packages to which the PP claims conformance.

If the PP does not claim conformance to a package, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that any referenced packages are unambiguously identified (e.g. by title and version number, or by the identification included in the introduction of that package).

The evaluator is reminded that claims of partial conformance to a package are not permitted.

ISO/IEC 15408-3 APE_CCL.1.6C: *The conformance claim shall describe any conformance of the PP to a package as either package-conformant or package-augmented.*

8.4.1.3.8 Work unit APE_CCL.1-8

The evaluator shall check that, for each identified package, the conformance claim states a claim of either package-name conformant or package-name augmented.

If the PP does not claim conformance to a package, this work unit is not applicable and therefore considered to be satisfied.

If the package conformance claim contains package-name conformant, the evaluator determines that:

- a) If the package is an assurance package, then the PP contains all SARs included in the package, but no additional SARs.
- b) If the package is a functional package, then the PP contains all SFRs included in the package, but no additional SFRs.

If the package conformance claim contains package-name augmented, the evaluator determines that:

- a) If the package is an assurance package, then the PP contains all SARs included in the package, and at least one additional SAR or at least one SAR that is hierarchical to a SAR in the package.
- b) If the package is a functional package, then the PP contains all SFRs included in the package, and at least one additional SFR or at least one SFR that is hierarchical to a SFR in the package.

ISO/IEC 15408-3 APE_CCL.1.7C: *The conformance claim rationale shall demonstrate that the TOE type is consistent with the TOE type in the PPs for which conformance is being claimed.*

8.4.1.3.9 Work unit APE_CCL.1-9

The evaluator shall examine the conformance claim rationale to determine that the TOE type of the TOE is consistent with all TOE types of the PPs.

If the PP does not claim conformance to another PP, this work unit is not applicable and therefore considered to be satisfied.

The relation between the types may be simple: a firewall PP claiming conformance to another firewall PP, or more complex: a smart card PP claiming conformance to a number of other PPs at the same time: a PP for the integrated circuit, a PP for the smart card OS, and two PPs for two applications on the smart card.

ISO/IEC 15408-3 APE_CCL.1.8C: *The conformance claim rationale shall demonstrate that the statement of the security problem definition is consistent with the statement of the security problem definition in the PPs for which conformance is being claimed.*

8.4.1.3.10 Work unit APE_CCL.1-10

The evaluator shall examine the conformance claim rationale to determine that it demonstrates that the statement of security problem definition is consistent, as defined by the conformance statement of the PP, with the statements of security problem definition stated in the PPs to which conformance is being claimed.

If the PP under evaluation does not claim conformance with another PP, this work unit is not applicable and therefore considered to be satisfied.

If the PP to which conformance is being claimed does not have a statement of security problem definition, this work unit is not applicable and therefore considered to be satisfied.

If strict conformance is required by the PP to which conformance is being claimed, no conformance claim rationale is required. Instead, the evaluator determines whether

- a) the threats in the PP under evaluation are a superset of or identical to the threats in the PP to which conformance is being claimed;
- b) the OSPs in the PP under evaluation are a superset of or identical to the OSPs in the PP to which conformance is being claimed;
- c) the assumptions in the PP under evaluation are identical to the assumptions in the PP to which conformance is being claimed;

If demonstrable conformance is required by the PP to which conformance is being claimed, the evaluator examines the conformance claim rationale to determine that it demonstrates that the statement of security problem definition of the PP under evaluation is equivalent or more restrictive than the statement of security problem definition in the PP to which conformance is being claimed.

For guidance on "equivalent or more restrictive" see ISO/IEC 15408-1 Annex D, PP conformance.

ISO/IEC 15408-3 APE_CCL.1.9C: *The conformance claim rationale shall demonstrate that the statement of security objectives is consistent with the statement of security objectives in the PPs for which conformance is being claimed.*

8.4.1.3.11 Work unit APE_CCL.1-11

The evaluator shall examine the conformance claim rationale to determine that the statement of security objectives is consistent, as defined by the conformance statement of the PPs, with the statement of security objectives in the PPs.

If the PP does not claim conformance to another PP, this work unit is not applicable and therefore considered to be satisfied.

If strict conformance is required by the PP to which conformance is being claimed, no conformance claim rationale is required. Instead, the evaluator determines whether:

- The PP under evaluation contains all security objectives for the TOE of the PP to which conformance is being claimed. Note that it is allowed for the PP under evaluation to have additional security objectives for the TOE;

- The PP under evaluation contains exactly all security objectives for the operational environment (with one exception in the next bullet). Note that it is not allowed for the PP under evaluation to have additional security objectives for the operational environment;
- The PP under evaluation may specify that certain objectives for the operational environment in the PP that conformance is being claimed to are security objectives for the TOE in the PP under evaluation. This is a valid exception to the previous bullet.

If demonstrable conformance is required by the PP to which conformance is being claimed, the evaluator examines the conformance claim rationale to determine that it demonstrates that the statement of security objectives of the PP under evaluation is equivalent or more restrictive than the statement of security objectives in the PP to which conformance is being claimed.

For guidance on “equivalent or more restrictive” see ISO/IEC 15408-1 Annex D, PP conformance.

ISO/IEC 15408-3 APE_CCL.1.10C: *The conformance claim rationale shall demonstrate that the statement of security requirements is consistent with the statement of security requirements in the PPs for which conformance is being claimed.*

8.4.1.3.12 Work unit APE_CCL.1-12

The evaluator shall examine the PP to determine that it is consistent, as defined by the conformance statement of the PP, with all security requirements in the PPs for which conformance is being claimed.

If the PP does not claim conformance to another PP, this work unit is not applicable and therefore considered to be satisfied.

If strict conformance is required by the PP to which conformance is being claimed, no conformance claim rationale is required. Instead, the evaluator determines whether the statement of security requirements in the PP under evaluation is a superset of or identical to the statement of security requirements in the PP to which conformance is being claimed (for strict conformance).

If demonstrable conformance is required by the PP to which conformance is being claimed, the evaluator examines the conformance claim rationale to determine that it demonstrates that the statement of security requirements of the PP under evaluation is equivalent or more restrictive than the statement of security requirements in the PP to which conformance is being claimed.

For guidance on “equivalent or more restrictive” see ISO/IEC 15408-1 Annex D, PP conformance.

ISO/IEC 15408-3 APE_CCL.1.11C: *The conformance statement shall describe the conformance required of any PPs/STs to the PP as strict-PP or demonstrable-PP conformance.*

8.4.1.3.13 Work unit APE_CCL.1-13

The evaluator shall check that the PP conformance statement states a claim of strict-PP or demonstrable-PP conformance.

8.5 Security problem definition (APE_SPD)

8.5.1 Evaluation of sub-activity (APE_SPD.1)

8.5.1.1 Objectives

The objective of this sub-activity is to determine that the security problem intended to be addressed by the TOE and its operational environment is clearly defined.

8.5.1.2 Input

The evaluation evidence for this sub-activity is:

a) the PP.

8.5.1.3 Action APE_SPD.1.1E

ISO/IEC 15408-3 APE_SPD.1.1C: *The security problem definition shall describe the threats.*

8.5.1.3.1 Work unit APE_SPD.1-1

The evaluator shall check that the security problem definition describes the threats.

If all security objectives are derived from assumptions and/or OSPs only, the statement of threats need not be present in the PP. In this case, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that the security problem definition describes the threats that must be countered by the TOE and/or its operational environment.

ISO/IEC 15408-3 APE_SPD.1.2C: *All threats shall be described in terms of a threat agent, an asset, and an adverse action.*

8.5.1.3.2 Work unit APE_SPD.1-2

The evaluator shall examine the security problem definition to determine that all threats are described in terms of a threat agent, an asset, and an adverse action.

If all security objectives are derived from assumptions and OSPs only, the statement of threats need not be present in the PP. In this case, this work unit is not applicable and therefore considered to be satisfied.

Threat agents may be further described by aspects such as expertise, resource, opportunity, and motivation.

ISO/IEC 15408-3 APE_SPD.1.3C: *The security problem definition shall describe the OSPs.*

8.5.1.3.3 Work unit APE_SPD.1-3

The evaluator shall check that the security problem definition describes the OSPs.

If all security objectives are derived from assumptions and/or threats only, OSPs need not be present in the PP. In this case, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that OSP statements are made in terms of rules or guidelines that must be followed by the TOE and/or its operational environment.

The evaluator determines that each OSP is explained and/or interpreted in sufficient detail to make it clearly understandable; a clear presentation of policy statements is necessary to permit tracing security objectives to them.

ISO/IEC 15408-3 APE_SPD.1.4C: *The security problem definition shall describe the assumptions about the operational environment of the TOE.*

8.5.1.3.4 Work unit APE_SPD.1-4

The evaluator shall examine the security problem definition to determine that it describes the assumptions about the operational environment of the TOE.

If there are no assumptions, this work unit is not applicable and is therefore considered to be satisfied.

The evaluator determines that each assumption about the operational environment of the TOE is explained in sufficient detail to enable consumers to determine that their operational environment matches the assumption. If the assumptions are not clearly understood, the end result may be that the TOE is used in an operational environment in which it will not function in a secure manner.

8.6 Security objectives (APE_OBJ)

8.6.1 Evaluation of sub-activity (APE_OBJ.1)

8.6.1.1 Objectives

The objective of this sub-activity is to determine whether the security objectives for the operational environment are clearly defined.

8.6.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the PP.

8.6.1.3 Action APE_OBJ.1.1E

ISO/IEC 15408-3 APE_OBJ.1.1C: *The statement of security objectives shall describe the security objectives for the operational environment.*

8.6.1.3.1 Work unit APE_OBJ.1-1

The evaluator shall check that the statement of security objectives defines the security objectives for the operational environment.

The evaluator checks that the security objectives for the operational environment are identified.

8.6.2 Evaluation of sub-activity (APE_OBJ.2)

8.6.2.1 Objectives

The objective of this sub-activity is to determine whether the security objectives adequately and completely address the security problem definition and that the division of this problem between the TOE and its operational environment is clearly defined.

8.6.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the PP.

8.6.2.3 Action APE_OBJ.2.1E

ISO/IEC 15408-3 APE_OBJ.2.1C: *The statement of security objectives shall describe the security objectives for the TOE and the security objectives for the operational environment.*

8.6.2.3.1 Work unit APE_OBJ.2-1

The evaluator shall check that the statement of security objectives defines the security objectives for the TOE and the security objectives for the operational environment.

The evaluator checks that both categories of security objectives are clearly identified and separated from the other category.

ISO/IEC 15408-3 APE_OBJ.2.2C: *The security objectives rationale shall trace each security objective for the TOE back to threats countered by that security objective and OSPs enforced by that security objective.*

8.6.2.3.2 Work unit APE_OBJ.2-2

The evaluator shall check that the security objectives rationale traces all security objectives for the TOE back to threats countered by the objectives and/or OSPs enforced by the objectives.

Each security objective for the TOE may trace back to threats or OSPs, or a combination of threats and OSPs, but it must trace back to at least one threat or OSP.

Failure to trace implies that either the security objectives rationale is incomplete, the security problem definition is incomplete, or the security objective for the TOE has no useful purpose.

ISO/IEC 15408-3 APE_OBJ.2.3C: *The security objectives rationale shall trace each security objective for the operational environment back to threats countered by that security objective, OSPs enforced by that security objective, and assumptions upheld by that security objective.*

8.6.2.3.3 Work unit APE_OBJ.2-3

The evaluator shall check that the security objectives rationale traces the security objectives for the operational environment back to threats countered by that security objective, to OSPs enforced by that security objective, and to assumptions upheld by that security objective.

Each security objective for the operational environment may trace back to threats, OSPs, assumptions, or a combination of threats, OSPs and/or assumptions, but it must trace back to at least one threat, OSP or assumption.

Failure to trace implies that either the security objectives rationale is incomplete, the security problem definition is incomplete, or the security objective for the operational environment has no useful purpose.

ISO/IEC 15408-3 APE_OBJ.2.4C: *The security objectives rationale shall demonstrate that the security objectives counter all threats.*

8.6.2.3.4 Work unit APE_OBJ.2-4

The evaluator shall examine the security objectives rationale to determine that it justifies for each threat that the security objectives are suitable to counter that threat.

If no security objectives trace back to the threat, the evaluator action related to this work unit is assigned a fail verdict.

The evaluator determines that the justification for a threat shows whether the threat is removed, diminished or mitigated.

The evaluator determines that the justification for a threat demonstrates that the security objectives are sufficient: if all security objectives that trace back to the threat are achieved, the threat is removed, sufficiently diminished, or the effects of the threat are sufficiently mitigated.

Note that the tracings from security objectives to threats provided in the security objectives rationale may be part of a justification, but do not constitute a justification by themselves. Even in the case that a security objective is merely a statement reflecting the intent to prevent a particular threat from being realised, a justification is required, but this justification may be as minimal as "Security Objective X directly counters Threat Y".

The evaluator also determines that each security objective that traces back to a threat is necessary: when the security objective is achieved it actually contributes to the removal, diminishing or mitigation of that threat.

ISO/IEC 15408-3 APE_OBJ.2.5C: *The security objectives rationale shall demonstrate that the security objectives enforce all OSPs.*

8.6.2.3.5 Work unit APE_OBJ.2-5

The evaluator shall examine the security objectives rationale to determine that for each OSP it justifies that the security objectives are suitable to enforce that OSP.

If no security objectives trace back to the OSP, the evaluator action related to this work unit is assigned a fail verdict.

The evaluator determines that the justification for an OSP demonstrates that the security objectives are sufficient: if all security objectives that trace back to that OSP are achieved, the OSP is enforced.

The evaluator also determines that each security objective that traces back to an OSP is necessary: when the security objective is achieved it actually contributes to the enforcement of the OSP.

Note that the tracings from security objectives to OSPs provided in the security objectives rationale may be part of a justification, but do not constitute a justification by themselves. In the case that a security objective is merely a statement reflecting the intent to enforce a particular OSP, a justification is required, but this justification may be as minimal as "Security Objective X directly enforces OSP Y".

ISO/IEC 15408-3 APE_OBJ.2.6C: *The security objectives rationale shall demonstrate that the security objectives for the operational environment uphold all assumptions.*

8.6.2.3.6 Work unit APE_OBJ.2-6

The evaluator shall examine the security objectives rationale to determine that for each assumption for the operational environment it contains an appropriate justification that the security objectives for the operational environment are suitable to uphold that assumption.

If no security objectives for the operational environment trace back to the assumption, the evaluator action related to this work unit is assigned a fail verdict.

The evaluator determines that the justification for an assumption about the operational environment of the TOE demonstrates that the security objectives are sufficient: if all security objectives for the operational environment that trace back to that assumption are achieved, the operational environment upholds the assumption.

The evaluator also determines that each security objective for the operational environment that traces back to an assumption about the operational environment of the TOE is necessary: when the security objective is achieved it actually contributes to the operational environment upholding the assumption.

Note that the tracings from security objectives for the operational environment to assumptions provided in the security objectives rationale may be a part of a justification, but do not constitute a justification by themselves. Even in the case that a security objective of the operational environment is merely a restatement of an assumption, a justification is required, but this justification may be as minimal as "Security Objective X directly upholds Assumption Y".

8.7 Extended components definition (APE_ECD)

8.7.1 Evaluation of sub-activity (APE_ECD.1)

8.7.1.1 Objectives

The objective of this sub-activity is to determine whether extended components have been clearly and unambiguously defined, and whether they are necessary, i.e. they may not be clearly expressed using existing ISO/IEC 15408-2 or ISO/IEC 15408-3 components.

8.7.1.2 Input

The evaluation evidence for this sub-activity is:

a) the PP.

8.7.1.3 Action APE_ECD.1.1E

ISO/IEC 15408-3 APE_ECD.1.1C: *The statement of security requirements shall identify all extended security requirements.*

8.7.1.3.1 Work unit APE_ECD.1-1

The evaluator shall check that all security requirements in the statement of security requirements that are not identified as extended requirements are present in ISO/IEC 15408-2 or in ISO/IEC 15408-3.

ISO/IEC 15408-3 APE_ECD.1.2C: *The extended components definition shall define an extended component for each extended security requirement.*

8.7.1.3.2 Work unit APE_ECD.1-2

The evaluator shall check that the extended components definition defines an extended component for each extended security requirement.

If the PP does not contain extended security requirements, this work unit is not applicable and therefore considered to be satisfied.

A single extended component may be used to define multiple iterations of an extended security requirement, it is not necessary to repeat this definition for each iteration.

ISO/IEC 15408-3 APE_ECD.1.3C: *The extended components definition shall describe how each extended component is related to the existing ISO/IEC 15408 components, families, and classes.*

8.7.1.3.3 Work unit APE_ECD.1-3

The evaluator shall examine the extended components definition to determine that it describes how each extended component fits into the existing ISO/IEC 15408 components, families, and classes.

If the PP does not contain extended security requirements, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that each extended component is either:

- a) a member of an existing ISO/IEC 15408-2 or ISO/IEC 15408-3 family, or
- b) a member of a new family defined in the PP.

If the extended component is a member of an existing ISO/IEC 15408-2 or ISO/IEC 15408-3 family, the evaluator determines that the extended components definition adequately describes why the extended component should be a member of that family and how it relates to other components of that family.

If the extended component is a member of a new family defined in the PP, the evaluator confirms that the extended component is not appropriate for an existing family.

If the PP defines new families, the evaluator determines that each new family is either:

- a) a member of an existing ISO/IEC 15408-2 or ISO/IEC 15408-3 class, or
- b) a member of a new class defined in the PP.

If the family is a member of an existing ISO/IEC 15408-2 or ISO/IEC 15408-3 class, the evaluator determines that the extended components definition adequately describes why the family should be a member of that class and how it relates to other families in that class.

If the family is a member of a new class defined in the PP, the evaluator confirms that the family is not appropriate for an existing class.

8.7.1.3.4 Work unit APE_ECD.1-4

The evaluator shall examine the extended components definition to determine that each definition of an extended component identifies all applicable dependencies of that component.

If the PP does not contain extended security requirements, this work unit is not applicable and therefore considered to be satisfied.

The evaluator confirms that no applicable dependencies have been overlooked by the PP author.

ISO/IEC 15408-3 APE_ECD.1.4C: *The extended components definition shall use the existing ISO/IEC 15408 components, families, classes, and methodology as a model for presentation.*

8.7.1.3.5 Work unit APE_ECD.1-5

The evaluator shall examine the extended components definition to determine that each extended functional component uses the existing ISO/IEC 15408-2 components as a model for presentation.

If the PP does not contain extended SFRs, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that the extended functional component is consistent with ISO/IEC 15408-2 Subclause 6.1.3, Component structure.

If the extended functional component uses operations, the evaluator determines that the extended functional component is consistent with ISO/IEC 15408-1 7, Operations.

If the extended functional component is hierarchical to an existing functional component, the evaluator determines that the extended functional component is consistent with ISO/IEC 15408-2 Subclause 6.2.1, Component changes highlighting.

8.7.1.3.6 Work unit APE_ECD.1-6

The evaluator shall examine the extended components definition to determine that each definition of a new functional family uses the existing ISO/IEC 15408 functional families as a model for presentation.

If the PP does not define new functional families, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that all new functional families are defined consistent with ISO/IEC 15408-2 Subclause 6.1.2, Family structure.

8.7.1.3.7 Work unit APE_ECD.1-7

The evaluator shall examine the extended components definition to determine that each definition of a new functional class uses the existing ISO/IEC 15408 functional classes as a model for presentation.

If the PP does not define new functional classes, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that all new functional classes are defined consistent with ISO/IEC 15408-2 Subclause 6.1.1, Class structure.

8.7.1.3.8 Work unit APE_ECD.1-8

The evaluator shall examine the extended components definition to determine that each definition of an extended assurance component uses the existing ISO/IEC 15408-3 components as a model for presentation.

If the PP does not contain extended SARs, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that the extended assurance component definition is consistent with ISO/IEC 15408-3 Subclause 6.1.3, Assurance component structure.

If the extended assurance component uses operations, the evaluator determines that the extended assurance component is consistent with ISO/IEC 15408-1 7, Operations.

If the extended assurance component is hierarchical to an existing assurance component, the evaluator determines that the extended assurance component is consistent with ISO/IEC 15408-3 Subclause 6.1.3, Assurance component structure.

8.7.1.3.9 Work unit APE_ECD.1-9

The evaluator shall examine the extended components definition to determine that, for each defined extended assurance component, applicable methodology has been provided.

If the PP does not contain extended SARs, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that, for each evaluator action element of each extended SAR, one or more work units are provided and that successfully performing all work units for a given evaluator action element will demonstrate that the element has been achieved.

8.7.1.3.10 Work unit APE_ECD.1-10

The evaluator shall examine the extended components definition to determine that each definition of a new assurance family uses the existing ISO/IEC 15408 assurance families as a model for presentation.

If the PP does not define new assurance families, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that all new assurance families are defined consistent with ISO/IEC 15408-3 Subclause 6.1.2, Assurance family structure.

8.7.1.3.11 Work unit APE_ECD.1-11

The evaluator shall examine the extended components definition to determine that each definition of a new assurance class uses the existing ISO/IEC 15408 assurance classes as a model for presentation.

If the PP does not define new assurance classes, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that all new assurance classes are defined consistent with ISO/IEC 15408-3 Subclause 6.1.1, Assurance class structure.

ISO/IEC 15408-3 APE_ECD.1.5C: *The extended components shall consist of measurable and objective elements such that conformance or nonconformance to these elements can be demonstrated.*

8.7.1.3.12 Work unit APE_ECD.1-12

The evaluator shall examine the extended components definition to determine that each element in each extended component is measurable and states objective evaluation requirements, such that conformance or nonconformance can be demonstrated.

If the PP does not contain extended security requirements, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that elements of extended functional components are stated in such a way that they are testable, and traceable through the appropriate TSF representations.

The evaluator also determines that elements of extended assurance components avoid the need for subjective evaluator judgement.

The evaluator is reminded that whilst being measurable and objective is appropriate for all evaluation criteria, it is acknowledged that no formal method exists to prove such properties. Therefore the existing ISO/IEC 15408 functional and assurance components are to be used as a model for determining what constitutes conformance to this requirement.

8.7.1.4 Action APE_ECD.1.2E

8.7.1.4.1 Work unit APE_ECD.1-13

The evaluator shall examine the extended components definition to determine that each extended component may not be clearly expressed using existing components.

If the PP does not contain extended security requirements, this work unit is not applicable and therefore considered to be satisfied.

The evaluator should take components from ISO/IEC 15408-2 and ISO/IEC 15408-3, other extended components that have been defined in the PP, combinations of these components, and possible operations on these components into account when making this determination.

The evaluator is reminded that the role of this work unit is to preclude unnecessary duplication of components, that is, components that may be clearly expressed by using other components. The evaluator should not undertake an exhaustive search of all possible combinations of components including operations in an attempt to find a way to express the extended component by using existing components.

8.8 Security requirements (APE_REQ)

8.8.1 Evaluation of sub-activity (APE_REQ.1)

8.8.1.1 Objectives

The objective of this sub-activity is to determine whether the SFRs and SARs are clear, unambiguous and well-defined and whether they are internally consistent.

8.8.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the PP.

8.8.1.3 Action APE_REQ.1.1E

ISO/IEC 15408-3 APE_REQ.1.1C: *The statement of security requirements shall describe the SFRs and the SARs.*

8.8.1.3.1 Work unit APE_REQ.1-1

The evaluator shall check that the statement of security requirements describes the SFRs.

The evaluator determines that each SFR is identified by one of the following means:

- a) by reference to an individual component in ISO/IEC 15408-2;
- b) by reference to an extended component in the extended components definition of the PP;
- c) by reference to a PP that the PP claims to be conformant with;
- d) by reference to a security requirements package that the PP claims to be conformant with;
- e) by reproduction in the PP.

It is not required to use the same means of identification for all SFRs.

8.8.1.3.2 Work unit APE_REQ.1-2

The evaluator shall check that the statement of security requirements describes the SARs.

The evaluator determines that each SAR is identified by one of the following means:

- a) by reference to an individual component in ISO/IEC 15408-3;
- b) by reference to an extended component in the extended components definition of the PP;
- c) by reference to a PP that the PP claims to be conformant with;
- d) by reference to a security requirements package that the PP claims to be conformant with;
- e) by reproduction in the PP.

It is not required to use the same means of identification for all SARs.

ISO/IEC 15408-3 APE_REQ.1.2C: *All subjects, objects, operations, security attributes, external entities and other terms that are used in the SFRs and the SARs shall be defined.*

8.8.1.3.3 Work unit APE_REQ.1-3

The evaluator shall examine the PP to determine that all subjects, objects, operations, security attributes, external entities and other terms that are used in the SFRs and the SARs are defined.

The evaluator determines that the PP defines all:

- (types of) subjects and objects that are used in the SFRs;
- (types of) security attributes of subjects, users, objects, information, sessions and/or resources, possible values that these attributes may take and any relations between these values (e.g. top_secret is "higher" than secret);
- (types of) operations that are used in the SFRs, including the effects of these operations;
- (types of) external entities in the SFRs;
- other terms that are introduced in the SFRs and/or SARs by completing operations, if these terms are not immediately clear, or are used outside their dictionary definition.

The goal of this work unit is to ensure that the SFRs and SARs are well-defined and that no misunderstanding may occur due to the introduction of vague terms. This work unit should not be taken into extremes, by forcing the PP writer to define every single word. The general audience of a set of security requirements should be assumed to have a reasonable knowledge of IT, security and "Evaluation criteria for IT security".

All of the above may be presented in groups, classes, roles, types or other groupings or characterisations that allow easy understanding.

The evaluator is reminded that these lists and definitions do not have to be part of the statement of security requirements, but may be placed (in part or in whole) in different subclauses. This may be especially applicable if the same terms are used in the rest of the PP.

ISO/IEC 15408-3 APE_REQ.1.3C: *The statement of security requirements shall identify all operations on the security requirements.*

8.8.1.3.4 Work unit APE_REQ.1-4

The evaluator shall check that the statement of security requirements identifies all operations on the security requirements.

The evaluator determines that all operations are identified in each SFR or SAR where such an operation is used. This includes both completed operations and uncompleted operations. Identification may be achieved by typographical distinctions, or by explicit identification in the surrounding text, or by any other distinctive means.

ISO/IEC 15408-3 APE_REQ.1.4C: *All operations shall be performed correctly.*

8.8.1.3.5 Work unit APE_REQ.1-5

The evaluator shall examine the statement of security requirements to determine that all assignment operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

8.8.1.3.6 Work unit APE_REQ.1-6

The evaluator shall examine the statement of security requirements to determine that all iteration operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

8.8.1.3.7 Work unit APE_REQ.1-7

The evaluator shall examine the statement of security requirements to determine that all selection operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

8.8.1.3.8 Work unit APE_REQ.1-8

The evaluator shall examine the statement of security requirements to determine that all refinement operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

ISO/IEC 15408-3 APE_REQ.1.5C: *Each dependency of the security requirements shall either be satisfied, or the security requirements rationale shall justify the dependency not being satisfied.*

8.8.1.3.9 Work unit APE_REQ.1-9

The evaluator shall examine the statement of security requirements to determine that each dependency of the security requirements is either satisfied, or that the security requirements rationale justifies the dependency not being satisfied.

A dependency is satisfied by the inclusion of the relevant component (or one that is hierarchical to it) within the statement of security requirements. The component used to satisfy the dependency should, if necessary, be modified by operations to ensure that it actually satisfies that dependency.

A justification that a dependency is not met should address either:

- a) why the dependency is not necessary or useful, in which case no further information is required; or
- b) that the dependency has been addressed by the operational environment of the TOE, in which case the justification should describe how the security objectives for the operational environment address this dependency.

ISO/IEC 15408-3 APE_REQ.1.6C: *The statement of security requirements shall be internally consistent.*

8.8.1.3.10 Work unit APE_REQ.1-10

The evaluator shall examine the statement of security requirements to determine that it is internally consistent.

The evaluator determines that the combined set of all SFRs and SARs is internally consistent.

The evaluator determines that on all occasions where different security requirements apply to the same types of developer evidence, events, operations, data, tests to be performed etc. or to "all objects", "all subjects" etc., that these requirements do not conflict.

Some possible conflicts are:

- a) an extended SAR specifying that the design of a certain cryptographic algorithm is to be kept secret, and another extended SAR specifying an open source review;
- b) FAU_GEN.1 Audit data generation specifying that subject identity is to be logged, FDP_ACC.1 Subset access control specifying who has access to these logs, and FPR_UNO.1 Unobservability specifying that some actions of subjects should be unobservable to other subjects. If the subject that should not be able to see an activity may access logs of this activity, these SFRs conflict;
- c) FDP_RIP.1 Subset residual information protection specifying deletion of information no longer needed, and FDP_ROL.1 Basic rollback specifying that a TOE may return to a previous state. If the information that is needed for the rollback to the previous state has been deleted, these requirements conflict;
- d) Multiple iterations of FDP_ACC.1 Subset access control especially where some iterations cover the same subjects, objects, or operations. If one access control SFR allows a subject to perform an operation on an object, while another access control SFR does not allow this, these requirements conflict.

8.8.2 Evaluation of sub-activity (APE_REQ.2)

8.8.2.1 Objectives

The objective of this sub-activity is to determine whether the SFRs and SARs are clear, unambiguous and well-defined, whether they are internally consistent, and whether the SFRs meet the security objectives of the TOE.

8.8.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the PP.

8.8.2.3 Action APE_REQ.2.1E

ISO/IEC 15408-3 APE_REQ.2.1C: *The statement of security requirements shall describe the SFRs and the SARs.*

8.8.2.3.1 Work unit APE_REQ.2-1

The evaluator shall check that the statement of security requirements describes the SFRs.

The evaluator determines that each SFR is identified by one of the following means:

- a) by reference to an individual component in ISO/IEC 15408-2;
- b) by reference to an extended component in the extended components definition of the PP;
- c) by reference to an individual component in a PP that the PP claims to be conformant with;
- d) by reference to an individual component in a security requirements package that the PP claims to be conformant with;
- e) by reproduction in the PP.

It is not required to use the same means of identification for all SFRs.

8.8.2.3.2 Work unit APE_REQ.2-2

The evaluator shall check that the statement of security requirements describes the SARs.

The evaluator determines that each SAR is identified by one of the following means:

- a) by reference to an individual component in ISO/IEC 15408-3;
- b) by reference to an extended component in the extended components definition of the PP;
- c) by reference to an individual component in a PP that the PP claims to be conformant with;
- d) by reference to an individual component in a security requirements package that the PP claims to be conformant with;
- e) by reproduction in the PP.

It is not required to use the same means of identification for all SARs.

ISO/IEC 15408-3 APE_REQ.2.2C: *All subjects, objects, operations, security attributes, external entities and other terms that are used in the SFRs and the SARs shall be defined.*

8.8.2.3.3 Work unit APE_REQ.2-3

The evaluator shall examine the PP to determine that all subjects, objects, operations, security attributes, external entities and other terms that are used in the SFRs and the SARs are defined.

The evaluator determines that the PP defines all:

- (types of) subjects and objects that are used in the SFRs;

- (types of) security attributes of subjects, users, objects, information, sessions and/or resources, possible values that these attributes may take and any relations between these values (e.g. top_secret is “higher” than secret);
- (types of) operations that are used in the SFRs, including the effects of these operations;
- (types of) external entities in the SFRs;
- other terms that are introduced in the SFRs and/or SARs by completing operations, if these terms are not immediately clear, or are used outside their dictionary definition.

The goal of this work unit is to ensure that the SFRs and SARs are well-defined and that no misunderstanding may occur due to the introduction of vague terms. This work unit should not be taken into extremes, by forcing the PP writer to define every single word. The general audience of a set of security requirements should be assumed to have a reasonable knowledge of IT, security and “Evaluation criteria for IT security”.

All of the above may be presented in groups, classes, roles, types or other groupings or characterisations that allow easy understanding.

The evaluator is reminded that these lists and definitions do not have to be part of the statement of security requirements, but may be placed (in part or in whole) in different subclauses. This may be especially applicable if the same terms are used in the rest of the PP.

ISO/IEC 15408-3 APE_REQ.2.3C: *The statement of security requirements shall identify all operations on the security requirements.*

8.8.2.3.4 Work unit APE_REQ.2-4

The evaluator shall check that the statement of security requirements identifies all operations on the security requirements.

The evaluator determines that all operations are identified in each SFR or SAR where such an operation is used. This includes both completed operations and uncompleted operations. Identification may be achieved by typographical distinctions, or by explicit identification in the surrounding text, or by any other distinctive means.

ISO/IEC 15408-3 APE_REQ.2.4C: *All operations shall be performed correctly.*

8.8.2.3.5 Work unit APE_REQ.2-5

The evaluator shall examine the statement of security requirements to determine that all assignment operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

8.8.2.3.6 Work unit APE_REQ.2-6

The evaluator shall examine the statement of security requirements to determine that all iteration operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

8.8.2.3.7 Work unit APE_REQ.2-7

The evaluator shall examine the statement of security requirements to determine that all selection operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

8.8.2.3.8 Work unit APE_REQ.2-8

The evaluator shall examine the statement of security requirements to determine that all refinement operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

ISO/IEC 15408-3 APE_REQ.2.5C: *Each dependency of the security requirements shall either be satisfied, or the security requirements rationale shall justify the dependency not being satisfied.*

8.8.2.3.9 Work unit APE_REQ.2-9

The evaluator shall examine the statement of security requirements to determine that each dependency of the security requirements is either satisfied, or that the security requirements rationale justifies the dependency not being satisfied.

A dependency is satisfied by the inclusion of the relevant component (or one that is hierarchical to it) within the statement of security requirements. The component used to satisfy the dependency should, if necessary, be modified by operations to ensure that it actually satisfies that dependency.

A justification that a dependency is not met should address either:

- a) why the dependency is not necessary or useful, in which case no further information is required; or
- b) that the dependency has been addressed by the operational environment of the TOE, in which case the justification should describe how the security objectives for the operational environment address this dependency.

ISO/IEC 15408-3 APE_REQ.2.6C: *The security requirements rationale shall trace each SFR back to the security objectives for the TOE.*

8.8.2.3.10 Work unit APE_REQ.2-10

The evaluator shall check that the security requirements rationale traces each SFR back to the security objectives for the TOE.

The evaluator determines that each SFR is traced back to at least one security objective for the TOE.

Failure to trace implies that either the security requirements rationale is incomplete, the security objectives for the TOE are incomplete, or the SFR has no useful purpose.

ISO/IEC 15408-3 APE_REQ.2.7C: *The security requirements rationale shall demonstrate that the SFRs meet all security objectives for the TOE.*

8.8.2.3.11 Work unit APE_REQ.2-11

The evaluator shall examine the security requirements rationale to determine that for each security objective for the TOE it justifies that the SFRs are suitable to meet that security objective for the TOE.

If no SFRs trace back to the security objective for the TOE, the evaluator action related to this work unit is assigned a fail verdict.

The evaluator determines that the justification for a security objective for the TOE demonstrates that the SFRs are sufficient: if all SFRs that trace back to the objective are satisfied, the security objective for the TOE is achieved.

If the SFRs that trace back to a security objective for the TOE have any uncompleted assignments, or uncompleted or restricted selections, the evaluator determines that for every conceivable completion or combination of completions of these operations, the security objective is still met.

The evaluator also determines that each SFR that traces back to a security objective for the TOE is necessary: when the SFR is satisfied, it actually contributes to achieving the security objective.

Note that the tracings from SFRs to security objectives for the TOE provided in the security requirements rationale may be a part of the justification, but do not constitute a justification by themselves.

ISO/IEC 15408-3 APE_REQ.2.8C: *The security requirements rationale shall explain why the SARs were chosen.*

8.8.2.3.12 Work unit APE_REQ.2-12

The evaluator shall check that the security requirements rationale explains why the SARs were chosen.

The evaluator is reminded that any explanation is correct, as long as it is coherent and neither the SARs nor the explanation have obvious inconsistencies with the remainder of the PP.

An example of an obvious inconsistency between the SARs and the remainder of the PP would be to have threat agents that are very capable, but an AVA_VAN SAR that does not protect against these threat agents.

ISO/IEC 15408-3 APE_REQ.2.9C: *The statement of security requirements shall be internally consistent.*

8.8.2.3.13 Work unit APE_REQ.2-13

The evaluator shall examine the statement of security requirements to determine that it is internally consistent.

The evaluator determines that the combined set of all SFRs and SARs is internally consistent.

The evaluator determines that on all occasions where different security requirements apply to the same types of developer evidence, events, operations, data, tests to be performed etc. or to "all objects", "all subjects" etc., that these requirements do not conflict.

Some possible conflicts are:

- a) an extended SAR specifying that the design of a certain cryptographic algorithm is to be kept secret, and another extended SAR specifying an open source review;
- b) FAU_GEN.1 Audit data generation specifying that subject identity is to be logged, FDP_ACC.1 Subset access control specifying who has access to these logs, and FPR_UNO.1 Unobservability specifying that some actions of subjects should be unobservable to other subjects. If the subject that should not be able to see an activity may access logs of this activity, these SFRs conflict;
- c) FDP_RIP.1 Subset residual information protection specifying deletion of information no longer needed, and FDP_ROL.1 Basic rollback specifying that a TOE may return to a previous state. If the information that is needed for the rollback to the previous state has been deleted, these requirements conflict;
- d) Multiple iterations of FDP_ACC.1 Subset access control especially where some iterations cover the same subjects, objects, or operations. If one access control SFR allows a subject to perform an operation on an object, while another access control SFR does not allow this, these requirements conflict.

9 Class ASE: Security Target evaluation

9.1 Introduction

This Clause describes the evaluation of an ST. The ST evaluation should be started prior to any TOE evaluation sub-activities since the ST provides the basis and context to perform these sub-activities. The evaluation methodology in this subclause is based on the requirements on the ST as specified in ISO/IEC 15408-3 class ASE.

This Clause should be used in conjunction with Annexes A, B and C in ISO/IEC 15408-1, as these Annexes clarify the concepts here and provide many examples.

9.2 Application notes

9.2.1 Re-using the evaluation results of certified PPs

While evaluating an ST that is based on one or more certified PPs, it may be possible to re-use the fact that these PPs were certified. The potential for re-use of the result of a certified PP is greater if the ST does not add threats, OSPs, assumptions, security objectives and/or security requirements to those of the PP. If the ST contains much more than the certified PP, re-use may not be useful at all.

The evaluator is allowed to re-use the PP evaluation results by doing certain analyses only partially or not at all if these analyses or parts thereof were already done as part of the PP evaluation. While doing this, the evaluator should assume that the analyses in the PP were performed correctly.

An example would be where the PP contains a set of security requirements, and these were determined to be internally consistent during the PP evaluation. If the ST uses the exact same requirements, the consistency analysis does not have to be repeated during the ST evaluation. If the ST adds one or more requirements, or performs operations on these requirements, the analysis will have to be repeated. However, it may be possible to save work in this consistency analysis by using the fact that the original requirements are internally consistent. If the original requirements are internally consistent, the evaluator only has to determine that:

- a) the set of all new and/or changed requirements is internally consistent, and
- b) the set of all new and/or changed requirements is consistent with the original requirements.

The evaluator notes in the ETR each case where analyses are not done or only partially done for this reason.

9.3 ST introduction (ASE_INT)

9.3.1 Evaluation of sub-activity (ASE_INT.1)

9.3.1.1 Objectives

The objective of this sub-activity is to determine whether the ST and the TOE are correctly identified, whether the TOE is correctly described in a narrative way at three levels of abstraction (TOE reference, TOE overview and TOE description), and whether these three descriptions are consistent with each other.

9.3.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST.

9.3.1.3 Action ASE_INT.1.1E

ISO/IEC 15408-3 ASE_INT.1.1C: *The ST introduction shall contain an ST reference, a TOE reference, a TOE overview and a TOE description.*

9.3.1.3.1 Work unit ASE_INT.1-1

The evaluator shall check that the ST introduction contains an ST reference, a TOE reference, a TOE overview and a TOE description.

ISO/IEC 15408-3 ASE_INT.1.2C: *The ST reference shall uniquely identify the ST.*

9.3.1.3.2 Work unit ASE_INT.1-2

The evaluator shall examine the ST reference to determine that it uniquely identifies the ST.

The evaluator determines that the ST reference identifies the ST itself, so that it may be easily distinguished from other STs, and that it also uniquely identifies each version of the ST, e.g. by including a version number and/or a date of publication.

In evaluations where a CM system is provided, the evaluator may validate the uniqueness of the reference by checking the configuration list. In the other cases, the ST should have some referencing system that is capable of supporting unique references (e.g. use of numbers, letters or dates).

ISO/IEC 15408-3 ASE_INT.1.3C: *The TOE reference shall identify the TOE.*

9.3.1.3.3 Work unit ASE_INT.1-3

The evaluator shall examine the TOE reference to determine that it identifies the TOE.

The evaluator determines that the TOE reference identifies the TOE, so that it is clear to which TOE the ST refers, and that it also identifies the version of the TOE, e.g. by including a version/release/build number, or a date of release.

9.3.1.3.4 Work unit ASE_INT.1-4

The evaluator shall examine the TOE reference to determine that it is not misleading.

If the TOE is related to one or more well-known products, it is allowed to reflect this in the TOE reference. However, this should not be used to mislead consumers: situations where only a small part of a product is evaluated, yet the TOE reference does not reflect this, are not allowed.

ISO/IEC 15408-3 ASE_INT.1.4C: *The TOE overview shall summarise the usage and major security features of the TOE.*

9.3.1.3.5 Work unit ASE_INT.1-5

The evaluator shall examine the TOE overview to determine that it describes the usage and major security features of the TOE.

The TOE overview should briefly (i.e. several paragraphs) describe the usage and major security features of the TOE. The TOE overview should enable potential consumers to quickly determine whether the TOE may be suitable for their security needs.

The TOE overview in an ST for a composed TOE should describe the usage and major security feature of the composed TOE, rather than those of the individual component TOEs.

The evaluator determines that the overview is clear enough for consumers, and sufficient to give them a general understanding of the intended usage and major security features of the TOE.

ISO/IEC 15408-3 ASE_INT.1.5C: *The TOE overview shall identify the TOE type.*

9.3.1.3.6 Work unit ASE_INT.1-6

The evaluator shall check that the TOE overview identifies the TOE type.

9.3.1.3.7 Work unit ASE_INT.1-7

The evaluator shall examine the TOE overview to determine that the TOE type is not misleading.

There are situations where the general consumer would expect certain functionality of the TOE because of its TOE type. If this functionality is absent in the TOE, the evaluator determines that the TOE overview adequately discusses this absence.

There are also TOEs where the general consumer would expect that the TOE should be able to operate in a certain operational environment because of its TOE type. If the TOE is unable to operate in such an operational environment, the evaluator determines that the TOE overview adequately discusses this.

ISO/IEC 15408-3 ASE_INT.1.6C: *The TOE overview shall identify any non-TOE hardware/software/firmware required by the TOE.*

9.3.1.3.8 Work unit ASE_INT.1-8

The evaluator shall examine the TOE overview to determine that it identifies any non-TOE hardware/software/firmware required by the TOE.

While some TOEs are able to run stand-alone, other TOEs (notably software TOEs) need additional hardware, software or firmware to operate. If the TOE does not require any hardware, software or firmware, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that the TOE overview identifies any additional hardware, software and firmware needed by the TOE to operate. This identification does not have to be exhaustive, but detailed enough for potential consumers of the TOE to determine whether their current hardware, software and firmware support use of the TOE, and, if this is not the case, which additional hardware, software and/or firmware is needed.

ISO/IEC 15408-3 ASE_INT.1.7C: *The TOE description shall describe the physical scope of the TOE.*

9.3.1.3.9 Work unit ASE_INT.1-9

The evaluator shall examine the TOE description to determine that it describes the physical scope of the TOE.

The evaluator determines that the TOE description lists the hardware, firmware, software and guidance parts that constitute the TOE and describes them at a level of detail that is sufficient to give the reader a general understanding of those parts.

The evaluator also determines that there is no possible misunderstanding as to whether any hardware, firmware, software or guidance part is part of the TOE or not.

ISO/IEC 15408-3 ASE_INT.1.8C: *The TOE description shall describe the logical scope of the TOE.*

9.3.1.3.10 Work unit ASE_INT.1-10

The evaluator shall examine the TOE description to determine that it describes the logical scope of the TOE.

The evaluator determines that the TOE description discusses the logical security features offered by the TOE at a level of detail that is sufficient to give the reader a general understanding of those features.

The evaluator also determines that there is no possible misunderstanding as to whether any logical security feature is offered by the TOE or not.

An ST for a composed TOE may refer out to the description of the logical scope of the component TOEs, provided in the component TOE STs to provide the majority of this description for the composed TOE. However, the evaluator determines that the composed TOE ST clearly discusses which features of the individual components are not within the composed TOE, and therefore not a feature of the composed TOE.

9.3.1.4 Action ASE_INT.1.2E

9.3.1.4.1 Work unit ASE_INT.1-11

The evaluator shall examine the TOE reference, TOE overview and TOE description to determine that they are consistent with each other.

9.4 Conformance claims (ASE_CCL)

9.4.1 Evaluation of sub-activity (ASE_CCL.1)

9.4.1.1 Objectives

The objective of this sub-activity is to determine the validity of various conformance claims. These describe how the ST and the TOE conform to ISO/IEC 15408 and how the ST conforms to PPs and packages.

9.4.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the PP(s) that the ST claims conformance to;
- c) the package(s) that the ST claims conformance to.

9.4.1.3 Action ASE_CCL.1.1E

ISO/IEC 15408-3 ASE_CCL.1.1C: *The conformance claim shall contain an ISO/IEC 15408 conformance claim that identifies the version of ISO/IEC 15408 to which the ST and the TOE claim conformance.*

9.4.1.3.1 Work unit ASE_CCL.1-1

The evaluator shall check that the conformance claim contains an ISO/IEC 15408 conformance claim that identifies the version of ISO/IEC 15408 to which the ST and the TOE claim conformance.

The evaluator determines that ISO/IEC 15408 conformance claim identifies the version of ISO/IEC 15408 that was used to develop this ST. This should include the version number of ISO/IEC 15408 and, unless the International English version of ISO/IEC 15408 was used, the language of the version of ISO/IEC 15408 that was used.

For a composed TOE, the evaluator will consider any differences between the version of ISO/IEC 15408 claimed for a component and the version of ISO/IEC 15408 claimed for the composed TOE. If the versions differ the evaluator will assess whether the differences between the versions will lead to conflicting claims.

For instances where ISO/IEC 15408 conformance claims for the base TOE and dependent TOE are for different major releases of ISO/IEC 15408 (e.g. one component TOE conformance claim is ISO/IEC 15408 v2.x and the other component TOE conformance claim is ISO/IEC 15408 v3.x), the conformance claim for the composed TOE will be the earlier release of ISO/IEC 15408, as ISO/IEC 15408 is developed with an aim to provide backwards compatibility (although this may not be achieved in the strictest sense, it is understood to be achieved in principle).

ISO/IEC 15408-3 ASE_CCL.1.2C: *ISO/IEC 15408 conformance claim shall describe the conformance of the ST to ISO/IEC 15408-2 as either ISO/IEC 15408-2 conformant or ISO/IEC 15408-2 extended.*

9.4.1.3.2 Work unit ASE_CCL.1-2

The evaluator shall check that ISO/IEC 15408 conformance claim states a claim of either ISO/IEC 15408-2 conformant or ISO/IEC 15408-2 extended for the ST.

For a composed TOE, the evaluator will consider whether this claim is consistent not only with ISO/IEC 15408-2, but also with the claims of conformance to ISO/IEC 15408-2 by each of the component TOEs. I.e. if one or more component TOEs claims to be ISO/IEC 15408-2 extended, then the composed TOE should also claim to be ISO/IEC 15408-2 extended.

ISO/IEC 15408 conformance claim for the composed TOE may be ISO/IEC 15408-2 extended, even though the component TOEs are Part 2 conformant, in the event that additional SFRs are claimed for the base TOE (see composed TOE guidance for ASE_CCL.1.6C).

ISO/IEC 15408-3 ASE_CCL.1.3C: *ISO/IEC 15408 conformance claim shall describe the conformance of the ST to ISO/IEC 15408-3 as either ISO/IEC 15408-3 conformant or ISO/IEC 15408-3 extended.*

9.4.1.3.3 Work unit ASE_CCL.1-3

The evaluator shall check that ISO/IEC 15408 conformance claim states a claim of either ISO/IEC 15408-3 conformant or ISO/IEC 15408-3 extended for the ST.

ISO/IEC 15408-3 ASE_CCL.1.4C: *ISO/IEC 15408 conformance claim shall be consistent with the extended components definition.*

9.4.1.3.4 Work unit ASE_CCL.1-4

The evaluator shall examine ISO/IEC 15408 conformance claim for ISO/IEC 15408-2 to determine that it is consistent with the extended components definition.

If ISO/IEC 15408 conformance claim contains ISO/IEC 15408-2 conformant, the evaluator determines that the extended components definition does not define functional components.

If ISO/IEC 15408 conformance claim contains ISO/IEC 15408-2 extended, the evaluator determines that the extended components definition defines at least one extended functional component.

9.4.1.3.5 Work unit ASE_CCL.1-5

The evaluator shall examine ISO/IEC 15408 conformance claim for ISO/IEC 15408-3 to determine that it is consistent with the extended components definition.

If ISO/IEC 15408 conformance claim contains ISO/IEC 15408-3 conformant, the evaluator determines that the extended components definition does not define assurance components.

If ISO/IEC 15408 conformance claim contains ISO/IEC 15408-3 extended, the evaluator determines that the extended components definition defines at least one extended assurance component.

ISO/IEC 15408-3 ASE_CCL.1.5C: *The conformance claim shall identify all PPs and security requirement packages to which the ST claims conformance.*

9.4.1.3.6 Work unit ASE_CCL.1-6

The evaluator shall check that the conformance claim contains a PP claim that identifies all PPs for which the ST claims conformance.

If the ST does not claim conformance to a PP, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that any referenced PPs are unambiguously identified (e.g. by title and version number, or by the identification included in the introduction of that PP).

The evaluator is reminded that claims of partial conformance to a PP are not permitted. Therefore, conformance to a PP requiring a composite solution may be claimed in an ST for a composed TOE. Conformance to such a PP would not have been possible during the evaluation of the component TOEs, as

these components would not have satisfied the composed solution. This is only possible in the instances where the “composite” PP permits use of the composition evaluation approach (use of ACO components).

The ST for a composed TOE will identify the STs of the component TOEs from which the composed ST is comprised. The composed TOE is essentially claiming conformance to the STs of the component TOEs.

9.4.1.3.7 Work unit ASE_CCL.1-7

The evaluator shall check that the conformance claim contains a package claim that identifies all packages to which the ST claims conformance.

If the ST does not claim conformance to a package, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that any referenced packages are unambiguously identified (e.g. by title and version number, or by the identification included in the introduction of that package).

The evaluator determines that the component TOE STs from which the composed TOE is derived are also unambiguously identified.

The evaluator is reminded that claims of partial conformance to a package are not permitted.

ISO/IEC 15408-3 ASE_CCL.1.6C: *The conformance claim shall describe any conformance of the ST to a package as either package-conformant or package-augmented.*

9.4.1.3.8 Work unit ASE_CCL.1-8

The evaluator shall check that, for each identified package, the conformance claim states a claim of either package-name conformant or package-name augmented.

If the ST does not claim conformance to a package, this work unit is not applicable and therefore considered to be satisfied.

If the package conformance claim contains package-name conformant, the evaluator determines that:

- a) If the package is an assurance package, then the ST contains all SARs included in the package, but no additional SARs.
- b) If the package is a functional package, then the ST contains all SFRs included in the package, but no additional SFRs.

If the package conformance claim contains package-name augmented, the evaluator determines that:

- a) If the package is an assurance package then the ST contains all SARs included in the package, and at least one additional SAR or at least one SAR that is hierarchical to a SAR in the package.
- b) If the package is a functional package, then the ST contains all SFRs included in the package, and at least one additional SFR or at least one SFR that is hierarchical to a SFR in the package.

ISO/IEC 15408-3 ASE_CCL.1.7C: *The conformance claim rationale shall demonstrate that the TOE type is consistent with the TOE type in the PPs for which conformance is being claimed.*

9.4.1.3.9 Work unit ASE_CCL.1-9

The evaluator shall examine the conformance claim rationale to determine that the TOE type of the TOE is consistent with all TOE types of the PPs.

If the ST does not claim conformance to a PP, this work unit is not applicable and therefore considered to be satisfied.

The relation between the types may be simple: a firewall ST claiming conformance to a firewall PP, or more complex: a smart card ST claiming conformance to a number of PPs at the same time (a PP for the integrated circuit, a PP for the smart card OS, and two PPs for two applications on the smart card).

For a composed TOE, the evaluator will determine whether the conformance claim rationale demonstrates that the TOE types of the component TOEs are consistent with the composed TOE type. This does not mean that both the component and the composed TOE types have to be the same, but rather that the component TOEs are suitable for integration to provide the composed TOE. It should be made clear in the composed TOE ST which SFRs are only included as a result of composition, and were not examined as SFRs in the base and dependent TOE (e.g. EALx) evaluation.

ISO/IEC 15408-3 ASE_CCL.1.8C: *The conformance claim rationale shall demonstrate that the statement of the security problem definition is consistent with the statement of the security problem definition in the PPs for which conformance is being claimed.*

9.4.1.3.10 Work unit ASE_CCL.1-10

The evaluator shall examine the conformance claim rationale to determine that it demonstrates that the statement of security problem definition is consistent, as defined by the conformance statement of the PP, with the statements of security problem definition stated in the PPs to which conformance is being claimed.

If the ST does not claim conformance with a PP, this work unit is not applicable and therefore considered to be satisfied.

If the PP does not have a statement of security problem definition, this work unit is not applicable and therefore considered to be satisfied.

If strict conformance is required by the PP to which conformance is being claimed no conformance claim rationale is required. Instead, the evaluator determines whether:

- a) the threats in the ST are a superset of or identical to the threats in the PP to which conformance is being claimed;
- b) the OSPs in the ST are a superset of or identical to the OSPs in the PP to which conformance is being claimed;
- c) the assumptions in the ST are identical to the assumptions in the PP to which conformance is being claimed.

If demonstrable conformance is required by the PP, the evaluator examines the conformance claim rationale to determine that it demonstrates that the statement of security problem definition of the ST is equivalent or more restrictive than the statement of security problem definition in the PP to which conformance is being claimed.

For guidance on “equivalent or more restrictive” see ISO/IEC 15408-1 Annex D, PP conformance.

For a composed TOE, the evaluator will consider whether the security problem definition of the composed TOE is consistent with that specified in the STs for the component TOEs. This is determined in terms of demonstrable conformance. In particular, the evaluator examines the conformance claim rationale to determine that:

- a) threat statements and OSPs in the composed TOE ST do not contradict those from the component STs.
- b) any assumptions made in the component STs are upheld in the composed TOE ST. That is, either the assumption should also be present in the composed ST, or the assumption should be positively addressed in the composed ST. The assumption may be positively addressed through specification of requirements in the composed TOE to provide functionality fulfilling the concern captured in the assumption.

ISO/IEC 15408-3 ASE_CCL.1.9C: *The conformance claim rationale shall demonstrate that the statement of security objectives is consistent with the statement of security objectives in the PPs for which conformance is being claimed.*

9.4.1.3.11 Work unit ASE_CCL.1-11

The evaluator shall examine the conformance claim rationale to determine that the statement of security objectives is consistent, as defined by the conformance statement of the PP, with the statement of security objectives in the PPs to which conformance is being claimed.

If the ST does not claim conformance to a PP, this work unit is not applicable and therefore considered to be satisfied.

If strict conformance is required by the PP, no conformance claim rationale is required. Instead, the evaluator determines whether:

- The ST contains all security objectives for the TOE of the PP to which conformance is being claimed. Note that it is allowed for the ST under evaluation to have additional security objectives for the TOE;
- The ST contains exactly all security objectives for the operational environment (with one exception in the next bullet). Note that it is not allowed for the ST under evaluation to have additional security objectives for the operational environment;
- The ST may specify that certain objectives for the operational environment in the PP that conformance is being claimed to are security objectives for the TOE in the ST. This is a valid exception to the previous bullet.

If demonstrable conformance is required by the PP to which conformance is being claimed, the evaluator examines the conformance claim rationale to determine that it demonstrates that the statement of security objectives of the ST is equivalent or more restrictive than the statement of security objectives in the PP to which conformance is being claimed.

For guidance on “equivalent or more restrictive” see ISO/IEC 15408-1 Annex D, PP conformance.

For a composed TOE, the evaluator will consider whether the security objectives of the composed TOE are consistent with that specified in the STs for the component TOEs. This is determined in terms of demonstrable conformance. In particular, the evaluator examines the conformance claim rationale to determine that:

- a) The statement of security objectives in the dependent TOE ST relevant to any IT in the operational environment are consistent with the statement of security objectives for the TOE in the base TOE ST. It is not expected that the statement of security objectives for the environment within in the dependent TOE ST will cover all aspects of the statement of security objectives for the TOE in the base TOE ST.
- b) The statement of security objectives in the composed ST is consistent with the statements of security objectives in the STs for the component TOEs.

If demonstrable conformance is required by the PP, the evaluator examines the conformance claim rationale to determine that it demonstrates that the statement of security objectives of the ST is at least equivalent to the statement of security objectives in the PP, or component TOE ST in the case of a composed TOE ST.

ISO/IEC 15408-3 ASE_CCL.1.10C: *The conformance claim rationale shall demonstrate that the statement of security requirements is consistent with the statement of security requirements in the PPs for which conformance is being claimed.*

9.4.1.3.12 Work unit ASE_CCL.1-12

The evaluator shall examine the ST to determine that it is consistent, as defined by the conformance statement of the PP, with all security requirements in the PPs for which conformance is being claimed.

If the ST does not claim conformance to a PP, this work unit is not applicable and therefore considered to be satisfied.

If strict conformance is required by the PP to which conformance is being claimed, no conformance claim rationale is required. Instead, the evaluator determines whether the statement of security requirements in the ST is a superset of or identical to the statement of security requirements in the PP to which conformance is being claimed (for strict conformance).

If demonstrable conformance is required by the PP to which conformance is being claimed, the evaluator examines the conformance claim rationale to determine that it demonstrates that the statement of security requirements of the ST is equivalent or more restrictive than the statement of security requirements in the PP to which conformance is being claimed.

For guidance on “equivalent or more restrictive” see ISO/IEC 15408-1 Annex D, PP conformance.

For a composed TOE, the evaluator will consider whether the security requirements of the composed TOE are consistent with that specified in the STs for the component TOEs. This is determined in terms of demonstrable conformance. In particular, the evaluator examines the conformance rationale to determine that:

- a) The statement of security requirements in the dependent TOE ST relevant to any IT in the operational environment is consistent with the statement of security requirements for the TOE in the base TOE ST. It is not expected that the statement of security requirements for the environment within in the dependent TOE ST will cover all aspects of the statement of security requirements for the TOE in the base TOE ST, as some SFRs may need to be added to the statement of security requirements in the composed TOE ST. However, the statement of security requirements in the base should support the operation of the dependent component.
- b) The statement of security objectives in the dependent TOE ST relevant to any IT in the operational environment is consistent with the statement of security requirements for the TOE in the base TOE ST. It is not expected that the statement of security objectives for the environment within in the dependent TOE ST will cover all aspects of the statement of security requirements for the TOE in the base TOE ST.
- c) The statement of security requirements in the composed is consistent with the statements of security requirements in the STs for the component TOEs.

If demonstrable conformance is required by the PP to which conformance is being claimed, the evaluator examines the conformance claim rationale to determine that it demonstrates that the statement of security requirements of the ST is at least equivalent to the statement of security requirements in the PP, or component TOE ST in the case of a composed TOE ST.

9.5 Security problem definition (ASE_SPD)

9.5.1 Evaluation of sub-activity (ASE_SPD.1)

9.5.1.1 Objectives

The objective of this sub-activity is to determine that the security problem intended to be addressed by the TOE and its operational environment is clearly defined.

9.5.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST.

9.5.1.3 Action ASE_SPD.1.1E

ISO/IEC 15408-3 ASE_SPD.1.1C: *The security problem definition shall describe the threats.*

9.5.1.3.1 Work unit ASE_SPD.1-1

The evaluator shall check that the security problem definition describes the threats.

If all security objectives are derived from assumptions and/or OSPs only, the statement of threats need not be present in the ST. In this case, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that the security problem definition describes the threats that must be countered by the TOE and/or operational environment.

ISO/IEC 15408-3 ASE_SPD.1.2C: *All threats shall be described in terms of a threat agent, an asset, and an adverse action.*

9.5.1.3.2 Work unit ASE_SPD.1-2

The evaluator shall examine the security problem definition to determine that all threats are described in terms of a threat agent, an asset, and an adverse action.

If all security objectives are derived from assumptions and/or OSPs only, the statement of threats need not be present in the ST. In this case, this work unit is not applicable and therefore considered to be satisfied.

Threat agents may be further described by aspects such as expertise, resource, opportunity, and motivation.

ISO/IEC 15408-3 ASE_SPD.1.3C: *The security problem definition shall describe the OSPs.*

9.5.1.3.3 Work unit ASE_SPD.1-3

The evaluator shall check that the security problem definition describes the OSPs.

If all security objectives are derived from assumptions and threats only, OSPs need not be present in the ST. In this case, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that OSP statements are made in terms of rules or guidelines that must be followed by the TOE and/or its operational environment.

The evaluator determines that each OSP is explained and/or interpreted in sufficient detail to make it clearly understandable; a clear presentation of policy statements is necessary to permit tracing security objectives to them.

ISO/IEC 15408-3 ASE_SPD.1.4C: *The security problem definition shall describe the assumptions about the operational environment of the TOE.*

9.5.1.3.4 Work unit ASE_SPD.1-4

The evaluator shall examine the security problem definition to determine that it describes the assumptions about the operational environment of the TOE.

If there are no assumptions, this work unit is not applicable and is therefore considered to be satisfied.

The evaluator determines that each assumption about the operational environment of the TOE is explained in sufficient detail to enable consumers to determine that their operational environment matches the assumption. If the assumptions are not clearly understood, the end result may be that the TOE is used in an operational environment in which it will not function in a secure manner.

9.6 Security objectives (ASE_OBJ)

9.6.1 Evaluation of sub-activity (ASE_OBJ.1)

9.6.1.1 Objectives

The objective of this sub-activity is to determine whether the security objectives for the operational environment are clearly defined.

9.6.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST.

9.6.1.3 Action ASE_OBJ.1.1E

ISO/IEC 15408-3 ASE_OBJ.1.1C: *The statement of security objectives shall describe the security objectives for the operational environment.*

9.6.1.3.1 Work unit ASE_OBJ.1-1

The evaluator shall check that the statement of security objectives defines the security objectives for the operational environment.

The evaluator checks that the security objectives for the operational environment are identified.

9.6.2 Evaluation of sub-activity (ASE_OBJ.2)

9.6.2.1 Objectives

The objective of this sub-activity is to determine whether the security objectives adequately and completely address the security problem definition and that the division of this problem between the TOE and its operational environment is clearly defined.

9.6.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST.

9.6.2.3 Action ASE_OBJ.2.1E

ISO/IEC 15408-3 ASE_OBJ.2.1C: *The statement of security objectives shall describe the security objectives for the TOE and the security objectives for the operational environment.*

9.6.2.3.1 Work unit ASE_OBJ.2-1

The evaluator shall check that the statement of security objectives defines the security objectives for the TOE and the security objectives for the operational environment.

The evaluator checks that both categories of security objectives are clearly identified and separated from the other category.

ISO/IEC 15408-3 ASE_OBJ.2.2C: *The security objectives rationale shall trace each security objective for the TOE back to threats countered by that security objective and OSPs enforced by that security objective.*

9.6.2.3.2 Work unit ASE_OBJ.2-2

The evaluator shall check that the security objectives rationale traces all security objectives for the TOE back to threats countered by the objectives and/or OSPs enforced by the objectives.

Each security objective for the TOE may trace back to threats or OSPs, or a combination of threats and OSPs, but it must trace back to at least one threat or OSP.

Failure to trace implies that either the security objectives rationale is incomplete, the security problem definition is incomplete, or the security objective for the TOE has no useful purpose.

ISO/IEC 15408-3 ASE_OBJ.2.3C: *The security objectives rationale shall trace each security objective for the operational environment back to threats countered by that security objective, OSPs enforced by that security objective, and assumptions upheld by that security objective.*

9.6.2.3.3 Work unit ASE_OBJ.2-3

The evaluator shall check that the security objectives rationale traces the security objectives for the operational environment back to threats countered by that security objective, to OSPs enforced by that security objective, and to assumptions upheld by that security objective.

Each security objective for the operational environment may trace back to threats, OSPs, assumptions, or a combination of threats, OSPs and/or assumptions, but it must trace back to at least one threat, OSP or assumption.

Failure to trace implies that either the security objectives rationale is incomplete, the security problem definition is incomplete, or the security objective for the operational environment has no useful purpose.

ISO/IEC 15408-3 ASE_OBJ.2.4C: *The security objectives rationale shall demonstrate that the security objectives counter all threats.*

9.6.2.3.4 Work unit ASE_OBJ.2-4

The evaluator shall examine the security objectives rationale to determine that it justifies for each threat that the security objectives are suitable to counter that threat.

If no security objectives trace back to the threat, the evaluator action related to this work unit is assigned a fail verdict.

The evaluator determines that the justification for a threat shows whether the threat is removed, diminished or mitigated.

The evaluator determines that the justification for a threat demonstrates that the security objectives are sufficient: if all security objectives that trace back to the threat are achieved, the threat is removed, sufficiently diminished, or the effects of the threat are sufficiently mitigated.

Note that the tracings from security objectives to threats provided in the security objectives rationale may be part of a justification, but do not constitute a justification by themselves. Even in the case that a security objective is merely a statement reflecting the intent to prevent a particular threat from being realised, a justification is required, but this justification may be as minimal as "Security Objective X directly counters Threat Y".

The evaluator also determines that each security objective that traces back to a threat is necessary: when the security objective is achieved it actually contributes to the removal, diminishing or mitigation of that threat.

ISO/IEC 15408-3 ASE_OBJ.2.5C: *The security objectives rationale shall demonstrate that the security objectives enforce all OSPs.*

9.6.2.3.5 Work unit ASE_OBJ.2-5

The evaluator shall examine the security objectives rationale to determine that for each OSP it justifies that the security objectives are suitable to enforce that OSP.

If no security objectives trace back to the OSP, the evaluator action related to this work unit is assigned a fail verdict.

The evaluator determines that the justification for an OSP demonstrates that the security objectives are sufficient: if all security objectives that trace back to that OSP are achieved, the OSP is enforced.

The evaluator also determines that each security objective that traces back to an OSP is necessary: when the security objective is achieved it actually contributes to the enforcement of the OSP.

Note that the tracings from security objectives to OSPs provided in the security objectives rationale may be part of a justification, but do not constitute a justification by themselves. In the case that a security objective is merely a statement reflecting the intent to enforce a particular OSP, a justification is required, but this justification may be as minimal as "Security Objective X directly enforces OSP Y".

ISO/IEC 15408-3 ASE_OBJ.2.6C: *The security objectives rationale shall demonstrate that the security objectives for the operational environment uphold all assumptions.*

9.6.2.3.6 Work unit ASE_OBJ.2-6

The evaluator shall examine the security objectives rationale to determine that for each assumption for the operational environment it contains an appropriate justification that the security objectives for the operational environment are suitable to uphold that assumption.

if no security objectives for the operational environment trace back to the assumption, the evaluator action related to this work unit is assigned a fail verdict.

The evaluator determines that the justification for an assumption about the operational environment of the TOE demonstrates that the security objectives are sufficient: if all security objectives for the operational environment that trace back to that assumption are achieved, the operational environment upholds the assumption.

The evaluator also determines that each security objective for the operational environment that traces back to an assumption about the operational environment of the TOE is necessary: when the security objective is achieved it actually contributes to the operational environment upholding the assumption.

Note that the tracings from security objectives for the operational environment to assumptions provided in the security objectives rationale may be a part of a justification, but do not constitute a justification by themselves. Even in the case that a security objective of the operational environment is merely a restatement of an assumption, a justification is required, but this justification may be as minimal as "Security Objective X directly upholds Assumption Y".

9.7 Extended components definition (ASE_ECD)

9.7.1 Evaluation of sub-activity (ASE_ECD.1)

9.7.1.1 Objectives

The objective of this sub-activity is to determine whether extended components have been clearly and unambiguously defined, and whether they are necessary, i.e. they may not be clearly expressed using existing ISO/IEC 15408-2 or ISO/IEC 15408-3 components.

9.7.1.2 Input

The evaluation evidence for this sub-activity is:

a) the ST.

9.7.1.3 Action ASE_ECD.1.1E

ISO/IEC 15408-3 ASE_ECD.1.1C: *The statement of security requirements shall identify all extended security requirements.*

9.7.1.3.1 Work unit ASE_ECD.1-1

The evaluator shall check that all security requirements in the statement of security requirements that are not identified as extended requirements are present in ISO/IEC 15408-2 or in ISO/IEC 15408-3.

ISO/IEC 15408-3 ASE_ECD.1.2C: *The extended components definition shall define an extended component for each extended security requirement.*

9.7.1.3.2 Work unit ASE_ECD.1-2

The evaluator shall check that the extended components definition defines an extended component for each extended security requirement.

If the ST does not contain extended security requirements, this work unit is not applicable and therefore considered to be satisfied.

A single extended component may be used to define multiple iterations of an extended security requirement, it is not necessary to repeat this definition for each iteration.

ISO/IEC 15408-3 ASE_ECD.1.3C: *The extended components definition shall describe how each extended component is related to the existing ISO/IEC 15408 components, families, and classes.*

9.7.1.3.3 Work unit ASE_ECD.1-3

The evaluator shall examine the extended components definition to determine that it describes how each extended component fits into the existing ISO/IEC 15408 components, families, and classes.

If the ST does not contain extended security requirements, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that each extended component is either:

- a) a member of an existing ISO/IEC 15408-2 or ISO/IEC 15408-3 family, or
- b) a member of a new family defined in the ST.

If the extended component is a member of an existing ISO/IEC 15408-2 or ISO/IEC 15408-3 family, the evaluator determines that the extended components definition adequately describes why the extended component should be a member of that family and how it relates to other components of that family.

If the extended component is a member of a new family defined in the ST, the evaluator confirms that the extended component is not appropriate for an existing family.

If the ST defines new families, the evaluator determines that each new family is either:

- a) a member of an existing ISO/IEC 15408-2 or ISO/IEC 15408-3 class, or
- b) a member of a new class defined in the ST.

If the family is a member of an existing ISO/IEC 15408-2 or ISO/IEC 15408-3 class, the evaluator determines that the extended components definition adequately describes why the family should be a member of that class and how it relates to other families in that class.

If the family is a member of a new class defined in the ST, the evaluator confirms that the family is not appropriate for an existing class.

9.7.1.3.4 Work unit ASE_ECD.1-4

The evaluator shall examine the extended components definition to determine that each definition of an extended component identifies all applicable dependencies of that component.

If the ST does not contain extended security requirements, this work unit is not applicable and therefore considered to be satisfied.

The evaluator confirms that no applicable dependencies have been overlooked by the ST author.

ISO/IEC 15408-3 ASE_ECD.1.4C: *The extended components definition shall use the existing ISO/IEC 15408 components, families, classes, and methodology as a model for presentation.*

9.7.1.3.5 Work unit ASE_ECD.1-5

The evaluator shall examine the extended components definition to determine that each extended functional component uses the existing ISO/IEC 15408-2 components as a model for presentation.

If the ST does not contain extended SFRs, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that the extended functional component is consistent with ISO/IEC 15408-2 Subclause 6.1.3, Component structure.

If the extended functional component uses operations, the evaluator determines that the extended functional component is consistent with ISO/IEC 15408-1 7, Operations.

If the extended functional component is hierarchical to an existing functional component, the evaluator determines that the extended functional component is consistent with ISO/IEC 15408-2 Subclause 6.2.1, Component changes highlighting.

9.7.1.3.6 Work unit ASE_ECD.1-6

The evaluator shall examine the extended components definition to determine that each definition of a new functional family uses the existing ISO/IEC 15408 functional families as a model for presentation.

If the ST does not define new functional families, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that all new functional families are defined consistent with ISO/IEC 15408-2 Subclause 6.1.2, Family structure.

9.7.1.3.7 Work unit ASE_ECD.1-7

The evaluator shall examine the extended components definition to determine that each definition of a new functional class uses the existing ISO/IEC 15408 functional classes as a model for presentation.

If the ST does not define new functional classes, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that all new functional classes are defined consistent with ISO/IEC 15408-2 Subclause 6.1.1, Class structure.

9.7.1.3.8 Work unit ASE_ECD.1-8

The evaluator shall examine the extended components definition to determine that each definition of an extended assurance component uses the existing ISO/IEC 15408-3 components as a model for presentation.

If the ST does not contain extended SARs, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that the extended assurance component definition is consistent with ISO/IEC 15408-3 Subclause 6.1.3, Assurance component structure.

If the extended assurance component uses operations, the evaluator determines that the extended assurance component is consistent with ISO/IEC 15408-1 Subclause 7, Operations.

If the extended assurance component is hierarchical to an existing assurance component, the evaluator determines that the extended assurance component is consistent with ISO/IEC 15408-3 Subclause 6.1.3, Assurance component structure.

9.7.1.3.9 Work unit ASE_ECD.1-9

The evaluator shall examine the extended components definition to determine that, for each defined extended assurance component, applicable methodology has been provided.

If the ST does not contain extended SARs, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that, for each evaluator action element of each extended SAR, one or more work units are provided and that successfully performing all work units for a given evaluator action element will demonstrate that the element has been achieved.

9.7.1.3.10 Work unit ASE_ECD.1-10

The evaluator shall examine the extended components definition to determine that each definition of a new assurance family uses the existing ISO/IEC 15408 assurance families as a model for presentation.

If the ST does not define new assurance families, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that all new assurance families are defined consistent with ISO/IEC 15408-3 Subclause 6.1.2, Assurance family structure.

9.7.1.3.11 Work unit ASE_ECD.1-11

The evaluator shall examine the extended components definition to determine that each definition of a new assurance class uses the existing ISO/IEC 15408 assurance classes as a model for presentation.

If the ST does not define new assurance classes, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that all new assurance classes are defined consistent with ISO/IEC 15408-3 Subclause 6.1.1, Assurance class structure.

ISO/IEC 15408-3 ASE_ECD.1.5C: *The extended components shall consist of measurable and objective elements such that conformance or nonconformance to these elements can be demonstrated.*

9.7.1.3.12 Work unit ASE_ECD.1-12

The evaluator shall examine the extended components definition to determine that each element in each extended component is measurable and states objective evaluation requirements, such that conformance or nonconformance can be demonstrated.

If the ST does not contain extended security requirements, this work unit is not applicable and therefore considered to be satisfied.

The evaluator determines that elements of extended functional components are stated in such a way that they are testable, and traceable through the appropriate TSF representations.

The evaluator also determines that elements of extended assurance components avoid the need for subjective evaluator judgement.

The evaluator is reminded that whilst being measurable and objective is appropriate for all evaluation criteria, it is acknowledged that no formal method exists to prove such properties. Therefore the existing ISO/IEC 15408 functional and assurance components are to be used as a model for determining what constitutes conformance with this requirement.

9.7.1.4 Action ASE_ECD.1.2E**9.7.1.4.1 Work unit ASE_ECD.1-13**

The evaluator shall examine the extended components definition to determine that each extended component can not be clearly expressed using existing components.

If the ST does not contain extended security requirements, this work unit is not applicable and therefore considered to be satisfied.

The evaluator should take components from ISO/IEC 15408-2 and ISO/IEC 15408-3, other extended components that have been defined in the ST, combinations of these components, and possible operations on these components into account when making this determination.

The evaluator is reminded that the role of this work unit is to preclude unnecessary duplication of components, that is, components that may be clearly expressed by using other components. The evaluator should not undertake an exhaustive search of all possible combinations of components including operations in an attempt to find a way to express the extended component by using existing components.

9.8 Security requirements (ASE_REQ)**9.8.1 Evaluation of sub-activity (ASE_REQ.1)****9.8.1.1 Objectives**

The objective of this sub-activity is to determine whether the SFRs and SARs are clear, unambiguous and well-defined and whether they are internally consistent.

9.8.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST.

9.8.1.3 Action ASE_REQ.1.1E

ISO/IEC 15408-3 ASE_REQ.1.1C: *The statement of security requirements shall describe the SFRs and the SARs.*

9.8.1.3.1 Work unit ASE_REQ.1-1

The evaluator shall check that the statement of security requirements describes the SFRs.

The evaluator determines that each SFR is identified by one of the following means:

- a) by reference to an individual component in ISO/IEC 15408-2;
- b) by reference to an extended component in the extended components definition of the ST;
- c) by reference to a PP that the ST claims to be conformant with;
- d) by reference to a security requirements package that the ST claims to be conformant with;
- e) by reproduction in the ST.

It is not required to use the same means of identification for all SFRs.

9.8.1.3.2 Work unit ASE_REQ.1-2

The evaluator shall check that the statement of security requirements describes the SARs.

The evaluator determines that each SAR is identified by one of the following means:

- a) by reference to an individual component in ISO/IEC 15408-3;
- b) by reference to an extended component in the extended components definition of the ST;
- c) by reference to a PP that the ST claims to be conformant with;
- d) by reference to a security requirements package that the ST claims to be conformant with;
- e) by reproduction in the ST.

It is not required to use the same means of identification for all SARs.

ISO/IEC 15408-3 ASE_REQ.1.2C: *All subjects, objects, operations, security attributes, external entities and other terms that are used in the SFRs and the SARs shall be defined.*

9.8.1.3.3 Work unit ASE_REQ.1-3

The evaluator shall examine the ST to determine that all subjects, objects, operations, security attributes, external entities and other terms that are used in the SFRs and the SARs are defined.

The evaluator determines that the ST defines all:

- (types of) subjects and objects that are used in the SFRs;
- (types of) security attributes of subjects, users, objects, information, sessions and/or resources, possible values that these attributes may take and any relations between these values (e.g. top_secret is "higher" than secret);
- (types of) operations that are used in the SFRs, including the effects of these operations;
- (types of) external entities in the SFRs;
- other terms that are introduced in the SFRs and/or SARs by completing operations, if these terms are not immediately clear, or are used outside their dictionary definition.

The goal of this work unit is to ensure that the SFRs and SARs are well-defined and that no misunderstanding may occur due to the introduction of vague terms. This work unit should not be taken into extremes, by forcing the ST writer to define every single word. The general audience of a set of security requirements should be assumed to have a reasonable knowledge of IT, security and "Evaluation criteria for IT security".

All of the above may be presented in groups, classes, roles, types or other groupings or characterisations that allow easy understanding.

The evaluator is reminded that these lists and definitions do not have to be part of the statement of security requirements, but may be placed (in part or in whole) in different subclauses. This may be especially applicable if the same terms are used in the rest of the ST.

ISO/IEC 15408-3 ASE_REQ.1.3C: *The statement of security requirements shall identify all operations on the security requirements.*

9.8.1.3.4 Work unit ASE_REQ.1-4

The evaluator shall check that the statement of security requirements identifies all operations on the security requirements.

The evaluator determines that all operations are identified in each SFR or SAR where such an operation is used. Identification may be achieved by typographical distinctions, or by explicit identification in the surrounding text, or by any other distinctive means.

ISO/IEC 15408-3 ASE_REQ.1.4C: *All operations shall be performed correctly.*

9.8.1.3.5 Work unit ASE_REQ.1-5

The evaluator shall examine the statement of security requirements to determine that all assignment operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

9.8.1.3.6 Work unit ASE_REQ.1-6

The evaluator shall examine the statement of security requirements to determine that all iteration operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

9.8.1.3.7 Work unit ASE_REQ.1-7

The evaluator shall examine the statement of security requirements to determine that all selection operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

9.8.1.3.8 Work unit ASE_REQ.1-8

The evaluator shall examine the statement of security requirements to determine that all refinement operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

ISO/IEC 15408-3 ASE_REQ.1.5C: *Each dependency of the security requirements shall either be satisfied, or the security requirements rationale shall justify the dependency not being satisfied.*

9.8.1.3.9 Work unit ASE_REQ.1-9

The evaluator shall examine the statement of security requirements to determine that each dependency of the security requirements is either satisfied, or that a security requirements rationale is provided which justifies the dependency not being satisfied.

A dependency is satisfied by the inclusion of the relevant component (or one that is hierarchical to it) within the statement of security requirements. The component used to satisfy the dependency should, if necessary, be modified by operations to ensure that it actually satisfies that dependency.

A justification that a dependency is not met should address either:

- a) why the dependency is not necessary or useful, in which case no further information is required; or
- b) that the dependency has been addressed by the operational environment of the TOE, in which case the justification should describe how the security objectives for the operational environment address this dependency.

ISO/IEC 15408-3 ASE_REQ.1.6C: *The statement of security requirements shall be internally consistent.*

9.8.1.3.10 Work unit ASE_REQ.1-10

The evaluator shall examine the statement of security requirements to determine that it is internally consistent.

The evaluator determines that the combined set of all SFRs and SARs is internally consistent.

The evaluator determines that on all occasions where different security requirements apply to the same types of developer evidence, events, operations, data, tests to be performed etc. or to "all objects", "all subjects" etc., that these requirements do not conflict.

Some possible conflicts are:

- a) an extended SAR specifying that the design of a certain cryptographic algorithm is to be kept secret, and another extended SAR specifying an open source review;
- b) FAU_GEN.1 Audit data generation specifying that subject identity is to be logged, FDP_ACC.1 Subset access control specifying who has access to these logs, and FPR_UNO.1 Unobservability specifying that some actions of subjects should be unobservable to other subjects. If the subject that should not be able to see an activity may access logs of this activity, these SFRs conflict;
- c) FDP_RIP.1 Subset residual information protection specifying deletion of information no longer needed, and FDP_ROL.1 Basic rollback specifying that a TOE may return to a previous state. If the information that is needed for the rollback to the previous state has been deleted, these requirements conflict;
- d) Multiple iterations of FDP_ACC.1 Subset access control especially where some iterations cover the same subjects, objects, or operations. If one access control SFR allows a subject to perform an operation on an object, while another access control SFR does not allow this, these requirements conflict.

9.8.2 Evaluation of sub-activity (ASE_REQ.2)

9.8.2.1 Objectives

The objective of this sub-activity is to determine whether the SFRs and SARs are clear, unambiguous and well-defined, whether they are internally consistent, and whether the SFRs meet the security objectives of the TOE.

9.8.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST.

9.8.2.3 Action ASE_REQ.2.1E

ISO/IEC 15408-3 ASE_REQ.2.1C: *The statement of security requirements shall describe the SFRs and the SARs.*

9.8.2.3.1 Work unit ASE_REQ.2-1

The evaluator shall check that the statement of security requirements describes the SFRs.

The evaluator determines that each SFRs is identified by one of the following means:

- a) by reference to an individual component in ISO/IEC 15408-2;
- b) by reference to an extended component in the extended components definition of the ST;
- c) by reference to an individual component in a PP that the ST claims to be conformant with;
- d) by reference to an individual component in a security requirements package that the ST claims to be conformant with;
- e) by reproduction in the ST.

It is not required to use the same means of identification for all SFRs.

9.8.2.3.2 Work unit ASE_REQ.2-2

The evaluator shall check that the statement of security requirements describes the SARs.

The evaluator determines that all SARs are identified by one of the following means:

- a) by reference to an individual component in ISO/IEC 15408-3;
- b) by reference to an extended component in the extended components definition of the ST;
- c) by reference to an individual component in a PP that the ST claims to be conformant with;
- d) by reference to an individual component in a security requirements package that the ST claims to be conformant with;
- e) by reproduction in the ST.

It is not required to use the same means of identification for all SARs.

ISO/IEC 15408-3 ASE_REQ.2.2C: *All subjects, objects, operations, security attributes, external entities and other terms that are used in the SFRs and the SARs shall be defined.*

9.8.2.3.3 Work unit ASE_REQ.2-3

The evaluator shall examine the ST to determine that all subjects, objects, operations, security attributes, external entities and other terms that are used in the SFRs and the SARs are defined.

The evaluator determines that the ST defines all:

- (types of) subjects and objects that are used in the SFRs;

- (types of) security attributes of subjects, users, objects, information, sessions and/or resources, possible values that these attributes may take and any relations between these values (e.g. top_secret is “higher” than secret);
- (types of) operations that are used in the SFRs, including the effects of these operations;
- (types of) external entities in the SFRs;
- other terms that are introduced in the SFRs and/or SARs by completing operations, if these terms are not immediately clear, or are used outside their dictionary definition.

The goal of this work unit is to ensure that the SFRs and SARs are well-defined and that no misunderstanding may occur due to the introduction of vague terms. This work unit should not be taken into extremes, by forcing the ST writer to define every single word. The general audience of a set of security requirements should be assumed to have a reasonable knowledge of IT, security and “Evaluation criteria for IT security”.

All of the above may be presented in groups, classes, roles, types or other groupings or characterisations that allow easy understanding.

The evaluator is reminded that these lists and definitions do not have to be part of the statement of security requirements, but may be placed (in part or in whole) in different subclauses. This may be especially applicable if the same terms are used in the rest of the ST.

ISO/IEC 15408-3 ASE_REQ.2.3C: *The statement of security requirements shall identify all operations on the security requirements.*

9.8.2.3.4 Work unit ASE_REQ.2-4

The evaluator shall check that the statement of security requirements identifies all operations on the security requirements.

The evaluator determines that all operations are identified in each SFR or SAR where such an operation is used. Identification may be achieved by typographical distinctions, or by explicit identification in the surrounding text, or by any other distinctive means.

ISO/IEC 15408-3 ASE_REQ.2.4C: *All operations shall be performed correctly.*

9.8.2.3.5 Work unit ASE_REQ.2-5

The evaluator shall examine the statement of security requirements to determine that all assignment operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 7, Operations.

9.8.2.3.6 Work unit ASE_REQ.2-6

The evaluator shall examine the statement of security requirements to determine that all iteration operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

9.8.2.3.7 Work unit ASE_REQ.2-7

The evaluator shall examine the statement of security requirements to determine that all selection operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

9.8.2.3.8 Work unit ASE_REQ.2-8

The evaluator shall examine the statement of security requirements to determine that all refinement operations are performed correctly.

Guidance on the correct performance of operations may be found in ISO/IEC 15408-1 Annex 7, Operations.

ISO/IEC 15408-3 ASE_REQ.2.5C: *Each dependency of the security requirements shall either be satisfied, or the security requirements rationale shall justify the dependency not being satisfied.*

9.8.2.3.9 Work unit ASE_REQ.2-9

The evaluator shall examine the statement of security requirements to determine that each dependency of the security requirements is either satisfied, or that the security requirements rationale justifies the dependency not being satisfied.

A dependency is satisfied by the inclusion of the relevant component (or one that is hierarchical to it) within the statement of security requirements. The component used to satisfy the dependency should, if necessary, be modified by operations to ensure that it actually satisfies that dependency.

A justification that a dependency is not met should address either:

- a) why the dependency is not necessary or useful, in which case no further information is required; or
- b) that the dependency has been addressed by the operational environment of the TOE, in which case the justification should describe how the security objectives for the operational environment address this dependency.

ISO/IEC 15408-3 ASE_REQ.2.6C: *The security requirements rationale shall trace each SFR back to the security objectives for the TOE.*

9.8.2.3.10 Work unit ASE_REQ.2-10

The evaluator shall check that the security requirements rationale traces each SFR back to the security objectives for the TOE.

The evaluator determines that each SFR is traced back to at least one security objective for the TOE.

Failure to trace implies that either the security requirements rationale is incomplete, the security objectives for the TOE are incomplete, or the SFR has no useful purpose.

ISO/IEC 15408-3 ASE_REQ.2.7C: *The security requirements rationale shall demonstrate that the SFRs meet all security objectives for the TOE.*

9.8.2.3.11 Work unit ASE_REQ.2-11

The evaluator shall examine the security requirements rationale to determine that for each security objective for the TOE it demonstrates that the SFRs are suitable to meet that security objective for the TOE.

If no SFRs trace back to the security objective for the TOE, the evaluator action related to this work unit is assigned a fail verdict.

The evaluator determines that the justification for a security objective for the TOE demonstrates that the SFRs are sufficient: if all SFRs that trace back to the objective are satisfied, the security objective for the TOE is achieved.

The evaluator also determines that each SFR that traces back to a security objective for the TOE is necessary: when the SFR is satisfied, it actually contributes to achieving the security objective.

Note that the tracings from SFRs to security objectives for the TOE provided in the security requirements rationale may be a part of the justification, but do not constitute a justification by themselves.

ISO/IEC 15408-3 ASE_REQ.2.8C: *The security requirements rationale shall explain why the SARs were chosen.*

9.8.2.3.12 Work unit ASE_REQ.2-12

The evaluator shall check that the security requirements rationale explains why the SARs were chosen.

The evaluator is reminded that any explanation is correct, as long as it is coherent and neither the SARs nor the explanation have obvious inconsistencies with the remainder of the ST.

An example of an obvious inconsistency between the SARs and the remainder of the ST would be to have threat agents that are very capable, but an AVA_VAN SAR that does not protect against these threat agents.

ISO/IEC 15408-3 ASE_REQ.2.9C: *The statement of security requirements shall be internally consistent.*

9.8.2.3.13 Work unit ASE_REQ.2-13

The evaluator shall examine the statement of security requirements to determine that it is internally consistent.

The evaluator determines that the combined set of all SFRs and SARs is internally consistent.

The evaluator determines that on all occasions where different security requirements apply to the same types of developer evidence, events, operations, data, tests to be performed etc. or to "all objects", "all subjects" etc., that these requirements do not conflict.

Some possible conflicts are:

- a) an extended SAR specifying that the design of a certain cryptographic algorithm is to be kept secret, and another extended assurance requirement specifying an open source review;
- b) FAU_GEN.1 Audit data generation specifying that subject identity is to be logged, FDP_ACC.1 Subset access control specifying who has access to these logs, and FPR_UNO.1 Unobservability specifying that some actions of subjects should be unobservable to other subjects. If the subject that should not be able to see an activity may access logs of this activity, these SFRs conflict;
- c) FDP_RIP.1 Subset residual information protection specifying deletion of information no longer needed, and FDP_ROL.1 Basic rollback specifying that a TOE may return to a previous state. If the information that is needed for the rollback to the previous state has been deleted, these requirements conflict;
- d) Multiple iterations of FDP_ACC.1 Subset access control especially where some iterations cover the same subjects, objects, or operations. If one access control SFR allows a subject to perform an operation on an object, while another access control SFR does not allow this, these requirements conflict.

9.9 TOE summary specification (ASE_TSS)

9.9.1 Evaluation of sub-activity (ASE_TSS.1)

9.9.1.1 Objectives

The objective of this sub-activity is to determine whether the TOE summary specification addresses all SFRs, and whether the TOE summary specification is consistent with other narrative descriptions of the TOE.

9.9.1.2 Input

The evaluation evidence for this sub-activity is:

a) the ST.

9.9.1.3 Action ASE_TSS.1.1E

ISO/IEC 15408-3 ASE_TSS.1.1C: *The TOE summary specification shall describe how the TOE meets each SFR.*

9.9.1.3.1 Work unit ASE_TSS.1-1

The evaluator shall examine the TOE summary specification to determine that it describes how the TOE meets each SFR.

The evaluator determines that the TOE summary specification provides, for each SFR from the statement of security requirements, a description on how that SFR is met.

The evaluator is reminded that the objective of each description is to provide potential consumers of the TOE with a high-level view of how the developer intends to satisfy each SFR and that the descriptions therefore should not be overly detailed.

For a composed TOE, the evaluator also determines that it is clear which component provides each SFR or how the components combine to meet each SFR.

9.9.1.4 Action ASE_TSS.1.2E

9.9.1.4.1 Work unit ASE_TSS.1-2

The evaluator shall examine the TOE summary specification to determine that it is consistent with the TOE overview and the TOE description.

The TOE overview, TOE description, and TOE summary specification describe the TOE in a narrative form at increasing levels of detail. These descriptions therefore need to be consistent.

9.9.2 Evaluation of sub-activity (ASE_TSS.2)

9.9.2.1 Objectives

The objective of this sub-activity is to determine whether the TOE summary specification addresses all SFRs, whether the TOE summary specification addresses interference, logical tampering and bypass, and whether the TOE summary specification is consistent with other narrative descriptions of the TOE.

9.9.2.2 Input

The evaluation evidence for this sub-activity is:

a) the ST.

9.9.2.3 Action ASE_TSS.2.1E

ISO/IEC 15408-3 ASE_TSS.2.1C: *The TOE summary specification shall describe how the TOE meets each SFR.*

9.9.2.3.1 Work unit ASE_TSS.2-1

The evaluator shall examine the TOE summary specification to determine that it describes how the TOE meets each SFR.

The evaluator determines that the TOE summary specification provides, for each SFR from the statement of security requirements, a description on how that SFR is met.

The evaluator is reminded that the objective of each description is to provide potential consumers of the TOE with a high-level view of how the developer intends to satisfy each SFR and that the descriptions therefore should not be overly detailed.

For a composed TOE, the evaluator also determines that it is clear which component provides each SFR or how the components combine to meet each SFR.

ISO/IEC 15408-3 ASE_TSS.2.2C: *The TOE summary specification shall describe how the TOE protects itself against interference and logical tampering.*

9.9.2.3.2 Work unit ASE_TSS.2-2

The evaluator shall examine the TOE summary specification to determine that it describes how the TOE protects itself against interference and logical tampering.

The evaluator is reminded that the objective of each description is to provide potential consumers of the TOE with a high-level view of how the developer intends to provide protection against interference and logical tampering and that the descriptions therefore should not be overly detailed.

For a composed TOE, the evaluator also determines that it is clear which component provides the protection or how the components combine to provide protection.

ISO/IEC 15408-3 ASE_TSS.2.3C: *The TOE summary specification shall describe how the TOE protects itself against bypass.*

9.9.2.3.3 Work unit ASE_TSS.2-3

The evaluator shall examine the TOE summary specification to determine that it describes how the TOE protects itself against bypass.

The evaluator is reminded that the objective of each description is to provide potential consumers of the TOE with a high-level view of how the developer intends to provide protection against bypass and that the descriptions therefore should not be overly detailed.

For a composed TOE, the evaluator also determines that it is clear which component provides the protection or how the components combine to provide protection.

9.9.2.4 Action ASE_TSS.2.2E

9.9.2.4.1 Work unit ASE_TSS.2-4

The evaluator shall examine the TOE summary specification to determine that it is consistent with the TOE overview and the TOE description.

The TOE overview, TOE description, and TOE summary specification describe the TOE in a narrative form at increasing levels of detail. These descriptions therefore need to be consistent.

10 Class ADV: Development

10.1 Introduction

The purpose of the development activity is to assess the design documentation in terms of its adequacy to understand how the TSF meets the SFRs and how the implementation of these SFRs cannot be tampered with or bypassed. This understanding is achieved through examination of increasingly refined descriptions of the TSF design documentation. Design documentation consists of a functional specification (which describes the interfaces of the TSF), a TOE design description (which describes the architecture of the TSF in terms of how it works in order to perform the functions related to the SFRs being claimed), and an implementation description (a source code level description). In addition, there is a security architecture description (which describes the architectural properties of the TSF to explain how its security enforcement cannot be

compromised or bypassed), an internal description (which describes how the TSF was constructed in a manner that encourages understandability), and a security policy model (which formally describes the security policies enforced by the TSF).

10.2 Application notes

ISO/IEC 15408 requirements for design documentation are levelled by the amount, and detail of information provided, and the degree of formality of the presentation of the information. At lower levels, the most security-critical portions of the TSF are described with the most detail, while less security-critical portions of the TSF are merely summarised; added assurance is gained by increasing the amount of information about the most security-critical portions of the TSF, and increasing the details about the less security-critical portions. The most assurance is achieved when thorough details and information of all portions are provided.

ISO/IEC 15408 considers a document's degree of formality (that is, whether it is informal or semiformal) to be hierarchical. An informal document is one that is expressed in a natural language. The methodology does not dictate the specific language that must be used; that issue is left for the scheme. The following paragraphs differentiate the contents of the different informal documents.

A functional specification provides a description of the purpose and method of use of interfaces to the TSF. For example, if an operating system presents the user with a means of self-identification, of creating files, of modifying or deleting files, of setting permissions defining what other users may access files, and of communicating with remote machines, its functional specification would contain descriptions of each of these and how they are realised through interactions with the externally-visible interfaces to the TSF. If there is also audit functionality that detects and records the occurrences of such events, descriptions of this audit functionality would also be expected to be part of the functional specification; while this functionality is technically not directly invoked by the user at the external interface, it certainly is affected by what occurs at the user's external interface.

A design description is expressed in terms of logical divisions (subsystems or modules) that each provide a comprehensible service or function. For example, a firewall might be composed of subsystems that deal with packet filtering, with remote administration, with auditing, and with connection-level filtering. The design description of the firewall would describe the actions that are taken, in terms of what actions each subsystem takes when an incoming packet arrives at the firewall.

10.3 Security Architecture (ADV_ARC)

10.3.1 Evaluation of sub-activity (ADV_ARC.1)

10.3.1.1 Objectives

The objective of this sub-activity is to determine whether the TSF is structured such that it cannot be tampered with or bypassed, and whether TSFs that provide security domains isolate those domains from each other.

10.3.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) the TOE design;
- d) the security architecture description;
- e) the implementation representation (if available);
- f) the operational user guidance.

10.3.1.3 Application notes

The notions of self-protection, domain separation, and non-bypassability are distinct from security functionality expressed in Part 2 SFRs because self-protection and non-bypassability largely have no directly observable interface at the TSF. Rather, they are properties of the TSF that are achieved through the design of the TOE, and enforced by the correct implementation of that design. Also, the evaluation of these properties is less straight-forward than the evaluation of mechanisms; it is more difficult to check for the absence of functionality than for its presence. However, the determination that these properties are being satisfied is just as critical as the determination that the mechanisms are properly implemented.

The overall approach used is that the developer provides a TSF that meets the above-mentioned properties, and provides evidence (in the form of documentation) that can be analysed to show that the properties are indeed met. The evaluator has the responsibility for looking at the evidence and, coupled with other evidence delivered for the TOE, determining that the properties are achieved. The work units can be characterised as those detailing with what information has to be provided, and those dealing with the actual analysis the evaluator performs.

The security architecture description describes how domains are defined and how the TSF keeps them separate. It describes what prevents untrusted processes from getting to the TSF and modifying it. It describes what ensures that all resources under the TSF's control are adequately protected and that all actions related to the SFRs are mediated by the TSF. It explains any role the environment plays in any of these (e.g. presuming it gets correctly invoked by its underlying environment, how is its security functionality invoked?). In short, it explains how the TOE is considered to be providing any kind of *security* service.

The analyses the evaluator performs must be done in the context of all of the development evidence provided for the TOE, at the level of detail the evidence is provided. At lower assurance levels there should not be the expectation that, for example, TSF self-protection is completely analysed, because only high-level design representations will be available. The evaluator also needs to be sure to use information gleaned from other portions of their analysis (e.g., analysis of the TOE design) in making their assessments for the properties being examined in the following work units.

10.3.1.4 Action ADV_ARC.1.1E

ISO/IEC 15408-3 ADV_ARC.1.1C: *The security architecture description shall be at a level of detail commensurate with the description of the SFR-enforcing abstractions described in the TOE design document.*

10.3.1.4.1 Work unit ADV_ARC.1-1

The evaluator shall examine the security architecture description to determine that the information provided in the evidence is presented at a level of detail commensurate with the descriptions of the SFR-enforcing abstractions contained in the functional specification and TOE design document.

With respect to the functional specification, the evaluator should ensure that the self-protection functionality described cover those effects that are evident at the TSFI. Such a description might include protection placed upon the executable images of the TSF, and protection placed on objects (e.g., files used by the TSF). The evaluator ensures that the functionality that might be invoked through the TSFI is described.

If Evaluation of sub-activity (ADV_TDS.1) or Evaluation of sub-activity (ADV_TDS.2) is included, the evaluator ensures the security architecture description contains information on how any subsystems that contribute to TSF domain separation work.

If Evaluation of sub-activity (ADV_TDS.3) or higher is available, the evaluator ensures that the security architecture description also contains implementation-dependent information. For example, such a description might contain information pertaining to coding conventions for parameter checking that would prevent TSF compromises (e.g. buffer overflows), and information on stack management for call and return operations. The evaluator checks the descriptions of the mechanisms to ensure that the level of detail is such that there is little ambiguity between the description in the security architecture description and the implementation representation.

The evaluator action related to this work unit is assigned a fail verdict if the security architecture description mentions any module, subsystem, or interface that is not described in the functional specification or TOE design document.

ISO/IEC 15408-3 ADV_ARC.1.2C: *The security architecture description shall describe the security domains maintained by the TSF consistently with the SFRs.*

10.3.1.4.2 Work unit ADV_ARC.1-2

The evaluator shall examine the security architecture description to determine that it describes the security domains maintained by the TSF.

Security domains refer to environments supplied by the TSF for use by potentially-harmful entities; for example, a typical secure operating system supplies a set of resources (address space, per-process environment variables) for use by processes with limited access rights and security properties. The evaluator determines that the developer's description of the security domains takes into account all of the SFRs claimed by the TOE.

For some TOEs such domains do not exist because all of the interactions available to users are severely constrained by the TSF. A packet-filter firewall is an example of such a TOE. Users on the LAN or WAN do not interact with the TOE, so there need be no security domains; there are only data structures maintained by the TSF to keep the users' packets separated. The evaluator ensures that any claim that there are no domains is supported by the evidence and that no such domains are, in fact, available.

ISO/IEC 15408-3 ADV_ARC.1.3C: *The security architecture description shall describe how the TSF initialisation process is secure.*

10.3.1.4.3 Work unit ADV_ARC.1-3

The evaluator shall examine the security architecture description to determine that the initialisation process preserves security.

The information provided in the security architecture description relating to TSF initialisation is directed at the TOE components that are involved in bringing the TSF into an initial secure state (i.e. when all parts of the TSF are operational) when power-on or a reset is applied. This discussion in the security architecture description should list the system initialisation components and the processing that occurs in transitioning from the "down" state to the initial secure state.

It is often the case that the components that perform this initialisation function are not accessible after the secure state is achieved; if this is the case then the security architecture description identifies the components and explains how they are not reachable by untrusted entities after the TSF has been established. In this respect, the property that needs to be preserved is that these components either 1) cannot be accessed by untrusted entities after the secure state is achieved, or 2) if they provide interfaces to untrusted entities, these TSFIs cannot be used to tamper with the TSF.

The TOE components related to TSF initialisation, then, are treated themselves as part of the TSF, and analysed from that perspective. It should be noted that even though these are treated as part of the TSF, it is likely that a justification (as allowed by TSF internals (ADV_INT)) can be made that they do not have to meet the internal structuring requirements of ADV_INT.

ISO/IEC 15408-3 ADV_ARC.1.4C: *The security architecture description shall demonstrate that the TSF protects itself from tampering.*

10.3.1.4.4 Work unit ADV_ARC.1-4

The evaluator shall examine the security architecture description to determine that it contains information sufficient to support a determination that the TSF is able to protect itself from tampering by untrusted active entities.

"Self-protection" refers to the ability of the TSF to protect itself from manipulation from external entities that may result in changes to the TSF. For TOEs that have dependencies on other IT entities, it is often the case that the TOE uses services supplied by the other IT entities in order to perform its functions. In such cases, the TSF alone does not protect itself because it depends on the other IT entities to provide some of the protection. For the purposes of the security architecture description, the notion of *self-protection* applies only to the services provided by the TSF through its TSFI, and not to services provided by underlying IT entities that it uses.

Self-protection is typically achieved by a variety of means, ranging from physical and logical restrictions on access to the TOE; to hardware-based means (e.g. "execution rings" and memory management functionality); to software-based means (e.g. boundary checking of inputs on a trusted server). The evaluator determines that all such mechanisms are described.

The evaluator determines that the design description covers how user input is handled by the TSF in such a way that the TSF does not subject itself to being corrupted by that user input. For example, the TSF might implement the notion of privilege and protect itself by using privileged-mode routines to handle user input. The TSF might make use of processor-based separation mechanisms such as privilege levels or rings. The TSF might implement software protection constructs or coding conventions that contribute to implementing separation of software domains, perhaps by delineating user address space from system address space. And the TSF might have reliance its environment to provide some support to the protection of the TSF.

All of the mechanisms contributing to the domain separation functions are described. The evaluator should use knowledge gained from other evidence (functional specification, TOE design, TSF internals description, other parts of the security architecture description, or implementation representation, as included in the assurance package for the TOE) in determining if any functionality contributing to self-protection was described that is not present in the security architecture description.

Accuracy of the description of the self-protection mechanisms is the property that the description faithfully describes what is implemented. The evaluator should use other evidence (functional specification, TOE design, TSF Internals documentation, other parts of the security architectural description, implementation representation, as included in the ST for the TOE) in determining whether there are discrepancies in any descriptions of the self-protection mechanisms. If Implementation representation (ADV_IMP) is included in the assurance package for the TOE, the evaluator will choose a sample of the implementation representation; the evaluator should also ensure that the descriptions are accurate for the sample chosen. If an evaluator cannot understand how a certain self-protection mechanism works or could work in the system architecture, it may be the case that the description is not accurate.

ISO/IEC 15408-3 ADV_ARC.1.5C: *The security architecture description shall demonstrate that the TSF prevents bypass of the SFR-enforcing functionality.*

10.3.1.4.5 Work unit ADV_ARC.1-5

The evaluator shall examine the security architecture description to determine that it presents an analysis that adequately describes how the SFR-enforcing mechanisms cannot be bypassed.

Non-bypassability is a property that the security functionality of the TSF (as specified by the SFRs) is always invoked. For example, if access control to files is specified as a capability of the TSF via an SFR, there must be no interfaces through which files can be accessed without invoking the TSF's access control mechanism (such as an interface through which a raw disk access takes place).

Describing how the TSF mechanisms cannot be bypassed generally requires a systematic argument based on the TSF and the TSFIs. The description of how the TSF works (contained in the design decomposition evidence, such as the functional specification, TOE design documentation) - along with the information in the TSS - provides the background necessary for the evaluator to understand what resources are being protected and what security functions are being provided. The functional specification provides descriptions of the TSFIs through which the resources/functions are accessed.

The evaluator assesses the description provided (and other information provided by the developer, such as the functional specification) to ensure that no available interface can be used to bypass the TSF. This means that every available interface must be either unrelated to the SFRs that are claimed in the ST (and does not

interact with anything that is used to satisfy SFRs) or else uses the security functionality that is described in other development evidence in the manner described. For example, a game would likely be unrelated to the SFRs, so there must be an explanation of how it cannot affect security. Access to user data, however, is likely to be related to access control SFRs, so the explanation would describe how the security functionality works when invoked through the data-access interfaces. Such a description is needed for every available interface.

An example of a description follows. Suppose the TSF provides file protection. Further suppose that although the “traditional” system call TSFIs for open, read, and write invoke the file protection mechanism described in the TOE design, there exists a TSFI that allows access to a batch job facility (creating batch jobs, deleting jobs, modifying unprocessed jobs). The evaluator should be able to determine from the vendor-provided description that this TSFI invokes the same protection mechanisms as do the “traditional” interfaces. This could be done, for example, by referencing the appropriate subclauses of the TOE design that discuss *how* the batch job facility TSFI achieves its security objectives.

Using this same example, suppose there is a TSFI whose sole purpose is to display the time of day. The evaluator should determine that the description adequately argues that this TSFI is not capable of manipulating any protected resources and should not invoke any security functionality.

Another example of bypass is when the TSF is supposed to maintain confidentiality of a cryptographic key (one is allowed to use it for cryptographic operations, but is not allowed to read/write it). If an attacker has direct physical access to the device, he might be able to examine side-channels such as the power usage of the device, the exact timing of the device, or even any electromagnetic emanations of the device and, from this, infer the key.

If such side-channels may be present, the demonstration should address the mechanisms that prevent these side-channels from occurring, such as random internal clocks, dual-line technology etc. Verification of these mechanisms would be verified by a combination of purely design-based arguments and testing.

For a final example using security functionality rather than a protected resource, consider an ST that contains FCO_NRO.2 Enforced proof of origin, which requires that the TSF provides evidence of origination for information types specified in the ST. Suppose that the “information types” included all information that is sent by the TOE via e-mail. In this case the evaluator should examine the description to ensure that all TSFI that can be invoked to send e-mail perform the “evidence of origination generation” function are detailed. The description might point to user guidance to show all places where e-mail can originate (e.g., e-mail program, notification from scripts/batch jobs) and then how each of these places invokes the evidence generation function.

The evaluator should also ensure that the description is comprehensive, in that each interface is analysed with respect to the entire set of claimed SFRs. This may require the evaluator to examine supporting information (functional specification, TOE design, other parts of the security architectural description, operational user guidance, and perhaps even the implementation representation, as provided for the TOE) to determine that the description has correctly capture all aspects of an interface. The evaluator should consider what SFRs each TSFI might affect (from the description of the TSFI and its implementation in the supporting documentation), and then examine the description to determine whether it covers those aspects.

10.4 Functional specification (ADV_FSP)

10.4.1 Evaluation of sub-activity (ADV_FSP.1)

10.4.1.1 Objectives

The objective of this sub-activity is to determine whether the developer has provided a high-level description of at least the SFR-enforcing and SFR-supporting TSFIs, in terms of descriptions of their parameters. There is no other required evidence that can be expected to be available to measure the accuracy of these descriptions; the evaluator merely ensures the descriptions seem plausible.

10.4.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) the operational user guidance.

10.4.1.3 Action ADV_FSP.1.1E

ISO/IEC 15408-3 ADV_FSP.1.1C: *The functional specification shall describe the purpose and method of use for each SFR-enforcing and SFR-supporting TSFI.*

10.4.1.3.1 Work unit ADV_FSP.1-1

The evaluator shall examine the functional specification to determine that it states the purpose of each SFR-supporting and SFR-enforcing TSFI.

The purpose of a TSFI is a general statement summarising the functionality provided by the interface. It is not intended to be a complete statement of the actions and results related to the interface, but rather a statement to help the reader understand in general what the interface is intended to be used for. The evaluator should not only determine that the purpose exists, but also that it accurately reflects the TSFI by taking into account other information about the interface, such as the description of the parameters; this can be done in association with other work units for this component.

If an action available through an interface plays a role in enforcing any security policy on the TOE (that is, if one of the actions of the interface can be traced to one of the SFRs levied on the TSF), then that interface is *SFR-enforcing*. Such policies are not limited to the access control policies, but also refer to any functionality specified by one of the SFRs contained in the ST. Note that it is possible that an interface may have various actions and results, some of which may be SFR-enforcing and some of which may not.

Interfaces to (or actions available through an interface relating to) actions that SFR-enforcing functionality depends on, but need only to function correctly in order for the security policies of the TOE to be preserved, are termed *SFR supporting*. Interfaces to actions on which SFR-enforcing functionality has no dependence are termed *SFR non-interfering*.

It should be noted that in order for an interface to be SFR supporting or SFR non-interfering it must have *no* SFR-enforcing actions or results. In contrast, an SFR-enforcing interface may have SFR-supporting actions (for example, the ability to set the system clock may be an SFR-enforcing action of an interface, but if that same interface is used to display the system date that action may only be SFR supporting). An example of a purely SFR-supporting interface is a system call interface that is used both by untrusted users and by a portion of the TSF that is running in user mode.

At this level, it is unlikely that a developer will have expended effort to label interfaces as SFR-enforcing and SFR-supporting. In the case that this has been done, the evaluator should verify to the extent that supporting documentation (e.g., operational user guidance) allows that this identification is correct. Note that this identification activity is necessary for several work units for this component.

In the more likely case that the developer has not labelled the interfaces, the evaluator must perform their own identification of the interfaces first, and then determine whether the required information (for this work unit, the purpose) is present. Again, because of the lack of supporting evidence this identification will be difficult and have low assurance that all appropriate interfaces have been correctly identified, but nonetheless the evaluator examines other evidence available for the TOE to ensure as complete coverage as is possible.

10.4.1.3.2 Work unit ADV_FSP.1-2

The evaluator shall examine the functional specification to determine that the method of use for each SFR-supporting and SFR-enforcing TSFI is given.

See work unit ADV_FSP.1-1 for a discussion on the identification of SFR-supporting and SFR-enforcing TSFI.

The method of use for a TSFI summarises how the interface is manipulated in order to invoke the actions and obtain the results associated with the TSFI. The evaluator should be able to determine, from reading this material in the functional specification, how to use each interface. This does not necessarily mean that there needs to be a separate method of use for each TSFI, as it may be possible to describe in general how kernel calls are invoked, for instance, and then identify each interface using that general style. Different types of interfaces will require different method of use specifications. APIs, network protocol interfaces, system configuration parameters, and hardware bus interfaces all have very different methods of use, and this should be taken into account by the developer when developing the functional specification, as well as by the evaluator evaluating the functional specification.

For administrative interfaces whose functionality is documented as being inaccessible to untrusted users, the evaluator ensures that the method of making the functions inaccessible is described in the functional specification. It should be noted that this inaccessibility needs to be tested by the developer in their test suite.

ISO/IEC 15408-3 ADV_FSP.1.2C: *The functional specification shall identify all parameters associated with each SFR-enforcing and SFR-supporting TSFI.*

10.4.1.3.3 Work unit ADV_FSP.1-3

The evaluator shall examine the presentation of the TSFI to determine that it identifies all parameters associated with each SFR-enforcing and SFR-supporting TSFI.

See work unit ADV_FSP.1-1 for a discussion on the identification of SFR-supporting and SFR-enforcing TSFI.

The evaluator examines the functional specification to ensure that all of the parameters are described for identified TSFI. Parameters are explicit inputs or outputs to an interface that control the behaviour of that interface. For examples, parameters are the arguments supplied to an API; the various fields in packet for a given network protocol; the individual key values in the Windows Registry; the signals across a set of pins on a chip; etc.

While difficult to obtain much assurance that all parameters for the applicable TSFI have been identified, the evaluator should also check other evidence provided for the evaluation (e.g., operational user guidance) to see if behaviour or additional parameters are described there but not in the functional specification.

ISO/IEC 15408-3 ADV_FSP.1.3C: *The functional specification shall provide rationale for the implicit categorisation of interfaces as SFR-non-interfering.*

10.4.1.3.4 Work unit ADV_FSP.1-4

The evaluator shall examine the rationale provided by the developer for the implicit categorisation of interfaces as SFR-non-interfering to determine that it is accurate.

In the case where the developer has provided adequate documentation to perform the analysis called for by the rest of the work units for this component without explicitly identifying SFR-enforcing and SFR-supporting interfaces, this work unit should be considered satisfied.

This work unit is intended to apply to cases where the developer has not described a portion of the TSFI, claiming that it is SFR-non-interfering and therefore not subject to other requirements of this component. In such a case, the developer provides a rationale for this characterisation in sufficient detail such that the evaluator understands the rationale, the characteristics of the interfaces affected (e.g., their high-level function with respect to the TOE, such as "colour palette manipulation"), and that the claim that these are SFR-non-interfering is supported. Given the level of assurance the evaluator should not expect more detail than is provided for the SFR-enforcing or SFR-supporting interfaces, and in fact the detail should be much less. In most cases, individual interfaces should not need to be addressed in the developer-provided rationale subclause.

ISO/IEC 15408-3 ADV_FSP.1.4C: *The tracing shall demonstrate that the SFRs trace to TSFIs in the functional specification.*

10.4.1.3.5 Work unit ADV_FSP.1-5

The evaluator shall check that the tracing links the SFRs to the corresponding TSFIs.

The tracing is provided by the developer to serve as a guide to which SFRs are related to which TSFIs. This tracing can be as simple as a table; it is used as input to the evaluator for use in the following work units, in which the evaluator verifies its completeness and accuracy.

10.4.1.4 Action ADV_FSP.1.2E

10.4.1.4.1 Work unit ADV_FSP.1-6

The evaluator shall examine the functional specification to determine that it is a complete instantiation of the SFRs.

To ensure that all SFRs are covered by the functional specification, as well as the test coverage analysis, the evaluator may build upon the developer's tracing (see ADV_FSP.1-5 a map between the TOE security functional requirements and the TSFI). Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

For example, the FDP_ACC.1 component contains an element with assignments. If the ST contained, for instance, ten rules in the FDP_ACC.1 assignment, and these ten rules were covered by three different TSFI, it would be inadequate for the evaluator to map FDP_ACC.1 to TSFI A, B, and C and claim they had completed the work unit. Instead, the evaluator would map FDP_ACC.1 (rule 1) to TSFI A; FDP_ACC.1 (rule 2) to TSFI B; etc. It might also be the case that the interface is a wrapper interface (e.g., IOCTL), in which case the mapping would need to be specific to certain set of parameters for a given interface.

The evaluator must recognise that for requirements that have little or no manifestation at the TSF boundary (e.g., FDP_RIP) it is not expected that they completely map those requirements to the TSFI. The analysis for those requirements will be performed in the analysis for the TOE design (ADV_TDS) when included in the ST. It is also important to note that since the parameters associated with TSFIs must be fully specified, the evaluator should be able to determine if all aspects of an SFR appear to be implemented at the interface level.

10.4.1.4.2 Work unit ADV_FSP.1-7

The evaluator shall examine the functional specification to determine that it is an accurate instantiation of the SFRs.

For each functional requirement in the ST that results in effects visible at the TSF boundary, the information in the associated TSFI for that requirement specifies the required functionality described by the requirement. For example, if the ST contains a requirement for access control lists, and the only TSFI that map to that requirement specify functionality for Unix-style protection bits, then the functional specification is not accurate with respect to the requirements.

The evaluator must recognise that for requirements that have little or no manifestation at the TSF boundary (e.g., FDP_RIP) it is not expected that the evaluator completely map those requirements to the TSFI. The analysis for those requirements will be performed in the analysis for the TOE design (ADV_TDS) when included in the ST.

10.4.2 Evaluation of sub-activity (ADV_FSP.2)

10.4.2.1 Objectives

The objective of this sub-activity is to determine whether the developer has provided a description of the TSFIs in terms of their purpose, method of use, and parameters. In addition, the SFR-enforcing actions, results and error messages of each TSFI that is SFR-enforcing are also described.

10.4.2.2 Input

The evaluation evidence for this sub-activity that is required by the work-units is:

- a) the ST;
- b) the functional specification;
- c) the TOE design.

The evaluation evidence for this sub-activity that is used if included in the ST for the TOE is:

- a) the security architecture description;
- b) the operational user guidance.

10.4.2.3 Action ADV_FSP.2.1E

ISO/IEC 15408-3 ADV_FSP.2.1C: *The functional specification shall completely represent the TSF.*

10.4.2.3.1 Work unit ADV_FSP.2-1

The evaluator shall examine the functional specification to determine that the TSF is fully represented.

The identification of the TSFI is a necessary prerequisite to all other activities in this sub-activity. The TSF must be identified (done as part of the TOE design (ADV_TDS) work units) in order to identify the TSFI. This activity can be done at a high level to ensure that no large groups of interfaces have been missed (network protocols, hardware interfaces, configuration files), or at a low level as the evaluation of the functional specification proceeds.

In making an assessment for this work unit, the evaluator determines that all portions of the TSF are addressed in terms of the interfaces listed in the functional specification. All portions of the TSF should have a corresponding interface description, or if there are no corresponding interfaces for a portion of the TSF, the evaluator determines that that is acceptable.

ISO/IEC 15408-3 ADV_FSP.2.2C: *The functional specification shall describe the purpose and method of use for all TSFI.*

10.4.2.3.2 Work unit ADV_FSP.2-2

The evaluator shall examine the functional specification to determine that it states the purpose of each TSFI.

The purpose of a TSFI is a general statement summarising the functionality provided by the interface. It is not intended to be a complete statement of the actions and results related to the interface, but rather a statement to help the reader understand in general what the interface is intended to be used for. The evaluator should not only determine that the purpose exists, but also that it accurately reflects the TSFI by taking into account other information about the interface, such as the description of actions and error messages.

10.4.2.3.3 Work unit ADV_FSP.2-3

The evaluator shall examine the functional specification to determine that the method of use for each TSFI is given.

The method of use for a TSFI summarises how the interface is manipulated in order to invoke the actions and obtain the results associated with the TSFI. The evaluator should be able to determine, from reading this material in the functional specification, how to use each interface. This does not necessarily mean that there needs to be a separate method of use for each TSFI, as it may be possible to describe in general how kernel calls are invoked, for instance, and then identify each interface using that general style. Different types of interfaces will require different method of use specifications. APIs, network protocol interfaces, system

configuration parameters, and hardware bus interfaces all have very different methods of use, and this should be taken into account by the developer when developing the functional specification, as well as by the evaluator evaluating the functional specification.

For administrative interfaces whose functionality is documented as being inaccessible to untrusted users, the evaluator ensures that the method of making the functions inaccessible is described in the functional specification. It should be noted that this inaccessibility needs to be tested by the developer in their test suite.

The evaluator should not only determine that the set of method of use descriptions exist, but also that they accurately cover each TSFI.

ISO/IEC 15408-3 ADV_FSP.2.3C: *The functional specification shall identify and describe all parameters associated with each TSFI.*

10.4.2.3.4 Work unit ADV_FSP.2-4

The evaluator shall examine the presentation of the TSFI to determine that it completely identifies all parameters associated with every TSFI.

The evaluator examines the functional specification to ensure that all of the parameters are described for each TSFI. Parameters are explicit inputs or outputs to an interface that control the behaviour of that interface. For examples, parameters are the arguments supplied to an API; the various fields in packet for a given network protocol; the individual key values in the Windows Registry; the signals across a set of pins on a chip; etc.

In order to determine that all of the parameters are present in the TSFI, the evaluator should examine the rest of the interface description (actions, error messages, etc.) to determine if the effects of the parameter are accounted for in the description. The evaluator should also check other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance, implementation representation) to see if behaviour or additional parameters are described there but not in the functional specification.

10.4.2.3.5 Work unit ADV_FSP.2-5

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes all parameters associated with every TSFI.

Once all of the parameters have been identified, the evaluator needs to ensure that they are accurately described, and that the description of the parameters is complete. A parameter description tells what the parameter is in some meaningful way. For instance, the interface *foo(i)* could be described as having "parameter *i* which is an integer"; this is not an acceptable parameter description. A description such as "parameter *i* is an integer that indicates the number of users currently logged in to the system" is much more acceptable.

In order to determine that the description of the parameters is complete, the evaluator should examine the rest of the interface description (purpose, method of use, actions, error messages, etc.) to determine if the descriptions of the parameter(s) are accounted for in the description. The evaluator should also check other evidence provided (e.g., TOE design, architectural design, operational user guidance, implementation representation) to see if behaviour or additional parameters are described there but not in the functional specification.

ISO/IEC 15408-3 ADV_FSP.2.4C: *For each SFR-enforcing TSFI, the functional specification shall describe the SFR-enforcing actions associated with the TSFI.*

10.4.2.3.6 Work unit ADV_FSP.2-6

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes the SFR-enforcing actions associated with the SFR-enforcing TSFIs.

If an action available through an interface can be traced to one of the SFRs levied on the TSF, then that interface is *SFR-enforcing*. Such policies are not limited to the access control policies, but also refer to any functionality specified by one of the SFRs contained in the ST. Note that it is possible that an interface may have various actions and results, some of which may be SFR-enforcing and some of which may not.

The developer is not required to “label” interfaces as SFR-enforcing, and likewise is not required to identify actions available through an interface as SFR-enforcing. It is the evaluator's responsibility to examine the evidence provided by the developer and determine that the required information is present. In the case where the developer has identified the SFR-enforcing TSFI and SFR-enforcing actions available through those TSFI, the evaluator must judge completeness and accuracy based on other information supplied for the evaluation (e.g., TOE design, security architecture description, operational user guidance), and on the other information presented for the interfaces (parameters and parameter descriptions, error messages, etc.).

In this case (where the developer has provided only the SFR-enforcing information for SFR-enforcing TSFI) the evaluator also ensures that no interfaces have been mis-categorised. This is done by examining other information supplied for the evaluation (e.g., TOE design, security architecture description, operational user guidance), and the other information presented for the interfaces (parameters and parameter descriptions, for example) not labelled as SFR-enforcing.

In the case where the developer has provided the same level of information on all interfaces, the evaluator performs the same type of analysis mentioned in the previous paragraphs. The evaluator should determine which interfaces are SFR-enforcing and which are not, and subsequently ensure that the SFR-enforcing aspects of the SFR-enforcing actions are appropriately described.

The SFR-enforcing actions are those that are visible at any external interface and that provide for the enforcement of the SFRs being claimed. For example, if audit requirements are included in the ST, then audit-related actions would be SFR-enforcing and therefore must be described, even if the result of that action is generally not visible through the invoked interface (as is often the case with audit, where a user action at one interface would produce an audit record visible at another interface).

The level of description that is required is that sufficient for the reader to understand what role the TSFI actions play with respect to the SFR. The evaluator should keep in mind that the description should be detailed enough to support the generation (and assessment) of test cases against that interface. If the description is unclear or lacking detail such that meaningful testing cannot be conducted against the TSFI, it is likely that the description is inadequate.

ISO/IEC 15408-3 ADV_FSP.2.5C: *For SFR-enforcing TSFIs, the functional specification shall describe direct error messages resulting from processing associated with the SFR-enforcing actions.*

10.4.2.3.7 Work unit ADV_FSP.2-7

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes error messages that may result from SFR-enforcing actions associated with each SFR-enforcing TSFI.

This work unit should be performed in conjunction with, or after, work unit ADV_FSP.2-6 in order to ensure the set of SFR-enforcing TSFI and SFR-enforcing actions is correctly identified. The developer may provide more information than is required (for example, all error messages associated with each interface), in which the case the evaluator should restrict their assessment of completeness and accuracy to only those that they determine to be associated with SFR-enforcing actions of SFR-enforcing TSFI.

Errors can take many forms, depending on the interface being described. For an API, the interface itself may return an error code, set a global error condition, or set a certain parameter with an error code. For a configuration file, an incorrectly configured parameter may cause an error message to be written to a log file. For a hardware PCI card, an error condition may raise a signal on the bus, or trigger an exception condition to the CPU.

Errors (and the associated error messages) come about through the invocation of an interface. The processing that occurs in response to the interface invocation may encounter error conditions, which trigger

(through an implementation-specific mechanism) an error message to be generated. In some instances this may be a return value from the interface itself; in other instances a global value may be set and checked after the invocation of an interface. It is likely that a TOE will have a number of low-level error messages that may result from fundamental resource conditions, such as "disk full" or "resource locked". While these error messages may map to a large number of TSFI, they could be used to detect instances where detail from an interface description has been omitted. For instance, a TSFI that produces a "disk full" message, but has no obvious description of why that TSFI should cause an access to the disk in its description of actions, might cause the evaluator to examine other evidence (Security Architecture (ADV_ARC), TOE design (ADV_TDS)) related that TSFI to determine if the description is accurate.

In order to determine that the description of the error messages of a TSFI is accurate and complete, the evaluator measures the interface description against the other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance), as well as other evidence available for that TSFI (parameters, analysis from work unit ADV_FSP.2-6).

ISO/IEC 15408-3 ADV_FSP.2.6C: *The tracing shall demonstrate that the SFRs trace to TSFIs in the functional specification.*

10.4.2.3.8 Work unit ADV_FSP.2-8

The evaluator shall check that the tracing links the SFRs to the corresponding TSFIs.

The tracing is provided by the developer to serve as a guide to which SFRs are related to which TSFIs. This tracing can be as simple as a table; it is used as input to the evaluator for use in the following work units, in which the evaluator verifies its completeness and accuracy.

10.4.2.4 Action ADV_FSP.2.2E

10.4.2.4.1 Work unit ADV_FSP.2-9

The evaluator shall examine the functional specification to determine that it is a complete instantiation of the SFRs.

To ensure that all SFRs are covered by the functional specification, as well as the test coverage analysis, the evaluator may build upon the developer's tracing (see ADV_FSP.2-8 a map between the TOE security functional requirements and the TSFI. Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

For example, the FDP_ACC.1 component contains an element with assignments. If the ST contained, for instance, ten rules in the FDP_ACC.1 assignment, and these ten rules were covered by three different TSFI, it would be inadequate for the evaluator to map FDP_ACC.1 to TSFI A, B, and C and claim they had completed the work unit. Instead, the evaluator would map FDP_ACC.1 (rule 1) to TSFI A; FDP_ACC.1 (rule 2) to TSFI B; etc. It might also be the case that the interface is a wrapper interface (e.g., IOCTL), in which case the mapping would need to be specific to certain set of parameters for a given interface.

The evaluator must recognise that for requirements that have little or no manifestation at the TSF boundary (e.g., FDP_RIP) it is not expected that they completely map those requirements to the TSFI. The analysis for those requirements will be performed in the analysis for the TOE design (ADV_TDS) when included in the ST. It is also important to note that since the parameters, actions, and error messages associated with TSFIs must be fully specified, the evaluator should be able to determine if all aspects of an SFR appear to be implemented at the interface level.

10.4.2.4.2 Work unit ADV_FSP.2-10

The evaluator shall examine the functional specification to determine that it is an accurate instantiation of the SFRs.

For each functional requirement in the ST that results in effects visible at the TSF boundary, the information in the associated TSFI for that requirement specifies the required functionality described by the requirement. For example, if the ST contains a requirement for access control lists, and the only TSFI that map to that requirement specify functionality for Unix-style protection bits, then the functional specification is not accurate with respect to the requirements.

The evaluator must recognise that for requirements that have little or no manifestation at the TSF boundary (e.g., FDP_RIP) it is not expected that the evaluator completely map those requirements to the TSFI. The analysis for those requirements will be performed in the analysis for the TOE design (ADV_TDS) when included in the ST.

10.4.3 Evaluation of sub-activity (ADV_FSP.3)

10.4.3.1 Objectives

The objective of this sub-activity is to determine whether the developer has provided a description of the TSFIs in terms of their purpose, method of use, and parameters. In addition, the actions, results and error messages of each TSFI are also described sufficiently that it can be determined whether they are SFR-enforcing, with the SFR-enforcing TSFI being described in more detail than other TSFIs.

10.4.3.2 Input

The evaluation evidence for this sub-activity that is required by the work-units is:

- a) the ST;
- b) the functional specification;
- c) the TOE design.

The evaluation evidence for this sub-activity that is used if included in the ST for the TOE is:

- a) the security architecture description;
- b) the implementation representation;
- c) the TSF internals description;
- d) the operational user guidance.

10.4.3.3 Action ADV_FSP.3.1E

ISO/IEC 15408-3 ADV_FSP.3.1C: *The functional specification shall completely represent the TSF.*

10.4.3.3.1 Work unit ADV_FSP.3-1

The evaluator shall examine the functional specification to determine that the TSF is fully represented.

The identification of the TSFI is a necessary prerequisite to all other activities in this sub-activity. The TSF must be identified (done as part of the TOE design (ADV_TDS) work units) in order to identify the TSFI. This activity can be done at a high level to ensure that no large groups of interfaces have been missed (network protocols, hardware interfaces, configuration files), or at a low level as the evaluation of the functional specification proceeds.

In making an assessment for this work unit, the evaluator determines that all portions of the TSF are addressed in terms of the interfaces listed in the functional specification. All portions of the TSF should have a corresponding interface description, or if there are no corresponding interfaces for a portion of the TSF, the evaluator determines that that is acceptable.

ISO/IEC 15408-3 ADV_FSP.3.2C: *The functional specification shall describe the purpose and method of use for all TSFI.*

10.4.3.3.2 Work unit ADV_FSP.3-2

The evaluator shall examine the functional specification to determine that it states the purpose of each TSFI.

The purpose of a TSFI is a general statement summarising the functionality provided by the interface. It is not intended to be a complete statement of the actions and results related to the interface, but rather a statement to help the reader understand in general what the interface is intended to be used for. The evaluator should not only determine that the purpose exists, but also that it accurately reflects the TSFI by taking into account other information about the interface, such as the description of actions and error messages.

10.4.3.3.3 Work unit ADV_FSP.3-3

The evaluator shall examine the functional specification to determine that the method of use for each TSFI is given.

The method of use for a TSFI summarises how the interface is manipulated in order to invoke the actions and obtain the results associated with the TSFI. The evaluator should be able to determine, from reading this material in the functional specification, how to use each interface. This does not necessarily mean that there needs to be a separate method of use for each TSFI, as it may be possible to describe in general how kernel calls are invoked, for instance, and then identify each interface using that general style. Different types of interfaces will require different method of use specifications. APIs, network protocol interfaces, system configuration parameters, and hardware bus interfaces all have very different methods of use, and this should be taken into account by the developer when developing the functional specification, as well as by the evaluator evaluating the functional specification.

For administrative interfaces whose functionality is documented as being inaccessible to untrusted users, the evaluator ensures that the method of making the functions inaccessible is described in the functional specification. It should be noted that this inaccessibility needs to be tested by the developer in their test suite.

The evaluator should not only determine that the set of method of use descriptions exist, but also that they accurately cover each TSFI.

ISO/IEC 15408-3 ADV_FSP.3.3C: *The functional specification shall identify and describe all parameters associated with each TSFI.*

10.4.3.3.4 Work unit ADV_FSP.3-4

The evaluator shall examine the presentation of the TSFI to determine that it completely identifies all parameters associated with every TSFI.

The evaluator examines the functional specification to ensure that all of the parameters are described for each TSFI. Parameters are explicit inputs or outputs to an interface that control the behaviour of that interface. For examples, parameters are the arguments supplied to an API; the various fields in packet for a given network protocol; the individual key values in the Windows Registry; the signals across a set of pins on a chip; etc.

In order to determine that all of the parameters are present in the TSFI, the evaluator should examine the rest of the interface description (actions, error messages, etc.) to determine if the effects of the parameter are accounted for in the description. The evaluator should also check other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance, implementation representation) to see if behaviour or additional parameters are described there but not in the functional specification.

10.4.3.3.5 Work unit ADV_FSP.3-5

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes all parameters associated with every TSFI.

Once all of the parameters have been identified, the evaluator needs to ensure that they are accurately described, and that the description of the parameters is complete. A parameter description tells what the parameter is in some meaningful way. For instance, the interface *foo(i)* could be described as having “parameter *i* which is an integer”; this is not an acceptable parameter description. A description such as “parameter *i* is an integer that indicates the number of users currently logged in to the system” is much more acceptable.

In order to determine that the description of the parameters is complete, the evaluator should examine the rest of the interface description (purpose, method of use, actions, error messages, etc.) to determine if the descriptions of the parameter(s) are accounted for in the description. The evaluator should also check other evidence provided (e.g., TOE design, architectural design, operational user guidance, implementation representation) to see if behaviour or additional parameters are described there but not in the functional specification.

ISO/IEC 15408-3 ADV_FSP.3.4C: *For each SFR-enforcing TSFI, the functional specification shall describe the SFR-enforcing actions associated with the TSFI.*

10.4.3.3.6 Work unit ADV_FSP.3-6

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes the SFR-enforcing actions associated with the SFR-enforcing TSFIs.

If an action available through an interface plays a role in enforcing any security policy on the TOE (that is, if one of the actions of the interface can be traced to one of the SFRs levied on the TSF), then that interface is *SFR-enforcing*. Such policies are not limited to the access control policies, but also refer to any functionality specified by one of the SFRs contained in the ST. Note that it is possible that an interface may have various actions and results, some of which may be SFR-enforcing and some of which may not.

The developer is not required to “label” interfaces as SFR-enforcing, and likewise is not required to identify actions available through an interface as SFR-enforcing. It is the evaluator's responsibility to examine the evidence provided by the developer and determine that the required information is present. In the case where the developer has identified the SFR-enforcing TSFI and SFR-enforcing actions available through those TSFI, the evaluator must judge completeness and accuracy based on other information supplied for the evaluation (e.g., TOE design, security architecture description, operational user guidance), and on the other information presented for the interfaces (parameters and parameter descriptions, error messages, etc.).

In this case (developer has provided only the SFR-enforcing information for SFR-enforcing TSFI) the evaluator also ensures that no interfaces have been mis-categorised. This is done by examining other information supplied for the evaluation (e.g., TOE design, security architecture description, operational user guidance), and the other information presented for the interfaces (parameters and parameter descriptions, for example) not labelled as SFR-enforcing. The analysis done for work units ADV_FSP.3-7 and ADV_FSP.3-8 are also used in making this determination.

In the case where the developer has provided the same level of information on all interfaces, the evaluator performs the same type of analysis mentioned in the previous paragraphs. The evaluator should determine which interfaces are SFR-enforcing and which are not, and subsequently ensure that the SFR-enforcing aspects of the SFR-enforcing actions are appropriately described. Note that in this case, the evaluator should be able to perform the bulk of the work associated with work unit ADV_FSP.3-8 in the course of performing this SFR-enforcing analysis.

The SFR-enforcing actions are those that are visible at any external interface and that provide for the enforcement of the SFRs being claimed. For example, if audit requirements are included in the ST, then audit-related actions would be SFR-enforcing and therefore must be described, even if the result of that action is generally not visible through the invoked interface (as is often the case with audit, where a user action at one interface would produce an audit record visible at another interface).

The level of description that is required is that sufficient for the reader to understand what role the TSFI actions play with respect to the SFR. The evaluator should keep in mind that the description should be detailed enough to support the generation (and assessment) of test cases against that interface. If the

description is unclear or lacking detail such that meaningful testing cannot be conducted against the TSFI, it is likely that the description is inadequate.

ISO/IEC 15408-3 ADV_FSP.3.5C: *For each SFR-enforcing TSFI, the functional specification shall describe direct error messages resulting from security enforcing effects and exceptions associated with invocation of the TSFI.*

10.4.3.3.7 Work unit ADV_FSP.3-7

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes error messages that may result from an invocation of each SFR-enforcing TSFI.

This work unit should be performed in conjunction with, or after, work unit ADV_FSP.3-6 in order to ensure the set of SFR-enforcing TSFI is correctly identified. The evaluator should note that the requirement and associated work unit is that all direct error messages associated with an SFR-enforcing TSFI must be described, that are associated with SFR-enforcing actions. This is because at this level of assurance, the “extra” information provided by the error message descriptions should be used in determining whether all of the SFR-enforcing aspects of an interface have been appropriately described. For instance, if an error message associated with a TSFI (e.g., “access denied”) indicated that an SFR-enforcing decision or action had taken place, but in the description of the SFR-enforcing actions there was no mention of that particular SFR-enforcing mechanism, then the description may not be complete.

Errors can take many forms, depending on the interface being described. For an API, the interface itself may return an error code, set a global error condition, or set a certain parameter with an error code. For a configuration file, an incorrectly configured parameter may cause an error message to be written to a log file. For a hardware PCI card, an error condition may raise a signal on the bus, or trigger an exception condition to the CPU.

Errors (and the associated error messages) come about through the invocation of an interface. The processing that occurs in response to the interface invocation may encounter error conditions, which trigger (through an implementation-specific mechanism) an error message to be generated. In some instances this may be a return value from the interface itself; in other instances a global value may be set and checked after the invocation of an interface. It is likely that a TOE will have a number of low-level error messages that may result from fundamental resource conditions, such as “disk full” or “resource locked”. While these error messages may map to a large number of TSFI, they could be used to detect instances where detail from an interface description has been omitted. For instance, a TSFI that produces a “disk full” message, but has no obvious description of why that TSFI should cause an access to the disk in its description of actions, might cause the evaluator to examine other evidence (Security Architecture (ADV_ARC), TOE design (ADV_TDS)) related that TSFI to determine if the description is accurate.

In order to determine that the description of the error messages of a TSFI is accurate and complete, the evaluator measures the interface description against the other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance), as well as for other evidence supplied for that TSFI (description of SFR-enforcing actions, summary of SFR-supporting and SFR-non-interfering actions and results).

ISO/IEC 15408-3 ADV_FSP.3.6C: *The functional specification shall summarise the SFR-supporting and SFR-non-interfering actions associated with each TSFI.*

10.4.3.3.8 Work unit ADV_FSP.3-8

The evaluator shall examine the presentation of the TSFI to determine that it summarises the SFR-supporting and SFR-non-interfering actions associated with each TSFI.

The purpose of this work unit is to supplement the details about the SFR-enforcing actions (provided in work unit ADV_FSP.3-6) with a summary of the remaining actions (i.e., those that are not SFR-enforcing). This covers *all* SFR-supporting and SFR-non-interfering actions, whether invocable through SFR-enforcing TSFI or through SFR-supporting or SFR-non-interfering TSFI. Such a summary about all SFR-supporting and SFR-

non-interfering actions helps to provide a more complete picture of the functions provided by the TSF, and is to be used by the evaluator in determining whether an action or TSFI may have been mis-categorised.

The information to be provided is more abstract than that required for SFR-enforcing actions. While it should still be detailed enough so that the reader can understand what the action does, the description does not have to be detailed enough to support writing tests against it, for instance. For the evaluator, the key is that the information must be sufficient to make a positive determination that the action is SFR-supporting or SFR-non-interfering. If that level of information is missing, the summary is insufficient and more information must be obtained.

ISO/IEC 15408-3 ADV_FSP.3.7C: *The tracing shall demonstrate that the SFRs trace to TSFIs in the functional specification.*

10.4.3.3.9 Work unit ADV_FSP.3-9

The evaluator shall check that the tracing links the SFRs to the corresponding TSFIs.

The tracing is provided by the developer to serve as a guide to which SFRs are related to which TSFIs. This tracing can be as simple as a table; it is used as input to the evaluator for use in the following work units, in which the evaluator verifies its completeness and accuracy.

10.4.3.4 Action ADV_FSP.3.2E

10.4.3.4.1 Work unit ADV_FSP.3-10

The evaluator shall examine the functional specification to determine that it is a complete instantiation of the SFRs.

To ensure that all SFRs are covered by the functional specification, as well as the test coverage analysis, the evaluator may build upon the developer's tracing (see ADV_FSP.3-9 a map between the TOE security functional requirements and the TSFI. Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

For example, the FDP_ACC.1 component contains an element with assignments. If the ST contained, for instance, ten rules in the FDP_ACC.1 assignment, and these ten rules were covered by three different TSFI, it would be inadequate for the evaluator to map FDP_ACC.1 to TSFI A, B, and C and claim they had completed the work unit. Instead, the evaluator would map FDP_ACC.1 (rule 1) to TSFI A; FDP_ACC.1 (rule 2) to TSFI B; etc. It might also be the case that the interface is a wrapper interface (e.g., IOCTL), in which case the mapping would need to be specific to certain set of parameters for a given interface.

The evaluator must recognise that for requirements that have little or no manifestation at the TSF boundary (e.g., FDP_RIP) it is not expected that they completely map those requirements to the TSFI. The analysis for those requirements will be performed in the analysis for the TOE design (ADV_TDS) when included in the ST. It is also important to note that since the parameters, actions, and error messages associated with TSFIs must be fully specified, the evaluator should be able to determine if all aspects of an SFR appear to be implemented at the interface level.

10.4.3.4.2 Work unit ADV_FSP.3-11

The evaluator shall examine the functional specification to determine that it is an accurate instantiation of the SFRs.

For each functional requirement in the ST that results in effects visible at the TSF boundary, the information in the associated TSFI for that requirement specifies the required functionality described by the requirement. For example, if the ST contains a requirement for access control lists, and the only TSFI that map to that requirement specify functionality for Unix-style protection bits, then the functional specification is not accurate with respect to the requirements.

The evaluator must recognise that for requirements that have little or no manifestation at the TSF boundary (e.g., FDP_RIP) it is not expected that the evaluator completely map those requirements to the TSFI. The analysis for those requirements will be performed in the analysis for the TOE design (ADV_TDS) when included in the ST.

10.4.4 Evaluation of sub-activity (ADV_FSP.4)

10.4.4.1 Objectives

The objective of this sub-activity is to determine whether the developer has completely described all of the TSFI in a manner such that the evaluator is able to determine whether the TSFI are completely and accurately described, and appears to implement the security functional requirements of the ST.

10.4.4.2 Input

The evaluation evidence for this sub-activity that is required by the work-units is:

- a) the ST;
- b) the functional specification;
- c) the TOE design.

The evaluation evidence for this sub-activity that is used if included in the ST for the TOE is:

- a) the security architecture description;
- b) the implementation representation;
- c) the TSF internals description;
- d) the operational user guidance.

10.4.4.3 Application notes

The functional specification describes the interfaces to the TSF (the TSFI) in a structured manner. Because of the dependency on Evaluation of sub-activity (ADV_TDS.1), the evaluator is expected to have identified the TSF prior to beginning work on this sub-activity. Without firm knowledge of what comprises the TSF, it is not possible to assess the completeness of the TSFI.

In performing the various work units included in this family, the evaluator is asked to make assessments of accuracy and completeness of several factors (the TSFI itself, as well as the individual components (parameters, actions, error messages, etc.) of the TSFI). In doing this analysis, the evaluator is expected to use the documentation provided for the evaluation. This includes the ST, the TOE design, and may include other documentation such as the operational user guidance, security architecture description, and implementation representation. The documentation should be examined in an iterative fashion. The evaluator may read, for example, in the TOE design how a certain function is implemented, but see no way to invoke that function from the interface. This might cause the evaluator to question the completeness of a particular TSFI description, or whether an interface has been left out of the functional specification altogether. Describing analysis activities of this sort in the ETR is a key method in providing rationale that the work units have been performed appropriately.

It should be recognised that there exist functional requirements whose functionality is manifested wholly or in part architecturally, rather than through a specific mechanism. An example of this is the implementation of mechanisms implementing the Residual information protection (FDP_RIP) requirements. Such mechanisms typically are implemented to ensure a behaviour isn't present, which is difficult to test and typically is verified through analysis. In the cases where such functional requirements are included in the ST, it is expected that the evaluator recognise that there may be SFRs of this type that have no interfaces, and that this should not be considered a deficiency in the functional specification.

10.4.4.4 Action ADV_FSP.4.1E

ISO/IEC 15408-3 ADV_FSP.4.1C: *The functional specification shall completely represent the TSF.*

10.4.4.4.1 Work unit ADV_FSP.4-1

The evaluator shall examine the functional specification to determine that the TSF is fully represented.

The identification of the TSFI is a necessary prerequisite to all other activities in this sub-activity. The TSF must be identified (done as part of the TOE design (ADV_TDS) work units) in order to identify the TSFI. This activity can be done at a high level to ensure that no large groups of interfaces have been missed (network protocols, hardware interfaces, configuration files), or at a low level as the evaluation of the functional specification proceeds.

In making an assessment for this work unit, the evaluator determines that all portions of the TSF are addressed in terms of the interfaces listed in the functional specification. All portions of the TSF should have a corresponding interface description, or if there are no corresponding interfaces for a portion of the TSF, the evaluator determines that that is acceptable.

ISO/IEC 15408-3 ADV_FSP.4.2C: *The functional specification shall describe the purpose and method of use for all TSFI.*

10.4.4.4.2 Work unit ADV_FSP.4-2

The evaluator shall examine the functional specification to determine that it states the purpose of each TSFI.

The purpose of a TSFI is a general statement summarising the functionality provided by the interface. It is not intended to be a complete statement of the actions and results related to the interface, but rather a statement to help the reader understand in general what the interface is intended to be used for. The evaluator should not only determine that the purpose exists, but also that it accurately reflects the TSFI by taking into account other information about the interface, such as the description of actions and error messages.

10.4.4.4.3 Work unit ADV_FSP.4-3

The evaluator shall examine the functional specification to determine that the method of use for each TSFI is given.

The method of use for a TSFI summarises how the interface is manipulated in order to invoke the actions and obtain the results associated with the TSFI. The evaluator should be able to determine, from reading this material in the functional specification, how to use each interface. This does not necessarily mean that there needs to be a separate method of use for each TSFI, as it may be possible to describe in general how kernel calls are invoked, for instance, and then identify each interface using that general style. Different types of interfaces will require different method of use specifications. APIs, network protocol interfaces, system configuration parameters, and hardware bus interfaces all have very different methods of use, and this should be taken into account by the developer when developing the functional specification, as well as by the evaluator evaluating the functional specification.

For administrative interfaces whose functionality is documented as being inaccessible to untrusted users, the evaluator ensures that the method of making the functions inaccessible is described in the functional specification. It should be noted that this inaccessibility needs to be tested by the developer in their test suite.

The evaluator should not only determine that the set of method of use descriptions exist, but also that they accurately cover each TSFI.

10.4.4.4.4 Work unit ADV_FSP.4-4

The evaluator shall examine the functional specification to determine the completeness of the TSFI

The evaluator shall use the design documentation to identify the possible types of interfaces. The evaluator shall search the design documentation and the guidance documentation for potential TSFI not contained in the developer's documentation, thus indicating that the set of TSFI defined by the developer is incomplete. The evaluator shall examine the arguments presented by the developer that the TSFI is complete and check down to the lowest level of design or with the implementation representation that no additional TSFI exist.

ISO/IEC 15408-3 ADV_FSP.4.3C: *The functional specification shall identify and describe all parameters associated with each TSFI.*

10.4.4.4.5 Work unit ADV_FSP.4-5

The evaluator shall examine the presentation of the TSFI to determine that it completely identifies all parameters associated with every TSFI.

The evaluator examines the functional specification to ensure that all of the parameters are described for each TSFI. Parameters are explicit inputs or outputs to an interface that control the behaviour of that interface. For examples, parameters are the arguments supplied to an API; the various fields in packet for a given network protocol; the individual key values in the Windows Registry; the signals across a set of pins on a chip; etc.

In order to determine that all of the parameters are present in the TSFI, the evaluator should examine the rest of the interface description (actions, error messages, etc.) to determine if the effects of the parameter are accounted for in the description. The evaluator should also check other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance, implementation representation) to see if behaviour or additional parameters are described there but not in the functional specification.

10.4.4.4.6 Work unit ADV_FSP.4-6

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes all parameters associated with every TSFI.

Once all of the parameters have been identified, the evaluator needs to ensure that they are accurately described, and that the description of the parameters is complete. A parameter description tells what the parameter is in some meaningful way. For instance, the interface *foo(i)* could be described as having "parameter *i* which is an integer"; this is not an acceptable parameter description. A description such as "parameter *i* is an integer that indicates the number of users currently logged in to the system" is much more acceptable.

In order to determine that the description of the parameters is complete, the evaluator should examine the rest of the interface description (purpose, method of use, actions, error messages, etc.) to determine if the descriptions of the parameter(s) are accounted for in the description. The evaluator should also check other evidence provided (e.g., TOE design, architectural design, operational user guidance, implementation representation) to see if behaviour or additional parameters are described there but not in the functional specification.

ISO/IEC 15408-3 ADV_FSP.4.4C: *The functional specification shall describe all actions associated with each TSFI.*

10.4.4.4.7 Work unit ADV_FSP.4-7

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes all actions associated with every TSFI.

The evaluator checks to ensure that all of the actions are described. actions available through an interface describe what the interface does (as opposed to the TOE design, which describes how the actions are provided by the TSF).

Actions of an interface describe functionality that can be invoked through the interface, and can be categorised as *regular* actions, and *SFR-related* actions. Regular actions are descriptions of what the

interface does. The amount of information provided for this description is dependant on the complexity of the interface. The SFR-related actions are those that are visible at any external interface (for instance, audit activity caused by the invocation of an interface (assuming audit requirements are included in the ST) should be described, even though the result of that action is generally not visible through the invoked interface). Depending on the parameters of an interface, there may be many different actions able to be invoked through the interface (for instance, an API might have the first parameter be a "subcommand", and the following parameters be specific to that subcommand. The IOCTL API in some Unix systems is an example of such an interface).

In order to determine that the description of the actions of a TSFI is complete, the evaluator should review the rest of the interface description (parameter descriptions, error messages, etc.) to determine if the actions described are accounted for. The evaluator should also analyse other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance, implementation representation) to see if there is evidence of actions that are described there but not in the functional specification.

ISO/IEC 15408-3 ADV_FSP.4.5C: *The functional specification shall describe all direct error messages that may result from an invocation of each TSFI.*

10.4.4.4.8 Work unit ADV_FSP.4-8

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes all errors messages resulting from an invocation of each TSFI.

Errors can take many forms, depending on the interface being described. For an API, the interface itself may return an error code; set a global error condition, or set a certain parameter with an error code. For a configuration file, an incorrectly configured parameter may cause an error message to be written to a log file. For a hardware PCI card, an error condition may raise a signal on the bus, or trigger an exception condition to the CPU.

Errors (and the associated error messages) come about through the invocation of an interface. The processing that occurs in response to the interface invocation may encounter error conditions, which trigger (through an implementation-specific mechanism) an error message to be generated. In some instances this may be a return value from the interface itself; in other instances a global value may be set and checked after the invocation of an interface. It is likely that a TOE will have a number of low-level error messages that may result from fundamental resource conditions, such as "disk full" or "resource locked". While these error messages may map to a large number of TSFI, they could be used to detect instances where detail from an interface description has been omitted. For instance, a TSFI that produces a "disk full" message, but has no obvious description of why that TSFI should cause an access to the disk in its description of actions, might cause the evaluator to examine other evidence (Security Architecture (ADV_ARC), TOE design (ADV_TDS)) related that TSFI to determine if the description is complete and accurate.

The evaluator determines that, for each TSFI, the exact set of error messages that can be returned on invoking that interface can be determined. The evaluator reviews the evidence provided for the interface to determine if the set of errors seems complete. They cross-check this information with other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance, implementation representation) to ensure that there are no errors steaming from processing mentioned that are not included in the functional specification.

10.4.4.4.9 Work unit ADV_FSP.4-9

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes the meaning of all errors associated with each TSFI.

In order to determine accuracy, the evaluator must be able to understand meaning of the error. For example, if an interface returns a numeric code of 0, 1, or 2, the evaluator would not be able to understand the error if the functional specification only listed: "possible errors resulting from invocation of the *foo()* interface are 0, 1, or 2". Instead the evaluator checks to ensure that the errors are described such as: "possible errors resulting from invocation of the *foo()* interface are 0 (processing successful), 1 (file not found), or 2 (incorrect filename specification)".

In order to determine that the description of the errors due to invoking a TSFI is complete, the evaluator examines the rest of the interface description (parameter descriptions, actions, etc.) to determine if potential error conditions that might be caused by using such an interface are accounted for. The evaluator also checks other evidence provided for the evaluation (e.g. TOE design, security architecture description, operational user guidance, implementation representation) to see if error processing related to the TSFI is described there but is not described in the functional specification.

ISO/IEC 15408-3 ADV_FSP.4.6C: *The tracing shall demonstrate that the SFRs trace to TSFIs in the functional specification.*

10.4.4.4.10 Work unit ADV_FSP.4-10

The evaluator shall check that the tracing links the SFRs to the corresponding TSFIs.

The tracing is provided by the developer to serve as a guide to which SFRs are related to which TSFIs. This tracing can be as simple as a table; it is used as input to the evaluator for use in the following work units, in which the evaluator verifies its completeness and accuracy.

10.4.4.5 Action ADV_FSP.4.2E

10.4.4.5.1 Work unit ADV_FSP.4-11

The evaluator shall examine the functional specification to determine that it is a complete instantiation of the SFRs.

To ensure that all SFRs are covered by the functional specification, as well as the test coverage analysis, the evaluator may build upon the developer's tracing (see ADV_FSP.4-10 a map between the TOE security functional requirements and the TSFI. Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

For example, the FDP_ACC.1 component contains an element with assignments. If the ST contained, for instance, ten rules in the FDP_ACC.1 assignment, and these ten rules were covered by three different TSFI, it would be inadequate for the evaluator to map FDP_ACC.1 to TSFI A, B, and C and claim they had completed the work unit. Instead, the evaluator would map FDP_ACC.1 (rule 1) to TSFI A; FDP_ACC.1 (rule 2) to TSFI B; etc. It might also be the case that the interface is a wrapper interface (e.g., IOCTL), in which case the mapping would need to be specific to certain set of parameters for a given interface.

The evaluator must recognise that for requirements that have little or no manifestation at the TSF boundary (e.g., FDP_RIP) it is not expected that they completely map those requirements to the TSFI. The analysis for those requirements will be performed in the analysis for the TOE design (ADV_TDS) when included in the ST. It is also important to note that since the parameters, actions, and error messages associated with TSFIs must be fully specified, the evaluator should be able to determine if all aspects of an SFR appear to be implemented at the interface level.

10.4.4.5.2 Work unit ADV_FSP.4-12

The evaluator shall examine the functional specification to determine that it is an accurate instantiation of the SFRs.

For each functional requirement in the ST that results in effects visible at the TSF boundary, the information in the associated TSFI for that requirement specifies the required functionality described by the requirement. For example, if the ST contains a requirement for access control lists, and the only TSFI that map to that requirement specify functionality for Unix-style protection bits, then the functional specification is not accurate with respect to the requirements.

The evaluator must recognise that for requirements that have little or no manifestation at the TSF boundary (e.g., FDP_RIP) it is not expected that the evaluator completely map those requirements to the TSFI. The

analysis for those requirements will be performed in the analysis for the TOE design (ADV_TDS) when included in the ST.

10.4.5 Evaluation of sub-activity (ADV_FSP.5)

10.4.5.1 Objectives

The objective of this sub-activity is to determine whether the developer has completely described all of the TSFI in a manner such that the evaluator is able to determine whether the TSFI are completely and accurately described, and appears to implement the security functional requirements of the ST. The completeness of the interfaces is judged based upon the implementation representation.

10.4.5.2 Input

The evaluation evidence for this sub-activity that is required by the work-units is:

- a) the ST;
- b) the functional specification;
- c) the TOE design;
- d) the implementation representation.

The evaluation evidence for this sub-activity that is used if included in the ST for the TOE is:

- a) the security architecture description;
- b) the TSF internals description;
- c) the formal security policy model;
- d) the operational user guidance.

10.4.5.3 Action ADV_FSP.5.1E

ISO/IEC 15408-3 ADV_FSP.5.1C: *The functional specification shall completely represent the TSF.*

10.4.5.3.1 Work unit ADV_FSP.5-1

The evaluator shall examine the functional specification to determine that the TSF is fully represented.

The identification of the TSFI is a necessary prerequisite to all other activities in this sub-activity. The TSF must be identified (done as part of the TOE design (ADV_TDS) work units) in order to identify the TSFI. This activity can be done at a high level to ensure that no large groups of interfaces have been missed (network protocols, hardware interfaces, configuration files), or at a low level as the evaluation of the functional specification proceeds.

In making an assessment for this work unit, the evaluator determines that all portions of the TSF are addressed in terms of the interfaces listed in the functional specification. All portions of the TSF should have a corresponding interface description, or if there are no corresponding interfaces for a portion of the TSF, the evaluator determines that that is acceptable.

ISO/IEC 15408-3 ADV_FSP.5.2C: *The functional specification shall describe the TSFI using a semi-formal style.*

10.4.5.3.2 Work unit ADV_FSP.5-2

The evaluator shall examine the functional specification to determine that it is presented using a semiformal style.

A semi-formal presentation is characterised by a standardised format with a well-defined syntax that reduces ambiguity that may occur in informal presentations. Since the intent of the semi-formal format is to enhance the reader's ability to understand the presentation, use of certain structured presentation methods (pseudo-code, flow charts, block diagrams) are appropriate, though not required.

For the purposes of this activity, the evaluator should ensure that the interface descriptions are formatted in a structured, consistent manner and use common terminology. A semiformal presentation of the interfaces also implies that the level of detail of the presentation for the interfaces is largely consistent across all TSFI. For the functional specification, it is acceptable to refer to external specifications for portions of the interface as long as those external specifications are themselves semiformal.

ISO/IEC 15408-3 ADV_FSP.5.3C: *The functional specification shall describe the purpose and method of use for all TSFI.*

10.4.5.3.3 Work unit ADV_FSP.5-3

The evaluator shall examine the functional specification to determine that it states the purpose of each TSFI.

The purpose of a TSFI is a general statement summarising the functionality provided by the interface. It is not intended to be a complete statement of the actions and results related to the interface, but rather a statement to help the reader understand in general what the interface is intended to be used for. The evaluator should not only determine that the purpose exists, but also that it accurately reflects the TSFI by taking into account other information about the interface, such as the description of actions and error messages.

10.4.5.3.4 Work unit ADV_FSP.5-4

The evaluator shall examine the functional specification to determine that the method of use for each TSFI is given.

The method of use for a TSFI summarises how the interface is manipulated in order to invoke the actions and obtain the results associated with the TSFI. The evaluator should be able to determine, from reading this material in the functional specification, how to use each interface. This does not necessarily mean that there needs to be a separate method of use for each TSFI, as it may be possible to describe in general how kernel calls are invoked, for instance, and then identify each interface using that general style. Different types of interfaces will require different method of use specifications. APIs, network protocol interfaces, system configuration parameters, and hardware bus interfaces all have very different methods of use, and this should be taken into account by the developer when developing the functional specification, as well as by the evaluator evaluating the functional specification.

For administrative interfaces whose functionality is documented as being inaccessible to untrusted users, the evaluator ensures that the method of making the functions inaccessible is described in the functional specification. It should be noted that this inaccessibility needs to be tested by the developer in their test suite.

The evaluator should not only determine that the set of method of use descriptions exist, but also that they accurately cover each TSFI.

10.4.5.3.5 Work unit ADV_FSP.5-5

The evaluator shall examine the functional specification to determine the completeness of the TSFI.

The evaluator shall use the design documentation to identify the possible types of interfaces. The evaluator shall search the design documentation and the guidance documentation for potential TSFI not contained in the developer's documentation, thus indicating that the set of TSFI defined by the developer is incomplete.

The evaluator shall examine the arguments presented by the developer that the TSFI is complete and check down to the lowest level of design or with the implementation representation that no additional TSFI exist.

ISO/IEC 15408-3 ADV_FSP.5.4C: *The functional specification shall identify and describe all parameters associated with each TSFI.*

10.4.5.3.6 Work unit ADV_FSP.5-6

The evaluator shall examine the presentation of the TSFI to determine that it completely identifies all parameters associated with every TSFI.

The evaluator examines the functional specification to ensure that all of the parameters are described for each TSFI. Parameters are explicit inputs or outputs to an interface that control the behaviour of that interface. For examples, parameters are the arguments supplied to an API; the various fields in packet for a given network protocol; the individual key values in the Windows Registry; the signals across a set of pins on a chip; etc.

In order to determine that all of the parameters are present in the TSFI, the evaluator should examine the rest of the interface description (actions, error messages, etc.) to determine if the effects of the parameter are accounted for in the description. The evaluator should also check other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance, implementation representation) to see if behaviour or additional parameters are described there but not in the functional specification.

10.4.5.3.7 Work unit ADV_FSP.5-7

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes all parameters associated with every TSFI.

Once all of the parameters have been identified, the evaluator needs to ensure that they are accurately described, and that the description of the parameters is complete. A parameter description tells what the parameter is in some meaningful way. For instance, the interface *foo(i)* could be described as having "parameter i which is an integer"; this is not an acceptable parameter description. A description such as "parameter i is an integer that indicates the number of users currently logged in to the system". is much more acceptable.

In order to determine that the description of the parameters is complete, the evaluator should examine the rest of the interface description (purpose, method of use, actions, error messages, etc.) to determine if the descriptions of the parameter(s) are accounted for in the description. The evaluator should also check other evidence provided (e.g., TOE design, architectural design, operational user guidance, implementation representation) to see if behaviour or additional parameters are described there but not in the functional specification.

ISO/IEC 15408-3 ADV_FSP.5.5C: *The functional specification shall describe all actions associated with each TSFI.*

10.4.5.3.8 Work unit ADV_FSP.5-8

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes all actions associated with every TSFI.

The evaluator checks to ensure that all of the actions are described. actions available through an interface describe what the interface does (as opposed to the TOE design, which describes how the actions are provided by the TSF).

actions of an interface describe functionality that can be invoked through the interface, and can be categorised as *regular* actions, and *SFR-related* actions. Regular actions are descriptions of what the interface does. The amount of information provided for this description is dependant on the complexity of the interface. The SFR-related actions are those that are visible at any external interface (for instance, audit activity caused by the invocation of an interface (assuming audit requirements are included in the ST) should be described, even

though the result of that action is generally not visible through the invoked interface). Depending on the parameters of an interface, there may be many different actions able to be invoked through the interface (for instance, an API might have the first parameter be a “subcommand”, and the following parameters be specific to that subcommand. The IOCTL API in some Unix systems is an example of such an interface).

In order to determine that the description of the actions of a TSFI is complete, the evaluator should review the rest of the interface description (parameter descriptions, error messages, etc.) to determine if the actions described are accounted for. The evaluator should also analyse other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance, implementation representation) to see if there is evidence of actions that are described there but not in the functional specification.

ISO/IEC 15408-3 ADV_FSP.5.6C: *The functional specification shall describe all direct error messages that may result from an invocation of each TSFI.*

10.4.5.3.9 Work unit ADV_FSP.5-9

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes all errors messages resulting from an invocation of each TSFI.

Errors can take many forms, depending on the interface being described. For an API, the interface itself may return an error code; set a global error condition, or set a certain parameter with an error code. For a configuration file, an incorrectly configured parameter may cause an error message to be written to a log file. For a hardware PCI card, an error condition may raise a signal on the bus, or trigger an exception condition to the CPU.

Errors (and the associated error messages) come about through the invocation of an interface. The processing that occurs in response to the interface invocation may encounter error conditions, which trigger (through an implementation-specific mechanism) an error message to be generated. In some instances this may be a return value from the interface itself; in other instances a global value may be set and checked after the invocation of an interface. It is likely that a TOE will have a number of low-level error messages that may result from fundamental resource conditions, such as “disk full” or “resource locked”. While these error messages may map to a large number of TSFI, they could be used to detect instances where detail from an interface description has been omitted. For instance, a TSFI that produces a “disk full” message, but has no obvious description of why that TSFI should cause an access to the disk in its description of actions, might cause the evaluator to examine other evidence (ADV_ARC, ADV_TDS) related that TSFI to determine if the description is complete and accurate.

The evaluator determines that, for each TSFI, the exact set of error messages that can be returned on invoking that interface can be determined. The evaluator reviews the evidence provided for the interface to determine if the set of errors seems complete. They cross-check this information with other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance, implementation representation) to ensure that there are no errors steaming from processing mentioned that are not included in the functional specification.

10.4.5.3.10 Work unit ADV_FSP.5-10

The evaluator shall examine the presentation of the TSFI to determine that it completely and accurately describes the meaning of all errors associated with each TSFI.

In order to determine accuracy, the evaluator must be able to understand meaning of the error. For example, if an interface returns a numeric code of 0, 1, or 2, the evaluator would not be able to understand the error if the functional specification only listed: “possible errors resulting from invocation of the *foo()* interface are 0, 1, or 2”. Instead the evaluator checks to ensure that the errors are described such as: “possible errors resulting from invocation of the *foo()* interface are 0 (processing successful), 1 (file not found), or 2 (incorrect filename specification)”.

In order to determine that the description of the errors due to invoking a TSFI is complete, the evaluator examines the rest of the interface description (parameter descriptions, actions, etc.) to determine if potential

error conditions that might be caused by using such an interface are accounted for. The evaluator also checks other evidence provided for the evaluation (e.g., TOE design, security architecture description, operational user guidance, implementation representation) to see if error processing related to the TSFI is described there but is not described in the functional specification.

ISO/IEC 15408-3 ADV_FSP.5.7C: *The functional specification shall describe all error messages that do not result from an invocation of a TSFI.*

10.4.5.3.11 Work unit ADV_FSP.5-11

The evaluator shall examine the functional specification to determine that it completely and accurately describes all errors messages that do not result from an invocation of any TSFI.

This work unit complements work unit ADV_FSP.5-9, which describes those error messages that result from an invocation of the TSFI. Taken together, these work units cover all error messages that might be generated by the TSF.

The evaluator assesses the completeness and accuracy of the functional specification by comparing its contents to instances of error message generation within the implementation representation. Most of these error messages will have already been covered by work unit ADV_FSP.5-9.

The error messages related to this work unit are typically those that are not expected to be generated, but are constructed as a matter of good programming practises. For example, a case statement that defines actions resulting from each of a list of cases may end with a final *else* statement to apply to anything that might not be expected; this practise ensures the TSF does not get into an undefined state. However, it is not expected that the path of execution would ever get to this *else* statement; therefore, any error message generation within this *else* statement would never be generated. Although it would not get generated, it must still be included in the functional specification.

ISO/IEC 15408-3 ADV_FSP.5.8C: *The functional specification shall provide a rationale for each error message contained in the TSF implementation yet does not result from an invocation of a TSFI.*

10.4.5.3.12 Work unit ADV_FSP.5-12

The evaluator shall examine the functional specification to determine that it provides a rationale for each error message contained in the TSF implementation yet does not result from an invocation of a TSFI.

The evaluator ensures that every error message found under work unit ADV_FSP.5-11 contains a rationale describing why it cannot be invoked from the TSFI.

As was described in the previous work unit, this rationale might be as straightforward as the fact that the error message in question is provided for completeness of execution logic and that it is never expected to be generated. The evaluator ensures that the rationale for each such error message is logical.

ISO/IEC 15408-3 ADV_FSP.5.9C: *The tracing shall demonstrate that the SFRs trace to TSFIs in the functional specification.*

10.4.5.3.13 Work unit ADV_FSP.5-13

The evaluator shall check that the tracing links the SFRs to the corresponding TSFIs.

The tracing is provided by the developer to serve as a guide to which SFRs are related to which TSFIs. This tracing can be as simple as a table; it is used as input to the evaluator for use in the following work units, in which the evaluator verifies its completeness and accuracy.

10.4.5.4 Action ADV_FSP.5.2E

10.4.5.4.1 Work unit ADV_FSP.5-14

The evaluator shall examine the functional specification to determine that it is a complete instantiation of the SFRs.

To ensure that all SFRs are covered by the functional specification, as well as the test coverage analysis, the evaluator may build upon the developer's tracing (see ADV_FSP.5-13 a map between the TOE security functional requirements and the TSFI. Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

For example, the FDP_ACC.1 component contains an element with assignments. If the ST contained, for instance, ten rules in the FDP_ACC.1 assignment, and these ten rules were covered by three different TSFI, it would be inadequate for the evaluator to map FDP_ACC.1 to TSFI A, B, and C and claim they had completed the work unit. Instead, the evaluator would map FDP_ACC.1 (rule 1) to TSFI A; FDP_ACC.1 (rule 2) to TSFI B; etc. It might also be the case that the interface is a wrapper interface (e.g., IOCTL), in which case the mapping would need to be specific to certain set of parameters for a given interface.

The evaluator must recognise that for requirements that have little or no manifestation at the TSF boundary (e.g., FDP_RIP) it is not expected that they completely map those requirements to the TSFI. The analysis for those requirements will be performed in the analysis for the TOE design (ADV_TDS) when included in the ST. It is also important to note that since the parameters, actions, and error messages associated with TSFIs must be fully specified, the evaluator should be able to determine if all aspects of an SFR appear to be implemented at the interface level.

10.4.5.4.2 Work unit ADV_FSP.5-15

The evaluator shall examine the functional specification to determine that it is an accurate instantiation of the SFRs.

For each functional requirement in the ST that results in effects visible at the TSF boundary, the information in the associated TSFI for that requirement specifies the required functionality described by the requirement. For example, if the ST contains a requirement for access control lists, and the only TSFI that map to that requirement specify functionality for Unix-style protection bits, then the functional specification is not accurate with respect to the requirements.

The evaluator must recognise that for requirements that have little or no manifestation at the TSF boundary (e.g., FDP_RIP) it is not expected that the evaluator completely map those requirements to the TSFI. The analysis for those requirements will be performed in the analysis for the TOE design (ADV_TDS) when included in the ST.

10.4.6 Evaluation of sub-activity (ADV_FSP.6)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

10.5 Implementation representation (ADV_IMP)

10.5.1 Evaluation of sub-activity (ADV_IMP.1)

10.5.1.1 Objectives

The objective of this sub-activity is to determine that the implementation representation made available by the developer is suitable for use in other analysis activities; *suitability* is judged by its conformance to the requirements for this component.

10.5.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the implementation representation;
- b) the documentation of the development tools, as resulting from ALC_TAT ;
- c) TOE design description.

10.5.1.3 Application notes

The entire implementation representation is made available to ensure that analysis activities are not curtailed due to lack of information. This does not, however, imply that all of the representation is examined when the analysis activities are being performed. This is likely impractical in almost all cases, in addition to the fact that it most likely will not result in a higher-assurance TOE vs. targeted sampling of the implementation representation. For this sub-activity, this is even truer. It would not be productive for the evaluator to spend large amounts of time verifying the requirements for one portion of the implementation representation, and then use a different portion of the implementation representation in performing analysis for other work units. Therefore, the evaluator is encouraged to select the sample of the implementation representation from the areas of the TOE that will be of most interest during the analysis performed during work units from other families (e.g. ATE_IND, AVA_VAN and ADV_INT).

10.5.1.4 Action ADV_IMP.1.1E

ISO/IEC 15408-3 ADV_IMP.1.1C: *The implementation representation shall define the TSF to a level of detail such that the TSF can be generated without further design decisions.*

10.5.1.4.1 Work unit ADV_IMP.1-1

The evaluator shall check that the implementation representation defines the TSF to a level of detail such that the TSF can be generated without further design decisions.

Source code or hardware diagrams and/or IC hardware design language code or layout data that are used to build the actual hardware are examples of parts of an implementation representation. The evaluator samples the implementation representation to gain confidence that it is at the appropriate level and not, for instance, a pseudo-code level which requires additional design decisions to be made. The evaluator is encouraged to perform a quick check when first looking at the implementation representation to assure themselves that the developer is on the right track. However, the evaluator is also encourage to perform the bulk of this check while working on other work units that call for examining the implementation; this will ensure the sample examined for this work unit is relevant.

ISO/IEC 15408-3 ADV_IMP.1.2C: *The implementation representation shall be in the form used by the development personnel.*

10.5.1.4.2 Work unit ADV_IMP.1-2

The evaluator shall check that the implementation representation is in the form used by development personnel.

The implementation representation is manipulated by the developer in form that it suitable for transformation to the actual implementation. For instance, the developer may work with files containing source code, which is eventually compiled to become part of the TSF. The developer makes available the implementation representation in the form they use, so that the evaluator may use automated techniques in the analysis. This also increases the confidence that the implementation representation examined is actually the one used in the production of the TSF (as opposed to the case where it is supplied in an alternate presentation format, such as a word processor document). It should be noted that other forms of the implementation representation may also be used by the developer; these forms are supplied as well. The overall goal is to supply the evaluator with the information that will maximise the evaluator's analysis efforts.

The evaluator samples the implementation representation to gain confidence that it is the version that is usable by the developer. The sample is such that the evaluator has assurance that all areas of the implementation representation are in conformance with the requirement; however, a complete examination of the entire implementation representation is unnecessary.

Conventions in some forms of the implementation representation may make it difficult or impossible to determine from just the implementation representation itself what the actual result of the compilation or run-time interpretation will be. For example, compiler directives for C language compilers will cause the compiler to exclude or include entire portions of the code.

Some forms of the implementation representation may require additional information because they introduce significant barriers to understanding and analysis. Examples include shrouded source code or source code that has been obfuscated in other ways such that it prevents understanding and/or analysis. These forms of implementation representation typically result from by taking a version of the implementation representation that is used by the TOE developer and running a shrouding or obfuscation program on it. While the shrouded representation is what is compiled and may be closer to the implementation (in terms of structure) than the original, un-shrouded representation, supplying such obfuscated code may cause significantly more time to be spent in analysis tasks involving the representation. When such forms of representation are created, the components require details on the shrouding tools/algorithms used so that the un-shrouded representation can be supplied, and the additional information can be used to gain confidence that the shrouding process does not compromise any security mechanisms.

The evaluator samples the implementation representation to gain confidence that all of the information needed to interpret the implementation representation has been supplied. Note that the tools are among those referenced by Tools and techniques (ALC_TAT) components. The evaluator is encouraged to perform a quick check when first looking at the implementation representation to assure themselves that the developer is on the right track. However, the evaluator is also encouraged to perform the bulk of this check while working on other work units that call for examining the implementation; this will ensure the sample examined for this work unit is relevant.

ISO/IEC 15408-3 ADV_IMP.1.3C: *The mapping between the TOE design description and the sample of the implementation representation shall demonstrate their correspondence.*

10.5.1.4.3 Work unit ADV_IMP.1-3

The evaluator shall examine the mapping between the TOE design description and the sample of the implementation representation to determine that it is accurate.

The evaluator augments the determination of existence (specified in work unit ADV_IMP.1-1) by verifying the accuracy of a portion of the implementation representation and the TOE design description. For parts of the TOE design description that are interesting, the evaluator would verify the implementation representation accurately reflects the description provided in the TOE design description.

For example, the TOE design description might identify a login module that is used to identify and authenticate users. If user authentication is sufficiently significant, the evaluator would verify that the corresponding code in fact implements that service as described in the TOE design description. It might also be worthwhile to verify that the code accepts the parameters as described in the functional specification.

It is worth pointing out the developer must choose whether to perform the mapping for the entire implementation representation, thereby guaranteeing that the chosen sample will be covered, or waiting for the sample to be chosen before performing the mapping. The first option is likely more work, but may be completed before the evaluation begins. The second option is less work, but will produce a suspension of evaluation activity while the necessary evidence is being produced.

10.5.2 Evaluation of sub-activity (ADV_IMP.2)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

10.6 TSF internals (ADV_INT)

10.6.1 Evaluation of sub-activity (ADV_INT.1)

10.6.1.1 Objectives

The objective of this sub-activity is to determine whether the defined subset of the TSF is designed and structured such that the likelihood of flaws is reduced and that maintenance can be more readily performed without the introduction of flaws.

10.6.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the TOE design description;
- c) the implementation representation (if ADV_IMP is part of the claimed assurance);
- d) the architectural description;
- e) the documentation of the coding standards, as resulting from ALC_TAT.

10.6.1.3 Application notes

The role of the internals description is to provide evidence of the structure of the design and implementation of the TSF.

The structure of the design has two aspects: the constituent parts of the TSF and the procedures used to design the TSF. In cases where the TSF is designed in a manner consistent with the design represented by the TOE design (see ADV_TDS), the assessment of the TSF design is obvious. In cases where the design procedures (see ALC_TAT) are being followed, the assessment of the TSF design procedures is similarly obvious.

In cases where the TSF is implemented using procedure-based software, this structure is assessed on the basis of its *modularity*; the modules identified in the internals description are the same as the modules identified in the TOE design (TOE design (ADV_TDS)). A module consists of one or more source code files that cannot be decomposed into smaller compilable units.

The use of the assignment in this component levies stricter constraints on the subset of the TSF that is explicitly identified in the assignment ADV_INT.1.1D than on the remainder of the TSF. While the entire TSF is to be designed using good engineering principles and result in a well-structured TSF, only the specified subset is specifically analysed for this characteristic. The evaluator determines that the developer's application of coding standards result in a TSF that is understandable.

The primary goal of this component is to ensure the TSF subset's implementation representation is understandable to facilitate maintenance and analysis (of both the developer and evaluator).

10.6.1.4 Action ADV_INT.1.1E

ISO/IEC 15408-3 ADV_INT.1.1C: *The justification shall explain the characteristics used to judge the meaning of "well-structured".*

10.6.1.4.1 Work unit ADV_INT.1-1

The evaluator shall examine the justification to determine that it identifies the basis for determining whether the TSF is well-structured.

The evaluator verifies that the criteria for determining the characteristic of being well-structured are clearly defined in the justification. Acceptable criteria typically originate from industry standards for the technology discipline. For example, procedural software that executes linearly is traditionally viewed as well-structured if it adheres to software engineering programming practises, such as those defined in the IEEE Standard (*IEEE Std 610.12-1990*). For example, it would identify the criteria for the procedural software portions of the TSF subset:

- a) the process used for modular decomposition,
- b) coding standards used in the development of the implementation,
- c) a description of the maximum acceptable level of intermodule coupling exhibited by the TSF subset, and
- d) a description of the minimum acceptable level of cohesion exhibited the modules of the TSF subset.

For other types of technologies used in the TOE - such as non-procedural software (e.g. object-oriented programming), widespread commodity hardware (e.g. PC microprocessors), and special-purpose hardware (e.g. smart-card processors) - the evaluator should seek guidance from the evaluation authority for determining the adequacy of criteria for being "well-structured".

ISO/IEC 15408-3 ADV_INT.1.2C: *The TSF internals description shall demonstrate that the assigned subset of the TSF is well-structured.*

10.6.1.4.2 Work unit ADV_INT.1-2

The evaluator shall check the TSF internals description to determine that it identifies the Assigned subset of the TSF.

This subset may be identified in terms of the internals of the TSF at any layer of abstraction. For example, it may be in terms of the structural elements of the TSF as identified in the TOE design (e.g. the audit subsystem), or in terms of the implementation (e.g. *encrypt.c* and *decrypt.c* files, or the 6227 IC chip).

It is insufficient to identify this subset in terms of the claimed SFRs (e.g. the portion of the TSF that provide anonymity as defined in FPR_ANO.2) because this does not indicate where to focus the analysis.

10.6.1.4.3 Work unit ADV_INT.1-3

The evaluator shall examine the TSF internals description to determine that it demonstrates that the assigned TSF subset is well-structured.

The evaluator examines the internals description to ensure that it provides a sound explanation of how the TSF subset meets the criteria from ADV_INT.1-1.

For example, it would explain how the procedural software portions of the TSF subset meets the following:

- a) that there is a one-to-one correspondence between the modules identified in the TSF subset and the modules described in the TOE design (ADV_TDS),
- b) how the TSF design is a reflection of the modular decomposition process,
- c) a justification for all instances where the coding standards were not used or met, and
- d) a justification for any coupling or cohesion outside the acceptable bounds.

10.6.1.5 Action ADV_INT.1.2E

10.6.1.5.1 Work unit ADV_INT.1-4

The evaluator shall determine that the TOE design for the assigned TSF subset is well-structured.

The evaluator examines a sample of the TOE design to verify the accuracy of the justification. For example, a sample of the TOE design is analysed to determine its adherence to the design standards, etc. As with all areas where the evaluator performs activities on a subset the evaluator provides a justification of the sample size and scope.

The description of the TOE's decomposition into subsystems and modules will make the argument that the TSF subset is well-structured self-evident. Verification that the procedures for structuring the TSF (as examined in ALC_TAT) are being followed will make it self-evident that the TSF subset is well-structured.

10.6.1.5.2 Work unit ADV_INT.1-5

The evaluator shall determine that the assigned TSF subset is well-structured.

If ADV_IMP is not part of the claimed assurance, then this work unit is not applicable and is therefore considered to be satisfied.

The evaluator examines a sample of the TSF subset to verify the accuracy of the internals description. For example, a sample of the procedural software portions of the TSF subset is analysed to determine its cohesion and coupling, its adherence to the coding standards, etc. As with all areas where the evaluator performs activities on a subset the evaluator provides a justification of the sample size and scope.

10.6.2 Evaluation of sub-activity (ADV_INT.2)

10.6.2.1 Objectives

The objective of this sub-activity is to determine whether the TSF is designed and structured such that the likelihood of flaws is reduced and that maintenance can be more readily performed without the introduction of flaws.

10.6.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the modular design description;
- b) the implementation representation (if ADV_IMP is part of the claimed assurance);
- c) the TSF internals description;
- d) the documentation of the coding standards, as resulting from ALC_TAT.

10.6.2.3 Application notes

The role of the internals description is to provide evidence of the structure of the design and implementation of the TSF.

The structure of the design has two aspects: the constituent parts of the TSF and the procedures used to design the TSF. In cases where the TSF is designed in a manner consistent with the design represented by the TOE design (see ADV_TDS), the assessment of the TSF design is obvious. In cases where the design procedures (see ALC_TAT) are being followed, the assessment of the TSF design procedures is similarly obvious.

In cases where the TSF is implemented using procedure-based software, this structure is assessed on the basis of its *modularity*; the modules identified in the internals description are the same as the modules identified in the TOE design (TOE design (ADV_TDS)). A module consists of one or more source code files that cannot be decomposed into smaller compilable units.

The primary goal of this component is to ensure the TSF's implementation representation is understandable to facilitate maintenance and analysis (of both the developer and evaluator).

10.6.2.4 Action ADV_INT.2.1E

ISO/IEC 15408-3 ADV_INT.2.1C: *The justification shall describe the characteristics used to judge the meaning of "well-structured".*

10.6.2.4.1 Work unit ADV_INT.2-1

The evaluator shall examine the justification to determine that it identifies the basis for determining whether the TSF is well-structured.

The evaluator verifies that the criteria for determining the characteristic of being well-structured are clearly defined in the justification. Acceptable criteria typically originate from industry standards for the technology discipline. For example, procedural software that executes linearly is traditionally viewed as well-structured if it adheres to software engineering programming practises, such as those defined in the IEEE Standard (*IEEE Std 610.12-1990*). For example, it would identify the criteria for the procedural software portions of the TSF:

- a) the process used for modular decomposition
- b) coding standards used in the development of the implementation
- c) a description of the maximum acceptable level of intermodule coupling exhibited by the TSF
- d) a description of the minimum acceptable level of cohesion exhibited the modules of the TSF

For other types of technologies used in the TOE - such as non-procedural software (e.g. object-oriented programming), widespread commodity hardware (e.g. PC microprocessors), and special-purpose hardware (e.g. smart-card processors) - the evaluation authority should be consulted for determining the adequacy of criteria for being "well-structured".

ISO/IEC 15408-3 ADV_INT.2.2C: *The TSF internals description shall demonstrate that the entire TSF is well-structured.*

10.6.2.4.2 Work unit ADV_INT.2-2

The evaluator shall examine the TSF internals description to determine that it demonstrates that the TSF is well-structured.

The evaluator examines the internals description to ensure that it provides a sound explanation of how the TSF meets the criteria from ADV_INT.2-1

For example, it would explain how the procedural software portions of the TSF meet the following:

- a) that there is a one-to-one correspondence between the modules identified in the TSF and the modules described in the TOE design (ADV_TDS)
- b) how the TSF design is a reflection of the modular decomposition process
- c) a justification for all instances where the coding standards were not used or met
- d) a justification for any coupling or cohesion outside the acceptable bounds

10.6.2.5 Action ADV_INT.2.2E

10.6.2.5.1 Work unit ADV_INT.2-3

The evaluator shall determine that the TOE design is well-structured.

The evaluator examines the TOE design of a sample of the TSF to verify the accuracy of the justification. For example, a sample of the TOE design is analysed to determine its adherence to the design standards, etc. As

with all areas where the evaluator performs activities on a subset the evaluator provides a justification of the sample size and scope.

The description of the TOE's decomposition into subsystems and modules will make the argument that the TSF subset is well-structured self-evident. Verification that the procedures for structuring the TSF (as examined in ALC_TAT) are being followed will make it self-evident that the TSF subset is well-structured.

10.6.2.5.2 Work unit ADV_INT.2-4

The evaluator shall determine that the TSF is well-structured.

If ADV_IMP is not part of the claimed assurance, then this work unit is not applicable and is therefore considered to be satisfied.

The evaluator examines a sample of the TSF to verify the accuracy of the internal description. For example, a sample of the procedural software portions of the TSF is analysed to determine its cohesion and coupling, its adherence to the coding standards, etc. As with all areas where the evaluator performs activities on a subset the evaluator provides a justification of the sample size and scope.

10.6.3 Evaluation of sub-activity (ADV_INT.3)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

10.7 Security policy modelling (ADV_SPM)

10.7.1 Evaluation of sub-activity (ADV_SPM.1)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

10.8 TOE design (ADV_TDS)

10.8.1 Evaluation of sub-activity (ADV_TDS.1)

10.8.1.1 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) security architecture description;
- d) the TOE design.

10.8.1.2 Action ADV_TDS.1.1E

ISO/IEC 15408-3 ADV_TDS.1.1C: *The design shall describe the structure of the TOE in terms of subsystems.*

10.8.1.2.1 Work unit ADV_TDS.1-1

The evaluator shall examine the TOE design to determine that the structure of the entire TOE is described in terms of subsystems.

The evaluator ensures that all of the subsystems of the TOE are identified. This description of the TOE will be used as input to work unit ADV_TDS.1-2, where the parts of the TOE that make up the TSF are identified. That is, this requirement is on the entire TOE rather than on only the TSF.

The TOE (and TSF) may be described in multiple layers of abstraction (i.e. subsystems and modules) Depending upon the complexity of the TOE, its design may be described in terms of subsystems and modules, as described in ISO/IEC 15408-3 Annex A.4, ADV_TDS: Subsystems and Modules. At this level of assurance, the decomposition only need be at the "subsystem" level.

In performing this activity, the evaluator examines other evidence presented for the TOE (e.g., ST, operator user guidance) to determine that the description of the TOE in such evidence is consistent with the description contained in the TOE design.

ISO/IEC 15408-3 ADV_TDS.1.2C: *The design shall identify all subsystems of the TSF.*

10.8.1.2.2 Work unit ADV_TDS.1-2

The evaluator shall examine the TOE design to determine that all subsystems of the TSF are identified.

In work unit ADV_TDS.1-1 all of the subsystems of the TOE were identified, and a determination made that the non-TSF subsystems were correctly characterised. Building on that work, the subsystems that were not characterised as non-TSF subsystems should be precisely identified. The evaluator determines that, of the hardware and software installed and configured according to the Preparative procedures (AGD_PRE) guidance, each subsystem has been accounted for as either one that is part of the TSF, or one that is not.

ISO/IEC 15408-3 ADV_TDS.1.3C: *The design shall describe the behaviour of each SFR-supporting or SFR-non-interfering TSF subsystem in sufficient detail to determine that it is not SFR-enforcing.*

10.8.1.2.3 Work unit ADV_TDS.1-3

The evaluator shall examine the TOE design to determine that each SFR-supporting or SFR-non-interfering subsystem of the TSF is described such that the evaluator can determine that the subsystem is SFR-supporting or SFR-non-interfering.

SFR-supporting and SFR-non-interfering subsystems do not need to be described in detail as to how they function in the system. However, the evaluator makes a determination, based on the evidence provided by the developer, that the subsystems that do not have high-level descriptions are SFR-supporting or SFR-non-interfering. Note that if the developer provides a uniform level of detailed documentation then this work unit will be largely satisfied, since the point of categorising the subsystems is to allow the developer to provide less information for SFR-supporting and SFR-non-interfering subsystems than for SFR-enforcing subsystems.

An SFR-supporting subsystem is one that is depended on by an SFR-enforcing subsystem in order to implement an SFR, but does not play as direct a role as an SFR-enforcing subsystem. An SFR-non-interfering subsystem is one that is not depended upon, in either a supporting or enforcing role, to implement an SFR.

ISO/IEC 15408-3 ADV_TDS.1.4C: *The design shall summarise the SFR-enforcing behaviour of the SFR-enforcing subsystems.*

10.8.1.2.4 Work unit ADV_TDS.1-4

The evaluator shall examine the TOE design to determine that it provides a complete, accurate, and high-level description of the SFR-enforcing behaviour of the SFR-enforcing subsystems.

The developer may designate subsystems as SFR-enforcing, SFR-supporting, and SFR non-interfering, but these "tags" are used only to describe the amount and type of information the developer must provide, and can be used to limit the amount of information the developer has to develop if their engineering process does not produce the documentation required. Whether the subsystems have been categorised by the developer or not, it is the evaluator's responsibility to determine that the subsystems have the appropriate information for their role (SFR-enforcing, etc.) in the TOE, and to obtain the appropriate information from the developer should the developer fail to provide the required information for a particular subsystem.

SFR-enforcing behaviour refers to *how* a subsystem provides the functionality that implements an SFR. A high-level description need not refer to specific data structures (although it may), but instead talks about more

general data flow, message flow, and control relationships within a subsystem. The goal of these descriptions is to give the evaluator enough information to understand *how* the SFR-enforcing behaviour is achieved. Note that the evaluator should find unacceptable asserts of SFR-enforcement in the TOE design documentation for this work unit. It should be noted that it is the evaluator's determination with respect to what "high-level" means for a particular TOE, and the evaluator obtains enough information from the developer to make a sound verdict for this work unit.

To determine completeness and accuracy, the evaluator examines other information available (e.g., functional specification, security architecture description, implementation representation). Descriptions of functionality in these documents should be consistent with what is provided for evidence for this work unit.

ISO/IEC 15408-3 ADV_TDS.1.5C: *The design shall provide a description of the interactions among SFR-enforcing subsystems of the TSF, and between the SFR-enforcing subsystems of the TSF and other subsystems of the TSF.*

10.8.1.2.5 Work unit ADV_TDS.1-5

The evaluator shall examine the TOE design to determine that interactions between the subsystems of the TSF are described.

The goal of describing the interactions between the SFR-enforcing subsystems and other subsystems is to help provide the reader a better understanding of how the TSF performs its functions. These interactions do not need to be characterised at the implementation level (e.g., parameters passed from one routine in a subsystem to a routine in a different subsystem; global variables; hardware signals (e.g., interrupts) from a hardware subsystem to an interrupt-handling subsystem), but the data elements identified for a particular subsystem that are going to be used by another subsystem need to be covered in this discussion. Any control relationships between subsystems (e.g., a subsystem responsible for configuring a rule base for a firewall system and the subsystem that actually implements these rules) should also be described.

The evaluators need to use their own judgement in assessing the completeness of the description. If the reason for an interaction is unclear, or if there are SFR-related interactions (discovered, for instance, in examining the descriptions of subsystem behaviour) that do not appear to be described, the evaluator ensures that this information is provided by the developer. However, if the evaluator can determine that interactions among a particular set of subsystems, while incompletely described by the developer, will not aid in understanding the overall functionality nor security functionality provided by the TSF, then the evaluator may choose to consider the description sufficient, and not pursue completeness for its own sake.

ISO/IEC 15408-3 ADV_TDS.1.6C: *The mapping shall demonstrate that all behaviour described in the TOE design is mapped to the TSFIs that invoke it.*

10.8.1.2.6 Work unit ADV_TDS.1-6

The evaluator shall examine the TOE design to determine that it contains a complete and accurate mapping from the TSFI described in the functional specification to the subsystems of the TSF described in the TOE design.

The subsystems described in the TOE design provide a description of how the TSF works at a detailed level for SFR-enforcing portions of the TSF, and at a higher level for other portions of the TSF. The TSFI provide a description of how the implementation is exercised. The evidence from the developer identifies the subsystem that is initially involved when an operation is requested at the TSFI, and identify the various subsystems that are primarily responsible for implementing the functionality. Note that a complete "call tree" for each TSFI is not required for this work unit.

The evaluator assesses the completeness of the mapping by ensuring that all of the TSFI map to at least one subsystem. The verification of accuracy is more complex.

The first aspect of accuracy is that each TSFI is mapped to a subsystem at the TSF boundary. This determination can be made by reviewing the subsystem description and interactions, and from this information determining its place in the architecture. The next aspect of accuracy is that the mapping makes sense. For

instance, mapping a TSFI dealing with access control to a subsystem that checks passwords is not accurate. The evaluator should again use judgement in making this determination. The goal is that this information aids the evaluator in understanding the system and implementation of the SFRs, and ways in which entities at the TSF boundary can interact with the TSF. The bulk of the assessment of whether the SFRs are described accurately by the subsystems is performed in other work units.

10.8.1.3 Action ADV_TDS.1.2E

10.8.1.3.1 Work unit ADV_TDS.1-7

The evaluator shall examine the TOE security functional requirements and the TOE design, to determine that all ST security functional requirements are covered by the TOE design.

The evaluator may construct a map between the TOE security functional requirements and the TOE design. This map will likely be from a functional requirement to a set of subsystems. Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

For example, the FDP_ACC.1 Subset access control component contains an element with assignments. If the ST contained, for instance, ten rules in the FDP_ACC.1 Subset access control assignment, and these ten rules were implemented in specific places within fifteen modules, it would be inadequate for the evaluator to map FDP_ACC.1 Subset access control to one subsystem and claim the work unit had been completed. Instead, the evaluator would map FDP_ACC.1 Subset access control (rule 1) to subsystem A, behaviours x, y, and z; FDP_ACC.1 Subset access control (rule 2) to subsystem A, behaviours x, p, and q; etc.

10.8.1.3.2 Work unit ADV_TDS.1-8

The evaluator shall examine the TOE design to determine that it is an accurate instantiation of all security functional requirements.

The evaluator ensures that each security requirement listed in the TOE security functional requirements subclause of the ST has a corresponding design description in the TOE design that accurately details how the TSF meets that requirement. This requires that the evaluator identify a collection of subsystems that are responsible for implementing a given functional requirement, and then examine those subsystems to understand how the requirement is implemented. Finally, the evaluator would assess whether the requirement was accurately implemented.

As an example, if the ST requirements specified a role-based access control mechanism, the evaluator would first identify the subsystems that contribute to this mechanism's implementation. This could be done by in-depth knowledge or understanding of the TOE design or by work done in the previous work unit. Note that this trace is only to identify the subsystems, and is not the complete analysis.

The next step would be to understand what mechanism the subsystems implemented. For instance, if the design described an implementation of access control based on UNIX-style protection bits, the design would not be an accurate instantiation of those access control requirements present in the ST example used above. If the evaluator could not determine that the mechanism was accurately implemented because of a lack of detail, the evaluator would have to assess whether all of the SFR-enforcing subsystems have been identified, or if adequate detail had been provided for those subsystems.

10.8.2 Evaluation of sub-activity (ADV_TDS.2)

10.8.2.1 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;

- c) security architecture description;
- d) the TOE design.

10.8.2.2 Action ADV_TDS.2.1E

ISO/IEC 15408-3 ADV_TDS.2.1C: *The design shall describe the structure of the TOE in terms of subsystems.*

10.8.2.2.1 Work unit ADV_TDS.2-1

The evaluator shall examine the TOE design to determine that the structure of the entire TOE is described in terms of subsystems.

The evaluator ensures that all of the subsystems of the TOE are identified. This description of the TOE will be used as input to work unit ADV_TDS.2-2, where the parts of the TOE that make up the TSF are identified. That is, this requirement is on the entire TOE rather than on only the TSF.

The TOE (and TSF) may be described in multiple layers of abstraction (i.e. subsystems and modules). Depending upon the complexity of the TOE, its design may be described in terms of subsystems and modules, as described in ISO/IEC 15408-3 Annex A.4, ADV_TDS: Subsystems and Modules. At this level of assurance, the decomposition only need be at the "subsystem" level.

In performing this activity, the evaluator examines other evidence presented for the TOE (e.g., ST, operator user guidance) to determine that the description of the TOE in such evidence is consistent with the description contained in the TOE design.

ISO/IEC 15408-3 ADV_TDS.2.2C: *The design shall identify all subsystems of the TSF.*

10.8.2.2.2 Work unit ADV_TDS.2-2

The evaluator shall examine the TOE design to determine that all subsystems of the TSF are identified.

In work unit ADV_TDS.2-1 all of the subsystems of the TOE were identified, and a determination made that the non-TSF subsystems were correctly characterised. Building on that work, the subsystems that were not characterised as non-TSF subsystems should be precisely identified. The evaluator determines that, of the hardware and software installed and configured according to the Preparative procedures (AGD_PRE) guidance, each subsystem has been accounted for as either one that is part of the TSF, or one that is not.

ISO/IEC 15408-3 ADV_TDS.2.3C: *The design shall describe the behaviour of each SFR non-interfering subsystem of the TSF in detail sufficient to determine that it is SFR non-interfering.*

10.8.2.2.3 Work unit ADV_TDS.2-3

The evaluator shall examine the TOE design to determine that each SFR-non-interfering subsystem of the TSF is described such that the evaluator can determine that the subsystem is SFR-non-interfering.

SFR-non-interfering subsystems do not need to be described in detail as to how they function in the system. However, the evaluator makes a determination, based on the evidence provided by the developer, that the subsystems that do not have detailed descriptions are SFR-non-interfering. Note that if the developer provides a uniform level of detailed documentation then this work unit will be largely satisfied, since the point of categorising the subsystems is to allow the developer to provide less information for SFR-non-interfering subsystems than for SFR-enforcing and SFR-supporting subsystems.

An SFR-non-interfering subsystem is one on which the SFR-enforcing and SFR-supporting subsystems have no dependence; that is, they play no role in implementing SFR functionality.

ISO/IEC 15408-3 ADV_TDS.2.4C: *The design shall describe the SFR-enforcing behaviour of the SFR-enforcing subsystems.*

10.8.2.2.4 Work unit ADV_TDS.2-4

The evaluator shall examine the TOE design to determine that it provides a complete, accurate, and detailed description of the SFR-enforcing behaviour of the SFR-enforcing subsystems.

The developer may designate subsystems as SFR-enforcing, SFR-supporting, and SFR non-interfering, but these “tags” are used only to describe the amount and type of information the developer must provide, and can be used to limit the amount of information the developer has to develop if their engineering process does not produce the documentation required. Whether the subsystems have been categorised by the developer or not, it is the evaluator's responsibility to determine that the subsystems have the appropriate information for their role (SFR-enforcing, etc.) in the TOE, and to obtain the appropriate information from the developer should the developer fail to provide the required information for a particular subsystem.

SFR-enforcing behaviour refers to *how* a subsystem provides the functionality that implements an SFR. While not at the level of an algorithmic description, a detailed description of behaviour typically discusses how the functionality is provided in terms of what key data and data structures are, what control relationships exist within a subsystem, and how these elements work together to provide the SFR-enforcing behaviour. Such a description also references SFR-supporting behaviour, which the evaluator should consider in performing subsequent work units.

To determine completeness and accuracy, the evaluator examines other information available (e.g., functional specification, security architecture description, implementation representation). Descriptions of functionality in these documents should be consistent with what is provided for evidence for this work unit.

ISO/IEC 15408-3 ADV_TDS.2.5C: *The design shall summarise the SFR-supporting and SFR-non-interfering behaviour of the SFR-enforcing subsystems.*

10.8.2.2.5 Work unit ADV_TDS.2-5

The evaluator shall examine the TOE design to determine that it provides a complete and accurate high-level description of the SFR-supporting and SFR-non-interfering behaviour of the SFR-enforcing subsystems.

The developer may designate subsystems as SFR-enforcing, SFR-supporting, and SFR non-interfering, but these “tags” are used only to describe the amount and type of information the developer must provide, and can be used to limit the amount of information the developer has to develop if their engineering process does not produce the documentation required. Whether the subsystems have been categorised by the developer or not, it is the evaluator's responsibility to determine that the subsystems have the appropriate information for their role (SFR-enforcing, etc.) in the TOE, and to obtain the appropriate information from the developer should the developer fail to provide the required information for a particular subsystem.

In contrast to the previous work unit, this work unit calls for the evaluator to assess the information provided for SFR-enforcing subsystems that is SFR-supporting or SFR-non-interfering. The goal of this assessment is two-fold. First, it should provide the evaluator greater understanding of the way each subsystem works. Second, the evaluator determines that all SFR-enforcing behaviour exhibited by a subsystem has been described. Unlike the previous work unit, the information provided for the SFR-supporting or SFR-non-interfering behaviour does not have to be as detailed as that provided by the SFR-enforcing behaviour. For example, data structures or data items that do not pertain to SFR-enforcing functionality will likely not need to be described in detail, if at all. It is the evaluator's determination, however, with respect to what “high-level” means for a particular TOE, and the evaluator obtains enough information from the developer (even if it turns out to be equivalent to information provided for the parts of the subsystem that are SFR-enforcing) to make a sound verdict for this work unit.

The evaluator is cautioned, however, that “perfect” assurance is not a goal nor required by this work unit, so judgement will have to be exercised in determine the amount and composition of the evidence required to make a verdict on this work unit.

To determine completeness and accuracy, the evaluator examines other information available (e.g., functional specification, security architecture description, implementation representation). Descriptions of functionality in these documents should be consistent with what is provided for evidence for this work unit. In particular, the

functional specification should be used to determine that the behaviour required to implement the TSF Interfaces described by the functional specification are completely described by the subsystem, since the behaviour will either be SFR-enforcing, SFR-supporting or SFR-non-interfering.

ISO/IEC 15408-3 ADV_TDS.2.6C: *The design shall summarise the behaviour of the SFR-supporting subsystems.*

10.8.2.2.6 Work unit ADV_TDS.2-6

The evaluator shall examine the TOE design to determine that it provides a complete and accurate high-level description of the behaviour of the SFR-supporting subsystems.

The developer may designate subsystems as SFR-enforcing, SFR-supporting, and SFR non-interfering, but these “tags” are used only to describe the amount and type of information the developer must provide, and can be used to limit the amount of information the developer has to develop if their engineering process does not produce the documentation required. Whether the subsystems have been categorised by the developer or not, it is the evaluator's responsibility to determine that the subsystems have the appropriate information for their role (SFR-enforcing, etc.) in the TOE, and to obtain the appropriate information from the developer should the developer fail to provide the required information for a particular subsystem.

In contrast to the previous two work units, this work unit calls for the developer to provide (and the evaluator to assess) information about SFR supporting subsystems. Such subsystems should be referenced by the descriptions of the SFR-enforcing subsystems, as well as by the descriptions of interactions in work unit ADV_TDS.2-7. The goal of evaluator's assessment, like that for the previous work unit, is two-fold. First, it should provide the evaluator with an understanding of the way each SFR-supporting subsystem works. Second, the evaluator determines that the behaviour is described in enough detail so that the way in which the subsystem supports the SFR-enforcing behaviour is clear, and that the behaviour is not itself SFR-enforcing. The information provided for SFR-supporting subsystem's behaviour does not have to be as detailed as that provided by the SFR-enforcing behaviour. For example, data structures or data items that do not pertain to SFR-enforcing functionality will likely not need to be described in detail, if at all. It is the evaluator's determination, however, with respect to what “high-level” means for a particular TOE, and the evaluator obtains enough information from the developer (even if it turns out to be equivalent to information provided for the parts of the subsystem that are SFR-enforcing) to make a sound verdict for this work unit.

The evaluator is cautions, however, that “perfect” assurance is not a goal nor required by this work unit, so judgement will have to be exercised in determine the amount and composition of the evidence required to make a verdict on this work unit.

To determine completeness and accuracy, the evaluator examines other information available (e.g., functional specification, security architecture description, implementation representation). Descriptions of functionality in these documents should be consistent with what is provided for evidence for this work unit. In particular, the functional specification should be used to determine that the behaviour required to implement the TSF Interfaces described by the functional specification are completely described by the subsystem.

ISO/IEC 15408-3 ADV_TDS.2.7C: *The design shall provide a description of the interactions among all subsystems of the TSF.*

10.8.2.2.7 Work unit ADV_TDS.2-7

The evaluator shall examine the TOE design to determine that interactions between the subsystems of the TSF are described.

The goal of describing the interactions between the subsystems is to help provide the reader a better understanding of how the TSF performs its functions. These interactions do not need to be characterised at the implementation level (e.g., parameters passed from one routine in a subsystem to a routine in a different subsystem; global variables; hardware signals (e.g., interrupts) from a hardware subsystem to an interrupt-handling subsystem), but the data elements identified for a particular subsystem that are going to be used by another subsystem need to be covered in this discussion. Any control relationships between subsystems (e.g.,

a subsystem responsible for configuring a rule base for a firewall system and the subsystem that actually implements these rules) should also be described.

It should be noted while the developer should characterise all interactions between subsystems, the evaluators need to use their own judgement in assessing the completeness of the description. If the reason for an interaction is unclear, or if there are SFR-related interactions (discovered, for instance, in examining the descriptions of subsystem behaviour) that do not appear to be described, the evaluator ensures that this information is provided by the developer. However, if the evaluator can determine that interactions among a particular set of subsystems, while incompletely described by the developer, will not aid in understanding the overall functionality nor security functionality provided by the TSF, then the evaluator may choose to consider the description sufficient, and not pursue completeness for its own sake.

ISO/IEC 15408-3 ADV_TDS.2.8C: *The mapping shall demonstrate that all behaviour described in the TOE design is mapped to the TSFIs that invoke it.*

10.8.2.2.8 Work unit ADV_TDS.2-8

The evaluator shall examine the TOE design to determine that it contains a complete and accurate mapping from the TSFI described in the functional specification to the subsystems of the TSF described in the TOE design.

The subsystems described in the TOE design provide a description of how the TSF works at a detailed level for SFR-enforcing portions of the TSF, and at a higher level for other portions of the TSF. The TSFI provide a description of how the implementation is exercised. The evidence from the developer identifies the subsystem that is initially involved when an operation is requested at the TSFI, and identify the various subsystems that are primarily responsible for implementing the functionality. Note that a complete "call tree" for each TSFI is not required for this work unit.

The evaluator assesses the completeness of the mapping by ensuring that all of the TSFI map to at least one subsystem. The verification of accuracy is more complex.

The first aspect of accuracy is that each TSFI is mapped to a subsystem at the TSF boundary. This determination can be made by reviewing the subsystem description and interactions, and from this information determining its place in the architecture. The next aspect of accuracy is that the mapping makes sense. For instance, mapping a TSFI dealing with access control to a subsystem that checks passwords is not accurate. The evaluator should again use judgement in making this determination. The goal is that this information aids the evaluator in understanding the system and implementation of the SFRs, and ways in which entities at the TSF boundary can interact with the TSF. The bulk of the assessment of whether the SFRs are described accurately by the subsystems is performed in other work units.

10.8.2.3 Action ADV_TDS.2.2E

10.8.2.3.1 Work unit ADV_TDS.2-9

The evaluator shall examine the TOE security functional requirements and the TOE design, to determine that all ST security functional requirements are covered by the TOE design.

The evaluator may construct a map between the TOE security functional requirements and the TOE design. This map will likely be from a functional requirement to a set of subsystems. Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

For example, the FDP_ACC.1 Subset access control component contains an element with assignments. If the ST contained, for instance, ten rules in the FDP_ACC.1 Subset access control assignment, and these ten rules were implemented in specific places within fifteen modules, it would be inadequate for the evaluator to map FDP_ACC.1 Subset access control to one subsystem and claim the work unit had been completed. Instead, the evaluator would map FDP_ACC.1 Subset access control (rule 1) to subsystem A, behaviours x, y, and z; FDP_ACC.1 Subset access control (rule 2) to subsystem A, behaviours x, p, and q; etc.

10.8.2.3.2 Work unit ADV_TDS.2-10

The evaluator shall examine the TOE design to determine that it is an accurate instantiation of all security functional requirements.

The evaluator ensures that each security requirement listed in the TOE security functional requirements subclause of the ST has a corresponding design description in the TOE design that accurately details how the TSF meets that requirement. This requires that the evaluator identify a collection of subsystems that are responsible for implementing a given functional requirement, and then examine those subsystems to understand how the requirement is implemented. Finally, the evaluator would assess whether the requirement was accurately implemented.

As an example, if the ST requirements specified a role-based access control mechanism, the evaluator would first identify the subsystems that contribute to this mechanism's implementation. This could be done by in-depth knowledge or understanding of the TOE design or by work done in the previous work unit. Note that this trace is only to identify the subsystems, and is not the complete analysis.

The next step would be to understand what mechanism the subsystems implemented. For instance, if the design described an implementation of access control based on UNIX-style protection bits, the design would not be an accurate instantiation of those access control requirements present in the ST example used above. If the evaluator could not determine that the mechanism was accurately implemented because of a lack of detail, the evaluator would have to assess whether all of the SFR-enforcing subsystems have been identified, or if adequate detail had been provided for those subsystems.

10.8.3 Evaluation of sub-activity (ADV_TDS.3)

10.8.3.1 Objectives

The objective of this sub-activity is to determine whether the TOE design provides a description of the TOE in terms of subsystems sufficient to determine the TSF boundary, and provides a description of the TSF internals in terms of modules (and optionally higher-level abstractions). It provides a detailed description of the SFR-enforcing modules and enough information about the SFR-supporting and SFR-non-interfering modules for the evaluator to determine that the SFRs are completely and accurately implemented; as such, the TOE design provides an explanation of the implementation representation.

10.8.3.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) security architecture description;
- d) the TOE design.

10.8.3.3 Application notes

There are three types of activity that the evaluator must undertake with respect to the TOE design. First, the evaluator determines that the TSF boundary has been adequately described. Second, the evaluator determines that the developer has provided documentation that conforms to the content and presentation requirements for this subsystem, and that is consistent with other documentation provided for the TOE. Finally, the evaluator must analyse the design information provided for the SFR-enforcing modules (at a detailed level) and the SFR-supporting and SFR-non-interfering modules (at a less detailed level) to understand how the system is implemented, and with that knowledge ensure that the TSFI in the functional specification are adequately described, and that the test information adequately tests the TSF (done in the Class ATE: Tests work units).

It is important to note that while the developer is obligated to provide a complete description of the TSF (although SFR-enforcing modules will have more detail than the SFR-supporting or SFR-non-interfering modules), the evaluator is expected to use their judgement in performing their analysis. While the evaluator is expected to look at every module, the detail to which they examine each module may vary. The evaluator analyses each module in order to gain enough understanding to determine the effect of the functionality of the module on the security of the system, and the depth to which they need to analyse the module may vary depending on the module's role in the system. An important aspect of this analysis is that the evaluator should use the other documentation provided (TSS, functional specification, security architecture description, and the TSF internal document) in order to determine that the functionality that is described is correct, and that the implicit designation of SFR-supporting or SFR-non-interfering modules (see below) is supported by their role in the system architecture.

The developer may designate modules as SFR-enforcing, SFR-supporting, and SFR non-interfering, but these “tags” are used only to describe the amount and type of information the developer must provide, and can be used to limit the amount of information the developer has to develop if their engineering process does not produce the documentation required. Whether the modules have been categorised by the developer or not, it is the evaluator's responsibility to determine that the modules have the appropriate information for their role (SFR-enforcing, etc.) in the TOE, and to obtain the appropriate information from the developer should the developer fail to provide the required information for a particular module.

10.8.3.4 Action ADV_TDS.3.1E

ISO/IEC 15408-3 ADV_TDS.3.1C: *The design shall describe the structure of the TOE in terms of subsystems.*

10.8.3.4.1 Work unit ADV_TDS.3-1

The evaluator shall examine the TOE design to determine that the structure of the entire TOE is described in terms of subsystems.

The evaluator ensures that all of the subsystems of the TOE are identified. This description of the TOE will be used as input to work unit ADV_TDS.3-2, where the parts of the TOE that make up the TSF are identified. That is, this requirement is on the entire TOE rather than on only the TSF.

The TOE (and TSF) may be described in multiple layers of abstraction (i.e. subsystems and modules). Depending upon the complexity of the TOE, its design may be described in terms of subsystems and modules, as described in ISO/IEC 15408-3 Annex A.4, ADV_TDS: Subsystems and Modules. For a very simple TOE that can be described solely at the “module” level (see ADV_TDS.3-2), this work unit is not applicable and therefore considered to be satisfied.

In performing this activity, the evaluator examines other evidence presented for the TOE (e.g., ST, operator user guidance) to determine that the description of the TOE in such evidence is consistent with the description contained in the TOE design.

ISO/IEC 15408-3 ADV_TDS.3.2C: *The design shall describe the TSF in terms of modules.*

10.8.3.4.2 Work unit ADV_TDS.3-2

The evaluator shall examine the TOE design to determine that the entire TSF is described in terms of modules.

The evaluator will examine the modules for specific properties in other work units; in this work unit the evaluator determines that the modular description covers the entire TSF, and not just a portion of the TSF. The evaluator uses other evidence provided for the evaluation (e.g., functional specification, security architecture description) in making this determination. For example, if the functional specification contains interfaces to functionality that does not appear to be described in the TOE design description, it may be the case that a portion of the TSF has not been included appropriately. Making this determination will likely be an iterative process, where as more analysis is done on the other evidence, more confidence can be gained with respect to the completeness of the documentation.

Unlike subsystems, modules describe the implementation in a level of detail that can serve as a guide to reviewing the implementation representation. A description of a module should be such that one could create an implementation of the module from the description, and the resulting implementation would be 1) identical to the actual TSF implementation in terms of the interfaces presented and used by the module, and 2) algorithmically identical to the TSF module. For instance, RFC 793 provides a high-level description of the TCP protocol. It is necessarily implementation independent. While it provides a wealth of detail, it is *not* a suitable design description because it is not specific to an implementation. An actual implementation can add to the protocol specified in the RFC, and implementation choices (for instance, the use of global data vs. local data in various parts of the implementation) may have an impact on the analysis that is performed. The design description of the TCP module would list the interfaces presented by the implementation (rather than just those defined in RFC 793), as well as an algorithm description of the processing associated with the modules implementing TCP (assuming it was part of the TSF).

ISO/IEC 15408-3 ADV_TDS.3.3C: *The design shall identify all subsystems of the TSF.*

10.8.3.4.3 Work unit ADV_TDS.3-3

The evaluator shall examine the TOE design to determine that all subsystems of the TSF are identified.

If the design is presented solely in terms of modules, then subsystems in these requirements are equivalent to modules and the activity should be performed at the module level.

In work unit ADV_TDS.3-1 all of the subsystems of the TOE were identified, and a determination made that the non-TSF subsystems were correctly characterised. Building on that work, the subsystems that were not characterised as non-TSF subsystems should be precisely identified. The evaluator determines that, of the hardware and software installed and configured according to the Preparative procedures (AGD_PRE) guidance, each subsystem has been accounted for as either one that is part of the TSF, or one that is not.

ISO/IEC 15408-3 ADV_TDS.3.4C: *The design shall provide a description of each subsystem of the TSF.*

10.8.3.4.4 Work unit ADV_TDS.3-4

The evaluator shall examine the TOE design to determine that each subsystem of the TSF describes its role in the enforcement of SFRs described in the ST.

If the design is presented solely in terms of modules, then this work unit will be considered satisfied by the assessment done in subsequent work units; no explicit action on the part of the evaluator is necessary in this case.

On systems that are complex enough to warrant a subsystem-level description of the TSF in addition to the modular description, the goal of the subsystem-level description is to give the evaluator context for the modular description that follows. Therefore, the evaluator ensures that the subsystem-level description contains a description of how the security functional requirements are achieved in the design, but at a level of abstraction above the modular description. This description should discuss the mechanisms used at a level that is aligned with the module description; this will provide the evaluators the road map needed to intelligently assess the information contained in the module description. A well-written set of subsystem descriptions will help guide the evaluator in determining the modules that are most important to examine, thus focusing the evaluation activity on the portions of the TSF that have the most relevance with respect to the enforcement of the SFRs.

The evaluator ensures that all subsystems of the TSF have a description. While the description should focus on the role that the subsystem plays in enforcing or supporting the implementation of the SFRs, enough information must be present so that a context for understanding the SFR-related functionality is provided.

ISO/IEC 15408-3 ADV_TDS.3.5C: *The design shall provide a description of the interactions among all subsystems of the TSF.*

10.8.3.4.5 Work unit ADV_TDS.3-5

The evaluator shall examine the TOE design to determine that interactions between the subsystems of the TSF are described.

If the design is presented solely in terms of modules, then this work unit will be considered satisfied by the assessment done in subsequent work units; no explicit action on the part of the evaluator is necessary in this case.

On systems that are complex enough to warrant a subsystem-level description of the TSF in addition to the modular description, the goal of describing the interactions between the subsystems is to help provide the reader a better understanding of how the TSF performs its functions. These interactions do not need to be characterised at the implementation level (e.g., parameters passed from one routine in a subsystem to a routine in a different subsystem; global variables; hardware signals (e.g., interrupts) from a hardware subsystem to an interrupt-handling subsystem), but the data elements identified for a particular subsystem that are going to be used by another subsystem should be covered in this discussion. Any control relationships between subsystems (e.g., a subsystem responsible for configuring a rule base for a firewall system and the subsystem that actually implements these rules) should also be described.

It should be noted while the developer should characterise all interactions between subsystems, the evaluators need to use their own judgement in assessing the completeness of the description. If the reason for an interaction is unclear, or if there are SFR-related interactions (discovered, for instance, in examining the module-level documentation) that do not appear to be described, the evaluator ensures that this information is provided by the developer. However, if the evaluator can determine that interactions among a particular set of subsystems, while incompletely described by the developer, and a complete description will not aid in understanding the overall functionality nor security functionality provided by the TSF, then the evaluator may choose to consider the description sufficient, and not pursue completeness for its own sake.

ISO/IEC 15408-3 ADV_TDS.3.6C: *The design shall provide a mapping from the subsystems of the TSF to the modules of the TSF.*

10.8.3.4.6 Work unit ADV_TDS.3-6

The evaluator shall examine the TOE design to determine that the mapping between the subsystems of the TSF and the modules of the TSF is complete.

If the design is presented solely in terms of modules, then this work unit is considered satisfied.

For TOEs that are complex enough to warrant a subsystem-level description of the TSF in addition to the modular description, the developer provides a simple mapping showing how the modules of the TSF are allocated to the subsystems. This will provide the evaluator a guide in performing their module-level assessment. To determine completeness, the evaluator examines each mapping and determines that all subsystems map to at least one module, and that all modules map to exactly one subsystem.

10.8.3.4.7 Work unit ADV_TDS.3-7

The evaluator shall examine the TOE design to determine that the mapping between the subsystems of the TSF and the modules of the TSF is accurate.

If the design is presented solely in terms of modules, then this work unit is considered satisfied.

For TOEs that are complex enough to warrant a subsystem-level description of the TSF in addition to the modular description, the developer provides a simple mapping showing how the modules of the TSF are allocated to the subsystems. This will provide the evaluator a guide in performing their module-level assessment. The evaluator may choose to check the accuracy of the mapping in conjunction with performing other work units. An "inaccurate" mapping is one where the module is mistakenly associated with a subsystem where its functions are not used within the subsystem. Because the mapping is intended to be a guide supporting more detailed analysis, the evaluator is cautioned to apply appropriate effort to this work unit. Expending extensive evaluator resources verifying the accuracy of the mapping is not necessary.

Inaccuracies that lead to mis-understandings related to the design that are uncovered as part of this or other work units are the ones that should be associated with this work unit and corrected.

ISO/IEC 15408-3 ADV_TDS.3.7C: *The design shall describe each SFR-enforcing module in terms of its purpose and interaction with other modules.*

10.8.3.4.8 Work unit ADV_TDS.3-8

The evaluator shall examine the TOE design to determine that the description of the purpose of each SFR-enforcing module is complete and accurate.

The developer may designate modules as SFR-enforcing, SFR-supporting, and SFR non-interfering, but these “tags” are used only to describe the amount and type of information the developer must provide, and can be used to limit the amount of information the developer has to develop if their engineering process does not produce the documentation required. Whether the modules have been categorised by the developer or not, it is the evaluator's responsibility to determine that the modules have the appropriate information for their role (SFR-enforcing, etc.) in the TOE, and to obtain the appropriate information from the developer should the developer fail to provide the required information for a particular module.

The purpose of a module provides a description indicating what function the module is fulfilling. A word of caution to evaluator is in order. The focus of this work unit should be to provide the evaluator an understanding of how the module works so that determinations can be made about the soundness of the implementation of the SFRs, as well as to support architectural analysis performed for ADV_ARC component. As long as the evaluator has a sound understanding of the module's operation, and its relationship to other modules and the TOE as a whole, the evaluator should consider the objective of the work achieved and not engage in a documentation exercise for the developer (by requiring, for example, a complete algorithmic description for a self-evident implementation representation).

ISO/IEC 15408-3 ADV_TDS.3.8C: *The design shall describe each SFR-enforcing module in terms of its SFR-related interfaces, return values from those interfaces, interaction with and called interfaces to other modules.*

10.8.3.4.9 Work unit ADV_TDS.3-9

The evaluator shall examine the TOE design to determine that the description of the interfaces presented by each SFR-enforcing module contain an accurate and complete description of the SFR-related parameters, the invocation conventions for each interface, and any values returned directly by the interface.

The SFR-related interfaces of a module are those interfaces used by other modules as a means to invoke the SFR-related operations provided, and to provide inputs to or receive outputs from the module. The purpose in the specification of these interfaces is to permit the exercise of them during testing. Inter-module interfaces that are not SFR-related need not be specified or described, since they are not a factor in testing. Likewise, other internal interfaces that are not a factor in traversing SFR-related paths of execution (such as those internal paths that are fixed) need not be specified or described, since they are not a factor in testing.

SFR-related interfaces are described in terms of how they are invoked, and any values that are returned. This description would include a list of SFR-related parameters, and descriptions of these parameters. Note that global data would also be considered parameters if used by the module (either as inputs or outputs) when invoked. If a parameter were expected to take on a set of values (e.g., a “flag” parameter), the complete set of values the parameter could take on that would have an effect on module processing would be specified. Likewise, parameters representing data structures are described such that each field of the data structure is identified and described. Note that different programming languages may have additional “interfaces” that would be non-obvious; an example would be operator/function overloading in C++. This “implicit interface” in the class description would also be described as part of the low-level TOE design. Note that although a module could present only one interface, it is more common that a module presents a small set of related interfaces.

In terms of the assessment of parameters (inputs and outputs) to a module, any use of global data must also be considered. A module “uses” global data if it either reads or writes the data. In order to assure the description of such parameters (if used) is complete, the evaluator uses other information provided about the

module in the TOE design (interfaces, algorithmic description, etc.), as well as the description of the particular set of global data assessed in work unit ADV_TDS.3-9. For instance, the evaluator could first determine the processing the module performs by examining its function and interfaces presented (particularly the parameters of the interfaces). They could then check to see if the processing appears to “touch” any of the global data areas identified in the TOE design. The evaluator then determines that, for each global data area that appears to be “touched”, that global data area is listed as a means of input or output by the module the evaluator is examining.

Invocation conventions are a programming-reference-type description that one could use to correctly invoke a module's interface if one were writing a program to make use of the module's functionality through that interface. This includes necessary inputs and outputs, including any set-up that may need to be performed with respect to global variables.

Values returned through the interface refer to values that are either passed through parameters or messages; values that the function call itself returns in the style of a “C” program function call; or values passed through global means (such as certain error routines in *ix-style operating systems).

In order to assure the description is complete, the evaluator uses other information provided about the module in the TOE design (e.g., algorithmic description, global data used) to ensure that it appears all data necessary for performing the functions of the module is presented to the module, and that any values that other modules expect the module under examination to provide are identified as being returned by the module. The evaluator determines accuracy by ensuring that the description of the processing matches the information listed as being passed to or from an interface.

Because the modules are at such a low level, it may be difficult determine completeness and accuracy impacts from other documentation, such as operational user guidance, the functional specification, the TSF internals, or the security architecture description. However, the evaluator uses the information present in those documents to the extent possible to help ensure that the purpose is accurately and completely described. This analysis can be aided by the analysis performed for the work units for the ADV_TDS.3.10C element, which maps the TSFI in the functional specification to the modules of the TSF.

ISO/IEC 15408-3 ADV_TDS.3.9C: *The design shall describe each SFR-supporting or SFR-non-interfering module in terms of its purpose and interaction with other modules.*

10.8.3.4.10 Work unit ADV_TDS.3-10

The evaluator shall examine the TOE design to determine that SFR-supporting and SFR-non-interfering modules are correctly categorised.

In the cases where the developer has provided different amounts of information for different modules, an implicit categorisation has been done. That is, modules (for instance) with detail presented on their SFR-related interfaces (see ADV_TDS.3.10C) are candidate SFR-enforcing modules, although examination by the evaluator may lead to a determination that some set of them are SFR-supporting or SFR-non-interfering. Those with only a description of their purpose and interaction with other modules (for instance) are “implicitly categorised” as SFR-supporting or SFR-non-interfering.

In these cases, a key focus of the evaluator for this work unit is attempting to determine from the evidence provided for each module implicitly categorised as SFR-supporting or SFR-non-interfering and the evaluation information about other modules (in the TOE design, the functional specification, the security architecture description, and the operational user guidance), whether the module is indeed SFR-supporting or SFR-non-interfering. At this level of assurance some error should be tolerated; the evaluator does not have to be absolutely sure that a given module is SFR-supporting or SFR-non-interfering, even though it is labelled as such. However, if the evidence provided indicates that a SFR-supporting or SFR-non-interfering module is SFR-enforcing, the evaluator requests additional information from the developer in order to resolve the apparent inconsistency. For instance, suppose the documentation for Module A (an SFR-enforcing module) indicates that it calls Module B to perform an access check on a certain type of construct. When the evaluator examines the information associated with Module B, they find that all the developer has provided is a purpose and a set of interactions (thus implicitly categorising Module B as SFR-supporting or SFR-non-interfering). On examining the purpose and interactions from Module A, the evaluator finds no mention of Module B performing any access checks, and Module A is not listed as a module with which Module B interacts. At this

point the evaluator should approach the developer to resolve the discrepancies between the information provided in Module A and that in Module B.

Another example would be where the evaluator examines the mapping of the TSFI to the modules as provided by ADV_TDS.3.2D. This examination shows that Module C is associated with an SFR requiring identification of the user. Again, when the evaluator examines the information associated with Module C, they find that all the developer has provided is a purpose and a set of interactions (thus implicitly categorising Module C as SFR-supporting or SFR-non-interfering). Examining the purpose and interactions presented for Module C, the evaluator is unable to determine why Module C, listed as mapping to a TSFI concerned with user identification, would not be classified as SFR-enforcing. Again, the evaluator should approach the developer to resolve this discrepancy.

A final example is from the opposite point of view. As before, the developer has provided information associated with Module D consisting of a purpose and a set of interactions (thus implicitly categorising Module D as SFR-supporting or SFR-non-interfering). The evaluator examines all of the evidence provided, including the purpose and interactions for Module D. The purpose appears to give a meaningful description of Module D's function in the TOE, the interactions are consistent with that description, and there is nothing to indicate that Module D is SFR-enforcing. In this case, the evaluator should not demand more information about Module D "just to be sure" it is correctly categorised. The developer has met their obligations and the resulting assurance the evaluator has in the implicit categorisation of Module D is (by definition) appropriate for this assurance level.

10.8.3.4.11 Work unit ADV_TDS.3-11

The evaluator shall examine the TOE design to determine that the description of the purpose of each SFR-supporting or SFR-non-interfering module is complete and accurate.

The description of the purpose of a module indicates what function the module is fulfilling. From the description, the evaluator should be able to obtain a general idea of the module's role. In order to assure the description is complete, the evaluator uses the information provided about the module's interactions with other modules to assess whether the reasons for the module being called are consistent with the module's purpose. If the interaction description contains functionality that is not apparent from, or in conflict with, the module's purpose, the evaluator needs to determine whether the problem is one of accuracy or of completeness. The evaluator should be wary of purposes that are too short, since meaningful analysis based on a one-sentence purpose is likely to be impossible.

In these cases, a key focus of the evaluator for this work unit is attempting to determine from the evidence provided for each module implicitly categorised as SFR-supporting or SFR-non-interfering and the evaluation information about other modules (in the TOE design, the functional specification, the security architecture description, and the operational user guidance), whether the module is indeed SFR-supporting or SFR-non-interfering. At this level of assurance some error should be tolerated; the evaluator does not have to be absolutely sure that a given module is SFR-supporting or SFR-non-interfering, even though it is labelled as such. However, if the evidence provided indicates that a SFR-supporting or SFR-non-interfering module is SFR-enforcing, the evaluator requests additional information from the developer in order to resolve the apparent inconsistency. For instance, suppose the documentation for Module A (an SFR-enforcing module) indicates that it calls Module B to perform an access check on a certain type of construct. When the evaluator examines the information associated with Module B, they find that all the developer has provided is a purpose and a set of interactions (thus implicitly categorising Module B as SFR-supporting or SFR-non-interfering). On examining the purpose and interactions from Module A, the evaluator finds no mention of Module B performing any access checks, and Module A is not listed as a module with which Module B interacts. At this point the evaluator should approach the developer to resolve the discrepancies between the information provided in Module A and that in Module B.

10.8.3.4.12 Work unit ADV_TDS.3-12

The evaluator shall examine the TOE design to determine that the description of a SFR-supporting or SFR-non-interfering module's interaction with other modules is complete and accurate.

It is important to note that, in terms of the Part 3 requirement and this work unit, the term *interaction* is intended to convey less rigour than *interface*. An interaction does not need to be characterised at the

implementation level (e.g., parameters passed from one routine in a module to a routine in a different module; global variables; hardware signals (e.g., interrupts) from a hardware subsystem to an interrupt-handling subsystem), but the data elements identified for a particular module that are going to be used by another module should be covered in this discussion. Any control relationships between modules (e.g., a module responsible for configuring a rule base for a firewall system and the module that actually implements these rules) should also be described.

Because the modules are at such a low level, it may be difficult to determine completeness and accuracy impacts from other documentation, such as operational user guidance, the functional specification, the security architecture description, or the TSF internals document. However, the evaluator uses the information present in those documents to the extent possible to help ensure that the function is accurately and completely described. This analysis can be aided by the analysis performed for the work units for the ADV_TDS.3.10C element, which maps the TSFI in the functional specification to the modules of the TSF.

A module's interaction with other modules goes beyond just a call-tree-type document. The interaction is described from a functional perspective of why a module interacts with other modules. The module's purpose describes what functions the module provides to other modules; the interactions should describe what the module depends on from other modules in order to accomplish this function.

Because the modules are at such a low level, it may be difficult to determine completeness and accuracy impacts from other documentation, such as operational user guidance, the functional specification, the security architecture description, or the TSF internals document. However, the evaluator uses the information present in those documents to the extent possible to help ensure that the interactions are accurately and completely described.

ISO/IEC 15408-3 ADV_TDS.3.10C: *The mapping shall demonstrate that all behaviour described in the TOE design is mapped to the TSFIs that invoke it.*

10.8.3.4.13 Work unit ADV_TDS.3-13

The evaluator shall examine the TOE design to determine that it contains a complete and accurate mapping from the TSFI described in the functional specification to the modules of the TSF described in the TOE design.

The modules described in the TOE design provide a description of the implementation of the TSF. The TSFI provide a description of how the implementation is exercised. The evidence from the developer identifies the module that is initially invoked when an operation is requested at the TSFI, and identifies the chain of modules invoked up to the module that is primarily responsible for implementing the functionality. However, a complete call tree for each TSFI is not required for this work unit. The cases in which more than one module would have to be identified are where there are "entry point" modules or wrapper modules that have no functionality other than conditioning inputs or de-multiplexing an input. Mapping to one of these modules would not provide any useful information to the evaluator.

The evaluator assesses the completeness of the mapping by ensuring that all of the TSFI map to at least one module. The verification of accuracy is more complex.

Because the modules are at such a low level, it may be difficult to determine completeness and accuracy impacts from other documentation, such as operational user guidance, the functional specification, the security architecture description, or the TSF internals document. However, the evaluator uses the information present in those documents to the extent possible to help ensure that the interactions are accurately and completely described.

10.8.3.5 Action ADV_TDS.3.2E

10.8.3.5.1 Work unit ADV_TDS.3-14

The evaluator shall examine the TOE security functional requirements and the TOE design, to determine that all ST security functional requirements are covered by the TOE design.

The evaluator may construct a map between the TOE security functional requirements and the TOE design. This map will likely be from a functional requirement to a set of subsystems, and later to modules. Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

For example, the FDP_ACC.1 Subset access control component contains an element with assignments. If the ST contained, for instance, ten rules in the FDP_ACC.1 Subset access control assignment, and these ten rules were implemented in specific places within fifteen modules, it would be inadequate for the evaluator to map FDP_ACC.1 Subset access control to one subsystem and claim the work unit had been completed. Instead, the evaluator would map FDP_ACC.1 Subset access control (rule 1) to modules x, y, and z of subsystem A; FDP_ACC.1 Subset access control (rule 2) to modules x, p, and q of subsystem A; etc.

10.8.3.5.2 Work unit ADV_TDS.3-15

The evaluator shall examine the TOE design to determine that it is an accurate instantiation of all security functional requirements.

The evaluator may construct a map between the TOE security functional requirements and the TOE design. This map will likely be from a functional requirement to a set of subsystems. Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

As an example, if the ST requirements specified a role-based access control mechanism, the evaluator would first identify the subsystems, and modules that contribute to this mechanism's implementation. This could be done by in-depth knowledge or understanding of the TOE design or by work done in the previous work unit. Note that this trace is only to identify the subsystems, and modules, and is not the complete analysis.

The next step would be to understand what mechanism the subsystems, and modules implemented. For instance, if the design described an implementation of access control based on UNIX-style protection bits, the design would not be an accurate instantiation of those access control requirements present in the ST example used above. If the evaluator could not determine that the mechanism was accurately implemented because of a lack of detail, the evaluator would have to assess whether all of the SFR-enforcing subsystems and modules have been identified, or if adequate detail had been provided for those subsystems and modules.

10.8.4 Evaluation of sub-activity (ADV_TDS.4)

10.8.4.1 Objectives

The objective of this sub-activity is to determine whether the TOE design provides a description of the TOE in terms of subsystems sufficient to determine the TSF boundary, and provides a description of the TSF internals in terms of modules (and optionally higher-level abstractions). It provides a detailed description of the SFR-enforcing and SFR-supporting modules and enough information about the SFR-non-interfering modules for the evaluator to determine that the SFRs are completely and accurately implemented; as such, the TOE design provides an explanation of the implementation representation.

10.8.4.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) security architecture description;
- d) the TOE design.

10.8.4.3 Application notes

There are three types of activity that the evaluator must undertake with respect to the TOE design. First, the evaluator determines that the TSF boundary has been adequately described. Second, the evaluator determines that the developer has provided documentation that conforms to the content and presentation requirements this subsystem, and that is consistent with other documentation provided for the TOE. Finally, the evaluator must analyse the design information provided for the SFR-enforcing modules (at a detailed level) and the SFR-supporting and SFR-non-interfering modules (at a less detailed level) to understand how the system is implemented, and with that knowledge ensure that the TSFI in the functional specification are adequately described, and that the test information adequately tests the TSF (done in the Class ATE: Tests work units).

10.8.4.4 Action ADV_TDS.4.1E

ISO/IEC 15408-3 ADV_TDS.4.1C: *The design shall describe the structure of the TOE in terms of subsystems.*

10.8.4.4.1 Work unit ADV_TDS.4-1

The evaluator shall examine the TOE design to determine that the structure of the entire TOE is described in terms of subsystems.

The evaluator ensures that all of the subsystems of the TOE are identified. This description of the TOE will be used as input to work unit ADV_TDS.4-5, where the parts of the TOE that make up the TSF are identified. That is, this requirement is on the entire TOE rather than on only the TSF.

The TOE (and TSF) may be described in multiple layers of abstraction (i.e. subsystems and modules) Depending upon the complexity of the TOE, its design may be described in terms of subsystems and modules, as described in ISO/IEC 15408-3 Annex A.4, ADV_TDS: Subsystems and Modules. For a very simple TOE that can be described solely at the "module" level (see ADV_TDS.4-3), this work unit is not applicable and therefore considered to be satisfied.

In performing this activity, the evaluator examines other evidence presented for the TOE (e.g., ST, operator user guidance) to determine that the description of the TOE in such evidence is consistent with the description contained in the TOE design.

10.8.4.4.2 Work unit ADV_TDS.4-2

The evaluator shall examine the TDS documentation to determine that the semiformal notation used for describing the subsystems, modules and their interfaces is defined or referenced.

A semiformal notation can be either defined by the sponsor or a corresponding standard be referenced. The evaluator should provide a mapping of security functions and their interfaces outlining in what part of the documentation a function or interface is semiformal described and what notation is used. The evaluator examines all semiformal notations used to make sure that they are of a semiformal style and to justify the appropriateness of the manner how the semiformal notations are used for the TOE.

The evaluator is reminded that a semi-formal presentation is characterised by a standardised format with a well-defined syntax that reduces ambiguity that may occur in informal presentations. The syntax of all semiformal notations used in the functional specification shall be defined or a corresponding standard be referenced. The evaluator verifies that the semiformal notations used for expressing the functional specification are capable of expressing features relevant to security. In order to determine this, the evaluator can refer to the SFR and compare the TSF security features stated in the ST and those described in the FSP using the semiformal notations.

ISO/IEC 15408-3 ADV_TDS.4.2C: *The design shall describe the TSF in terms of modules, designating each module as SFR-enforcing, SFR-supporting, or SFR-non-interfering.*

10.8.4.4.3 Work unit ADV_TDS.4-3

The evaluator shall examine the TOE design to determine that the entire TSF is described in terms of modules.

The evaluator will examine the modules for specific properties in other work units; in this work unit the evaluator determines that the modular description covers the entire TSF, and not just a portion of the TSF. The evaluator uses other evidence provided for the evaluation (e.g., functional specification, architectural description) in making this determination. For example, if the functional specification contains interfaces to functionality that does not appear to be described in the TOE design description, it may be the case that a portion of the TSF has not been included appropriately. Making this determination will likely be an iterative process, where as more analysis is done on the other evidence, more confidence can be gained with respect to the completeness of the documentation.

Unlike subsystems, modules describe the implementation in a level of detail that can serve as a guide to reviewing the implementation representation. A description of a module should be such that one could create an implementation of the module from the description, and the resulting implementation would be 1) identical to the actual TSF implementation in terms of the interfaces presented and used by the module, and 2) algorithmically identical to the TSF module. For instance, RFC 793 provides a high-level description of the TCP protocol. It is necessarily implementation independent. While it provides a wealth of detail, it is *not* a suitable design description because it is not specific to an implementation. An actual implementation can add to the protocol specified in the RFC, and implementation choices (for instance, the use of global data vs. local data in various parts of the implementation) may have an impact on the analysis that is performed. The design description of the TCP module would list the interfaces presented by the implementation (rather than just those defined in RFC 793), as well as an algorithm description of the processing associated with the modules implementing TCP (assuming it was part of the TSF).

10.8.4.4.4 Work unit ADV_TDS.4-4

The evaluator shall check the TOE design to determine that the TSF modules are identified as either SFR-enforcing, SFR-supporting, or SFR-non-interfering.

The purpose of designating each module (according to the role a particular module plays in the enforcement of the SFRs) is to allow developers to provide less information about the parts of the TSF that have little role in security. It is always permissible for the developer to provide more information or detail than the requirements demand, as might occur when the information has been gathered outside the evaluation context. In such cases the developer must still designate the modules as either SFR-enforcing, SFR-supporting, or SFR-non-interfering.

The accuracy of these designations is continuously reviewed as the evaluation progresses. The concern is the mis-designation of modules as being less important (and hence, having less information) than is really the case. While blatant mis-designations may be immediately apparent (e.g., designating an authentication module as anything but SFR-enforcing when User identification (FIA_UID) is one of the SFRs being claimed), other mis-designations might not be discovered until the TSF is better understood. The evaluator must therefore keep in mind that these designations are the developer's initial best effort, but are subject to change. Further guidance is provided under work unit ADV_TDS.4-16, which examines the accuracy of these designations.

ISO/IEC 15408-3 ADV_TDS.4.3C: *The design shall identify all subsystems of the TSF.*

10.8.4.4.5 Work unit ADV_TDS.4-5

The evaluator shall examine the TOE design to determine that all subsystems of the TSF are identified.

If the design is presented solely in terms of modules, then subsystems in these requirements are equivalent to modules and the activity should be performed at the module level.

In work unit ADV_TDS.4-1 all of the subsystems of the TOE were identified, and a determination made that the non-TSF subsystems were correctly characterised. Building on that work, the subsystems that were not

characterised as non-TSF subsystems should be precisely identified. The evaluator determines that, of the hardware and software installed and configured according to the Preparative procedures (AGD_PRE) guidance, each subsystem has been accounted for as either one that is part of the TSF, or one that is not.

ISO/IEC 15408-3 ADV_TDS.4.4C: *The design shall provide a semiformal description of each subsystem of the TSF, supported by informal, explanatory text where appropriate.*

10.8.4.4.6 Work unit ADV_TDS.4-6

The evaluator shall examine the TOE design to determine that each subsystem of the TSF describes its role in the enforcement of SFRs described in the ST.

If the design is presented solely in terms of modules, then this work unit will be considered satisfied by the assessment done in subsequent work units; no explicit action on the part of the evaluator is necessary in this case.

On systems that are complex enough to warrant a subsystem-level description of the TSF in addition to the modular description, the goal of the subsystem-level description is to give the evaluator context for the modular description that follows. Therefore, the evaluator ensures that the subsystem-level description contains a description of how the security functional requirements are achieved in the design, but at a level of abstraction above the modular description. This description should discuss the mechanisms used at a level that is aligned with the module description; this will provide the evaluators the road map needed to intelligently assess the information contained in the module description. A well-written set of subsystem descriptions will help guide the evaluator in determining the modules that are most important to examine, thus focusing the evaluation activity on the portions of the TSF that have the most relevance with respect to the enforcement of the SFRs.

The evaluator ensures that all subsystems of the TSF have a description. While the description should focus on the role that the subsystem plays in enforcing or supporting the implementation of the SFRs, enough information must be present so that a context for understanding the SFR-related functionality is provided.

ISO/IEC 15408-3 ADV_TDS.4.5C: *The design shall provide a description of the interactions among all subsystems of the TSF.*

10.8.4.4.7 Work unit ADV_TDS.4-7

The evaluator shall examine the TOE design to determine that interactions between the subsystems of the TSF are described.

If the design is presented solely in terms of modules, then this work unit will be considered satisfied by the assessment done in subsequent work units; no explicit action on the part of the evaluator is necessary in this case.

On systems that are complex enough to warrant a subsystem-level description of the TSF in addition to the modular description, the goal of describing the interactions between the subsystems is to help provide the reader a better understanding of how the TSF performs its functions. These interactions do not need to be characterised at the implementation level (e.g., parameters passed from one routine in a subsystem to a routine in a different subsystem; global variables; hardware signals (e.g., interrupts) from a hardware subsystem to an interrupt-handling subsystem), but the data elements identified for a particular subsystem that are going to be used by another subsystem need to be covered in this discussion. Any control relationships between subsystems (e.g., a subsystem responsible for configuring a rule base for a firewall system and the subsystem that actually implements these rules) should also be described.

It should be noted while the developer should characterise all interactions between subsystems, the evaluators need to use their own judgement in assessing the completeness of the description. If the reason for an interaction is unclear, or if there are SFR-related interactions (discovered, for instance, in examining the module-level documentation) that do not appear to be described, the evaluator ensures that this information is provided by the developer. However, if the evaluator can determine that interactions among a particular set of subsystems, while incompletely described by the developer, and a complete description will not aid in

understanding the overall functionality nor security functionality provided by the TSF, then the evaluator may choose to consider the description sufficient, and not pursue completeness for its own sake.

ISO/IEC 15408-3 ADV_TDS.4.6C: *The design shall provide a mapping from the subsystems of the TSF to the modules of the TSF.*

10.8.4.4.8 Work unit ADV_TDS.4-8

The evaluator shall examine the TOE design to determine that the mapping between the subsystems of the TSF and the modules of the TSF is complete.

If the design is presented solely in terms of modules, then this work unit is considered satisfied.

For TOEs that are complex enough to warrant a subsystem-level description of the TSF in addition to the modular description, the developer provides a simple mapping showing how the modules of the TSF are allocated to the subsystems. This will provide the evaluator a guide in performing their module-level assessment. To determine completeness, the evaluator examines each mapping and determines that all subsystems map to at least one module, and that all modules map to exactly one subsystem.

10.8.4.4.9 Work unit ADV_TDS.4-9

The evaluator shall examine the TOE design to determine that the mapping between the subsystems of the TSF to the modules of the TSF is accurate.

If the design is presented solely in terms of modules, then this work unit is considered satisfied.

For TOEs that are complex enough to warrant a subsystem-level description of the TSF in addition to the modular description, the developer provides a simple mapping showing how the modules of the TSF are allocated to the subsystems. This will provide the evaluator a guide in performing their module-level assessment. The evaluator may choose to check the accuracy of the mapping in conjunction with performing other work units. An "inaccurate" mapping is one where the module is mistakenly associated with a subsystem where its functions are not used within the subsystem. Because the mapping is intended to be a guide supporting more detailed analysis, the evaluator is cautioned to apply appropriate effort to this work unit. Expending extensive evaluator resources verifying the accuracy of the mapping is not necessary. Inaccuracies that lead to mis-understandings related to the design that are uncovered as part of this or other work units are the ones that should be associated with this work unit and corrected.

ISO/IEC 15408-3 ADV_TDS.4.7C: *The design shall describe each SFR-enforcing and SFR-supporting module in terms of its purpose and interaction with other modules.*

10.8.4.4.10 Work unit ADV_TDS.4-10

The evaluator shall examine the TOE design to determine that the description of the purpose of each SFR-enforcing and SFR-supporting module is complete and accurate.

The developer may designate modules as SFR-enforcing, SFR-supporting, and SFR non-interfering, but these "tags" are used only to describe the amount and type of information the developer must provide, and can be used to limit the amount of information the developer has to develop if their engineering process does not produce the documentation required. Whether the modules have been categorised by the developer or not, it is the evaluator's responsibility to determine that the modules have the appropriate information for their role (SFR-enforcing, etc.) in the TOE, and to obtain the appropriate information from the developer should the developer fail to provide the required information for a particular module.

The purpose of a module provides a description indicating what function the module is fulfilling. A word of caution to evaluator is in order. The focus of this work unit should be to provide the evaluator an understanding of how the module works so that determinations can be made about the soundness of the implementation of the SFRs, as well as to support architectural analysis performed for ADV_ARC subsystems. As long as the evaluator has a sound understanding of the module's operation, and its relationship to other modules and the TOE as a whole, the evaluator should consider the objective of the work achieved and not

engage in a documentation exercise for the developer (by requiring, for example, a complete algorithmic description for a self-evident implementation representation).

ISO/IEC 15408-3 ADV_TDS.4.8C: *The design shall describe each SFR-enforcing and SFR-supporting module in terms of its SFR-related interfaces, return values from those interfaces, interaction with and called interfaces to other modules.*

10.8.4.4.11 Work unit ADV_TDS.4-11

The evaluator shall examine the TOE design to determine that the description of the interfaces presented by each SFR-enforcing and SFR-supporting module contain an accurate and complete description of the SFR-related parameters, the invocation conventions for each interface, and any values returned directly by the interface.

The SFR-related interfaces of a module are those interfaces used by other modules as a means to invoke the SFR-related operations provided, and to provide inputs to or receive outputs from the module. The purpose in the specification of these interfaces is to permit the exercise of them during testing. Inter-module interfaces that are not SFR-related need not be specified or described, since they are not a factor in testing. Likewise, other internal interfaces that are not a factor in traversing SFR-related paths of execution (such as those internal paths that are fixed).

SFR-related interfaces are described in terms of how they are invoked, and any values that are returned. This description would include a list of parameters, and descriptions of these parameters. Note that global data would also be considered parameters if used by the module (either as inputs or outputs) when invoked. If a parameter were expected to take on a set of values (e.g., a “flag” parameter), the complete set of values the parameter could take on that would have an effect on module processing would be specified. Likewise, parameters representing data structures are described such that each field of the data structure is identified and described. Note that different programming languages may have additional “interfaces” that would be non-obvious; an example would be operator/function overloading in C++. This “implicit interface” in the class description would also be described as part of the low-level TOE design. Note that although a module could present only one interface, it is more common that a module presents a small set of related interfaces.

In terms of the assessment of parameters (inputs and outputs) to a module, any use of global data must also be considered. A module “uses” global data if it either reads or writes the data. In order to assure the description of such parameters (if used) is complete, the evaluator uses other information provided about the module in the TOE design (interfaces, algorithmic description, etc.), as well as the description of the particular set of global data assessed in work unit ADV_TDS.4-10. For instance, the evaluator could first determine the processing the module performs by examining its function and interfaces presented (particularly the parameters of the interfaces). They could then check to see if the processing appears to “touch” any of the global data areas identified in the TDS design. The evaluator then determines that, for each global data area that appears to be “touched”, that global data area is listed as a means of input or output by the module the evaluator is examining.

Invocation conventions are a programming-reference-type description that one could use to correctly invoke a module's interface if one were writing a program to make use of the module's functionality through that interface. This includes necessary inputs and outputs, including any set-up that may need to be performed with respect to global variables.

Values returned through the interface refer to values that are either passed through parameters or messages; values that the function call itself returns in the style of a “C” program function call; or values passed through global means (such as certain error routines in *ix-style operating systems).

In order to assure the description is complete, the evaluator uses other information provided about the module in the TOE design (e.g., algorithmic description, global data used) to ensure that it appears all data necessary for performing the functions of the module is presented to the module, and that any values that other modules expect the module under examination to provide are identified as being returned by the module. The evaluator determines accuracy by ensuring that the description of the processing matches the information listed as being passed to or from an interface.

Because the modules are at such a low level, it may be difficult to determine completeness and accuracy impacts from other documentation, such as operational user guidance, the functional specification, the TSF internals, or the security architecture description. However, the evaluator uses the information present in those documents to the extent possible to help ensure that the purpose is accurately and completely described. This analysis can be aided by the analysis performed for the work units for the ADV_TDS.4.10C element, which maps the TSFI in the functional specification to the modules of the TSF.

ISO/IEC 15408-3 ADV_TDS.4.9C: *The design shall describe each SFR-non-interfering module in terms of its purpose and interaction with other modules.*

10.8.4.4.12 Work unit ADV_TDS.4-12

The evaluator shall examine the TOE design to determine that SFR-non-interfering modules are correctly categorised.

As mentioned in work unit ADV_TDS.4-3, less information is required about modules that are SFR-non-interfering. A key focus of the evaluator for this work unit is attempting to determine from the evidence provided for each module implicitly categorised as SFR-non-interfering and the evaluation (information about other modules in the TOE design, the functional specification, the security architecture description, the operational user guidance, the TSF internals document, and perhaps even the implementation representation) whether the module is indeed SFR-non-interfering. At this level of assurance some error should be tolerated; the evaluator does not have to be absolutely sure that a given module is SFR-non-interfering, even though it is labelled as such. However, if the evidence provided indicates that a SFR-non-interfering module is SFR-enforcing or SFR-supporting, the evaluator requests additional information from the developer in order to resolve the apparent inconsistency. For example, suppose the documentation for Module A (an SFR-enforcing module) indicates that it calls Module B to perform an access check on a certain type of construct. When the evaluator examines the information associated with Module B, it is discovered that the only information the developer has provided is a purpose and a set of interactions (thus implicitly categorising Module B as SFR-supporting or SFR-non-interfering). On examining the purpose and interactions from Module A, the evaluator finds no mention of Module B performing any access checks, and Module A is not listed as a module with which Module B interacts. At this point the evaluator should approach the developer to resolve the discrepancies between the information provided in Module A and that in Module B.

Another example would be where the evaluator examines the mapping of the TSFI to the modules as provided by ADV_TDS.4.2D. This examination shows that Module C is associated with an SFR requiring identification of the user. Again, when the evaluator examines the information associated with Module C, they find that all the developer has provided is a purpose and a set of interactions (thus implicitly categorising Module C as SFR-non-interfering). Examining the purpose and interactions presented for Module C, the evaluator is unable to determine why Module C, listed as mapping to a TSFI concerned with user identification, would not be classified as SFR-enforcing or SFR-supporting. Again, the evaluator should approach the developer to resolve this discrepancy.

A final example illustrates the opposite situation. As before, the developer has provided information associated with Module D consisting of a purpose and a set of interactions (thus implicitly categorising Module D as SFR-non-interfering). The evaluator examines all of the evidence provided, including the purpose and interactions for Module D. The purpose appears to give a meaningful description of Module D's function in the TOE, the interactions are consistent with that description, and there is nothing to indicate that Module D is SFR-enforcing or SFR-supporting. In this case, the evaluator should not demand more information about Module D "just to be sure" it is correctly categorised. The developer has met the obligations and the resulting assurance the evaluator has in the implicit categorisation of Module D is (by definition) appropriate for this assurance level.

10.8.4.4.13 Work unit ADV_TDS.4-13

The evaluator shall examine the TOE design to determine that the description of the purpose of each SFR-non-interfering module is complete and accurate.

The description of the purpose of a module indicates what function the module is fulfilling. From the description, the evaluator should be able to obtain a general idea of the module's role. In order to assure the description is complete, the evaluator uses the information provided about the module's interactions with other

modules to assess whether the reasons for the module being called are consistent with the module's purpose. If the interaction description contains functionality that is not apparent from, or in conflict with, the module's purpose, the evaluator needs to determine whether the problem is one of accuracy or of completeness. The evaluator should be wary of purposes that are too short, since meaningful analysis based on a one-sentence purpose is likely to be impossible.

Because the modules are at such a low level, it may be difficult to determine completeness and accuracy impacts from other documentation, such as operational user guidance, the functional specification, the security architecture description, or the TSF internals document. However, the evaluator uses the information present in those documents to the extent possible to help ensure that the function is accurately and completely described. This analysis can be aided by the analysis performed for the work units for the ADV_TDS.4.10C element, which maps the TSFI in the functional specification to the modules of the TSF.

10.8.4.4.14 Work unit ADV_TDS.4-14

The evaluator shall examine the TOE design to determine that the description of a SFR-non-interfering module's interaction with other modules is complete and accurate.

It is important to note that, in terms of the Part 3 requirement and this work unit, the term *interaction* is intended to convey less rigour than *interface*. An interaction does not need to be characterised at the implementation level (e.g., parameters passed from one routine in a module to a routine in a different module; global variables; hardware signals (e.g., interrupts) from a hardware subsystem to an interrupt-handling subsystem), but the data elements identified for a particular module that are going to be used by another module should be covered in this discussion. Any control relationships between modules (e.g., a module responsible for configuring a rule base for a firewall system and the module that actually implements these rules) should also be described.

A module's interaction with other modules can be captured in many ways. The intent for the TOE design is to allow the evaluator to understand (in part through analysis of module interactions) the role of the SFR-supporting and SFR-non-interfering modules in the overall TOE design. Understanding of this role will aid the evaluator in performing work unit ADV_TDS.4-7.

A module's interaction with other modules goes beyond just a call-tree-type document. The interaction is described from a functional perspective of why a module interacts with other modules. The module's purpose describes what functions the module provides to other modules; the interactions should describe what the module depends on from other modules in order to accomplish this function.

Because the modules are at such a low level, it may be difficult to determine completeness and accuracy impacts from other documentation, such as operational user guidance, the functional specification, the security architecture description, or the TSF internals document. However, the evaluator uses the information present in those documents to the extent possible to help ensure that the interactions are accurately and completely described.

ISO/IEC 15408-3 ADV_TDS.4.10C: *The mapping shall demonstrate that all behaviour described in the TOE design is mapped to the TSFIs that invoke it.*

10.8.4.4.15 Work unit ADV_TDS.4-15

The evaluator shall examine the TOE design to determine that it contains a complete and accurate mapping from the TSFI described in the functional specification to the modules of the TSF described in the TOE design.

The modules described in the TOE design provide a description of the implementation of the TSF. The TSFI provide a description of how the implementation is exercised. The evidence from the developer identifies the module that is initially invoked when an operation is requested at the TSFI, and identify the chain of modules invoked up to the module that is primarily responsible for implementing the functionality. However, a complete call tree for each TSFI is not required for this work unit. The cases in which more than one module would have to be identified are where there are "entry point" modules or wrapper modules that have no functionality other than conditioning inputs or de-multiplexing an input. Mapping to one of these modules would not provide any useful information to the evaluator.

The evaluator assesses the completeness of the mapping by ensuring that all of the TSFI map to at least one module. The verification of accuracy is more complex.

The first aspect of accuracy is that each TSFI is mapped to a module at the TSF boundary. This determination can be made by reviewing the module description and its interfaces/interactions. The next aspect of accuracy is that each TSFI identifies a chain of modules between the initial module identified and a module that is primarily responsible for implementing the function presented at the TSF. Note that this may be the initial module, or there may be several modules, depending on how much pre-conditioning of the inputs is done. It should be noted that one indicator of a pre-conditioning module is that it is invoked for a large number of the TSFI, where the TSFI are all of similar type (e.g., system call). The final aspect of accuracy is that the mapping makes sense. For instance, mapping a TSFI dealing with access control to a module that checks passwords is not accurate. The evaluator should again use judgement in making this determination. The goal is that this information aids the evaluator in understanding the system and implementation of the SFRs, and ways in which entities at the TSF boundary can interact with the TSF. The bulk of the assessment of whether the SFRs are described accurately by the modules is performed in other work units.

10.8.4.5 Action ADV_TDS.4.2E

10.8.4.5.1 Work unit ADV_TDS.4-16

The evaluator shall examine the TOE security functional requirements and the TOE design, to determine that all ST security functional requirements are covered by the TOE design.

The evaluator may construct a map between the TOE security functional requirements and the TOE design. This map will likely be from a functional requirement to a set of subsystems, and later to modules. Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

For example, the FDP_ACC.1 Subset access control component contains an element with assignments. If the ST contained, for instance, ten rules in the FDP_ACC.1 Subset access control assignment, and these ten rules were implemented in specific places within fifteen modules, it would be inadequate for the evaluator to map FDP_ACC.1 Subset access control to one subsystem and claim the work unit had been completed. Instead, the evaluator would map FDP_ACC.1 Subset access control (rule 1) to modules x, y and z of subsystem A; FDP_ACC.1 Subset access control (rule 2) to x, p, and q of subsystem A; etc.

10.8.4.5.2 Work unit ADV_TDS.4-17

The evaluator shall examine the TOE design to determine that it is an accurate instantiation of all security functional requirements.

The evaluator may construct a map between the TOE security functional requirements and the TOE design. This map will likely be from a functional requirement to a set of subsystems. Note that this map may have to be at a level of detail below the component or even element level of the requirements, because of operations (assignments, refinements, selections) performed on the functional requirement by the ST author.

As an example, if the ST requirements specified a role-based access control mechanism, the evaluator would first identify the subsystems, and modules that contribute to this mechanism's implementation. This could be done by in-depth knowledge or understanding of the TOE design or by work done in the previous work unit. Note that this trace is only to identify the subsystems, and modules, and is not the complete analysis.

The next step would be to understand what mechanism the subsystems, and modules implemented. For instance, if the design described an implementation of access control based on UNIX-style protection bits, the design would not be an accurate instantiation of those access control requirements present in the ST example used above. If the evaluator could not determine that the mechanism was accurately implemented because of a lack of detail, the evaluator would have to assess whether all of the SFR-enforcing subsystems and modules have been identified, or if adequate detail had been provided for those subsystems and modules.

10.8.5 Evaluation of sub-activity (ADV_TDS.5)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

10.8.6 Evaluation of sub-activity (ADV_TDS.6)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

11 Class AGD: Guidance documents

11.1 Introduction

The purpose of the guidance document activity is to judge the adequacy of the documentation describing how the user can handle the TOE in a secure manner. Such documentation should take into account the various types of users (e.g. those who accept, install, administrate or operate the TOE) whose incorrect actions could adversely affect the security of the TOE or of their own data.

The guidance documents class is subdivided into two families which are concerned firstly with the preparative user guidance (all that has to be done to transform the delivered TOE into its evaluated configuration in the environment as described in the ST, i.e. accepting and installing the TOE) and secondly with the operational user guidance (all that has to be done during the operation of the TOE in its evaluated configuration, i.e. operation and administration).

11.2 Application notes

The guidance documents activity applies to those functions and interfaces which are related to the security of the TOE. The secure configuration of the TOE is described in the ST.

11.3 Operational user guidance (AGD_OPE)

11.3.1 Evaluation of sub-activity (AGD_OPE.1)

11.3.1.1 Objectives

The objectives of this sub-activity are to determine whether the user guidance describes for each user role the security functionality and interfaces provided by the TSF, provides instructions and guidelines for the secure use of the TOE, addresses secure procedures for all modes of operation, facilitates prevention and detection of insecure TOE states, or whether it is misleading or unreasonable.

11.3.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) the TOE design, if applicable;
- d) the user guidance;

11.3.1.3 Action AGD_OPE.1.1E

ISO/IEC 15408-3 AGD_OPE.1.1C: *The operational user guidance shall describe, for each user role, the user-accessible functions and privileges that should be controlled in a secure processing environment, including appropriate warnings.*

11.3.1.3.1 Work unit AGD_OPE.1-1

The evaluator shall examine the operational user guidance to determine that it describes, for each user role, the user-accessible functions and privileges that should be controlled in a secure processing environment, including appropriate warnings.

The configuration of the TOE may allow different user roles to have dissimilar privileges in making use of the different functions of the TOE. This means that some users are authorised to perform certain functions, while other users may not be so authorised. These functions and privileges should be described, for each user role, by the user guidance.

The user guidance identifies, for each user role, the functions and privileges that must be controlled, the types of commands required for them, and the reasons for such commands. The user guidance should contain warnings regarding the use of these functions and privileges. Warnings should address expected effects, possible side effects, and possible interactions with other functions and privileges.

ISO/IEC 15408-3 AGD_OPE.1.2C: *The operational user guidance shall describe, for each user role, how to use the available interfaces provided by the TOE in a secure manner.*

11.3.1.3.2 Work unit AGD_OPE.1-2

The evaluator shall examine the operational user guidance to determine that it describes, for each user role, the secure use of the available interfaces provided by the TOE.

The user guidance should provide advice regarding effective use of the TSF (e.g. reviewing password composition practises, suggested frequency of user file backups, discussion on the effects of changing user access privileges).

ISO/IEC 15408-3 AGD_OPE.1.3C: *The operational user guidance shall describe, for each user role, the available functions and interfaces, in particular all security parameters under the control of the user, indicating secure values as appropriate.*

11.3.1.3.3 Work unit AGD_OPE.1-3

The evaluator shall examine the operational user guidance to determine that it describes, for each user role, the available security functionality and interfaces, in particular all security parameters under the control of the user, indicating secure values as appropriate.

The user guidance should contain an overview of the security functionality that is visible at the user interfaces.

The user guidance should identify and describe the purpose, behaviour, and interrelationships of the security interfaces and functionality.

For each user-accessible interface, the user guidance should:

- a) describe the method(s) by which the interface is invoked (e.g. command-line, programming-language system call, menu selection, command button);
- b) describe the parameters to be set by the user, their particular purposes, valid and default values, and secure and insecure use settings of such parameters, both individually or in combination;
- c) describe the immediate TSF response, message, or code returned.

The evaluator should consider the functional specification and the ST to determine that the TSF described in these documents is consistent to the operational user guidance. The evaluator has to ensure that the operational user guidance is complete to allow the secure use through the TSFI available to all types of human users. The evaluator may, as an aid, prepare an informal mapping between the guidance and these documents. Any omissions in this mapping may indicate incompleteness.

ISO/IEC 15408-3 AGD_OPE.1.4C: *The operational user guidance shall, for each user role, clearly present each type of security-relevant event relative to the user-accessible functions that need to be performed, including changing the security characteristics of entities under the control of the TSF.*

11.3.1.3.4 Work unit AGD_OPE.1-4

The evaluator shall examine the operational user guidance to determine that it describes, for each user role, each type of security-relevant event relative to the user functions that need to be performed, including changing the security characteristics of entities under the control of the TSF and operation following failure or operational error.

All types of security-relevant events are detailed for each user role, such that each user knows what events may occur and what action (if any) he may have to take in order to maintain security. Security-relevant events that may occur during operation of the TOE (e.g. audit trail overflow, system crash, updates to user records, such as when a user account is removed when the user leaves the organisation) are adequately defined to allow user intervention to maintain secure operation.

ISO/IEC 15408-3 AGD_OPE.1.5C: *The operational user guidance shall identify all possible modes of operation of the TOE (including operation following failure or operational error), their consequences and implications for maintaining secure operation.*

11.3.1.3.5 Work unit AGD_OPE.1-5

The evaluator shall examine the operational user guidance and other evaluation evidence to determine that the guidance identifies all possible modes of operation of the TOE (including, if applicable, operation following failure or operational error), their consequences and implications for maintaining secure operation.

Other evaluation evidence, particularly the functional specification, provide an information source that the evaluator should use to determine that the guidance contains sufficient guidance information.

If test documentation is included in the assurance package, then the information provided in this evidence can also be used to determine that the guidance contains sufficient guidance documentation. The detail provided in the test steps can be used to confirm that the guidance provided is sufficient for the use and administration of the TOE.

The evaluator should focus on a single human visible TSFI at a time, comparing the guidance for securely using the TSFI with other evaluation evidence, to determine that the guidance related to the TSFI is sufficient for the secure usage (i.e. consistent with the SFRs) of that TSFI. The evaluator should also consider the relationships between interfaces, searching for potential conflicts.

ISO/IEC 15408-3 AGD_OPE.1.6C: *The operational user guidance shall, for each user role, describe the security measures to be followed in order to fulfil the security objectives for the operational environment as described in the ST.*

11.3.1.3.6 Work unit AGD_OPE.1-6

The evaluator shall examine the operational user guidance to determine that it describes, for each user role, the security measures to be followed in order to fulfil the security objectives for the operational environment as described in the ST.

The evaluator analyses the security objectives for the operational environment in the ST and determines that for each user role, the relevant security measures are described appropriately in the user guidance.

The security measures described in the user guidance should include all relevant external procedural, physical, personnel and connectivity measures.

Note that those measures relevant for secure installation of the TOE are examined in Preparative procedures (AGD_PRE).

ISO/IEC 15408-3 AGD_OPE.1.7C: *The operational user guidance shall be clear and reasonable.*

11.3.1.3.7 Work unit AGD_OPE.1-7

The evaluator shall examine the operational user guidance to determine that it is clear.

The guidance is unclear if it can reasonably be misconstrued by an administrator or user, and used in a way detrimental to the TOE, or to the security provided by the TOE.

11.3.1.3.8 Work unit AGD_OPE.1-8

The evaluator shall examine the operational user guidance to determine that it is reasonable.

The guidance is unreasonable if it makes demands on the TOE's usage or operational environment that are inconsistent with the ST or unduly onerous to maintain security.

11.4 Preparative procedures (AGD_PRE)

11.4.1 Evaluation of sub-activity (AGD_PRE.1)

11.4.1.1 Objectives

The objective of this sub-activity is to determine whether the procedures and steps for the secure preparation of the TOE have been documented and result in a secure configuration.

11.4.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the TOE including its preparative procedures;
- c) the description of developer's delivery procedures, if applicable.

11.4.1.3 Application notes

The preparative procedures refer to all acceptance and installation procedures, that are necessary to progress the TOE to the secure configuration as described in the ST.

11.4.1.4 Action AGD_PRE.1.1E

ISO/IEC 15408-3 AGD_PRE.1.1C: *The preparative procedures shall describe all the steps necessary for secure acceptance of the delivered TOE in accordance with the developer's delivery procedures.*

11.4.1.4.1 Work unit AGD_PRE.1-1

The evaluator shall examine the provided acceptance procedures to determine that they describe the steps necessary for secure acceptance of the TOE in accordance with the developer's delivery procedures.

If it is not anticipated by the developer's delivery procedures that acceptance procedures will or can be applied, this work unit is not applicable, and is therefore considered to be satisfied.

The acceptance procedures should include as a minimum, that the user has to check that all parts of the TOE as indicated in the ST have been delivered in the correct version.

The acceptance procedures should reflect the steps the user has to perform in order to accept the delivered TOE that are implied by the developer's delivery procedures.

The acceptance procedures should provide detailed information about the following, if applicable:

- a) making sure that the delivered TOE is the complete evaluated instance;
- b) detecting modification/masquerading of the delivered TOE.

ISO/IEC 15408-3 AGD_PRE.1.2C: *The preparative procedures shall describe all the steps necessary for secure installation of the TOE and for the secure preparation of the operational environment in accordance with the security objectives for the operational environment as described in the ST.*

11.4.1.4.2 Work unit AGD_PRE.1-2

The evaluator shall examine the provided installation procedures to determine that they describe the steps necessary for secure installation of the TOE and the secure preparation of the operational environment in accordance with the security objectives in the ST.

If it is not anticipated that installation procedures will or can be applied for the TOE and the operational environment (e.g. because the TOE may already be delivered in an operational state and there are no requirements for the environment) this work unit is not applicable, and is therefore considered to be satisfied.

If it is not anticipated that installation procedures will or can be applied (e.g. because the TOE may already be delivered in an operational state), this work unit is not applicable, and is therefore considered to be satisfied.

The installation procedures should provide detailed information about the following, if applicable:

- a) minimum system requirements for secure installation;
- b) requirements for the operational environment in accordance with the security objectives provided by the ST;
- c) the steps the user has to perform in order to get to an operational TOE being commensurate with its evaluated configuration. Such a description shall include - for each step - a clear scheme for the decision on the next step depended on success, failure or problems at the current step;
- d) changing the installation specific security characteristics of entities under the control of the TSF (for example parameters, settings, passwords);
- e) handling exceptions and problems.

11.4.1.5 Action AGD_PRE.1.2E

11.4.1.5.1 Work unit AGD_PRE.1-3

The evaluator shall perform all user procedures necessary to prepare the TOE to determine that the TOE and its operational environment can be prepared securely using only the supplied preparative user guidance.

Preparation requires the evaluator to advance the TOE from a deliverable state to the state in which it is operational, including acceptance and installation of the TOE, and enforcing the SFRs consistent with the security objectives for the TOE specified in the ST.

The evaluator should follow only the developer's procedures and may perform the activities that customers are usually expected to perform to accept and install the TOE, using the supplied preparative guidance documentation only. Any difficulties encountered during such an exercise may be indicative of incomplete, unclear or unreasonable guidance.

This work unit may be performed in conjunction with the evaluation activities under Independent testing (ATE_IND).

If it is known that the TOE will be used as a dependent component for a composed TOE evaluation, then the evaluator should ensure that the operational environment is satisfied by the base component used in the composed TOE.

12 Class ALC: Life-cycle support

12.1 Introduction

The purpose of the life-cycle support activity is to determine the adequacy of the security procedures that the developer uses during the development and maintenance of the TOE. These procedures include the life-cycle model used by the developer, the configuration management, the security measures used throughout TOE development, the tools used by the developer throughout the life-cycle of the TOE, the handling of security flaws, and the delivery activity.

Poorly controlled development and maintenance of the TOE can result in vulnerabilities in the implementation. Conformance to a defined life-cycle model can help to improve controls in this area. A measurable life-cycle model used for the TOE can remove ambiguity in assessing the development progress of the TOE.

The purpose of the configuration management activity is to assist the consumer in identifying the evaluated TOE, to ensure that configuration items are uniquely identified, and the adequacy of the procedures that are used by the developer to control and track changes that are made to the TOE. This includes details on what changes are tracked, how potential changes are incorporated, and the degree to which automation is used to reduce the scope for error.

Developer security procedures are intended to protect the TOE and its associated design information from interference or disclosure. Interference in the development process may allow the deliberate introduction of vulnerabilities. Disclosure of design information may allow vulnerabilities to be more easily exploited. The adequacy of the procedures will depend on the nature of the TOE and the development process.

The use of well-defined development tools and the application of implementation standards by the developer and by third parties involved in the development process help to ensure that vulnerabilities are not inadvertently introduced during refinement.

The flaw remediation activity is intended to track security flaws, to identify corrective actions, and to distribute the corrective action information to TOE users.

The purpose of the delivery activity is to judge the adequacy of the documentation of the procedures used to ensure that the TOE is delivered to the consumer without modification.

12.2 CM capabilities (ALC_CMC)

12.2.1 Evaluation of sub-activity (ALC_CMC.1)

12.2.1.1 Objectives

The objectives of this sub-activity are to determine whether the developer has clearly identified the TOE.

12.2.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the TOE suitable for testing.

12.2.1.3 Action ALC_CMC.1.1E

ISO/IEC 15408-3 ALC_CMC.1.1C: *The TOE shall be labelled with its unique reference.*

12.2.1.3.1 Work unit ALC_CMC.1-1

The evaluator shall check that the TOE provided for evaluation is labelled with its reference.

The evaluator should ensure that the TOE contains the unique reference which is stated in the ST. This could be achieved through labelled packaging or media, or by a label displayed by the operational TOE. This is to ensure that it would be possible for consumers to identify the TOE (e.g. at the point of purchase or use).

The TOE may provide a method by which it can be easily identified. For example, a software TOE may display its name and version number during the start up routine, or in response to a command line entry. A hardware or firmware TOE may be identified by a part number physically stamped on the TOE.

Alternatively, the unique reference provided for the TOE may be the combination of the unique reference of each component from which the TOE is comprised (e.g. in the case of a composed TOE).

12.2.1.3.2 Work unit ALC_CMC.1-2

The evaluator shall check that the TOE references used are consistent.

If the TOE is labelled more than once then the labels have to be consistent. For example, it should be possible to relate any labelled guidance documentation supplied as part of the TOE to the evaluated operational TOE. This ensures that consumers can be confident that they have purchased the evaluated version of the TOE, that they have installed this version, and that they have the correct version of the guidance to operate the TOE in accordance with its ST.

The evaluator also verifies that the TOE reference is consistent with the ST.

If this work unit is applied to a composed TOE, the following will apply. The composed IT TOE will not be labelled with its unique (composite) reference, but only the individual components will be labelled with their appropriate TOE reference. It would require further development for the IT TOE to be labelled, i.e. during start-up and/or operation, with the composite reference. If the composed TOE is delivered as the constituent component TOEs, then the TOE items delivered will not contain the composite reference. However, the composed TOE ST will include the unique reference for the composed TOE and will identify the components comprising the composed TOE through which the consumers will be able to determine whether they have the appropriate items.

12.2.2 Evaluation of sub-activity (ALC_CMC.2)

12.2.2.1 Objectives

The objectives of this sub-activity are to determine whether the developer uses a CM system that uniquely identifies all configuration items.

12.2.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the TOE suitable for testing;
- c) the configuration management documentation.

12.2.2.3 Application notes

This component contains an implicit evaluator action to determine that the CM system is being used. As the requirements here are limited to identification of the TOE and provision of a configuration list, this action is already covered by, and limited to, the existing work units. At Evaluation of sub-activity (ALC_CMC.3) the requirements are expanded beyond these two items, and more explicit evidence of operation is required.

12.2.2.4 Action ALC_CMC.2.1E

ISO/IEC 15408-3 ALC_CMC.2.1C: *The TOE shall be labelled with its unique reference.*

12.2.2.4.1 Work unit ALC_CMC.2-1

The evaluator shall check that the TOE provided for evaluation is labelled with its reference.

The evaluator should ensure that the TOE contains the unique reference which is stated in the ST. This could be achieved through labelled packaging or media, or by a label displayed by the operational TOE. This is to ensure that it would be possible for consumers to identify the TOE (e.g. at the point of purchase or use).

The TOE may provide a method by which it can be easily identified. For example, a software TOE may display its name and version number during the start up routine, or in response to a command line entry. A hardware or firmware TOE may be identified by a part number physically stamped on the TOE.

Alternatively, the unique reference provided for the TOE may be the combination of the unique reference of each component from which the TOE is comprised (e.g. in the case of a composed TOE).

12.2.2.4.2 Work unit ALC_CMC.2-2

The evaluator shall check that the TOE references used are consistent.

If the TOE is labelled more than once then the labels have to be consistent. For example, it should be possible to relate any labelled guidance documentation supplied as part of the TOE to the evaluated operational TOE. This ensures that consumers can be confident that they have purchased the evaluated version of the TOE, that they have installed this version, and that they have the correct version of the guidance to operate the TOE in accordance with its ST.

The evaluator also verifies that the TOE reference is consistent with the ST.

If this work unit is applied to a composed TOE, the following will apply. The composed IT TOE will not be labelled with its unique (composite) reference, but only the individual components will be labelled with their appropriate TOE reference. It would require further development for the IT TOE to be labelled, i.e. during start-up and/or operation, with the composite reference. If the composed TOE is delivered as the constituent component TOEs, then the TOE items delivered will not contain the composite reference. However, the composed TOE ST will include the unique reference for the composed TOE and will identify the components comprising the composed TOE through which the consumers will be able to determine whether they have the appropriate items.

ISO/IEC 15408-3 ALC_CMC.2.2C: *The CM documentation shall describe the method used to uniquely identify the configuration items.*

12.2.2.4.3 Work unit ALC_CMC.2-3

The evaluator shall examine the method of identifying configuration items to determine that it describes how configuration items are uniquely identified.

Procedures should describe how the status of each configuration item can be tracked throughout the life-cycle of the TOE. The procedures may be detailed in the CM plan or throughout the CM documentation. The information included should describe:

- a) the method how each configuration item is uniquely identified, such that it is possible to track versions of the same configuration item;
- b) the method how configuration items are assigned unique identifiers and how they are entered into the CM system;
- c) the method to be used to identify superseded versions of a configuration item.

ISO/IEC 15408-3 ALC_CMC.2.3C: *The CM system shall uniquely identify all configuration items.*

12.2.2.4.4 Work unit ALC_CMC.2-4

The evaluator shall examine the configuration items to determine that they are identified in a way that is consistent with the CM documentation.

Assurance that the CM system uniquely identifies all configuration items is gained by examining the identifiers for the configuration items. For both configuration items that comprise the TOE, and drafts of configuration items that are submitted by the developer as evaluation evidence, the evaluator confirms that each configuration item possesses a unique identifier in a manner consistent with the unique identification method that is described in the CM documentation.

12.2.3 Evaluation of sub-activity (ALC_CMC.3)

12.2.3.1 Objectives

The objectives of this sub-activity are to determine whether the developer uses a CM system that uniquely identifies all configuration items, and whether the ability to modify these items is properly controlled.

12.2.3.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the TOE suitable for testing;
- c) the configuration management documentation.

12.2.3.3 Action ALC_CMC.3.1E

ISO/IEC 15408-3 ALC_CMC.3.1C: *The TOE shall be labelled with its unique reference.*

12.2.3.3.1 Work unit ALC_CMC.3-1

The evaluator shall check that the TOE provided for evaluation is labelled with its reference.

The evaluator should ensure that the TOE contains the unique reference which is stated in the ST. This could be achieved through labelled packaging or media, or by a label displayed by the operational TOE. This is to ensure that it would be possible for consumers to identify the TOE (e.g. at the point of purchase or use).

The TOE may provide a method by which it can be easily identified. For example, a software TOE may display its name and version number during the start up routine, or in response to a command line entry. A hardware or firmware TOE may be identified by a part number physically stamped on the TOE.

Alternatively, the unique reference provided for the TOE may be the combination of the unique reference of each component from which the TOE is comprised (e.g. in the case of a composed TOE).

12.2.3.3.2 Work unit ALC_CMC.3-2

The evaluator shall check that the TOE references used are consistent.

If the TOE is labelled more than once then the labels have to be consistent. For example, it should be possible to relate any labelled guidance documentation supplied as part of the TOE to the evaluated operational TOE. This ensures that consumers can be confident that they have purchased the evaluated version of the TOE, that they have installed this version, and that they have the correct version of the guidance to operate the TOE in accordance with its ST.

The evaluator also verifies that the TOE reference is consistent with the ST.

If this work unit is applied to a composed TOE, the following will apply. The composed IT TOE will not be labelled with its unique (composite) reference, but only the individual components will be labelled with their appropriate TOE reference. It would require further development for the IT TOE to be labelled, i.e. during start-up and/or operation, with the composite reference. If the composed TOE is delivered as the constituent component TOEs, then the TOE items delivered will not contain the composite reference. However, the composed TOE ST will include the unique reference for the composed TOE and will identify the components comprising the composed TOE through which the consumers will be able to determine whether they have the appropriate items.

ISO/IEC 15408-3 ALC_CMC.3.2C: *The CM documentation shall describe the method used to uniquely identify the configuration items.*

12.2.3.3.3 Work unit ALC_CMC.3-3

The evaluator shall examine the method of identifying configuration items to determine that it describes how configuration items are uniquely identified.

Procedures should describe how the status of each configuration item can be tracked throughout the life-cycle of the TOE. The procedures may be detailed in the CM plan or throughout the CM documentation. The information included should describe:

- a) the method how each configuration item is uniquely identified, such that it is possible to track versions of the same configuration item;
- b) the method how configuration items are assigned unique identifiers and how they are entered into the CM system;
- c) the method to be used to identify superseded versions of a configuration item.

ISO/IEC 15408-3 ALC_CMC.3.3C: *The CM system shall uniquely identify all configuration items.*

12.2.3.3.4 Work unit ALC_CMC.3-4

The evaluator shall examine the configuration items to determine that they are identified in a way that is consistent with the CM documentation.

Assurance that the CM system uniquely identifies all configuration items is gained by examining the identifiers for the configuration items. For both configuration items that comprise the TOE, and drafts of configuration items that are submitted by the developer as evaluation evidence, the evaluator confirms that each configuration item possesses a unique identifier in a manner consistent with the unique identification method that is described in the CM documentation.

ISO/IEC 15408-3 ALC_CMC.3.4C: *The CM system shall provide measures such that only authorised changes are made to the configuration items.*

12.2.3.3.5 Work unit ALC_CMC.3-5

The evaluator shall examine the CM access control measures described in the CM plan to determine that they are effective in preventing unauthorised access to the configuration items.

The evaluator may use a number of methods to determine that the CM access control measures are effective. For example, the evaluator may exercise the access control measures to ensure that the procedures could not be bypassed. The evaluator may use the outputs generated by the CM system procedures required by ALC_CMC.3.8C. The evaluator may also witness a demonstration of the CM system to ensure that the access control measures employed are operating effectively.

ISO/IEC 15408-3 ALC_CMC.3.5C: *The CM documentation shall include a CM plan.*

12.2.3.3.6 Work unit ALC_CMC.3-6

The evaluator shall check that the CM documentation provided includes a CM plan.

The CM plan needs not to be a connected document, but it is recommended that there is a single document that describes where the various parts of the CM plan can be found. If the CM plan is no single document, the list in the following work unit gives hints regarding which context is expected.

ISO/IEC 15408-3 ALC_CMC.3.6C: *The CM plan shall describe how the CM system is used for the development of the TOE.*

12.2.3.3.7 Work unit ALC_CMC.3-7

The evaluator shall examine the CM plan to determine that it describes how the CM system is used for the development of the TOE.

The descriptions contained in a CM plan include, if applicable:

- a) all activities performed in the TOE development that are subject to configuration management procedures (e.g. creation, modification or deletion of a configuration item, data-backup, archiving);
- b) which means (e.g. CM tools, forms) have to be made available;
- c) the usage of the CM tools: the necessary details for a user of the CM system to be able to operate the CM tools correctly in order to maintain the integrity of the TOE;
- d) which other objects (development components, tools, assessment environments, etc) are taken under CM control;
- e) the roles and responsibilities of individuals required to perform operations on individual configuration items (different roles may be identified for different types of configuration items (e.g. design documentation or source code));
- f) how CM instances (e.g. change control boards, interface control working groups) are introduced and staffed;
- g) the description of the change management;
- h) the procedures that are used to ensure that only authorised individuals can make changes to configuration items;
- i) the procedures that are used to ensure that concurrency problems do not occur as a result of simultaneous changes to configuration items;
- j) the evidence that is generated as a result of application of the procedures. For example, for a change to a configuration item, the CM system might record a description of the change, accountability for the change, identification of all configuration items affected, status (e.g. pending or completed), and date and time of the change. This might be recorded in an audit trail of changes made or change control records;
- k) the approach to version control and unique referencing of TOE versions (e.g. covering the release of patches in operating systems, and the subsequent detection of their application).

ISO/IEC 15408-3 ALC_CMC.3.7C: *The evidence shall demonstrate that all configuration items are being maintained under the CM system.*

12.2.3.3.8 Work unit ALC_CMC.3-8

The evaluator shall check that the configuration items identified in the configuration list are being maintained by the CM system.

The CM system employed by the developer should maintain the integrity of the TOE. The evaluator should check that for each type of configuration item (e.g. design documents or source code modules) contained in the configuration list there are examples of the evidence generated by the procedures described in the CM plan. In this case, the approach to sampling will depend upon the level of granularity used in the CM system to control CM items. Where, for example, 10,000 source code modules are identified in the configuration list, a different sampling strategy needs to be applied compared to the case in which there are only 5, or even 1. The emphasis of this activity should be on ensuring that the CM system is being operated correctly, rather than on the detection of any minor error.

For guidance on sampling see A.2, Sampling.

ISO/IEC 15408-3 ALC_CMC.3.8C: *The evidence shall demonstrate that the CM system is being operated in accordance with the CM plan.*

12.2.3.3.9 Work unit ALC_CMC.3-9

The evaluator shall check the CM documentation to ascertain that it includes the CM system records identified by the CM plan.

The output produced by the CM system should provide the evidence that the evaluator needs to be confident that the CM plan is being applied, and also that all configuration items are being maintained by the CM system as required by ALC_CMC.3.7C. Example output could include change control forms, or configuration item access approval forms.

12.2.3.3.10 Work unit ALC_CMC.3-10

The evaluator shall examine the evidence to determine that the CM system is being operated in accordance with the CM plan.

The evaluator should select and examine a sample of evidence covering each type of CM-relevant operation that has been performed on a configuration item (e.g. creation, modification, deletion, reversion to an earlier version) to confirm that all operations of the CM system have been carried out in line with documented procedures. The evaluator confirms that the evidence includes all the information identified for that operation in the CM plan. Examination of the evidence may require access to a CM tool that is used. The evaluator may choose to sample the evidence.

For guidance on sampling see A.2, Sampling.

Further confidence in the correct operation of the CM system and the effective maintenance of configuration items may be established by means of interviews with selected development staff. In conducting such interviews, the evaluator aims to gain a deeper understanding of how the CM system is used in practise as well as to confirm that the CM procedures are being applied as described in the CM documentation. Note that such interviews should complement rather than replace the examination of documentary evidence, and may not be necessary if the documentary evidence alone satisfies the requirement. However, given the wide scope of the CM plan it is possible that some aspects (e.g. roles and responsibilities) may not be clear from the CM plan and records alone. This is one case where clarification may be necessary through interviews.

It is expected that the evaluator will visit the development site in support of this activity.

For guidance on site visits see A.4, Site Visits.

12.2.4 Evaluation of sub-activity (ALC_CMC.4)

12.2.4.1 Objectives

The objectives of this sub-activity are to determine whether the developer has clearly identified the TOE and its associated configuration items, and whether the ability to modify these items is properly controlled by automated tools, thus making the CM system less susceptible to human error or negligence.

12.2.4.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the TOE suitable for testing;
- c) the configuration management documentation.

12.2.4.3 Action ALC_CMC.4.1E

ISO/IEC 15408-3 ALC_CMC.4.1C: *The TOE shall be labelled with its unique reference.*

12.2.4.3.1 Work unit ALC_CMC.4-1

The evaluator shall check that the TOE provided for evaluation is labelled with its reference.

The evaluator should ensure that the TOE contains the unique reference which is stated in the ST. This could be achieved through labelled packaging or media, or by a label displayed by the operational TOE. This is to ensure that it would be possible for consumers to identify the TOE (e.g. at the point of purchase or use).

The TOE may provide a method by which it can be easily identified. For example, a software TOE may display its name and version number during the start up routine, or in response to a command line entry. A hardware or firmware TOE may be identified by a part number physically stamped on the TOE.

Alternatively, the unique reference provided for the TOE may be the combination of the unique reference of each component from which the TOE is comprised (e.g. in the case of a composed TOE).

12.2.4.3.2 Work unit ALC_CMC.4-2

The evaluator shall check that the TOE references used are consistent.

If the TOE is labelled more than once then the labels have to be consistent. For example, it should be possible to relate any labelled guidance documentation supplied as part of the TOE to the evaluated operational TOE. This ensures that consumers can be confident that they have purchased the evaluated version of the TOE, that they have installed this version, and that they have the correct version of the guidance to operate the TOE in accordance with its ST.

The evaluator also verifies that the TOE reference is consistent with the ST.

If this work unit is applied to a composed TOE, the following will apply. The composed IT TOE will not be labelled with its unique (composite) reference, but only the individual components will be labelled with their appropriate TOE reference. It would require further development for the IT TOE to be labelled, i.e. during start-up and/or operation, with the composite reference. If the composed TOE is delivered as the constituent component TOEs, then the TOE items delivered will not contain the composite reference. However, the composed TOE ST will include the unique reference for the composed TOE and will identify the components comprising the composed TOE through which the consumers will be able to determine whether they have the appropriate items.

ISO/IEC 15408-3 ALC_CMC.4.2C: *The CM documentation shall describe the method used to uniquely identify the configuration items.*

12.2.4.3.3 Work unit ALC_CMC.4-3

The evaluator shall examine the method of identifying configuration items to determine that it describes how configuration items are uniquely identified.

Procedures should describe how the status of each configuration item can be tracked throughout the life-cycle of the TOE. The procedures may be detailed in the CM plan or throughout the CM documentation. The information included should describe:

- a) the method how each configuration item is uniquely identified, such that it is possible to track versions of the same configuration item;
- b) the method how configuration items are assigned unique identifiers and how they are entered into the CM system;
- c) the method to be used to identify superseded versions of a configuration item.

ISO/IEC 15408-3 ALC_CMC.4.3C: *The CM system shall uniquely identify all configuration items.*

12.2.4.3.4 Work unit ALC_CMC.4-4

The evaluator shall examine the configuration items to determine that they are identified in a way that is consistent with the CM documentation.

Assurance that the CM system uniquely identifies all configuration items is gained by examining the identifiers for the configuration items. For both configuration items that comprise the TOE, and drafts of configuration items that are submitted by the developer as evaluation evidence, the evaluator confirms that each configuration item possesses a unique identifier in a manner consistent with the unique identification method that is described in the CM documentation.

ISO/IEC 15408-3 ALC_CMC.4.4C: *The CM system shall provide automated measures such that only authorised changes are made to the configuration items.*

12.2.4.3.5 Work unit ALC_CMC.4-5

The evaluator shall examine the CM access control measures described in the CM plan (cf. ALC_CMC.4.6C) to determine that they are automated and effective in preventing unauthorised access to the configuration items.

The evaluator may use a number of methods to determine that the CM access control measures are effective. For example, the evaluator may exercise the access control measures to ensure that the procedures could not be bypassed. The evaluator may use the outputs generated by the CM system procedures required by ALC_CMC.4.10C. The evaluator may also witness a demonstration of the CM system to ensure that the access control measures employed are operating effectively.

ISO/IEC 15408-3 ALC_CMC.4.5C: *The CM system shall support the production of the TOE by automated means.*

12.2.4.3.6 Work unit ALC_CMC.4-6

The evaluator shall check the CM plan (cf. ALC_CMC.4.6C) for automated procedures for supporting the production of the TOE.

The term “production” applies to those processes adopted by the developer to progress the TOE from the implementation representation to a state acceptable for delivery to the end customer.

The evaluator verifies the existence of automated production support procedures within the CM plan.

The following are examples for automated means supporting the production of the TOE:

- a “make” tool (as provided with many software development tools) in the case of a software TOE;
- a tool ensuring automatically (for example by means of bar codes) that only parts are combined which indeed belong together in the case of a hardware TOE.

12.2.4.3.7 Work unit ALC_CMC.4-7

The evaluator shall examine the TOE production support procedures to determine that they are effective in ensuring that a TOE is generated that reflects its implementation representation.

The production support procedures should describe which tools have to be used to produce the final TOE from the implementation representation in a clearly defined way. The conventions, directives, or other necessary constructs are described under ALC_TAT.

The evaluator determines that by following the production support procedures the correct configuration items would be used to generate the TOE. For example, in a software TOE this may include checking that the automated production procedures ensure that all source files and related libraries are included in the compiled object code. Moreover, the procedures should ensure that compiler options and comparable other options are defined uniquely. For a hardware TOE, this work unit may include checking that the automatic production procedures ensure that the belonging parts are built together and no parts are missing.

The customer can then be confident that the version of the TOE delivered for installation is derived from the implementation representation in an unambiguous way and implements the SFRs as described in the ST.

The evaluator should bear in mind that the CM system need not necessarily possess the capability to produce the TOE, but should provide support for the process that will help reduce the probability of human error.

ISO/IEC 15408-3 ALC_CMC.4.6C: *The CM documentation shall include a CM plan.*

12.2.4.3.8 Work unit ALC_CMC.4-8

The evaluator shall check that the CM documentation provided includes a CM plan.

The CM plan does not need to be contained within a single document, but it is recommended that there is a separate document that describes where the various parts of the CM plan can be found. If the CM plan is provided by a set of documents, the list in the following work unit gives guidance regarding the required content.

ISO/IEC 15408-3 ALC_CMC.4.7C: *The CM plan shall describe how the CM system is used for the development of the TOE.*

12.2.4.3.9 Work unit ALC_CMC.4-9

The evaluator shall examine the CM plan to determine that it describes how the CM system is used for the development of the TOE.

The descriptions contained in a CM plan include, if applicable:

- a) all activities performed in the TOE development that are subject to configuration management procedures (e.g. creation, modification or deletion of a configuration item, data-backup, archiving);
- b) which means (e.g. CM tools, forms) have to be made available;
- c) the usage of the CM tools: the necessary details for a user of the CM system to be able to operate the CM tools correctly in order to maintain the integrity of the TOE;
- d) the production support procedures;
- e) which other objects (development components, tools, assessment environments, etc) are taken under CM control;
- f) the roles and responsibilities of individuals required to perform operations on individual configuration items (different roles may be identified for different types of configuration items (e.g. design documentation or source code));

- g) how CM instances (e.g. change control boards, interface control working groups) are introduced and staffed;
- h) the description of the change management;
- i) the procedures that are used to ensure that only authorised individuals can make changes to configuration items;
- j) the procedures that are used to ensure that concurrency problems do not occur as a result of simultaneous changes to configuration items;
- k) the evidence that is generated as a result of application of the procedures. For example, for a change to a configuration item, the CM system might record a description of the change, accountability for the change, identification of all configuration items affected, status (e.g. pending or completed), and date and time of the change. This might be recorded in an audit trail of changes made or change control records;
- l) the approach to version control and unique referencing of TOE versions (e.g. covering the release of patches in operating systems, and the subsequent detection of their application).

ISO/IEC 15408-3 ALC_CMC.4.8C: *The CM plan shall describe the procedures used to accept modified or newly created configuration items as part of the TOE.*

12.2.4.3.10 Work unit ALC_CMC.4-10

The evaluator shall examine the CM plan to determine that it describes the procedures used to accept modified or newly created configuration items as parts of the TOE.

The descriptions of the acceptance procedures in the CM plan should include the developer roles or individuals responsible for the acceptance and the criteria to be used for acceptance. They should take into account all acceptance situations that may occur, in particular:

- a) accepting an item into the CM system for the first time, in particular inclusion of software, firmware and hardware components from other manufacturers into the TOE ("integration");
- b) moving configuration items to the next life-cycle phase at each stage of the construction of the TOE (e.g. module, subsystem, system);
- c) subsequent to transports between different development sites.

If this work unit is applied to a dependent component that is going to be integrated in a composed TOE, the CM plan should consider the control of base components obtained by the dependent TOE developer.

When obtaining the components the evaluators are to verify the following:

- a) Transfer of each base component from the base component developer to the integrator (dependent TOE developer) was performed in accordance with the base component TOE's secure delivery procedures, as reported in the base component TOE certification report.
- b) The component received has the same identifiers as those stated in the ST and Certification Report for the component TOE.
- c) All additional material required by a developer for composition (integration) is provided. This is to include the necessary extract of the component TOE's functional specification.

ISO/IEC 15408-3 ALC_CMC.4.9C: *The evidence shall demonstrate that all configuration items are being maintained under the CM system.*

12.2.4.3.11 Work unit ALC_CMC.4-11

The evaluator shall check that the configuration items identified in the configuration list are being maintained by the CM system.

The CM system employed by the developer should maintain the integrity of the TOE. The evaluator should check that for each type of configuration item (e.g. design documents or source code modules) contained in the configuration list there are examples of the evidence generated by the procedures described in the CM plan. In this case, the approach to sampling will depend upon the level of granularity used in the CM system to control CM items. Where, for example, 10,000 source code modules are identified in the configuration list, a different sampling strategy needs to be applied compared to the case in which there are only 5, or even 1. The emphasis of this activity should be on ensuring that the CM system is being operated correctly, rather than on the detection of any minor error.

For guidance on sampling see A.2, Sampling.

ISO/IEC 15408-3 ALC_CMC.4.10C: *The evidence shall demonstrate that the CM system is being operated in accordance with the CM plan.*

12.2.4.3.12 Work unit ALC_CMC.4-12

The evaluator shall check the CM documentation to ascertain that it includes the CM system records identified by the CM plan.

The output produced by the CM system should provide the evidence that the evaluator needs to be confident that the CM plan is being applied, and also that all configuration items are being maintained by the CM system as required by ALC_CMC.4.9C. Example output could include change control forms, or configuration item access approval forms.

12.2.4.3.13 Work unit ALC_CMC.4-13

The evaluator shall examine the evidence to determine that the CM system is being operated in accordance with the CM plan.

The evaluator should select and examine a sample of evidence covering each type of CM-relevant operation that has been performed on a configuration item (e.g. creation, modification, deletion, reversion to an earlier version) to confirm that all operations of the CM system have been carried out in line with documented procedures. The evaluator confirms that the evidence includes all the information identified for that operation in the CM plan. Examination of the evidence may require access to a CM tool that is used. The evaluator may choose to sample the evidence.

For guidance on sampling see A.2, Sampling.

Further confidence in the correct operation of the CM system and the effective maintenance of configuration items may be established by means of interviews with selected development staff. In conducting such interviews, the evaluator aims to gain a deeper understanding of how the CM system is used in practise as well as to confirm that the CM procedures are being applied as described in the CM documentation. Note that such interviews should complement rather than replace the examination of documentary evidence, and may not be necessary if the documentary evidence alone satisfies the requirement. However, given the wide scope of the CM plan it is possible that some aspects (e.g. roles and responsibilities) may not be clear from the CM plan and records alone. This is one case where clarification may be necessary through interviews.

It is expected that the evaluator will visit the development site in support of this activity.

For guidance on site visits see A.4, Site Visits.

12.2.5 Evaluation of sub-activity (ALC_CMC.5)

12.2.5.1 Objectives

The objectives of this sub-activity are to determine whether the developer has clearly identified the TOE and its associated configuration items, and whether the ability to modify these items is properly controlled by automated tools, thus making the CM system less susceptible to human error or negligence.

12.2.5.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the TOE suitable for testing;
- c) the configuration management documentation.

12.2.5.3 Action ALC_CMC.5.1E

ISO/IEC 15408-3 ALC_CMC.5.1C: *The TOE shall be labelled with its unique reference.*

12.2.5.3.1 Work unit ALC_CMC.5-1

The evaluator shall check that the TOE provided for evaluation is labelled with its reference.

The evaluator should ensure that the TOE contains the unique reference which is stated in the ST. This could be achieved through labelled packaging or media, or by a label displayed by the operational TOE. This is to ensure that it would be possible for consumers to identify the TOE (e.g. at the point of purchase or use).

The TOE may provide a method by which it can be easily identified. For example, a software TOE may display its name and version number during the start up routine, or in response to a command line entry. A hardware or firmware TOE may be identified by a part number physically stamped on the TOE.

Alternatively, the unique reference provided for the TOE may be the combination of the unique reference of each component from which the TOE is comprised (e.g. in the case of a composed TOE).

12.2.5.3.2 Work unit ALC_CMC.5-2

The evaluator shall check that the TOE references used are consistent.

If the TOE is labelled more than once then the labels have to be consistent. For example, it should be possible to relate any labelled guidance documentation supplied as part of the TOE to the evaluated operational TOE. This ensures that consumers can be confident that they have purchased the evaluated version of the TOE, that they have installed this version, and that they have the correct version of the guidance to operate the TOE in accordance with its ST.

The evaluator also verifies that the TOE reference is consistent with the ST.

If this work unit is applied to a composed TOE, the following will apply. The composed IT TOE will not be labelled with its unique (composite) reference, but only the individual components will be labelled with their appropriate TOE reference. It would require further development for the IT TOE to be labelled, i.e. during start-up and/or operation, with the composite reference. If the composed TOE is delivered as the constituent component TOEs, then the TOE items delivered will not contain the composite reference. However, the composed TOE ST will include the unique reference for the composed TOE and will identify the components comprising the composed TOE through which the consumers will be able to determine whether they have the appropriate items.

ISO/IEC 15408-3 ALC_CMC.5.2C: *The CM documentation shall describe the method used to uniquely identify the configuration items.*

12.2.5.3.3 Work unit ALC_CMC.5-3

The evaluator shall examine the method of identifying configuration items to determine that it describes how configuration items are uniquely identified.

Procedures should describe how the status of each configuration item can be tracked throughout the life-cycle of the TOE. The procedures may be detailed in the CM plan or throughout the CM documentation. The information included should describe:

- a) the method how each configuration item is uniquely identified, such that it is possible to track versions of the same configuration item;
- b) the method how configuration items are assigned unique identifiers and how they are entered into the CM system;
- c) the method to be used to identify superseded versions of a configuration item.

ISO/IEC 15408-3 ALC_CMC.5.3C: *The CM documentation shall justify that the acceptance procedures provide for an adequate and appropriate review of changes to all configuration items.*

12.2.5.3.4 Work unit ALC_CMC.5-4

The evaluator shall examine the CM documentation to determine that it justifies that the acceptance procedures provide for an adequate and appropriate review of changes to all configuration items.

The CM documentation should make it sufficiently clear that by following the acceptance procedures only parts of adequate quality are incorporated into the TOE.

ISO/IEC 15408-3 ALC_CMC.5.4C: *The CM system shall uniquely identify all configuration items.*

12.2.5.3.5 Work unit ALC_CMC.5-5

The evaluator shall examine the configuration items to determine that they are identified in a way that is consistent with the CM documentation.

Assurance that the CM system uniquely identifies all configuration items is gained by examining the identifiers for the configuration items. For both configuration items that comprise the TOE, and drafts of configuration items that are submitted by the developer as evaluation evidence, the evaluator confirms that each configuration item possesses a unique identifier in a manner consistent with the unique identification method that is described in the CM documentation.

ISO/IEC 15408-3 ALC_CMC.5.5C: *The CM system shall provide automated measures such that only authorised changes are made to the configuration items.*

12.2.5.3.6 Work unit ALC_CMC.5-6

The evaluator shall examine the CM access control measures described in the CM plan (cf. ALC_CMC.5.12C) to determine that they are automated and effective in preventing unauthorised access to the configuration items.

The evaluator may use a number of methods to determine that the CM access control measures are effective. For example, the evaluator may exercise the access control measures to ensure that the procedures could not be bypassed. The evaluator may use the outputs generated by the CM system procedures required by ALC_CMC.5.16C. The evaluator may also witness a demonstration of the CM system to ensure that the access control measures employed are operating effectively.

ISO/IEC 15408-3 ALC_CMC.5.6C: *The CM system shall support the production of the TOE by automated means.*

12.2.5.3.7 Work unit ALC_CMC.5-7

The evaluator shall check the CM plan (cf. ALC_CMC.5.12C) for automated procedures for supporting the production of the TOE.

The term “production” applies to those processes adopted by the developer to progress the TOE from the implementation representation to a state acceptable for delivery to the end customer.

The evaluator verifies the existence of automated production support procedures within the CM plan.

The following are examples for automated means supporting the production of the TOE:

- a “make” tool (as provided with many software development tools) in the case of a software TOE;
- a tool ensuring automatically (for example by means of bar codes) that only parts are combined which indeed belong together in the case of a hardware TOE.

12.2.5.3.8 Work unit ALC_CMC.5-8

The evaluator shall examine the TOE production support procedures to determine that they are effective in ensuring that a TOE is generated that reflects its implementation representation.

The production support procedures should describe which tools have to be used to produce the final TOE from the implementation representation in a clearly defined way. The conventions, directives, or other necessary constructs are described under ALC_TAT.

The evaluator determines that by following the production support procedures the correct configuration items would be used to generate the TOE. For example, in a software TOE this may include checking that the automated production procedures ensure that all source files and related libraries are included in the compiled object code. Moreover, the procedures should ensure that compiler options and comparable other options are defined uniquely. For a hardware TOE, this work unit may include checking that the automatic production procedures ensure that the belonging parts are built together and no parts are missing.

The customer can then be confident that the version of the TOE delivered for installation is derived from the implementation representation in an unambiguous way and implements the SFRs as described in the ST.

The evaluator should bear in mind that the CM system need not necessarily possess the capability to produce the TOE, but should provide support for the process that will help reduce the probability of human error.

ISO/IEC 15408-3 ALC_CMC.5.7C: *The CM system shall ensure that the person responsible for accepting a configuration item into CM is not the person who developed it.*

12.2.5.3.9 Work unit ALC_CMC.5-9

The evaluator shall examine the CM system to determine that it ensures that the person responsible for accepting a configuration item is not the person who developed it.

The acceptance procedures describe who is responsible for accepting a configuration item. From these descriptions, the evaluator should be able to determine that the person who developed a configuration item is in no case responsible for its acceptance.

ISO/IEC 15408-3 ALC_CMC.5.8C: *The CM system shall identify the configuration items that comprise the TSF.*

12.2.5.3.10 Work unit ALC_CMC.5-10

The evaluator shall examine the CM system to determine that it identifies the configuration items that comprise the TSF.

The CM documentation should describe how the CM system identifies the configuration items that comprise the TSF. The evaluator should select a sample of configuration items covering each type of items, particularly containing TSF and non-TSF items, and check that they are correctly classified by the CM system.

For guidance on sampling see A.2, Sampling.

ISO/IEC 15408-3 ALC_CMC.5.9C: *The CM system shall support the audit of all changes to the TOE by automated means, including the originator, date, and time in the audit trail.*

12.2.5.3.11 Work unit ALC_CMC.5-11

The evaluator shall examine the CM system to determine that it supports the audit of all changes to the TOE by automated means, including the originator, date, and time in the audit trail.

The evaluator should inspect a sample of audit trails and check, if they contain the minimum information.

ISO/IEC 15408-3 ALC_CMC.5.10C: *The CM system shall provide an automated means to identify all other configuration items that are affected by the change of a given configuration item.*

12.2.5.3.12 Work unit ALC_CMC.5-12

The evaluator shall examine the CM system to determine that it provides an automated means to identify all other configuration items that are affected by the change of a given configuration item.

The CM documentation should describe how the CM system identifies all other configuration items that are affected by the change of a given configuration item. The evaluator should select a sample of configuration items, covering all types of items, and exercise the automated means to determine that it identifies all items that are affected by the change of the selected item.

For guidance on sampling see A.2, Sampling.

ISO/IEC 15408-3 ALC_CMC.5.11C: *The CM system shall be able to identify the version of the implementation representation from which the TOE is generated.*

12.2.5.3.13 Work unit ALC_CMC.5-13

The evaluator shall examine the CM system to determine that it is able to identify the version of the implementation representation from which the TOE is generated.

The CM documentation should describe how the CM system identifies the version of the implementation representation from which the TOE is generated. The evaluator should select a sample of the parts used to produce the TOE and should apply the CM system to verify that it identifies the corresponding implementation representation in the correct version.

For guidance on sampling see A.2, Sampling.

ISO/IEC 15408-3 ALC_CMC.5.12C: *The CM documentation shall include a CM plan.*

12.2.5.3.14 Work unit ALC_CMC.5-14

The evaluator shall check that the CM documentation provided includes a CM plan.

The CM plan needs not to be a connected document, but it is recommended that there is a single document that describes where the various parts of the CM plan can be found. If the CM plan is no single document, the list in the following work unit gives hints regarding which context is expected.

ISO/IEC 15408-3 ALC_CMC.5.13C: *The CM plan shall describe how the CM system is used for the development of the TOE.*

12.2.5.3.15 Work unit ALC_CMC.5-15

The evaluator shall examine the CM plan to determine that it describes how the CM system is used for the development of the TOE.

The descriptions contained in a CM plan include, if applicable:

- a) all activities performed in the TOE development that are subject to configuration management procedures (e.g. creation, modification or deletion of a configuration item, data-backup, archiving);
- b) which means (e.g. CM tools, forms) have to be made available;
- c) the usage of the CM tools: the necessary details for a user of the CM system to be able to operate the CM tools correctly in order to maintain the integrity of the TOE;
- d) the production support procedures;
- e) which other objects (development components, tools, assessment environments, etc) are taken under CM control;
- f) the roles and responsibilities of individuals required to perform operations on individual configuration items (different roles may be identified for different types of configuration items (e.g. design documentation or source code));
- g) how CM instances (e.g. change control boards, interface control working groups) are introduced and staffed;
- h) the description of the change management;
- i) the procedures that are used to ensure that only authorised individuals can make changes to configuration items;
- j) the procedures that are used to ensure that concurrency problems do not occur as a result of simultaneous changes to configuration items;
- k) the evidence that is generated as a result of application of the procedures. For example, for a change to a configuration item, the CM system might record a description of the change, accountability for the change, identification of all configuration items affected, status (e.g. pending or completed), and date and time of the change. This might be recorded in an audit trail of changes made or change control records;
- l) the approach to version control and unique referencing of TOE versions (e.g. covering the release of patches in operating systems, and the subsequent detection of their application).

ISO/IEC 15408-3 ALC_CMC.5.14C: *The CM plan shall describe the procedures used to accept modified or newly created configuration items as part of the TOE.*

12.2.5.3.16 Work unit ALC_CMC.5-16

The evaluator shall examine the CM plan to determine that it describes the procedures used to accept modified or newly created configuration items as parts of the TOE.

The descriptions of the acceptance procedures in the CM plan should include the developer roles or individuals responsible for the acceptance and the criteria to be used for acceptance. They should take into account all acceptance situations that may occur, in particular:

- a) accepting an item into the CM system for the first time, in particular inclusion of software, firmware and hardware components from other manufacturers into the TOE ("integration");
- b) moving configuration items to the next life-cycle phase at each stage of the construction of the TOE (e.g. module, subsystem, system);
- c) subsequent to transports between different development sites.

ISO/IEC 15408-3 ALC_CMC.5.15C: *The evidence shall demonstrate that all configuration items are being maintained under the CM system.*

12.2.5.3.17 Work unit ALC_CMC.5-17

The evaluator shall check that the configuration items identified in the configuration list are being maintained by the CM system.

The CM system employed by the developer should maintain the integrity of the TOE. The evaluator should check that for each type of configuration item (e.g. design documents or source code modules) contained in the configuration list there are examples of the evidence generated by the procedures described in the CM plan. In this case, the approach to sampling will depend upon the level of granularity used in the CM system to control CM items. Where, for example, 10,000 source code modules are identified in the configuration list, a different sampling strategy needs to be applied compared to the case in which there are only 5, or even 1. The emphasis of this activity should be on ensuring that the CM system is being operated correctly, rather than on the detection of any minor error.

For guidance on sampling see A.2, Sampling.

ISO/IEC 15408-3 ALC_CMC.5.16C: *The evidence shall demonstrate that the CM system is being operated in accordance with the CM plan.*

12.2.5.3.18 Work unit ALC_CMC.5-18

The evaluator shall check the CM documentation to ascertain that it includes the CM system records identified by the CM plan.

The output produced by the CM system should provide the evidence that the evaluator needs to be confident that the CM plan is being applied, and also that all configuration items are being maintained by the CM system as required by ALC_CMC.5.15C. Example output could include change control forms, or configuration item access approval forms.

12.2.5.3.19 Work unit ALC_CMC.5-19

The evaluator shall examine the evidence to determine that the CM system is being operated in accordance with the CM plan.

The evaluator should select and examine a sample of evidence covering each type of CM-relevant operation that has been performed on a configuration item (e.g. creation, modification, deletion, reversion to an earlier version) to confirm that all operations of the CM system have been carried out in line with documented procedures. The evaluator confirms that the evidence includes all the information identified for that operation in the CM plan. Examination of the evidence may require access to a CM tool that is used. The evaluator may choose to sample the evidence.

For guidance on sampling see A.2, Sampling.

Further confidence in the correct operation of the CM system and the effective maintenance of configuration items may be established by means of interviews with selected development staff. In conducting such interviews, the evaluator aims to gain a deeper understanding of how the CM system is used in practise as well as to confirm that the CM procedures are being applied as described in the CM documentation. Note that such interviews should complement rather than replace the examination of documentary evidence, and may not be necessary if the documentary evidence alone satisfies the requirement. However, given the wide scope of the CM plan it is possible that some aspects (e.g. roles and responsibilities) may not be clear from the CM plan and records alone. This is one case where clarification may be necessary through interviews.

It is expected that the evaluator will visit the development site in support of this activity.

For guidance on site visits see A.4, Site Visits.

12.2.5.4 Action ALC_CMC.5.2E

12.2.5.4.1 Work unit ALC_CMC.5-20

The evaluator shall examine the production support procedures to determine that by following these procedures a TOE would be produced like that one provided by the developer for testing activities.

If the TOE is a small software TOE and production consists of compiling and linking, the evaluator might confirm the adequacy of the production support procedures by reapplying them himself.

If the production process of the TOE is more complicated (as for example in the case of a smart card), but has already started, the evaluator should inspect the application of the production support procedures during a visit of the development site. He might compare a copy of the TOE produced in his presence with the samples used for his testing activities.

For guidance on site visits see A.4, Site Visits.

Otherwise the evaluator's determination should be based on the documentary evidence provided by the developer.

This work unit may be performed in conjunction with the evaluation activities under Implementation representation (ADV_IMP).

12.3 CM scope (ALC_CMS)

12.3.1 Evaluation of sub-activity (ALC_CMS.1)

12.3.1.1 Objectives

The objective of this sub-activity is to determine whether the developer performs configuration management on the TOE and the evaluation evidence. These configuration items are controlled in accordance with CM capabilities (ALC_CMC).

12.3.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the configuration list.

12.3.1.3 Action ALC_CMS.1.1E

ISO/IEC 15408-3 ALC_CMS.1.1C: *The configuration list shall include the following: the TOE itself; and the evaluation evidence required by the SARs.*

12.3.1.3.1 Work unit ALC_CMS.1-1

The evaluator shall check that the configuration list includes the following set of items:

- a) the TOE itself;
- b) the evaluation evidence required by the SARs in the ST.

ISO/IEC 15408-3 ALC_CMS.1.2C: *The configuration list shall uniquely identify the configuration items.*

12.3.1.3.2 Work unit ALC_CMS.1-2

The evaluator shall examine the configuration list to determine that it uniquely identifies each configuration item.

The configuration list contains sufficient information to uniquely identify which version of each item has been used (typically a version number). Use of this list will enable the evaluator to check that the correct configuration items, and the correct version of each item, have been used during the evaluation.

12.3.2 Evaluation of sub-activity (ALC_CMS.2)

12.3.2.1 Objectives

The objective of this sub-activity is to determine whether the configuration list includes the TOE, the parts that comprise the TOE, and the evaluation evidence. These configuration items are controlled in accordance with CM capabilities (ALC_CMC).

12.3.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the configuration list.

12.3.2.3 Action ALC_CMS.2.1E

ISO/IEC 15408-3 ALC_CMS.2.1C: *The configuration list shall include the following: the TOE itself; the evaluation evidence required by the SARs; and the parts that comprise the TOE.*

12.3.2.3.1 Work unit ALC_CMS.2-1

The evaluator shall check that the configuration list includes the following set of items:

- a) the TOE itself;
- b) the parts that comprise the TOE;
- c) the evaluation evidence required by the SARs.

ISO/IEC 15408-3 ALC_CMS.2.2C: *The configuration list shall uniquely identify the configuration items.*

12.3.2.3.2 Work unit ALC_CMS.2-2

The evaluator shall examine the configuration list to determine that it uniquely identifies each configuration item.

The configuration list contains sufficient information to uniquely identify which version of each item has been used (typically a version number). Use of this list will enable the evaluator to check that the correct configuration items, and the correct version of each item, have been used during the evaluation.

ISO/IEC 15408-3 ALC_CMS.2.3C: *For each TSF relevant configuration item, the configuration list shall indicate the developer of the item.*

12.3.2.3.3 Work unit ALC_CMS.2-3

The evaluator shall check that the configuration list indicates the developer of each TSF relevant configuration item.

If only one developer is involved in the development of the TOE, this work unit is not applicable, and is therefore considered to be satisfied.

12.3.3 Evaluation of sub-activity (ALC_CMS.3)

12.3.3.1 Objectives

The objective of this sub-activity is to determine whether the configuration list includes the TOE, the parts that comprise the TOE, the TOE implementation representation, and the evaluation evidence. These configuration items are controlled in accordance with CM capabilities (ALC_CMC).

12.3.3.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the configuration list.

12.3.3.3 Action ALC_CMS.3.1E

ISO/IEC 15408-3 ALC_CMS.3.1C: *The configuration list shall include the following: the TOE itself; the evaluation evidence required by the SARs; the parts that comprise the TOE; and the implementation representation.*

12.3.3.3.1 Work unit ALC_CMS.3-1

The evaluator shall check that the configuration list includes the following set of items:

- a) the TOE itself;
- b) the parts that comprise the TOE;
- c) the TOE implementation representation;
- d) the evaluation evidence required by the SARs in the ST.

ISO/IEC 15408-3 ALC_CMS.3.2C: *The configuration list shall uniquely identify the configuration items.*

12.3.3.3.2 Work unit ALC_CMS.3-2

The evaluator shall examine the configuration list to determine that it uniquely identifies each configuration item.

The configuration list contains sufficient information to uniquely identify which version of each item has been used (typically a version number). Use of this list will enable the evaluator to check that the correct configuration items, and the correct version of each item, have been used during the evaluation.

ISO/IEC 15408-3 ALC_CMS.3.3C: *For each TSF relevant configuration item, the configuration list shall indicate the developer of the item.*

12.3.3.3.3 Work unit ALC_CMS.3-3

The evaluator shall check that the configuration list indicates the developer of each TSF relevant configuration item.

If only one developer is involved in the development of the TOE, this work unit is not applicable, and is therefore considered to be satisfied.

12.3.4 Evaluation of sub-activity (ALC_CMS.4)

12.3.4.1 Objectives

The objective of this sub-activity is to determine whether the configuration list includes the TOE, the parts that comprise the TOE, the TOE implementation representation, security flaws, and the evaluation evidence. These configuration items are controlled in accordance with CM capabilities (ALC_CMC).

12.3.4.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the configuration list.

12.3.4.3 Action ALC_CMS.4.1E

ISO/IEC 15408-3 ALC_CMS.4.1C: *The configuration list shall include the following: the TOE itself; the evaluation evidence required by the SARs; the parts that comprise the TOE; the implementation representation; and security flaw reports and resolution status.*

12.3.4.3.1 Work unit ALC_CMS.4-1

The evaluator shall check that the configuration list includes the following set of items:

- a) the TOE itself;
- b) the parts that comprise the TOE;
- c) the TOE implementation representation;
- d) the evaluation evidence required by the SARs in the ST;
- e) the documentation used to record details of reported security flaws associated with the implementation (e.g., problem status reports derived from a developer's problem database).

ISO/IEC 15408-3 ALC_CMS.4.2C: *The configuration list shall uniquely identify the configuration items.*

12.3.4.3.2 Work unit ALC_CMS.4-2

The evaluator shall examine the configuration list to determine that it uniquely identifies each configuration item.

The configuration list contains sufficient information to uniquely identify which version of each item has been used (typically a version number). Use of this list will enable the evaluator to check that the correct configuration items, and the correct version of each item, have been used during the evaluation.

ISO/IEC 15408-3 ALC_CMS.4.3C: *For each TSF relevant configuration item, the configuration list shall indicate the developer of the item.*

12.3.4.3.3 Work unit ALC_CMS.4-3

The evaluator shall check that the configuration list indicates the developer of each TSF relevant configuration item.

If only one developer is involved in the development of the TOE, this work unit is not applicable, and is therefore considered to be satisfied.

12.3.5 Evaluation of sub-activity (ALC_CMS.5)

12.3.5.1 Objectives

The objective of this sub-activity is to determine whether the configuration list includes the TOE, the parts that comprise the TOE, the TOE implementation representation, security flaws, development tools and related information, and the evaluation evidence. These configuration items are controlled in accordance with CM capabilities (ALC_CMC).

12.3.5.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the configuration list.

12.3.5.3 Action ALC_CMS.5.1E

ISO/IEC 15408-3 ALC_CMS.5.1C: *The configuration list shall include the following: the TOE itself; the evaluation evidence required by the SARs; the parts that comprise the TOE; the implementation representation; security flaw reports and resolution status; and development tools and related information.*

12.3.5.3.1 Work unit ALC_CMS.5-1

The evaluator shall check that the configuration list includes the following set of items:

- a) the TOE itself;
- b) the parts that comprise the TOE;
- c) the TOE implementation representation;
- d) the evaluation evidence required by the SARs in the ST;
- e) the documentation used to record details of reported security flaws associated with the implementation (e.g., problem status reports derived from a developer's problem database);
- f) all tools (incl. test software, if applicable) involved in the development and production of the TOE including the names, versions, configurations and roles of each development tool, and related documentation.

For a software TOE, "development tools" are usually programming languages and compiler and "related documentation" comprises compiler and linker options. For a hardware TOE, "development tools" might be hardware design languages, simulation and synthesis tools, compilers, and "related documentation" might comprise compiler options again.

ISO/IEC 15408-3 ALC_CMS.5.2C: *The configuration list shall uniquely identify the configuration items.*

12.3.5.3.2 Work unit ALC_CMS.5-2

The evaluator shall examine the configuration list to determine that it uniquely identifies each configuration item.

The configuration list contains sufficient information to uniquely identify which version of each item has been used (typically a version number). Use of this list will enable the evaluator to check that the correct configuration items, and the correct version of each item, have been used during the evaluation.

ISO/IEC 15408-3 ALC_CMS.5.3C: *For each TSF relevant configuration item, the configuration list shall indicate the developer of the item.*

12.3.5.3.3 Work unit ALC_CMS.5-3

The evaluator shall check that the configuration list indicates the developer of each TSF relevant configuration item.

If only one developer is involved in the development of the TOE, this work unit is not applicable, and is therefore considered to be satisfied.

12.4 Delivery (ALC_DEL)

12.4.1 Evaluation of sub-activity (ALC_DEL.1)

12.4.1.1 Objectives

The objective of this sub-activity is to determine whether the delivery documentation describes all procedures used to maintain security of the TOE when distributing the TOE to the user.

12.4.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the delivery documentation.

12.4.1.3 Action ALC_DEL.1.1E

ISO/IEC 15408-3 ALC_DEL.1.1C: *The delivery documentation shall describe all procedures that are necessary to maintain security when distributing versions of the TOE to the consumer.*

12.4.1.3.1 Work unit ALC_DEL.1-1

The evaluator shall examine the delivery documentation to determine that it describes all procedures that are necessary to maintain security when distributing versions of the TOE or parts of it to the consumer.

The delivery documentation describes proper procedures to maintain security of the TOE during transfer of the TOE or its component parts and to determine the identification of the TOE.

The delivery documentation should cover the entire TOE, but may contain different procedures for different parts of the TOE. The evaluation should consider the totality of procedures.

The delivery procedures should be applicable across all phases of delivery from the production environment to the installation environment (e.g. packaging, storage and distribution). Standard commercial practise for packaging and delivery may be acceptable. This includes shrink wrapped packaging, a security tape or a sealed envelope. For the distribution, physical (e.g. public mail or a private distribution service) or electronic (e.g. electronic mail or downloading off the Internet) procedures may be used.

Cryptographic checksums or a software signature may be used by the developer to ensure that tampering or masquerading can be detected. Tamper proof seals additionally indicate if the confidentiality has been broken. For software TOEs, confidentiality might be assured by using encryption. If availability is of concern, a secure transportation might be required.

Interpretation of the term “necessary to maintain security” will need to consider:

- The nature of the TOE (e.g. whether it is software or hardware).
- The overall security level stated for the TOE by the chosen level of the Vulnerability Assessment. If the TOE is required to be resistant against attackers of a certain potential in its intended environment, this should also apply to the delivery of the TOE. The evaluator should determine that a balanced approach has been taken, such that delivery does not present a weak point in an otherwise secure development process.
- The security objectives provided by the ST. The emphasis in the delivery documentation is likely to be on measures related to integrity, as integrity of the TOE is always important. However, confidentiality and availability of the delivery will be of concern in the delivery of some TOEs; procedures relating to these aspects of the secure delivery should also be discussed in the procedures.

12.4.1.4 Implied evaluator action

ISO/IEC 15408-3 ALC_DEL.1.2D: *The developer shall use the delivery procedures.*

12.4.1.4.1 Work unit ALC_DEL.1-2

The evaluator shall examine aspects of the delivery process to determine that the delivery procedures are used.

The approach taken by the evaluator to check the application of delivery procedures will depend on the nature of the TOE, and the delivery process itself. In addition to examination of the procedures themselves, the evaluator seeks some assurance that they are applied in practise. Some possible approaches are:

- a) a visit to the distribution site(s) where practical application of the procedures may be observed;
- b) examination of the TOE at some stage during delivery, or after the user has received it (e.g. checking for tamper proof seals);
- c) observing that the process is applied in practise when the evaluator obtains the TOE through regular channels;
- d) questioning end users as to how the TOE was delivered.

For guidance on site visits see A.4, Site Visits.

It may be the case of a newly developed TOE that the delivery procedures have yet to be exercised. In these cases, the evaluator has to be satisfied that appropriate procedures and facilities are in place for future deliveries and that all personnel involved are aware of their responsibilities. The evaluator may request a “dry run” of a delivery if this is practical. If the developer has produced other similar products, then an examination of procedures in their use may be useful in providing assurance.

12.5 Development security (ALC_DVS)

12.5.1 Evaluation of sub-activity (ALC_DVS.1)

12.5.1.1 Objectives

The objective of this sub-activity is to determine whether the developer's security controls on the development environment are adequate to provide the confidentiality and integrity of the TOE design and implementation that is necessary to ensure that secure operation of the TOE is not compromised.

12.5.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the development security documentation.

In addition, the evaluator may need to examine other deliverables to determine that the security controls are well-defined and followed. Specifically, the evaluator may need to examine the developer's configuration management documentation (the input for the Evaluation of sub-activity (ALC_CMC.4) "Production support and acceptance procedures" and the Evaluation of sub-activity (ALC_CMS.4) "Problem tracking CM coverage"). Evidence that the procedures are being applied is also required.

12.5.1.3 Action ALC_DVS.1.1E

ISO/IEC 15408-3 ALC_DVS.1.1C: *The development security documentation shall describe all the physical, procedural, personnel, and other security measures that are necessary to protect the confidentiality and integrity of the TOE design and implementation in its development environment.*

12.5.1.3.1 Work unit ALC_DVS.1-1

The evaluator shall examine the development security documentation to determine that it details all security measures used in the development environment that are necessary to protect the confidentiality and integrity of the TOE design and implementation.

The evaluator determines what is necessary by first referring to the ST for any information that may assist in the determination of necessary protection.

If no explicit information is available from the ST the evaluator will need to make a determination of the necessary measures. In cases where the developer's measures are considered less than what is necessary, a clear justification should be provided for the assessment, based on a potential exploitable vulnerability.

The following types of security measures are considered by the evaluator when examining the documentation:

- a) physical, for example physical access controls used to prevent unauthorised access to the TOE development environment (during normal working hours and at other times);
- b) procedural, for example covering:
 - granting of access to the development environment or to specific parts of the environment such as development machines
 - revocation of access rights when a person leaves the development team
 - transfer of protected material within and out of the development environment and between different development sites in accordance with defined acceptance procedures
 - admitting and escorting visitors to the development environment

- roles and responsibilities in ensuring the continued application of security measures, and the detection of security breaches;
- c) personnel, for example any controls or checks made to establish the trustworthiness of new development staff;
- d) other security measures, for example the logical protections on any development machines.

The development security documentation should identify the locations at which development occurs, and describe the aspects of development performed, along with the security measures applied at each location and for transports between different locations. For example, development could occur at multiple facilities within a single building, multiple buildings at the same site, or at multiple sites. Transports of parts of the TOE or the unfinished TOE between different development sites are to be covered by Development security (ALC_DVS), whereas the transport of the finished TOE to the consumer is dealt with in Delivery (ALC_DEL).

Development includes the production of the TOE.

12.5.1.3.2 Work unit ALC_DVS.1-2

The evaluator shall examine the development confidentiality and integrity policies in order to determine the sufficiency of the security measures employed.

The evaluator should examine whether the following is included in the policies:

- a) what information relating to the TOE development needs to be kept confidential, and which members of the development staff are allowed to access such material;
- b) what material must be protected from unauthorised modification in order to preserve the integrity of the TOE, and which members of the development staff are allowed to modify such material.

The evaluator should determine that these policies are described in the development security documentation, that the security measures employed are consistent with the policies, and that they are complete.

It should be noted that configuration management procedures will help protect the integrity of the TOE and the evaluator should avoid overlap with the work-units conducted for the CM capabilities (ALC_CMC). For example, the CM documentation may describe the security procedures necessary for controlling the roles or individuals who should have access to the development environment and who may modify the TOE.

Whereas the CM capabilities (ALC_CMC) requirements are fixed, those for the Development security (ALC_DVS), mandating only necessary measures, are dependent on the nature of the TOE, and on information that may be provided in the ST. For example, the ST may identify a security objective for the development environment that requires the TOE to be developed by staff that has security clearance. The evaluators would then determine that such a policy had been applied under this sub-activity.

12.5.1.4 Action ALC_DVS.1.2E

12.5.1.4.1 Work unit ALC_DVS.1-3

The evaluator shall examine the development security documentation and associated evidence to determine that the security measures are being applied.

This work unit requires the evaluator to determine that the security measures described in the development security documentation are being followed, such that the integrity of the TOE and the confidentiality of associated documentation is being adequately protected. For example, this could be determined by examination of the documentary evidence provided. Documentary evidence should be supplemented by visiting the development environment. A visit to the development environment will allow the evaluator to:

- a) observe the application of security measures (e.g. physical measures);

- b) examine documentary evidence of application of procedures;
- c) interview development staff to check awareness of the development security policies and procedures, and their responsibilities.

A development site visit is a useful means of gaining confidence in the measures being used. Any decision not to make such a visit should be determined in consultation with the evaluation authority.

For guidance on site visits see A.4, Site Visits.

12.5.2 Evaluation of sub-activity (ALC_DVS.2)

12.5.2.1 Objectives

The objective of this sub-activity is to determine whether the developer's security controls on the development environment are adequate to provide the confidentiality and integrity of the TOE design and implementation that is necessary to ensure that secure operation of the TOE is not compromised. Additionally, sufficiency of the measures as applied is intended be justified.

12.5.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the development security documentation.

In addition, the evaluator may need to examine other deliverables to determine that the security controls are well-defined and followed. Specifically, the evaluator may need to examine the developer's configuration management documentation (the input for the Evaluation of sub-activity (ALC_CMC.4) "Production support and acceptance procedures" and the Evaluation of sub-activity (ALC_CMS.4) "Problem tracking CM coverage"). Evidence that the procedures are being applied is also required.

12.5.2.3 Action ALC_DVS.2.1E

ISO/IEC 15408-3 ALC_DVS.2.1C: *The development security documentation shall describe all the physical, procedural, personnel, and other security measures that are necessary to protect the confidentiality and integrity of the TOE design and implementation in its development environment.*

12.5.2.3.1 Work unit ALC_DVS.2-1

The evaluator shall examine the development security documentation to determine that it details all security measures used in the development environment that are necessary to protect the confidentiality and integrity of the TOE design and implementation.

The evaluator determines what is necessary by first referring to the ST for any information that may assist in the determination of necessary protection.

If no explicit information is available from the ST the evaluator will need to make a determination of the necessary measures. In cases where the developer's measures are considered less than what is necessary, a clear justification should be provided for the assessment, based on a potential exploitable vulnerability.

The following types of security measures are considered by the evaluator when examining the documentation:

- a) physical, for example physical access controls used to prevent unauthorised access to the TOE development environment (during normal working hours and at other times);
- b) procedural, for example covering:

- granting of access to the development environment or to specific parts of the environment such as development machines
 - revocation of access rights when a person leaves the development team
 - transfer of protected material out of the development environment and between different development sites in accordance with defined acceptance procedures
 - admitting and escorting visitors to the development environment
 - roles and responsibilities in ensuring the continued application of security measures, and the detection of security breaches;
- c) personnel, for example any controls or checks made to establish the trustworthiness of new development staff;
- d) other security measures, for example the logical protections on any development machines.

The development security documentation should identify the locations at which development occurs, and describe the aspects of development performed, along with the security measures applied at each location and for transports between different locations. For example, development could occur at multiple facilities within a single building, multiple buildings at the same site, or at multiple sites. Transports of parts of the TOE or the unfinished TOE between different development sites are to be covered by the Development security (ALC_DVS), whereas the transport of the finished TOE to the consumer is dealt with in the Delivery (ALC_DEL).

Development includes the production of the TOE.

ISO/IEC 15408-3 ALC_DVS.2.2C: *The development security documentation shall justify that the security measures provide the necessary level of protection to maintain the confidentiality and integrity of the TOE.*

12.5.2.3.2 Work unit ALC_DVS.2-2

The evaluator shall examine the development security documentation to determine that an appropriate justification is given why the security measures provide the necessary level of protection to maintain the confidentiality and integrity of the TOE.

Since attacks on the TOE or its related information are assumed in different design and production stages, measures and procedures need to have an appropriate level necessary to prevent those attacks or to make them more difficult.

Since this level depends on the overall attack potential claimed for the TOE (cf. the Vulnerability analysis (AVA_VAN) component chosen), the development security documentation should justify the necessary level of protection to maintain the confidentiality and integrity of the TOE. This level has to be achieved by the security measures applied.

The concept of protection measures should be consistent, and the justification should include an analysis of how the measures are mutually supportive. All aspects of development and production on all the different sites with all roles involved up to delivery of the TOE should be analysed.

Justification may include an analysis of potential vulnerabilities taking the applied security measures into account.

There may be a convincing argument showing that e.g.

- The technical measures and mechanisms of the developer's infrastructure are sufficient for keeping the appropriate security level (e.g. cryptographic mechanisms as well as physical protection mechanisms, properties of the CM system (cf. ALC_CMC.4-5));

- The system containing the implementation representation of the TOE (including concerning guidance documents) provides effective protection against logical attacks e.g. by “Trojan” code or viruses. It might be adequate, if the implementation representation is kept on an isolated system where only the software necessary to maintain it is installed and where no additional software is installed afterwards.
- Data brought into this system need to be carefully considered to prevent the installation of hidden functionality onto the system. The effectiveness of these measures need to be tested, e.g. by independently trying to get access to the machine, install some additional executable (program, macro etc.) or get some information out of the machine using logical attacks.
- The appropriate organisational (procedural and personal) measures are unconditionally enforced.

12.5.2.3.3 Work unit ALC_DVS.2-3

The evaluator shall examine the development confidentiality and integrity policies in order to determine the sufficiency of the security measures employed.

The evaluator should examine whether the following is included in the policies:

- a) what information relating to the TOE development needs to be kept confidential, and which members of the development staff are allowed to access such material;
- b) what material must be protected from unauthorised modification in order to preserve the integrity of the TOE, and which members of the development staff are allowed to modify such material.

The evaluator should determine that these policies are described in the development security documentation, that the security measures employed are consistent with the policies, and that they are complete.

It should be noted that configuration management procedures will help protect the integrity of the TOE and the evaluator should avoid overlap with the work-units conducted for the CM capabilities (ALC_CMC). For example, the CM documentation may describe the security procedures necessary for controlling the roles or individuals who should have access to the development environment and who may modify the TOE.

Whereas the CM capabilities (ALC_CMC) requirements are fixed, those for the Development security (ALC_DVS), mandating only necessary measures, are dependent on the nature of the TOE, and on information that may be provided in the ST. For example, the ST may identify a security objective for the development environment that requires the TOE to be developed by staff that has security clearance. The evaluators would then determine that such a policy had been applied under this sub-activity.

12.5.2.4 Action ALC_DVS.2.2E

12.5.2.4.1 Work unit ALC_DVS.2-4

The evaluator shall examine the development security documentation and associated evidence to determine that the security measures are being applied.

This work unit requires the evaluator to determine that the security measures described in the development security documentation are being followed, such that the integrity of the TOE and the confidentiality of associated documentation is being adequately protected. For example, this could be determined by examination of the documentary evidence provided. Documentary evidence should be supplemented by visiting the development environment. A visit to the development environment will allow the evaluator to:

- a) observe the application of security measures (e.g. physical measures);
- b) examine documentary evidence of application of procedures;
- c) interview development staff to check awareness of the development security policies and procedures, and their responsibilities.

A development site visit is a useful means of gaining confidence in the measures being used. Any decision not to make such a visit should be determined in consultation with the evaluation authority.

For guidance on site visits see A.4, Site Visits.

12.6 Flaw remediation (ALC_FLR)

12.6.1 Evaluation of sub-activity (ALC_FLR.1)

12.6.1.1 Objectives

The objective of this sub-activity is to determine whether the developer has established flaw remediation procedures that describe the tracking of security flaws, the identification of corrective actions, and the distribution of corrective action information to TOE users.

12.6.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the flaw remediation procedures documentation.

12.6.1.3 Action ALC_FLR.1.1E

ISO/IEC 15408-3 ALC_FLR.1.1C: *The flaw remediation procedures documentation shall describe the procedures used to track all reported security flaws in each release of the TOE.*

12.6.1.3.1 Work unit ALC_FLR.1-1

The evaluator shall examine the flaw remediation procedures documentation to determine that it describes the procedures used to track all reported security flaws in each release of the TOE.

The procedures describe the actions that are taken by the developer from the time each suspected security flaw is reported to the time that it is resolved. This includes the flaw's entire time frame, from initial detection through ascertaining that the flaw is a security flaw, to resolution of the security flaw.

If a flaw is discovered not to be security-relevant, there is no need (for the purposes of the Flaw remediation (ALC_FLR) requirements) for the flaw remediation procedures to track it further; only that there be an explanation of why the flaw is not security-relevant.

While these requirements do not mandate that there be a publicised means for TOE users to report security flaws, they do mandate that all security flaws that are reported be tracked. That is, a reported security flaw cannot be ignored simply because it comes from outside the developer's organisation.

ISO/IEC 15408-3 ALC_FLR.1.2C: *The flaw remediation procedures shall require that a description of the nature and effect of each security flaw be provided, as well as the status of finding a correction to that flaw.*

12.6.1.3.2 Work unit ALC_FLR.1-2

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would produce a description of each security flaw in terms of its nature and effects.

The procedures identify the actions that are taken by the developer to describe the nature and effects of each security flaw in sufficient detail to be able to reproduce it. The description of the nature of a security flaw addresses whether it is an error in the documentation, a flaw in the design of the TSF, a flaw in the implementation of the TSF, etc. The description of the security flaw's effects identifies the portions of the TSF that are affected and how those portions are affected. For example, a security flaw in the implementation might be found that affects the identification and authentication enforced by the TSF by permitting authentication with the password "BACK DOOR".

12.6.1.3.3 Work unit ALC_FLR.1-3

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would identify the status of finding a correction to each security flaw.

The flaw remediation procedures identify the different stages of security flaws. This differentiation includes at least: suspected security flaws that have been reported, suspected security flaws that have been confirmed to be security flaws, and security flaws whose solutions have been implemented. It is permissible that additional stages (e.g. flaws that have been reported but not yet investigated, flaws that are under investigation, security flaws for which a solution has been found but not yet implemented) be included.

ISO/IEC 15408-3 ALC_FLR.1.3C: *The flaw remediation procedures shall require that corrective actions be identified for each of the security flaws.*

12.6.1.3.4 Work unit ALC_FLR.1-4

The evaluator shall check the flaw remediation procedures to determine that the application of these procedures would identify the corrective action for each security flaw.

Corrective action may consist of a repair to the hardware, firmware, or software portions of the TOE, a modification of TOE guidance, or both. Corrective action that constitutes modifications to TOE guidance (e.g. details of procedural measures to be taken to obviate the security flaw) includes both those measures serving as only an interim solution (until the repair is issued) as well as those serving as a permanent solution (where it is determined that the procedural measure is the best solution).

If the source of the security flaw is a documentation error, the corrective action consists of an update of the affected TOE guidance. If the corrective action is a procedural measure, this measure will include an update made to the affected TOE guidance to reflect these corrective procedures.

ISO/IEC 15408-3 ALC_FLR.1.4C: *The flaw remediation procedures documentation shall describe the methods used to provide flaw information, corrections and guidance on corrective actions to TOE users.*

12.6.1.3.5 Work unit ALC_FLR.1-5

The evaluator shall examine the flaw remediation procedures documentation to determine that it describes a means of providing the TOE users with the necessary information on each security flaw.

The *necessary information* about each security flaw consists of its description (not necessarily at the same level of detail as that provided as part of work unit ALC_FLR.1-2), the prescribed corrective action, and any associated guidance on implementing the correction.

TOE users may be provided with such information, correction, and documentation updates in any of several ways, such as their posting to a website, their being sent to TOE users, or arrangements made for the developer to install the correction. In cases where the means of providing this information requires action to be initiated by the TOE user, the evaluator examines any TOE guidance to ensure that it contains instructions for retrieving the information.

The only metric for assessing the adequacy of the method used for providing the information, corrections and guidance is that there be a reasonable expectation that TOE users can obtain or receive it. For example, consider the method of dissemination where the requisite data is posted to a website for one month, and the TOE users know that this will happen and when this will happen. This may not be especially reasonable or effective (as, say, a permanent posting to the website), yet it is feasible that the TOE user could obtain the necessary information. On the other hand, if the information were posted to the website for only one hour, yet TOE users had no way of knowing this or when it would be posted, it is infeasible that they would ever get the necessary information.

12.6.2 Evaluation of sub-activity (ALC_FLR.2)

12.6.2.1 Objectives

The objective of this sub-activity is to determine whether the developer has established flaw remediation procedures that describe the tracking of security flaws, the identification of corrective actions, and the distribution of corrective action information to TOE users. Additionally, this sub-activity determines whether the developer's procedures provide for the corrections of security flaws, for the receipt of flaw reports from TOE users, and for assurance that the corrections introduce no new security flaws.

In order for the developer to be able to act appropriately upon security flaw reports from TOE users, TOE users need to understand how to submit security flaw reports to the developer, and developers need to know how to receive these reports. Flaw remediation guidance addressed to the TOE user ensures that TOE users are aware of how to communicate with the developer; flaw remediation procedures describe the developer's role in such communication.

12.6.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the flaw remediation procedures documentation;
- b) flaw remediation guidance documentation.

12.6.2.3 Action ALC_FLR.2.1E

ISO/IEC 15408-3 ALC_FLR.2.1C: *The flaw remediation procedures documentation shall describe the procedures used to track all reported security flaws in each release of the TOE.*

12.6.2.3.1 Work unit ALC_FLR.2-1

The evaluator shall examine the flaw remediation procedures documentation to determine that it describes the procedures used to track all reported security flaws in each release of the TOE.

The procedures describe the actions that are taken by the developer from the time each suspected security flaw is reported to the time that it is resolved. This includes the flaw's entire time frame, from initial detection through ascertaining that the flaw is a security flaw, to resolution of the security flaw.

If a flaw is discovered not to be security-relevant, there is no need (for the purposes of the Flaw remediation (ALC_FLR) requirements) for the flaw remediation procedures to track it further; only that there be an explanation of why the flaw is not security-relevant.

ISO/IEC 15408-3 ALC_FLR.2.2C: *The flaw remediation procedures shall require that a description of the nature and effect of each security flaw be provided, as well as the status of finding a correction to that flaw.*

12.6.2.3.2 Work unit ALC_FLR.2-2

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would produce a description of each security flaw in terms of its nature and effects.

The procedures identify the actions that are taken by the developer to describe the nature and effects of each security flaw in sufficient detail to be able to reproduce it. The description of the nature of a security flaw addresses whether it is an error in the documentation, a flaw in the design of the TSF, a flaw in the implementation of the TSF, etc. The description of the security flaw's effects identifies the portions of the TSF that are affected and how those portions are affected. For example, a security flaw in the implementation might be found that affects the identification and authentication enforced by the TSF by permitting authentication with the password "BACKDOOR".

12.6.2.3.3 Work unit ALC_FLR.2-3

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would identify the status of finding a correction to each security flaw.

The flaw remediation procedures identify the different stages of security flaws. This differentiation includes at least: suspected security flaws that have been reported, suspected security flaws that have been confirmed to be security flaws, and security flaws whose solutions have been implemented. It is permissible that additional stages (e.g. flaws that have been reported but not yet investigated, flaws that are under investigation, security flaws for which a solution has been found but not yet implemented) be included.

ISO/IEC 15408-3 ALC_FLR.2.3C: *The flaw remediation procedures shall require that corrective actions be identified for each of the security flaws.*

12.6.2.3.4 Work unit ALC_FLR.2-4

The evaluator shall check the flaw remediation procedures to determine that the application of these procedures would identify the corrective action for each security flaw.

Corrective action may consist of a repair to the hardware, firmware, or software portions of the TOE, a modification of TOE guidance, or both. Corrective action that constitutes modifications to TOE guidance (e.g. details of procedural measures to be taken to obviate the security flaw) includes both those measures serving as only an interim solution (until the repair is issued) as well as those serving as a permanent solution (where it is determined that the procedural measure is the best solution).

If the source of the security flaw is a documentation error, the corrective action consists of an update of the affected TOE guidance. If the corrective action is a procedural measure, this measure will include an update made to the affected TOE guidance to reflect these corrective procedures.

ISO/IEC 15408-3 ALC_FLR.2.4C: *The flaw remediation procedures documentation shall describe the methods used to provide flaw information, corrections and guidance on corrective actions to TOE users.*

12.6.2.3.5 Work unit ALC_FLR.2-5

The evaluator shall examine the flaw remediation procedures documentation to determine that it describes a means of providing the TOE users with the necessary information on each security flaw.

The necessary information about each security flaw consists of its description (not necessarily at the same level of detail as that provided as part of work unit ALC_FLR.2-2), the prescribed corrective action, and any associated guidance on implementing the correction.

TOE users may be provided with such information, correction, and documentation updates in any of several ways, such as their posting to a website, their being sent to TOE users, or arrangements made for the developer to install the correction. In cases where the means of providing this information requires action to be initiated by the TOE user, the evaluator examines any TOE guidance to ensure that it contains instructions for retrieving the information.

The only metric for assessing the adequacy of the method used for providing the information, corrections and guidance is that there be a reasonable expectation that TOE users can obtain or receive it. For example, consider the method of dissemination where the requisite data is posted to a website for one month, and the TOE users know that this will happen and when this will happen. This may not be especially reasonable or effective (as, say, a permanent posting to the website), yet it is feasible that the TOE user could obtain the necessary information. On the other hand, if the information were posted to the website for only one hour, yet TOE users had no way of knowing this or when it would be posted, it is infeasible that they would ever get the necessary information.

ISO/IEC 15408-3 ALC_FLR.2.5C: *The flaw remediation procedures shall describe a means by which the developer receives from TOE users reports and enquiries of suspected security flaws in the TOE.*

12.6.2.3.6 Work unit ALC_FLR.2-6

The evaluator shall examine the flaw remediation procedures to determine that they describe procedures for the developer to accept reports of security flaws or requests for corrections to such flaws.

The procedures ensure that TOE users have a means by which they can communicate with the TOE developer. By having a means of contact with the developer, the user can report security flaws, enquire about the status of security flaws, or request corrections to flaws. This means of contact may be part of a more general contact facility for reporting non-security related problems.

The use of these procedures is not restricted to TOE users; however, only the TOE users are actively supplied with the details of these procedures. Others who might have access to or familiarity with the TOE can use the same procedures to submit reports to the developer, who is then expected to process them. Any means of submitting reports to the developer, other than those identified by the developer, are beyond the scope of this work unit; reports generated by other means need not be addressed.

ISO/IEC 15408-3 ALC_FLR.2.6C: *The procedures for processing reported security flaws shall ensure that any reported flaws are remediated and the remediation procedures issued to TOE users.*

12.6.2.3.7 Work unit ALC_FLR.2-7

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would help to ensure every reported flaw is corrected.

The flaw remediation procedures cover not only those security flaws discovered and reported by developer personnel, but also those reported by TOE users. The procedures are sufficiently detailed so that they describe how it is ensured that each reported security flaw is corrected. The procedures contain reasonable steps that show progress leading to the eventual, inevitable resolution.

The procedures describe the process that is taken from the point at which the suspected security flaw is determined to be a security flaw to the point at which it is resolved.

12.6.2.3.8 Work unit ALC_FLR.2-8

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would help to ensure that the TOE users are issued remediation procedures for each security flaw.

The procedures describe the process that is taken from the point at which a security flaw is resolved to the point at which the remediation procedures are provided. The procedures for delivering corrective actions should be consistent with the security objectives; they need not necessarily be identical to the procedures used for delivering the TOE, as documented to meet ALC_DEL, if included in the assurance requirements. For example, if the hardware portion of a TOE were originally delivered by bonded courier, updates to hardware resulting from flaw remediation would likewise be expected to be distributed by bonded courier. Updates unrelated to flaw remediation would follow the procedures set forth in the documentation meeting the Delivery (ALC_DEL) requirements.

ISO/IEC 15408-3 ALC_FLR.2.7C: *The procedures for processing reported security flaws shall provide safeguards that any corrections to these security flaws do not introduce any new flaws.*

12.6.2.3.9 Work unit ALC_FLR.2-9

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would result in safeguards that the potential correction contains no adverse effects.

Through analysis, testing, or a combination of the two, the developer may reduce the likelihood that adverse effects will be introduced when a security flaw is corrected. The evaluator assesses whether the procedures provide detail in how the necessary mix of analysis and testing actions is to be determined for a given correction.

The evaluator also determines that, for instances where the source of the security flaw is a documentation problem, the procedures include the means of safeguarding against the introduction of contradictions with other documentation.

ISO/IEC 15408-3 ALC_FLR.2.8C: *The flaw remediation guidance shall describe a means by which TOE users report to the developer any suspected security flaws in the TOE.*

12.6.2.3.10 Work unit ALC_FLR.2-10

The evaluator shall examine the flaw remediation guidance to determine that the application of these procedures would result in a means for the TOE user to provide reports of suspected security flaws or requests for corrections to such flaws.

The guidance ensures that TOE users have a means by which they can communicate with the TOE developer. By having a means of contact with the developer, the user can report security flaws, enquire about the status of security flaws, or request corrections to flaws.

12.6.3 Evaluation of sub-activity (ALC_FLR.3)

12.6.3.1 Objectives

The objective of this sub-activity is to determine whether the developer has established flaw remediation procedures that describe the tracking of security flaws, the identification of corrective actions, and the distribution of corrective action information to TOE users. Additionally, this sub-activity determines whether the developer's procedures provide for the corrections of security flaws, for the receipt of flaw reports from TOE users, for assurance that the corrections introduce no new security flaws, for the establishment of a point of contact for each TOE user, and for the timely issue of corrective actions to TOE users.

In order for the developer to be able to act appropriately upon security flaw reports from TOE users, TOE users need to understand how to submit security flaw reports to the developer, and developers need to know how to receive these reports. Flaw remediation guidance addressed to the TOE user ensures that TOE users are aware of how to communicate with the developer; flaw remediation procedures describe the developer's role in such communication.

12.6.3.2 Input

The evaluation evidence for this sub-activity is:

- a) the flaw remediation procedures documentation;
- b) flaw remediation guidance documentation.

12.6.3.3 Action ALC_FLR.3.1E

ISO/IEC 15408-3 ALC_FLR.3.1C: *The flaw remediation procedures documentation shall describe the procedures used to track all reported security flaws in each release of the TOE.*

12.6.3.3.1 Work unit ALC_FLR.3-1

The evaluator shall examine the flaw remediation procedures documentation to determine that it describes the procedures used to track all reported security flaws in each release of the TOE.

The procedures describe the actions that are taken by the developer from the time each suspected security flaw is reported to the time that it is resolved. This includes the flaw's entire time frame, from initial detection through ascertaining that the flaw is a security flaw, to resolution of the security flaw.

If a flaw is discovered not to be security-relevant, there is no need (for the purposes of the Flaw remediation (ALC_FLR) requirements) for the flaw remediation procedures to track it further; only that there be an explanation of why the flaw is not security-relevant.

ISO/IEC 15408-3 ALC_FLR.3.2C: *The flaw remediation procedures shall require that a description of the nature and effect of each security flaw be provided, as well as the status of finding a correction to that flaw.*

12.6.3.3.2 Work unit ALC_FLR.3-2

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would produce a description of each security flaw in terms of its nature and effects.

The procedures identify the actions that are taken by the developer to describe the nature and effects of each security flaw in sufficient detail to be able to reproduce it. The description of the nature of a security flaw addresses whether it is an error in the documentation, a flaw in the design of the TSF, a flaw in the implementation of the TSF, etc. The description of the security flaw's effects identifies the portions of the TSF that are affected and how those portions are affected. For example, a security flaw in the implementation might be found that affects the identification and authentication enforced by the TSF by permitting authentication with the password "BACKDOOR".

12.6.3.3.3 Work unit ALC_FLR.3-3

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would identify the status of finding a correction to each security flaw.

The flaw remediation procedures identify the different stages of security flaws. This differentiation includes at least: suspected security flaws that have been reported, suspected security flaws that have been confirmed to be security flaws, and security flaws whose solutions have been implemented. It is permissible that additional stages (e.g. flaws that have been reported but not yet investigated, flaws that are under investigation, security flaws for which a solution has been found but not yet implemented) be included.

ISO/IEC 15408-3 ALC_FLR.3.3C: *The flaw remediation procedures shall require that corrective actions be identified for each of the security flaws.*

12.6.3.3.4 Work unit ALC_FLR.3-4

The evaluator shall check the flaw remediation procedures to determine that the application of these procedures would identify the corrective action for each security flaw.

Corrective action may consist of a repair to the hardware, firmware, or software portions of the TOE, a modification of TOE guidance, or both. Corrective action that constitutes modifications to TOE guidance (e.g. details of procedural measures to be taken to obviate the security flaw) includes both those measures serving as only an interim solution (until the repair is issued) as well as those serving as a permanent solution (where it is determined that the procedural measure is the best solution).

If the source of the security flaw is a documentation error, the corrective action consists of an update of the affected TOE guidance. If the corrective action is a procedural measure, this measure will include an update made to the affected TOE guidance to reflect these corrective procedures.

ISO/IEC 15408-3 ALC_FLR.3.4C: *The flaw remediation procedures documentation shall describe the methods used to provide flaw information, corrections and guidance on corrective actions to TOE users.*

12.6.3.3.5 Work unit ALC_FLR.3-5

The evaluator shall examine the flaw remediation procedures documentation to determine that it describes a means of providing the TOE users with the necessary information on each security flaw.

The necessary information about each security flaw consists of its description (not necessarily at the same level of detail as that provided as part of work unit ALC_FLR.3-2), the prescribed corrective action, and any associated guidance on implementing the correction.

TOE users may be provided with such information, correction, and documentation updates in any of several ways, such as their posting to a website, their being sent to TOE users, or arrangements made for the

developer to install the correction. In cases where the means of providing this information requires action to be initiated by the TOE user, the evaluator examines any TOE guidance to ensure that it contains instructions for retrieving the information.

The only metric for assessing the adequacy of the method used for providing the information, corrections and guidance is that there be a reasonable expectation that TOE users can obtain or receive it. For example, consider the method of dissemination where the requisite data is posted to a website for one month, and the TOE users know that this will happen and when this will happen. This may not be especially reasonable or effective (as, say, a permanent posting to the website), yet it is feasible that the TOE user could obtain the necessary information. On the other hand, if the information were posted to the website for only one hour, yet TOE users had no way of knowing this or when it would be posted, it is infeasible that they would ever get the necessary information.

For TOE users who register with the developer (see work unit ALC_FLR.3-12), the passive availability of this information is not sufficient. Developers must actively send the information (or a notification of its availability) to registered TOE users.

ISO/IEC 15408-3 ALC_FLR.3.5C: *The flaw remediation procedures shall describe a means by which the developer receives from TOE users reports and enquiries of suspected security flaws in the TOE.*

12.6.3.3.6 Work unit ALC_FLR.3-6

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would result in a means for the developer to receive from TOE user reports of suspected security flaws or requests for corrections to such flaws.

The procedures ensure that TOE users have a means by which they can communicate with the TOE developer. By having a means of contact with the developer, the user can report security flaws, enquire about the status of security flaws, or request corrections to flaws. This means of contact may be part of a more general contact facility for reporting non-security related problems.

The use of these procedures is not restricted to TOE users; however, only the TOE users are actively supplied with the details of these procedures. Others who might have access to or familiarity with the TOE can use the same procedures to submit reports to the developer, who is then expected to process them. Any means of submitting reports to the developer, other than those identified by the developer, are beyond the scope of this work unit; reports generated by other means need not be addressed.

ISO/IEC 15408-3 ALC_FLR.3.6C: *The flaw remediation procedures shall include a procedure requiring timely response and the automatic distribution of security flaw reports and the associated corrections to registered users who might be affected by the security flaw.*

12.6.3.3.7 Work unit ALC_FLR.3-7

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would result in a timely means of providing the registered TOE users who might be affected with reports about, and associated corrections to, each security flaw.

The issue of timeliness applies to the issuance of both security flaw reports and the associated corrections. However, these need not be issued at the same time. It is recognised that flaw reports should be generated and issued as soon as an interim solution is found, even if that solution is as drastic as turn off the TOE. Likewise, when a more permanent (and less drastic) solution is found, it should be issued without undue delay.

It is unnecessary to restrict the recipients of the reports and associated corrections to only those TOE users who might be affected by the security flaw; it is permissible that all TOE users be given such reports and corrections for all security flaws, provided such is done in a timely manner.

12.6.3.3.8 Work unit ALC_FLR.3-8

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would result in automatic distribution of the reports and associated corrections to the registered TOE users who might be affected.

Automatic distribution does not mean that human interaction with the distribution method is not permitted. In fact, the distribution method could consist entirely of manual procedures, perhaps through a closely monitored procedure with prescribed escalation upon the lack of issue of reports or corrections.

It is unnecessary to restrict the recipients of the reports and associated corrections to only those TOE users who might be affected by the security flaw; it is permissible that all TOE users be given such reports and corrections for all security flaws, provided such is done automatically.

ISO/IEC 15408-3 ALC_FLR.3.7C: *The procedures for processing reported security flaws shall ensure that any reported flaws are remediated and the remediation procedures issued to TOE users.*

12.6.3.3.9 Work unit ALC_FLR.3-9

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would help to ensure that every reported flaw is corrected.

The flaw remediation procedures cover not only those security flaws discovered and reported by developer personnel, but also those reported by TOE users. The procedures are sufficiently detailed so that they describe how it is ensured that each reported security flaw is remediated. The procedures contain reasonable steps that show progress leading to the eventual, inevitable resolution.

The procedures describe the process that is taken from the point at which the suspected security flaw is determined to be a security flaw to the point at which it is resolved.

12.6.3.3.10 Work unit ALC_FLR.3-10

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would help to ensure that the TOE users are issued remediation procedures for each security flaw.

The procedures describe the process that is taken from the point at which a security flaw is resolved to the point at which the remediation procedures are provided. The procedures for delivering remediation procedures should be consistent with the security objectives; they need not necessarily be identical to the procedures used for delivering the TOE, as documented to meet Delivery (ALC_DEL), if included in the assurance requirements. For example, if the hardware portion of a TOE were originally delivered by bonded courier, updates to hardware resulting from flaw remediation would likewise be expected to be distributed by bonded courier. Updates unrelated to flaw remediation would follow the procedures set forth in the documentation meeting the Delivery (ALC_DEL) requirements.

ISO/IEC 15408-3 ALC_FLR.3.8C: *The procedures for processing reported security flaws shall provide safeguards that any corrections to these security flaws do not introduce any new flaws.*

12.6.3.3.11 Work unit ALC_FLR.3-11

The evaluator shall examine the flaw remediation procedures to determine that the application of these procedures would result in safeguards that the potential correction contains no adverse effects.

Through analysis, testing, or a combination of the two, the developer may reduce the likelihood that adverse effects will be introduced when a security flaw is corrected. The evaluator assesses whether the procedures provide detail in how the necessary mix of analysis and testing actions is to be determined for a given correction.

The evaluator also determines that, for instances where the source of the security flaw is a documentation problem, the procedures include the means of safeguarding against the introduction of contradictions with other documentation.

ISO/IEC 15408-3 ALC_FLR.3.9C: *The flaw remediation guidance shall describe a means by which TOE users report to the developer any suspected security flaws in the TOE.*

12.6.3.3.12 Work unit ALC_FLR.3-12

The evaluator shall examine the flaw remediation guidance to determine that the application of these procedures would result in a means for the TOE user to provide reports of suspected security flaws or requests for corrections to such flaws.

The guidance ensures that TOE users have a means by which they can communicate with the TOE developer. By having a means of contact with the developer, the user can report security flaws, enquire about the status of security flaws, or request corrections to flaws.

ISO/IEC 15408-3 ALC_FLR.3.10C: *The flaw remediation guidance shall describe a means by which TOE users may register with the developer, to be eligible to receive security flaw reports and corrections.*

12.6.3.3.13 Work unit ALC_FLR.3-13

The evaluator shall examine the flaw remediation guidance to determine that it describes a means of enabling the TOE users to register with the developer.

Enabling the TOE users to register with the developer simply means having a way for each TOE user to provide the developer with a point of contact; this point of contact is to be used to provide the TOE user with information related to security flaws that might affect that TOE user, along with any corrections to the security flaw. Registering the TOE user may be accomplished as part of the standard procedures that TOE users undergo to identify themselves to the developer, for the purposes of registering a software licence, or for obtaining update and other useful information.

There need not be one registered TOE user per installation of the TOE; it would be sufficient if there were one registered TOE user for an organisation. For example, a corporate TOE user might have a centralised acquisition office for all of its sites. In this case, the acquisition office would be a sufficient point of contact for all of that TOE user's sites, so that all of the TOE user's installations of the TOE have a registered point of contact.

In either case, it must be possible to associate each TOE that is delivered with an organisation in order to ensure that there is a registered user for each TOE. For organisations that have many different addresses, this assures that there will be no user who is erroneously presumed to be covered by a registered TOE user.

It should be noted that TOE users need not register; they must only be provided with a means of doing so. However, users who choose to register must be directly sent the information (or a notification of its availability).

ISO/IEC 15408-3 ALC_FLR.3.11C: *The flaw remediation guidance shall identify the specific points of contact for all reports and enquiries about security issues involving the TOE.*

12.6.3.3.14 Work unit ALC_FLR.3-14

The evaluator shall examine the flaw remediation guidance to determine that it identifies specific points of contact for user reports and enquiries about security issues involving the TOE.

The guidance includes a means whereby registered TOE users can interact with the developer to report discovered security flaws in the TOE or to make enquiries regarding discovered security flaws in the TOE.

12.7 Life-cycle definition (ALC_LCD)

12.7.1 Evaluation of sub-activity (ALC_LCD.1)

12.7.1.1 Objectives

The objective of this sub-activity is to determine whether the developer has used a documented model of the TOE life-cycle.

12.7.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the life-cycle definition documentation.

12.7.1.3 Action ALC_LCD.1.1E

ISO/IEC 15408-3 ALC_LCD.1.1C: *The life-cycle definition documentation shall describe the model used to develop and maintain the TOE.*

12.7.1.3.1 Work unit ALC_LCD.1-1

The evaluator shall examine the documented description of the life-cycle model used to determine that it covers the development and maintenance process.

The description of the life-cycle model should include:

- a) information on the life-cycle phases of the TOE and the boundaries between the subsequent phases;
- b) information on the procedures, tools and techniques used by the developer (e.g. for design, coding, testing, bug-fixing);
- c) overall management structure governing the application of the procedures (e.g. an identification and description of the individual responsibilities for each of the procedures required by the development and maintenance process covered by the life-cycle model);
- d) information on which parts of the TOE are delivered by subcontractors, if subcontractors are involved.

Evaluation of sub-activity (ALC_LCD.1) does not require the model used to conform to any standard life-cycle model.

ISO/IEC 15408-3 ALC_LCD.1.2C: *The life-cycle model shall provide for the necessary control over the development and maintenance of the TOE.*

12.7.1.3.2 Work unit ALC_LCD.1-2

The evaluator shall examine the life-cycle model to determine that use of the procedures, tools and techniques described by the life-cycle model will make the necessary positive contribution to the development and maintenance of the TOE.

The information provided in the life-cycle model gives the evaluator assurance that the development and maintenance procedures adopted would minimise the likelihood of security flaws. For example, if the life-cycle model described the review process, but did not make provision for recording changes to components, then the evaluator may be less confident that errors will not be introduced into the TOE. The evaluator may gain further assurance by comparing the description of the model against an understanding of the development process gleaned from performing other evaluator actions relating to the TOE development (e.g. those covered under the CM capabilities (ALC_CMC)). Identified deficiencies in the life-cycle model will be of concern if they

might reasonably be expected to give rise to the introduction of flaws into the TOE, either accidentally or deliberately.

ISO/IEC 15408 does not mandate any particular development approach, and each should be judged on merit. For example, spiral, rapid-prototyping and waterfall approaches to design can all be used to produce a quality TOE if applied in a controlled environment.

12.7.2 Evaluation of sub-activity (ALC_LCD.2)

12.7.2.1 Objectives

The objective of this sub-activity is to determine whether the developer has used a documented and measurable model of the TOE life-cycle.

12.7.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the life-cycle definition documentation;
- c) information about the standard used;
- d) the life-cycle output documentation.

12.7.2.3 Action ALC_LCD.2.1E

ISO/IEC 15408-3 ALC_LCD.2.1C: *The life-cycle definition documentation shall describe the model used to develop and maintain the TOE, including the details of its arithmetic parameters and/or metrics used to measure the quality of the TOE and/or its development.*

12.7.2.3.1 Work unit ALC_LCD.2-1

The evaluator shall examine the documented description of the life-cycle model used to determine that it covers the development and maintenance process, including the details of its arithmetic parameters and/or metrics used to measure the TOE development.

The description of the life-cycle model includes:

- a) information on the life-cycle phases of the TOE and the boundaries between the subsequent phases;
- b) information on the procedures, tools and techniques used by the developer (e.g. for design, coding, testing, bug-fixing);
- c) overall management structure governing the application of the procedures (e.g. an identification and description of the individual responsibilities for each of the procedures required by the development and maintenance process covered by the life-cycle model);
- d) information on which parts of the TOE are delivered by subcontractors, if subcontractors are involved;
- e) information on the parameters/metrics that are used to measure the TOE development. Metrics standards typically include guides for measuring and producing reliable products and cover the aspects reliability, quality, performance, complexity and cost. For the evaluation all those metrics are of relevance, which are used to increase quality by decreasing the probability of faults and thereby in turn increase assurance in the security of the TOE.

ISO/IEC 15408-3 ALC_LCD.2.2C: *The life-cycle model shall provide for the necessary control over the development and maintenance of the TOE.*

12.7.2.3.2 Work unit ALC_LCD.2-2

The evaluator shall examine the life-cycle model to determine that use of the procedures, tools and techniques described by the life-cycle model will make the necessary positive contribution to the development and maintenance of the TOE.

The information provided in the life-cycle model gives the evaluator assurance that the development and maintenance procedures adopted would minimise the likelihood of security flaws. For example, if the life-cycle model described the review process, but did not make provision for recording changes to components, then the evaluator may be less confident that errors will not be introduced into the TOE. The evaluator may gain further assurance by comparing the description of the model against an understanding of the development process gleaned from performing other evaluator actions relating to the TOE development (e.g. those covered under the CM capabilities (ALC_CMC)). Identified deficiencies in the life-cycle model will be of concern if they might reasonably be expected to give rise to the introduction of flaws into the TOE, either accidentally or deliberately.

ISO/IEC 15408 does not mandate any particular development approach, and each should be judged on merit. For example, spiral, rapid-prototyping and waterfall approaches to design can all be used to produce a quality TOE if applied in a controlled environment.

For the metrics/measurements used in the life-cycle model, evidence has to be provided that shows how those metrics/measurements usefully contribute to the minimisation of the likelihood of flaws. This can be viewed as the overall goal for measurement in an ALC context. As a consequence the metrics/measurements have to be selected based on their capability to achieve that overall goal or contribute to that. In the first place a metric/measure is suitable with respect to ALC if a correlation between the metric/measure and the number of flaws can be stated with a certain degree of reliability. But also a metric/measure useful for management purposes as for planning and monitoring the TOE development are helpful since badly managed projects are endangered to produce bad quality and to introduce flaws.

It may be possible to use metrics for quality improvement, for which this use is not obvious. For example a metric to estimate the expected cost of a product development may help quality, if the developer can show that this is used to provide an adequate budget for development projects and that this helps to avoid quality problems arising from resource shortages.

It is not required that every single step in the life cycle of the TOE is measurable. However the evaluator should see from the description of the measures and procedures that the metrics are appropriate to control the overall quality of the TOE and to minimise possible security flaws by this.

ISO/IEC 15408-3 ALC_LCD.2.3C: *The life-cycle output documentation shall provide the results of the measurements of the TOE development using the measurable life-cycle model.*

12.7.2.3.3 Work unit ALC_LCD.2-3

The evaluator shall examine the life-cycle output documentation to determine that it provides the results of the measurements of the TOE development using the measurable life-cycle model.

The results of the measurements and the life-cycle progress of the TOE should be in accordance with the life-cycle model.

The output documentation not only includes numeric values of the metrics but also documents actions taken as a result of the measurements and in accordance with the model. For example there may be a requirement that a certain design phase needs to be repeated, if some error rates measured during testing are outside of a defined threshold. In this case the documentation should show that such action was taken, if indeed the thresholds were not met.

If the evaluation is conducted in parallel with the development of the TOE it may be possible that quality measurements have not been used in the past. In this case the evaluator should use the documentation of the planned procedures in order to gain confidence that corrective actions are defined if results of quality measurements deviate from some threshold.

12.8 Tools and techniques (ALC_TAT)

12.8.1 Evaluation of sub-activity (ALC_TAT.1)

12.8.1.1 Objectives

The objective of this sub-activity is to determine whether the developer has used well-defined development tools (e.g. programming languages or computer-aided design (CAD) systems) that yield consistent and predictable results.

12.8.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the development tool documentation;
- b) the subset of the implementation representation.

12.8.1.3 Application notes

This work may be performed in parallel with the evaluation activities under Implementation representation (ADV_IMP), specifically with regard to determining the use of features in the tools that will affect the object code (e.g. compilation options).

12.8.1.4 Action ALC_TAT.1.1E

ISO/IEC 15408-3 ALC_TAT.1.1C: *Each development tool used for implementation shall be well-defined.*

12.8.1.4.1 Work unit ALC_TAT.1-1

The evaluator shall examine the development tool documentation provided to determine that each development tool is well-defined.

For example, a well-defined language, compiler or CAD system may be considered to be one that conforms to a recognised standard, such as the ISO standards. A well-defined language is one that has a clear and complete description of its syntax, and a detailed description of the semantics of each construct.

ISO/IEC 15408-3 ALC_TAT.1.2C: *The documentation of each development tool shall unambiguously define the meaning of all statements as well as all conventions and directives used in the implementation.*

12.8.1.4.2 Work unit ALC_TAT.1-2

The evaluator shall examine the documentation of each development tool to determine that it unambiguously defines the meaning of all statements as well as all conventions and directives used in the implementation.

The development tool documentation (e.g. programming language specifications and user manuals) should cover all statements used in the implementation representation of the TOE, and for each such statement should provide a clear and unambiguous definition of the purpose and effect of that statement. This work may be performed in parallel with the evaluator's examination of the implementation representation performed during the ADV_IMP sub-activity. The key test the evaluator should apply is whether or not the documentation is sufficiently clear for the evaluator to be able to understand the implementation representation. The documentation should not assume (for example) that the reader is an expert in the programming language used.

Reference to the use of a documented standard is an acceptable approach to meet this requirement, provided that the standard is available to the evaluator. Any differences from the standard should be documented.

The critical test is whether the evaluator can understand the TOE source code when performing source code analysis covered in the ADV_IMP sub-activity. However, the following checklist can additionally be used in searching for problem areas:

- a) In the language definition, phrases such as “the effect of this construct is undefined” and terms such as “implementation dependent” or “erroneous” may indicate ill-defined areas.
- b) Aliasing (allowing the same piece of memory to be referenced in different ways) is a common source of ambiguity problems.
- c) Exception handling (e.g. what happens after memory exhaustion or stack overflow) is often poorly defined.

Most languages in common use, however well designed, will have some problematic constructs. If the implementation language is mostly well defined, but some problematic constructs exist, then an inconclusive verdict should be assigned, pending examination of the source code.

The evaluator should verify, during the examination of source code, that any use of the problematic constructs does not introduce vulnerabilities. The evaluator should also ensure that constructs precluded by the documented standard are not used.

The development tool documentation should define all conventions and directives used in the implementation.

ISO/IEC 15408-3 ALC_TAT.1.3C: *The documentation of each development tool shall unambiguously define the meaning of all implementation-dependent options.*

12.8.1.4.3 Work unit ALC_TAT.1-3

The evaluator shall examine the development tool documentation to determine that it unambiguously defines the meaning of all implementation-dependent options.

The documentation of software development tools should include definitions of implementation-dependent options that may affect the meaning of the executable code, and those that are different from the standard language as documented. Where source code is provided to the evaluator, information should also be provided on compilation and linking options used.

The documentation for hardware design and development tools should describe the use of all options that affect the output from the tools (e.g. detailed hardware specifications, or actual hardware).

12.8.2 Evaluation of sub-activity (ALC_TAT.2)

12.8.2.1 Objectives

The objective of this sub-activity is to determine whether the developer has used well-defined development tools (e.g. programming languages or computer-aided design (CAD) systems) that yield consistent and predictable results, and whether implementation standards have been applied.

12.8.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the development tool documentation;
- b) the implementation standards description;
- c) the provided implementation representation of the TSF.

12.8.2.3 Application notes

This work may be performed in parallel with the evaluation activities under ADV_IMP, specifically with regard to determining the use of features in the tools that will affect the object code (e.g. compilation options).

12.8.2.4 Action ALC_TAT.2.1E

ISO/IEC 15408-3 ALC_TAT.2.1C: *Each development tool used for implementation shall be well-defined.*

12.8.2.4.1 Work unit ALC_TAT.2-1

The evaluator shall examine the development tool documentation provided to determine that each development tool is well-defined.

For example, a well-defined language, compiler or CAD system may be considered to be one that conforms to a recognised standard, such as the ISO standards. A well-defined language is one that has a clear and complete description of its syntax, and a detailed description of the semantics of each construct.

ISO/IEC 15408-3 ALC_TAT.2.2C: *The documentation of each development tool shall unambiguously define the meaning of all statements as well as all conventions and directives used in the implementation.*

12.8.2.4.2 Work unit ALC_TAT.2-2

The evaluator shall examine the documentation of each development tool to determine that it unambiguously defines the meaning of all statements as well as all conventions and directives used in the implementation.

The development tool documentation (e.g. programming language specifications and user manuals) should cover all statements used in the implementation representation of the TOE, and for each such statement should provide a clear and unambiguous definition of the purpose and effect of that statement. This work may be performed in parallel with the evaluator's examination of the implementation representation performed during the ADV_IMP sub-activity. The key test the evaluator should apply is whether or not the documentation is sufficiently clear for the evaluator to be able to understand the implementation representation. The documentation should not assume (for example) that the reader is an expert in the programming language used.

Reference to the use of a documented standard is an acceptable approach to meet this requirement, provided that the standard is available to the evaluator. Any differences from the standard should be documented.

The critical test is whether the evaluator can understand the TOE source code when performing source code analysis covered in the ADV_IMP sub-activity. However, the following checklist can additionally be used in searching for problem areas:

- a) In the language definition, phrases such as "the effect of this construct is undefined" and terms such as "implementation dependent" or "erroneous" may indicate ill-defined areas.
- b) Aliasing (allowing the same piece of memory to be referenced in different ways) is a common source of ambiguity problems.
- c) Exception handling (e.g. what happens after memory exhaustion or stack overflow) is often poorly defined.

Most languages in common use, however well designed, will have some problematic constructs. If the implementation language is mostly well defined, but some problematic constructs exist, then an inconclusive verdict should be assigned, pending examination of the source code.

The evaluator should verify, during the examination of source code, that any use of the problematic constructs does not introduce vulnerabilities. The evaluator should also ensure that constructs precluded by the documented standard are not used.

The development tool documentation should define all conventions and directives used in the implementation.

ISO/IEC 15408-3 ALC_TAT.2.3C: *The documentation of each development tool shall unambiguously define the meaning of all implementation-dependent options.*

12.8.2.4.3 Work unit ALC_TAT.2-3

The evaluator shall examine the development tool documentation to determine that it unambiguously defines the meaning of all implementation-dependent options.

The documentation of software development tools should include definitions of implementation-dependent options that may affect the meaning of the executable code, and those that are different from the standard language as documented. Where source code is provided to the evaluator, information should also be provided on compilation and linking options used.

The documentation for hardware design and development tools should describe the use of all options that affect the output from the tools (e.g. detailed hardware specifications, or actual hardware).

12.8.2.5 Action ALC_TAT.2.2E

12.8.2.5.1 Work unit ALC_TAT.2-4

The evaluator shall examine aspects of the implementation process to determine that documented implementation standards have been applied.

This work unit requires the evaluator to analyse the provided implementation representation of the TOE to determine whether the documented implementation standards have been applied.

The evaluator should verify that constructs excluded by the documented standard are not used.

Additionally, the evaluator should verify the developer's procedures which ensure the application of the defined standards within the design and implementation process of the TOE. Therefore, documentary evidence should be supplemented by visiting the development environment. A visit to the development environment will allow the evaluator to:

- a) observe the application of defined standards;
- b) examine documentary evidence of application of procedures describing the use of defined standards;
- c) interview development staff to check awareness of the application of defined standards and procedures.

A development site visit is a useful means of gaining confidence in the procedures being used. Any decision not to make such a visit should be determined in consultation with the evaluation authority.

The evaluator compares the provided implementation representation with the description of the applied implementation standards and verifies their use.

At this level it is not required that the complete provided implementation representation of the TSF is based on implementation standards, but only those parts that are developed by the TOE developer himself. The evaluator may consult the configuration list required by the CM scope (ALC_CMS) to get the information which parts are developed by the TOE developer, and which by third party developers.

If the referenced implementation standards are not applied for at least parts of the provided implementation representation, the evaluator action related to this work unit is assigned a fail verdict.

Note that parts of the TOE which are not TSF relevant do not need to be examined.

This work unit may be performed in conjunction with the evaluation activities under ADV_IMP.

12.8.3 Evaluation of sub-activity (ALC_TAT.3)

12.8.3.1 Objectives

The objective of this sub-activity is to determine whether the developer and his subcontractors have used well-defined development tools (e.g. programming languages or computer-aided design (CAD) systems) that yield consistent and predictable results, and whether implementation standards have been applied.

12.8.3.2 Input

The evaluation evidence for this sub-activity is:

- a) the development tool documentation;
- b) the implementation standards description;
- c) the provided implementation representation of the TSF.

12.8.3.3 Application notes

This work may be performed in parallel with the evaluation activities under ADV_IMP, specifically with regard to determining the use of features in the tools that will affect the object code (e.g. compilation options).

12.8.3.4 Action ALC_TAT.3.1E

ISO/IEC 15408-3 ALC_TAT.3.1C: *Each development tool used for implementation shall be well-defined.*

12.8.3.4.1 Work unit ALC_TAT.3-1

The evaluator shall examine the development tool documentation provided to determine that each development tool is well-defined.

For example, a well-defined language, compiler or CAD system may be considered to be one that conforms to a recognised standard, such as the ISO standards. A well-defined language is one that has a clear and complete description of its syntax, and a detailed description of the semantics of each construct.

At this level, the documentation of development tools used by third party contributors to the TOE has to be included in the evaluator's examination.

ISO/IEC 15408-3 ALC_TAT.3.2C: *The documentation of each development tool shall unambiguously define the meaning of all statements as well as all conventions and directives used in the implementation.*

12.8.3.4.2 Work unit ALC_TAT.3-2

The evaluator shall examine the documentation of each development tool to determine that it unambiguously defines the meaning of all statements as well as all conventions and directives used in the implementation.

The development tool documentation (e.g. programming language specifications and user manuals) should cover all statements used in the implementation representation of the TOE, and for each such statement should provide a clear and unambiguous definition of the purpose and effect of that statement. This work may be performed in parallel with the evaluator's examination of the implementation representation performed during the ADV_IMP sub-activity. The key test the evaluator should apply is whether or not the documentation is sufficiently clear for the evaluator to be able to understand the implementation representation. The documentation should not assume (for example) that the reader is an expert in the programming language used.

Reference to the use of a documented standard is an acceptable approach to meet this requirement, provided that the standard is available to the evaluator. Any differences from the standard should be documented.

The critical test is whether the evaluator can understand the TOE source code when performing source code analysis covered in the ADV_IMP sub-activity. However, the following checklist can additionally be used in searching for problem areas:

- a) In the language definition, phrases such as “the effect of this construct is undefined” and terms such as “implementation dependent” or “erroneous” may indicate ill-defined areas.
- b) Aliasing (allowing the same piece of memory to be referenced in different ways) is a common source of ambiguity problems.
- c) Exception handling (e.g. what happens after memory exhaustion or stack overflow) is often poorly defined.

Most languages in common use, however well designed, will have some problematic constructs. If the implementation language is mostly well defined, but some problematic constructs exist, then an inconclusive verdict should be assigned, pending examination of the source code.

The evaluator should verify, during the examination of source code, that any use of the problematic constructs does not introduce vulnerabilities. The evaluator should also ensure that constructs precluded by the documented standard are not used.

The development tool documentation should define all conventions and directives used in the implementation.

At this level, the documentation of development tools used by third party contributors to the TOE has to be included in the evaluator's examination.

ISO/IEC 15408-3 ALC_TAT.3.3C: *The documentation of each development tool shall unambiguously define the meaning of all implementation-dependent options.*

12.8.3.4.3 Work unit ALC_TAT.3-3

The evaluator shall examine the development tool documentation to determine that it unambiguously defines the meaning of all implementation-dependent options.

The documentation of software development tools should include definitions of implementation-dependent options that may affect the meaning of the executable code, and those that are different from the standard language as documented. Where source code is provided to the evaluator, information should also be provided on compilation and linking options used.

The documentation for hardware design and development tools should describe the use of all options that affect the output from the tools (e.g. detailed hardware specifications, or actual hardware).

At this level, the documentation of development tools used by third party contributors to the TOE has to be included in the evaluator's examination.

12.8.3.5 Action ALC_TAT.3.2E

12.8.3.5.1 Work unit ALC_TAT.3-4

The evaluator shall examine aspects of the implementation process to determine that documented implementation standards have been applied.

This work unit requires the evaluator to analyse the provided implementation representation of the TOE to determine whether the documented implementation standards have been applied.

The evaluator should verify that constructs excluded by the documented standard are not used.

Additionally, the evaluator should verify the developer's procedures which ensure the application of the defined standards within the design and implementation process of the TOE. Therefore, documentary

evidence should be supplemented by visiting the development environment. A visit to the development environment will allow the evaluator to:

- a) observe the application of defined standards;
- b) examine documentary evidence of application of procedures describing the use of defined standards;
- c) interview development staff to check awareness of the application of defined standards and procedures.

A development site visit is a useful means of gaining confidence in the procedures being used. Any decision not to make such a visit should be determined in consultation with the evaluation authority.

The evaluator compares the provided implementation representation with the description of the applied implementation standards and verifies their use.

At this level it is required that the complete provided implementation representation of the TSF is based on implementation standards, including third party contributions. This may require the evaluator to visit the sites of contributors. The evaluator may consult the configuration list required by the CM scope (ALC_CMS) to see who has developed which part of the TOE.

Note that parts of the TOE which are not TSF relevant do not need to be examined.

This work unit may be performed in conjunction with the evaluation activities under ADV_IMP.

13 Class ATE: Tests

13.1 Introduction

The goal of this activity is to determine whether the TOE behaves as described in the ST and as specified in the evaluation evidence (described in the ADV class). This determination is achieved through some combination of the developer's own functional testing of the TSF (Functional tests (ATE_FUN)) and independent testing the TSF by the evaluator (Independent testing (ATE_IND)). At the lowest level of assurance, there is no requirement for developer involvement, so the only testing is conducted by the evaluator, using the limited available information about the TOE. Additional assurance is gained as the developer becomes increasingly involved both in testing and in providing additional information about the TOE, and as the evaluator increases the independent testing activities.

13.2 Application notes

Testing of the TSF is conducted by the evaluator and, in most cases, by the developer. The evaluator's testing efforts consist not only of creating and running original tests, but also of assessing the adequacy of the developer's tests and re-running a subset of them.

The evaluator analyses the developer's tests to determine the extent to which they are sufficient to demonstrate that TSFI (see Functional specification (ADV_FSP)) perform as specified, and to understand the developer's approach to testing. Similarly, the evaluator analyses the developer's tests to determine the extent to which they are sufficient to demonstrate the internal behaviour and properties of the TSF.

The evaluator also executes a subset of the developer's tests as documented to gain confidence in the developer's test results: the evaluator will use the results of this analysis as an input to independently testing a subset of the TSF. With respect to this subset, the evaluator takes a testing approach that is different from that of the developer, particularly if the developer's tests have shortcomings.

To determine the adequacy of developer's test documentation or to create new tests, the evaluator needs to understand the desired expected behaviour of the TSF, both internally and as seen at the TSFI, in the context of the SFRs it is to satisfy. The evaluator may choose to divide the TSF and TSFI into subsets according to functional areas of the ST (audit subsystem, audit-related TSFI, authentication module, authentication-related TSFI, etc.) if they were not already divided in the ST, and focus on one subset of the TSF and TSFI at a time, examining the ST requirement and the relevant parts of the development and guidance documentation to gain

an understanding of the way the TOE is expected to behave. This reliance upon the development documentation underscores the need for the dependencies on ADV by Coverage (ATE_COV) and Depth (ATE_DPT).

ISO/IEC 15408 has separated coverage and depth from functional tests to increase the flexibility when applying the components of the families. However, the requirements of the families are intended to be applied together to confirm that the TSF operates according to its specification. This tight coupling of families has led to some duplication of evaluator work units across sub-activities. These application notes are used to minimise duplication of text between sub-activities.

13.2.1 Understanding the expected behaviour of the TOE

Before the adequacy of test documentation can be accurately evaluated, or before new tests can be created, the evaluator has to understand the desired expected behaviour of a security function in the context of the requirements it is to satisfy.

As mentioned earlier, the evaluator may choose to subset the TSF and TSFI according to SFRs (audit, authentication, etc.) in the ST and focus on one subset at a time. The evaluator examines each ST requirement and the relevant parts of the functional specification and guidance documentation to gain an understanding of the way the related TSFI is expected to behave. Similarly, the evaluator examines the relevant parts of the TOE design and security architecture documentation to gain an understanding of the way the related modules or subsystems of the TSF are expected to behave.

With an understanding of the expected behaviour, the evaluator examines the test plan to gain an understanding of the testing approach. In most cases, the testing approach will entail a TSFI being stimulated and its responses observed. Externally-visible functionality can be tested directly; however, in cases where functionality is not visible external to the TOE (for example, testing the residual information protection functionality), other means will need to be employed.

13.2.2 Testing vs. alternate approaches to verify the expected behaviour of functionality

In cases where it is impractical or inadequate to test specific functionality (where it provides no externally-visible TSFI), the test plan should identify the alternate approach to verify expected behaviour. It is the evaluator's responsibility to determine the suitability of the alternate approach. However, the following should be considered when assessing the suitability of alternate approaches:

- a) an analysis of the implementation representation to determine that the required behaviour should be exhibited by the TOE is an acceptable alternate approach. This could mean a code inspection for a software TOE or perhaps a chip mask inspection for a hardware TOE.
- b) it is acceptable to use evidence of developer integration or module testing, even if the claimed assurance requirements do not include availability of lower level descriptions of the TOE modules (e.g. Evaluation of sub-activity (ADV_TDS.3)) or implementation (Implementation representation (ADV_IMP)). If evidence of developer integration or module testing is used in verifying the expected behaviour of a security functionality, care should be given to confirm that the testing evidence reflects the current implementation of the TOE. If the subsystems or modules have been changed since testing occurred, evidence that the changes were tracked and addressed by analysis or further testing will usually be required.

It should be emphasised that supplementing the testing effort with alternate approaches should only be undertaken when both the developer and evaluator determine that there exists no other practical means to test the expected behaviour.

13.2.3 Verifying the adequacy of tests

Test pre-requisites are necessary to establish the required initial conditions for the test. They may be expressed in terms of parameters that must be set or in terms of test ordering in cases where the completion of one test establishes the necessary pre-requisites for another test. The evaluator must determine that the pre-requisites are complete and appropriate in that they will not bias the observed test results towards the expected test results.

The test steps and expected results specify the actions and parameters to be applied to the TSFI as well as how the expected results should be verified and what they are. The evaluator must determine that the test steps and expected results are consistent with the descriptions of the TSFI in the functional specification. This means that each characteristic of the TSFI behaviour explicitly described in the functional specification should have tests and expected results to verify that behaviour.

The overall aim of this testing activity is to determine that each subsystem, module, and TSFI has been sufficiently tested against the behavioural claims in the functional specification, TOE design, and architecture description. At the higher assurance levels, testing also includes bounds testing and negative testing. The test procedures will provide insight as to how the TSFIs, modules, and subsystems have been exercised by the developer during testing. The evaluator uses this information when developing additional tests to independently test the TSF.

13.3 Coverage (ATE_COV)

13.3.1 Evaluation of sub-activity (ATE_COV.1)

13.3.1.1 Objectives

The objective of this sub-activity is to determine whether the developer has tested the TSFIs, and that the developer's test coverage evidence shows correspondence between the tests identified in the test documentation and the TSFIs described in the functional specification.

13.3.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) the test documentation;
- d) the test coverage evidence.

13.3.1.3 Application notes

The coverage analysis provided by the developer is required to show the correspondence between the tests provided as evaluation evidence and the functional specification. However, the coverage analysis need not demonstrate that all TSFI have been tested, or that all externally-visible interfaces to the TOE have been tested. Such shortcomings are considered by the evaluator during the independent testing (Evaluation of sub-activity (ATE_IND.2)) sub-activity.

13.3.1.4 Action ATE_COV.1.1E

ISO/IEC 15408-3 ATE_COV.1.1C: *The evidence of the test coverage shall show the correspondence between the tests in the test documentation and the TSFIs in the functional specification.*

13.3.1.4.1 Work unit ATE_COV.1-1

The evaluator shall examine the test coverage evidence to determine that the correspondence between the tests identified in the test documentation and the TSFIs described in the functional specification is accurate.

Correspondence may take the form of a table or matrix. The coverage evidence required for this component will reveal the extent of coverage, rather than to show complete coverage. In cases where coverage is shown to be poor the evaluator should increase the level of independent testing to compensate.

13.3.2 Evaluation of sub-activity (ATE_COV.2)

13.3.2.1 Objectives

The objective of this sub-activity is to determine whether the developer has tested all of the TSFIs, and that the developer's test coverage evidence shows correspondence between the tests identified in the test documentation and the TSFIs described in the functional specification.

13.3.2.2 Input

- a) the ST;
- b) the functional specification;
- c) the test documentation;
- d) the test coverage analysis.

13.3.2.3 Action ATE_COV.2.1E

ISO/IEC 15408-3 ATE_COV.2.1C: *The analysis of the test coverage shall demonstrate the correspondence between the tests in the test documentation and the TSFIs in the functional specification.*

13.3.2.3.1 Work unit ATE_COV.2-1

The evaluator shall examine the test coverage analysis to determine that the correspondence between the tests in the test documentation and the interfaces in the functional specification is accurate.

A simple cross-table may be sufficient to show test correspondence. The identification of the tests and the interfaces presented in the test coverage analysis has to be unambiguous.

The evaluator is reminded that this does not imply that all tests in the test documentation must map to interfaces in the functional specification.

13.3.2.3.2 Work unit ATE_COV.2-2

The evaluator shall examine the test plan to determine that the testing approach for each interface demonstrates the expected behaviour of that interface.

Guidance on this work unit can be found in:

- a) 13.2.1, Understanding the expected behaviour of the TOE
- b) 13.2.2, Testing vs. alternate approaches to verify the expected behaviour of functionality

13.3.2.3.3 Work unit ATE_COV.2-3

The evaluator shall examine the test procedures to determine that the test prerequisites, test steps and expected result(s) adequately test each interface.

Guidance on this work units, as it pertains to the functional specification, can be found in:

- a) 13.2.3, Verifying the adequacy of tests

ISO/IEC 15408-3 ATE_COV.2.2C: *The analysis of the test coverage shall demonstrate that all TSFIs in the functional specification have been tested.*

13.3.2.3.4 Work unit ATE_COV.2-4

The evaluator shall examine the test coverage analysis to determine that the correspondence between the interfaces in the functional specification and the tests in the test documentation is complete.

All TSFIs that are described in the functional specification have to be present in the test coverage analysis and mapped to tests in order for completeness to be claimed, although exhaustive specification testing of interfaces is not required. Incomplete coverage would be evident if an interface was identified in the functional specification and no test was mapped to it.

The evaluator is reminded that this does not imply that all tests in the test documentation must map to interfaces in the functional specification.

13.3.3 Evaluation of sub-activity (ATE_COV.3)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

13.4 Depth (ATE_DPT)

13.4.1 Evaluation of sub-activity (ATE_DPT.1)

13.4.1.1 Objectives

The objective of this sub-activity is to determine whether the developer has tested the TSF subsystems against the TOE design and the security architecture description.

13.4.1.2 Input

- a) the ST;
- b) the functional specification;
- c) the TOE design;
- d) the security architecture description;
- e) the test documentation;
- f) the depth of testing analysis.

13.4.1.3 Action ATE_DPT.1.1E

ISO/IEC 15408-3 ATE_DPT.1.1C: *The analysis of the depth of testing shall demonstrate the correspondence between the tests in the test documentation and the TSF subsystems in the TOE design.*

13.4.1.3.1 Work unit ATE_DPT.1-1

The evaluator shall examine the depth of testing analysis to determine that the descriptions of the behaviour of TSF subsystems and of their interactions is included within the test documentation.

This work unit verifies the content of the correspondence between the tests and the descriptions in the TOE design. In cases where the description of the TSF's architectural soundness (in Security Architecture (ADV_ARC)) cites specific mechanisms, this work unit also verifies the correspondence between the tests and the descriptions of the behaviour of such mechanisms.

A simple cross-table may be sufficient to show test correspondence. The identification of the tests and the behaviour/interaction presented in the depth-of coverage analysis has to be unambiguous.

The evaluator is reminded that not all tests in the test documentation must map to a subsystem behaviour or interaction description.

13.4.1.3.2 Work unit ATE_DPT.1-2

The evaluator shall examine the test plan, test prerequisites, test steps and expected result(s) to determine that the testing approach for the behaviour description demonstrates the behaviour of that subsystem as described in the TOE design.

Guidance on this work unit can be found in:

- a) 13.2.1, Understanding the expected behaviour of the TOE
- b) 13.2.2, Testing vs. alternate approaches to verify the expected behaviour of functionality

If TSF subsystem interfaces are described, the behaviour of those subsystems may be tested directly from those interfaces. Otherwise, the behaviour of those subsystems is tested from the TSFI interfaces. Or a combination of the two may be employed. Whatever strategy is used the evaluator will consider its appropriateness for adequately testing the behaviour that is described in the TOE design.

13.4.1.3.3 Work unit ATE_DPT.1-3

The evaluator shall examine the test plan, test prerequisites, test steps and expected result(s) to determine that the testing approach for the behaviour description demonstrates the interactions among subsystems as described in the TOE design.

While the previous work unit addresses behaviour of subsystems, this work unit addresses the interactions among subsystems.

Guidance on this work unit can be found in:

- a) 13.2.1, Understanding the expected behaviour of the TOE
- b) 13.2.2, Testing vs. alternate approaches to verify the expected behaviour of functionality

If TSF subsystem interfaces are described, the interactions with other subsystems may be tested directly from those interfaces. Otherwise, the interactions among subsystems must be inferred from the TSFI interfaces. Whatever strategy is used the evaluator will consider its appropriateness for adequately testing the interactions among subsystems that are described in the TOE design.

ISO/IEC 15408-3 ATE_DPT.1.2C: *The analysis of the depth of testing shall demonstrate that all TSF subsystems in the TOE design have been tested.*

13.4.1.3.4 Work unit ATE_DPT.1-4

The evaluator shall examine the test procedures to determine that all descriptions of TSF subsystem behaviour and interaction are tested.

This work unit verifies the completeness of work unit ATE_DPT.1-1. All descriptions of TSF subsystem behaviour and of interactions among TSF subsystems that are provided in the TOE design have to be tested. Incomplete depth of testing would be evident if a description of TSF subsystem behaviour or of interactions among TSF subsystems was identified in the TOE design and no tests could be attributed to it.

The evaluator is reminded that this does not imply that all tests in the test documentation must map to subsystem interfaces in the TOE design.

13.4.2 Evaluation of sub-activity (ATE_DPT.2)

13.4.2.1 Objectives

The objective of this sub-activity is to determine whether the developer has tested all the TSF subsystems and SFR-enforcing modules against the TOE design and the security architecture description.

13.4.2.2 Input

- a) the ST;
- b) the functional specification;
- c) the TOE design;
- d) the security architecture description;
- e) the test documentation;
- f) the depth of testing analysis.

13.4.2.3 Action ATE_DPT.2.1E

ISO/IEC 15408-3 ATE_DPT.2.1C: *The analysis of the depth of testing shall demonstrate the correspondence between the tests in the test documentation and the TSF subsystems and SFR-enforcing modules in the TOE design.*

13.4.2.3.1 Work unit ATE_DPT.2-1

The evaluator shall examine the depth of testing analysis to determine that descriptions of the behaviour of TSF subsystems and of their interactions are included within the test documentation.

This work unit verifies the content of the correspondence between the tests and the descriptions in the TOE design. In cases where the description of the TSF's architectural soundness (in Security Architecture (ADV_ARC)) cites specific mechanisms, this work unit also verifies the correspondence between the tests and the descriptions of the behaviour of such mechanisms.

A simple cross-table may be sufficient to show test correspondence. The identification of the tests and the behaviour/interaction presented in the depth-of coverage analysis has to be unambiguous.

The evaluator is reminded that not all tests in the test documentation must map to a subsystem behaviour or interaction description.

13.4.2.3.2 Work unit ATE_DPT.2-2

The evaluator shall examine the test plan, test prerequisites, test steps and expected result(s) to determine that the testing approach for the behaviour description demonstrates the behaviour of that subsystem as described in the TOE design.

Guidance on this work unit can be found in:

- a) 13.2.1, Understanding the expected behaviour of the TOE
- b) 13.2.2, Testing vs. alternate approaches to verify the expected behaviour of functionality

If TSF subsystem interfaces are described, the behaviour of those subsystems may be tested directly from those interfaces. Otherwise, the behaviour of those subsystems is tested from the TSFI interfaces. Or a combination of the two may be employed. Whatever strategy is used the evaluator will consider its appropriateness for adequately testing the behaviour that is described in the TOE design.

13.4.2.3.3 Work unit ATE_DPT.2-3

The evaluator shall examine the test plan, test prerequisites, test steps and expected result(s) to determine that the testing approach for the behaviour description demonstrates the interactions among subsystems as described in the TOE design.

While the previous work unit addresses behaviour of subsystems, this work unit addresses the interactions among subsystems.

Guidance on this work unit can be found in:

- a) 13.2.1, Understanding the expected behaviour of the TOE
- b) 13.2.2, Testing vs. alternate approaches to verify the expected behaviour of functionality

If TSF subsystem interfaces are described, the interactions with other subsystems may be tested directly from those interfaces. Otherwise, the interactions among subsystems must be inferred from the TSFI interfaces. Whatever strategy is used the evaluator will consider its appropriateness for adequately testing the interactions among subsystems that are described in the TOE design.

13.4.2.3.4 Work unit ATE_DPT.2-4

The evaluator shall examine the depth of testing analysis to determine that the interfaces of SFR-enforcing modules are included within the test documentation.

This work unit verifies the content of the correspondence between the tests and the descriptions in the TOE design. In cases where the description of the TSF's architectural soundness (in Security Architecture (ADV_ARC)) cites specific mechanisms at the modular level, this work unit also verifies the correspondence between the tests and the descriptions of the behaviour of such mechanisms.

A simple cross-table may be sufficient to show test correspondence. The identification of the tests and the behaviour/interaction presented in the depth of coverage analysis has to be unambiguous.

The evaluator is reminded that not all tests in the test documentation must map to a subsystem behaviour or interaction description.

13.4.2.3.5 Work unit ATE_DPT.2-5

The evaluator shall examine the test plan, test prerequisites, test steps and expected result(s) to determine that the testing approach for each SFR-enforcing module interface demonstrates the expected behaviour of that interface.

While work unit ATE_DPT.2-1 addresses expected behaviour of subsystems, this work unit addresses expected behaviour of the SFR-enforcing module interfaces that are covered by ATE_DPT.2-4.

Guidance on this work unit can be found in:

- a) 13.2.1, Understanding the expected behaviour of the TOE
- b) 13.2.2, Testing vs. alternate approaches to verify the expected behaviour of functionality

Testing of an interface may be performed directly at that interface, or at the external interfaces, or a combination of both. Whatever strategy is used the evaluator will consider its appropriateness for adequately testing the interfaces. Specifically the evaluator determines whether testing at the internal interfaces is necessary or whether these internal interfaces can be adequately tested (albeit implicitly) by exercising the external interfaces. This determination is left to the evaluator, as is its justification.

ISO/IEC 15408-3 ATE_DPT.2.2C: *The analysis of the depth of testing shall demonstrate that all TSF subsystems in the TOE design have been tested.*

13.4.2.3.6 Work unit ATE_DPT.2-6

The evaluator shall examine the test procedures to determine that all descriptions of TSF subsystem behaviour and interaction are tested.

This work unit verifies the completeness of work unit ATE_DPT.2-1. All descriptions of TSF subsystem behaviour and of interactions among TSF subsystems that are provided in the TOE design have to be tested. Incomplete depth of testing would be evident if a description of TSF subsystem behaviour or of interactions among TSF subsystems was identified in the TOE design and no tests could be attributed to it.

The evaluator is reminded that this does not imply that all tests in the test documentation must map to subsystem interfaces in the TOE design.

ISO/IEC 15408-3 ATE_DPT.2.3C: *The analysis of the depth of testing shall demonstrate that the SFR-enforcing modules in the TOE design have been tested.*

13.4.2.3.7 Work unit ATE_DPT.2-7

The evaluator shall examine the test procedures to determine that all interfaces of SFR-enforcing modules are tested.

This work unit verifies the completeness of work unit ATE_DPT.2-4. All interfaces of SFR-enforcing modules that are provided in the TOE design have to be tested. Incomplete depth of testing would be evident if any interface of any SFR-enforcing modules was identified in the TOE design and no tests could be attributed to it.

The evaluator is reminded that this does not imply that all tests in the test documentation must map to an interface of an SFR-enforcing module in the TOE design.

13.4.3 Evaluation of sub-activity (ATE_DPT.3)

13.4.3.1 Objectives

The objective of this sub-activity is to determine whether the developer has tested the all the TSF subsystems and modules against the TOE design and the security architecture description.

13.4.3.2 Input

- a) the ST;
- b) the functional specification;
- c) the TOE design;
- d) the security architecture description;
- e) the test documentation;
- f) the depth of testing analysis.

13.4.3.3 Action ATE_DPT.3.1E

ISO/IEC 15408-3 ATE_DPT.3.1C: *The analysis of the depth of testing shall demonstrate the correspondence between the tests in the test documentation and the TSF subsystems and modules in the TOE design.*

13.4.3.3.1 Work unit ATE_DPT.3-1

The evaluator shall examine the depth of testing analysis to determine that descriptions of the behaviour of TSF subsystems and of their interactions are included within the test documentation.

This work unit verifies the content of the correspondence between the tests and the descriptions in the TOE design. A simple cross-table may be sufficient to show test correspondence. The identification of the tests and the behaviour/interaction presented in the depth-of coverage analysis has to be unambiguous.

The evaluator is reminded that not all tests in the test documentation must map to a subsystem behaviour or interaction description.

13.4.3.3.2 Work unit ATE_DPT.3-2

The evaluator shall examine the test plan, test prerequisites, test steps and expected result(s) to determine that the testing approach for the behaviour description demonstrates the behaviour of that subsystem as described in the TOE design.

Guidance on this work unit can be found in:

- a) 13.2.1, Understanding the expected behaviour of the TOE
- b) 13.2.2, Testing vs. alternate approaches to verify the expected behaviour of functionality

If TSF subsystem interfaces are provided, the behaviour of those subsystems may be performed directly from those interfaces. Otherwise, the behaviour of those subsystems is tested from the TSFI interfaces. Or a combination of the two may be employed. Whatever strategy is used the evaluator will consider its appropriateness for adequately testing the behaviour that is described in the TOE design.

13.4.3.3.3 Work unit ATE_DPT.3-3

The evaluator shall examine the test plan, test prerequisites, test steps and expected result(s) to determine that the testing approach for the behaviour description demonstrates the interactions among subsystems as described in the TOE design.

Guidance on this work unit can be found in:

- a) 13.2.1, Understanding the expected behaviour of the TOE
- b) 13.2.2, Testing vs. alternate approaches to verify the expected behaviour of functionality

While the previous work unit addresses behaviour of subsystems, this work unit addresses the interactions among subsystems.

If TSF subsystem interfaces are provided, the interactions with other subsystems may be performed directly from those interfaces. Otherwise, the interactions among subsystems must be inferred from the TSFI interfaces. Whatever strategy is used the evaluator will consider its appropriateness for adequately testing the interactions among subsystems that are described in the TOE design.

13.4.3.3.4 Work unit ATE_DPT.3-4

The evaluator shall examine the depth of testing analysis to determine that the interfaces of TSF modules are included within the test documentation.

This work unit verifies the content of the correspondence between the tests and the descriptions in the TOE design. A simple cross-table may be sufficient to show test correspondence. The identification of the tests and the behaviour/interaction presented in the depth-of coverage analysis has to be unambiguous.

The evaluator is reminded that not all tests in the test documentation must map to a subsystem behaviour or interaction description.

13.4.3.3.5 Work unit ATE_DPT.3-5

The evaluator shall examine the test plan, test prerequisites, test steps and expected result(s) to determine that the testing approach for each TSF module interface demonstrates the expected behaviour of that interface.

Guidance on this work unit can be found in:

- a) 13.2.1, Understanding the expected behaviour of the TOE
- b) 13.2.2, Testing vs. alternate approaches to verify the expected behaviour of functionality

Testing of an interface may be performed directly at that interface, or at the external interfaces, or a combination of both. Whatever strategy is used the evaluator will consider its appropriateness for adequately testing the interfaces. Specifically the evaluator determines whether testing at the internal interfaces is necessary or whether these internal interfaces can be adequately tested (albeit implicitly) by exercising the external interfaces. This determination is left to the evaluator, as is its justification.

ISO/IEC 15408-3 ATE_DPT.3.2C: *The analysis of the depth of testing shall demonstrate that all TSF subsystems in the TOE design have been tested.*

13.4.3.3.6 Work unit ATE_DPT.3-6

The evaluator shall examine the test procedures to determine that all descriptions of TSF subsystem behaviour and interaction are tested.

This work unit verifies the completeness of work unit ATE_DPT.3-1. All descriptions of TSF subsystem behaviour and of interactions among TSF subsystems that are provided in the TOE design have to be tested. Incomplete depth of testing would be evident if a description of TSF subsystem behaviour or of interactions among TSF subsystems was identified in the TOE design and no tests could be attributed to it.

The evaluator is reminded that this does not imply that all tests in the test documentation must map to subsystem interfaces in the TOE design.

ISO/IEC 15408-3 ATE_DPT.3.3C: *The analysis of the depth of testing shall demonstrate that all TSF modules in the TOE design have been tested.*

13.4.3.3.7 Work unit ATE_DPT.3-7

The evaluator shall examine the test procedures to determine that all interfaces of all TSF modules are tested.

This work unit verifies the completeness of work unit ATE_DPT.3-4. All interfaces of TSF modules that are provided in the TOE design have to be tested. Incomplete depth of testing would be evident if any interface of any TSF module was identified in the TOE design and no tests could be attributed to it.

The evaluator is reminded that this does not imply that all tests in the test documentation must map to an interface of a TSF module in the TOE design.

13.4.4 Evaluation of sub-activity (ATE_DPT.4)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

13.5 Functional tests (ATE_FUN)

13.5.1 Evaluation of sub-activity (ATE_FUN.1)

13.5.1.1 Objectives

The objective of this sub-activity is to determine whether the developer correctly performed and documented the tests in the test documentation.

13.5.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) the test documentation.

13.5.1.3 Application notes

The extent to which the test documentation is required to cover the TSF is dependent upon the coverage assurance component.

For the developer tests provided, the evaluator determines whether the tests are repeatable, and the extent to which the developer's tests can be used for the evaluator's independent testing effort. Any TSFI for which the developer's test results indicate that it might not perform as specified should be tested independently by the evaluator to determine whether or not it does.

13.5.1.4 Action ATE_FUN.1.1E

ISO/IEC 15408-3 ATE_FUN.1.1C: *The test documentation shall consist of test plans, expected test results and actual test results.*

13.5.1.4.1 Work unit ATE_FUN.1-1

The evaluator shall check that the test documentation includes test plans, expected test results and actual test results.

The evaluator checks that test plans, expected tests results and actual test results are included in the test documentation.

ISO/IEC 15408-3 ATE_FUN.1.2C: *The test plans shall identify the tests to be performed and describe the scenarios for performing each test. These scenarios shall include any ordering dependencies on the results of other tests.*

13.5.1.4.2 Work unit ATE_FUN.1-2

The evaluator shall examine the test plan to determine that it describes the scenarios for performing each test.

The evaluator determines that the test plan provides information about the test configuration being used: both on the configuration of the TOE and on any test equipment being used. This information should be detailed enough to ensure that the test configuration is reproducible.

The evaluator also determines that the test plan provides information about how to execute the test: any necessary automated set-up procedures (and whether they require privilege to run), inputs to be applied, how these inputs are applied, how output is obtained, any automated clean-up procedures (and whether they require privilege to run), etc. This information should be detailed enough to ensure that the test is reproducible.

The evaluator may wish to employ a sampling strategy when performing this work unit.

13.5.1.4.3 Work unit ATE_FUN.1-3

The evaluator shall examine the test plan to determine that the TOE test configuration is consistent with the ST.

The TOE referred to in the developer's test plan should have the same unique reference as established by the CM capabilities (ALC_CMC) sub-activities and identified in the ST introduction.

It is possible for the ST to specify more than one configuration for evaluation. The evaluator verifies that all test configurations identified in the developer test documentation are consistent with the ST. For example, the ST might define configuration options that must be set, which could have an impact upon what constitutes the TOE by including or excluding additional portions. The evaluator verifies that all such variations of the TOE are considered.

The evaluator should consider the security objectives for the operational environment described in the ST that may apply to the test environment. There may be some objectives for the operational environment that do not apply to the test environment. For example, an objective about user clearances may not apply; however, an objective about a single point of connection to a network would apply.

The evaluator may wish to employ a sampling strategy when performing this work unit.

If this work unit is applied to a component TOE that might be used/integrated in a composed TOE (see Class ACO: Composition), the following will apply. In the instances that the component TOE under evaluation depends on other components in the operational environment to support their operation, the developer may wish to consider using the other component(s) that will be used in the composed TOE to fulfil the requirements of the operational environment as one of the test configurations. This will reduce the amount of additional testing that will be required for the composed TOE evaluation.

13.5.1.4.4 Work unit ATE_FUN.1-4

The evaluator shall examine the test plans to determine that sufficient instructions are provided for any ordering dependencies.

Some steps may have to be performed to establish initial conditions. For example, user accounts need to be added before they can be deleted. An example of ordering dependencies on the results of other tests is the need to perform actions in a test that will result in the generation of audit records, before performing a test to consider the searching and sorting of those audit records. Another example of an ordering dependency would be where one test case generates a file of data to be used as input for another test case.

The evaluator may wish to employ a sampling strategy when performing this work unit.

ISO/IEC 15408-3 ATE_FUN.1.3C: *The expected test results shall show the anticipated outputs from a successful execution of the tests.*

13.5.1.4.5 Work unit ATE_FUN.1-5

The evaluator shall examine the test documentation to determine that all expected tests results are included.

The expected test results are needed to determine whether or not a test has been successfully performed. Expected test results are sufficient if they are unambiguous and consistent with expected behaviour given the testing approach.

The evaluator may wish to employ a sampling strategy when performing this work unit.

ISO/IEC 15408-3 ATE_FUN.1.4C: *The actual test results shall be consistent with the expected test results.*

13.5.1.4.6 Work unit ATE_FUN.1-6

The evaluator shall check that the actual test results in the test documentation are consistent with the expected test results in the test documentation.

A comparison of the actual and expected test results provided by the developer will reveal any inconsistencies between the results. It may be that a direct comparison of actual results cannot be made until some data reduction or synthesis has been first performed. In such cases, the developer's test documentation should describe the process to reduce or synthesise the actual data.

For example, the developer may need to test the contents of a message buffer after a network connection has occurred to determine the contents of the buffer. The message buffer will contain a binary number. This binary number would have to be converted to another form of data representation in order to make the test more meaningful. The conversion of this binary representation of data into a higher-level representation will have to be described by the developer in enough detail to allow an evaluator to perform the conversion process (i.e. synchronous or asynchronous transmission, number of stop bits, parity, etc.).

It should be noted that the description of the process used to reduce or synthesise the actual data is used by the evaluator not to actually perform the necessary modification but to assess whether this process is correct. It is up to the developer to transform the expected test results into a format that allows an easy comparison with the actual test results.

The evaluator may wish to employ a sampling strategy when performing this work unit.

13.5.1.4.7 Work unit ATE_FUN.1-7

The evaluator shall report the developer testing effort, outlining the testing approach, configuration, depth and results.

The developer testing information recorded in the ETR allows the evaluator to convey the overall testing approach and effort expended on the testing of the TOE by the developer. The intent of providing this information is to give a meaningful overview of the developer testing effort. It is not intended that the information regarding developer testing in the ETR be an exact reproduction of specific test steps or results of individual tests. The intention is to provide enough detail to allow other evaluators and evaluation authorities to gain some insight about the developer's testing approach, amount of testing performed, TOE test configurations, and the overall results of the developer testing.

Information that would typically be found in the ETR subclause regarding the developer testing effort is:

- a) TOE test configurations. The particular configurations of the TOE that were tested, including whether any privileged code was required to set up the test or clean up afterwards;
- b) testing approach. An account of the overall developer testing strategy employed;
- c) testing results. A description of the overall developer testing results.

This list is by no means exhaustive and is only intended to provide some context as to the type of information that should be present in the ETR concerning the developer testing effort.

13.5.2 Evaluation of sub-activity (ATE_FUN.2)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

13.6 Independent testing (ATE_IND)

13.6.1 Evaluation of sub-activity (ATE_IND.1)

13.6.1.1 Objectives

The goal of this activity is to determine, by independently testing a subset of the TSFI, whether the TOE behaves as specified in the functional specification and guidance documentation.

13.6.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) the operational user guidance;
- d) the preparative user guidance;
- e) the TOE suitable for testing.

13.6.1.3 Action ATE_IND.1.1E

ISO/IEC 15408-3 ATE_IND.1.1C: *The TOE shall be suitable for testing.*

13.6.1.3.1 Work unit ATE_IND.1-1

The evaluator shall examine the TOE to determine that the test configuration is consistent with the configuration under evaluation as specified in the ST.

The TOE provided by the developer should have the same unique reference as established by the CM capabilities (ALC_CMC) sub-activities and identified in the ST introduction.

It is possible for the ST to specify more than one configuration for evaluation. The TOE may comprise a number of distinct hardware and software entities that need to be tested in accordance with the ST. The evaluator verifies that all test configurations are consistent with the ST.

The evaluator should consider the security objectives for the operational environment described in the ST that may apply to the test environment and ensure they are met in the testing environment. There may be some objectives for the operational environment that do not apply to the test environment. For example, an objective about user clearances may not apply; however, an objective about a single point of connection to a network would apply.

If any test resources are used (e.g. meters, analysers) it will be the evaluator's responsibility to ensure that these resources are calibrated correctly.

13.6.1.3.2 Work unit ATE_IND.1-2

The evaluator shall examine the TOE to determine that it has been installed properly and is in a known state.

It is possible for the evaluator to determine the state of the TOE in a number of ways. For example, previous successful completion of the Evaluation of sub-activity (AGD_PRE.1) sub-activity will satisfy this work unit if the evaluator still has confidence that the TOE being used for testing was installed properly and is in a known state. If this is not the case, then the evaluator should follow the developer's procedures to install and start up the TOE, using the supplied guidance only.

If the evaluator has to perform the installation procedures because the TOE is in an unknown state, this work unit when successfully completed could satisfy work unit AGD_PRE.1-3.

13.6.1.4 Action ATE_IND.1.2E

13.6.1.4.1 Work unit ATE_IND.1-3

The evaluator shall devise a test subset.

The evaluator selects a test subset and testing strategy that is appropriate for the TOE. One extreme testing strategy would be to have the test subset contain as many interfaces as possible tested with little rigour. Another testing strategy would be to have the test subset contain a few interfaces based on their perceived relevance and rigorously test these interfaces.

Typically the testing approach taken by the evaluator should fall somewhere between these two extremes. The evaluator should exercise most of the interfaces using at least one test, but testing need not demonstrate exhaustive specification testing.

The evaluator, when selecting the subset of the interfaces to be tested, should consider the following factors:

- a) The number of interfaces from which to draw upon for the test subset. Where the TSF includes only a small number of relatively simple interfaces, it may be practical to rigorously test all of the interfaces. In other cases this may not be cost-effective, and sampling is required.
- b) Maintaining a balance of evaluation activities. The evaluator effort expended on the test activity should be commensurate with that expended on any other evaluation activity.

The evaluator selects the interfaces to compose the subset. This selection will depend on a number of factors, and consideration of these factors may also influence the choice of test subset size:

- a) Significance of interfaces. Those interfaces more significant than others should be included in the test subset. One major factor of "significance" is the security-relevance (SFR-enforcing interfaces would be more significant than SFR-supporting interfaces, which are more significant than SFR-non-interfering interfaces; see ISO/IEC 15408-3 Subclause Functional specification (ADV_FSP)). The other major factor of "significance" is the number of SFRs mapping to this interface (as determined when identifying the correspondence between levels of abstraction in ADV).
- b) Complexity of the interface. Complex interfaces may require complex tests that impose onerous requirements on the developer or evaluator, which may not be conducive to cost-effective evaluations. Conversely, they are a likely area to find errors and are good candidates for the subset. The evaluator will need to strike a balance between these considerations.
- c) Implicit testing. Testing some interfaces may often implicitly test other interfaces, and their inclusion in the subset may maximise the number of interfaces tested (albeit implicitly). Certain interfaces will typically be used to provide a variety of security functionality, and will tend to be the target of an effective testing approach.
- d) Types of interfaces (e.g. programmatic, command-line, protocol). The evaluator should consider including tests for all different types of interfaces that the TOE supports.
- e) Interfaces that give rise to features that are innovative or unusual. Where the TOE contains innovative or unusual features, which may feature strongly in marketing literature and guidance documents, the corresponding interfaces should be strong candidates for testing.

This guidance articulates factors to consider during the selection process of an appropriate test subset, but these are by no means exhaustive.

13.6.1.4.2 Work unit ATE_IND.1-4

The evaluator shall produce test documentation for the test subset that is sufficiently detailed to enable the tests to be reproducible.

With an understanding of the expected behaviour of the TSF, from the ST and the functional specification, the evaluator has to determine the most feasible way to test the interface. Specifically the evaluator considers:

- a) the approach that will be used, for instance, whether an external interface will be tested, or an internal interface using a test harness, or will an alternate test approach be employed (e.g. in exceptional circumstances, a code inspection, if the implementation representation is available);
- b) the interface(s) that will be used to test and observe responses;
- c) the initial conditions that will need to exist for the test (i.e. any particular objects or subjects that will need to exist and security attributes they will need to have);
- d) special test equipment that will be required to either stimulate an interface (e.g. packet generators) or make observations of an interface (e.g. network analysers).

The evaluator may find it practical to test each interface using a series of test cases, where each test case will test a very specific aspect of expected behaviour.

The evaluator's test documentation should specify the derivation of each test, tracing it back to the relevant interface(s).

13.6.1.4.3 Work unit ATE_IND.1-5

The evaluator shall conduct testing.

The evaluator uses the test documentation developed as a basis for executing tests on the TOE. The test documentation is used as a basis for testing but this does not preclude the evaluator from performing additional ad hoc tests. The evaluator may devise new tests based on behaviour of the TOE discovered during testing. These new tests are recorded in the test documentation.

13.6.1.4.4 Work unit ATE_IND.1-6

The evaluator shall record the following information about the tests that compose the test subset:

- a) identification of the interface behaviour to be tested;
- b) instructions to connect and setup all required test equipment as required to conduct the test;
- c) instructions to establish all prerequisite test conditions;
- d) instructions to stimulate the interface;
- e) instructions for observing the behaviour of the interface;
- f) descriptions of all expected results and the necessary analysis to be performed on the observed behaviour for comparison against expected results;
- g) instructions to conclude the test and establish the necessary post-test state for the TOE;
- h) actual test results.

The level of detail should be such that another evaluator could repeat the tests and obtain an equivalent result. While some specific details of the test results may be different (e.g. time and date fields in an audit record) the overall result should be identical.

There may be instances when it is unnecessary to provide all the information presented in this work unit (e.g. the actual test results of a test may not require any analysis before a comparison between the expected results can be made). The determination to omit this information is left to the evaluator, as is the justification.

13.6.1.4.5 Work unit ATE_IND.1-7

The evaluator shall check that all actual test results are consistent with the expected test results.

Any differences in the actual and expected test results may indicate that the TOE does not perform as specified or that the evaluator test documentation may be incorrect. Unexpected actual results may require corrective maintenance to the TOE or test documentation and perhaps require re-running of impacted tests and modifying the test sample size and composition. This determination is left to the evaluator, as is its justification.

13.6.1.4.6 Work unit ATE_IND.1-8

The evaluator shall report in the ETR the evaluator testing effort, outlining the testing approach, configuration, depth and results.

The evaluator testing information reported in the ETR allows the evaluator to convey the overall testing approach and effort expended on the testing activity during the evaluation. The intent of providing this information is to give a meaningful overview of the testing effort. It is not intended that the information regarding testing in the ETR be an exact reproduction of specific test instructions or results of individual tests. The intention is to provide enough detail to allow other evaluators and evaluation authorities to gain some insight about the testing approach chosen, amount of testing performed, TOE test configurations, and the overall results of the testing activity.

Information that would typically be found in the ETR subclause regarding the evaluator testing effort is:

- a) TOE test configurations. The particular configurations of the TOE that were tested;
- b) subset size chosen. The amount of interfaces that were tested during the evaluation and a justification for the size;
- c) selection criteria for the interfaces that compose the subset. Brief statements about the factors considered when selecting interfaces for inclusion in the subset;
- d) interfaces tested. A brief listing of the interfaces that merited inclusion in the subset;
- e) verdict for the activity. The overall judgement on the results of testing during the evaluation.

This list is by no means exhaustive and is only intended to provide some context as to the type of information that should be present in the ETR concerning the testing the evaluator performed during the evaluation.

13.6.2 Evaluation of sub-activity (ATE_IND.2)

13.6.2.1 Objectives

The goal of this activity is to determine, by independently testing a subset of the TSF, whether the TOE behaves as specified in the design documentation, and to gain confidence in the developer's test results by performing a sample of the developer's tests.

13.6.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;

- c) the TOE design description;
- d) the operational user guidance;
- e) the preparative user guidance;
- f) the configuration management documentation;
- g) the test documentation;
- h) the TOE suitable for testing.

13.6.2.3 Action ATE_IND.2.1E

ISO/IEC 15408-3 ATE_IND.2.1C: *The TOE shall be suitable for testing.*

13.6.2.3.1 Work unit ATE_IND.2-1

The evaluator shall examine the TOE to determine that the test configuration is consistent with the configuration under evaluation as specified in the ST.

The TOE provided by the developer and identified in the test plan should have the same unique reference as established by the CM capabilities (ALC_CMC) sub-activities and identified in the ST introduction.

It is possible for the ST to specify more than one configuration for evaluation. The TOE may comprise a number of distinct hardware and software entities that need to be tested in accordance with the ST. The evaluator verifies that all test configurations are consistent with the ST.

The evaluator should consider the security objectives for the operational environment described in the ST that may apply to the test environment and ensure they are met in the testing environment. There may be some objectives for the operational environment that do not apply to the test environment. For example, an objective about user clearances may not apply; however, an objective about a single point of connection to a network would apply.

If any test resources are used (e.g. meters, analysers) it will be the evaluator's responsibility to ensure that these resources are calibrated correctly.

13.6.2.3.2 Work unit ATE_IND.2-2

The evaluator shall examine the TOE to determine that it has been installed properly and is in a known state.

It is possible for the evaluator to determine the state of the TOE in a number of ways. For example, previous successful completion of the Evaluation of sub-activity (AGD_PRE.1) sub-activity will satisfy this work unit if the evaluator still has confidence that the TOE being used for testing was installed properly and is in a known state. If this is not the case, then the evaluator should follow the developer's procedures to install and start up the TOE, using the supplied guidance only.

If the evaluator has to perform the installation procedures because the TOE is in an unknown state, this work unit when successfully completed could satisfy work unit AGD_PRE.1-3.

ISO/IEC 15408-3 ATE_IND.2.2C: *The developer shall provide an equivalent set of resources to those that were used in the developer's functional testing of the TSF.*

13.6.2.3.3 Work unit ATE_IND.2-3

The evaluator shall examine the set of resources provided by the developer to determine that they are equivalent to the set of resources used by the developer to functionally test the TSF.

The set of resource used by the developer is documented in the developer test plan, as considered in the Functional tests (ATE_FUN) family. The resource set may include laboratory access and special test equipment, among others. Resources that are not identical to those used by the developer need to be equivalent in terms of any impact they may have on test results.

13.6.2.4 Action ATE_IND.2.2E

13.6.2.4.1 Work unit ATE_IND.2-4

The evaluator shall conduct testing using a sample of tests found in the developer test plan and procedures.

The overall aim of this work unit is to perform a sufficient number of the developer tests to confirm the validity of the developer's test results. The evaluator has to decide on the size of the sample, and the developer tests that will compose the sample (see A.2).

All the developer tests can be traced back to specific interfaces. Therefore, the factors to consider in the selection of the tests to compose the sample are similar to those listed for subset selection in work-unit ATE_IND.2-6. Additionally, the evaluator may wish to employ a random sampling method to select developer tests to include in the sample.

13.6.2.4.2 Work unit ATE_IND.2-5

The evaluator shall check that all the actual test results are consistent with the expected test results.

Inconsistencies between the developer's expected test results and actual test results will compel the evaluator to resolve the discrepancies. Inconsistencies encountered by the evaluator could be resolved by a valid explanation and resolution of the inconsistencies by the developer.

If a satisfactory explanation or resolution can not be reached, the evaluator's confidence in the developer's test results may be lessened and it may be necessary for the evaluator to increase the sample size to the extent that the subset identified in work unit ATE_IND.2-4 is adequately tested: deficiencies with the developer's tests need to result in either corrective action to the developer's tests or in the production of new tests by the evaluator.

13.6.2.5 Action ATE_IND.2.3E

13.6.2.5.1 Work unit ATE_IND.2-6

The evaluator shall devise a test subset.

The evaluator selects a test subset and testing strategy that is appropriate for the TOE. One extreme testing strategy would be to have the test subset contain as many interfaces as possible tested with little rigour. Another testing strategy would be to have the test subset contain a few interfaces based on their perceived relevance and rigorously test these interfaces.

Typically the testing approach taken by the evaluator should fall somewhere between these two extremes. The evaluator should exercise most of the interfaces using at least one test, but testing need not demonstrate exhaustive specification testing.

The evaluator, when selecting the subset of the interfaces to be tested, should consider the following factors:

- a) The developer test evidence. The developer test evidence consists of: the test documentation, the available test coverage analysis, and the available depth of testing analysis. The developer test evidence will provide insight as to how the TSF has been exercised by the developer during testing. The evaluator applies this information when developing new tests to independently test the TOE. Specifically the evaluator should consider:
 - 1) augmentation of developer testing for interfaces. The evaluator may wish to perform more of the same type of tests by varying parameters to more rigorously test the interface.

- 2) supplementation of developer testing strategy for interfaces. The evaluator may wish to vary the testing approach of a specific interface by testing it using another test strategy.
- b) The number of interfaces from which to draw upon for the test subset. Where the TSF includes only a small number of relatively simple interfaces, it may be practical to rigorously test all of them. In other cases this may not be cost-effective, and sampling is required.
- c) Maintaining a balance of evaluation activities. The evaluator effort expended on the test activity should be commensurate with that expended on any other evaluation activity.

The evaluator selects the interfaces to compose the subset. This selection will depend on a number of factors, and consideration of these factors may also influence the choice of test subset size:

- a) Rigour of developer testing of the interfaces. Those interfaces that the evaluator determines require additional testing should be included in the test subset.
- b) Developer test results. If the results of developer tests cause the evaluator to doubt that an interface is not properly implemented, then the evaluator should include such interfaces in the test subset.
- c) Significance of interfaces. Those interfaces more significant than others should be included in the test subset. One major factor of "significance" is the security-relevance (SFR-enforcing interfaces would be more significant than SFR-supporting interfaces, which are more significant than SFR-non-interfering interfaces; see ISO/IEC 15408-3 Subclause ADV_FSP). The other major factor of "significance" is the number of SFRs mapping to this interface (as determined when identifying the correspondence between levels of abstraction in ADV).
- d) Complexity of interfaces. Interfaces that require complex implementation may require complex tests that impose onerous requirements on the developer or evaluator, which may not be conducive to cost-effective evaluations. Conversely, they are a likely area to find errors and are good candidates for the subset. The evaluator will need to strike a balance between these considerations.
- e) Implicit testing. Testing some interfaces may often implicitly test other interfaces, and their inclusion in the subset may maximise the number of interfaces tested (albeit implicitly). Certain interfaces will typically be used to provide a variety of security functionality, and will tend to be the target of an effective testing approach.
- f) Types of interfaces (e.g. programmatic, command-line, protocol). The evaluator should consider including tests for all different types of interfaces that the TOE supports.
- g) Interfaces that give rise to features that are innovative or unusual. Where the TOE contains innovative or unusual features, which may feature strongly in marketing literature and guidance documents, the corresponding interfaces should be strong candidates for testing.

This guidance articulates factors to consider during the selection process of an appropriate test subset, but these are by no means exhaustive.

13.6.2.5.2 Work unit ATE_IND.2-7

The evaluator shall produce test documentation for the test subset that is sufficiently detailed to enable the tests to be reproducible.

With an understanding of the expected behaviour of the TSF, from the ST, the functional specification, and the TOE design description, the evaluator has to determine the most feasible way to test the interface. Specifically the evaluator considers:

- a) the approach that will be used, for instance, whether an external interface will be tested, or an internal interface using a test harness, or will an alternate test approach be employed (e.g. in exceptional circumstances, a code inspection);

- b) the interface(s) that will be used to test and observe responses;
- c) the initial conditions that will need to exist for the test (i.e. any particular objects or subjects that will need to exist and security attributes they will need to have);
- d) special test equipment that will be required to either stimulate an interface (e.g. packet generators) or make observations of an interface (e.g. network analysers).

The evaluator may find it practical to test each interface using a series of test cases, where each test case will test a very specific aspect of expected behaviour of that interface.

The evaluator's test documentation should specify the derivation of each test, tracing it back to the relevant interface(s).

13.6.2.5.3 Work unit ATE_IND.2-8

The evaluator shall conduct testing.

The evaluator uses the test documentation developed as a basis for executing tests on the TOE. The test documentation is used as a basis for testing but this does not preclude the evaluator from performing additional ad hoc tests. The evaluator may devise new tests based on behaviour of the TOE discovered during testing. These new tests are recorded in the test documentation.

13.6.2.5.4 Work unit ATE_IND.2-9

The evaluator shall record the following information about the tests that compose the test subset:

- a) identification of the interface behaviour to be tested;
- b) instructions to connect and setup all required test equipment as required to conduct the test;
- c) instructions to establish all prerequisite test conditions;
- d) instructions to stimulate the interface;
- e) instructions for observing the interface;
- f) descriptions of all expected results and the necessary analysis to be performed on the observed behaviour for comparison against expected results;
- g) instructions to conclude the test and establish the necessary post-test state for the TOE;
- h) actual test results.

The level of detail should be such that another evaluator could repeat the tests and obtain an equivalent result. While some specific details of the test results may be different (e.g. time and date fields in an audit record) the overall result should be identical.

There may be instances when it is unnecessary to provide all the information presented in this work unit (e.g. the actual test results of a test may not require any analysis before a comparison between the expected results can be made). The determination to omit this information is left to the evaluator, as is the justification.

13.6.2.5.5 Work unit ATE_IND.2-10

The evaluator shall check that all actual test results are consistent with the expected test results.

Any differences in the actual and expected test results may indicate that the TOE does not perform as specified or that the evaluator test documentation may be incorrect. Unexpected actual results may require corrective maintenance to the TOE or test documentation and perhaps require re-running of impacted tests.

and modifying the test sample size and composition. This determination is left to the evaluator, as is its justification.

13.6.2.5.6 Work unit ATE_IND.2-11

The evaluator shall report in the ETR the evaluator testing effort, outlining the testing approach, configuration, depth and results.

The evaluator testing information reported in the ETR allows the evaluator to convey the overall testing approach and effort expended on the testing activity during the evaluation. The intent of providing this information is to give a meaningful overview of the testing effort. It is not intended that the information regarding testing in the ETR be an exact reproduction of specific test instructions or results of individual tests. The intention is to provide enough detail to allow other evaluators and evaluation authorities to gain some insight about the testing approach chosen, amount of evaluator testing performed, amount of developer tests performed, TOE test configurations, and the overall results of the testing activity.

Information that would typically be found in the ETR subclause regarding the evaluator testing effort is:

- a) TOE test configurations. The particular configurations of the TOE that were tested.
- b) subset size chosen. The amount of interfaces that were tested during the evaluation and a justification for the size.
- c) selection criteria for the interfaces that compose the subset. Brief statements about the factors considered when selecting interfaces for inclusion in the subset.
- d) Interfaces tested. A brief listing of the interfaces that merited inclusion in the subset.
- e) developer tests performed. The amount of developer tests performed and a brief description of the criteria used to select the tests.
- f) verdict for the activity. The overall judgement on the results of testing during the evaluation.

This list is by no means exhaustive and is only intended to provide some context as to the type of information that should be present in the ETR concerning the testing the evaluator performed during the evaluation.

13.6.3 Evaluation of sub-activity (ATE_IND.3)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

14 Class AVA: Vulnerability assessment

14.1 Introduction

The purpose of the vulnerability assessment activity is to determine the exploitability of flaws or weaknesses in the TOE in the operational environment. This determination is based upon analysis of the evaluation evidence and a search of publicly available material by the evaluator and is supported by evaluator penetration testing.

14.2 Vulnerability analysis (AVA_VAN)

14.2.1 Evaluation of sub-activity (AVA_VAN.1)

14.2.1.1 Objectives

The objective of this sub-activity is to determine whether the TOE, in its operational environment, has easily identifiable exploitable vulnerabilities.

14.2.1.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the guidance documentation;
- c) the TOE suitable for testing;
- d) information publicly available to support the identification of potential vulnerabilities.

Other input for this sub-activity is:

- a) current information regarding potential vulnerabilities (e.g. from an evaluation authority).

14.2.1.3 Application notes

The evaluator should consider performing additional tests as a result of potential vulnerabilities encountered during the conduct of other parts of the evaluation.

The use of the term guidance in this sub-activity refers to the operational guidance and the preparative guidance.

Potential vulnerabilities may be in information that is publicly available, or not, and may require skill to exploit, or not. These two aspects are related, but are distinct. It should not be assumed that, simply because a potential vulnerability is identifiable from information that is publicly available, it can be easily exploited.

14.2.1.4 Action AVA_VAN.1.1E

ISO/IEC 15408-3 AVA_VAN.1.1C: *The TOE shall be suitable for testing.*

14.2.1.4.1 Work unit AVA_VAN.1-1

The evaluator shall examine the TOE to determine that the test configuration is consistent with the configuration under evaluation as specified in the ST.

The TOE provided by the developer and identified in the test plan should have the same unique reference as established by the CM capabilities (ALC_CMC) sub-activities and identified in the ST introduction.

It is possible for the ST to specify more than one configuration for evaluation. The TOE may comprise a number of distinct hardware and software entities that need to be tested in accordance with the ST. The evaluator verifies that all test configurations are consistent with the ST.

The evaluator should consider the security objectives for the operational environment described in the ST that may apply to the test environment and ensure they are met in the testing environment. There may be some objectives for the operational environment that do not apply to the test environment. For example, an objective about user clearances may not apply; however, an objective about a single point of connection to a network would apply.

If any test resources are used (e.g. meters, analysers) it will be the evaluator's responsibility to ensure that these resources are calibrated correctly.

14.2.1.4.2 Work unit AVA_VAN.1-2

The evaluator shall examine the TOE to determine that it has been installed properly and is in a known state.

It is possible for the evaluator to determine the state of the TOE in a number of ways. For example, previous successful completion of the Evaluation of sub-activity (AGD_PRE.1) sub-activity will satisfy this work unit if

the evaluator still has confidence that the TOE being used for testing was installed properly and is in a known state. If this is not the case, then the evaluator should follow the developer's procedures to install and start up the TOE, using the supplied guidance only.

If the evaluator has to perform the installation procedures because the TOE is in an unknown state, this work unit when successfully completed could satisfy work unit AGD_PRE.1-3.

14.2.1.5 Action AVA_VAN.1.2E

14.2.1.5.1 Work unit AVA_VAN.1-3

The evaluator shall examine sources of information publicly available to identify potential vulnerabilities in the TOE.

The evaluator examines the sources of information publicly available to support the identification of possible potential vulnerabilities in the TOE. There are many sources of publicly available information, which should be considered, e.g. mailing lists and security forums on the world wide web that report known vulnerabilities in specified technologies.

The evaluator should not constrain their consideration of publicly available information to the above, but should consider any other relevant information available.

While examining the evidence provided the evaluator will use the information in the public domain to further search for potential vulnerabilities. Where the evaluators have identified areas of concern, the evaluator should consider information publicly available that relate to those areas of concern.

The availability of information that may be readily available to an attacker that helps to identify and facilitate attacks effectively operates to substantially enhance the attack potential of a given attacker. The accessibility of vulnerability information and sophisticated attack tools on the Internet makes it more likely that this information will be used in attempts to identify potential vulnerabilities in the TOE and exploit them. Modern search tools make such information easily available to the evaluator, and the determination of resistance to published potential vulnerabilities and well known generic attacks can be achieved in a cost-effective manner.

The search of the information publicly available should be focused on those sources that refer specifically to the product from which the TOE is derived. The extensiveness of this search should consider the following factors: TOE type, evaluator experience in this TOE type, expected attack potential and the level of ADV evidence available.

The identification process is iterative, where the identification of one potential vulnerability may lead to identifying another area of concern that requires further investigation.

The evaluator will report what actions were taken to identify potential vulnerabilities in the information publicly available. However, in this type of search, the evaluator may not be able to describe the steps in identifying potential vulnerabilities before the outset of the examination, as the approach may evolve as a result of findings during the search.

The evaluator will report the evidence examined in completing the search for potential vulnerabilities.

14.2.1.5.2 Work unit AVA_VAN.1-4

The evaluator shall record in the ETR the identified potential vulnerabilities that are candidates for testing and applicable to the TOE in its operational environment.

It may be identified that no further consideration of the potential vulnerability is required if for example the evaluator identifies that measures in the operational environment, either IT or non-IT, prevent exploitation of the potential vulnerability in that operational environment. For instance, restricting physical access to the TOE to authorised users only may effectively render a potential vulnerability to tampering unexploitable.

The evaluator records any reasons for exclusion of potential vulnerabilities from further consideration if the evaluator determines that the potential vulnerability is not applicable in the operational environment. Otherwise the evaluator records the potential vulnerability for further consideration.

A list of potential vulnerabilities applicable to the TOE in its operational environment, which can be used as an input into penetration testing activities, shall be reported in the ETR by the evaluators.

14.2.1.6 Action AVA_VAN.1.3E

14.2.1.6.1 Work unit AVA_VAN.1-5

The evaluator shall devise penetration tests, based on the independent search for potential vulnerabilities.

The evaluator prepares for penetration testing as necessary to determine the susceptibility of the TOE, in its operational environment, to the potential vulnerabilities identified during the search of the sources of information publicly available. Any current information provided to the evaluator by a third party (e.g. evaluation authority) regarding known potential vulnerabilities will be considered by the evaluator, together with any encountered potential vulnerabilities resulting from the performance of other evaluation activities.

The evaluator will probably find it practical to carry out penetration test using a series of test cases, where each test case will test for a specific potential vulnerability.

The evaluator is not expected to test for potential vulnerabilities (including those in the public domain) beyond those which required a Basic attack potential. In some cases, however, it will be necessary to carry out a test before the exploitability can be determined. Where, as a result of evaluation expertise, the evaluator discovers a potential vulnerability that is beyond Basic attack potential, this is reported in the ETR as a residual vulnerability.

14.2.1.6.2 Work unit AVA_VAN.1-6

The evaluator shall produce penetration test documentation for the tests based on the list of potential vulnerabilities in sufficient detail to enable the tests to be repeatable. The test documentation shall include:

- a) identification of the potential vulnerability the TOE is being tested for;
- b) instructions to connect and setup all required test equipment as required to conduct the penetration test;
- c) instructions to establish all penetration test prerequisite initial conditions;
- d) instructions to stimulate the TSF;
- e) instructions for observing the behaviour of the TSF;
- f) descriptions of all expected results and the necessary analysis to be performed on the observed behaviour for comparison against expected results;
- g) instructions to conclude the test and establish the necessary post-test state for the TOE.

The evaluator prepares for penetration testing based on the list of potential vulnerabilities identified during the search of the public domain.

The evaluator is not expected to determine the exploitability for potential vulnerabilities beyond those for which a Basic attack potential is required to effect an attack. However, as a result of evaluation expertise, the evaluator may discover a potential vulnerability that is exploitable only by an attacker with greater than Basic attack potential. Such vulnerabilities are to be reported in the ETR as residual vulnerabilities.

With an understanding of the potential vulnerability, the evaluator determines the most feasible way to test for the TOE's susceptibility. Specifically the evaluator considers:

- a) the TSFI or other TOE interface that will be used to stimulate the TSF and observe responses;
- b) initial conditions that will need to exist for the test (i.e. any particular objects or subjects that will need to exist and security attributes they will need to have);
- c) special test equipment that will be required to either stimulate a TSFI or make observations of a TSFI (although it is unlikely that specialist equipment would be required to exploit a potential vulnerability assuming a Basic attack potential);
- d) whether theoretical analysis should replace physical testing, particularly relevant where the results of an initial test can be extrapolated to demonstrate that repeated attempts of an attack are likely to succeed after a given number of attempts.

The evaluator will probably find it practical to carry out penetration testing using a series of test cases, where each test case will test for a specific potential vulnerability.

The intent of specifying this level of detail in the test documentation is to allow another evaluator to repeat the tests and obtain an equivalent result.

14.2.1.6.3 Work unit AVA_VAN.1-7

The evaluator shall conduct penetration testing.

The evaluator uses the penetration test documentation resulting from work unit AVA_VAN.1-5 as a basis for executing penetration tests on the TOE, but this does not preclude the evaluator from performing additional ad hoc penetration tests. If required, the evaluator may devise ad hoc tests as a result of information learnt during penetration testing that, if performed by the evaluator, are to be recorded in the penetration test documentation. Such tests may be required to follow up unexpected results or observations, or to investigate potential vulnerabilities suggested to the evaluator during the pre-planned testing.

The evaluator is not expected to test for potential vulnerabilities (including those in the public domain) beyond those which required a Basic attack potential. In some cases, however, it will be necessary to carry out a test before the exploitability can be determined. Where, as a result of evaluation expertise, the evaluator discovers a potential vulnerability that is beyond Basic attack potential, this is reported in the ETR as a residual vulnerability.

14.2.1.6.4 Work unit AVA_VAN.1-8

The evaluator shall record the actual results of the penetration tests.

While some specific details of the actual test results may be different from those expected (e.g. time and date fields in an audit record) the overall result should be identical. Any unexpected test results should be investigated. The impact on the evaluation should be stated and justified.

14.2.1.6.5 Work unit AVA_VAN.1-9

The evaluator shall report in the ETR the evaluator penetration testing effort, outlining the testing approach, configuration, depth and results.

The penetration testing information reported in the ETR allows the evaluator to convey the overall penetration testing approach and effort expended on this sub-activity. The intent of providing this information is to give a meaningful overview of the evaluator's penetration testing effort. It is not intended that the information regarding penetration testing in the ETR be an exact reproduction of specific test steps or results of individual penetration tests. The intention is to provide enough detail to allow other evaluators and evaluation authorities to gain some insight about the penetration testing approach chosen, amount of penetration testing performed, TOE test configurations, and the overall results of the penetration testing activity.

Information that would typically be found in the ETR subclause regarding evaluator penetration testing efforts is:

- a) TOE test configurations. The particular configurations of the TOE that were penetration tested;
- b) TSFI penetration tested. A brief listing of the TSFI and other TOE interfaces that were the focus of the penetration testing;
- c) verdict for the sub-activity. The overall judgement on the results of penetration testing.

This list is by no means exhaustive and is only intended to provide some context as to the type of information that should be present in the ETR concerning the penetration testing the evaluator performed during the evaluation.

14.2.1.6.6 Work unit AVA_VAN.1-10

The evaluator shall examine the results of all penetration testing to determine that the TOE, in its operational environment, is resistant to an attacker possessing a Basic attack potential.

If the results reveal that the TOE, in its operational environment, has vulnerabilities exploitable by an attacker possessing less than Enhanced-Basic attack potential, then this evaluator action fails.

The guidance in B.4 should be used to determine the attack potential required to exploit a particular vulnerability and whether it can therefore be exploited in the intended environment. It may not be necessary for the attack potential to be calculated in every instance, only if there is some doubt as to whether or not the vulnerability can be exploited by an attacker possessing an attack potential less than Enhanced-Basic.

14.2.1.6.7 Work unit AVA_VAN.1-11

The evaluator shall report in the ETR all exploitable vulnerabilities and residual vulnerabilities, detailing for each:

- a) its source (e.g. evaluation methodology activity being undertaken when it was conceived, known to the evaluator, read in a publication);
- b) the SFR(s) not met;
- c) a description;
- d) whether it is exploitable in its operational environment or not (i.e. exploitable or residual);
- e) the amount of time, level of expertise, level of knowledge of the TOE, level of opportunity and the equipment required to perform the identified vulnerabilities, and the corresponding values using the tables B.2 and B.3 of Annex B.4.

14.2.2 Evaluation of sub-activity (AVA_VAN.2)

14.2.2.1 Objectives

The objective of this sub-activity is to determine whether the TOE, in its operational environment, has vulnerabilities exploitable by attackers possessing Basic attack potential.

14.2.2.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) the TOE design;

- d) the security architecture description;
- e) the guidance documentation;
- f) the TOE suitable for testing;
- g) information publicly available to support the identification of possible potential vulnerabilities.

The remaining implicit evaluation evidence for this sub-activity depends on the components that have been included in the assurance package. The evidence provided for each component is to be used as input in this sub-activity.

Other input for this sub-activity is:

- a) current information regarding public domain potential vulnerabilities and attacks (e.g. from an evaluation authority).

14.2.2.3 Application notes

The evaluator should consider performing additional tests as a result of potential vulnerabilities encountered during other parts of the evaluation.

14.2.2.4 Action AVA_VAN.2.1E

ISO/IEC 15408-3 AVA_VAN.2.1C: *The TOE shall be suitable for testing.*

14.2.2.4.1 Work unit AVA_VAN.2-1

The evaluator shall examine the TOE to determine that the test configuration is consistent with the configuration under evaluation as specified in the ST.

The TOE provided by the developer and identified in the test plan should have the same unique reference as established by the CM capabilities (ALC_CMC) sub-activities and identified in the ST introduction.

It is possible for the ST to specify more than one configuration for evaluation. The TOE may comprise a number of distinct hardware and software entities that need to be tested in accordance with the ST. The evaluator verifies that all test configurations are consistent with the ST.

The evaluator should consider the security objectives for the operational environment described in the ST that may apply to the test environment and ensure they are met in the testing environment. There may be some objectives for the operational environment that do not apply to the test environment. For example, an objective about user clearances may not apply; however, an objective about a single point of connection to a network would apply.

If any test resources are used (e.g. meters, analysers) it will be the evaluator's responsibility to ensure that these resources are calibrated correctly.

14.2.2.4.2 Work unit AVA_VAN.2-2

The evaluator shall examine the TOE to determine that it has been installed properly and is in a known state.

It is possible for the evaluator to determine the state of the TOE in a number of ways. For example, previous successful completion of the Evaluation of sub-activity (AGD_PRE.1) sub-activity will satisfy this work unit if the evaluator still has confidence that the TOE being used for testing was installed properly and is in a known state. If this is not the case, then the evaluator should follow the developer's procedures to install and start up the TOE, using the supplied guidance only.

If the evaluator has to perform the installation procedures because the TOE is in an unknown state, this work unit when successfully completed could satisfy work unit AGD_PRE.1-3.

14.2.2.5 Action AVA_VAN.2.2E**14.2.2.5.1 Work unit AVA_VAN.2-3**

The evaluator shall examine sources of information publicly available to identify potential vulnerabilities in the TOE.

The evaluator examines the sources of information publicly available to support the identification of possible potential vulnerabilities in the TOE. There are many sources of publicly available information which the evaluator should consider using items such as those available on the world wide web, including:

- a) specialist publications (magazines, books);
- b) research papers.

The evaluator should not constrain their consideration of publicly available information to the above, but should consider any other relevant information available.

While examining the evidence provided the evaluator will use the information in the public domain to further search for potential vulnerabilities. Where the evaluators have identified areas of concern, the evaluator should consider information publicly available that relate to those areas of concern.

The availability of information that may be readily available to an attacker that helps to identify and facilitate attacks may substantially enhance the attack potential of a given attacker. The accessibility of vulnerability information and sophisticated attack tools on the Internet makes it more likely that this information will be used in attempts to identify potential vulnerabilities in the TOE and exploit them. Modern search tools make such information easily available to the evaluator, and the determination of resistance to published potential vulnerabilities and well known generic attacks can be achieved in a cost-effective manner.

The search of the information publicly available should be focused on those sources that refer specifically to the product from which the TOE is derived. The extensiveness of this search should consider the following factors: TOE type, evaluator experience in this TOE type, expected attack potential and the level of ADV evidence available.

The identification process is iterative, where the identification of one potential vulnerability may lead to identifying another area of concern that requires further investigation.

The evaluator will report what actions were taken to identify potential vulnerabilities in the evidence. However, in this type of search, the evaluator may not be able to describe the steps in identifying potential vulnerabilities before the outset of the examination, as the approach may evolve as a result of findings during the search.

The evaluator will report the evidence examined in completing the search for potential vulnerabilities. This selection of evidence may be derived from those areas of concern identified by the evaluator, linked to the evidence the attacker is assumed to be able to obtain, or according to another rationale provided by the evaluator.

14.2.2.6 Action AVA_VAN.2.3E**14.2.2.6.1 Work unit AVA_VAN.2-4**

The evaluator shall conduct a search of ST, guidance documentation, functional specification, TOE design and security architecture description evidence to identify possible potential vulnerabilities in the TOE.

A search of the evidence should be completed whereby specifications and documentation for the TOE are analysed and then potential vulnerabilities in the TOE are hypothesised, or speculated. The list of hypothesised potential vulnerabilities is then prioritised on the basis of the estimated probability that a potential vulnerability exists and, assuming an exploitable vulnerability does exist the attack potential required to exploit it, and on the extent of control or compromise it would provide. The prioritised list of potential vulnerabilities is used to direct penetration testing against the TOE.

The security architecture description provides the developer vulnerability analysis, as it documents how the TSF protects itself from interference from untrusted subjects and prevents the bypass of security enforcement functionality. Therefore, the evaluator should use this description of the protection of the TSF as a basis for the search for possible ways to undermine the TSF.

Subject to the SFRs the TOE is to meet in the operational environment, the evaluator's independent vulnerability analysis should consider generic potential vulnerabilities under each of the following headings:

- a) generic potential vulnerabilities relevant for the type of TOE being evaluated, as may be supplied by the evaluation authority;
- b) bypassing;
- c) tampering;
- d) direct attacks;
- e) monitoring;
- f) misuse.

Items b) - f) are explained in greater detail in Annex B.

The security architecture description should be considered in light of each of the above generic potential vulnerabilities. Each potential vulnerability should be considered to search for possible ways in which to defeat the TSF protection and undermine the TSF.

14.2.2.6.2 Work unit AVA_VAN.2-5

The evaluator shall record in the ETR the identified potential vulnerabilities that are candidates for testing and applicable to the TOE in its operational environment.

It may be identified that no further consideration of the potential vulnerability is required if for example the evaluator identifies that measures in the operational environment, either IT or non-IT, prevent exploitation of the potential vulnerability in that operational environment. For instance, restricting physical access to the TOE to authorised users only may effectively render a potential vulnerability to tampering unexploitable.

The evaluator records any reasons for exclusion of potential vulnerabilities from further consideration if the evaluator determines that the potential vulnerability is not applicable in the operational environment. Otherwise the evaluator records the potential vulnerability for further consideration.

A list of potential vulnerabilities applicable to the TOE in its operational environment, which can be used as an input into penetration testing activities, shall be reported in the ETR by the evaluators.

14.2.2.7 Action AVA_VAN.2.4E

14.2.2.7.1 Work unit AVA_VAN.2-6

The evaluator shall devise penetration tests, based on the independent search for potential vulnerabilities.

The evaluator prepares for penetration testing as necessary to determine the susceptibility of the TOE, in its operational environment, to the potential vulnerabilities identified during the search of the sources of information publicly available. Any current information provided to the evaluator by a third party (e.g. evaluation authority) regarding known potential vulnerabilities will be considered by the evaluator, together with any encountered potential vulnerabilities resulting from the performance of other evaluation activities.

The evaluator is reminded that, as for considering the security architecture description in the search for vulnerabilities (as detailed in AVA_VAN.2-4), testing should be performed to confirm the architectural properties. This is likely to require negative tests attempting to disprove the properties of the security

architecture. In developing the strategy for penetration testing, the evaluator will ensure that each of the major characteristics of the security architecture description are tested, either in functional testing (as considered in 13) or evaluator penetration testing.

The evaluator will probably find it practical to carry out penetration test using a series of test cases, where each test case will test for a specific potential vulnerability.

The evaluator is not expected to test for potential vulnerabilities (including those in the public domain) beyond those which required a Basic attack potential. In some cases, however, it will be necessary to carry out a test before the exploitability can be determined. Where, as a result of evaluation expertise, the evaluator discovers an exploitable vulnerability that is beyond Basic attack potential, this is reported in the ETR as a residual vulnerability.

Guidance on determining the necessary attack potential to exploit a potential vulnerability can be found in Annex B.4.

Potential vulnerabilities hypothesised as exploitable only by attackers possessing Enhanced-Basic, Moderate or High attack potential do not result in a failure of this evaluator action. Where analysis supports the hypothesis, these need not be considered further as an input to penetration testing. However, such vulnerabilities are reported in the ETR as residual vulnerabilities.

Potential vulnerabilities hypothesised as exploitable by an attacker possessing a Basic attack potential and resulting in a violation of the security objectives should be the highest priority potential vulnerabilities comprising the list used to direct penetration testing against the TOE.

14.2.2.7.2 Work unit AVA_VAN.2-7

The evaluator shall produce penetration test documentation for the tests based on the list of potential vulnerabilities in sufficient detail to enable the tests to be repeatable. The test documentation shall include:

- a) identification of the potential vulnerability the TOE is being tested for;
- b) instructions to connect and setup all required test equipment as required to conduct the penetration test;
- c) instructions to establish all penetration test prerequisite initial conditions;
- d) instructions to stimulate the TSF;
- e) instructions for observing the behaviour of the TSF;
- f) descriptions of all expected results and the necessary analysis to be performed on the observed behaviour for comparison against expected results;
- g) instructions to conclude the test and establish the necessary post-test state for the TOE.

The evaluator prepares for penetration testing based on the list of potential vulnerabilities identified during the search of the public domain and the analysis of the evaluation evidence.

The evaluator is not expected to determine the exploitability for potential vulnerabilities beyond those for which a Basic attack potential is required to effect an attack. However, as a result of evaluation expertise, the evaluator may discover a potential vulnerability that is exploitable only by an attacker with greater than Basic attack potential. Such vulnerabilities are to be reported in the ETR as residual vulnerabilities.

With an understanding of the potential vulnerability, the evaluator determines the most feasible way to test for the TOE's susceptibility. Specifically the evaluator considers:

- a) the TSFI or other TOE interface that will be used to stimulate the TSF and observe responses (It is possible that the evaluator will need to use an interface to the TOE other than the TSFI to demonstrate properties of the TSF such as those described in the security architecture description (as required by

ADV_ARC). It should be noted, that although these TOE interfaces provide a means of testing the TSF properties, they are not the subject of the test.);

- b) initial conditions that will need to exist for the test (i.e. any particular objects or subjects that will need to exist and security attributes they will need to have);
- c) special test equipment that will be required to either stimulate a TSFI or make observations of a TSFI (although it is unlikely that specialist equipment would be required to exploit a potential vulnerability assuming a Basic attack potential);
- d) whether theoretical analysis should replace physical testing, particularly relevant where the results of an initial test can be extrapolated to demonstrate that repeated attempts of an attack are likely to succeed after a given number of attempts.

The evaluator will probably find it practical to carry out penetration testing using a series of test cases, where each test case will test for a specific potential vulnerability.

The intent of specifying this level of detail in the test documentation is to allow another evaluator to repeat the tests and obtain an equivalent result.

14.2.2.7.3 Work unit AVA_VAN.2-8

The evaluator shall conduct penetration testing.

The evaluator uses the penetration test documentation resulting from work unit AVA_VAN.2-6 as a basis for executing penetration tests on the TOE, but this does not preclude the evaluator from performing additional ad hoc penetration tests. If required, the evaluator may devise ad hoc tests as a result of information learnt during penetration testing that, if performed by the evaluator, are to be recorded in the penetration test documentation. Such tests may be required to follow up unexpected results or observations, or to investigate potential vulnerabilities suggested to the evaluator during the pre-planned testing.

Should penetration testing show that a hypothesised potential vulnerability does not exist, then the evaluator should determine whether or not the evaluator's own analysis was incorrect, or if evaluation deliverables are incorrect or incomplete.

The evaluator is not expected to test for potential vulnerabilities (including those in the public domain) beyond those which required a Basic attack potential. In some cases, however, it will be necessary to carry out a test before the exploitability can be determined. Where, as a result of evaluation expertise, the evaluator discovers an exploitable vulnerability that is beyond basic attack potential, this is reported in the ETR as a residual vulnerability.

14.2.2.7.4 Work unit AVA_VAN.2-9

The evaluator shall record the actual results of the penetration tests.

While some specific details of the actual test results may be different from those expected (e.g. time and date fields in an audit record) the overall result should be identical. Any unexpected test results should be investigated. The impact on the evaluation should be stated and justified.

14.2.2.7.5 Work unit AVA_VAN.2-10

The evaluator shall report in the ETR the evaluator penetration testing effort, outlining the testing approach, configuration, depth and results.

The penetration testing information reported in the ETR allows the evaluator to convey the overall penetration testing approach and effort expended on this sub-activity. The intent of providing this information is to give a meaningful overview of the evaluator's penetration testing effort. It is not intended that the information regarding penetration testing in the ETR be an exact reproduction of specific test steps or results of individual penetration tests. The intention is to provide enough detail to allow other evaluators and evaluation authorities

to gain some insight about the penetration testing approach chosen, amount of penetration testing performed, TOE test configurations, and the overall results of the penetration testing activity.

Information that would typically be found in the ETR subclause regarding evaluator penetration testing efforts is:

- a) TOE test configurations. The particular configurations of the TOE that were penetration tested;
- b) TSFI penetration tested. A brief listing of the TSFI and other TOE interfaces that were the focus of the penetration testing;
- c) Verdict for the sub-activity. The overall judgement on the results of penetration testing.

This list is by no means exhaustive and is only intended to provide some context as to the type of information that should be present in the ETR concerning the penetration testing the evaluator performed during the evaluation.

14.2.2.7.6 Work unit AVA_VAN.2-11

The evaluator shall examine the results of all penetration testing to determine that the TOE, in its operational environment, is resistant to an attacker possessing a Basic attack potential.

If the results reveal that the TOE, in its operational environment, has vulnerabilities exploitable by an attacker possessing less than an Enhanced-Basic attack potential, then this evaluator action fails.

The guidance in B.4 should be used to determine the attack potential required to exploit a particular vulnerability and whether it can therefore be exploited in the intended environment. It may not be necessary for the attack potential to be calculated in every instance, only if there is some doubt as to whether or not the vulnerability can be exploited by an attacker possessing an attack potential less than Enhanced-Basic.

14.2.2.7.7 Work unit AVA_VAN.2-12

The evaluator shall report in the ETR all exploitable vulnerabilities and residual vulnerabilities, detailing for each:

- a) its source (e.g. evaluation methodology activity being undertaken when it was conceived, known to the evaluator, read in a publication);
- b) the SFR(s) not met;
- c) a description;
- d) whether it is exploitable in its operational environment or not (i.e. exploitable or residual);
- e) the amount of time, level of expertise, level of knowledge of the TOE, level of opportunity and the equipment required to perform the identified vulnerabilities, and the corresponding values using the tables B.2 and B.3 of Annex B.4.

14.2.3 Evaluation of sub-activity (AVA_VAN.3)

14.2.3.1 Objectives

The objective of this sub-activity is to determine whether the TOE, in its operational environment, has vulnerabilities exploitable by attackers possessing Enhanced-Basic attack potential.

14.2.3.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) the TOE design;
- d) the security architecture description;
- e) the implementation subset selected;
- f) the guidance documentation;
- g) the TOE suitable for testing;
- h) information publicly available to support the identification of possible potential vulnerabilities.

The remaining implicit evaluation evidence for this sub-activity depends on the components that have been included in the assurance package. The evidence provided for each component is to be used as input in this sub-activity.

Other input for this sub-activity is:

- a) current information regarding public domain potential vulnerabilities and attacks (e.g. from an evaluation authority).

14.2.3.3 Application notes

During the conduct of evaluation activities the evaluator may also identify areas of concern. These are specific portions of the TOE evidence that the evaluator has some reservation about, although the evidence meets the requirements for the activity with which the evidence is associated. For example, a particular interface specification looks particularly complex, and therefore may be prone to error either in the development of the TOE or in the operation of the TOE. There is no potential vulnerability apparent at this stage, further investigation is required. This is beyond the bounds of encountered, as further investigation is required.

The focused approach to the identification of potential vulnerabilities is an analysis of the evidence with the aim of identifying any potential vulnerabilities evident through the contained information. It is an unstructured analysis, as the approach is not predetermined. Further guidance on focused vulnerability analysis can be found in Annex B.2.2.2.2.

14.2.3.4 Action AVA_VAN.3.1E

ISO/IEC 15408-3 AVA_VAN.3.1C: *The TOE shall be suitable for testing.*

14.2.3.4.1 Work unit AVA_VAN.3-1

The evaluator shall examine the TOE to determine that the test configuration is consistent with the configuration under evaluation as specified in the ST.

The TOE provided by the developer and identified in the test plan should have the same unique reference as established by the CM capabilities (ALC_CMC) sub-activities and identified in the ST introduction.

It is possible for the ST to specify more than one configuration for evaluation. The TOE may comprise a number of distinct hardware and software entities that need to be tested in accordance with the ST. The evaluator verifies that all test configurations are consistent with the ST.

The evaluator should consider the security objectives for the operational environment described in the ST that may apply to the test environment and ensure they are met in the testing environment. There may be some objectives for the operational environment that do not apply to the test environment. For example, an objective

about user clearances may not apply; however, an objective about a single point of connection to a network would apply.

If any test resources are used (e.g. meters, analysers) it will be the evaluator's responsibility to ensure that these resources are calibrated correctly.

14.2.3.4.2 Work unit AVA_VAN.3-2

The evaluator shall examine the TOE to determine that it has been installed properly and is in a known state.

It is possible for the evaluator to determine the state of the TOE in a number of ways. For example, previous successful completion of the Evaluation of sub-activity (AGD_PRE.1) sub-activity will satisfy this work unit if the evaluator still has confidence that the TOE being used for testing was installed properly and is in a known state. If this is not the case, then the evaluator should follow the developer's procedures to install and start up the TOE, using the supplied guidance only.

If the evaluator has to perform the installation procedures because the TOE is in an unknown state, this work unit when successfully completed could satisfy work unit AGD_PRE.1-3.

14.2.3.5 Action AVA_VAN.3.2E

14.2.3.5.1 Work unit AVA_VAN.3-3

The evaluator shall examine sources of information publicly available to identify potential vulnerabilities in the TOE.

The evaluator examines the sources of information publicly available to support the identification of possible potential vulnerabilities in the TOE. There are many sources of publicly available information which the evaluator should consider using items such as those available on the world wide web, including:

- a) specialist publications (magazines, books);
- b) research papers;
- c) conference proceedings.

The evaluator should not constrain their consideration of publicly available information to the above, but should consider any other relevant information available.

While examining the evidence provided the evaluator will use the information in the public domain to further search for potential vulnerabilities. Where the evaluators have identified areas of concern, the evaluator should consider information publicly available that relate to those areas of concern.

The availability of information that may be readily available to an attacker that helps to identify and facilitate attacks may substantially enhance the attack potential of a given attacker. The accessibility of vulnerability information and sophisticated attack tools on the Internet makes it more likely that this information will be used in attempts to identify potential vulnerabilities in the TOE and exploit them. Modern search tools make such information easily available to the evaluator, and the determination of resistance to published potential vulnerabilities and well known generic attacks can be achieved in a cost-effective manner.

The search of the information publicly available should be focused on those sources that refer to the technologies used in the development of the product from which the TOE is derived. The extensiveness of this search should consider the following factors: TOE type, evaluator experience in this TOE type, expected attack potential and the level of ADV evidence available.

The identification process is iterative, where the identification of one potential vulnerability may lead to identifying another area of concern that requires further investigation.

The evaluator will report what actions were taken to identify potential vulnerabilities in the evidence. However, in this type of search, the evaluator may not be able to describe the steps in identifying potential vulnerabilities before the outset of the examination, as the approach may evolve as a result of findings during the search.

The evaluator will report the evidence examined in completing the search for potential vulnerabilities. This selection of evidence may be derived from those areas of concern identified by the evaluator, linked to the evidence the attacker is assumed to be able to obtain, or according to another rationale provided by the evaluator.

14.2.3.6 Action AVA_VAN.3.3E

14.2.3.6.1 Work unit AVA_VAN.3-4

The evaluator shall conduct a focused search of ST, guidance documentation, functional specification, TOE design, security architecture description and implementation representation to identify possible potential vulnerabilities in the TOE.

A flaw hypothesis methodology needs to be used whereby specifications and development and guidance evidence are analysed and then potential vulnerabilities in the TOE are hypothesised, or speculated.

The evaluator uses the knowledge of the TOE design and operation gained from the TOE deliverables to conduct a flaw hypothesis to identify potential flaws in the development of the TOE and potential errors in the specified method of operation of the TOE.

The security architecture description provides the developer vulnerability analysis, as it documents how the TSF protects itself from interference from untrusted subjects and prevents the bypass of security enforcement functionality. Therefore, the evaluator should build upon the understanding of the TSF protection gained from the analysis of this evidence and then develop this in the knowledge gained from other development ADV evidence.

The approach taken is directed by areas of concern identified during examination of the evidence during the conduct of evaluation activities and ensuring a representative sample of the development and guidance evidence provided for the evaluation is searched.

For guidance on sampling see Annex A.2. This guidance should be considered when selecting the subset, giving reasons for:

- a) the approach used in selection;
- b) qualification that the evidence to be examined supports that approach.

The areas of concern may relate to the sufficiency of specific protection features detailed in the security architecture description.

The evidence to be considered during the vulnerability analysis may be linked to the evidence the attacker is assumed to be able to obtain. For example, the developer may protect the TOE design and implementation representations, so the only information assumed to be available to an attacker is the functional specification and guidance (publicly available). So, although the objectives for assurance in the TOE ensure the TOE design and implementation representation requirements are met, these design representations may only be searched to further investigate areas of concerns.

On the other hand, if the source is publicly available it would be reasonable to assume that the attacker has access to the source and can use this in attempts to attack the TOE. Therefore, the source should be considered in the focused examination approach.

The following indicates examples for the selection of the subset of evidence to be considered:

- a) For an evaluation where all levels of design abstraction from functional specification to implementation representation are provided, examination of information in the functional specification and the

implementation representation may be selected, as the functional specification provides detail of interfaces available to an attacker, and the implementation representation incorporates the design decisions made at all other design abstractions. Therefore, the TOE design information will be considered as part of the implementation representation.

- b) Examination of a particular subset of information in each of the design representations provided for the evaluation.
- c) Coverage of particular SFRs through each of the design representations provided for the evaluation.
- d) Examination of each of the design representations provided for the evaluation, considering different SFRs within each design representations.
- e) Examination of aspects of the evidence provided for the evaluation relating to current potential vulnerability information the evaluator has received (e.g. from a scheme).

This approach to identification of potential vulnerabilities is to take an ordered and planned approach; applying a system to the examination. The evaluator is to describe the method to be used in terms of what evidence will be considered, the information within the evidence that is to be examined, the manner in which this information is to be considered and the hypothesis that is to be created.

The following provide some examples that a hypothesis may take:

- a) consideration of malformed input for interfaces available to an attacker at the external interfaces;
- b) examination of a key security mechanism cited in the security architecture description, such as process separation, hypothesising internal buffer overflows that may lead to degradation of separation;
- c) search to identify any objects created in the TOE implementation representation that are then not fully controlled by the TSF, and could be used by an attacker to undermine SFRs.

For example, the evaluator may identify that interfaces are a potential area of weakness in the TOE and specify an approach to the search that "all interface specifications provided in the functional specification and TOE design will be searched to hypothesise potential vulnerabilities" and go on to explain the methods used in the hypothesis.

The identification process is iterative, where the identification of one potential vulnerability may lead to identifying another area of concern that requires further investigation.

The evaluator will report what actions were taken to identify potential vulnerabilities in the evidence. However, in this type of search, the evaluator may not be able to describe the steps in identifying potential vulnerabilities before the outset of the examination, as the approach may evolve as a result of findings during the search.

The evaluator will report the evidence examine in completing the search for potential vulnerabilities. This selection of evidence may be derived from those areas of concern identified by the evaluator, linked to the evidence the attacker is assumed to be able to obtain, or according to another rationale provided by the evaluator.

Subject to the SFRs the TOE is to meet in the operational environment, the evaluator's independent vulnerability analysis should consider generic potential vulnerabilities under each of the following headings:

- a) generic potential vulnerabilities relevant for the type of TOE being evaluated, as may be supplied by the evaluation authority;
- b) bypassing;
- c) tampering;
- d) direct attacks;

- e) monitoring;
- f) misuse.

Items b) - f) are explained in greater detail in Annex B.

The security architecture description should be considered in light of each of the above generic potential vulnerabilities. Each potential vulnerability should be considered to search for possible ways in which to defeat the TSF protection and undermine the TSF.

14.2.3.6.2 Work unit AVA_VAN.3-5

The evaluator shall record in the ETR the identified potential vulnerabilities that are candidates for testing and applicable to the TOE in its operational environment.

It may be identified that no further consideration of the potential vulnerability is required if for example the evaluator identifies that measures in the operational environment, either IT or non-IT, prevent exploitation of the potential vulnerability in that operational environment. For instance, restricting physical access to the TOE to authorised users only may effectively render a potential vulnerability to tampering unexploitable.

The evaluator records any reasons for exclusion of potential vulnerabilities from further consideration if the evaluator determines that the potential vulnerability is not applicable in the operational environment. Otherwise the evaluator records the potential vulnerability for further consideration.

A list of potential vulnerabilities applicable to the TOE in its operational environment, which can be used as an input into penetration testing activities, shall be reported in the ETR by the evaluators.

14.2.3.7 Action AVA_VAN.3.4E

14.2.3.7.1 Work unit AVA_VAN.3-6

The evaluator shall devise penetration tests, based on the independent search for potential vulnerabilities.

The evaluator prepares for penetration testing as necessary to determine the susceptibility of the TOE, in its operational environment, to the potential vulnerabilities identified during the search of the sources of information publicly available. Any current information provided to the evaluator by a third party (e.g. evaluation authority) regarding known potential vulnerabilities will be considered by the evaluator, together with any encountered potential vulnerabilities resulting from the performance of other evaluation activities.

The evaluator is reminded that, as for considering the security architecture description in the search for vulnerabilities (as detailed in AVA_VAN.3-4), testing should be performed to confirm the architectural properties. If requirements from ATE_DPT are included in the SARs, the developer testing evidence will include testing performed to confirm the correct implementation of any specific mechanisms detailed in the security architecture description. However, the developer testing will not necessarily include testing of all aspects of the architectural properties that protect the TSF, as much of this testing will be negative testing in nature, attempting to disprove the properties. In developing the strategy for penetration testing, the evaluator will ensure that all aspects of the security architecture description are tested, either in functional testing (as considered in 13) or evaluator penetration testing.

It will probably be practical to carry out penetration test using a series of test cases, where each test case will test for a specific potential vulnerability.

The evaluator is not expected to test for potential vulnerabilities (including those in the public domain) beyond those which required an Enhanced-Basic attack potential. In some cases, however, it will be necessary to carry out a test before the exploitability can be determined. Where, as a result of evaluation expertise, the evaluator discovers an exploitable vulnerability that is beyond Enhanced-Basic attack potential, this is reported in the ETR as a residual vulnerability.

Guidance on determining the necessary attack potential to exploit a potential vulnerability can be found in Annex B.4.

Potential vulnerabilities hypothesised as exploitable only by attackers possessing Moderate or High attack potential do not result in a failure of this evaluator action. Where analysis supports the hypothesis, these need not be considered further as an input to penetration testing. However, such vulnerabilities are reported in the ETR as residual vulnerabilities.

Potential vulnerabilities hypothesised as exploitable by an attacker possessing a Basic or Enhanced-Basic attack potential and resulting in a violation of the security objectives should be the highest priority potential vulnerabilities comprising the list used to direct penetration testing against the TOE.

14.2.3.7.2 Work unit AVA_VAN.3-7

The evaluator shall produce penetration test documentation for the tests based on the list of potential vulnerabilities in sufficient detail to enable the tests to be repeatable. The test documentation shall include:

- a) identification of the potential vulnerability the TOE is being tested for;
- b) instructions to connect and setup all required test equipment as required to conduct the penetration test;
- c) instructions to establish all penetration test prerequisite initial conditions;
- d) instructions to stimulate the TSF;
- e) instructions for observing the behaviour of the TSF;
- f) descriptions of all expected results and the necessary analysis to be performed on the observed behaviour for comparison against expected results;
- g) instructions to conclude the test and establish the necessary post-test state for the TOE.

The evaluator prepares for penetration testing based on the list of potential vulnerabilities identified during the search of the public domain and the analysis of the evaluation evidence.

The evaluator is not expected to determine the exploitability for potential vulnerabilities beyond those for which an Enhanced-Basic attack potential is required to effect an attack. However, as a result of evaluation expertise, the evaluator may discover a potential vulnerability that is exploitable only by an attacker with greater than Enhanced-Basic attack potential. Such vulnerabilities are to be reported in the ETR as residual vulnerabilities.

With an understanding of the potential vulnerability, the evaluator determines the most feasible way to test for the TOE's susceptibility. Specifically the evaluator considers:

- a) the TSFI or other TOE interface that will be used to stimulate the TSF and observe responses (It is possible that the evaluator will need to use an interface to the TOE other than the TSFI to demonstrate properties of the TSF such as those described in the security architecture description (as required by ADV_ARC). It should be noted, that although these TOE interfaces provide a means of testing the TSF properties, they are not the subject of the test.);
- b) initial conditions that will need to exist for the test (i.e. any particular objects or subjects that will need to exist and security attributes they will need to have);
- c) special test equipment that will be required to either stimulate a TSFI or make observations of a TSFI (although it is unlikely that specialist equipment would be required to exploit a potential vulnerability assuming an Enhanced-Basic attack potential);

- d) whether theoretical analysis should replace physical testing, particularly relevant where the results of an initial test can be extrapolated to demonstrate that repeated attempts of an attack are likely to succeed after a given number of attempts.

The evaluator will probably find it practical to carry out penetration testing using a series of test cases, where each test case will test for a specific potential vulnerability.

The intent of specifying this level of detail in the test documentation is to allow another evaluator to repeat the tests and obtain an equivalent result.

14.2.3.7.3 Work unit AVA_VAN.3-8

The evaluator shall conduct penetration testing.

The evaluator uses the penetration test documentation resulting from work unit AVA_VAN.3-6 as a basis for executing penetration tests on the TOE, but this does not preclude the evaluator from performing additional ad hoc penetration tests. If required, the evaluator may devise ad hoc tests as a result of information learnt during penetration testing that, if performed by the evaluator, are to be recorded in the penetration test documentation. Such tests may be required to follow up unexpected results or observations, or to investigate potential vulnerabilities suggested to the evaluator during the pre-planned testing.

Should penetration testing show that a hypothesised potential vulnerability does not exist, then the evaluator should determine whether or not the evaluator's own analysis was incorrect, or if evaluation deliverables are incorrect or incomplete.

The evaluator is not expected to test for potential vulnerabilities (including those in the public domain) beyond those which required an Enhanced-Basic attack potential. In some cases, however, it will be necessary to carry out a test before the exploitability can be determined. Where, as a result of evaluation expertise, the evaluator discovers an exploitable vulnerability that is beyond Enhanced-Basic attack potential, this is reported in the ETR as a residual vulnerability.

14.2.3.7.4 Work unit AVA_VAN.3-9

The evaluator shall record the actual results of the penetration tests.

While some specific details of the actual test results may be different from those expected (e.g. time and date fields in an audit record) the overall result should be identical. Any unexpected test results should be investigated. The impact on the evaluation should be stated and justified.

14.2.3.7.5 Work unit AVA_VAN.3-10

The evaluator shall report in the ETR the evaluator penetration testing effort, outlining the testing approach, configuration, depth and results.

The penetration testing information reported in the ETR allows the evaluator to convey the overall penetration testing approach and effort expended on this sub-activity. The intent of providing this information is to give a meaningful overview of the evaluator's penetration testing effort. It is not intended that the information regarding penetration testing in the ETR be an exact reproduction of specific test steps or results of individual penetration tests. The intention is to provide enough detail to allow other evaluators and evaluation authorities to gain some insight about the penetration testing approach chosen, amount of penetration testing performed, TOE test configurations, and the overall results of the penetration testing activity.

Information that would typically be found in the ETR subclause regarding evaluator penetration testing efforts is:

- a) TOE test configurations. The particular configurations of the TOE that were penetration tested;
- b) TSFI penetration tested. A brief listing of the TSFI and other TOE interfaces that were the focus of the penetration testing;

- c) Verdict for the sub-activity. The overall judgement on the results of penetration testing.

This list is by no means exhaustive and is only intended to provide some context as to the type of information that should be present in the ETR concerning the penetration testing the evaluator performed during the evaluation.

14.2.3.7.6 Work unit AVA_VAN.3-11

The evaluator shall examine the results of all penetration testing to determine that the TOE, in its operational environment, is resistant to an attacker possessing an Enhanced-Basic attack potential.

If the results reveal that the TOE, in its operational environment, has vulnerabilities exploitable by an attacker possessing less than Moderate attack potential, then this evaluator action fails.

The guidance in B.4 should be used to determine the attack potential required to exploit a particular vulnerability and whether it can therefore be exploited in the intended environment. It may not be necessary for the attack potential to be calculated in every instance, only if there is some doubt as to whether or not the vulnerability can be exploited by an attacker possessing an attack potential less than Moderate.

14.2.3.7.7 Work unit AVA_VAN.3-12

The evaluator shall report in the ETR all exploitable vulnerabilities and residual vulnerabilities, detailing for each:

- a) its source (e.g. evaluation methodology activity being undertaken when it was conceived, known to the evaluator, read in a publication);
- b) the SFR(s) not met;
- c) a description;
- d) whether it is exploitable in its operational environment or not (i.e. exploitable or residual);
- e) the amount of time, level of expertise, level of knowledge of the TOE, level of opportunity and the equipment required to perform the identified vulnerabilities, and the corresponding values using the tables B.2 and B.3 of Annex B.4.

14.2.4 Evaluation of sub-activity (AVA_VAN.4)

14.2.4.1 Objectives

The objective of this sub-activity is to determine whether the TOE, in its operational environment, has vulnerabilities exploitable by attackers possessing Moderate attack potential.

14.2.4.2 Input

The evaluation evidence for this sub-activity is:

- a) the ST;
- b) the functional specification;
- c) the TOE design;
- d) the security architecture description;
- e) the implementation representation;
- f) the guidance documentation;

- g) the TOE suitable for testing;
- h) information publicly available to support the identification of possible potential vulnerabilities.

The remaining implicit evaluation evidence for this sub-activity depends on the components that have been included in the assurance package. The evidence provided for each component is to be used as input in this sub-activity.

Other input for this sub-activity is:

- a) current information regarding public domain potential vulnerabilities and attacks (e.g. from an evaluation authority).

14.2.4.3 Application notes

The methodical analysis approach takes the form of a structured examination of the evidence. This method requires the evaluator to specify the structure and form the analysis will take (i.e. the manner in which the analysis is performed is predetermined, unlike the focused analysis). The method is specified in terms of the information that will be considered and how/why it will be considered. Further guidance on methodical vulnerability analysis can be found in Annex B.2.2.2.3.

14.2.4.4 Action AVA_VAN.4.1E

ISO/IEC 15408-3 AVA_VAN.4.1C: *The TOE shall be suitable for testing.*

14.2.4.4.1 Work unit AVA_VAN.4-1

The evaluator shall examine the TOE to determine that the test configuration is consistent with the configuration under evaluation as specified in the ST.

The TOE provided by the developer and identified in the test plan should have the same unique reference as established by the CM capabilities (ALC_CMC) sub-activities and identified in the ST introduction.

It is possible for the ST to specify more than one configuration for evaluation. The TOE may comprise a number of distinct hardware and software entities that need to be tested in accordance with the ST. The evaluator verifies that all test configurations are consistent with the ST.

The evaluator should consider the security objectives for the operational environment described in the ST that may apply to the test environment and ensure they are met in the testing environment. There may be some objectives for the operational environment that do not apply to the test environment. For example, an objective about user clearances may not apply; however, an objective about a single point of connection to a network would apply.

If any test resources are used (e.g. meters, analysers) it will be the evaluator's responsibility to ensure that these resources are calibrated correctly.

14.2.4.4.2 Work unit AVA_VAN.4-2

The evaluator shall examine the TOE to determine that it has been installed properly and is in a known state.

It is possible for the evaluator to determine the state of the TOE in a number of ways. For example, previous successful completion of the Evaluation of sub-activity (AGD_PRE.1) sub-activity will satisfy this work unit if the evaluator still has confidence that the TOE being used for testing was installed properly and is in a known state. If this is not the case, then the evaluator should follow the developer's procedures to install and start up the TOE, using the supplied guidance only.

If the evaluator has to perform the installation procedures because the TOE is in an unknown state, this work unit when successfully completed could satisfy work unit AGD_PRE.1-3.

14.2.4.5 Action AVA_VAN.4.2E

14.2.4.5.1 Work unit AVA_VAN.4-3

The evaluator shall examine sources of information publicly available to identify potential vulnerabilities in the TOE.

The evaluator examines the sources of information publicly available to support the identification of possible potential vulnerabilities in the TOE. There are many sources of publicly available information which the evaluator should consider using items such as those available on the world wide web, including:

- a) specialist publications (magazines, books);
- b) research papers;
- c) conference proceedings.

The evaluator should not constrain their consideration of publicly available information to the above, but should consider any other relevant information available.

While examining the evidence provided the evaluator will use the information in the public domain to further search for potential vulnerabilities. Where the evaluators have identified areas of concern, the evaluator should consider information publicly available that relate to those areas of concern.

The availability of information that may be readily available to an attacker that helps to identify and facilitate attacks may substantially enhance the attack potential of a given attacker. The accessibility of vulnerability information and sophisticated attack tools on the Internet makes it more likely that this information will be used in attempts to identify potential vulnerabilities in the TOE and exploit them. Modern search tools make such information easily available to the evaluator, and the determination of resistance to published potential vulnerabilities and well known generic attacks can be achieved in a cost-effective manner.

The search of the information publicly available should be focused on those sources that refer to the technologies used in the development of the product from which the TOE is derived. The extensiveness of this search should consider the following factors: TOE type, evaluator experience in this TOE type, expected attack potential and the level of ADV evidence available.

The identification process is iterative, where the identification of one potential vulnerability may lead to identifying another area of concern that requires further investigation.

The evaluator will describe the approach to be taken to identify potential vulnerabilities in the publicly available material, detailing the search to be performed. This may be driven by factors such as areas of concern identified by the evaluator, linked to the evidence the attacker is assumed to be able to obtain. However, it is recognised that in this type of search the approach may further evolve as a result of findings during the search. Therefore, the evaluator will also report any actions taken in addition to those described in the approach to further investigate issues thought to lead to potential vulnerabilities, and will report the evidence examined in completing the search for potential vulnerabilities.

14.2.4.6 Action AVA_VAN.4.3E

14.2.4.6.1 Work unit AVA_VAN.4-4

The evaluator shall conduct a methodical analysis of ST, guidance documentation, functional specification, TOE design, security architecture description and implementation representation to identify possible potential vulnerabilities in the TOE.

Guidance on methodical vulnerability analysis is provided in Annex B.2.2.2.3.

This approach to identification of potential vulnerabilities is to take an ordered and planned approach. A system is to be applied in the examination. The evaluator is to describe the method to be used in terms of the manner in which this information is to be considered and the hypothesis that is to be created.

A flaw hypothesis methodology needs to be used whereby the ST, development (functional specification, TOE design and implementation representation) and guidance evidence are analysed and then vulnerabilities in the TOE are hypothesised, or speculated.

The evaluator uses the knowledge of the TOE design and operation gained from the TOE deliverables to conduct a flaw hypothesis to identify potential flaws in the development of the TOE and potential errors in the specified method of operation of the TOE.

The security architecture description provides the developer vulnerability analysis, as it documents how the TSF protects itself from interference from untrusted subjects and prevents the bypass of security enforcement functionality. Therefore, the evaluator should build upon the understanding of the TSF protection gained from the analysis of this evidence and then develop this in the knowledge gained from other development ADV evidence.

The approach taken to the methodical search for vulnerabilities is to consider any areas of concern identified in the results of the evaluator's assessment of the development and guidance evidence. However, the evaluator should also consider each aspect of the security architecture analysis to search for any ways in which the protection of the TSF can be undermined. It may be helpful to structure the methodical analysis on the basis of the material presented in the security architecture description, introducing concerns from other ADV evidence as appropriate. The analysis can then be further developed to ensure all other material from the ADV evidence is considered.

The following provide some examples of hypotheses that may be created when examining the evidence:

- a) consideration of malformed input for interfaces available to an attacker at the external interfaces;
- b) examination of a key security mechanism cited in the security architecture description, such as process separation, hypothesising internal buffer overflows that may lead to degradation of separation;
- c) search to identify any objects created in the TOE implementation representation that are then not fully controlled by the TSF, and could be used by an attacker to undermine SFRs.

For example, the evaluator may identify that interfaces are a potential area of weakness in the TOE and specify an approach to the search that all interface specifications in the evidence provided will be searched to hypothesise potential vulnerabilities, and go on to explain the methods used in the hypothesis.

In addition, areas of concern the evaluator has identified during examination of the evidence during the conduct of evaluation activities. Areas of concern may also be identified during the conduct of other work units associated with this component, in particular AVA_VAN.4-7, AVA_VAN.4-5 and AVA_VAN.4-6 where the development and conduct of penetration tests may identify further areas of concerns for investigation, or potential vulnerabilities.

However, examination of only a subset of the development and guidance evidence or their contents is not permitted in this level of rigour. The approach description should provide a demonstration that the methodical approach used is complete, providing confidence that the approach used to search the deliverables has considered all of the information provided in those deliverables.

This approach to identification of potential vulnerabilities is to take an ordered and planned approach; applying a system to the examination. The evaluator is to describe the method to be used in terms of how the evidence will be considered; the manner in which this information is to be considered and the hypothesis that is to be created. This approach should be agreed with the evaluation authority, and the evaluation authority may provide detail of any additional approaches the evaluator should take to the vulnerability analysis and identify any additional information that should be considered by the evaluator.

Although a system to identifying potential vulnerabilities is predefined, the identification process may still be iterative, where the identification of one potential vulnerability may lead to identifying another area of concern that requires further investigation.

Subject to the SFRs the TOE is to meet in the operational environment, the evaluator's independent vulnerability analysis should consider generic potential vulnerabilities under each of the following headings:

- a) generic potential vulnerabilities relevant for the type of TOE being evaluated, as may be supplied by the evaluation authority;
- b) bypassing;
- c) tampering;
- d) direct attacks;
- e) monitoring;
- f) misuse.

Items b) - f) are explained in greater detail in Annex B.

The security architecture description should be considered in light of each of the above generic potential vulnerabilities. Each potential vulnerability should be considered to search for possible ways in which to defeat the TSF protection and undermine the TSF.

14.2.4.6.2 Work unit AVA_VAN.4-5

The evaluator shall record in the ETR the identified potential vulnerabilities that are candidates for testing and applicable to the TOE in its operational environment.

It may be identified that no further consideration of the potential vulnerability is required if for example the evaluator identifies that measures in the operational environment, either IT or non-IT, prevent exploitation of the potential vulnerability in that operational environment. For instance, restricting physical access to the TOE to authorised users only may effectively render a potential vulnerability to tampering unexploitable.

The evaluator records any reasons for exclusion of potential vulnerabilities from further consideration if the evaluator determines that the potential vulnerability is not applicable in the operational environment. Otherwise the evaluator records the potential vulnerability for further consideration.

A list of potential vulnerabilities applicable to the TOE in its operational environment, which can be used as an input into penetration testing activities, shall be reported in the ETR by the evaluators.

14.2.4.7 Action AVA_VAN.4.4E

14.2.4.7.1 Work unit AVA_VAN.4-6

The evaluator shall devise penetration tests, based on the independent search for potential vulnerabilities.

The evaluator prepares for penetration testing as necessary to determine the susceptibility of the TOE, in its operational environment, to the potential vulnerabilities identified during the search of the sources of information publicly available. Any current information provided to the evaluator by a third party (e.g. evaluation authority) regarding known potential vulnerabilities will be considered by the evaluator, together with any encountered potential vulnerabilities resulting from the performance of other evaluation activities.

The evaluator is reminded that, as for considering the security architecture description in the search for vulnerabilities (as detailed in AVA_VAN.4-3), testing should be performed to confirm the architectural properties. If requirements from ATE_DPT are included in the SARs, the developer testing evidence will include testing performed to confirm the correct implementation of any specific mechanisms detailed in the

security architecture description. However, the developer testing will not necessarily include testing of all aspects of the architectural properties that protect the TSF, as much of this testing will be negative testing in nature, attempting to disprove the properties. In developing the strategy for penetration testing, the evaluator will ensure that all aspects of the security architecture description are tested, either in functional testing (as considered in 13) or evaluator penetration testing.

The evaluator will probably find it practical to carry out penetration test using a series of test cases, where each test case will test for a specific potential vulnerability.

The evaluator is not expected to test for potential vulnerabilities (including those in the public domain) beyond those which required a Moderate attack potential. In some cases, however, it will be necessary to carry out a test before the exploitability can be determined. Where, as a result of evaluation expertise, the evaluator discovers an exploitable vulnerability that is beyond Moderate attack potential, this is reported in the ETR as a residual vulnerability.

Guidance on determining the necessary attack potential to exploit a potential vulnerability can be found in Annex B.4.

Potential vulnerabilities hypothesised as exploitable by an attacker possessing a Moderate (or less) attack potential and resulting in a violation of the security objectives should be the highest priority potential vulnerabilities comprising the list used to direct penetration testing against the TOE.

14.2.4.7.2 Work unit AVA_VAN.4-7

The evaluator shall produce penetration test documentation for the tests based on the list of potential vulnerabilities in sufficient detail to enable the tests to be repeatable. The test documentation shall include:

- a) identification of the potential vulnerability the TOE is being tested for;
- b) instructions to connect and setup all required test equipment as required to conduct the penetration test;
- c) instructions to establish all penetration test prerequisite initial conditions;
- d) instructions to stimulate the TSF;
- e) instructions for observing the behaviour of the TSF;
- f) descriptions of all expected results and the necessary analysis to be performed on the observed behaviour for comparison against expected results;
- g) instructions to conclude the test and establish the necessary post-test state for the TOE.

The evaluator prepares for penetration testing based on the list of potential vulnerabilities identified during the search of the public domain and the analysis of the evaluation evidence.

The evaluator is not expected to determine the exploitability for potential vulnerabilities beyond those for which a Moderate attack potential is required to effect an attack. However, as a result of evaluation expertise, the evaluator may discover a potential vulnerability that is exploitable only by an attacker with greater than Moderate attack potential. Such vulnerabilities are to be reported in the ETR as residual vulnerabilities.

With an understanding of the potential vulnerability, the evaluator determines the most feasible way to test for the TOE's susceptibility. Specifically the evaluator considers:

- a) the TSFI or other TOE interface that will be used to stimulate the TSF and observe responses (It is possible that the evaluator will need to use an interface to the TOE other than the TSFI to demonstrate properties of the TSF such as those described in the security architecture description (as required by ADV_ARC). It should be noted, that although these TOE interfaces provide a means of testing the TSF properties, they are not the subject of the test.);

- b) initial conditions that will need to exist for the test (i.e. any particular objects or subjects that will need to exist and security attributes they will need to have);
- c) special test equipment that will be required to either stimulate a TSFI or make observations of a TSFI;
- d) whether theoretical analysis should replace physical testing, particularly relevant where the results of an initial test can be extrapolated to demonstrate that repeated attempts of an attack are likely to succeed after a given number of attempts.

The evaluator will probably find it practical to carry out penetration testing using a series of test cases, where each test case will test for a specific potential vulnerability.

The intent of specifying this level of detail in the test documentation is to allow another evaluator to repeat the tests and obtain an equivalent result.

14.2.4.7.3 Work unit AVA_VAN.4-8

The evaluator shall conduct penetration testing.

The evaluator uses the penetration test documentation resulting from work unit AVA_VAN.4-6 as a basis for executing penetration tests on the TOE, but this does not preclude the evaluator from performing additional ad hoc penetration tests. If required, the evaluator may devise ad hoc tests as a result of information learnt during penetration testing that, if performed by the evaluator, are to be recorded in the penetration test documentation. Such tests may be required to follow up unexpected results or observations, or to investigate potential vulnerabilities suggested to the evaluator during the pre-planned testing.

Should penetration testing show that a hypothesised potential vulnerability does not exist, then the evaluator should determine whether or not the evaluator's own analysis was incorrect, or if evaluation deliverables are incorrect or incomplete.

The evaluator is not expected to test for potential vulnerabilities (including those in the public domain) beyond those which required a Moderate attack potential. In some cases, however, it will be necessary to carry out a test before the exploitability can be determined. Where, as a result of evaluation expertise, the evaluator discovers an exploitable vulnerability that is beyond Moderate attack potential, this is reported in the ETR as a residual vulnerability.

14.2.4.7.4 Work unit AVA_VAN.4-9

The evaluator shall record the actual results of the penetration tests.

While some specific details of the actual test results may be different from those expected (e.g. time and date fields in an audit record) the overall result should be identical. Any unexpected test results should be investigated. The impact on the evaluation should be stated and justified.

14.2.4.7.5 Work unit AVA_VAN.4-10

The evaluator shall report in the ETR the evaluator penetration testing effort, outlining the testing approach, configuration, depth and results.

The penetration testing information reported in the ETR allows the evaluator to convey the overall penetration testing approach and effort expended on this sub-activity. The intent of providing this information is to give a meaningful overview of the evaluator's penetration testing effort. It is not intended that the information regarding penetration testing in the ETR be an exact reproduction of specific test steps or results of individual penetration tests. The intention is to provide enough detail to allow other evaluators and evaluation authorities to gain some insight about the penetration testing approach chosen, amount of penetration testing performed, TOE test configurations, and the overall results of the penetration testing activity.

Information that would typically be found in the ETR subclause regarding evaluator penetration testing efforts is:

- a) TOE test configurations. The particular configurations of the TOE that were penetration tested;
- b) TSFI penetration tested. A brief listing of the TSFI and other TOE interfaces that were the focus of the penetration testing;
- c) Verdict for the sub-activity. The overall judgement on the results of penetration testing.

This list is by no means exhaustive and is only intended to provide some context as to the type of information that should be present in the ETR concerning the penetration testing the evaluator performed during the evaluation.

14.2.4.7.6 Work unit AVA_VAN.4-11

The evaluator shall examine the results of all penetration testing to determine that the TOE, in its operational environment, is resistant to an attacker possessing a Moderate attack potential.

If the results reveal that the TOE, in its operational environment, has vulnerabilities exploitable by an attacker possessing less than a High attack potential, then this evaluator action fails.

The guidance in B.4 should be used to determine the attack potential required to exploit a particular vulnerability and whether it can therefore be exploited in the intended environment. It may not be necessary for the attack potential to be calculated in every instance, only if there is some doubt as to whether or not the vulnerability can be exploited by an attacker possessing an attack potential less than High.

14.2.4.7.7 Work unit AVA_VAN.4-12

The evaluator shall report in the ETR all exploitable vulnerabilities and residual vulnerabilities, detailing for each:

- a) its source (e.g. evaluation methodology activity being undertaken when it was conceived, known to the evaluator, read in a publication);
- b) the SFR(s) not met;
- c) a description;
- d) whether it is exploitable in its operational environment or not (i.e. exploitable or residual);
- e) the amount of time, level of expertise, level of knowledge of the TOE, level of opportunity and the equipment required to perform the identified vulnerabilities, and the corresponding values using the tables B.2 and B.3 of Annex B.4.

14.2.5 Evaluation of sub-activity (AVA_VAN.5)

There is no general guidance; the scheme should be consulted for guidance on this sub-activity.

15 Class ACO: Composition

15.1 Introduction

The goal of this activity is to determine whether the components can be integrated in a secure manner, as defined in the ST for the composed TOE. This is achieved through examination and testing of the interfaces between the components, supported by examination of the design of the components and the conduct of vulnerability analysis.

15.2 Application notes

The Reliance of dependent component (ACO_REL) family identifies where the dependent component is reliant upon IT in its operational environment (satisfied by a base component in the composed TOE

evaluation) in order to provide its own security services. This reliance is identified in terms of the interfaces expected by the dependent component to be provided by the base component. Development evidence (ACO_DEV) then determines which interfaces of the base component were considered (as TSFI) during the component evaluation of the base component.

It should be noted that Reliance of dependent component (ACO_REL) does not cover other evidence that may be needed to address the technical integration problem of composing components (e.g. descriptions of non-TSF interfaces of the operating system, rules for integration, etc.). This is outside the security assessment of the composition and is a functional composition issue.

As part of Composed TOE testing (ACO_CTT) the evaluator will perform testing of the composed TOE SFRs at the composed TOE interfaces and of the interfaces of the base component relied upon by the dependent component to confirm they operate as specified. The subset selected will consider the possible effects of changes to the configuration/use of the base component as used in the composed TOE. These changes are identified from the configuration of the base component determined during the base component evaluation. The developer will provide test evidence for each of the base component interfaces (the requirements for coverage are consistent with those applied to the evaluation of the base component).

Composition rationale (ACO_COR) requires the evaluator to determine whether the appropriate assurance measures have been applied to the base component, and whether the base component is being used in its evaluated configuration. This includes determination of whether all security functionality required by the dependent component was within the TSF of the base component. The Composition rationale (ACO_COR) requirement may be met through the production of evidence that each of these is demonstrated to be upheld. This evidence may be in the form of the security target and a public report of the component evaluation (e.g. certification report).

If, on the other hand, one of the above have not been upheld, then it may be possible that an argument can be made as to why the assurance gained during an original evaluation is unaffected. If this is not possible then additional evaluation evidence for those aspects of the base component not covered may have to be provided. This material is then assessed in Development evidence (ACO_DEV).

For example, it may be the case as described in the Interactions between entities (see Annex B.3, Interactions between composed IT entities in ISO/IEC 15408-3) that the dependent component requires the base component to provide more security functionality in the composed TOE than included in the base component evaluation. This would be determined during the application of the Reliance of dependent component (ACO_REL) and Development evidence (ACO_DEV) families. In this case the composition rationale evidence provided for Composition rationale (ACO_COR) would demonstrate that the assurance gained from the base component evaluation is unaffected. This may be achieved by means including:

- a) Performing a re-evaluation of the base component focusing on the evidence relating to the extended part of the TSF;
- b) Demonstrating that the extended part of the TSF cannot affect other portions of the TSF, and providing evidence that the extended part of the TSF provides the necessary security functionality.

15.3 Composition rationale (ACO_COR)

15.3.1 Evaluation of sub-activity (ACO_COR.1)

15.3.1.1 Input

The evaluation evidence for this sub-activity is:

- a) the composed ST;
- b) the composition rationale;
- c) the reliance information;

- d) the development information;
- e) unique identifier.

15.3.1.2 Action ACO_COR.1.1E

ISO/IEC 15408-3 ACO_COR.1.1C: *The composition rationale shall demonstrate that a level of assurance at least as high as that of the dependent component has been obtained for the support functionality of the base component, when the base component is configured as required to support the TSF of the dependent component.*

15.3.1.2.1 Work unit ACO_COR.1-1

The evaluator shall examine the correspondence analysis with the development information and the reliance information to identify the interfaces that are relied upon by the dependent component which are not detailed in the development information.

The evaluator's goal in this work unit is two fold:

- a) to determine which interfaces relied upon by the dependent component have had the appropriate assurance measures applied;
- b) to determine that the assurance package applied to the base component during the base component evaluation contained either the same assurance requirements as those in the package applied to the dependent component during its' evaluation, or hierarchically higher assurance requirements.

The evaluator may use the correspondence tracing in the development information developed during the Development evidence (ACO_DEV) activities (e.g. ACO_DEV.1-2, ACO_DEV.2-4, ACO_DEV.3-6) to help identify the interfaces identified in the reliance information that are not considered in the development information.

The evaluator will record the SFR-enforcing interfaces described in the reliance information that are not included in the development information. These will provide input to ACO_COR.1-3 work unit, helping to identify the portions of the base component in which further assurance is required.

If the both the base and dependent components were evaluated against the same assurance package, then the determination of whether the level of assurance in the portions within the base component evaluation is at least as high as that of the dependent component is trivial. If however, the assurance packages applied to the components during the component evaluations differ, the evaluator needs to determine that the assurance requirements applied to the base component are all hierarchically higher to the assurance requirements applied to the dependent component.

15.3.1.2.2 Work unit ACO_COR.1-2

The evaluator shall examine the composition rationale to determine, for those included base component interfaces on which the dependent TSF relies, whether the interface was considered during the evaluation of the base component.

The ST, component public evaluation report (e.g. certification report) and guidance documents for the base component all provide information on the scope and boundary of the base component. The ST provides details of the logical scope and boundary of the composed TOE, allowing the evaluator to determine whether an interface relates to a portion of the product that was within the scope of the evaluation. The guidance documentation provides details of use of all interfaces for the composed TOE. Although the guidance documentation may include details of interfaces in the product that are not within the scope of the evaluation, any such interfaces should be identifiable, either from the scoping information in the ST or through a portion of the guidance that deals with the evaluated configuration. The public evaluation report may provide any additional constraints on the use of the composed TOE that are necessary.

Therefore, the combination of these inputs allows the evaluator to determine whether an interface described in the composition rationale has the necessary assurance associated with it, or whether further assurance is required. The evaluator will record those interfaces of the base component for which additional assurance is required, for consideration during ACO_COR.1-3.

15.3.1.2.3 Work unit ACO_COR.1-3

The evaluator shall examine the composition rationale to determine that the necessary assurance measures have been applied to the base component.

The evaluation verdicts, and resultant assurance, for the base component can be reused provided the same portions of the base component are used in the composed TOE and they are used in a consistent manner.

In order to determine whether the necessary assurance measures have already been applied to the component, and the portions of the component for which assurance measures still need to be applied, the evaluator should use the output of the ACO_DEV.*.2E action and the work units ACO_COR.1-1 and ACO_COR.1-2:

- a) For those interfaces identified in the reliance information (Reliance of dependent component (ACO_REL)), but not discussed in development information (Development evidence (ACO_DEV)), additional information is required. (Identified in ACO_COR.1-1.)
- b) For those interfaces used inconsistently in the composed TOE from the base component (difference between the information provided in Development evidence (ACO_DEV) and Reliance of dependent component (ACO_REL) the impact of the differences in use need to be considered. (Identified in ACO_DEV.*.2E.)
- c) For those interfaces identified in composition rationale for which no assurance has previously been gained, additional information is required. (Identified in ACO_COR.1-2.)
- d) For those interfaces consistently described in the reliance information, composition rationale and the development information, no further action is required as the results from the base component evaluation can be re-used.

The interfaces of the base component reported to be required by the reliance information but not included in the development information indicate the portions of the base component where further assurance is required. The interfaces identify the entry points into the base component.

For those interfaces included in both the development information and reliance information, the evaluator is to determine whether the interfaces are being used in the composed TOE in a manner that is consistent with the base component evaluation. The method of use of the interface will be considered during the Development evidence (ACO_DEV) activities to determine that the use of the interface is consistent in both the base component and the composed TOE. The remaining consideration is the determination of whether the configurations of the base component and the composed TOE are consistent. To determine this, the evaluator will consider the guidance documentation of each to ensure they are consistent (see further guidance below regarding consistent guidance documentation). Any deviation in the documentation will be further analysed by the evaluation to determine the possible effects.

For those interfaces that are consistently described in the reliance information and development information, and for which the guidance is consistent for the base component and the composed TOE, the required level of assurance has been provided.

The following subsubclauses provide guidance on how to determine consistency between assurance gained in the base component, the evidence provided for the composed TOE, and the analysis performed by the evaluator in the instances where inconsistencies are identified.
