Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT), see the following URL: Foreword — Supplementary information.

Amendment 2 to ISO/IEC 19794–5:2011 was prepared by ISO/IEC JTC 1, *Information Technology*, Subcommittee SC 37, *Biometrics*.

AMENDMENT 2: XML encoding and clarification of defects

Page 1, Conformance

Insert the following text as second paragraph:

An XML document conforms to this part of ISO/IEC 19794 if it satisfies the format requirements with respect to its structure, with respect to relations among its fields, and with respect to relations between its fields and the underlying input that are specified within Annex F of this part of ISO/IEC 19794.

Page 2, Normative references

Add the following URL as the last item in Clause 3:

XML Schema: http://www.w3.org/XML/Schema.html

Page v, ISO/IEC 19794–5:2011/Amd 1:2014, Introduction

Add the following paragraph after the last paragraph:

Additionally, this part of the ISO/IEC standard supports both binary and XML encoding, to support a spectrum of user requirement. With XML, this part will meet the requirements of modern IT architectures. With binary encoding this part will also be able to be used in bandwidth or storage constrained environments. Annex F specifies the schema that XML encoded face image records must conform to, and Annex G provides an example of a valid XML encoded face image record.

R-108	5.6.6	**Anthropometric Landmarks** Anthropometric landmarks extend the MPEG-4 feature model with new points that are used in forensics and anthropology for person identification via two facial images or image and skull over a long time. They also allow specification of points that are in use by criminal experts and anthropologists[10]. Figure 9 and Table 15 show the definition of the anthropometric landmarks. The set of points represents the craniofacial landmark points of the head and face. The latter are used in forensics for "Face to face" and "Skull to face" identification. Some of these points have MPEG 4 counterparts, others not. The anthropometric landmark code has the format: A.B. A specifies the global landmark of the face to which this landmark belongs such as nose, mouth, etc. B specifies the particular point. In case a Landmark Point has two symmetrical entities (left and right) the right entity always has a greater and even minor code value. Hence, all Landmark Points from the left part of the face have odd minor codes, and from the right part — even minor codes. Both A and B are in the range from 1 to 15. Hence, the code A*16 + B is written to the 1 byte Landmark Point Code field.	3C	O-1	Y	Y	Y	Y	Y

Post -acquisition Processing	PostAcquisitionProcessing	Each post-processing step is an XML element. The application of an step is reflected by its boolean value. See Table F.11.
Cross Reference	CrossReference	attribute of the FaceImageInformation element
Image Colour Space	ImageColourSpace	The format is changed to xs:string. See Table F.12.
Image Data	ImageData	This element contains the base64-encoded binary image. "Data Structure" and "Image Data Length" are obsoleted.
3D Information Block	FaceRepresentation3D	
Coordinate System Type	N/A	The type of the coordinate system has been merged into the name of the respective coordinate. See ISO/IEC 19794–1 for details.
Scale X, Y, Z	SamplingRate	The type of the coordinate is specific to the coordinate system it is based on (see ISO/IEC 19794–1).A choice has been introduced to enable the correct definition of the respective value.
Offset X, Y, Z	Offset	X, Y, Z values are subsidiary elements to "Offset".
3D Representation Type	N/A	Obsoleted by the existence of the respective element.
