RECTIFICATIF TECHNIQUE 1

Technical Corrigendum 1 to ISO/IEC 23001-8:2013 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 29, *Coding of audio, picture, multimedia and hypermedia information*.

Replace 7.2 (Transfer characteristics) with the following:

“

7.2 Transfer characteristics

Type: *Unsigned integer, enumeration*

Range: *0 – 255*

TransferCharacteristics indicates the opto-electronic transfer characteristic of the source picture as specified in Table 3 as a function of a linear optical intensity input L_c with a nominal real-valued range of 0 to 1. For interpretation of entries in Table 3 that are expressed in terms of multiple curve segments parameterized by the variable α over a region bounded by the variable β or by the variables β and γ , the values of α and β are defined to be the positive constants necessary for the curve segments that meet at the value β to have continuity of value and continuity of slope at the the value β , and the value of γ , when applicable, is defined to be the positive constant necessary for the associated curve segments to meet at the

value γ . For example, for transfer_characteristics equal to 1, 6, 14, or 15, α has the value $1 + 5.5 * \beta = 1.099\ 296\ 826\ 809\ 442\dots$ and β has the value $0.018\ 053\ 968\ 510\ 807\dots$

An 8-bit field should be adequate for representation of the **TransferCharacteristics** code point.

In 7.3 (Matrix coefficients) replace the specification of case 10 with the following:

- Otherwise (MatrixCoefficients is equal to 10), the signal E'_Y is determined by application of the transfer characteristics function as follows, and Equations 30 to 37 apply for specification of the signals E'_{PB} and E'_{PR} :

$$E_Y = K_R * E_R + (1 - K_R - K_B) * E_G + K_B * E_B \quad (28)$$

$$E'_Y = (E_Y)' \quad (29)$$

NOTE 2 – In this case, E_Y is defined from the "linear-domain" signals for E_R , E_G , and E_B , prior to application of the transfer characteristics function, which is then applied to produce the signal E'_Y . E_Y and E'_Y are real values with the value 0 associated with nominal black and the value 1 associated with nominal white.

$$E'_{PB} = (E'_B - E'_Y) \div (2 * N_B) \quad \text{for } -N_B \leq E'_B - E'_Y \leq 0 \quad (30)$$

$$E'_{PB} = (E'_B - E'_Y) \div (2 * P_B) \quad \text{for } 0 < E'_B - E'_Y \leq P_B \quad (31)$$

$$E'_{PR} = (E'_R - E'_Y) \div (2 * N_R) \quad \text{for } -N_R \leq E'_R - E'_Y \leq 0 \quad (32)$$
