disableEdit (Disable Edit)	Specifies whether the connection element used with this query table shall be editable. If `true`, then the connection is not editable. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
disableRefresh (Disable Refresh)	Specifies whether the query table shall be refreshable. If `true`, then then query table is not refreshable. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
fillFormulas (Fill Adjacent Formulas)	Specifies whether or not formulas in columns adjacent to the query table should be filled down whenever the query table is refreshed. This is helpful since the number of rows returned by a query table refresh operation can vary. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
firstBackgroundRefresh (First Background Refresh)	Specifies whether or not data has ever been refreshed for this query table. If the very first background data refresh had not completed at the time the file was saved, this attribute is set to `true`. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
growShrinkType (Grow Shrink Type)	Specifies the type of behavior expected for dealing with a variable number of rows of data in the query table between refresh operations. The meaning of the possible values of this attribute {`insertClear`, `insertDelete`, `overwriteClear`} are explained in detail in the definition of the simple type. The possible values for this attribute are defined by the ST_GrowShrinkType simple type (§18.18.39).
headers (First Row	Specifies whether or not the query table has first row with column titles.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
Column Titles)	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
intermediate (Intermediate)	Specifies whether this query table is in an intermediate state, having been defined but not fully formed and populated with data. In this state, fields and ranges of the query table can be unknown. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
name (QueryTable Name)	Specifies the name of the query table. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
preserveFormatting (Preserve Formatting On Refresh)	Specifies whether the application should try to preserve formatting in the query table and copy this formatting to any new rows of data. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
refreshOnLoad (Refresh On Load)	Specifies whether the query table shall refresh its data automatically when the spreadsheetML document is loaded or opened. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
removeDataOnSave (Remove Data On Save)	Specifies whether the query table shall remove all data from the worksheet before the spreadsheetML document is saved. This is very helpful for situations where people who have different permissions to view data want to share the same spreadsheetML document. All data from the last user is removed, and new users re-query the external data sources with their own credentials. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rowNumbers (Row Numbers)	Specifies whether the query table shall include a first column of row numbers. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_QueryTable) is located in §A.2. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.12.3 queryTableDeletedFields (Deleted Fields)

This element is the collection for deletedField (§18.12.1) elements, each of which represents a column or field that has been deleted from the query table.

[*Example*:

```
<queryTableDeletedFields count="2">
  <deletedField name="ShipVia"/>
  <deletedField name="Freight"/>
</queryTableDeletedFields>
```

end example]

Parent Elements
queryTableRefresh (§18.12.6)

Child Elements	Subclause
deletedField (Deleted Field)	§18.12.1

Attributes	Description
count (Deleted Fields Count)	Specifies how many deleted fields there are. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_QueryTableDeletedFields) is located in §A.2. *end note*]

18.12.4 queryTableField (QueryTable Field)

This element holds the properties related to a specific field or column in a query table.

Parent Elements
queryTableFields (§18.12.5)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§18.2.10

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
clipped (Clipped Column)	Specifies whether this field/column is currently clipped and thus not visible in the worksheet. [*Note*: this state might occur for example when a query table is defined near the edge of a worksheet or other object in the spreadsheet that can't be overwritten with external data. In this case some of the fields are displayed, but not all of them. *end note*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
dataBound (Data Bound Column)	Specifies whether this column is a user-defined column or comes from the external data query. User defined columns shall be preserved during data refresh operations. User-defined columns are only supported on query tables that are attached to table objects. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
fillFormulas (Fill This Formula On Refresh)	Specifies whether the formula in this field/column should be filled down on data refresh. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
id (Field Id)	Specifies the unique identifier of the query table field. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
name (Name)	Specifies the unique name of the query table field. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
rowNumbers (Row Numbers)	`true` if this column contains the row numbers for the records returned. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
tableColumnId (Table Column Id)	Specifies the unique identifier for the table column if the query table is attached to a table object rather than just a range in the sheet. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_QueryTableField) is located in §A.2. *end note*]

18.12.5 queryTableFields (Query table fields)

This element is the collection for queryTableField elements.

Parent Elements
queryTableRefresh (§18.12.6)

Child Elements	Subclause
queryTableField (QueryTable Field)	§18.12.4

Attributes	Description
count (Column Count)	Specifies the number of columns there are in this query table. Includes both query-defined and user-defined columns, but not deleted columns. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_QueryTableFields) is located in §A.2. *end note*]

18.12.6 queryTableRefresh (QueryTable Refresh Information)

This element contains information related to refreshing the query table.

Parent Elements
queryTable (§18.12.2)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§18.2.10
queryTableDeletedFields (Deleted Fields)	§18.12.3
queryTableFields (Query table fields)	§18.12.5
sortState (Sort State)	§18.3.1.92

Attributes	Description
fieldIdWrapped (Next Field Id Wrapped)	Whether or not the idFieldNext value wrapped around. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
headersInLastRefresh (Headers In Last Refresh)	Whether or not the Query Table had titles last refresh. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
minimumVersion (Minimum Refresh Version)	For backward compatibility with legacy versions of spreadsheet applications, this attribute specifies the minimum version of the application that is expected to correctly refresh the data in the query table without any problems. If this attribute is specified, an earlier version of a spreadsheet application should alert the user to the potential incompatibilities when a refresh is attempted. The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.
nextId (Next field id)	Specifies the next unique queryTableField (§18.12.4) id number available for assignment. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
preserveSortFilterLayout (Preserve Sort & Filter Layout)	Specifies whether sorting, autofilter, layout, and table block formatting should be preserved for this query table across data refresh operations. If this attribute is set to `false`, the query table might be more or less recreated from scratch when data is refreshed. In this case, all user deleted or rearranged columns, user inserted columns that aren't bound to external data, and table column formatting are discarded. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
unboundColumnsLeft (Columns Left)	Specifies the number of extra columns included at the left end of the field array that aren't bound to external data. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
unboundColumnsRight (Columns Right)	Specifies the number of extra columns included at the right end of the Table that aren't bound to external data. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_QueryTableRefresh) is located in §A.2. *end note*]

18.13 External Data Connections

SpreadsheetML allows for the definition of top level data connection objects that describe how to retrieve data from external sources. These connection objects are independent of the constructs in the spreadsheet application that display data such as tables, PivotTables, etc.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Some information about a connection is considered part of the connection's definition. Other information is not inherently part of the connection, but it describes the way the connection is to be used by the containing workbook. Note that in many cases, the spreadsheet application does not need knowledge of the command syntax for the external data source (e.g., database query language), and simply stores a command string that was created by a data provider API (e.g., an ODBC driver).

A connection's definition can be established in a standalone connection file for easier sharing and reuse, but this reference documentation deals with the XML representation for external data connections that is directly embedded within a SpreadsheetML document. This embedded representation is expected whenever external data is used, and ensures portability of the document and continued operation of the external query in the most cases.

18.13.1 connection (Connection)

This element contains both the definition of how to get at an external data source as well as information describing how the connection is used within the workbook. Specific constructs in a worksheet, such as OLAP formulas, QueryTables, or PivotTables make use of information in the connection to retrieve or refresh data based on default events or the user's explicit request.

Parent Elements
connections (§18.13.2)

Child Elements	Subclause
dbPr (Database Properties)	§18.13.3
extLst (Future Feature Data Storage Area)	§18.2.10
olapPr (OLAP Properties)	§18.13.5
parameters (Query Parameters)	§18.13.7
textPr (Text Import Settings)	§18.13.12
webPr (Web Query Properties)	§18.13.13

Attributes	Description
background (Background Refresh)	Indicates whether the connection can be refreshed in the background (asynchronously). `true` if preferred usage of the connection is to refresh asynchronously in the background; `false` if preferred usage of the connection is to refresh synchronously in the foreground. This flag should be intentionally ignored in specific cases. [*Example*: An example of when the flag would be ignored is in the case of a connection to OLAP data on Microsoft SQL Server Analysis Services, where the connection is used by both a PivotTable and also by CUBE functions within the workbook. That connection will always be refreshed synchronously by the PivotTable and will always be refreshed

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
	asynchronously by the CUBE functions. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
credentials (Reconnection Method)	Specifies the authentication method to be used when establishing (or re-establishing) the connection. The possible values for this attribute are defined by the ST_CredMethod simple type (§18.18.16).
deleted (Deleted Connection)	Indicates whether the associated workbook connection has been deleted. `true` if the connection has been deleted; otherwise, `false`. Deleted connections contain only the attributes name and deleted=`true`, all other information is removed from the SpreadsheetML file. If a new connection is created with the same name as a deleted connection, then the deleted connection is overwritten by the new connection. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
description (Connection Description)	Specifies the user description for this connection. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
id (Connection Id)	Specifies The unique identifier of this connection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
interval (Automatic Refresh Interval)	Specifies the number of minutes between automatic refreshes of the connection. When this attribute is not present, the connection is not automatically refreshed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
keepAlive (Keep Connection Open)	`true` when the spreadsheet application should make efforts to keep the connection open. When `false`, the application should close the connection after retrieving the information. This corresponds to the MaintainConnection property of a PivotCache object. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
minRefreshableVersion (Minimum Version Required	For compatibility with legacy spreadsheet applications. This represents the minimum version # that is required to be able to correctly refresh the data connection. This attribute applies to connections that are used by a QueryTable.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
for Refresh)	The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.
name (Connection Name)	Specifies the name of the connection. Each connection shall have a unique name. When a connection has been marked as deleted and then a new connection is added with the same name, the deleted connection is replaced with the new connection. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
new (New Connection)	`true` if the connection has not been refreshed for the first time; otherwise, `false`. This state can happen when the user saves the file before a query has finished returning. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
odcFile (Connection File)	Specifies the full path to external connection file from which this connection was created. If a connection fails during an attempt to refresh data, and reconnectionMethod=1, then the spreadsheet application will try again using information from the external connection file instead of the connection object embedded within the workbook. This is a benefit for data source and spreadsheetML document manageability. If the definition in the external connection file is changed (e.g., because of a database server name change), then the workbooks that made use of that connection will fail to connect with their internal connection information, and reload the new connection information from this file. This attribute is cleared by the spreadsheet application when the user manually edits the connection definition within the workbook. Can be expressed in URI or system-specific file path notation. [*Note*: Applications can decide what forms of URI they support, and whether system-specific file path notations are supported. *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
onlyUseConnection File (Only Use Connection File)	Indicates whether the spreadsheet application should always and only use the connection information in the external connection file indicated by the odcFile attribute when the connection is refreshed. If `false`, then the spreadsheet application should follow the procedure indicated by the reconnectionMethod attribute described below. Applies only to OLE DB and ODBC connections, this attribute is ignored for other types of

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	connections. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
reconnectionMethod (Reconnection Method)	Specifies what the spreadsheet application should do when a connection fails. The values are as follows: `1 = As required`: On refresh use the existing connection information. If the existing information cannot be used to establish a connection, get updated connection information, if available from the external connection file. `2 = Always`: On every refresh get updated connection information from the external connection file, if available, and use that instead of the existing connection information. In this case the data refresh will fail if the external connection file is unavailable. `3 = Never`: Never get updated connection information from the external connection file even if it is available and even if the existing connection information cannot be used. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
refreshedVersion (Last Refresh Version)	For backward compatibility purposes, this attribute indicates the version of the spreadsheet application that last refreshed the connection. This attribute applies to connections that are used by a query table. The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.
refreshOnLoad (Refresh on Open)	`true` if this connection should be refreshed when opening the file; otherwise, `false`. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
saveData (Save Data)	`true` if the external data fetched over the connection to populate a table is to be saved with the workbook; otherwise, `false`. This exists for data security purposes - if no external data is saved in (or "cached") in the workbook, then current user credentials can be required every time to retrieve the relevant data, and people won't see the data the workbook author had last been using before saving the file. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
savePassword (Save Password)	`true` if the password is to be saved as part of the connection string; otherwise, False.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
singleSignOnId (SSO Id)	Identifier for Single Sign On (SSO) used for authentication between an intermediate spreadsheetML server and the external data source. [*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/spptsdk/html/cSSOReturnCodes_SV01001109.asp *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
sourceFile (Source Database File)	Used when the external data source is file-based. When a connection to such a data source fails, the spreadsheet application attempts to connect directly to this file. Can be expressed in URI or system-specific file path notation. [*Note*: Applications can decide what forms of URI they support, and whether system-specific file path notations are supported. *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
type (Database Source Type)	Specifies the data source type. Values are as follows: 1. ODBC-based source 2. DAO-based source 3. File based database source 4. Web query 5. OLE DB-based source 6. Text-based source 7. ADO record set 8. DSP The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_Connection) is located in §A.2. *end note*]

18.13.2 connections (Connections)

This element exists when there are one or more connections in the workbook. It is a container for the individual connection objects.

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
Root element of SpreadsheetML Connections part

Child Elements	Subclause
connection (Connection)	§18.13.1

[*Note*: The W3C XML Schema definition of this element's content model (CT_Connections) is located in §A.2. *end note*]

18.13.3 dbPr (Database Properties)

This element stores all properties associated with an ODBC or OLE DB external data connection.

[*Example*:

Data connectivity can use a number of different technologies. The following is one example XML fragment defining an OLE DB connection and the associated dbPr element:

```
<connection id="2"
  odcFile="C:\My Documents\My Data Sources\Northwind Orders.odc" keepAlive="1"
  name="Northwind Orders" description="northwind" type="5" refreshedVersion="3">
  <dbPr connection="Provider=SQLOLEDB.1;Persist
    Security Info=True;Initial Catalog=Northwind;Data Source=dataserver1;Use
    Procedure for Prepare=1;Auto Translate=True;Packet Size=4096;Workstation
    ID=LOCAL_MACHINE_NAME;Use Encryption for Data=False;Tag with column
    collation when possible=False"
    command="&amp;quot;Northwind&amp;quot;.&amp;quot;dbo&amp;quot;.&amp;quot;Orders&amp;quot;"
    commandType="3"/>
</connection>
```

end example]

Parent Elements
connection (§18.13.1)

Attributes	Description
command (Command Text)	The string containing the database command to pass to the data provider API that will interact with the external source in order to retrieve data. These strings can be constructed in a variety of ways (from simple UIs built into the spreadsheet application for browsing and choosing tables and fields, to external applications providing user interface to build up complex queries, to advanced users editing text queries). The spreadsheetML application need not understand the command syntax; it can simply pass

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description

	the command string to the data provider API in order to retrieve the latest external data.
	
	[*Example*:
	Data connectivity can use a number of different technologies. The following is one example of an ODBC command string of commandType=2 (for a Microsoft SQL Server database):
	
	`command="SELECT Orders.OrderID, Orders.OrderDate, Orders.ShipName, Orders.ShipAddress, Orders.ShipCity, Orders.ShipRegion, Orders.ShipPostalCode, Orders.ShipCountry_x000d__x000a_FROM Northwind.dbo.Orders Orders_x000d__x000a_WHERE (Orders.ShipCountry=?)"`
	
	Some characters in this string have been escaped - for more information on the escaping scheme, please refer to the ST_Xstring simple type definition. *end example*]
	
	[*Note*: the "?" syntax in the string is something that the ODBC data provider is aware of and might replace with a parameter before execution. *end note*]
	
	[*Example*:
	Data connectivity can use a number of different technologies. The following is one example of an OLE DB command string of commandType=3 (for an Oracle database):
	
	`command=""TESTDB"."ShippersTable""`
	
	end example]
	
	[*Note*: Data connectivity can use a number of different technologies. A few examples of potential values stored in this attribute can be found at:
	• http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_statements.asp
	• http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_minimum_grammar.asp
	• http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/oledbusing_commands.asp
	end note]
	
	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

commandType (OLE DB Command Type)	Specifies the OLE DB command type. Supported values are as follows: 1. Query specifies a cube name 2. Query specifies a SQL statement 3. Query specifies a table name 4. Query specifies that default information has been given, and it is up to the provider

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	how to interpret. 5. Query is against a web based List Data Provider. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

connection
(Connection String)
	The connection string is used to make contact with an OLE DB or ODBC data source. These can be constructed in a variety of ways (from UI wizards built into the data provider code, to external query applications, to advanced users editing text files). The spreadsheetML application need not understand the connection syntax at all; it can simply pass the command string to the data provider API in order to re-establish a connection with the external data source.
	
	[*Example*: ODBC connection string to a database:
	
	`connection="DRIVER=SQL Server;SERVER=example_server;UID=example_useralias;APP=Microsoft Office 2007;WSID=user_alias;Trusted_Connection=Yes"`
	
	end example]
	
	[*Example*: of an OLE DB connection string to an Oracle database:
	
	`connection="Provider=OraOLEDB.Oracle.1;Password=example_password;Persist Security Info=True;User ID=example_useralias;Data Source=example_server;Extended Properties="""`
	
	end example]
	
	[*Note*: Data connectivity can use a number of different technologies. A few examples of potential values stored in this attribute can be found at:
	• http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/dasdkodbcoverview.asp
	• http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbcsql/od_odbc_d_4x4k.asp
	• http://msdn.microsoft.com/library/default.asp?url=/library/en-us/ado270/htm/mdreforacleprovspec.asp
	end note]
	
	Connection strings syntaxes are specific to individual ODBC or OLE DB data provider drivers.
	
	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

serverCommand (Command Text)	Specifies a second command text string that is persisted when PivotTable server-based page fields are in use.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	For ODBC connections, serverCommand is usually a broader query than command (no WHERE clause is present in the former). Based on these 2 commands, parameter UI can be populated and parameterized queries can be constructed. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (CT_DbPr) is located in §A.2. *end note*]

18.13.4 m (No Value)

This element is present when tables in a web query are missing.

Parent Elements
tables (§18.13.9)

[*Note*: The W3C XML Schema definition of this element's content model (CT_TableMissing) is located in §A.2. *end note*]

18.13.5 olapPr (OLAP Properties)

This element contains all the properties needed for an OLAP data connection. OLE DB for OLAP is the data provider, and OLAP connections contain both the dbPr and olapPr child elements.

[*Example*:

Data connectivity can use a number of different technologies. The following is an example of a connection to an SAP BW OLAP data source:

```
<connection id="1" odcFile="C:\My Documents\My Data Sources\$INFOCUBE.odc"
  keepAlive="1" name="SAP demo cube" description="SAP DemoCube" type="5"
  refreshedVersion="3" background="1">
  <dbPr connection="Provider=MDrmSap.2;Data Source=BI2;User
    ID=TESTUSER;Location=TESTSERVERNAME;Cache Authentication=False;Encrypt
    Password=False;Integrated Security=&amp;quot;&amp;quot;;Mask Password=False;Persist
    Encrypted=False;Persist Security Info=True;Impersonation
    Level=Anonymous;Mode=Read;Protection Level=None;Extended
    Properties=&amp;quot;SFC_CLIENT=800;&amp;quot;;Initial Catalog=$INFOCUBE"
    command="$0D_DECU" commandType="1"/>
  <olapPr sendLocale="1" rowDrillCount="1000" serverFill="0"
    serverNumberFormat="0" serverFont="0" serverFontColor="0"/>
</connection>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

end example]

[*Example*:

Data connectivity can use a number of different technologies. The following is an example of a connection to a Microsoft SQL Server Analysis Services OLAP data source:

```
<connection id="1"
  odcFile="C:\My Documents\My Data Sources\Adventure Works DW.odc" keepAlive="1"
  name="Adventure Works DW" type="5" refreshedVersion="3" background="1">
  <dbPr connection="Provider=MSOLAP.3;Cache Authentication=False;Persist
Security Info=True;Initial Catalog=Adventure Works
    DW;Data Source=DATASERVER1;Impersonation
    Level=Impersonate;Mode=ReadWrite;Protection Level=Pkt Privacy;Auto Synch
    Period=20000;Default Isolation Mode=0;Default MDX Visual Mode=0;MDX
    Compatibility=1;MDX Unique Name Style=0;Non Empty
    Threshold=0;SQLQueryMode=Calculated;Safety Options=2;Secured Cell
    Value=0;SOURCE_DSN_SUFFIX=&quot;Prompt=CompleteRequired;Window
    Handle=0x6A903CC;&quot;;SQL Compatibility=0;Compression Level=0;Real Time
    Olap=False;Packet Size=4096" command="Adventure Works" commandType="1"/>
  <olapPr sendLocale="1" rowDrillCount="1000"/>
</connection>
```

end example]

[*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/dasdkoledboverview.asp *end note*]

Parent Elements
connection (§18.13.1)

Attributes	Description
local (Local Cube)	Flag indicating whether we should get data from the local cube on refresh versus the original data source. `true` if a local cube has been created for OLAP data, and it should be used instead of the server. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
localConnection (Local Cube Connection)	Specifies a connection string to use when a local cube is available. This is used when local is set to `true`. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	<olapPr local="true" localConnection="OLEDB;Provider=MSOLAP;Data Source=C:\Data\DataCube.cub" > *end example*] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
localRefresh (Local Refresh)	Flag indicating whether we should refresh the local cube from the original data source. When `true`, the original OLAP data source is queried each time the user explicitly refreshes the data in the application, and a new local cube is constructed from this query. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rowDrillCount (Drill Through Count)	Maximum number of drill-through rows to return when the user drills through an aggregate value in a PivotTable. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
sendLocale (Send Locale to OLAP)	When `true`, the spreadsheetML app should send the user interface locale ID to the OLAP provider to retrieve localized member names and properties, etc. When `false`, no locale ID is expected. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
serverFill (OLAP Fill Formatting)	When `true` a PivotTable based on an OLAP source should format the data and aggregate cells in the PivotTable view using the background color from the OLAP source if this information is available. When `false`, OLAP server background fill colors are ignored, and standard formatting rules within the worksheet are followed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
serverFont (OLAP Server Font)	When `true`, a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the font from the OLAP source (e.g., Arial or Tahoma). When `false`, OLAP server fonts are ignored, and standard formatting rules within the worksheet are followed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
serverFontColor (OLAP Font Formatting)	When `true` a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the font color from the OLAP source. When `false`, OLAP server font colors are ignored, and standard formatting rules within the worksheet are followed.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
serverNumberFormat (OLAP Number Format)	When `true`, a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the number format from the OLAP source. When `false`, OLAP server number formats are ignored, and standard formatting rules within the worksheet are followed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_OlapPr) is located in §A.2. *end note*]

18.13.6 parameter (Parameter Properties)

This element stores properties about any parameters used with external data connections. Parameters are used to change the query executed externally and cause different data to be retrieved into the workbook. The type of parameter used – see ST_parameterType (§18.18.54) – determines whether the user is prompted for a value before data is refreshed, or the value is pulled from a cell in the workbook, or whether the same value should be used until explicitly changed in the data connection. Parameters are permitted for ODBC and web queries.

[*Example*:

Data connectivity can use a number of different technologies. The following is an example of XML defining a connection to a Microsoft Access database, with a parameter based on the value in cell C1 on the first sheet.

```
<connection id="1" name="Connection" type="1" refreshedVersion="2"
  background="1" saveData="1">
  <dbPr connection="DSN=MS Access
    Database;DBQ=C:\Desktop\db1.mdb;DefaultDir=C:\Desktop;DriverId=25;FIL=MS
    Access;MaxBufferSize=2048;PageTimeout=5;" command="SELECT Table1.Field1,
    Table1.Field2_x000d__x000a_FROM `C:\Desktop\db1`.Table1
    Table1_x000d__x000a_WHERE (Table1.Field2=?)"/>
  <parameters count="1">
    <parameter name="user specified value" sqlType="4" parameterType="cell"
      cell="Sheet1!$C$1"/>
  </parameters>
</connection>
```

end example]

Note that the command string in the dbPr element contains a "?" character. This character serves as a parameter marker.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcstatement_parameters.asp *end note*]

Parent Elements
parameters (§18.13.7)

Attributes	Description
boolean (Boolean)	Boolean value to use as the query parameter. Used only when parameterType = value. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
cell (Cell Reference)	Cell reference indicating which cell's value to use for the query parameter. Used only when parameterType = cell. [*Example*: `<Parameter parameterType="cell" cell="Sheet1!$C$1">` *end example*] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
double (Double)	Non-integer numeric value to use as the query parameter. Used only when parameterType = value. The possible values for this attribute are defined by the W3C XML Schema double datatype.
integer (Integer)	Integer value to use as the query parameter. Used when parameterType = value. The possible values for this attribute are defined by the W3C XML Schema int datatype.
name (Parameter Name)	The name of the parameter. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
parameterType (Parameter Type)	Type of parameter used. If the parameterType=value, then the value from boolean, double, integer, or string are used. In this case, it is expected that only one of {boolean, double, integer, or string} is specified. The possible values for this attribute are defined by the ST_ParameterType simple type (§18.18.54).
prompt (Parameter Prompt String)	Prompt string for the parameter. Presented to the spreadsheet user along with input UI to collect the parameter value before refreshing the external data. Used only when

[*Note*: The W3C XML Schema definition of this element's content model (CT_Parameter) is located in §A.2. *end note*]

18.13.7 parameters (Query Parameters)

This element serves as a collection of parameters for an ODBC or web query.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
connection (§18.13.1)

Child Elements	Subclause
parameter (Parameter Properties)	§18.13.6

Attributes	Description
count (Parameter Count)	The number of parameters used. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Parameters) is located in §A.2. *end note*]

18.13.8 s (Character Value)

This element is used to specify an HTML table to import by name. If the tables are not named, they shall be specified with the `<x v="[index]">` syntax instead.

Parent Elements
metadataStrings (§18.9.9); tables (§18.13.9)

Attributes	Description
v (Value)	The name of the table to retrieve when the web query is refreshed. This corresponds to the string used for the id attribute of the HTML <table> tag. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (CT_XStringElement) is located in §A.2. *end note*]

18.13.9 tables (Tables)

This element serves as the collection of tables to be returned via a web query data connection. Tables are then most commonly referenced by <x> via their indices (in order of the <Table> tags in the HTML page).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Parent Elements
webPr (§18.13.13)

Child Elements	Subclause
m (No Value)	§18.13.4
s (Character Value)	§18.13.8
x (Shared Items Index)	§18.10.1.97

Attributes	Description
count (Count of Tables)	Number of tables to pull data from when refreshing from a web query. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Tables) is located in §A.2. *end note*]

18.13.10 textField (Text Import Field Settings)

This element specifies field settings for text import.

Parent Elements
textFields (§18.13.11)

Attributes	Description
position (Position)	The character position the field starts at for fixed-length fields. The index is 0-based. If this attribute does not exist, position=0 is assumed. Subsequent textField elements or carriage returns in the text stream serve to denote endpoints for text fields. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
type (Field Type)	Specifies the field Type. When text is imported into cells in the worksheet, the data in the cells are converted to the field type defined here. Types can be specified by the user, or determined algorithmically via heuristics and text analysis. The possible values for this attribute are defined by the ST_ExternalConnectionType simple type (§18.18.27).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextField) is located in §A.2. *end note*]

18.13.11 textFields (Fields)

This element that denotes a set of fields to retrieve from a text file. Contains 1 or more textField elements.

Parent Elements
textPr (§18.13.12)

Child Elements	Subclause
textField (Text Import Field Settings)	§18.13.10

Attributes	Description
count (Count of Fields)	Number of distinct fields to retrieve. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextFields) is located in §A.2. *end note*]

18.13.12 textPr (Text Import Settings)

This element contains all of the text import settings.

[*Example*: Here's an example of the XML for a text connection:

```
<connection id="1" name="text data" type="6" refreshedVersion="3" background="1"
  saveData="1">
  <textPr prompt="0" characterSet="IBM437" sourceFile="C:\Desktop\text data.txt"
    delimiter="|">
    <textFields count="5">
      <textField/>
      <textField type="text" position="7"/>
      <textField type="text" position="28"/>
      <textField position="36"/>
      <textField type="text" position="41"/>
    </textFields>
  </textPr>
</connection>
```

example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
connection (§18.13.1)

Child Elements	Subclause
textFields (Fields)	§18.13.11

Attributes	Description
characterSet (Character Set)	Name of the character set associated with the text file. Values for this attribute are restricted to the names and aliases listed in the IANA CHARACTER SETS listing found at http://www.iana.org/assignments/character-sets. [*Note*: When reading this value, if a system does not support a particular character set, the application is allowed to decide what is the best course of fallback action. *end note*] If this attribute is not present then the codePage attribute are used. The possible values for this attribute are defined by the W3C XML Schema string datatype.
comma (Comma is Delimiter)	Flag indicating whether to treat comma characters as field delimiters. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
consecutive (Consecutive Delimiters)	Flag indicating whether consecutive delimiters should be treated as just one delimiter. If this flag is `true` than it's possible or even likely that some rows will return more fields than others, and these fields will always fill cells in the worksheet from left to right. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
decimal (Decimal Separator)	The decimal separator character. This and the thousands attribute are used only when data in the text file contains decimal and thousands separators that are different from those used on the computer, due to a different language setting being used. The following table shows the results when you import text into a spreadsheet application using various separators. Numeric results are displayed in the rightmost column.

System decimal separator	System thousands separator	Text file decimal separator value	Text file thousands Separator value	Text imported	Cell value (data type)
Period	Comma	Comma	Period	123.123,45	123,123.45 (numeric)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>Period</td><td>Comma</td><td>Comma</td><td>Comma</td><td>123.123,45</td><td>123.123,45 (text)</td></tr>
<tr><td>Comma</td><td>Period</td><td>Comma</td><td>Period</td><td>123,123.45</td><td>123,123.45 (numeric)</td></tr>
<tr><td>Period</td><td>Comma</td><td>Period</td><td>Comma</td><td>123 123.45</td><td>123 123.45 (text)</td></tr>
<tr><td>Period</td><td>Comma</td><td>Period</td><td>Space</td><td>123 123.45</td><td>123,123.45 (numeric)</td></tr>
</table>
Strings values of this attribute are expected to be one character in length.
The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
</td></tr>
<tr><td>delimited (Delimited File)</td><td> <code>true</code> if the file is Tab or character delimited. <code>false</code> if the file should be parsed according to fixed length fields. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. </td></tr>
<tr><td>delimiter (Custom Delimiter)</td><td> User-specified character to be treated as a field delimiter. Only single characters are supported. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). </td></tr>
<tr><td>fileType (File Type)</td><td> Ignorable attribute with enum value that defined by ST_FileType. Determines the kind of character set to use during import. Only one of fileType and characterSet or codePage shall be specified for a textPr. The possible values for this attribute are defined by the ST_FileType simple type (§18.18.29). </td></tr>
<tr><td>firstRow (First Row)</td><td> Indicates at what row of the file to start the data import. All unsignedInt values are permitted, although it's possible that firstRow is higher than the number of rows in the text file, in which case no data is imported. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. </td></tr>
<tr><td>prompt (Prompt for File Name)</td><td> Flag indicating whether the user wants to be prompted for the file name on refresh. If <code>false</code>, then the user is not prompted. If <code>true</code> or not present, then the user is prompted. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. </td></tr>
<tr><td>qualifier (Qualifier)</td><td> Character used as the text string qualifier. The possible values for this attribute are defined by the ST_Qualifier simple type </td></tr>
</table>

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	(§18.18.61).
semicolon (Semicolon is Delimiter)	Flag indicating whether to treat semicolon characters as field delimiters. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sourceFile (Source File Name)	Path to the text file to use to import external data. Can be expressed in URI or system-specific file path notation. [*Note*: Applications can decide what forms of URI they support, and whether system-specific file path notations are supported. *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
space (Space is Delimiter)	Flag indicating whether to treat space characters as field delimiters. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
tab (Tab as Delimiter)	Flag indicating whether to treat tab characters as field delimiters. If `false`, then tabs will not be used as delimiters. If `true` or not present, then they are used as delimiters. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
thousands (Thousands Separator)	The thousands separator character. This and the decimal attribute are used only when data in the text file contains decimal and thousands separators that are different from those used on the computer, due to a different language setting being used. Please refer to the decimal attribute description above for a Table describing the behavior. Strings values of this attribute are expected to be one character in length. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextPr) is located in §A.2. *end note*]

18.13.93 webPr (Web Query Properties)

This element specifies the properties for a web query source. A web query will retrieve data from HTML tables, and can also supply HTTP "Get" parameters to be processed by the web server in generating the HTML by including the parameters and parameter elements.

Here's an example of a web query connection:

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<connection id="1" name="Connection" type="4" refreshedVersion="0"
  background="1" saveData="1">
  <webPr sourceData="1" parsePre="1" consecutive="1"
    url="http://ServerName/Image%20Library/Forms/AllItems.aspx" htmlTables="1">
    <tables count="1">
      <s v="contentthumbnail"/>
    </tables>
  </webPr>
</connection>
```

end example]

Parent Elements
connection (§18.13.1)

Child Elements	Subclause
tables (Tables)	§18.13.9

Attributes	Description
consecutive (Consecutive Delimiters)	Flag indicating whether consecutive delimiters should be treated as just one delimiter. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
editPage (Edit Query URL)	The URL of the user-facing web page showing the web query data. This URL is persisted in the case that sourceData="true" and url has been redirected to reference an XML file. Then the user-facing page can be shown in the UI, and the XML data can be retrieved behind the scenes. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
firstRow (Use First Row)	Flag indicating whether to parse all tables inside a PRE block with the same width settings as the first row. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
htmlFormat (HTML Formatting Handling)	How to handle formatting from the HTML source when bringing web query data into the worksheet. Relevant when sourceData is True. Values are as follows: 1. None - no formatting at all 2. RTF - honor just rich text formatting 3. All - honor all html formatting.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_HtmlFmt simple type (§18.18.41).
htmlTables (HTML Tables Only)	Flag indicating whether web queries should only work on HTML tables. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
parsePre (Parse PRE)	Flag indicating whether data contained within HTML <PRE> tags in the web page is parsed into columns when you import the page into a query table. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
post (Web Post)	Returns or sets the string used with the post method of inputting data into a web server to return data from a web query. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
sourceData (Import XML Source Data)	Flag indicating that XML source data should be imported instead of the HTML table itself. Used when a web query exists to an HTML table with the following attribute. `<TABLE … o:WebQuerySourceHRef=”http://…” … > … </TABLE>` The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
textDates (Dates as Text)	Flag indicating whether dates should be imported into cells in the worksheet as text rather than dates. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
url (URL)	URL to use to refresh external data. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
xl2000 (Refreshed in Excel 2000)	This flag exists for backward compatibility with older existing spreadsheet files, and is set to `true` if this web query was refreshed in a spreadsheet application newer than or equal to Microsoft Excel 2000. This is an optional attribute that can be ignored. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
xl97 (Created in Excel 97)	This flag exists for backward compatibility with older existing spreadhseet files, and is set to `true` if this web query was created in Microsoft Excel 97.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	This is an optional attribute that can be ignored. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
xml (XML Source)	`true` if the web query source is XML (versus HTML), otherwise `false`. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_WebPr) is located in §A.2. *end note*]

18.14 Supplementary Workbook Data

External links are used when linking the workbook to other workbooks or external data. The most frequent feature for linking a workbook to other workbooks is through the use of formulas. In this case the formula references a range or defined name in another workbook. Hyperlinks on cells and other spreadsheet objects are also considered an external link. Object-linking technologies are yet another technology used to link the workbook to another object. [*Example*: KParts or OLE. *end example*] Finally, Dynamic Data Exchange, or DDE, servers can be used to access external data. DDE servers are accessed through formulas in the workbook.

External links are saved with the target source in a relationship file so that external resources are easily discoverable in lightweight relationship XML rather than deep in the application's XML.

For a workbook consumer.xlsx that makes use of data in another workbook called data.xlsx, the following XML would exist in consumer.xlsx to describe the external link:

[*Example*:

```
<Relationships xmlns="…">
  <Relationship Id="rId1" Type="…/externalLinkPath" Target="data.xlsx"
    TargetMode="External"/>
</Relationships>
```

end example]

And the following XML would exist to describe cached data retrieved from the external workbook:

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<externalLink xmlns="…">
  <externalBook xmlns:r="…" r:id="rId1">
    <sheetNames>
      <sheetName val="Sheet1"/>
      <sheetName val="Sheet2"/>
      <sheetName val="Sheet3"/>
    </sheetNames>
    <sheetDataSet>
      <sheetData sheetId="0"/>
      <sheetData sheetId="1"/>
      <sheetData sheetId="2">
        <row r="11">
          <cell r="B11">
            <v>47</v>
          </cell>
        </row>
        <row r="12">
          <cell r="B12">
            <v>19</v>
          </cell>
        </row>
        <row r="13">
          <cell r="B13">
            <v>38</v>
          </cell>
        </row>
      </sheetData>
    </sheetDataSet>
  </externalBook>
</externalLink>
```

end example]

The Supplementary Workbook Data section of SpreadsheetML is complimentary to the External Data Connnections (§18.13) section in maintaining all the information about external information that impacts the workbook.

18.14.1 cell (External Cell Data)

This element is used to store cached values from external sources such as other workbooks. Formulas from external cells are not stored in the consuming workbook. Also, for this context, the attribute t cannot have a value of `inlineStr`. Rich text is not supported in this context either.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
row (§18.14.12)

Child Elements	Subclause
v (Cell Value)	§18.3.1.96

Attributes	Description

r (Reference)	Describes the cell location in the external book.
	
	[*Example*:
	
	`<cell r="B12">`
	`  <v>74</v>`
	`</cell>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).

t (Type)	Indicates the data type of the cell value. The possible values for this attribute are defined by the ST_CellType simple type (§18.18.11).
vm (Value Metadata)	The index of the cell's value metadata, if any exists. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExternalCell) is located in §A.2. *end note*]

18.14.2 ddeItem (DDE Item definition)

This element represents a DDE item.

Parent Elements
ddeItems (§18.14.3)

Child Elements	Subclause
values (DDE Name Values)	§18.14.19

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
advise (Advise)	Specifies whether the DDE server should notify the application when the external data changes. Default value is `false`. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
name (DDE Name)	Specifies the DDE item name. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
ole (Object Linking TechnologyE)	Set to `true` if this is item uses an object linking technology. Default value is `false`. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
preferPic (Data is an Image)	Set to `true` if data from this DDE item is an image format. Default value is `false`. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_DdeItem) is located in §A.2. *end note*]

18.14.3 ddeItems (DDE Items Collection)

This element serves as a collection for ddeItem elements.

Parent Elements
ddeLink (§18.14.4)

Child Elements	Subclause
ddeItem (DDE Item definition)	§18.14.2

[*Note*: The W3C XML Schema definition of this element's content model (CT_DdeItems) is located in §A.2. *end note*]

18.14.4 ddeLink (DDE Connection)

This element represents a connection to an external Dynamic Data Exchange (DDE) server. DDE is a method of sending data between applications using Windows messages according to a documented protocol that has been stable since about 1990.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

The hierarchy of names defined by a DDE server is Application, Topics, and Items. Topics often correspond to units such as files or documents or database names, and Items refer to subsets of the data such as cell ranges, rows, fields, columns. DDE items can have multiple values as well.

[*Example*:

Data connectivity can use a number of different technologies.The following is just one example of a spreadsheetML fragment describing the product Microsoft Excel being used as a DDE server to provide data to the current spreadsheet document:

```
<ddeLink xmlns:r="…" ddeService="excel" ddeTopic="[ddesource.xls]Sheet1">
  <ddeItems>
    <ddeItem name="R1C1" advise="1"/>
    <ddeItem name="StdDocumentName" ole="1" advise="1"/>
  </ddeItems>
</ddeLink>
```

end example]

Parent Elements
externalLink (§18.14.8)

Child Elements	Subclause
ddeItems (DDE Items Collection)	§18.14.3

Attributes	Description
ddeService (Service name)	Service name (i.e., application name) for the DDE connection. This is a required attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
ddeTopic (Topic for DDE server)	Describes something for the DDE application to which the channel pertains— usually a document of that application. This is a required attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (CT_DdeLink) is located in §A.2. *end note*]

18.14.5 definedName (Defined Name)

This element contains information about a named range in an external workbook.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
definedNames (§18.14.6)

Attributes	Description
name (Defined Name)	The defined name. This attribute is required. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

refersTo (Refers To)	Name range definition string.
	
	[*Example*:
	
	`<definedNames>`
	`  <definedName name="namedrange"`
	`  refersTo="='Sheet1'!$D$5:$D$10"/>`
	`</definedNames>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

sheetId (Sheet Id)	The index of the worksheet that the named range applies to for named ranges that are scoped to a particular worksheet rather than the full workbook. This attribute is optional. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExternalDefinedName) is located in §A.2. *end note*]

18.14.6 definedNames (Named Links)

This element is a collection of the defined names associated with the supporting workbook.

Parent Elements
externalBook (§18.14.7)

Child Elements	Subclause
definedName (Defined Name)	§18.14.5

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExternalDefinedNames) is located in §A.2. *end note*]

18.14.7 externalBook (External Workbook)

This element represents an external workbook which is supplying data to the current workbook.

Parent Elements
externalLink (§18.14.8)

Child Elements	Subclause
definedNames (Named Links)	§18.14.6
sheetDataSet (Cached Worksheet Data)	§18.14.14
sheetNames (Supporting Workbook Sheet Names)	§18.14.16

Attributes	Description
id (Relationship to supporting book file path) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the worksheet XML file in the current spreadsheetML document ZIP archive that makes use of this externalbook. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExternalBook) is located in §A.2. *end note*]

18.14.8 externalLink (External Reference)

This element is a container for specific types of external links.

Parent Elements
Root element of SpreadsheetML External Workbook References part

Child Elements	Subclause
ddeLink (DDE Connection)	§18.14.4
externalBook (External Workbook)	§18.14.7
extLst (Future Feature Data Storage Area)	§18.2.10

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
oleLink (Generic Object Link Connection)	§18.14.11

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExternalLink) is located in §A.2. *end note*]

18.14.9 oleItem (Object Link Item)

This element represents a single link within the object referenced by the parent element.

Parent Elements
oleItems (§18.14.10)

Attributes	Description
advise (Advise)	Set to `true` if the linked object should notify the application when the external data changes. Default value is `false`. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
icon (Icon)	Set to `true` if the linked object is represented by an icon. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
name (Object Name)	The linked object's name. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
preferPic (Object is an Image)	Set to `true` if the linked object is represented by an image. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_OleItem) is located in §A.2. *end note*]

18.14.10 oleItems (Object Link Items)

This element is a collection of items within the link specified by the parent element.

Parent Elements
oleLink (§18.14.11)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
oleItem (Object Link Item)	§18.14.9

[*Note*: The W3C XML Schema definition of this element's content model (CT_OleItems) is located in §A.2. *end note*]

18.14.11 oleLink (Generic Object Link Connection)

This element represents an external link to an embedded object, specified by a progID/object pair. The type of object link is determined by reading the target of the id attribute.

[*Example*: The following markup defines a reference to a linked object using Bonobo. The progId attribute contains the shared library that contains the widget. The r:id identifies the referenced Bonobo object.

```
<oleLink r:id="rb1" progId="OAFIID:Bonobo_Sample_Calculator">
  …
</oleLink>
```

The target of the relationship with ID rb1, defines the Bonobo object itself. This example shows a link to a sample Bonobo widget taken from the following article, which also provides an introduction to Bonobo – http://www.ibm.com/developerworks/webservices/library/co-bnbo2.html. *end example*]

[*Example*: The following markup defines a reference to a linked object using KParts. The progId attribute contains the shared library that contains the plugin. The r:id identifies the referenced KParts object.

```
<oleLink r:id="rKp1" progId="libhtmlvalidatorplugin">
  …
</oleLink>
```

The following XML, contained in the target of the relationship with ID rKp1, defines the KPart object, and will follow the kpartgui DTD:

```
<!DOCTYPE kpartgui SYSTEM "kpartgui.dtd">
<kpartgui library="libhtmlvalidatorplugin" name="htmlvalidatorplugin"
version="1">
  <MenuBar>
    <Menu name="tools"><Text>&amp;Tools</Text>
    <Action name="validatewebpage"/>
    </Menu>
  </MenuBar>
</kpartgui>
```

This example is taken from the kde.org web site, and contains a tutorial on building the plugin referenced by the above markup – http://developer.kde.org/documentation/tutorials/dot/writing-plugins.html. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Parent Elements
externalLink (§18.14.8)

Child Elements	Subclause
oleItems (Object Link Items)	§18.14.10

Attributes	Description
id (Object Link Relationship) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the external file name used for this oleLink. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
progId (Object Link Identifier)	The ID for the object link connection. [*Example*: For a KParts link, this would store the name of the appropriate KParts library. For an OLE link, this would store the ProgID of the appropriate OLE object. *end example*] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OleLink) is located in §A.2. *end note*]

18.14.12 row (Row)

This element contains data for an external worksheet row.

Parent Elements
sheetData (§18.14.13)

Child Elements	Subclause
cell (External Cell Data)	§18.14.1

Attributes	Description
r (Row)	Row number of the row in the external book containing the cell data referenced. This attribute is required.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExternalRow) is located in §A.2. *end note*]

18.14.13 sheetData (External Sheet Data Set)

This element contains the cached worksheet data associated with a supporting workbook.

[*Note*: For an example, please refer to example at the beginning of this section. *end note*]

Parent Elements
sheetDataSet (§18.14.14)

Child Elements	Subclause
row (Row)	§18.14.12

Attributes	Description
refreshError (Last Refresh Resulted in Error)	Specifies that the last external data refresh for this sheet did not succeed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sheetId (Sheet Id)	Index of sheet in the external workbook that is referenced and partially cached in this data set. This is a 1-based index. This attribute is required. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExternalSheetData) is located in §A.2. *end note*]

18.14.14 sheetDataSet (Cached Worksheet Data)

This element serves as the collection for 1 or more sheetData elements.

Parent Elements
externalBook (§18.14.7)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
sheetData (External Sheet Data Set)	§18.14.13

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExternalSheetDataSet) is located in §A.2. *end note*]

18.14.15 sheetName (Sheet Name)

Name of a worksheet in the supporting workbook

Parent Elements
sheetNames (§18.14.16)

Attributes	Description
val (Sheet Name Value)	Name of the sheet. This attribute is required. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExternalSheetName) is located in §A.2. *end note*]

18.14.16 sheetNames (Supporting Workbook Sheet Names)

This element is the container for all of the worksheet names in a supporting workbook.

Parent Elements
externalBook (§18.14.7)

Child Elements	Subclause
sheetName (Sheet Name)	§18.14.15

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExternalSheetNames) is located in §A.2. *end note*]

18.14.17 val (DDE Link Value)

This element specifies a value associated with a particular DDE item.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*: Here's an example of how values, value, and val elements are written out in the spreadsheetML for a ddeItem supplied by a DDE server. In this example different cells in the workbook are bound to these specific DDE items:

```
<ddeLink xmlns:r="…" ddeService="StockSrv" ddeTopic="Prices">
  <ddeItems>
    <ddeItem name="Bread" advise="1">
      <values>
        <value>
          <val>3.5</val>
        </value>
      </values>
    </ddeItem>
    <ddeItem name="Milk" advise="1">
      <values>
        <value>
          <val>5.7400000000000002</val>
        </value>
      </values>
    </ddeItem>
    <ddeItem name="MSFT" advise="1">
      <values>
        <value>
          <val>54.130000000000003</val>
        </value>
      </values>
    </ddeItem>
    <ddeItem name="StdDocumentName" ole="1" advise="1"/>
  </ddeItems>
</ddeLink>
```

end example]

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Parent Elements
value (§18.14.18)

[*Note*: The W3C XML Schema definition of this element's content model (ST_Xstring) is located in §A.6.9. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.14.18 value (Value)

This element contains a value associated with a particular DDE item. This serves as a container for the val element.

Parent Elements
values (§18.14.19)

Child Elements	Subclause
val (DDE Link Value)	§18.14.17

Attributes	Description
t (DDE Value Type)	Indicates the DDE value type. The possible values for this attribute are defined by the ST_DdeValueType simple type (§18.18.23).

[*Note*: The W3C XML Schema definition of this element's content model (CT_DdeValue) is located in §A.2. *end note*]

18.14.19 values (DDE Name Values)

This element defines a collection of values associated with DDE item.

Parent Elements
ddeItem (§18.14.2)

Child Elements	Subclause
value (Value)	§18.14.18

Attributes	Description
cols (Columns)	The number of columns of data that is returned by the DDE server for this DDE item. The default value of this attribute is 1. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rows (Rows)	The number of rows of data that is returned by the DDE server for this DDE item. The default value of this attribute is 1.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_DdeValues) is located in §A.2. *end note*]

18.15 Volatile Dependencies

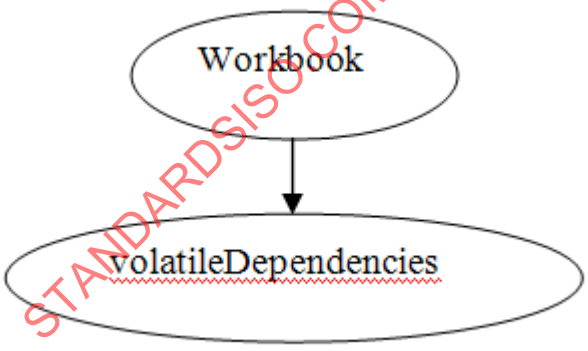
The volatileDependencies part provides a cache of data that supports Real Time Data (RTD) and CUBE functions in the workbook. Both of these types of functions require connectivity to external servers to retrieve their data. For RTD functions, an RTD interface defines how data is provided on the server, and how it is retrieved on the client. Similarly, CUBE functions access data in OLAP cubes via their own function syntax. The volatileDependencies part provides that cache of data and supporting information about these functions and their data servers and connections. This allows the spreadsheet application to work with cached values when recalculating the workbook when the external server is not available.

[*Note*: How users of SpreadsheetML access RTD data depends on the integration the user's spreadsheet application provides for RTD. *end note*]

[*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/vbaxl11/html/xlobjIRtdServer_HV03085058.asp *end note*]

File Architecture

The workbook holds the relationship to the volatile dependencies part.



Illustration

[*Example*: The following image shows an example implementation of CUBE and Real Time Data (RTD) functions in a worksheet.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

	A
1	=RTD("jrtdx.rtd",,"aaa")
2	
3	=CUBEMEMBER("xlextdat9 Adventure Works DW Adventure Works","[Department].[Departments].[Corporate]")
4	=CUBEVALUE("xlextdat9 Adventure Works DW Adventure Works",A3)
5	=CUBESET("xlextdat9 Adventure Works DW Adventure Works","[Customer].[Customer Geography].[All Customers].[United Kingdom].children","Set")
6	=CUBERANKEDMEMBER("xlextdat9 Adventure Works DW Adventure Works",$A$3,ROW(A1))
7	=CUBESETCOUNT(A3)
8	=CUBEMEMBERPROPERTY("xlextdat9 Adventure Works DW Adventure Works","[Product].[Product].[All Products].[Blade]","Class")
9	=CUBEKPIMEMBER("xlextdat9 Adventure Works DW Adventure Works","Growth in Customer Base",2)
10	

The following example shows the XML that describes the functions in the illustration.

```
<volTypes xmlns="…">
  <volType type="realTimeData">
    <main first="jrtdx.rtd">
      <tp t="s">
        <v>aaa: 4447</v>
        <stp/>
        <stp>aaa</stp>
        <tr r="A1" s="1"/>
      </tp>
    </main>
  </volType>
  <volType type="olapFunctions">
    <main first="xlextdat9 Adventure Works DW Adventure Works">
      <tp t="e">
        <v>#N/A</v>
        <stp>1</stp>
        <tr r="A6" s="1"/>
        <tr r="A9" s="1"/>
        <tr r="A8" s="1"/>
        <tr r="A5" s="1"/>
        <tr r="A4" s="1"/>
        <tr r="A3" s="1"/>
      </tp>
    </main>
  </volType>
</volTypes>
```

end example]

While RTD and Cube functions share the cache, there are differences in how the data is interpreted. [*Example*: RTD dependencies, volTypes/volType/main@`first` specifies the ProgId of the RTD server. Whereas for OLAP dependencies, main@`first` indicates the connection name. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.15.1 main (Main)

Represents dependency information for all topics within a volatile dependency type that share the same first string or function argument.

Parent Elements
volType (§18.15.5)

Child Elements	Subclause
tp (Topic)	§18.15.3

Attributes	Description

first (First String)	Specifies the first string of all topics within this main. This string corresponds to the first argument to the RTD or CUBE function.
	
	For RTD functions, this argument represents the progID of the IRTDServer.
	
	[*Example*:
	`<main first="jrtdx.rtd">`
	end example]
	
	For CUBE functions, this argument represents the CUBE connection.
	
	[*Example*:
	`<main first="xlextdat9 Adventure Works DW Adventure Works">`
	end example]
	
	For more information on RTD and CUBE functions in SpreadsheetML, see §18.17 in Formulas.
	
	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (CT_VolMain) is located in §A.2. *end note*]

18.15.2 stp (Strings in Subtopic)

Represents all strings in the topic except for the first. An stp is allocated for each additional argument. [*Example*: For the topic {"progid","","foo"}, there would be two STPs: "" and "foo". *end example*]

For Cube functions, value of "1" indicates that all of the related cells with calling cube functions have been refreshed.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Parent Elements
tp (§18.15.3)

[*Note*: The W3C XML Schema definition of this element's content model (ST_Xstring) is located in §A.6.9. *end note*]

18.15.3 tp (Topic)

Represents dependency information for all topics within a volatile dependency type that share the same first string or argument.

For the RTD function, this collection will contain the remaining parameters of the function, and indicate the last known value and data type of that value.

Parent Elements
main (§18.15.1)

Child Elements	Subclause
stp (Strings in Subtopic)	§18.15.2
tr (References)	§18.15.4
v (Cell Value)	§18.3.1.96

Attributes	Description

t (Type)	Specifies the type of the cell value. This value corresponds to the type of data returned by the RTD or CUBE function.
	
	[*Example*: In the following RTD example, the value "aaa: 4447" has a string data type.
	
	`<tp t="s">`
	`  <v>aaa: 4447</v>`
	`</tp>`
	
	end example]
	
	For Cube functions, this attribute can be ignored when stp value is "1".
	
	The possible values for this attribute are defined by the ST_VolValueType simple type (§18.18.91).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_VolTopic) is located in §A.2. *end note*]

18.15.4 tr (References)

Represents the reference to a cell that depends on this topic. Each topic can have one or more cells dependencies.

For CUBE functions, each <tr> element contains a cell whose cube function call dependent on the connection in `main@first`.

Parent Elements
tp (§18.15.3)

Attributes	Description
r (Reference)	Specifies a reference to the cell location. The location is scoped to the sheet specified in `s`. [*Example*: `<tr r="A6" s="1"/>` *end example*] The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).
s (Sheet Id)	Specifies the sheet index. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_VolTopicRef) is located in §A.2. *end note*]

18.15.5 volType (Volatile Dependency Type)

Represents dependency information for a specific type of external data server. There is no limit on the number of external dependencies that can exist for a workbook in SpreadsheetML.

Parent Elements
volTypes (§18.15.6)

Child Elements	Subclause
main (Main)	§18.15.1

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
type (Type)	Specifies the type of the external dependency. [*Example*: `<volType type="olapFunctions">` *end example*] The possible values for this attribute are defined by the ST_VolDepType simple type (§18.18.90).

[*Note*: The W3C XML Schema definition of this element's content model (CT_VolType) is located in §A.2. *end note*]

18.15.6 volTypes (Volatile Dependency Types)

Represents the collection of external dependencies for a workbook. This element defines the structure of the volatilateDependencies part. There can only be one volatileDependencies part for each workbook. However, the part can contain one or more dependency types.

The volatileDependencies part stores the following information for Real Time Data (RTD) and CUBE functions:

- Cached values
- Parameters used
- Connection and Server names

[*Example*: *Outline of XML Structure*

```
<volTypes xmlns="…">
  <volType type="realTimeData">
  </volType>
  <volType type="olapFunctions">
  </volType>
</volTypes>
```

end example]

Parent Elements
Root element of SpreadsheetML Volatile Dependencies part

Child Elements	Subclause
volType (Volatile Dependency Type)	§18.15.5

[*Note*: The W3C XML Schema definition of this element's content model (CT_VolTypes) is located in §A.2. *end note*]

18.16 Custom XML Mappings

Custom XML Mappings enable binding of arbitrary XML data structures and arbitrary XML schema definitions to the workbook. Once a DataBinding has been established, then various XML nodes can be mapped to table columns, ranges of cells, or even single cells (for non-repeating attributes and elements). Once an XML Mapping is fully defined, the application is able to import and export XML instance structures according to the schema definition. ISO/IEC 29500 does not require any particular XML schema language.

[*Note:* Some examples of XML schema languages that might be used to implement Custom XML Mappings include:

- W3C XML Schema - http://www.w3.org/XML/Schema
- RELAX NG – ISO/IEC 19757-2
- Schematron – ISO/IEC 19757-3
- NVDL – ISO/IEC 19757-4

end note]

While the original schema or XML definition can reside on disk or at some file location outside the workbook, a copy of the schema is stored in the workbook.

Every time an XML instance or schema is added to the workbook, a new map object is created which ties together the schemas and where the various elements are mapped in the workbook.

[*Example*:

```
<MapInfo SelectionNamespaces="">
  <Schema ID="Schema1">
    <xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema">
      <xsd:element nillable="true" name="Root">
        <xsd:complexType>
          <xsd:sequence minOccurs="0">
            <xsd:element minOccurs="0" nillable="true" name="EmployeeInfo"
              form="unqualified">
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
                <xsd:complexType>
                  <xsd:sequence minOccurs="0">
                    <xsd:element minOccurs="0" nillable="true" type="xsd:string"
                      name="Name" form="unqualified"></xsd:element>
                    <xsd:element minOccurs="0" nillable="true" type="xsd:date"
                      name="Date" form="unqualified"></xsd:element>
                    <xsd:element minOccurs="0" nillable="true" type="xsd:integer"
                      name="Code" form="unqualified"></xsd:element>
                  </xsd:sequence>
                </xsd:complexType></xsd:element>

                <xsd:element minOccurs="0" maxOccurs="unbounded" nillable="true"
                  name="ExpenseItem" form="unqualified">
                  <xsd:complexType>
                    <xsd:sequence minOccurs="0">
                      <xsd:element minOccurs="0" nillable="true" type="xsd:date"
                        name="Date" form="unqualified"></xsd:element>
                      <xsd:element minOccurs="0" nillable="true" type="xsd:string"
                        name="Description" form="unqualified"></xsd:element>
                      <xsd:element minOccurs="0" nillable="true" type="xsd:double"
                        name="Amount" form="unqualified"></xsd:element>
                    </xsd:sequence>
                  </xsd:complexType></xsd:element>
              </xsd:sequence>
              <xsd:attribute name="Currency" form="unqualified"
                type="xsd:string"></xsd:attribute>
              <xsd:attribute name="Approved" form="unqualified"
                type="xsd:string"></xsd:attribute>
            </xsd:complexType>
          </xsd:element>
        </xsd:schema>
      </Schema>
      <Map ID="1" Name="Root_Map" RootElement="Root" SchemaID="Schema1"
        ShowImportExportValidationErrors="false" AutoFit="true" Append="false"
        PreserveSortAFLayout="true" PreserveFormat="true">
        <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
      </Map>
    </MapInfo>
```

end example]

For XML mapped into a SpreadsheetML Table there will also be additional information in the SpreadsheetML file which refers back to the XML Map and XPath of the element or attribute mapped. This information is stored in a xmlColumnPr element, under the tableColumn node.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*:

```
<table xmlns="…" id="1" name="Table1" displayName="Table1" ref="A1:H11"
  tableType="xml" totalsRowShown="0" connectionId="1">
  <tableColumns count="5">
    <tableColumn id="1" uniqueName="Name" name="Name">
      <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Name"
        xmlDataType="string"/>
    </tableColumn>
    <tableColumn id="2" uniqueName="Date" name="Date">
      <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Date"
        xmlDataType="date"/>
    </tableColumn>
    <tableColumn id="3" uniqueName="Code" name="Code">
      <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Code"
        xmlDataType="integer"/>
    </tableColumn>
    <tableColumn id="4" uniqueName="Description" name="Description">
      <xmlColumnPr mapId="1" xpath="/Root/ExpenseItem/Description"
        xmlDataType="string"/>
    </tableColumn>
    <tableColumn id="5" uniqueName="Amount" name="Amount">
      <xmlColumnPr mapId="1" xpath="/Root/ExpenseItem/Amount"
        xmlDataType="double"/>
    </tableColumn>
  </tableColumns>
  <tableStyleInfo name="TableStyleMedium9" showFirstColumn="0"
    showLastColumn="0" showRowStripes="1" showColumnStripes="0"/>
</table>
```

end example]

For XML mapped into a single SpreadsheetML cell there will also be additional information in the TableSingleCells part which refers back to the XML Map and XPath of the element or attribute mapped. This information is stored in the xmlPr element under the xmlCellPr node.

[*Example*:

```
<singleXmlCells xmlns="…">
  <singleXmlCell id="2" name="Table2" displayName="Table2" r="D19"
    connectionId="1">
    <xmlCellPr id="1" uniqueName="Currency">
      <xmlPr mapId="1" xpath="/Root/@Currency" xmlDataType="string"/>
    </xmlCellPr>
  </singleXmlCell>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
    <singleXmlCell id="3" name="Table3" displayName="Table3" r="D20"
      connectionId="1">
      <xmlCellPr id="1" uniqueName="Approved">
        <xmlPr mapId="1" xpath="/Root/@Approved" xmlDataType="string"/>
      </xmlCellPr>
    </singleXmlCell
    <singleXmlCell id="4" name="Table4" displayName="Table4" r="D18"
      connectionId="1">
      <xmlCellPr id="1" uniqueName="Name">
        <xmlPr mapId="1" xpath="/Root/EmployeeInfo/Name" xmlDataType="string"/>
      </xmlCellPr>
    </singleXmlCell>
  </singleXmlCells>
```

end example]

18.16.1 DataBinding (XML Mapping)

This element contains properties which specify how the XML mapping should work.

[*Example*:

```
  <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
```

end example]

[*Note*: This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

Parent Elements
Map (§18.16.2)

Child Elements	Subclause
Any element in any namespace	n/a

Attributes	Description
ConnectionID (Reference to Connection ID)	Specifies the Connection ID to the external connection in the External Data Connections part. Required if FileBinding is true. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
DataBindingLoadMode (XML Data Loading Behavior)	Specifies the mode for loading XML data related to this DataBinding. Supported values are as follows: 0 - None 1 - Normal 2 - Delay Load 3 - Asynchronous 4 - Object Model The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
DataBindingName (Unique Identifer)	Specifies the data binding name. These shall be unique for each DataBinding. [*Example*: `<DataBinding DataBindingName="Binding1" FileBinding="true" FileBindingName="Binding1" DataBindingLoadMode="1"/>` *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
FileBinding (Binding to External File)	Specifies whether the data should be retrieved directly from an XML file. The path to the file is in the corresponding connection element The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
FileBindingName (File Binding Name)	Specifies the file binding name. These shall be unique for each DataBinding. [*Example*: `<DataBinding DataBindingName="Binding1" FileBinding="true" FileBindingName="Binding1" DataBindingLoadMode="1"/>` *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_DataBinding) is located in §A.2. *end note*]

18.16.2 Map (XML Mapping Properties)

This element contains all of the properties related to the XML map, and the behaviors expected during data refresh operations.

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<Map ID="1" Name="Root_Map" RootElement="Root" SchemaID="Schema1"
  ShowImportExportValidationErrors="false" AutoFit="true" Append="false"
  PreserveSortAFLayout="true" PreserveFormat="true">
  <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
</Map>
```

end example]

Parent Elements
MapInfo (§18.16.3)

Child Elements	Subclause
DataBinding (XML Mapping)	§18.16.1

Attributes	Description
Append (Append Data to Table)	Specifies whether XML data should overwrite or be appended to the end of the table or range of mapped cells when data is refreshed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
AutoFit (AutoFit Table on Refresh)	Specifies whether columns should be resized to fit the XML data after a data refresh operation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
ID (XML Mapping ID)	Specifies the ID of the XML map. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
Name (XML Mapping Name)	Specifies the name of the XML map. The possible values for this attribute are defined by the W3C XML Schema string datatype.
PreserveFormat (Preserve Cell Formatting)	Specifies whether cell number formatting in the sheet should be preserved during data refresh operations, or whether the number formatting defined by the XML data type should be used. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
PreserveSortAFLayout (Preserve AutoFilter State)	Specifies whether to keep the filter state of the Table or cell range intact during a data refresh.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
RootElement (Root Element Name)	Specifies the names of the root XML element. The possible values for this attribute are defined by the W3C XML Schema string datatype.
SchemaID (Schema Name)	Specifies the unique name of the schema used for the mapping. The possible values for this attribute are defined by the W3C XML Schema string datatype.
ShowImportExportValidationErrors (Show Validation Errors)	Specifies whether XML schema validation errors should be displayed during data refresh or data export. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Map) is located in §A.2. *end note*]

18.16.3 MapInfo (XML Mapping)

This element acts as the container for all of the XML schemas and maps attached to the SpreadsheetML document.

Parent Elements
Root element of SpreadsheetML Custom XML Mappings part

Child Elements	Subclause
Map (XML Mapping Properties)	§18.16.2
Schema (XML Schema)	§18.16.4

Attributes	Description

SelectionNamespaces (Prefix Mappings for XPath Expressions)	Specifies namespaces for use in XPath expressions when it is necessary to define new namespaces externally. Namespaces are defined in the XML style, as a space-separated list of namespace declaration attributes
	
	[*Example*: The following example contains elements that belong to "a" and "b", in addition to elements that do not belong to any namespace.
	
	`<?xml version="1.0"?>`
	`<root>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	<branch>branch</branch> <a:root xmlns:a="http://myserver.com"> <a:branch>a-branch</a:branch> <b:branch xmlns:b="http://yourserver.com"> b-branch</b:branch> </a:root> </root> *end example*] This is used when writing Xpath expressions at runtime against the XML instance structures, because the Xpath expressions use namespace prefixes instead of the fully spelled out namespace. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_MapInfo) is located in §A.2. *end note*]

18.16.4 Schema (XML Schema)

This element contains the XML tree for an attached schema.

[*Note*: This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

Parent Elements
MapInfo (§18.16.3)

Child Elements	Subclause
Any element in any namespace	n/a

Attributes	Description
ID (Schema ID)	Specifies the unique name or ID for this attached schema. [*Example*: ID = "Schema1" *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
Namespace	Specifies the namespace used by the schema.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
(Schema Root Namespace)	[*Example*: `<MapInfo SelectionNamespaces="…"> <Schema ID="Schema1" Namespace="…">` *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
SchemaLanguage (Schema Language)	Specifies the media type of the schema language. [*Example*: `<Schema … SchemaLanguage="application/relax-ng-compact-syntax"/>` *end example*] The possible values for this attribute are defined by the W3C XML Schema token datatype.
SchemaRef (Schema Reference)	The schemaRef attribute is used in the specific case where the schema definition happens to include another schema file that contributes to the same namespace. The value of this attribute is the relative path to a "root" schema file on disk which in turn references the other schema files contributing type definitions to the same namespace. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Schema) is located in §A.2. *end note*]

18.17 Formulas

18.17.1 Introduction

A SpreadsheetML *formula* is the syntactic representation of a series of calculations that is parsed or interpreted by the spreadsheet application into a function that calculates a value or array of values based upon zero-to-many inputs.

A formula is an expression that can contain the following: constants, operators, cell references, calls to functions, and names.

[*Example*: Consider the formula `PI()*(A2^2)`. In this case,

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- `PI()` results in a call to the function `PI`, which returns the value of π.
- The cell reference `A2` returns the value in that cell.
- `2` is a numeric constant.
- The caret (^) operator raises its left operand to the power of its right operand.
- The parentheses, `(` and `)`, are used for grouping.
- The asterisk (*) operator performs multiplication of its two operands.

end example]

18.17.2 Syntax

The syntax rules in this subclause follow the system shown in ISO/IEC 14977: literal text is surrounded by double-quotes (or by apostrophes); the left-square-bracket and right-square-bracket designate the start and end of an option; the left-curly-bracket and right-curly-bracket designate the start and end of an sequence of one-or-more items; the vertical-line indicates an alternative; and each rule ends with a semicolon. Whenever hyphen is used as the exception-symbol (as per ISO/IEC 14977), it is surrounded by white space, and further clarified by a comment.

The syntax rules below are modified by the context-sensitive rules stated in other subclauses of §18.17.*, as indicated by an EBNF comment of the form "(* see semantic rules at 18.17… *)". [*Note*: Thus, in order to produce an automated verifier, the context-sensitive rules in subclauses 18.17.* must all be considered. The context-free syntax rules shown in this subclause provide an overview to assist comprehension by the reader, but do not represent the entirety of the context-sensitive rules. *end note*]

When used in narrative, production names are set in an italic style, as in *array-constant*, *expression*, and *function-name*.

The syntax of a formula is as follows:

```
formula=
  expression  ;
expression=
  "(",  expression,  ")"  |
  constant  |
  prefix-operator,  expression  |
  expression,  infix-operator,  expression  |
  expression,  postfix-operator  |
  cell-reference  |
  function-call  |
  name  ;
```

where *expression* is an arbitrarily complex expression involving constants (§18.17.2.1), operators (§18.17.2.2), cell references (§18.17.2.3), calls to functions (§18.17.2.4), and names (§18.17.2.5).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

A *token* is the minimal lexical element of a formula. The categories of tokens are: constants (except for *array-constant*), operators, cell references, function names, names, and punctuators. The *punctuator*s are:

- Left parenthesis (`(`) and right parenthesis (`)`) used for expression grouping and in a function call.
- Comma (`,`) used in a function call and an *array-constant*.
- Left brace (`{`), right brace (`}`), and semicolon (`;`) used in an *array-constant*.

In a formula, an arbitrary number of space characters (`U+0020`) can precede the first token or follow the final token. An arbitrary number of space characters can separate two adjacent tokens, except that no space characters shall separate a *function-name* from the left parenthesis (`(`) that follows it. Such space characters have no effect on the semantics of a formula; however, such spaces shall be distinguished from the space operator (§18.17.2.2).

All arithmetic terms in an *expression* are numbers that can be represented by the workbook's value space. For any given workbook, the default value space is IEC 60559's double precision. However, an implementation is permitted to override that default value space by use of the characteristics markup (§22.7). [*Example*: In the expression `1/3`, although the operands appear to be integers, they are, in fact, floating-point numbers, and the result is `0.33`…, not `0`, as would result from integer division. *end example*]

As ranges of data are fundamental to spreadsheet calculations, many SpreadsheetML functions are able to take arrays as inputs and to return arrays as outputs. Based on whether the formula is an *array formula* or not, the way in which input ranges are interpreted and output values are understood to relate to cells sharing the formula can mean one of two things.

For an array formula: All range arguments are interpreted to be their full range. If the result of the formula is an array, the values of the array are meant to be returned across all of the cells in the sheet sharing the formula. (When the size of the range for an array formula exceeds in either dimension the size of the returned array, the excess cells take on a value of `#N/A`.)

For a normal (non-array) formula:

- Implicit intersection (§18.17.2.2) is performed on all arguments to functions except for those that allow a range.
- If the formula results in an array, only the first value from the array is returned to the cell.

Implicit intersection is determined as follows: When a range is passed to a function which expects only a single cell, a test is made to discover whether the calling cell intersects that range at any point horizontally or vertically. If it does, the cell at the point of intersection is passed to the function. [*Example*: The formula `ABS(B1:B3)` is entered into A2. Because the ABS function does not expect a range, implicit intersection is performed. A2 intersects `B1:B3` horizontally on row 2, and so the value in B2 is passed into the function. *end example*]

The list of function arguments that allow a range is as follows:

- AND - all arguments

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- AREAS – *reference* argument
- AVEDEV - all arguments
- AVERAGE - all arguments
- AVERAGEA - all arguments
- AVERAGEIF - all arguments except for *criteria*
- AVERAGEIFS - all arguments except for *criteria1*, *criteria2*, etc.
- CELL - *reference* argument
- CHITEST - all arguments
- COLUMN - all arguments
- COLUMNS - all arguments
- CORREL - all arguments
- COUNT - all arguments
- COUNTA - all arguments
- COUNTBLANK - all arguments
- COUNTIF - all arguments except *criteria*
- COUNTIFS - all arguments except for *criteria1*, *criteria2*, etc.
- COVAR - all arguments
- DAVERAGE - all arguments
- DCOUNT - all arguments
- DCOUNTA - all arguments
- DEVSQ - all arguments
- DGET - all arguments
- DMAX - all arguments
- DMIN - all arguments
- DPRODUCT - all arguments
- DSTDEV - all arguments
- DSTDEVP - all arguments
- DSUM - all arguments
- DVAR - all arguments
- DVARP - all arguments
- FORECAST - all arguments except for *x*
- FREQUENCY - all arguments
- FTEST - all arguments
- FVSCHEDULE - *schedule* argument
- GCD - all arguments
- GEOMEAN - all arguments
- GROWTH - all arguments
- HARMEAN - all arguments
- HLOOKUP - *table_array* argument
- IMPRODUCT - all arguments

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- IMSUM - all arguments
- INDEX - *array* or *reference* argument
- INTERCEPT - all arguments
- LARGE - *array* argument
- LCM - all arguments
- LINEST - *known-xs* and *known-ys* arguments
- LOGEST - *known-xs* and *known-ys* arguments
- LOOKUP - all arguments except *lookup_value*
- MATCH - *lookup_array* argument
- MAX - all arguments
- MAXA - all arguments
- MDETERM – *array* argument
- MEDIAN - all arguments
- MIN - all arguments
- MINA - all arguments
- MINVERSE - all arguments
- MIRR - *values* argument
- MMULT - all arguments
- MODE - all arguments
- MULTINOMIAL - all arguments
- NETWORKDAYS - *holidays* argument
- NETWORKDAYS.INTL - *holidays* argument
- NPV - all arguments except *rate*
- OFFSET - *reference* argument
- OR - all arguments
- PEARSON - all arguments
- PERCENTILE - *array* argument
- PERCENTRANK - *array* argument
- PROB - *x_range* and *prob_range* arguments
- PRODUCT - all arguments
- QUARTILE – *array* argument
- RANK - *ref* argument
- ROW – *reference* argument
- ROWS – *array* argument
- RSQ - all arguments
- SKEW - all arguments
- SLOPE - all arguments
- SMALL - *array* argument
- STDEV - all arguments
- STDEVA - all arguments

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

- STDEVP - all arguments
- STDEVPA - all arguments
- STEYX - all arguments
- SUBTOTAL - all arguments except *function_num*
- SUM - all arguments
- SUMIF - all arguments except *criteria*
- SUMIFS - all arguments except *criteria1*, *criteria2*, etc.
- SUMPRODUCT - all arguments
- SUMSQ - all arguments
- SUMX2MY2 - all arguments
- SUMX2PY2 - all arguments
- SUMXMY2 - all arguments
- TRANSPOSE – all arguments
- TREND – all arguments except *const-flag*
- TRIMMEAN – *array* argument
- TRUNC – *x* argument
- TTEST – *array-1* and *array-2* arguments
- TYPE – all arguments
- VALUE – all arguments
- VAR – all arguments
- VARA – all arguments
- VARP – all arguments
- VARPA – all arguments
- VLOOKUP – *table-array* argument
- WORKDAY – *holidays* argument
- WORKDAY.INTL – *holidays* argument
- XIRR – all arguments except *guess*
- XNPV – all arguments except *rate*
- ZTEST – *array* argument

[*Example*: Here are some formulas taking array constants and ranges:

- `(B2:B4*C2:C4)+10.5` performs three calculations: `(B2*C2)+10.5`, `(B3*C3)+10.5`, and `(B4*C4)+10.5`.
- `SQRT({1,2,3,4})` returns 1 when entered normally.
- `SQRT({1,2,3,4})` returns 1 when used in an array formula in a single cell, but if the array formula spans four or more contiguous cells in a row, it will return 1, 1.41, 1.73, and 2 in the first four cells, respectively, and #N/A in any additional cells in the horizontal range spanned by the array formula. (For display purposes, the values returned have been truncated to two decimal places.)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- SUM(SQRT({1,2,3,4})) returns 6.14 when entered normally; when used in an array formula, the intermediate calculation (in this instance performed by the SQRT function) is performed upon each element of the array.

With A1:A4 holding the values 1, 2, 3, and 4, respectively:

- SQRT(A1:A4) entered normally will do implicit intersection if it is in any of the rows 1–4, and return the SQRT of the number in the same row.
- SQRT(A1:A4) returns 1 when used in an array formula in a single cell, since it does not do implicit intersection in this case. If it is used in an array formula spanning multiple contiguous cells in a column, it will return 1, 1.41, 1.73, 2, #N/A, …, respectively, in the cells in its vertical output range. *end example*]

18.17.2.1 Constants

A *constant* represents a fixed value that can be used in the calculation of a formula. A constant has the following form:

```
constant=
  error-constant  |
  logical-constant  |
  numerical-constant  |
  string-constant  |
  array-constant  ;
error-constant=
  "#DIV/0!"  |  "#N/A"  |  "#NAME?"  |  "#NULL!"  |
  "#NUM!"  |  "#REF!"  | "#VALUE!" |  "#GETTING_DATA"  ;
logical-constant=
  "FALSE"  |  "TRUE"  ;
numerical-constant=
  whole-number-part,  [full-stop],  [exponent-part]  |
  full-stop,  fractional-part,  [exponent-part]  |
  whole-number-part,  full-stop,  fractional-part  [exponent-part]  ;
full-stop=
  "."    ;  (* also known as “period” *)
whole-number-part=
  digit-sequence  ;
fractional-part=
  digit-sequence  ;
exponent-part=
  "e" [ sign ] digit-sequence  |
  "E" [ sign ] digit-sequence  ;
sign=
  "+"  |
  "-"  ;
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
digit-sequence=
  decimal-digit,  {decimal-digit}  ;
decimal-digit=
  "0"  |  "1"  |  "2”  |  "3"  |  "4"  |
  "5”  |  "6"  |  "7"  |  "8”  |  "9"  ;
string-constant=
  double-quote, [string-chars], double-quote  ;
double-quote=
  '"'  ; (* one double-quote character*)
string-chars=
  string-char,  {string-char}  ;
string-char=
  '""'  |   (* consecutive double-quotes, with no space between them *)
  character  -  double-quote  ;   (* any character except double-quote *)
character=
  as defined by the production Char in the XML 1.0 specification, §2.2.
```

[*Example*: =$A$1/3 divides the value in A1 by the constant value three; =$A$1&"a" appends the constant string "a" to the string representation of the contents of cell A1. *end example*]

To include a double-quote character (") in *string-chars*, precede it with another double-quote character. [*Example*: `"ab""cd"` contains the characters `ab"cd`, and `""""abcd""""` contains the characters `"abcd"`. *end example*]

An *array constant* is a list of one or more constants organized in one or two dimensions, and delimited by braces. An array constant has the following form:

```
array-constant=
  "{",  constant-list-rows,  "}"  ;
constant-list-rows=
  constant-list-row,  {  semicolon,  constant-list-row  }  ;
semicolon=
  ";"    ;
constant-list-row=
  constant,  {  comma,  constant  }  ;
```

An *array-constant* shall not contain

- An *array-constant.*
- Columns or rows of unequal length.

Any *numerical-constant* in an *array-constant* can be preceded immediately by a *prefix-operator*.

The *constant*s in an *array-constant* can have different types.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[G*uidance* An implementation is encouraged to not unnecessarily limit the number of rows and columns in an *array-constant*. *end guidance*]

[*Example*: `{1,3.5,TRUE,"Hello"}` is a 1x4 array of constants.

To represent the values 10, 20, 30, and 40, as a 1x4 array, use `{10,20,30,40}`.

To represent the values 10, 20, 30, and 40 in the first row, and 50, 60, 70, and 80 in the second row, use the following 2x4 array constant: `{10,20,30,40;50,60,70,80}`. *end example*]

error-constant is described in §18.17.3.

Each *constant* has a corresponding type (§18.17.2.6), as follows:

Constant Form	Type
array-constant	array
error-constant	error
logical-constant	logical
numerical-constant	number
string-constant	text

In the context of cell formulas and values in SpreadsheetML, the following definition of precision shall apply:

By default, default representation of precision shall be as defined by the XML schema double type: http://www.w3.org/TR/xmlschema-2/#double. The default is therefore 53-bits of mantissa precision.

An application that uses XML schema double can optionally state the precision in the Additional Characteristics part by writing out the number of bits in the mantissa and exponent.

A compliant consumer shall parse numbers of arbitrary precision without error.

18.17.2.2 Operators

An *operator* is a symbol that specifies the type of operation to perform on one or more operands. There are arithmetic, comparison, text, and reference operators.

```
operator=
  ":"  |  comma  |  space  |  "^"  |  "*"  |  "/"  |  "+"  |  "-"
  |  "&"  |  "="  |  "<>"  |  "<"  |  "<="  |  ">"  |  ">="  |  “%”  ;
infix-operator=
  ":"  |  comma  |  space  |  "^"  |  "*"  |  "/"  |  "+"  |  "-"  |  "&"
  |  "="  |  "<>"  |  "<"  |  "<="  |  ">"  |  ">="  ;
postfix-operator=
  "%"  ;
prefix-operator=
  "-"  ;
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

The *operator*s permitted in *expression* are:

Operators			
Family	Operator	Description	Precedence
Reference operators	:	Binary range operator, which takes two cell reference (§18.17.2.3) operands, and results in one reference to the cells inclusive of, and between, those references. [*Example*: `SUM(B5:C15)`, which references 11 cells. *end example*]	highest
	,	Binary union operator, which takes two cell reference (§18.17.2.3) operands, and results in one reference to all those, possibly non-contiguous, cells. [*Example*: `SUM((B5:B15,D5:D15))`, which references 22 cells, 11 from column B and 11 from column D. The grouping parentheses are necessary to indicate that the comma is an operator rather than a punctuator separating two arguments. *end example*]	
	space	Binary intersection operator, which takes two cell reference (§18.17.2.3) operands, and results in one reference to those, possibly non-contiguous, cells that are common. If the intersection is empty, the result is `#NULL!`. [*Example*: `(B1:C1) (C1:D1)` results in a reference to `C1`, while `(B1:D1) (B1,D1)` results in a single reference to `B1` and `D1`. *end example*]	
Arithmetic operators	-	Unary minus	
	%	Percentage (unary postfix), which divides its operand by 100. [*Example*: `10.5%`, which results in `0.105`. *end example*]	
	^	Exponentiation	
	*	Multiplication	
	/	Division	
	+	Addition	
	-	Subtraction	
Text operator	&	Text concatenation (Each of the two operands is converted to text, if necessary, before concatenation.)	
Comparison	=	Equal-to	lowest

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Operators			
operators	<>	Not-equal-to	
	<	Less-than	
	<=	Less-than or equal-to	
	>	Greater-than	
	>=	Greater-than-or-equal-to	

expression can contain grouping parentheses to document the default precedence or to override it.

*operator*s in *expression* having the same precedence associate left-to-right.

[*Example*: Given that cell E38 contains the value 4, and cell F38 contains the value 2, the formula

```
((-1+E38^2)*3-F38)/2
```

produces the result `21.5`. *end example*]

The comparison operators yield TRUE for true and FALSE for false. An expression with value 0 tests logically false while one with any non-zero numeric value tests true.

For any given operator in an expression, if only one operand is an error value, the result is that error value. If more than one operand has an error value and those error values are the same, the result is that error value. If more than one operand has an error value and those error values are not all the same, as to which of those error values is used as the result is unspecified.

It the semantics of an operator having a given operand are not specified by ISO/IEC 29500, the result is `#VALUE!`. [*Example*: `"abc"+1` results in `#VALUE!`, and `"abc"/0` results in `#VALUE!` rather than `#DIV/0!`. *end example*]

18.17.2.3 Cell References

Each set of horizontal cells in a worksheet is a *row*, and each set of vertical cells is a *column*. A cell's row and column combination designates the location of that cell. [G*uidance* An implementation is encouraged to not unnecessarily limit the number of rows and columns in a worksheet. *end guidance*]

A *cell reference* designates one or more cells on the same worksheet. Using references, one can:

- Use data contained in different parts of the same worksheet in a single formula.
- Use the value from a single cell in several formulas.
- Refer to cells on other sheets in the same workbook, and even to other workbooks. (References to cells in other workbooks are called *links*.)

A cell reference has the following form:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
cell-reference=
  name       |
  [work-sheet-prefix]  A1-reference      |
  [work-sheet-prefix]  A1-reference,  ":",  A1-reference      |
  [work-sheet-prefix]  R1C1-reference    |
  [work-sheet-prefix]  R1C1-reference,  ":",  R1C1-reference    ;

     |  "?")  ;
     (* any character, including operator, except ‘ *, [, ], \, :, /, or ? *)
```

A *relative cell reference* is based on the relative position of the cell that contains the formula and the cell to which the reference refers. If the position of the cell that contains the formula changes, the reference is changed along with it.

An *absolute cell reference* always refers to the absolute location of a cell. If the position of the cell that contains the formula changes, the absolute reference remains the same.

A *mixed cell reference* has either an absolute column and relative row, or an absolute row and relative column.

A *link* or *external reference* to a workbook is a reference that specifies the location of the workbook, including file or network path, book name, sheet name, and cell reference. Instead of writing the full file path or network location and workbook name directly in the f (formula) element, in order to make all external references more accessible, the workbook name shall be written in a Relationship part according to the Relationships semantic:

- Type shall be set to http://purl.oclc.org/ooxml/officeDocument/relationships/externalLinkPath,
- Target shall specify the full file path and file name, and
- TargetMode shall be set to `External`.

Additionally, in order to support the possibility that the external workbook is offline or otherwise inaccessible, a cache of the relevant sheet values in the referenced external workbook shall be stored within the referencing workbook according to §18.14.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This Supplementary Workbook Data part shall be the source part of the relationship that points to the external workbook as a target resource, and the Id of this relationship shall be referenced within the markup of the Supplementary Workbook Data part, using the externalBook element (§18.14.7).

The Supplementary Workbook Data part shall also be the target of a relationship whose source is the Workbook part (§18.2). The markup within the Workbook part shall reference this relationship Id using the externalReference element (§18.2.8).

Finally, a 1-based index referencing an externalReference within the collection externalReferences shall be written inline within the formula expression containing the reference to the external workbook. The index in this context shall be enclosed within square brackets, i.e.; left square bracket ([), followed by the index, followed by a right square bracket (]).

In this way, external resource files can more easily be accessed and updated.

[*Example*:

Consider the formula `=SUM('C:\[Source.xlsx]Sheet1'!$A$1:$A$3)`

This formula is expressed in the f element (formula) like this:

```
<f>SUM([1]Sheet1!$A$1:$A$3)</f>
```

The external reference to another workbook in this case is tokenized to `[1]`. The value inside the brackets is a 1-based index to the externalReferences collection in the workbook part, referencing a specific externalReference element.

The corresponding content of externalReferences in the workbook part is:

```
<externalReferences>
    <externalReference r:id="rId4"/>
</externalReferences>
```

The workbook part's externalReferences collection indicates that there is an external workbook reference in this workbook. The Supplementary Workbook Data cache, also stored in this workbook, can be found by following the relationship from the workbook whose id value is `rId4`.

That particular relationship (rId4) is expressed as:

```
<Relationship Id="rId4" Type=
"http://purl.oclc.org/ooxml/officeDocument/relationships/externalLinkPath"
Target="externalLinks/externalLink1.xml"/>
```

The above relationship indicates that the formula is supported by the Supplementary Workbook Data cache located at externalLinks/externalLink1.xml in the package.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

The corresponding content in externalLink1.xml follows the markup specified in §18.14, Supplementary Workbook Data. The externalBook element in that markup indicates the id of the relationship that points from the source part externalLink1.xml to the location of the actual external workbook:

```
<externalBook xmlns:r="http://purl.oclc.org/ooxml/officeDocument/relationships"
r:id="rId1">
```

That relationship (rId1) is shown here:

```
<Relationship Id="rId1" Type=
"http://purl.oclc.org/ooxml/officeDocument/relationships/externalLinkPath"
Target="file:///C:/Source.xlsx" TargetMode="External"/>
```

This relationship indicates that the external workbook that the formula references resides on a local drive, at c:\source.xlsx. *end example*]

It is possible to process the same cell or set of cells on multiple worksheets within a workbook, using a *3-D reference*. A reference of this type is made up of the cell reference, preceded by a range of worksheet names, and an exclamation mark character (!), in that order. A 3-D reference can be used to refer to cells on other sheets, to defined names, and to create formulas by using the following functions: AVERAGE, AVERAGEA, COUNT, COUNTA, MAX, MAXA, MIN, MINA, PRODUCT, STDEV, STDEVA, STDEVP, STDEVPA, SUM, VAR, VARA, VARP, and VARPA.

3-D references shall not be used in array formulas.

By default, a cell reference is understood to refer to one or more cells in the current worksheet. However, a cell reference can be preceded by its parent worksheet name and an exclamation mark (!), in that order. This allows cells in one worksheet to be referenced in another worksheet of the same workbook. [*Example*: The cell reference `MonthlyTotals!D1:D12` might be used from within a sibling (or the same) worksheet of `MonthlyTotals` to refer to those 12 cells. *end example*]

An *area* is a set of rectangular-shaped contiguous cells. An area can be a single cell. [*Example*: `A5` and `B6:C10` each designate one area, and `D3:D5,E12:F15` designates two areas (the comma (`,`) being the union operator). *end example*] [*Note*: The number of areas designated by a cell reference can be obtained by calling the function AREAS (§18.17.7.10). *end note*]

There are two cell reference styles: A1 (§18.17.2.3.1) and R1C1 (§18.17.2.3.2).

18.17.2.3.1 A1-Style Cell References

A cell reference using the A1 reference style has the following form:

```
A1-reference=
  A1-column,  ":",  A1-column    |
  A1-row,  ":", A1-row    |
  A1-column,  A1-row  ;
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
A1-column=
  A1-relative-column  |
  A1-absolute-column  ;
A1-relative-column=
  letter, {letter}  ;  (* see semantic rules at 3.17.2.3.1 *)
letter=
  "a"|"b"|"c"|"d"|"e"|"f"|"g"|"h"|"i"|"j"|"k"|"l"|"m"|
  "n"|"o"|"p"|"q"|"r"|"s"|"t"|"u"|"v"|"w"|"x"|"y"|"z"|
  "A"|"B"|"C"|"D"|"E"|"F"|"G"|"H"|"I"|"J"|"K"|"L"|"M"|
  "N"|"O"|"P"|"Q"|"R"|"S"|"T"|"U"|"V"|"W"|"X"|"Y"|"Z" ;
A1-absolute-column=
  "$", A1-relative-column  ;
A1-row=
  A1-relative-row  |
  A1-absolute-row  ;
A1-relative-row=
  digit-sequence  ;  (* shall be non-zero; see 3.17.2.3.1 *)
A1-absolute-row=
  “$”, A1-relative-row  ;
```

In this style, each row has a numeric heading numbered sequentially from the top down, starting at 1. Each column has an alphabetic heading named sequentially from left-to-right, A–Z, then AA–AZ, BA–BZ, …, ZA–ZZ, AAA–AAZ, ABA–ABZ, and so on. Column letters are not case-sensitive.

A relative reference to a single cell is written as its column letter immediately followed by its row number. A relative reference to a whole row is written as its row number. A relative reference to a whole column is written as its column letter. A reference to a range of two or more cells is written as two single-cell references separated by the binary range operator (`:`). An absolute A1 reference is made up of a cell's column letter followed by its row number, with each being preceded by a dollar character (`$`). [*Example*: `A2`, `B34`, and `B5:D8` are relative A1 references. `$A$2`, `$B$34`, and `$B$5:$D$8` are absolute A1 references. `$A2`, `B$34`, and `$B5:D$8` are mixed A1 references. *end example*]

[*Example*: `SUM(Sheet2:Sheet13!B5)` adds all the values contained in cell B5 on all the worksheets between and including Sheet2 and Sheet13. *end example*]

For rules on how deal with potential ambiguities between cell references and defined names, see §18.17.5.1.

18.17.2.3.2 R1C1-Style Cell Reference

A cell reference using the R1C1 reference style has the following form:

```
R1C1-reference=
  R1C1-row-only     |
  R1C1-column-only     |
  R1C1-row,  R1C1-column  ;
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
R1C1-row-only=
  "R",  R1C1-absolute-number,   |
  "R[",  R1C1-relative-number, "]"  ;
R1C1-row=
  R1C1-relative-row  |
  R1C1-absolute-row  ;
R1C1-relative-row=
  "R[",  R1C1-relative-number, "]"  ;
R1C1-absolute-row=
  "R"    |
  "R", R1C1-absolute-number  ;
R1C1-column-only=
  "C",  R1C1-abolute-number  |
  "C[",  R1C1-relative-number,  "]"  ;
R1C1-column=
  R1C1-relative-column  |
  R1C1-absolute-column  ;
R1C1-relative-column=
  "C[",  R1C1-relative-number,  "]"  ;
R1C1-absolute-column=
  "C"    |
  "C", R1C1-absolute-number  ;
R1C1-relative-number=
  ["-"], digit-sequence   ;
R1C1-absolute-number=
  digit-sequence  ;  (* shall be non-zero; see 3.17.2.3.2 *)
```

In this style, each row has a numeric heading numbered sequentially from the top down, starting at 1. Each column has a numeric heading numbered sequentially from left-to-right, starting at 1.

A whole row is referenced by omitting the column, and a whole column is referenced by omitting the row. An absolute row or column reference uses absolute row or column numbers, respectively. A relative row or column reference uses, respectively, row or column offsets from the cell containing the formula, with a negative offset indicating a row to the left or a column above, and a positive offset indicateing a row to the right or a column below. Specifying an offset of zero is equivalent to omitting that offset and its delimiting brackets. [*Example*: `R[-2]C` refers to the cell two rows up and in the same column, `R[2]C[2]` refers to the cell two rows down and two columns to the right, R2C2 refers to the cell in the second row and in the second column, `R[-1]` refers to the entire row above the active cell, and R refers to the current row. *end example*]

The R1C1 alternate reference style can only be used at runtime. See §18.17.6.1 for XML-related details.

18.17.2.4 Functions

A *function* is a named formula that takes zero or more arguments, performs an operation, and, optionally, returns a result. A function call has the following form:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
function-call=
  function-name,  "(",  [argument-list],  ")"    ;
function-name=
  prefixed-function-name       |
  predefined-function-name     |
  user-defined-function-name     ;
predefined-function-name=
  "ABS"  |  "ACOS"  |  "ACOSH"
     |  ( any of the other functions defined in §18.17.7)  ;
prefixed-function-name=
  "ISO.", predefined-function-name |
  "ECMA.", predefined-function-name
user-defined-function-name=
  letter,  [ user-defined-name-characters ]    ;
user-defined-name-characters=
  user-defined-name-character,  {user-defined-name-character}  ;
user-defined-name-character=
  letter  |  decimal-digit  |  full-stop    ;
argument-list=
  argument,  {  comma,  argument  }  ;
comma=
  ","  ;
argument=
  expression  ;
```

*predefined-function-name*s and *user-defined-function-name*s are not case-sensitive.

A *user-defined-function-name* shall not have any of the following forms:

- TRUE or FALSE
- *name*
- *cell-reference*

[*Guidance*: An implementation is encouraged to support *user-defined-function-name*s at least as long as 255 characters. *end guidance*]

The semantics of a call to a function having a *user-defined-function-name* are unspecified.

[*Example*: Here are some function calls: `PI()`, `POWER(A1,B3)`, and `SUM(C6:C10)`. *end example*]

An argument to a function can be a call to a function. That is, function calls can nest. [G*uidance* An implementation is encouraged to support at least 64 levels of nested function calls. *end guidance*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Some functions take a variable number of arguments. This is indicated in the Syntax sections of §18.17.7 by their having *argument-list* as all, or the trailing part, of their argument list. The total number of arguments that shall be passed to such functions is at least 1.

[*Guidance* An implementation is encouraged to support function calls having at least 255 arguments. *end guidance*]

Expressions can have one or more values. Scalar expressions designate a single value, and cell references and array constants can designate multiple values. In the case of a multi-value expression, the way in which this is handled by a function when passed as an argument depends on a number of factors.

Most functions and operators expect either single- or multi-valued arguments and perform all of the array calculations whenever multi-valued arguments are present. [*Example*: `SQRT({1;2;3;4})`; see the examples in §18.17.2. *end example*]

When a function expects a single-valued argument but a multi-valued expression is passed, an attempt can be made to convert that set of values to a single value. For an array value or constant, the value of the expression is the value of the first element within that array value or constant. For a cell range, the first element can be used, or implicit intersection can be performed—the exact behavior is unspecified.

When a function expects a multi-valued argument but a single-valued expression is passed, that single-valued argument is treated as a 1x1 array.

For rules on how deal with potential ambiguities between function names and defined names, see §18.17.5.1.

18.17.2.5 Names

A *name* is an alias for a constant, a cell reference, or a formula. [*Note*: A name in a formula can make it easier to understand the purpose of that formula. For example, the formula `SUM(FirstQuarterSales)` is easier to identify than `SUM(C20:C30)`. *end note*]

Here is the syntax for *name*:

```
name=
  [ workbook-name, "!" ], name-start-character, [ name-characters ]  ;
name-start-character=
  letter  |  underscore  |  backslash  ;
underscore=
  "_" ;

*name*s are not case-sensitive.

All *name*s within a workbook shall be unique. If the same *name*s are defined in two workbooks, both *name*s can be used in the same context be prefixing them with their corresponding workbook name and an exclamation mark (`!`). [*Example*: `SUM(Sales.xlsx!ProjectedSales)` refers to the named range `ProjectedSales` in the workbook named `Sales.xlsx`. *end example*]

A *name* shall not have any of the following forms:

- TRUE or FALSE
- *user-defined-function-name*
- *cell-reference*

[*Guidance* An implementation is encouraged to support *name*s at least as long as 255 characters. *end guidance*]

For rules on how deal with potential ambiguities between function names and defined names, or between cell references and defined names, see §18.17.5.1.

18.17.2.6 Types and Values

Each *expression* has a type. SpreadsheetML formulas support the following types: array, error, logical, number, and text.

An array value or constant represents a collection of one or more elements, whose values can have any type (i.e., the elements of an array need not all have the same type).

An error value (§18.17.3) or constant represents an error, and can have any value defined for *error-constant* (§18.17.2.1).

A logical value or constant represents a truth value, and can have any value defined for *logical-constant* (§18.17.2.1).

A numeric value or constant represents a real number, and can have any value defined for *numeric-constant* (§18.17.2.1). The term "number" is used as a generic name for any expression of type *number*.

A text value or constant represents arbitrary text, and can have any value defined for *string-constant* (§18.17.2.1). The term "string" is used as a generic name for any expression of type *text*.

An implementation is permitted to provide an implicit conversion from *string-constant* to number. However, the rules by which such conversions take place are implementation-defined. [*Example*: An implementation might choose to accept "123"+10 by converting the string "123" to the number 123. Such conversions might be locale-specific in that a *string-constant* such as "10,56" might be converted to 10.56 in some locales, but not in others, depending on the radix point character. *end example*]

[*Guidance* An implementation is encouraged to support strings at least as long as 32,767 characters. *end guidance*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

A complex number is represented as a string in one of two equivalent text formats: *x* + *y*`i` or *x* + *y*`j`, where *x* is the real part, and *y* is the imaginary part. [*Example*: `"3+4i"` and `"-2.5-34.6j"` *end example*]

18.17.2.7 Single- and Array Formulas

A formula can either be a single-cell formula, or an array formula.

A single-cell formula is applied to a single cell while an array formula is applied to a range of cells as a group.

When a single-cell formula results in a single value, the designated cell takes on that value. [*Example*: When cell `A10` contains `SIN(0.3)`, the result stored in that cell is `0.295520207`. *end example*]

When a single-cell formula results in multiple values, the designated cell takes on the first of those values. [*Example*: When cell A10 contains `SIN({0.3,0.4,0.5})`, the result stored in that cell is 0.295520207 (SIN(0.3)). *end example*]

Array formulas are an extension of the formula paradigm. They allow for combining of several formula operations into one, and the returning of multiple results. Array formulas span one or more cells. There are three primary functions that array formulas perform:

2. Returning multiple results from one single function call. [*Example*: the function `LINEST` returns an array of several results, and, therefore, ought to be spanned across several cells as an array formula in order to display those results. *end example*]
3. Executing one formula several times to generate an array of results. [*Example*: The array formula `SIN(A1:A3)` returns an array with three elements, those being the sines of A1, A2 and A3, respectively. *end example*]
4. Returning one single result from an operation that incorporated arrays as an intermediate step. [*Example*: The array formula `SUM(SIN(A1:A3))` returns a single result, that being the SUM of the sines of A1, A2 and A3, respectively. *end example*]

When an array formula results in a single value, all of the cells spanned by the array formula take on that value. [*Example*: When the group of cells `A10:A12` contains `SIN(0.3)`, the result stored in each of those cells is `0.295520207`. *end example*]

When an array formula results in multiple values, the designated cells take on corresponding values, according to the shape of the cell group and the values. Specifically,

- If the cell group and values have the same shape (i.e., the same number of rows and columns), each cell takes on the value corresponding to its relative position.
- If the cell group has fewer columns than the values, the left-most columns of the values are stored in the cells.
- If the cell group has fewer rows than the values, the top-most rows of the values are stored in the cells.
- If the cell group has more columns than the values, each cell takes on the value corresponding to its relative position, except that

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

- For a cell group 1x*N* array or a two-dimensional array, the excess right-most cells take on an unspecified value.
- For a cell group *N*x1 array, the excess columns are clones of the first column.

- If the cell group has more rows than the values, each cell takes on the value corresponding to its relative position, except that:

  - For a cell group *N*x1 array or a two-dimensional array, the excess bottom-most cells take on an unspecified value.
  - For a cell group 1x*N* array, the excess rows are clones of the first row.

[*Example*: Case 1: The 1x3 group of cells `A20:C20` has applied to it the array formula `SIN({0.3,0.4,0.5})`. The number of rows and columns in the group exactly matches the number of rows and columns in the result. Those cells then contain 0.295520207, 0.389418342, and 0.479425539, which correspond to `SIN(0.3)`, `SIN(0.4)`, and `SIN(0.5)`, respectively.

Case 2: The 1x2 group of cells `A20:B20` has applied to it the array formula `SIN({0.3,0.4,0.5})`. The number of columns in the group is less than the number of columns in the result. (The number of rows is the same in each.) Those cells then contain 0.295520207 and 0.389418342, which correspond to `SIN(0.3)` and `SIN(0.4)`, respectively, the left-most part of the set of values.

Case 3: The 1x4 group of cells `A20:D20` has applied to it the array formula `SIN({0.3,0.4,0.5})`. The number of columns in the group is greater than the number of columns in the result. (The number of rows is the same in each.) Those cells then contain 0.295520207, 0.389418342, 0.479425539, and an unspecified value, which correspond to `SIN(0.3)`, `SIN(0.4)`, and `SIN(0.5)`, respectively, with the fourth value being unspecified.

Case 4: The 2x2 group of cells `A30:B31` has applied to it the array formula `SIN({0.1,0.2,0.3})`. The number of columns in the group is less than the number of columns in the result. As a result, the cells in row 30 contain 0.295520207 and 0.389418342, which correspond to `SIN(0.3)` and `SIN(0.4)`, respectively. The number of rows in the group is greater than the number of rows in the result, so the cells in 31 are a copy of the cells in row 30. The left-most part of the set of values is propagated into the cells.

Case 5: The 2x2 group of cells `A40:B41` has applied to it the array formula `SIN({0.1,0.2,0.3; 0.4,0.5,0.6; 0.7,0.8,0.9})`. The number of columns in the group is less than the number of columns in the result. As a result, the left-most column values are stored. The number of rows in the group is less than the number of rows in the result. As a result, the top-most column values are stored. *end example*]

18.17.3 Error values

The evaluation of an expression can result in an error having one of a number of *error value*s. These error values are:

Error Value	Reason for Occurrence
`#DIV/0!`	Intended to indicate when any number (including zero) or any error code is divided by zero.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Error Value	Reason for Occurrence
#GETTING_DATA	Intended to indicate when a cell reference cannot be evaluated because the value for the cell has not been retrieved or calculated. [*Note*: This can happen when connected to an OLAP cube. *end note*] This error constant differs from #N/A in that #GETTING_DATA is used when there is an expectation that the value for the cell will eventually be available, whereas #N/A is used when there is no such expectation.
#N/A	Intended to indicate when a designated value is not available. [*Example*: Some functions, such as SUMX2MY2, perform a series of operations on corresponding elements in two arrays. If those arrays do not have the same number of elements, then for some elements in the longer array, there are no corresponding elements in the shorter one; that is, one or more values in the shorter array are not available. *end example*] This error value can be produced by calling the function NA (§18.17.7.223).
#NAME?	Intended to indicate when what looks like a name is used, but no such name has been defined. [*Example*: XYZ/3, where XYZ is not a defined name. `Total is & A10`, where neither `Total` nor `is` is a defined name. Presumably, `"Total is " & A10` was intended. `SUM(A1C10)`, where the range `A1:C10` was intended. *end example*]
#NULL!	Intended to indicate when two areas are required to intersect, but do not. [*Example*: In the case of `SUM(B1 C1)`, the space between B1 and C1 is treated as the binary intersection operator, when a comma was intended. *end example*]
#NUM!	Intended to indicate when an argument to a function has a compatible type, but has a value that is outside the domain over which that function is defined. (This is known as a *domain error*.) [*Example*: Certain calls to ASIN, ATANH, FACT, and SQRT might result in domain errors. *end example*] Intended to indicate that the result of a function cannot be represented in a value of the specified type, typically due to extreme magnitude. (This is known as a *range error*.) [*Example*: `FACT(1000)` might result in a range error. *end example*]
#REF!	Intended to indicate when a cell reference cannot be evaluated. [*Example*: If a formula contains a reference to a cell, and then the row or column containing that cell is deleted, a `#REF!` error results. If a worksheet does not support 20,001 columns, `OFFSET(A1,0,20000)` will result in a `#REF!` error. *end example*]
#VALUE!	Intended to indicate when an incompatible type argument is passed to a function, or an incompatible type operand is used with an operator. [*Example*: In the case of a function argument, text was expected, but a number was provided *end example*]

Each error value has a corresponding *error-constant* (§18.17.2.1).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: A number of functions operate on error values: They include ERROR.TYPE (§18.17.7.110), ISERR (§18.17.7.175), ISERROR (§18.17.7.176), and ISNA (§18.17.7.179). *end note*]

18.17.4 Dates and Times

Each unique instant in SpreadsheetML time is stored as an ISO 8601-formatted string, which is made up of a date component, a time component, and a timezone component.

Numerous functions take dates and/or times as arguments. Functions that care only about the date shall ignore any time information that is provided. Functions that care only about the time shall ignore any date information that is provided.

[*Example*: The date 22 November 1976 at exactly 08:30 Pacific Standard Time (+08:00 UTC) could be represented in the following (non-exhaustive list of) ways within SpreadsheetML:

1976-11-22T08:30:00,000+08:00
1976-11-22T16:30Z
end example]

For compatibility with existing spreadsheet applications, a consuming application should allow certain numeric serial values to be interpreted as dates and times for display or for use in calculations. These values should behave as defined in §18.17.4.1, §18.17.4.2, and §18.17.4.3.

18.17.4.1 Date Conversion for Serial Values

All date values stored in cells within a SpreadsheetML file are stored in the ISO 8601 format.

For compatibility, a SpreadsheetML application can interpret serial-number values in cells or in formulas as dates. This subclause describes how serial number values can be converted to date values depending on the compatibility mode.

A date that can be interpreted as a numeric value is a *serial value*. This is made up of a signed integer date component and an unsigned fractional time component. Going forward in time, the date component of a serial value increases by 1 each day. A serial value represents a UTC date and time, and, as such, has no timezone information.

Three different bases can be used for converting dates into serial values:

- In the *1900 date base system*, the lower limit is January 1, -9999 00:00:00, which has serial value -4346018. The upper-limit is December 31, 9999, 23:59:59, which has serial value 2,958,465.9999884. The base date for this date base system is December 30, 1899, which has a serial value of 0.
- In the *1900 backward compatibility date-base system*, the lower limit is January 1, 1900, 00:00:00, which has serial value 1. The upper limit is December 31, 9999, 23:59:59, which has serial value 2,958,465.9999884. The base date for this date base system is December 31, 1899, which has a serial value of 0.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- In the *1904 backward compatibility date-base system*, the lower limit is January 1, 1904, 00:00:00, which has serial value 0. The upper limit is December 31, 9999, 23:59:59, which has serial value 2,957,003.9999884. The base date for this date base system is January 1, 1904, which has a serial value of 0.

A serial value outside of the range for its date base system is ill-formed.

[*Note*: The 1900 date-base system is the preferred system to be used by applications when converting serial values to dates. The use of the 1900 backward compatibility or 1904 backward compatibility date-base system should be avoided. *end note*]

The date-base system is recorded in the Workbook part's XML by the presence or absence of the dateCompatibility and date1904 attributes of the workbookPr element. [*Example*:

1900 date-base system: `<workbookPr dateCompatibility="0" showObjects="all"/>`
1900 backward compatibility date-base system: `<workbookPr dateCompatibility="1" showObjects="all"/>`
1904 backward compatibility date-base system: `<workbookPr dateCompatibility="1" date1904="1" showObjects="all"/>`

end example]

For legacy reasons, an implementation using the 1900 backward compatibility date base system shall treat 1900 as though it was a leap year. [*Note*: That is, serial value 59 corresponds to February 28, and serial value 61 corresponds to March 1, the next day, allowing the (non-existent) date February 29 to have the serial value 60. *end note*] A consequence of this is that for dates between January 1 and February 28, WEEKDAY shall return a value for the day immediately prior to the correct day, so that the (non-existent) date February 29, 1900, has a day-of-the-week that immediately follows that of February 28, and immediately precedes that of March 1, 1900.

[*Example*: For the 1900 date base system:

The serial value -2338.0000000… represents 1893-08-05
The serial value 2.0000000… represents 1900-01-01
The serial value 3687.0000000… represents 1910-02-03
The serial value 38749.0000000… represents 2006-02-01
The serial value 2958465.0000000… represents 9999-12-31

For the 1904 backward compatibility date base system:

The serial value -3800.0000000… represents 1893-08-05
The serial value 0.0000000… represents 1904-01-01
The serial value 2225.0000000… represents 1910-02-03
The serial value 37287.0000000… represents 2006-02-01
The serial value 2957003.0000000… represents 9999-12-31

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

end example]

18.17.4.2 Time Conversion for Serial Values

The time component of a serial value ranges in value from 0–0.99999999, and represents times from the instant starting 0:00:00 (12:00:00 AM) to the last instant of 23:59:59 (11:59:59 P.M.), respectively.

Going forward in time, the time component of a serial value increases by 1/86,400 each second. [*Note*: As such, the time 12:00 has a serial value time component of 0.5. *end note*]

[*Example*:

The serial value `0.0000000`… represents `00:00:00`
The serial value `0.0000115`… represents `00:00:01`
The serial value `0.4207639`… represents `10:05:54`
The serial value `0.5000000`… represents `12:00:00`
The serial value `0.9999884`… represents `23:59:59`

end example]

18.17.4.3 Combined Date and Time Conversion for Serial Values

Any date component can be added to any time component to produce a serial value for that date/time combination. The resulting serial value encodes that date whose (positive or negative) time span from base date in the respective date-base equals the serial value.

[*Note*: In the 1900 date base system, the serial value -1.25 represents December 28, 1899, 18:00. *end note*]

[*Example*: For the 1900 date base system:

The serial value -2337.999989… represents 1893-08-05T00:00:01Z
The serial value `3687.4207639`… represents 1910-02-03T10:05:54Z
The serial value `1.5000000`… represents 1900-01-01T12:00:00Z
The serial value `2958465.9999884`… represents 9999-12-31T23:59:59Z

For the 1904 backward compatibility date base system:

The serial value -3799.999989… represents 1893-08-05T00:00:01Z
The serial value `2225.4207639`… represents 1910-02-03T10:05:54Z
The serial value `0.5000000`… represents 1904-01-01T12:00:00Z
The serial value `2957003.9999884`… represents 9999-12-31T23:59:59Z

end example]

18.17.5 Limits and Precision

18.17.5.1 Limits

In SpreadsheetML, cell references range from column A1–A1048576 (column A:A) to column XFD1–XFD1048576 (column XFD:XFD).

An implementation can extend this range. However, to avoid ambiguities, it is necessary to ensure that defined names are distinct from cell references, or that one takes precedence over the other. With this in mind, the following rules apply:

- A producer or consumer shall consider a defined name of the form used by cells in the range A1–XFD1048576 to be an error.
- All other names outside this range can be defined names and shall override a cell reference if an ambiguity exists.

[*Example*: `LOG10` is always a cell reference, `LOG10(…)` is always a formula, and `LOGO1000` can be a defined name that overrides a cell reference. *end example*]

18.17.5.2 Precision

In order to clarify the semantics of cell formulas and values in SpreadsheetML, it is necessary to specify the precision of the numbers being represented in the file format. These numbers are therefore regarded as ranging over a specific value space, which defaults to the following:

The *value space* consists of the values (-1)^s × m × 2^n, where s is 0 or 1, m is an integer greater than or equal to 0 and less than 2^53, and n is an integer between -1074 and 971, inclusive. m is herein referred to as the *binary mantissa*, and n is herein referred to as the *binary exponent*. [*Note*: The default precision is patterned after the IEC double-precision 64-bit floating-point type [IEC 60559]. *end note*]

Implementing applications can use the characteristics markup (§22.7) to specify other value spaces to replace the default in a given workbook. When present in the workbook, the value space defined using the characteristics markup overrides the default value space.

Regardless of the specific value space in use, values shall have a lexical representation as described in §18.17.5.3. Any numerical expression conforming to this lexical description is permitted. However, numbers of higher precision than available in the value space, and numbers that lie outside the range representable in the value space shall be handled as prescribed in §18.17.5.4.

18.17.5.3 Lexical Representation

The value space shall have a lexical representation consisting of a base 10 mantissa followed, optionally, by the character "E" or "e", followed by a base 10 exponent. The exponent shall be an integer. The mantissa shall be a decimal number. The representations for exponent and mantissa shall follow the lexical rules for integer and decimal below. If the "E" or "e" and the following exponent are omitted, an exponent value of 0 is assumed.

Lexical representations for zero can take a positive or negative sign.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Example*: -1E4, 1267.43233E12, 12.78e-2, 12 , -0, and 0 are all literals for numbers in the default value space. 4503599627370497.5 is also a literal, although it represents the same value as 4503599627370497 (2^52 + 1) in the default value space (as explained in §18.17.5.4). *end example*]

An *Integer* has a lexical representation consisting of a finite-length sequence of decimal digits (#x30–#x39) with an optional leading sign. If the sign is omitted, "+" is assumed. [*Example*: -1, 0, 12678967543233, +100000. *end example*]

A *Decimal Number* has a lexical representation consisting of a finite-length sequence of decimal digits (#x30–#x39) separated by a period as a decimal indicator. An optional leading sign is allowed. If the sign is omitted, "+" is assumed. Leading and trailing zeroes are optional. If the fractional part is zero, the period and following zero(s) can be omitted. [*Example*: -1.23, 12678967.543233, +100000.00, 210. *end example*]

18.17.5.4 Interpretation

Strings that are permitted according to the lexical definition in §18.17.5.3 shall be interpreted as values in the value space as follows:

1. The mantissa shall be interpreted as a real number expressed in base 10
2. The exponent shall be interpreted as an integer expressed in base 10
3. The raw value for a numerical expression shall be interpreted as mantissa x $10^{exponent}$
4. If the absolute value is larger than the largest value in the value space (2^1024 minus 2^971) then a consuming application shall treat this as equivalent to the error value #NUM! (§18.17.3). Otherwise the value in the value space that is closed to the raw value is chosen as the interpretation. In the case that two values are equally close, the one with the smaller absolute value is chosen.

18.17.6 XML Representation

18.17.6.1 Cell Reference Style

A workbook saved with reference style A1 (§18.17.2.3.1), shall have the refMode attribute of the calcPr element (§18.2.2) in the Workbook part's XML omitted or set to A1. A workbook saved with reference style R1C1 (§18.17.2.3.2) shall have that refMode attribute set to R1C1. [*Example*: With R1C1 mode set, here is how the XML might look:

```
<workbook …>
  …
  <calcPr calcId="122211" fullCalcOnLoad="1" refMode="R1C1"/>
  …
</workbook>
```

end example]

Regardless of the value of the refMode attribute, cell references shall be stored in XML in the A1 form. This attribute's value tells an implementation which reference style to use at runtime.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.6.2 Scalar Formulas

A scalar formula shall be represented in a worksheet's XML by an f element that contains the text of the formula, and a v element that contains the text version of the last computed value for that formula. This pair of elements shall be inside a c element, which is, in turn, shall be inside a row element. [*Example*: Consider the scalar formula SQRT(C2^2+D2^2), where C2 refers to a cell containing the number 12.5, and D2 refers to a cell containing the number 9.6. The corresponding XML might be as follows:

```
<row r="2" spans="2:4">
  <c r="B2" s="40">
    <f>SQRT(C2^2+D2^2)</f>
    <v>15.761027885261798</v>
  </c>
  <c r="C2" s="0">
    <v>12.5</v>
  </c>
  <c r="D2" s="0">
    <v>9.6</v>
  </c>
</row>
```

In the scalar formula CONCATENATE("The total is ",C7," units"), C7 refers to a cell containing the number 23. The corresponding XML might be as follows:

```
<row r="7" spans="2:4" ht="285">
  <c r="B7" s="4" t="str">
    <f>CONCATENATE("The total is ",C7," units")</f>
    <v>The total is 23 units</v>
  </c>
  <c r="C7" s="0">
    <v>23</v>
  </c>
</row>
```

As the function CONCATENATE returns a string, the value for the cell's t attribute is str.

end example]

18.17.6.3 Array Formulas

An array formula shall be represented in XML just like other formulas, except that the array formula's f element shall contain an attribute t, whose value shall be array.

For a single-cell formula, the r attribute shall designate that cell. [*Example*: Consider the array formula SUM(C11:C12*D11:D12). The corresponding XML might be as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
<row r="11" spans="2:4" ht="300">
  <c r="B11" s="16">
    <f t="array" r="B11">SUM(C11:C12*D11:D12)</f>
    <v>110</v>
  </c>
  <c r="C11" s="4">
    <v>10</v>
  </c>
  <c r="D11" s="0">
    <v>3</v>
  </c>
</row>
<row r="12" spans="2:4" ht="285">
  <c r="C12" s="4">
    <v>20</v>
  </c>
  <c r="D12" s="0">
    <v>4</v>
  </c>
</row>
```

As this formula is a single-cell formula, the r attribute contains the name of that cell, B11. *end example*]

For an array formula spanning multiple cells, the r attribute of the top-left cell of the range of cells to which that formula applies shall designate the range of cells to which that formula applies. The c elements for all cells except the top-left cell in that range shall not have an f element; however, they shall each have a v element. [*Example*: Consider the array formula A1:A3*B1:B3, which is applied to the cell range C1:C3. The corresponding XML might be as follows:

```
<row r="1" spans="1:3">
  <c r="A1" s="0">
    <v>112</v>
  </c>
  <c r="B1" s="0">
    <v>2.34</v>
  </c>
  <c r="C1" s="0">
    <f t="array" r="C1:C3">A1:A3*B1:B3</f>
    <v>262.08</v>
  </c>
</row>
<row r="2" spans="1:3">
  <c r="A2" s="0">
    <v>209</v>
  </c>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
    <c r="B2" s="0">
      <v>1.28</v>
    </c>
    <c r="C2" s="0">
      <v>267.52</v>
    </c>
  </row>
  <row r="3" spans="1:3">
    <c r="A3" s="0">
      <v>128</v>
    </c>
    <c r="B3" s="0">
      <v>3.12</v>
    </c>
    <c r="C3" s="0">
      <v>399.36</v>
    </c>
  </row>
```

As this formula is an array formula spanning multiple cells, the r attribute of cell C1 contains the name of that cell range, C1:C3, and cells C2 and C3 do not have an f element. *end example*]

18.17.6.4 Formula Evaluation Order

The order in which formulas are evaluated is determined by the order of their corresponding c elements in the calcChain element of the Calculation Chain part (§18.6.2).

18.17.6.5 Name Representation

A formula can contain one or more names. These names shall be defined in the Workbook part's XML with each being the subject of a definedName element, inside a definedNames element. [*Example*: Consider the scalar formula SUM(value1,value2). The corresponding XML might be as follows:

```
<definedNames>
  <definedName name="value1" localSheetId="0">Sheet2!$B$2</definedName>
  <definedName name="value2" localSheetId="0">Sheet2!$B$3</definedName>
</definedNames>
…
<c r="E5" s="0">
  <f ce="1">SUM(value1,value2)</f>
  <v>8</v>
</c>
```

end example]

Each name shall be the subject of an lpstr element in the Application-Defined File Properties part.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<TitlesOfParts>
  <vt:vector … baseType="lpstr">
    <vt:lpstr>Sheet1</vt:lpstr>
    <vt:lpstr>Sheet2</vt:lpstr>
    <vt:lpstr>Sheet3</vt:lpstr>
    <vt:lpstr>value1</vt:lpstr>
    <vt:lpstr>value2</vt:lpstr>
  </vt:vector>
</TitlesOfParts>
```

18.17.6.6 Value Representation

The most recent value of a formula shall be stored in the corresponding v element, as follows:

Result Type	Representation
array	The text form of the array's value.
error	The text form of the error value.
logical	The text `0` for FALSE and `1` for TRUE.
number	The unformatted text form of the number, as accurately as possible.
text	All of the characters in the text.

18.17.6.7 Dates and Times

A date and/or time is stored as an ISO 8601 string.

The date base system is recorded in the Workbook part's XML by the dateCompatibility and date1904 attributes of the workbookPr element. [*Example*:

```
1900 date-base: <workbookPr dateCompatibility="false" showObjects="all"/>
1904 backward compatibility date-base: <workbookPr dateCompatibility="true"
  date1904="true" showObjects="all"/>
```

end example]

18.17.7 Predefined Function Definitions

Each of the subclauses below this subclause describes a separate function, and each description contains a section marked **Syntax**. That section contains pieces of the function grammar as they pertain to that specific function. These pieces are presented in a slightly simpler form to aid in the understanding of the description. In those sections, the left-square-bracket and right-square-bracket designate the start and end of an option, as used in ISO/IEC 14977. However, the function-name, the open-parenthesis and the close-parenthesis designate actual literal text, as does each comma. [*Note*: Therefore, in a strict presentation according to ISO/IEC 14977, each would appear with double-quotes surrounding each instance. *end note*]

The **Syntax** section for each function defined in this subclause corresponds to a call to that function. Except for *argument-list*, the names in any **Syntax** section typeset as in *number* and *string-1*, are parameter names for that

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

function, and are local to that function definition's description. *argument-list* is the name of a production in the grammar, and, as defined in §18.17.2, permits a comma-separated list of *argument*s.

When the type of an argument passed to a function is incompatible with the type expected the error value `#VALUE!` is returned by that function.

The set of predefined functions is divided into the following functional categories [*Note*: The predefined functions defined here reflect current spreadsheet semantics and might not match common practice in other contexts. New functions might be added in future versions of the specification. *end note*]:

All predefined functions can be used with their simple name, with the prefix `ECMA.` or with the prefix `ISO.`, with the following exception: the predefined function named `CEILING` in ISO/IEC 29500 can only be used with the prefix `ECMA.`. The predefined function named `ISO.CEILING` is specified in ISO/IEC 29500.

18.17.7.1 ABS

Syntax:

ABS (*x*)

Description: Computes the absolute value of x.

Arguments:

Name	Type	Description
x	number	The value whose absolute value is to be determined.

Return Type and Value: number – The absolute value of x.

[*Example*:

ABS(10.5) results in 10.5
ABS(0) results in 0
ABS(-10.5) results in 10.5

end example]

18.17.7.2 ACCRINT

Syntax:

ACCRINT (*issue* , *first-interest* , *settlement* , *rate* , [*par*] , *frequency* [, [*basis*]])

Description: Computes the accrued interest for a security that pays periodic interest.

Mathematical Formula:

$$ACCRINT = par \times \frac{rate}{frequency} \times \sum_{i=1}^{NC} \frac{A_i}{NL_i}$$

where:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- A_iAi = number of accrued days for the i[th] quasi-coupon period within odd period.
- *frequency* = argument *frequency*
- *NC* = number of quasi-coupon periods that fit in odd period. If this number contains a fraction, raise it to the next whole number. The quasi-coupon period can be calculated in one of two following ways:
  - Odd long first coupon: by working backwards in time from the long coupon's interest payment date (first coupon date) and adding together the number of standard coupon periods that would fit in the long coupon, rounding up to the next whole number;
  - Odd long last coupon: by working forward in time from the long coupon's interest payment date (last coupon date before redemption) and adding together the number of standard coupon periods that would fit in the long coupon, rounding up to the next whole number.
- NL_iNLi = normal length in days of the i[th] quasi-coupon period within odd period.
- *par* = argument *par*
- *rate* = argument *rate*

Arguments:

Name	Type	Description
issue	number	The security's issue date.
first-interest	number	The security's first interest date.
settlement	number	The security's settlement date.
rate	number	The security's annual coupon rate.
par	number	The security's par value. If omitted, 1,000 is used.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** 0 or omitted / US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
		day 30, including situations where the first date is 28 or 29 February.
		1 — Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2 — Actual/360. Similar to Basis 1, but only has 360 days per year.
		3 — Actual/365. Similar to Basis 1, but always has 365 days per year.
		4 — European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The accrued interest for a security that pays periodic interest.

However, if

- *issue*, *first-interest*, or *settlement* is out of range for the current date base value, #NUM! is returned
- *issue* ≥ *settlement*, #NUM! is returned
- *rate* or *par* ≤ 0, #NUM! is returned
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned
- *basis* < 0 or *basis* > 4, #NUM! is returned

`ACCRINT(DATE(2006,3,1),DATE(2006,9,1),DATE(2006,5,1),0.1,1100,2,0)` results in `18.33`
`ACCRINT(DATE(2006,3,1),DATE(2006,9,1),DATE(2006,5,1),0.1,,2,0)` results in `16.67`

end example]

18.17.7.3 ACCRINTM

Syntax:

`ACCRINTM` (*issue* , *settlement* , *rate* , [[*par*] [, [*basis*]]])

Description: Computes the accrued interest for a security that pays interest at maturity.

Mathematical Formula:

$$ACCRINTM = par \times rate \times \frac{A}{D}$$

where:

- A = Number of accrued days counted according to a monthly basis. For interest at maturity items, the number of days from the issue date to the maturity date is used.
- D = Annual Year Basis.
- *par* = argument *par*
- *rate* = argument *rate*

Arguments:

Name	Type	Description
issue	number	The security's issue date.
settlement	number	The security's settlement date.
rate	number	The security's annual coupon rate.
par	number	The security's par value. If omitted, 1,000 is used.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** `0` or omitted / US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description	
			or 29 February, it is adjusted to 30 February. • For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the

Name	Type	Description
		following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 Februar y.

Time information in the date arguments is ignored.

Return Type and Value: number – The accrued interest for a security that pays interest at maturity.

However, if

- *issue* or *settlement* is out of range for the current date base value, #NUM! is returned
- *issue* ≥ *settlement*, #NUM! is returned
- *rate* or *par* ≤ 0, #NUM! is returned
- *basis* < 0 or *basis* > 4, #NUM! is returned

[*Example*:

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,1100,0) results in 18.33333333
ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,,0) results in 16.66666667
ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,) results in 16.66666667

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.17.7.4 ACOS

Syntax:

ACOS (*x*)

Description: Computes the arc cosine of x.

Arguments:

Name	Type	Description
x	number	The value whose arc cosine is to be determined.

Return Type and Value: number – The arc cosine of x, in radians.

However, if x is outside the interval [-1,+1], `#NUM!` is returned

[*Example*:

`ACOS(-1)` results in `3.141592654`
`ACOS(0)` results in `1.570796327`
`ACOS(1)` results in `0`

end example]

18.17.7.5 ACOSH

Syntax:

ACOSH (*x*)

Description: Computes the inverse hyperbolic cosine of x.

Arguments:

Name	Type	Description
x	number	The value whose inverse hyperbolic cosine is to be determined.

Return Type and Value: number – The inverse hyperbolic cosine of x.

However, if x < 1, `#NUM!` is returned.

[*Example*:

`ACOSH(1)` results in `0`
`ACOSH(10)` results in `2.993222846`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

ACOSH(100) results in 5.298292366

end example]

18.17.7.6 ADDRESS

Syntax:

ADDRESS (*row-number* , *col-number* [, [*ref-type*] [, [*A1-ref-style-flag*] [, *sheet-name*]]])

Description: Creates a cell address, given the specified row and column numbers.

Arguments:

Name	Type	Description
row-number	number	The number of the row.
col-number	number	The number of the column.
ref-type	number	The type of reference to return, as follows: 1 or omitted – Absolute row and column 2 – Absolute row; relative column 3 – Relative row; absolute column 4 – Relative row and column
A1-ref-style-flag	logical	The style of the reference. If TRUE or omitted, an A1-style reference (§18.17.2.3.1) is returned; otherwise, an R1C1-style reference (§18.17.2.3.2) is returned.
sheet-name	text	The name of the worksheet to be used. If omitted, no sheet name is used.

Return Type and Value: text – A cell address, given the specified row and column numbers.

However, if

- *row-number* or *col-number* < 1, #NUM! is returned.
- *ref-type* is outside the range 1–4, #NUM! is returned.

[*Example*:

In A1-reference style mode:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

`ADDRESS(5,7,1)` results in `$G$5`
`ADDRESS(5,7,2)` results in `G$5`
`ADDRESS(5,7,3)` results in `$G5`
`ADDRESS(5,7,4)` results in `G5`
`ADDRESS(5,7,,,"Sheet1")` results in `Sheet1!$G$5`

In R1C1-reference style mode:

`ADDRESS(5,7,1,FALSE)` results in `R5C7`
`ADDRESS(5,7,2,FALSE)` results in `R5C[7]`
`ADDRESS(5,7,3,FALSE)` results in `R[5]C7`
`ADDRESS(5,7,4,FALSE)` results in `R[5]C[7]`

end example]

18.17.7.7 AMORDEGRC

Syntax:

AMORDEGRC (*cost* , *date-purchased* , *first-period* , *salvage* , *period* , *rate* [, [*basis*]])

Description: Computes the depreciation for each accounting period. (This function is provided for the French accounting system. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account. The function is similar to `AMORLINC` (§18.17.7.7), except that a depreciation coefficient is applied in the calculation depending on the life of the assets.)

Arguments:

Name	Type	Description
cost	number	The cost of the asset.
date-purchased	number	The date of the purchase of the asset.
first-period	number	The date of the end of the first period.
salvage	number	The salvage value at the end of the life of the asset.
period	number	The period.
rate	number	The rate of depreciation.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** `0` or omitted / US (NASD) 30/360. Assumes that each month has 30 days and

</td></tr>
</table>

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description	
			Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Return Type and Value: number – The depreciation for each accounting period.

However, if

- *cost*, *salvage*, *period*, *or rate* < 0, `#NUM!` is returned.
- *date-purchased* or *first-period* is out of range for the current date base value, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.
- The life of the assets is between 0 and 1, 1 and 2, 2 and 3, or 4 and 5, `#NUM!` is returned.

This function returns the depreciation until the last period of the life of the assets or until the cumulated value of depreciation is greater than the cost of the assets minus the salvage value.

The depreciation coefficients are:

Life of assets (1/rate)	Depreciation Coefficient
Between 3 and 4 years	1.5
Between 5 and 6 years	2
More than 6 years	2.5

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

The depreciation rate grows to 50 percent for the period preceding the last period, and grows to 100 percent for the last period.

[*Example*:

`AMORDEGRC(2400,DATE(2008,8,19),DATE(2008,12,31),300,1,0.15,1)` results in `776.00`

end example]

18.17.7.8 AMORLINC

Syntax:

```
AMORLINC ( cost , date-purchased , first-period , salvage , period ,
    rate [ , [ basis ] ] )
```

Description: Computes the depreciation for each accounting period. (This function is provided for the French accounting system. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account.)

Arguments:

Name	Type	Description
cost	number	The cost of the asset.
date-purchased	number	The date of the purchase of the asset.
first-period	number	The date of the end of the first period.
salvage	number	The salvage value at the end of the life of the asset.
period	number	The period.
rate	number	The rate of depreciation.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** `0` or omitted / US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description		
				30 February. • For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
			1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
			2	Actual/360. Similar to Basis 1, but only has 360 days per year.
			3	Actual/365. Similar to Basis 1, but always has 365 days per year.
			4	European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 Februar y.

Return Type and Value: number – The depreciation for each accounting period.

However, if:

- *cost*, *salvage*, *period*, or *rate* < 0, `#NUM!` is returned.
- *date-purchased* or *first-period* is out of range for the current date base value, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`AMORLINC(2400,DATE(2008,8,19),DATE(2008,12,31),300,1,0.15,1)` results in `360.00`

end example]

18.17.7.9 AND

Syntax:

AND (*argument-list*)

Description: Tests if all *argument*s in *argument-list* are TRUE. The function evaluates all arguments prior to returning a value.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Arguments:

Name	Type	Description
argument-list	logical, array, or cell reference	The *argument*s in *argument-list* designate the values to be tested. For an array or cell reference, a cell that contains text or is empty shall be ignored.

Return Type and Value: logical – TRUE if all *argument*s in *argument-list* are TRUE; otherwise, FALSE.

However, if no logical values are found, `#VALUE!` is returned.

[*Example*:

`AND(TRUE)` results in TRUE
`AND(TRUE,FALSE)` results in FALSE
`AND(10>5,3=1+2,5)` results in TRUE
`AND({10,5,6,7},TRUE,E6:F6)` results in TRUE, when E6 contains TRUE and F6 contains 10

end example]

18.17.7.10 AREAS

Syntax:

AREAS (*reference*)

Description: Finds the number of areas (§18.17.2.3) designated by *reference*.

Arguments:

Name	Type	Description
reference	reference	A reference to a single cell or to a range of cells that can refer to multiple areas.

Return Type and Value: number – The number of areas designated by *reference*.

However, if the reference designates no areas, `#NUM!` is returned.

[*Example*:

`AREAS(E312)` results in 1
`AREAS(E311:F313)` results in 1
`AREAS((E312:F314,G316:H316,G311))` results in 3, given the union of the three areas
`AREAS((E312:F314 E313:F314 F312:F314))` results in 1, given the intersection of the three areas

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.11 ASC

Syntax:

ASC (*string*)

Description: For double-byte character set (DBCS) languages, converts all full-width (double-byte) characters to half-width (single-byte) characters.

Arguments:

Name	Type	Description
string	text	Designate the text to be converted. If *string* does not contain any full-width characters, nothing in *string* is converted.

Return Type and Value: text – The text resulting from the conversion.

[*Example*:

ASC("ABC") results in ABC
ASC("エクセル") results in ｴｸｾﾙ

end example]

18.17.7.12 ASIN

Syntax:

ASIN (*x*)

Description: Computes the arc sine of x.

Arguments:

Name	Type	Description
x	number	The value whose arc sine is to be determined.

Return Type and Value: number – The arc sine of x, in radians.

However, if x is outside the interval [-1,+1], #NUM! is returned.

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

`ASIN(-1)` results in `-1.570796327`
`ASIN(0)` results in `0`
`ASIN(1)` results in `1.570796327`

end example]

18.17.7.13 ASINH

Syntax:

```
ASINH ( x )
```

Description: Computes the inverse hyperbolic cosine of x.

Arguments:

Name	Type	Description
x	number	The value whose inverse hyperbolic sine is to be determined.

Return Type and Value: number – The inverse hyperbolic cosine of x.

[*Example*:

`ASINH(1)` results in `0.881373587`
`ASINH(10)` results in `2.99822295`
`ASINH(100)` results in `5.298342366`
`ASINH(0.5)` results in `0.481211825`

end example]

18.17.7.14 ATAN

Syntax:

```
ATAN ( x )
```

Description: Computes the arc tangent of x.

Arguments:

Name	Type	Description
x	number	The value whose arc tangent is to be determined.

Return Type and Value: number – The arc tangent of x, in radians.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*:

`ATAN(-1)` results in `-0.785398163`
`ATAN(0)` results in `0`
`ATAN(1)` results in `0.785398163`
`ATAN(-10)` results in `1.471127674`
`ATAN(10)` results in `1.471127674`

end example]

18.17.7.15 ATAN2

Syntax:

```
ATAN2 ( x , y )
```

Description: Computes the arc tangent of the coordinates x and y.

Arguments:

Name	Type	Description
x	number	The first coordinate.
y	number	The second coordinate.

Return Type and Value: number – The arc tangent of y/x, in radians.

However, if both x and y are zero, `#DIV/0!` is returned.

[*Example*:

`ATAN2(1,1)` results in `0.785398163`
`ATAN2(-2,2)` results in `2.35619449`
`ATAN2(3,-3)` results in `-0.785398163`

end example]

18.17.7.16 ATANH

Syntax:

```
ATANH ( x )
```

Description: Computes the inverse hyperbolic tangent of x.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
x	number	The value whose inverse hyperbolic tangent is to be determined.

Return Type and Value: number – The inverse hyperbolic tangent of *x*.

However, if *x* is outside the interval [-1,+1], `#NUM!` is returned.

[*Example*:

`ATANH(-0.999999)` results in `-7.254328619`
`ATANH(0)` results in `0`
`ATANH(0.999999)` results in `7.254328619`

end example]

18.17.7.17 AVEDEV

Syntax:

AVEDEV (*argument-list*)

Description: Computes the average of the absolute deviations of a set of data points from their mean. AVEDEV is a measure of the variability in a data set.

Mathematical Formula:

The average of the absolute deviations of a set of data points from their mean is as follows:

$$\frac{1}{n}\sum|x - \bar{x}|$$

where:

- n = the number of *arguments* in *argument-list*
- x = an *argument* in *argument-list*
- $\bar{x}$= the x mean value

Arguments:

Name	Type	Description
argument-list	logical, number, name, array, or reference that contains a number. The list	The *argument*s in *argument-list* designate the values for which the average of the absolute deviations is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. If an array or reference argument contains text,

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
	can be a single argument that is an array or a reference to an array.	logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The average of the absolute deviations of a set of data points from their mean.

[*Example*:

AVEDEV(-3.5,1.4,6.9,-4.5) results in 4.075
AVEDEV({-3.5,1.4,6.9,-4.5}) results in 4.075

end example]

18.17.7.18 AVERAGE

Syntax:

AVERAGE (*argument-list*)

Description: Computes the arithmetic mean of the numeric values of its arguments.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, or reference that contains a number.	The *argument*s in *argument-list* designate the values to be averaged. An argument that is a logical value or the text representation of a number shall be counted. If an array or cell reference argument contains logical values, text, or empty cells, those values shall be ignored; however, cells having the value 0value 0 shall be counted. [*Note*: The function AVERAGEA (§18.17.7.18) does include cell reference arguments that refer to logical values or text representations of numbers. *end note*]

Return Type and Value: number – The arithmetic mean of the values of its arguments.

[*Example*:

AVERAGE(1,2,3,4,5) results in 3
AVERAGE({1,2;3,4}) results in 2.5
AVERAGE({1,2,3,4,5},6,"7") results in 4

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

AVERAGE({1,"2",TRUE,4}) results in 2.5, as the logical value and numeric text are ignored

end example]

18.17.7.19 AVERAGEA

Syntax:

AVERAGEA (*argument-list*)

Description: Computes the arithmetic mean of the values of its arguments.

Arguments:

Name	Type	Description
argument-list	logical, number, text, or reference that contains a number.	The *argument*s in *argument-list* designate the values to be averaged. An argument that is a logical value or the text representation of a number shall be counted. Arguments with value TRUE evaluate to 1; arguments with value FALSE evaluate to 0. An array or cell reference argument that contains text evaluates to 0. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[*Note*: The function AVERAGE (§18.17.7.18) does not include cell reference arguments that refer to logical values or text representations of numbers. *end note*]

Return Type and Value: number – The arithmetic mean of the values of its arguments.

[*Example*:

AVERAGEA(10,E1), where E1 is an empty cell, results in 10, as E1 is ignored
AVERAGEA(10,E2), where E2 contains TRUE, results in 5.5
AVERAGEA(10,E3), where E3 contains FALSE, results in 5

end example]

18.17.7.20 AVERAGEIF

Syntax:

AVERAGEIF (*cell-range* , *selection-criteria* [, *average-range*])

Description: Applies selection criteria on the values in one range of cells and averages the values of the cells in a corresponding range.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
cell-range	reference	The range of cells to be inspected. Cells in *cell-range* that contain TRUE or FALSE are ignored. If a cell is an empty cell, it is ignored.
selection-criteria	number, expression, reference, text	Designates the cells that are to be averaged. In the case of text, *selection-criteria* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. *selection-criteria* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). If a cell in *selection-criteria* is empty, it is treated as if it contained 0.
average-range	reference	Designates the cells whose values are averaged. In this case, *average-range* need not have the same size and shape as *cell-range*. The actual cells that are averaged are determined by using the top, left cell in *average-range* as the beginning cell, and then including cells that correspond in size and shape to *cell-range*. If *average-range* is omitted, *cell-range* also designates the cells whose values are averaged. If a cell is an empty cell, it is ignored.

Return Type and Value: number – The average of the values of the cells corresponding to those selected.

However, if no cells in the range meet the criteria, the return value is unspecified.

[*Example*: Assuming A2:A4 contains 10, 20, and 30:

AVERAGEIF(A2:A4,“>15”) results in 25, the average of 20 and 30.

end example]

18.17.7.21 AVERAGEIFS

Syntax:

AVERAGEIFS (*average-range* , *cell-range-1* , *selection-criteria-1*
[, *cell-range-2* , *selection-criteria-2* [, …]])

Description: The average of the values of all cells that meet multiple criteria.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
average-range	reference	Designates the cells whose values are averaged. In this case, *average-range* need not have the same size and shape as *cell-range-1* through *cell-range-n*. The actual cells that are added are determined by using the top, left cell in *average-range* as the beginning cell, and then including cells that correspond in size and shape to *cell-range-1* through *cell-range-n*. If a cell in *average-range* is empty, that cell is ignored. Each cell in *average-range* is used in the average calculation only if all of the corresponding criteria specified are true for that cell.
cell-range-1	number, expression, reference, text	Designates the first range of cells to be inspected.
selection-criteria-1	reference, text	*selection-criteria-1* specifies the criteria for the first range of cells that is averaged. In the case of text, *selection-criteria-1* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. If a cell in any selection criteria range is empty, it is treated as if its value was 0. Cells that contain TRUE evaluate to 1; cells in any range that contain FALSE evaluate to 0. *selection-criteria-1* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
cell-range-n	number, expression, reference, text	The optional arguments *selection-criteria-2* through *selection-criteria-n* have corresponding arguments *cell-range-2* through *cell-range-n*, and have the same semantics as *selection-criteria-1* and *cell-range-1*, respectively.
selection-criteria-n	reference, text	

Return Type and Value: number – The average of the cells corresponding to those selected.

However, if

- Cells in *average-range* are empty or contain text values that cannot be translated into numbers, the return value is unspecified.
- There are no cells that meet all the criteria, the return value is unspecified.

[*Example*: Given the following data:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

	A	B	C	D
1	Student	First Quiz Grade	Second Quiz Grade	Final Exam Grade
2	Emilio	75	85	87
3	Julie	94	80	88
4	Hans	86	93	Incomplete
5	Frederique	Incomplete	75	75

`AVERAGEIFS(B2:B5,B2:B5,">70",B2:B5,"<90")` results in `80.5` (the average for all students all first quiz grades that are between 70 and 90)

`AVERAGEIFS(D2:D5,D2:D5,"<>Incomplete",D2:D5,">80")` results in `87.5` (the average for all students all first quiz grades that are above 80 and not marked "Incomplete")

`AVERAGEIFS(B2:D5,B2:B5,"<>Incomplete",C2:C5,"<>Incomplete",D2:D5, "<>Incomplete")` results in 82.375 (the average grades for all students who do not have incomplete grades)

end example]

18.17.7.22 BAHTTEXT

Syntax:

```
BAHTTEXT ( number )
```

Description: Produces a string containing *number* formatted according to the Thai convention.

Arguments:

Name	Type	Description
number	number	The value to be formatted.

Return Type and Value: text – The text containing *number* formatted.

[*Example*:

`BAHTTEXT(1234)` results in หนึ่งพันสองร้อยสามสิบสี่บาทถ้วน

end example]

18.17.7.23 BESSELI

Syntax:

```
BESSELI ( x , n )
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Description: The modified Bessel function In(x), which is equivalent to the Bessel function Jn(x) evaluated for purely imaginary arguments.

Mathematical Formula:

The n-th order modified Bessel function of the variable x is:

$$\mathrm{I_n}(x) = (i)^{-n} J_n\,(ix)$$

where:

- x = argument x
- n = argument n

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Bessel function In(x).

However, if $n < 0$, `#NUM!` is returned.

[*Example*:

`BESSELI(-5.6,0)` results in `46.73755194`
`BESSELI(2.345,5)` results in `0.023137792`

end example]

18.17.7.24 BESSELJ

Syntax:

```
BESSELJ ( x , n )
```

Description: The Bessel function Jn(x).

Mathematical Formula:

The n-th order Bessel function of the variable x is:

$$J_n(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!\,\Gamma(n+k+1)} \left(\frac{x}{2}\right)^{n+2k}$$

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

where:

$$\Gamma(n+k+1) = \int_0^{\infty} e^{-x} x^{n+k}\, dx$$

is the Gamma function, and

- x = argument x
- n = argument n

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Bessel function Jn(x).

However, if $n < 0$, `#NUM!` is returned.

[*Example*:

`BESSELJ(-5.6,0)` results in `0.026970887`
`BESSELJ(2.345,5)` results in `0.014627862`

end example]

18.17.7.25 BESSELK

Syntax:

```
BESSELK ( x , n )
```

Description: The modified Bessel function Kn(x), which is equivalent to using the Bessel function Jn(x) and Yn(x).

Mathematical Formula:

The n-th order modified Bessel function of the variable x is:

$$K_n(x) = \frac{p}{2} i^{n+1} [\, J_n(ix) + iY_n(ix)]$$

where:

- J_n is the J Bessel function
- n = argument n

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- $p = \pi$
- x = argument x
- Y_nYn is the Y Bessel function
- **Arguments:**

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Bessel function Kn(x).

However, if $n < 0$, `#NUM!` is returned.

[*Example*:

`BESSELK(2.345,5)` results in `3.904137225`

end example]

18.17.7.26 BESSELY

Syntax:

```
BESSELY ( x , n )
```

Description: Weber's Bessel function Yn(x).

Mathematical Formula:

The n-th order Bessel function of the variable x is:

$$Y_n(x) = \lim_{v \to n} \frac{J_v(x)\cos(v\,\pi) - J_{-v}(x)}{\sin(v\,\pi)}$$

where:

- n = argument n
- x = argument x

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The Weber's Bessel function Yn(x).

However, if $n < 0$, `#NUM!` is returned.

[*Example*:

`BESSELY(2.345,5)` results in `-4.98977884`

end example]

18.17.7.27 BETADIST

Syntax:

`BETADIST ( x , alpha , beta [ , [ A ] , [ B ]] )`

Description: Computes the cumulative beta probability density function.

Arguments:

Name	Type	Description
x	number	The value between A and B at which to evaluate the function.
alpha	number	A parameter of the distribution.
beta	number	A parameter of the distribution.
A	number	The lower bound to the interval of x. If omitted, the lower bound is 0.
B	number	The upper bound to the interval of x. If omitted, the upper bound is 1.

Return Type and Value: number – The cumulative beta probability density function.

However, if

- *alpha* or *beta* ≤ 0, `#NUM!` is returned.
- $x < A$, $x > B$, or $A = B$, `#NUM!` is returned.

[*Example*:

`BETADIST(0.5,1,2)` results in `0.75`
`BETADIST(0.5,1,2,-4.5,7.3)` results in `0.66791152`
`BETADIST(0.5,1,2,,2.3)` results in `0.387523629`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.28 BETAINV

Syntax:

BETAINV (*probability* , *alpha* , *beta* [, [*A*] , [*B*]])

Description: Computes the inverse of the cumulative distribution function for a specified beta distribution. Given a value for *probability*, BETAINV is used to seek for the value x such that BETADIST(x, *alpha*, *beta*, A, B) = *probability*. Thus, precision of BETAINV depends on precision of BETADIST.

Arguments:

Name	Type	Description
probability	number	A probability associated with the beta distribution.
alpha	number	A parameter of the distribution.
beta	number	A parameter of the distribution.
A	number	The lower bound to the interval of x. If omitted, the lower bound is 0.
B	number	The upper bound to the interval of x. If omitted, the upper bound is 1.

Return Type and Value: number – The inverse of the cumulative distribution function for a specified beta distribution.

However, if

- *alpha* or *beta* ≤ 0, #NUM! is returned.
- *probability* < 0 or *probability* > 1, #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned.

[*Example*:

BETAINV(0.5,1,2) results in 0.29289341
BETAINV(0.5,1,2,-4.5,7.3) results in -1.043857765
BETAINV(0.5,1,2,,2.3) results in 0.673654842

end example]

18.17.7.29 BIN2DEC

Syntax:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

BIN2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

Name	Type	Description
number	number	A 10-digit binary number that is to be converted to a decimal string. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, #NUM! is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range 1000000000 (-512 decimal) to 0111111111 (511 decimal), inclusive, #NUM! is returned.

[*Example*:

BIN2DEC(111) results in 7
BIN2DEC(11111111) results in 255
BIN2DEC(1111111110) results in -2
BIN2DEC(1000000000) results in -512

end example]

18.17.7.30 BIN2HEX

Syntax:

BIN2HEX (*number* [, *num-hex-digits*])

Description: Makes the uppercase hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

Name	Type	Description
number	number	A 10-digit binary number that is to be converted to a hexadecimal string. If *number* has less than 10 digits, leading zero digits are implied until it has exactly

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.
num-hex-digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-hex-digits* is ignored and the result has 10 digits. If *num-hex-digits* is omitted, the minimum number of digits is used in the result. *num-hex-digits* is truncated to an integer.

Return Type and Value: text – The uppercase hexadecimal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, `#NUM!` is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range `1000000000` (200 hex, -512 decimal) to `0111111111` (1FF hex, 511 decimal), inclusive, `#NUM!` is returned.
- *number* needs more digits that *num-hex-digits*, `#NUM!` is returned.
- *num-hex-digits* ≤ 0 or > 10, `#NUM!` is returned.

[*Example*:

`BIN2HEX(1)` results in `1`
`BIN2HEX(1,4)` results in `0001`
`BIN2HEX(111111)` results in `3F`
`BIN2HEX(1111000000)` results in `FFFFFFFFC0`
`BIN2HEX(1000000000,3)` results in `FFFFFFFE00`

end example]

18.17.7.31 BIN2OCT

Syntax:

`BIN2OCT ( number [ , num-oct-digits ] )`

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

Name	Type	Description
number	number	A 10-digit binary number that is to be converted to an octal string. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.
num-oct-digits	number	*num-oct-digits* is the number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-oct-digits* is ignored and the result has 10 digits. If *num-oct-digits* is omitted, the minimum number of digits is used in the result. *num-oct-digits* is truncated to an integer.

Return Type and Value: text – The octal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, `#NUM!` is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range `1000000000` (1000 octal, -512 decimal) to `0111111111` (0777 octal, 511 decimal), inclusive, `#NUM!` is returned.
- *number* needs more digits that *num-oct-digits*, `#NUM!` is returned.
- *num-oct-digits* < 0 or > 10, `#NUM!` is returned.

[*Example*:

`BIN2OCT(1)` results in `1`
`BIN2OCT(1,4)` results in `0001`
`BIN2OCT(111111)` results in `77`
`BIN2OCT(1111000000)` results in `7777777700`
`BIN2OCT(1000000000,3)` results in `7777777000`

end example]

18.17.7.32 BINOMDIST

Syntax:

`BINOMDIST` (*number-successes* , *number-trials* , *success-probability* , *cumulative-flag*)

Description: Computes the individual term binomial distribution probability.

Mathematical Formula:

The binomial probability mass function is:

$$b(x,n,p) = \binom{n}{x} p^x (1-p)^{n-x}$$

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

where:

$\binom{n}{x}$

is `COMBIN(n,x)`.

The cumulative binomial distribution is:

$$B(x,n,p) = \sum_{y=0}^{x} b(y,n,p)$$

where:

- n = argument *number-trials*
- p = argument *success-probability*
- x = argument *number-successes*

Arguments:

Name	Type	Description
number-successes	number	The number of successes in *number-trials*, truncated to an integer.
number-trials	number	The number of independent trials, truncated to an integer.
success-probability	number	The probability of success on each trial.
cumulative-flag	logical	Determines the form of the function. If TRUE, then the cumulative distribution function is returned, which is the probability that there are at most *number-successes* successes; if FALSE, the probability mass function is returned, which is the probability that there are *number-successes* successes.

Return Type and Value: number – The individual term binomial distribution probability.

However, if

- *number-successes* < 0 or *number-successes* > *number-trials*, `#NUM!` is returned.
- *success-probability* < 0 or *success-probability* > 1, `#NUM!` is returned.

[*Example*:

`BINOMDIST(6,10,0.5,FALSE)` results in `0.205078125`
`BINOMDIST(6,10,0.5,TRUE)` results in `0.828125`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.33 CEILING

Syntax:

```
CEILING ( x , significance )
```

Description: Computes a value that is *x* rounded-up, away from zero, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
x	number	The value to be rounded
significance	number	The multiple to which *x* is to be rounded. If *x* is negative, and *significance* is negative, then the value is rounded down (away from zero). If *x* is negative, and *significance* is positive, then the value is rounded up, towards zero.

Return Type and Value: number – The rounded-up value of *x*.

However, if *x* and *significance* have different signs, #NUM! is returned.

[*Example*:

`CEILING(2.5,1)` rounds 2.5 up to nearest multiple of 1; that is, to 3
`CEILING(-2.5,-2)` rounds -2.5 up to nearest multiple of -2; that is, to `-4`
`CEILING(1.5,0.1)` rounds 1.5 up to the nearest multiple of 0.1; that is, to `1.5`
`CEILING(0.234,0.01)` rounds 0.234 up to the nearest multiple of 0.01; that is, to `0.24`

end example]

18.17.7.34 CELL

Syntax:

```
CELL ( category [ , reference ] )
```

Description: Retrieves information about the formatting, location, or contents of the upper-left cell indicated by *reference*. *category* indicates the kind of information to be retrieved.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
category	text	The category string as defined in the table following.
reference	reference	Refers to the cell whose category information is being requested. If *reference* is a cell range, the first cell in that range is the cell whose category information is being requested. If *reference* is omitted, the information retrieved pertains to the most recent cell whose value was changed. For the category `"format"`, if *reference* designates a cell formatted with a built-in number format, the number format string is as defined in the table following.

category	Meaning	Result Type
`"address"`	Reference of the first cell in *reference*.	text
`"col"`	Column number of the cell in *reference*.	number
`"color"`	1 if the cell is formatted in color for negative values; otherwise, 0. 0 if the cell does not contain a number.	number
`"contents"`	Value of the upper-left cell in *reference*.	Text or number
`"filename"`	Fully qualified filename of the file that contains *reference*. However, if the worksheet that contains *reference* has not yet been saved, the filename is an empty string.	text
`"format"`	Number format of the cell. (See the discussion of formats below.) The number format string has `"-"` appended if the cell is formatted in color for negative values. The number format string has `"()"` appended if the cell is formatted in color for positive or all values.	text
`"parentheses"`	1 if the cell is formatted with parentheses for positive or all values; otherwise, 0. 0 if the cell does not contain a number.	number
`"prefix"`	Text value corresponding to the label prefix of the cell, as follows: • Single quotation mark (') if the cell contains left-aligned text • Double quotation mark (") if the cell contains right-aligned text • Caret (^) if the cell contains centered text • Backslash (\) if the cell contains fill-aligned text • Empty string if the cell contains anything else	text
`"protect"`	0 if the cell is not locked; otherwise, 1.	number
`"row"`	Row number of the cell in reference.	number
`"type"`	Text value corresponding to the type of data in the cell.	text

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

category	Meaning	Result Type
	• "b" (blank) if the cell is empty • "l" (label) if the cell contains a text constant • "v" (value) if the cell contains anything else	
"width"	Column width of the cell rounded off to an integer. Each unit of column width is equal to the width of one character in the default font size.	number

If the SpreadsheetML is intended to be used in certain non-English locales, the *category* string can be the English value shown in the table above, or the translation shown in the following table. Locales not specified in the table below shall only use the English versions of the *category* string.

[*Note*: Using translated versions of the *category* string is strongly discouraged, as spreadsheet applications might not support these translations. *end note*]

Return Type and Value: various (see table above) – The value corresponding to *category*, and whose type is shown in the category value table above.

When the category parameter is `"format"`, then the value returned depends upon the number format of the upper-left cell of *reference*, and, more specifically, upon the number format code of the upper-left cell of *reference*. Depending upon the number format code of the appropriate cell, the result value of CELL when the category is `"format"` is based upon the rules defined below.

First, some observations regarding the rules are in order:

- The various "sections" of the number format code are referred to within the rules. For more information on sections in the number format code, see numFmts (Number Formats) (§18.8.31).
- There are cases in which it is useful to discuss the characters from the number format code that are dependent upon the value in the cell. Instead of representing text or spacing in the cell's display text, these characters interpret, in some fashion, the value to be displayed. In the rules, these characters are referred to as "interpreted characters" of the number format code. The following table shows all the interpreted characters:

Interpreted Characters
0
#
@
d
m
y
h
s
?
AM/PM
A/P
g
e
r

- There are cases in which it is also useful to discuss runs of similar interpreted characters. [*Example*: Each "d", "m", and "y" within the number format code "dd/mm/yyyy" does not represent a separate

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

interpretation of the day of the date value to be represented, and instead helps to make up a representation of the day of the date that is two digits in length. *end example*] These runs of similar characters are referred to below as “interpreted symbols” since multiple characters are used, but the result is a single symbolic representation of at least part of the value.

- Since there are multiple different symbols for days, months, years, hours, minutes, seconds, and AM/PM, it is sometimes useful to discuss all of the representations of each of these. When any of "Day", "Month", "Year", "Hour", "Minute", etc., is referred to within a rule, what is meant is any of the possible representations for that date/time portion. For example, a “Day” symbol would be any of d, dd, ddd, or dddd.
- The use of characters such as "0", "E", and "%" as a symbol within a number format code does not include usages of these same characters either escaped (by preceding them with a backslash character “\”) or as a part of a quoted string.

Here are the rules to determine the result value:

1. If the first interpreted symbols within the first section are any of the date or time characters (any of "y", "m", "d", "h", "m", "s") then the first one or two characters of the return value are determined by the order of interpreted symbols (including any interpreted symbols, not just date/time symbols) according to the following table. ("anything" can mean "no additional symbols". If the type is "anything except <type>", then the excepted symbol type cannot follow the previously specified symbol.)

Interpreted Symbols in Order	Return Value Characters
Day, month, year, anything	"D1"
Day, month, anything besides year, anything	"D2"
Month, year, anything	"D3"
Month, day, year, anything	"D4"
Month, day, anything besides year, anything	"D5"
Hours, minutes, seconds, AM/PM, anything	"D6"
Hours, minutes, AM/PM, anything	"D7"
Hours, minutes, seconds, anything besides AM/PM, anything	"D8"
Hours, minutes, anything besides seconds or AM/PM, anything	"D9"
Any other combination of symbols	"G" or "C" depending on whether there is a $ in the first condition

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

2. Otherwise, the first character of the return value is determined based upon the referenced cell's number format code according to the rules in the table below:

First Section of the Number Format Code		First Return Value Character
Absent Characters (as Symbols)	Present Characters (as Symbols)	
	@	"G"
@	$	"C"
@, $	%	"P"
@, $, %	E	"S"
@, $, %, E	A run of any combination of one or more "0", "#", and "?" characters, followed by a comma, followed by a run of any combination of one or more "0", "#", and "?" characters. This run can not be preceded by a period (".") or by any interpreted characters.	","
@, $, %, E, or a run of characters containing a comma as described in the row above	At least one of "0", "?", or "#"	"F"
Any of the above conditions	Anything	"G"

3. The final value is determined by appending any of the applicable characters from the table below to the return value characters obtained from the previous two tables:

Case	Characters to Append
The first character of the return value is C, F, S, P, or "," and the number format code contains any of "?", "0", or "#" as a symbol.	The decimal number equal to the total number of "#", "?", and "0" characters to the right of the first "." within the first section
The first character of the return value was C, and the number format code does not contains any of "?", "0", or "#" as a symbol.	15 or the length of the string immediately following the first "$" sign in the number format code that is a symbol.
The first section of the number format code contains an open parenthesis ("(") as a symbol.	"()"
The second section of the number format code contains [Red], [Black], [Green], [White], [Blue],	"-"

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Case	Characters to Append
[Magenta], [Yellow], or [Cyan] as a symbol.	

However, if *category* is not one of the defined values, #VALUE! is returned.

[*Example*:

`CELL("address",A10)` might result in `$E$289`
`CELL("contents",A10:B10)`, results in `xxx`, when A10 contains `xxx`, and B10 contains anything
`CELL("filename",A10)` might result in `E:\Formulas\[Test.xlsx]Sheet1`
`CELL("format",A10)` results in `G`, when A10 contains `xxx`
`CELL("format",A10)` results in `F2-`, when A10 contains `(123.00)`
`CELL("format",A10)` results in `C3-`, when A10 contains `$123,456.780`
`CELL("format",A10)` results in `S3`, when A10 contains `1.235E+05`
`CELL("prefix",A10)` results in `'`, when A10 contains `xxx`
`CELL("type",A10)` results in `l`, when A10 contains `xxx`

end example]

18.17.7.35 CHAR

Syntax:

CHAR (*x*)

Description: Determines the character that is represented by the value *number*. On the Macintosh platform, the Macintosh character set is used. On all other platforms, the Latin character set with IANA name `iso-8859-1` is used.

Arguments:

Name	Type	Description
x	number	A value in the range 1–255, which designates the character.

Return Type and Value: text – The character represented by the value *number*.

[*Example*:

`CHAR(65)` results in A
`CHAR(A10)` results in A, when A10 contains 65

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.36 CHIDIST

Syntax:

`CHIDIST` (*x* , *degrees-freedom*)

Description: Computes the one-tailed probability of the chi-squared distribution.

Mathematical Formula:

$CHIDIST = P(X > x)$

where:

- X = an χ2 random variable
- x = argument x

Arguments:

Name	Type	Description
x	number	The value at which the distribution is to be evaluated.
degrees-freedom	number	The number of degrees of freedom, truncated to an integer.

Return Type and Value: number – The one-tailed probability of the chi-squared distribution.

However, if

- *x* < 0, `#NUM!` is returned.
- *degrees-freedom* < 1 or *degrees-freedom* > 10^{10}, `#NUM!` is returned.

[*Example*:

`CHIDIST(3.5,4)` results in `0.47787835`
`CHIDIST(12.34,7)` results in `0.089917721`

end example]

18.17.7.37 CHIINV

Syntax:

`CHIINV` (*probability* , *degrees-freedom*)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Description: Computes the inverse of the one-tailed probability of the chi-squared distribution. Given a value for *probability*, CHIINV seeks for a value *x* such that CHIDIST(*x*, *degrees-freedom*) = *probability*. Thus, precision of CHIINV depends on precision of CHIDIST.

Arguments:

Name	Type	Description
probability	number	A probability associated with the chi-squared distribution.
degrees-freedom	number	The number of degrees of freedom, truncated to an integer.

Return Type and Value: number – The inverse of the one-tailed probability of the chi-squared distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *degrees-freedom* < 1 or *degrees-freedom* ≥ 10^{10}, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned

[*Example*:

CHIINV(0.5,4) results in 3.356694001
CHIINV(0.3,7) results in 8.38343064

end example]

18.17.7.38 CHITEST

Syntax:

CHITEST (*actual-range* , *expected-range*)

Description: Computes the test for independence. CHITEST returns the value from the chi-squared distribution for the statistic and the appropriate degrees of freedom.

Mathematical Formula:

The χ2 test first calculates a χ2 statistic using the formula:

$$x^2 = \sum_{i=1}^{r}\sum_{j=1}^{c}\frac{(A_{ij} - E_{ij})^2}{E_{ij}}$$

where:

- A_{ij} = actual frequency in the i-th row, j-th column of the argument *actual-range*

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- c = number of columns in argument *actual-range* (or argument *expected-range*)
- E_{ij} = expected frequency in the i-th row, j-th column of the argument *expected-range*
- r = number or rows in argument *actual-range* (or argument *expected-range*)

CHITEST uses the χ2 distribution with an appropriate number of degrees of freedom, df. If r > 1 and c > 1, then df = (r - 1)(c - 1). If r = 1 and c > 1, then df = c - 1 or if r > 1 and c = 1, then df = r - 1.

Arguments:

Name	Type	Description
actual-range	reference	The range of data that contains observations to test against expected values.
expected-range	reference	The range of data that contains the ratio of the product of row totals and column totals to the grand total.

Return Type and Value: number – The value from the chi-squared distribution for the statistic and the appropriate degrees of freedom.

However, if:

- The number of rows and columns is exactly one, the return value is unspecified.
- *actual-range* and *expected-range* have a different number of data points, #N/A is returned.

[*Example*: Given the following data:

	A	B	C
1	Men (Actual)	Women (Actual)	Description
2	58	35	Agree
3	11	25	Neutral
4	10	23	Disagree
5	Men (Expected)	Women (Expected)	Description
6	45.35	47.65	Agree
7	17.56	18.44	Neutral
8	16.09	16.91	Disagree

`CHITEST(A2:B4,A6:B8)` results in `0.000308`

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

18.17.7.39 CHOOSE

Syntax:

CHOOSE (*index* , *argument-list*)

Description: Selects the *argument* in *argument-list* that corresponds by position to *index*.

Arguments:

Name	Type	Description
index	number	An index into *argument-list*, truncated to an integer. The value of *index* shall be in the position range 1–*n*, where *argument-1* is position 1, *argument-2* is position 2, and so on up to *argument-n*. If *index* is an array, the value or every element in that array is evaluated, and if the formula is an array formula, the result is an array of chosen values.
argument-list	any	The *argument*s in any given *argument-list* need not all have the same type.

Return Type and Value: any, including array – The *argument* in *argument-list* that corresponds by position to *index*.

However, if the value of *index* is not an index into *argument-list*, #VALUE! is returned.

[*Example*:

CHOOSE(E7,F7,G7,H7,I7,J7,K7,L7) results in Monday, when E7 contains 2, and the cells F7:L7 each contain the names of the week, from Sunday to Saturday

SUM(CHOOSE(E1,F20:G20,H20:J24)) results in the sum of the elements designated by F20:G20 or H20:J24, as determined by the value of E1

If B9:B11 contain 1, 3, and 3, respectively, and CHOOSE(B9:B11,10,20,30) is an array formula spanning 3 cells, the values of those 3 cells is 10, 30, and 30, respectively.

end example]

18.17.7.40 CLEAN

Syntax:

CLEAN (*string*)

Description:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Makes a string that is a copy of *string* with all so-called "non-printable" characters—those with internal values in the range U+0000–001F—removed.

Arguments:

Name	Type	Description
string	text	Designate the string to be cleaned.

Return Type and Value: text – The trimmed copy of *string*.

[*Example*:

`CLEAN("A" & CHAR(2) & "BC")` results in ABC, which is stored in A10
`LEN(A10)` results in 3

end example]

18.17.7.41 CODE

Syntax:

CODE (*string*)

Description: Determines the numeric code of the first character in *string*.

Arguments:

Name	Type	Description
string	text	Designates a string containing one or more characters.

Return Type and Value: number – The numeric code of the first character in *string*.

However, if *string* is empty, #VALUE! is returned.

[*Example*:

`CODE("abc")` results in 97
`CODE(A10)` results in 97, when A1 contains abc

end example]

18.17.7.42 COLUMN

Syntax:

COLUMN ([*reference*])

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Description: Finds the number of the column(s) corresponding to *reference*.

Arguments:

Name	Type	Description
reference	reference	A reference to a single cell or to a range of contiguous cells. If omitted, the behavior is as if *reference* referred to the cell containing the formula.

Return Type and Value: number – If *reference* refers to a single cell or to a single column of cells, the corresponding column is returned. If *reference* refers to a range of cells involving multiple columns, a horizontal array of the corresponding columns as numbers is returned.

However, if the range of cells referred to by *reference* is not contiguous, `#REF!` is returned.

[*Example*:

`COLUMN()` results in 4, when the cell containing the formula is in column 4
`COLUMN(E17:E19)` results in 5
`COLUMN(E16:F17)` results in a horizontal array containing 5and 6, respectively

end example]

18.17.7.43 COLUMNS

Syntax:

`COLUMNS ( array )`

Description: Finds the number of columns corresponding to *array*.

Arguments:

Name	Type	Description
array	array, reference	Any array.

Return Type and Value: number – The number of columns corresponding to *array*.

However, if the range of cells referred to by *array* is not contiguous, `#NULL!` is returned.

[*Example*:

`COLUMNS(E16:F16)` results in 2
`COLUMNS(E16:G18)` results in 3
`COLUMNS({1,2;3,4})` results in 2

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.44 COMBIN

Syntax:

```
COMBIN ( number , number-chosen )
```

Description: Computes the possible number of groups of size *number-chosen* that can be formed from *number* objects. [*Note*: A combination is any set or subset of objects, regardless of their internal order. Combinations are distinct from permutations, for which the internal order is significant. *end note*]

Mathematical Formula:

The number of combinations is as follows, where *number* = n and *number-chosen* = k:

$$\binom{n}{k} = \frac{P_{k,n}}{k!} = \frac{n!}{k!\,(n-k)!}$$

where:

$$P_{k,n} = \frac{n!}{(n-k)!}$$

where:

- k = argument *number-chosen*
- n = argument *number*

Arguments:

Name	Type	Description
number	number	The total number of objects available, truncated to an integer.
number-chosen	number	The number of objects in each combination, truncated to an integer.

Return Type and Value: number – The number of different combinations of *number-chosen* in *number*.

However, if

- *number* < 0, `#NUM!` is returned.
- *number-chosen* < 0, `#NUM!` is returned.
- *number* < *number-chosen*, `#NUM!` is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Example*:

`COMBIN(8,2)` results in `28`
`COMBIN(10,4)` results in `210`
`COMBIN(6,5)` results in `6`

end example]

18.17.7.45 COMPLEX

Syntax:

`COMPLEX` (*real-number* , *imaginary-number* [, *suffix*])

Description: Makes a complex number in *x + yi* or *x + yj* text format from the arguments.

Arguments:

Name	Type	Description
real-number	number	The real number coefficient.
imaginary-number	number	The imaginary number coefficient.
suffix	text	`"i"` or `"j"`. If omitted, `"i"` is used.

Return Type and Value: text – The complex number string specified by the arguments.

If *real-number* has the value 0 and *imaginary-number* has a non-zero value, the resulting string contains just the real number. If *real-number* has a non-zero value and *imaginary-number* has a zero value, the resulting string contains just the imaginary number and suffix. If both *real-number* and *imaginary-number* have a zero value, the resulting string is `"0"`.

However, if *suffix* is neither `"i"` nor `"j"`, `#VALUE!` is returned.

[*Example*:

`COMPLEX(-3.5,19.6)` results in `-3.5+19.6i`
`COMPLEX(3.5,-19.6,"j")` results in `3.5-19.6j`
`COMPLEX(3.5,0)` results in `3.5`
`COMPLEX(0,2.4)` results in `2.4i`
`COMPLEX(0,0)` results in `0`

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.46 CONCATENATE

Syntax:

CONCATENATE (*argument-list*)

Description: Makes a string that is the concatenation of all the strings corresponding to the *argument*s in *argument-list*, taken left-to-right.

Arguments:

Name	Type	Description
argument-list	text	Each *argument* in *argument-list* shall designate a string.

Return Type and Value: text – The concatenated string.

[*Example*:

`CONCATENATE("text")` results in `text`
`CONCATENATE("The total is ",A10," units")` results in `The total is 43 units`, when `A10` contains `43`
`CONCATENATE(3," + ",4," = ",3+4)` results in `3 + 4 = 7`

end example]

18.17.7.47 CONFIDENCE

Syntax:

CONFIDENCE (*alpha* , *standard-dev* , *size*)

Description: Computes a value that can be used to construct a confidence interval for a population mean. The CONFIDENCE function assumes a normal distribution for calculation.

Arguments:

Name	Type	Description
alpha	number	The significance level used to compute the confidence level.
standard-dev	number	The population standard deviation for the data range.
size	number	The sample size, truncated to an integer.

Return Type and Value: number – A value that can be used to construct a confidence interval for a population mean.

However, if

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

- *alpha* ≤ 0 or *alpha* ≥ 1, `#NUM!` is returned.
- *standard-dev* ≤ 0, `#NUM!` is returned.
- *size* < 1, `#NUM!` is returned.

[*Example*:

`CONFIDENCE(0.4,5,12)` results in `1.214775614`
`CONFIDENCE(0.75,9,7)` results in `1.083909234`

end example]

18.17.7.48 CONVERT

Syntax:

`CONVERT` (*number* , *from-unit* , *to-unit*)

Description: Converts a number from one measurement system to another.

Arguments:

Name	Type	Description
number	number	The value to be converted from *from-unit*s to *to-unit*s.
from-unit	text	The unit to be converted from, where the permitted string values are shown in the tables below.
to-unit	text	The unit to be converted to, where the permitted string values are shown in the tables below.

Weight and Mass	
Unit String	*Meaning*
`g`	Gram
`lbm`	Pound mass (avoirdupois)
`ozm`	Ounce mass (avoirdupois)
`sg`	Slug
`u`	U (atomic mass unit)

Distance

E	exa (1E+18)
P	peta (1E+15)
T	tera (1E+12)
G	giga (1E+09)
M	mega (1E+06)
k	kilo (1E+03)
h	hecto (1E+02)
e	deka (1E+01)
d	deci (1E-01)
c	centi (1E-02)
m	milli (1E-03)
u	micro (1E-06)
n	nano 1E-09)
p	pico (1E-12)
f	femto (1E-15)
a	atto (1E-18)

Unit names and prefixes are case-sensitive.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The value of *number* in *from-unit*s converted to *to-unit*s.

However, if

- The value of *from-unit* or *to-unit* is not one of the defined values, #N/A is returned.
- The *from-unit* and *to-unit* are from different measurement categories, #N/A is returned.
- The value of *from-unit* or *to-unit* has an abbreviated unit prefix, yet none is supported for that unit, #N/A is returned.

[*Example*:

`CONVERT(10,"ozm","g")` results in `283.4951521`
`CONVERT(1,"yd","mm")` results in `914.4000003`
`CONVERT(1,"yd","cm")` results in `91.44000003`
`CONVERT(1,"yd","m")` results in `0.9144`
`CONVERT(1,"yd","km")` results in `0.0009144`
`CONVERT(1,"mi","Nmi")` results in `0.868976242`
`CONVERT(1,"day","sec")` results in `86400`
`CONVERT(0,"K","C")` results in `-273.15`

end example]

18.17.7.49 CORREL

Syntax:

CORREL (*array-1* , *array-2*)

Description: Computes the correlation coefficient of the two cell ranges designated by *array-1* and *array-2*.

Mathematical Formula:

The equation for the correlation coefficient is:

$$Correl(X,Y) = \frac{\sum(x-\bar{x})(y-\bar{y})}{\sqrt{\sum(x-\bar{x})^2 \sum(y-\bar{y})^2}}$$

where

- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*array-1*)
- y = a sample value
- $\bar{y}$ = the sample mean AVERAGE(*array-2*)

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
array-1	array, reference	The first cell range. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
array-2	array, reference	The second cell range. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The correlation coefficient of the cells in two cell ranges.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* and *array-2* is empty, the return value is unspecified.
- The standard deviation of the values in *array-1* or *array-2* equals zero, the return value is unspecified.

[*Example*:

`CORREL({2.532,5.621;2.1,3.4},{5.32,2.765;5.2,6.7})` results in `-0.714976`

end example]

18.17.7.50 COS

Syntax:

COS (*x*)

Description: Computes the cosine of *x*.

Arguments:

Name	Type	Description
x	number	The value, in radians, whose cosine is to be determined.

Return Type and Value: number – The cosine of *x*.

[*Example*:

`COS(-1)` results in `0.540302306`
`COS(0)` results in `1`
`COS(1)` results in `0.540302306`

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.51 COSH

Syntax:

COSH (*x*)

Description: Computes the hyperbolic cosine of *x*.

Arguments:

Name	Type	Description
x	number	The value whose hyperbolic cosine is to be determined.

Return Type and Value: number – The hyperbolic cosine of *x*.

However, if the magnitude of *x* is too large, `#NUM!` is returned.

[*Example*:

`COSH(-1)` results in `1.543080635`
`COSH(0)` results in `1`
`COSH(1)` results in `1.543080635`

end example]

18.17.7.52 COUNT

Syntax:

COUNT (*argument-list*)

Description: Counts the number of *argument*s in *argument-list* that contain numbers, and the number of cells referred to by *argument*s in *argument-list*, which contain numbers.

Arguments:

Name	Type	Description
argument-list	text	Each *argument* in *argument-list* designates a value. Arguments that are numbers, logical values, dates, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, text, or error values in the array or reference shall be ignored. [*Note*: To count logical values, text, or error values as well, use the COUNTA (§18.17.7.53) function. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The numeric argument and reference to numeric argument count.

[*Example*:

COUNT(1,2,3,4,5) results in 5
COUNT({1,2,3,4,5}) results in 5
COUNT({1,2,3,4,5},6,"7") results in 7
COUNT(10,E1), where E1 is an empty cell, results in 1, as E1 is ignored
COUNT(10,E2), where E2 contains TRUE, results in 1, as E2 is ignored

end example]

18.17.7.53 COUNTA

Syntax:

COUNTA (*argument-list*)

Description: Counts the number of arguments that are not cell references, and the number of cells, referred to by arguments, which are not empty.

Arguments:

Name	Type	Description
argument-list	text	Each *argument* in *argument-list* designates a value. Arguments with values of any type shall be counted. However, empty cells shall not be counted. If an argument is an array or reference, only values in that array or reference shall be counted. Empty cells and text values in the array or reference shall be ignored. [*Note*: To exclude logical values, text, or error values, use the COUNT (§18.17.7.52) function. *end note*]

Return Type and Value: number – The number of arguments that are not cell references, and the number of cells, referred to by arguments, which are not empty.

[*Example*:

COUNTA(1,2,3,4,5) results in 5
COUNTA({1,2,3,4,5}) results in 15
COUNTA({1,2,3,4,5},6,"7") results in 7
COUNTA(10,E1), where E1 is an empty cell, results in 1, as E1 is ignored
COUNTA(10,E2), where E2 contains TRUE, results in 2, as E2 is counted

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.54 COUNTBLANK

Syntax:

COUNTBLANK (*cell-range*)

Description: Counts the number of cells in a specified range of cells, which are empty. A cell containing a formula that returns an empty string is counted, whereas a cell containing a zero value is not.

Arguments:

Name	Type	Description
cell-range	reference	Designates the range of cells to be inspected.

Return Type and Value: number – The number of empty cells in the range specified.

[*Example*:

`COUNTBLANK(A2:C2)`, where A2 and B2 are empty, but C2 is not, results in 2

end example]

18.17.7.55 COUNTIF

Syntax:

COUNTIF (*cell-range* , *selection-criteria*)

Description: Counts the number of cells in a specified range of cells, whose values meet the specified criteria.

Arguments:

Name	Type	Description
cell-range	reference	Designates the range of cells to be inspected.
selection-criteria	number, expression, reference, text	Designates the cells to be counted. In the case of text, *selection-criteria* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. *selection-criteria* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).

Return Type and Value: number – The number of cells in the range specified that meet the criteria.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Example*: Given that A1, B1, C1, and D1, respectively, contain the values 3, 10, 7, and 10

`COUNTIF(A1:D1,"=10")` results in 2
`COUNTIF(A1:D1,">5")` results in 30
`COUNTIF(A1:D1,"<>10")` results in 2

Given that A2, B2, C2, and D2, respectively, contain the values `apples`, `oranges`, `grapes`, and `melons`

`COUNTIF(A2:D2,"*es")` results in 3
`COUNTIF(A2:D2,"??a*")` results in 2
`COUNTIF(A2:D2,"*l*")` results in 2

end example]

18.17.7.56 COUNTIFS

Syntax:

`COUNTIFS (` *count-range* `,` *cell-range-1* `,` *selection-criteria-1*
`[ ,` *cell-range-2* `,` *selection-criteria-2* `[ , … ] ] )`

Description: Counts the number of cells within a range that meet multiple criteria.

Arguments:

Name	Type	Description
count-range	reference	Designates the cells whose values are included. *count-range* does not have to have the same size and shape as *cell-range-1* through *cell-range-n*. The actual cells that are added are determined by using the top, left cell in *count-range* as the beginning cell, and then including cells that correspond in size and shape to *cell-range-1* through *cell-range-n*.
cell-range-1	reference	Designates the first range of cells to be inspected. Each cell in a range is counted only if all of the corresponding criteria specified are true for that cell.
selection-criteria-1	number, expression, reference, text	Designates the first range of cells to be counted. In the case of text, *selection-criteria-1* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. *selection-criteria* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
cell-range-n	reference	The optional arguments *selection-criteria-2* through *selection-criteria-n* have corresponding arguments *cell-range-2* through *cell-range-n*, and have the same semantics as *selection-criteria-1* and *cell-range-1*, respectively.
selection-criteria-n	number, expression, reference, text	

If a cell in any argument is an empty cell, it is treated as if it had the value 0.

Return Type and Value: number – The count of the cells corresponding to those selected.

[*Example*: Given the following data:

	A	B	C	D
1	Sales Person	Exceeded Tables Quota	Exceeded Chairs Quota	Exceeded Desks Quota
2	Davolio	Yes	No	No
3	Buchanan	Yes	Yes	No
4	Suyama	Yes	Yes	Yes
5	Leverling	No	Yes	Yes

`COUNTIFS(B2:D2,"=Yes")` results in 1 (counts how many times Davolio exceeded a sales quota for tables, chairs, and desks)

`COUNTIFS(B2:B5,"=Yes",C2:C5,"=Yes")` results in 2 (counts how many sales people exceeded both their tables and chairs quota)

`COUNTIFS(B5:D5,"=Yes",B3:D3,"=Yes")` results in 1 (counts how many times Leverling and Buchanan exceeded the same quota for tables, chairs, and desks)

end example]

18.17.7.57 COUPDAYBS

Syntax:

COUPDAYBS (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of days from the beginning of the coupon period to the settlement date.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Time information in the date arguments is ignored.

Return Type and Value: number – The number of days from the beginning of the coupon period to the settlement date.

©ISO/IEC 2011 – All rights reserved

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* ≥ *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[*Example*:

COUPDAYBS(DATE(2007,1,25),DATE(2008,11,15),2,1) results in 71
COUPDAYBS(DATE(2007,1,25),DATE(2008,11,15),2) results in 70

end example]

18.17.7.58 COUPDAYS

Syntax:

COUPDAYS (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of days in the coupon period that contains the settlement date.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: number – The number of coupons payable between the settlement date and maturity date, rounded up to the nearest whole coupon.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`COUPNUM(DATE(2007,1,25),DATE(2008,11,15),2,1)` results in 4

end example]

18.17.7.62 COUPPCD

COUPPCD (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the previous coupon date before the settlement date.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** `0` or omitted / US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description		
				• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
			1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
			2	Actual/360. Similar to Basis 1, but only has 360 days per year.
			3	Actual/365. Similar to Basis 1, but always has 365 days per year.
			4	European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The previous coupon date before the settlement date, as a date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`COUPPCD(DATE(2007,1,25),DATE(2008,11,15),2,1)` results in `15-Nov-2006`

end example]

18.17.7.63 COVAR

Syntax:

COVAR (*array-1* , *array-2*)

Description: Computes covariance; that is, the average of the products of deviations for each data point pair in the two cell ranges designated by *array-1* and *array-2*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Mathematical Formula:

The covariance is:

$$Cov(X,Y) = \frac{\sum(x-\bar{x})(y-\bar{y})}{n}$$

where

- n = the sample size
- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*array-1*)
- y = a sample value
- $\bar{y}$ = the sample mean AVERAGE(*array-2*)

Arguments:

Name	Type	Description
array-1	number, name, array, reference to number	If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
array-2		

Return Type and Value: number – The covariance.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* or *array-2* is empty, the return value is unspecified.

[*Example*:

`COVAR({2.532,5.621;2.1,3.4},{5.32,2.765;5.2,6.7})` results in `-1.375374`

end example]

18.17.7.64 CRITBINOM

Syntax:

`CRITBINOM` (*number-trials* , *success-probability* , *alpha*)

Description: Computes the smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
number-trials	number	The number of Bernoulli trials.
success-probability	number	The probability of success on each trial.
alpha	number	The criterion value.

Return Type and Value: number – The smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value.

However, if

- *number-trials* < 0, `#NUM!` is returned.
- *success-probability* is < 0 or *success-probability* > 1, `#NUM!` is returned.
- *alpha* < 0 or *alpha* > 1, `#NUM!` is returned.

[*Example*:

`CRITBINOM(6,0.5,0.75)` results in 4
`CRITBINOM(12,0.3,0.95)` results in 6

end example]

18.17.7.65 CUBEKPIMEMBER

Syntax:

`CUBEKPIMEMBER ( connection , kpi-name , kpi-property [ , [ caption ] ] )`

Description: Fetches from the OLAP cube on the OLAP server designated by *connection*, a Key Performance Indicator (KPI) name, property, and measure, and displays the name and property in the cell. A KPI is a quantifiable measurement, such as monthly gross profit or quarterly employee turnover, used to monitor an organization's performance.

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.
kpi-name	text	The name of the KPI in the cube.
kpi-property	number	The KPI component to be returned, truncated to integer; it shall be one of the following:

Value	Description
1	The actual value, at the time the

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

<table>
<tr><th>Name</th><th>Type</th><th>Description</th></tr>
<tr><td></td><td></td><td>
<table>
<tr><td></td><td>function is executed.</td></tr>
<tr><td>2</td><td>A target value of the KPI, which can be compared to the actual value in order to determine if the underlying indicator is meeting its goal.</td></tr>
<tr><td>3</td><td>The state of the KPI at a specific moment in time</td></tr>
<tr><td>4</td><td>A measure of the value over time</td></tr>
<tr><td>5</td><td>The relative importance assigned to the KPI on the server. If this KPI is assigned a parent KPI, then this number can be used on the server to proportionally adjust the results of this KPI value when calculating the value of the parent KPI. While this number can be shown in the spreadsheet application, it is assumed that it is used by the server for any calculations affecting the KPI.</td></tr>
<tr><td>6</td><td>The unique name of the member in the time dimension that defines the timeframe of the KPI. [Example: A KPI could be associated with the first quarter of the year 2007. end example]</td></tr>
</table>
If 1 is specified, only kpi-name is displayed in the cell.
</td></tr>
<tr><td>caption</td><td>text</td><td>An alternative string whose value is displayed in the cell instead of kpi-name and kpi-property.</td></tr>
</table>

Return Type and Value: any – The selected key performance indicator.

However, if

- *kpi-name* is not the name of a KPI in the cube, the return value is unspecified.
- *kpi-property* is outside the range 1–6, #N/A is returned.
- The *connection* name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Example*:

```
CUBEKPIMEMBER("Sales","MySalesKPI",1)
CUBEKPIMEMBER("Sales","MySalesKPI",2,"Sales KPI Goal")
```

end example]

18.17.7.66 CUBEMEMBER

Syntax:

CUBEMEMBER (*connection* , *member-expression* , [, [*caption*]])

Description: Fetches from the OLAP cube on the OLAP server designated by *connection*, the member or tuple defined by *member-expression*. [*Note*: This function is used to ensure that the member or tuple exists in the cube. *end note*]

When a call to CUBEMEMBER is used as an argument to another CUBExxx function, the MDX expression that identifies the member or tuple is used by that CUBExxx function, rather than the displayed value in the cell of the CUBEMEMBER function.

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.
member-expression	text, reference, array	A multidimensional expression (MDX) that evaluates to a unique member in the cube. Alternatively, *member-expression* can be a tuple, specified as a cell range or an array constant. [*Note*: MDX is a standard query language for OLAP cubes. *end note*]
caption	text	The string displayed in the cell instead of the caption from the cube (assuming it defines such a caption). When a tuple is returned, the caption used is the one for the last member in the tuple.

Return Type and Value: any – A member or tuple in a cube hierarchy.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- At least one element within the tuple is invalid, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- The member specified by *member-expression* doesn't exist in the cube, the return value is unspecified.
- The tuple is invalid because there is no intersection for the specified values, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[*Example*:

```
CUBEMEMBER("Sales","[Time].[Fiscal].[2004]")
CUBEMEMBER($A$1,D$12)
CUBEMEMBER("Sales",(B4,C6,D5),"SalesFor2004")
CUBEMEMBER("Sales",{[Products].[Food];[Time].[Fiscal].[2004]})
CUBEMEMBER($A$1,C$12:D$12)
```

end example]

18.17.7.67 CUBEMEMBERPROPERTY

Syntax:

CUBEMEMBERPROPERTY (*connection* , *member-expression* , *property*)

Description: Fetches a property of a member in the OLAP cube on an OLAP server. [*Note*: Use this function o ensure that a member name exists within the cube and to return the specified property for this member. *end note*]

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.
member-expression	text	A multidimensional expression (MDX) that evaluates to a unique member in the cube. [*Note*: MDX is a standard query language for OLAP cubes. *end note*]
property	text	The name of the property returned or a reference to a cell that contains the name of the property.

Return Type and Value: any – A property of a member in the OLAP cube.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

- The member specified by *member-expression* doesn't exist in the cube, the return value is unspecified.

[*Example*:

```
CUBEMEMBERPROPERTY("Sales","[Time].[Fiscal].[2004]",$A$3)
CUBEMEMBERPROPERTY("Sales","[Store].[MyFavoriteStore]",
  "[Store].[Store Name].[Store Sqft]")
```

end example]

18.17.7.68 CUBERANKEDMEMBER

Syntax:

CUBERANKEDMEMBER (*connection* , *set-expression* , *rank* [, *caption*])

Description: Fetches the nth, or ranked, member in a set.

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.
set-expression	text	A set expression, such as "{[Item1].children}".
rank	number	Specifies the top value to return, truncated to integer. If 1, the top value is returned; if 2, the second-most top value is returned; and so on.
caption	text	The text displayed in the cell instead of the caption from the cube (assuming it defines such a caption).

Return Type and Value: any – The nth member in the set.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified. , the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[*Example*:

```
CUBERANKEDMEMBER("Sales",$D$4,1,"Top Month")
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
CUBERANKEDMEMBER("Sales",CUBESET("Sales","Summer","[2004].[June]",
  "[2004].[July]","[2004].[August]"),3,"Top Month")
```

end example]

18.17.7.69 CUBESET

Syntax:

CUBESET (*connection* , *set-expression* [, [*caption*][, [*sort-order*] [, [*sort-by*]]]])

Description: Fetches from the OLAP cube on the OLAP server designated by *connection* the set of members or tuples that is defined by *set-expression*. [*Note*: Use this function to build dynamic reports that aggregate and filter data, by using the return value as a slicer in the CUBEVALUE function, the CUBERANKEDMEMBER function to choose specific members from the calculated set, and the CUBESETCOUNT function to control the size of the set. *end note*]

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.
set-expression	text, reference	A set expression that results in a set of members or tuples. *set-expression* can also be a cell reference to range that contains one or more members, tuples, or sets included in the set.
caption	text	The text displayed in the cell instead of the caption from the cube (assuming it defines such a caption).
sort-order	text	The type of sort, if any, to perform; it can be one of the following:

Value	Description	*sort-by* argument
0 or default	Leaves the set in existing order	Ignored
1	Sorts set in ascending order by sort_by	Required
2	Sorts set in descending order by sort_by	Required
3	Sorts set in alphabetic ascending order	Ignored

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

<table>
<tr><th>Name</th><th>Type</th><th>Description</th></tr>
<tr><td></td><td></td><td>
<table>
<tr><td>4</td><td>Sorts set in alphabetic descending order</td><td>Ignored</td></tr>
<tr><td>5</td><td>Sorts set in natural ascending order</td><td>Ignored</td></tr>
<tr><td>6</td><td>Sorts set in natural descending order</td><td>Ignored</td></tr>
</table>
An alphabetic sort for a set of tuples sorts on the last element in each tuple.
</td></tr>
<tr><td>sort-by</td><td>text</td><td>The value by which to sort. [Example: To get the city with the highest sales, set-expression would be a set of cities, and sort-by would be the sales measure. To get the city with the highest population, set-expression would be a set of cities, and sort-by would be the population measure. end example]</td></tr>
</table>

Return Type and Value: any – The set of members or tuples.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.
- *sort-order* is outside the range 0–6, #N/A is returned.
- *sort-order* requires *sort-by*, but *sort-by* is omitted, #VALUE! is returned.

[*Example*:

```
CUBESET("Finance","Order([Product].[Product].[Product Category]
.Members,[Measures].[Unit Sales],ASC)","Products")

CUBESET("Sales","[Product].[All Products].Children",
  "Products",1,"[Measures].[Sales Amount]")
```

end example]

18.17.7.70 CUBESETCOUNT

Syntax:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

CUBESETCOUNT (*set*)

Description: Computes the number of items in a set.

Arguments:

Name	Type	Description
set	text	An expression that evaluates to a set defined by the CUBESET function.

Return Type and Value: number – The number of items in a set.

[*Example*:

```
CUBESETCOUNT(A3)
CUBESETCOUNT(CUBESET("Sales","[Product].[All Products].Children",
  "Products",1,"[Measures].[Sales Amount]"))
```

end example]

18.17.7.71 CUBEVALUE

Syntax:

CUBEVALUE (*connection* , *argument-list*)

Description: Fetches from the OLAP cube on the OLAP server designated by *connection*, the aggregated value defined by a series of member-expression *arguments* in *argument-list*.

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.
argument-list	text, reference	Each *argument* in *argument-list* is text containing a multidimensional expression (MDX) that evaluates to a member or tuple within the cube. Alternatively, an *argument* can be a set defined with the CUBESET function. Use any *argument* as a slicer to define the portion of the cube for which the aggregated value is returned. If no measure is specified in an *argument*, the default measure for that cube is used. If a cell reference is used for an *argument*, and that cell reference contains a CUBE function, then that *argument* uses the MDX expression for the item in the referenced cell, and not the value displayed in that referenced cell. [*Note*: MDX is a standard query language for OLAP cubes. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Return Type and Value: any – The aggregated value.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- At least one element within the tuple is invalid, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by an *argument* doesn't exist in the cube, the return value is unspecified.
- The tuple is invalid because there is no intersection for the specified values, the return value is unspecified. (This can occur with multiple elements from the same hierarchy.)
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[*Example*:

```
CUBEVALUE("Sales","[Measures].[Profit]","[Time].[2004]",
  "[All Product].[Beverages]")
CUBEVALUE($A$1,"[Measures].[Profit]",D$12,$A23)
CUBEVALUE("Sales",$B$7,D$12,$A23)
```

end example]

18.17.7.72 CUMIPMT

Syntax:

CUMIPMT (*rate* , *nper* , *pv* , *start-period* , *end-period* , *type*)

Description: Computes the cumulative interest paid on a loan between *start-period* and *end-period*.

Arguments:

Name	Type	Description
rate	number	The interest rate.
nper	number	The total number of payment periods, truncated to integer.
pv	number	The present value.
start-period	number	The first period in the calculation. (Payment periods are numbered beginning with 1.)
end-period	number	The last period in the calculation.
type	number	The timing of the payment, truncated to integer, as

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		follows: `0` — Payment at the end of the period `1` — Payment at the beginning of the period

Time information in the date arguments is ignored.

Return Type and Value: number – The cumulative interest paid on a loan.

However, if

- *rate*, *nper*, or *pv* ≤ 0, `#NUM!` is returned.
- *start-period* < 1 or *end-period* < 1, or *start-period* > *end_period*, `#NUM!` is returned.
- *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`CUMIPMT(0.09/12,30*12,125000,13,24,0)` results in `-11135.23`
`CUMIPMT(0.09/12,30*12,125000,1,1,0)` results in `-937.50`

end example]

18.17.7.73 CUMPRINC

Syntax:

`CUMPRINC ( rate , nper , pv , start-period , end-period , type )`

Description: Computes the cumulative principal paid on a loan between *start-period* and *end-period*.

Arguments:

Name	Type	Description
rate	number	The interest rate.
nper	number	The total number of payment periods, truncated to integer.
pv	number	The present value.
start-period	number	The first period in the calculation. (Payment periods are numbered beginning with 1.)
end-period	number	The last period in the calculation.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
type	number	The timing of the payment, truncated to integer, as follows: **Value** / **Timing** `0` – Payment at the end of the period `1` – Payment at the beginning of the period

Time information in the date arguments is ignored.

Return Type and Value: number – The cumulative principal paid on a loan.

However, if

- *rate*, *nper*, or *pv* ≤ 0, `#NUM!` is returned.
- *start-period* < 1 or *end-period* < 1, or *start-period* > *end_period*, `#NUM!` is returned.
- *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`CUMPRINC(0.09/12,30*12,125000,13,24,0)` results in `-934.11`
`CUMPRINC(0.09/12,30*12,125000,1,1,0)` results in `-68.28`

end example]

18.17.7.74 DATE

Syntax:

`DATE ( year , month , day )`

Description: Computes the serial value for the given date.

Arguments:

Name	Type	Description
year	number	A positive number, truncated to an integer representing the year, that together with *month* and *day* specifies the date whose serial value is to be computed. For the 1900 date base system: • If *year* is in the range 0–99, inclusive, the year shall be interpreted as *year* + 1900. • If *year* is in the range -9999–-1, inclusive, or 100–

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		9999, inclusive, the year shall be interpreted as *year*. For the 1900 backward compatibility date-base and 1904 backward compatibility date base systems: • If *year* is in the range 0–1899, inclusive, the year shall be interpreted as *year* + 1900. • If *year* is in the range 1900–9999, inclusive, the year shall be interpreted as *year*.
month	number	A month, truncated to integer, that together with *year* and *day* specifies the date whose serial value is to be computed. *month* shall be interpreted as the number of months relative to the final month of the year prior to the specified year.
day	number	A day, truncated to integer, that together with *month* and *year* specifies the date whose serial value is to be computed. *day* shall be interpreted as the number of days relative to the last day of the month (and its associated year) prior to the month (and its associated year) as determined from *month* and *year* (see below).

The value of *month* or *day* in a *year-month-day* argument triplet can be out of range. *month* is simply an instance of counting a given number of months, minus one, relative to January of the year specified, using the Gregorian calendar [ISO 8601]. This calendar defines that there are 12 months in a year, and that when counting forward, the month following December of one year is January of the following year, and when counting backward, the month preceding January of one year is December of the previous year. Likewise, *day* is simply an instance of counting a given number of days, minus one, relative to the first day of the adjusted month, using the Gregorian calendar. This calendar defines the number of days in each month, and that when counting forward, the day following the final day of one month is the first day of the following month, and when counting backward, the day preceding the first day of one month is the final day of the previous month. [*Example*: The *year-month-day* argument triplets (2007, 12,32), (2007,13,1), and (2008,1,1) all result in the same serial date. *end example*]

[*Note*: One way to handle out-of-range values for *month* or *day* is as follows:

Compute yearAdjust = INT((*month* - 1)/12)
Compute adjustedMonth = *month* - (yearAdjust * 12)
Compute adjustedYear = *year* + yearAdjust.

A serialDateBase can now be computed for the first day of the adjustedYear and adjustedMonth. Finally, compute the serial date for the full triplet by adding (*day*-1) to this serialDateBase. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The serial value for the given date.

However, if *year* is outside the acceptable range for the date base currently in use, `#NUM!` is returned.

[*Example*: For the 1900 backward compatibility date-base date base system:

`DATE(0,1,1)` results in a serial value of `1`
`DATE(1899,1,1)` results in a serial value of `693598`
`DATE(1900,1,1)` results in a serial value of `1`
`DATE(9999,12,31)` results in a serial value of `2958465`

For the 1904 backward compatibility date-base date base system:

`DATE(4,1,1)` results in a serial value of `0`
`DATE(1899,1,1)` results in a serial value of `692136`
`DATE(1904,1,1)` results in a serial value of `0`
`DATE(9999,12,31)` results in a serial value of `2957003`

end example]

18.17.7.75 DATEDIF

Syntax:

`DATEDIF ( start-date , end-date , unit )`

Description: Calculates the number of days, months, or years between two dates.

Arguments:

Name	Type	Description
start-date	number	The first date in the period, truncated to integer.
end-date	number	The last date in the period, truncated to integer.
unit	text	The count to be returned, as follows: **Value** / **Day Count Basis** `"Y"` – The number of complete years in the period. `"M"` – The number of complete months in the period. `"D"` – The number of days in the period. `"MD"` – The difference between the days in *start-date* and *end-date*. The months and years of

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		<table><tr><td></td><td>the dates are ignored.</td></tr><tr><td>"YM"</td><td>The difference between the months in *start-date* and *end-date*. The days and years of the dates are ignored.</td></tr><tr><td>"YD"</td><td>The difference between the days of *start-date* and *end-date*. The years of the dates are ignored.</td></tr></table>

Return Type and Value: number – The number of days, months, or years between two dates, depending on the value of *unit*.

However, if

- *start-date* or *end-date* is out of range for the current date base value, `#NUM!` is returned.
- *start-date* ≥ *end-date* `#NUM!` is returned.
- *unit* is any value other than those shown in the table above, `#NUM!` is returned.

[*Example*:

`DATEDIF(DATE(2001,1,1),DATE(2003,1,1),"Y")` results in 2 complete years
`DATEDIF(DATE(2001,6,1),DATE(2002,8,15),"D")` results in 440 days
`DATEDIF(DATE(2001,6,1),DATE(2002,8,15),"YD")` results in 75 days
`DATEDIF(DATE(2001,6,1),DATE(2002,8,15),"MD")` results in 14 days

end example]

18.17.7.76 DATEVALUE

Syntax:

DATEVALUE (*date-time-string*)

Description: Computes the serial value of the date represented by the string *date-time-string*, taking into account the current date base value.

Arguments:

Name	Type	Description
date-time-string	text	The date and/or time whose date component serial value is to be computed. *date-time-string* can have any supported date and/or time format. If the year portion of

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		date-time-string is omitted, the current year is used. Any time information in *date-time-string* shall be ignored. When *date-time-string* contains both a date and time part, times in *date-time-string* are truncated. Time-only values for *date-time-string* are special cased to return 0 so that when they are used in date addition and subtraction, time-only strings are ignored.

Return Type and Value: number – The serial value of the date represented by the string *date-time-string*.

However, if

- *date-time-string* is out of range for the current date base value, #VALUE ! is returned.
- *date-time-string* does not represent a date, #VALUE ! is returned.
- *date-time-string* contains only a time, 0 is returned so that when it used in date addition and subtraction, time-only strings are ignored.

[*Example*: When the current year is 2006,

```
DATEVALUE("2/1/2006")
DATEVALUE("01-Feb-2006 10:06 AM")
DATEVALUE("2006/2/1")
DATEVALUE("2006-2-1")
DATEVALUE("1-Feb")
```

all result in 38749 for the 1900 date base system, or 37287 for the 1904 date base system. *end example*]

18.17.7.77 DAVERAGE

Syntax:

DAVERAGE (*database* , *field* , *criteria*)

Description: Averages the values in a column of a list or database that match the specified criteria.

In order to perform an operation on an entire column in a database, a blank line shall be entered below the column labels in the criteria range.

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database, which shall be a list of related data in which rows of related information are records, and columns of data are fields. The first row of the list shall contain labels for each

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		column.
field	text, number	Indicates the column to which *criteria* shall be applied. It can either be a string containing the column's label, or the column's position number, where columns are numbered starting at 1. [*Example*: If column 3's label is "Age" then either 3 or "Age" can be used. *end example*]
criteria	reference	The range of cells that contains the specified conditions. Each cell in that range that contains a condition shall have a value that is the form of a number, an expression, a cell reference, or text that defines which cells are selected. In the case of text, *criteria* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). A text *criteria* can also consist of any comparison operator followed by the operand against which each cell's value is to be compared. If the text does not begin with a comparison operator, the criteria matches any string starting with that text, as though the criteria were suffixed by an asterisk (*). [*Example*: A criteria of "Pea" can result in Pea, Pear, and Peach's being matched, whereas a criteria of "=Pea" only matches Pea. *end example*] Comparison operators do not require a prefix if used in the string, however it is not possible to specifically search for a string which begins with a comparison operator. The range shall include at least one column label and at least one cell below the column label in which a condition for the column is specified. [*Example*: If the range `G1:G2` contains the column label `Income` in `G1` and the amount 10,000 in `G2`, one could define the range as `MatchIncome` and use that name as *criteria*. *end example*] The value of *criteria* shall not overlap the range specified by *database*. To find rows that meet multiple criteria for a single column, all of the criteria shall be specified directly below one another in separate rows of the *criteria* range. To find rows that meet multiple criteria for multiple columns, all of the criteria shall be specified in the same row of the *criteria* range. To find rows that meet multiple criteria for multiple columns, where any criteria can be true, each of the criteria shall be specified in a different row of the *criteria*

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		range. To find rows that meet multiple sets of criteria, where each set includes criteria for multiple columns, each set of criteria shall be specified in a separate row of the *criteria* range. To find rows that meet multiple sets of criteria, where each set includes criteria for one column, multiple columns with the same column heading shall be included in the *criteria* range.

Return Type and Value: number – The average of the values of the cells that correspond to the specified criteria.

[*Example*: Given the following data:

	A	B	C	D	E	F
1	Tree	Height	Age	Yield	Profit	Height
2	=Apple	>10				<16
3	=Pear					
4	Tree	Height	Age	Yield	Profit	
5	Apple	18	20	14	105.00	
6	Pear	12	12	10	96.00	
7	Cherry	13	14	9	105.00	
8	Apple	14	15	10	75.00	
9	Pear	9	8	8	76.80	
10	Apple	8	9	6	45.00	

the average yield of apple trees over 10 feet in height is computed by `DAVERAGE(A4:E10,"Yield",A1:B2)`, which results in 12

The average age of all trees is computed by `DAVERAGE(A4:E10,3,A4:E10)`, which results in 13

end example]

18.17.7.78 DAY

Syntax:

DAY (*date-value*)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Description: Computes the numeric day of the month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, taking into account the current date base value.

Arguments:

Name	Type	Description
date-value	number, text	The date and/or time whose day is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any date and/or time format, in which case, any time information shall be ignored.

Return Type and Value: number – The day of the month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*. The returned value shall be in the range 1–31.

However, if *date-value* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`DAY(DATE(2006,1,2))` results in 2
`DAY(DATE(2006,0,2))` results in 31
`DAY("2006/1/2 10:45 AM")` results in 2
`DAY(30000)` results in 18 for the 1900 date base system, or 19 for the 1904 date base system

end example]

18.17.7.79 DAYS360

Syntax:

`DAYS360 ( start-date , end-date [ , method-flag ] )`

Description: Computes the signed number of days between two dates based on a 360-day year (twelve 30-day months).

Arguments:

Name	Type	Description
start-date	number	*start-date* and *end-date* are the dates for which the difference is to be computed. *start-date* can be earlier than, the same as, or later than *end-date*.
start-date	number	
method-flag	logical	Specifies whether to use the U.S. or European method in the calculation, as follows:

Value	Meaning

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description	
		FALSE or omitted	U.S. (NASD) method: If the *start-date* is the 31st day of a month, it is changed to the 30th day of that same month. If the *end-date* is the 31st day of a month and the *start-date* is earlier than the 30th day of a month, the *end-date* is changed to the 1st day of the following month; otherwise the *end-date* is changed to the 30th day of the same month.
		TRUE	European method: *start-date*s and *end-date*s that occur on the 31st day of a month are changed to the 30th day of the same month.

Return Type and Value: number – The signed number of days between two dates based on a 360-day year (12 30-day months). If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the difference in days.

However, if *start-date* or *end-date* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`DAYS360(DATE(2002,2,3),DATE(2005,5,31))` results in `1198`
`DAYS360(DATE(2005,5,31),DATE(2002,2,3))` results in `-1197`
`DAYS360(DATE(2002,2,3),DATE(2005,5,31),FALSE)` results in `1198`
`DAYS360(DATE(2002,2,3),DATE(2005,5,31),TRUE)` results in `1197`

|*end example*]

18.17.7.80 DB

Syntax:

DB (*cost* , *salvage* , *life* , *period* [, [*month*]])

Description: Computes the depreciation of an asset for a specified period using the fixed-declining balance method.

Mathematical Formula:

The fixed-declining balance method computes depreciation at a fixed rate. DB uses the following formulas to calculate depreciation for a period:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

$(cost\ -\ total\ depreciation\ from\ prior\ periods)\ \times\ rate$

where:

$rate = 1\ -\left(\frac{salvage}{cost}\right)^{\frac{1}{life}}$, rounded to three decimal places

Depreciation for the first and last periods is a special case. If argument *month* is omitted, depreciation for the first period is calculated using the formula cost × rate.

If month argument is entered, use the following formulas:

For the first period, DB uses this formula:

$$\frac{cost \times rate\ \times month}{12}$$

For the last period, DB uses this formula:

$$\frac{(cost\ -total\ depreciation\ from\ prior\ periods) \times rate\ \times (12\ -month)}{12}$$

where:

- *cost* = argument *cost*
- *life* = argument *life*
- *rate* = 1 – (salvage / cost) ^ (1 / life), rounded to three decimals
- *salvage* = argument *salvage*
- *total depreciation from prior periods* = `DB(cost, salvage, life, 1, [month]) + DB(cost, salvage, life, 2, [month]) + … + DB(cost, salvage, life, period-1, [month]), where period > 1`

Arguments:

Name	Type	Description
cost	number	The initial cost of the asset.
salvage	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
life	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
period	number	The period for which the depreciation is to be calculated. (*period* shall use the same units as *life*.)
month	number	The number of months in the first year. If omitted, a value of 12 is used.

Return Type and Value: number – The depreciation of an asset for a specified period using the fixed-declining balance method.

However, if

- *cost*, *salvage*, *life*, or *period* < 0, `#NUM!` is returned.
- *month* is outside the range 1–12, `#NUM!` is returned.

[*Example*:

`DB(1000000,100000,6,1,7)` results in `186,083.33`
`DB(1000000,100000,6,2,7)` results in `259,639.42`
`DB(1000000,100000,6,3,7)` results in `176,814.44`
`DB(1000000,100000,6,4,7)` results in `120,410.64`
`DB(1000000,100000,6,5,7)` results in `81,999.64`
`DB(1000000,100000,6,6,7)` results in `55,841.76`
`DB(1000000,100000,6,7,7)` results in `15,845.10`

end example]

18.17.7.81 DCOUNT

Syntax:

DCOUNT (*database* , *field* , *criteria*)

Description: Counts the number of values in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The count of the values of the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Age fields that contain numbers is computed by `DCOUNT(A4:E10,"Age",A1:F2)`, which results in `1`.

end example]

18.17.7.82 DCOUNTA

Syntax:

DCOUNTA (*database* , *field* , *criteria*)

Description: Counts the number of non-blank cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.)

Return Type and Value: number – The count of the non-blank cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Profit fields that are not blank is computed by `DCOUNTA(A4:E10,"Profit",A1:F2)`, which results in `1`.

end example]

18.17.7.83 DDB

Syntax:

DDB (*cost* , *salvage* , *life* , *period* [, *factor*])

Description: Computes the depreciation of an asset for a specified period using the double-declining balance or some other specified method. [*Note*: Use VDB (§18.17.7.341) for a straight-line depreciation method when depreciation is greater than the declining balance calculation. *end note*]

Mathematical Formula:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

$$MIN(\ (cost\ -total\ depreciation\ from\ prior\ periods) \times \left(\frac{factor}{life}\right), (cost\ -salvage\ -total\ depreiation\ from\ prior\ periods)\ )$$

where:

cost = argument *cost*

factor = argument *factor*

life = argument *life*

salvage = argument *salvage*

total depreciation from prior periods = `DDB(cost, salvage, life, 1, [factor]) + DDB(cost, salvage, life, 2, [factor]) + … + DDB(cost, salvage, life, period-1, [factor])`, `where period > 1.` Depreciation for period = 1 can be calculated by using cost × factor/life.

Arguments:

Name	Type	Description
cost	number	The initial cost of the asset.
salvage	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
life	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
period	number	The period for which the depreciation is to be calculated. (*period* shall use the same units as *life*.)
factor	number	The rate at which the balance declines. If omitted, it is assumed to be 2 (the double-declining balance method).

Return Type and Value: number – The depreciation of an asset for a specified period.

However, if

- salvage < 0 #NUM! is returned.
- cost life <= 0, #NUM! is returned.
- life <= 0 #NUM! is returned.
- period <= 0, #NUM! is returned.
- factor <= 0, #NUM! is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*:

DDB(2400,300,10*365,1) results in 1.32
DDB(2400,300,10*12,1,2) results in 40.00
DDB(2400,300,10,1,2) results in 480.00
DDB(2400,300,10,2,1.5) results in 306.00
DDB(2400,300,10,10) results in 22.12

end example]

18.17.7.84 DEC2BIN

Syntax:

DEC2BIN (*number* [, *num-bin-digits*])

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

Name	Type	Description
number	number	The decimal number that is to be converted to a binary string.
num-bin-digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-bin-digits* is ignored and the result has 10 digits. If omitted, the minimum number of digits is used in the result. *num-bin-digits* is truncated to an integer.

Return Type and Value: text – The binary equivalent of *number* using twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.

However, if

- *number* is outside the range -512 (1000000000 binary) to 511 (0111111111 binary), inclusive, #NUM! is returned.
- *number* needs more digits that *num-bin-digits*, #NUM! is returned.
- *num-bin-digits* ≤ 0 or > 10, #NUM! is returned.

[*Example*:

DEC2BIN(23) results in 10111
DEC2BIN(-256) results in 1100000000
DEC2BIN(18,7) results in 0010010

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.85 DEC2HEX

Syntax:

DEC2HEX (*number* [, *num-hex-digits*])

Description: Makes the hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

Name	Type	Description
number	number	The decimal number that is to be converted to a hexadecimal string.
num-bin-digits	number	*num-hex-digits* is the number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-hex-digits* is ignored and the result has 10 digits. If *num-hex-digits* is omitted, the minimum number of digits is used in the result. *num-hex-digits* is truncated to an integer.

Return Type and Value: text – The hexadecimal equivalent of *number* using twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.

However, if

- *number* is outside the range -549,755,813,888 (8000000000 hex) to 549,755,813,887 (7FFFFFFFFF hex), inclusive, #NUM! is returned.
- *number* needs more digits that *num-hex-digits*, #NUM! is returned.
- *num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[*Example*:

DEC2HEX(23) results in 17
DEC2HEX(-256) results in FFFFFFFF00
DEC2HEX(18,7) results in 0000012

end example]

18.17.7.86 DEC2OCT

Syntax:

DEC2OCT (*number* [, *num-oct-digits*])

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

Name	Type	Description
number	number	The decimal number that is to be converted to an octal string.
num-bin-digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-oct-digits* is ignored and the result has 10 digits. If *num-oct-digits* is omitted, the minimum number of digits is used in the result. *num-oct-digits* is truncated to an integer.

Return Type and Value: text – The octal equivalent of *number* using twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.

However, if

- *number* is outside the range `-536,870,912` (4000000000 octal) to `536,870,911` (3777777777 octal), inclusive, `#NUM!` is returned.
- *number* needs more digits that *num-oct-digits*, `#NUM!` is returned.
- *num-oct-digits* ≤ 0 or > 10, `#NUM!` is returned.

[*Example*:

`DEC2OCT(23)` results in `27`
`DEC2OCT(-256)` results in `7777777400`
`DEC2OCT(18,7)` results in `0000022`

end example]

18.17.7.87 DEGREES

Syntax:

`DEGREES ( angle )`

Description: Converts *angle* in radians into degrees.

Arguments:

Name	Type	Description
angle	number	The number of radians that is to be converted into degrees.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: number – *angle* in degrees.

[*Example*:

`DEGREES(2 * PI())` results in `360`
`DEGREES(PI())` results in `180`
`DEGREES(PI()/2)` results in `90`
`DEGREES(8.5)` results in `487.0141259`

end example]

18.17.7.88 DELTA

Syntax:

DELTA (*number-1* [, *number-2*])

Description: Compares two numbers for equality.

Arguments:

Name	Type	Description
number-1	number	The numbers that are to be compared for equality. If *number-2* is omitted, it is assumed to be zero.
number-2	number	

Return Type and Value: number – 1 if *number-1* equals *number-2*; otherwise, 0.

[*Example*:

`DELTA(10.5,10.5)` results in `1`
`DELTA(10.5,10.6)` results in `0`
`DELTA(10.5)` results in `0`
`DELTA(0)` results in `1`

end example]

18.17.7.89 DEVSQ

Syntax:

DEVSQ (*argument-list*)

Description: Computes the sum of squares of deviations of data points from their sample mean.

Mathematical Formula:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

$$DEVSQ = \sum (x - \bar{x})^2$$

where:

- x = each element in *argument-list*
- $\bar{x}$ = the mean of the elements in *argument-list*

Arguments:

Name	Type	Description
argument-list	logical, number, name, array, or reference to a number. Argument list can be a single argument that is an array or a reference to an array.	The *argument*s in *argument-list* designate the values for which the sum of squared deviations is to be calculated. Logical values and text representations of numbers occurring directly in the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The sum of squares of deviations of data points from their sample mean.

[*Example*:

DEVSQ(5.6,8.2,9.2) results in 6.906666667
DEVSQ({5.6,8.2,9.2}) results in 6.906666667

end example]

18.17.7.90 DGET

Syntax:

DGET (*database* , *field* , *criteria*)

Description: Extracts a single value from a column of a list that matches the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The value of the cell that corresponds to the specified criteria.

However, if

- No record matches the criteria, `#VALUE!` is returned.
- More than one record matches the criteria, `#NUM!` is returned.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Profit fields that are not blank is computed by `DGET(A4:E7,"Yield",A1:A2)`, which results in 14.

end example]

18.17.7.91 DISC

Syntax:

`DISC ( `*settlement*` , `*maturity*` , `*pr*` , `*redemption*` [ , [ `*basis*` ] ] )`

Description: Computes the discount rate for a security.

Mathematical Formula:

$$DISC = \frac{redemption - par}{par} \times \frac{B}{SM}$$

where:

- B = number of days in a year, depending on the year basis.
- DSM = number of days between settlement and maturity.
- par = argument *pr*
- $redemption$ = argument *redemption*

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
pr	number	The security's price per 100 currency units face value.
redemption	number	The security's redemption value per 100 currency units face value.

Name	Type	Description
		<table><tr><td></td><td>360 days per year.</td></tr><tr><td>3</td><td>Actual/365. Similar to Basis 1, but always has 365 days per year.</td></tr><tr><td>4</td><td>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: - If the date is 28 or 29 February, it is adjusted to 30 February. - For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. </td></tr></table>

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Time information in the date arguments is ignored.

The currency units of *pr* and *redemption* are assumed to be the same currency.

Return Type and Value: number – The discount rate for a security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.

 ©ISO/IEC 2011 – All rights reserved

- *settlement* ≥ *maturity*, #NUM! is returned.
- *pr* or *redemption* ≤ 0, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[*Example*:

`DISC(DATE(2007,1,25),DATE(2007,6,15),97.975,100,1)` results in `5.2420%`

end example]

18.17.7.92 DMAX

Syntax:

`DMAX` (*database* , *field* , *criteria*)

Description: Computes the maximum value of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The maximum of the values of the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

The maximum profit of apple and pear trees is computed by `DMAX(A4:E10,"Profit",A1:A3)`, which results in `105`.

end example]

18.17.7.93 DMIN

Syntax:

`DMIN` (*database* , *field* , *criteria*)

Description: Computes the minimum value of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The minimum of the values of the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

The minimum profit of apple trees over 10 in height is computed by `DMIN(A4:E10,"Profit",A1:B2)`, which results in 75.

end example]

18.17.7.94 DOLLAR

Syntax:

DOLLAR (*number* [, *num-decimal*])

Description: Produces a string containing *number* rounded to *num-decimal* decimal places. The formatting applied to the string for the thousands separator, radix point, and currency symbol are implementation-specific.

Arguments:

Name	Type	Description
number	number	The number that is to be formatted.
num-decimal	number	Designate the number of decimal places to be used in the resulting string; it is truncated to an integer. If *num-decimal* is negative, *number* is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places, and have a currency symbol and thousands separators.

[*Example*: When the spreadsheet application defines the currency symbol to be "$", the thousands separator to be "," and the radix to be ".":

`DOLLAR(1234.567)` results in `$1,234.57`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

DOLLAR(1234.567,-2) results in $1,200
DOLLAR(-1234.567,4) results in ($1,234.5670)

When the spreadsheet application defines the currency symbol to be "€", the thousands separator to be " " and the radix to be ",":

DOLLAR(1234.567) results in 1 234,57 €
DOLLAR(1234.567,-2) results in 1 200 €
DOLLAR(-1234.567,4) results in -1 234,5670 €

When the spreadsheet application defines the currency symbol to be "SFr.", the thousands separator to be "'" and the radix to be ".":

DOLLAR(1234.567) results in SFr. 1'234.57
DOLLAR(1234.567,-2) results in SFr. 1'200
DOLLAR(-1234.567,4) results in SFr. -1'234.5670

When the spreadsheet application defines the currency symbol to be "kr", the thousands separator to be " " and the radix to be ",":

DOLLAR(1234.567) results in kr 1 234,57
DOLLAR(1234.567,-2) results in kr 1 200
DOLLAR(-1234.567,4) results in kr -1 234,5670
end example]

18.17.7.95 DOLLARDE

Syntax:

DOLLARDE (*fractional-dollar* , *fraction*)

Description: Converts a fractional dollar price into a dollar price expressed as a decimal number. [*Note*: Fractional dollar numbers are sometimes used for securities prices. *end note*] The fractional part of *fractional-dollar* is scaled to match the magnitude of *fraction* by moving the decimal place right by the number of digits in *fraction*. The *fractional-dollar* m.n is computed into a decimal dollar value as m + i, where i is an intermediate result equal to ((0.n)*(10x))/fraction), and x is the base 10 log of fraction, rounded up to the nearest whole number.

[*Example*: Given a *fractional-dollar* value of 1.02 and a *fraction* value of 16, the fractional part of *fractional-dollar* is multiplied by 100, giving a value of 2 to be divided by *fraction* before being added to the integral part of *fractional-dollar*, yielding a decimal price of 1.125. *end example*]

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
fractional-dollar	number	The number to be interpreted as a fractional dollar price.
fraction	number	The integer to use in the denominator of the fraction.

Return Type and Value: number – The dollar price expressed as a decimal number.

However, if

- *fraction* < 0, `#NUM!` is returned.
- *fraction* = 0, `#DIV/0!` is returned.

[*Example*:

`DOLLARDE(1.02,16)` results in `1.125`
`DOLLARDE(1.1,32)` results in `1.3125`

end example]

18.17.7.96 DOLLARFR

Syntax:

`DOLLARFR ( `*decimal-dollar*` , `*fraction*` )`

Description: Converts a dollar price expressed as a decimal into a dollar price expressed as a fraction. This function is used to convert decimal dollar numbers, such as securities prices, to fractional numbers.

Arguments:

Name	Type	Description
decimal-dollar	number	The number expressed as a decimal.
fraction	number	The integer to use in the denominator of the fraction.

Return Type and Value: number – The dollar price expressed as a fractional number. [*Example*: A result of *m.n* means *m* + *n*/*fraction* dollars. *end example*] The fractional part of the return value is scaled to have the same number of digits after the decimal point, as there are digits in *fraction*. [*Example*: DOLLARFR(1.125, 16) has a two-digit *fraction* value and so returns the two-digit fractional number 1.02 *end example*] If an exact numerator cannot be found, the function returns the lowest numerator that could be used with *fraction*, multiplied by a power of ten. [*Example*: DOLLARFR(1.5,3) returns 1.15, as there is no exact fraction which satisfies n/3 = 0.5, and 15/30 represents the lowest power of ten *fraction* can be multiplied by to obtain an exact value. *end example*]

However, if

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- *fraction* < 0, `#NUM!` is returned.
- *fraction* = 0, `#DIV/0!` is returned.

[*Example*:

`DOLLARFR(1.125,16)` results in `1.02`
`DOLLARFR(1.125,32)` results in `1.04`

end example]

18.17.7.97 DPRODUCT

Syntax:

DPRODUCT (*database* , *field* , *criteria*)

Description: Computes the product of the values of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The product of the values of the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

The product of the yields from apple trees with a height greater than 10 is computed by `DPRODUCT(A4:E10,"Yield",A1:B2)`, which results in `140`.

end example]

18.17.7.98 DSTDEV

Syntax:

DSTDEV (*database* , *field* , *criteria*)

Description: Estimates the standard deviation of a population based on a sample by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – An estimate of the standard deviation of a population based on the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

The estimated standard deviation in the yield of apple and pear trees if the data in the database is only a sample of the total orchard population is computed by DSTDEV(A4:E10,"Yield",A1:A3), which results in 2.97.

end example]

18.17.7.99 DSTDEVP

Syntax:

DSTDEVP (*database* , *field* , *criteria*)

Description: Computes the standard deviation of a population based on the entire population by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The standard deviation of a population based on the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

The true standard deviation in the yield of apple and pear trees if the data in the database is the entire population is computed by DSTDEVP(A4:E10,"Yield",A1:A3), which results in 2.65.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.100 DSUM

Syntax:

DSUM (*database* , *field* , *criteria*)

Description: Computes the sum of the values in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The sum of the values of the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

The total profit from apple trees is computed by `DSUM(A4:E10,"Profit",A1:A2)`, which results in 225.

The total profit from apple trees with a height between 10 and 16 is computed by `DSUM(A4:E10,"Profit",A1:F2)`, which results in 75.

end example]

18.17.7.101 DURATION

Syntax:

DURATION (*settlement* , *maturity* , *coupon* , *yld* , *frequency* [, [*basis*]])

Description: Computes the Macaulay duration for an assumed par value of 100. Duration is defined as the weighted average term to maturity of the cash flows from a bond. The weight of each cash flow is determined by dividing the present value of the cash flow by the price.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

<table>
<tr><th>Name</th><th>Type</th><th>Description</th></tr>
<tr><td>maturity</td><td>number</td><td>The security's maturity date.</td></tr>
<tr><td>coupon</td><td>number</td><td>The security's annual coupon rate.</td></tr>
<tr><td>yld</td><td>number</td><td>The security's annual yield.</td></tr>
<tr><td>frequency</td><td>number</td><td>The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. frequency is truncated to an integer.</td></tr>
<tr><td>basis</td><td>number</td><td>The truncated integer type of day count basis to use, as follows:
<table>
<tr><th>Value</th><th>Day Count Basis</th></tr>
<tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:
If the date is 28 or 29 February, it is adjusted to 30 February.
For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr>
<tr><td>1</td><td>Actual/actual. The actual number of days between the two dates</td></tr>
</table>
</td></tr>
</table>

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2 — Actual/360. Similar to Basis 1, but only has 360 days per year.
		3 — Actual/365. Similar to Basis 1, but always has 365 days per year.
		4 — European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: number – The Macaulay duration for an assumed par value of 100.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* ≥ *maturity*, #NUM! is returned.
- *coupon* or *yld* < 0, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[*Example*:

`DURATION(DATE(2008,1,1),DATE(2016,1,1),0.08,0.09,2,1)` results in `5.993774956`

end example]

18.17.7.102 DVAR

Syntax:

DVAR (*database* , *field* , *criteria*)

Description: Estimates the variance of a population based on a sample by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – An estimate of the variance of a population based on the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

The estimated variance in the yield of apple and pear trees if the data in the database is only a sample of the total orchard population is computed by `DVAR(A4:E10,"Yield",A1:A3)`, which results in `8.8`.

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.103 DVARP

Syntax:

DVARP (*database* , *field* , *criteria*)

Description: Calculates the variance of a population based on the entire population by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The variance of a population based on the entire population using the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §18.17.7.77:

The true variance in the yield of apple and pear trees if the data in the database is the entire orchard population is computed by `DVARP(A4:E10,"Yield",A1:A3)`, which results in `7.04`.

end example]

18.17.7.104 ECMA.CEILING

Syntax:

ECMA.CEILING (*x* , *significance*)

Description: Computes a value that is x rounded-up, away from zero, to the nearest multiple of *significance*. Regardless of the sign of x, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
x	number	The value to be rounded
significance	number	The multiple to which x is to be rounded. If x is negative, and *significance* is negative, then the value is rounded down (away from zero). If x is negative, and *significance* is positive, then the value is

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		rounded up, towards zero.

Return Type and Value: number – The rounded-up value of *x*.

However, if

- *x* is positive and *significance* is negative, `#NUM!` is returned.
- *x* and/or *significance* is zero, zero is returned.

[*Example*:

`ECMA.CEILING(4.3,2)` rounds 4.3 up to nearest multiple of 2; that is, to 6
`ECMA.CEILING(4.3,-2)` rounds 4.3 up to nearest multiple of -2; that is, to #NUM!
`ECMA.CEILING(-4.3,2)` rounds -4.3 up to the nearest multiple of 2; that is, to -4
`ECMA.CEILING(-4.3,-2)` rounds -4.3 up to the nearest multiple of -2; that is, to -6

end example]

18.17.7.105 EDATE

Syntax:

`EDATE` (*start-date* , *month-offset*)

Description: Computes the serial value of the date that is *month-offset* months from the date specified by the date *date-string*, taking into account the current date base value.

Arguments:

Name	Type	Description
start-date	number	The start date.
month-offset	number	The number of months before or after *start-date*, truncated to integer. A positive value yields a future date; a negative value yields a past date; a zero value yields the date *start-date*.

Return Type and Value: number – The serial value of the date that is *month-offset* months from the date specified by the date *date-string*, as a whole number.

However, if

- *start-value* is out of range for the current date base value, `#NUM!` is returned.
- *start-value* plus *month-offset* is out of range for the current date base value, `#NUM!` is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*: For the 1900 date base system:

`EDATE(DATE(2006,1,31),5)` results in a serial value of `38898`
`EDATE(DATE(2004,2,29),12)` results in a serial value of `38411`
`EDATE(DATE(2004,2,28),12)` results in a serial value of `38411`
`EDATE(DATE(2004,1,15),-23)` results in a serial value of `37302`

For the 1904 date base system:

`EDATE(DATE(2006,1,31),5)` results in a serial value of `37436`
`EDATE(DATE(2004,2,29),12)` results in a serial value of `36949`
`EDATE(DATE(2004,2,28),12)` results in a serial value of `36949`
`EDATE(DATE(2004,1,15),-23)` results in a serial value of `35840`

end example]

18.17.7.106 EFFECT

Syntax:

EFFECT (*nominal-rate* , *npery*)

Description: Computes the effective annual interest rate, given the nominal annual interest rate and the number of compounding periods per year.

Mathematical Formula:

$$EFFECT = \left(1 + \frac{Nominal_rate}{Npery}\right)^{Npery} - 1$$

where:

- $Nominal_rate$ = argument *nominal-rate*
- $Npery$ = argument *npery*

Arguments:

Name	Type	Description
nominal-rate	number	The nominal interest rate.
npery	number	The number of compounding periods per year, truncated to integer.

Return Type and Value: number – The effective annual interest rate.

However, if

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- *nominal-rate* ≤ 0, #NUM! is returned.
- *npery* < 1, #NUM! is returned.

[*Example*:

EFFECT(0.0525,4) results in 5.3543%

end example]

18.17.7.107 EOMONTH

Syntax:

EOMONTH (*start-date* , *month-offset*)

Description: Computes the serial value of the last day of the month for the date that is *month-offset* months from the date specified by the date *start-date*, taking into account the current date base value.

Arguments:

Name	Type	Description
start-date	number	The start date.
month-offset	number	The number of months before or after *start-date*, truncated to integer. A positive value yields a future date; a negative value yields a past date; a zero value yields the date *start-date*.

Return Type and Value: number – The serial value of the last day of the month for the date that is *month-offset* months from the date specified by the date *start-date*, as a whole number.

However, if

- *start-date* is not a date, #NUM! is returned.
- *start-date* plus *month-offset* does not yield a date, #NUM! is returned.

[*Example*: For the 1900 date base system:

EOMONTH(DATE(2006,1,31),5) results in a serial value of 38898
EOMONTH(DATE(2004,2,29),12) results in a serial value of 38411
EOMONTH(DATE(2004,2,28),12) results in a serial value of 38411
EOMONTH(DATE(2004,1,15),-23) results in a serial value of 37315

For the 1904 date base system:

EOMONTH(DATE(2006,1,31),5) results in a serial value of 37436

`EOMONTH(DATE(2004,2,29),12)` results in a serial value of 36949
`EOMONTH(DATE(2004,2,28),12)` results in a serial value of 36949
`EOMONTH(DATE(2004,1,15),-23)` results in a serial value of 35853

end example]

18.17.7.108 ERF

Syntax:

`ERF ( lower-bound [ , upper-bound ] )`

Description: Computes the error function integrated between *lower-bound* and *upper-bound*.

Mathematical Formula:

If *upper-bound* is omitted:

$$ERF(z) = \frac{2}{\sqrt{\pi}} \int_0^z e^{-t^2}\, dt$$

where:

- z = argument *lower-bound*

If *upper-bound* is present:

$$ERF(a,b) = \frac{2}{\sqrt{\pi}} \int_a^b e^{-t^2}\, dt = ERF(b) - ERF(a)$$

where:

- b = argument *upper-bound*
- a = argument *lower-bound*

Arguments:

Name	Type	Description
lower-bound	number	The lower bound for integrating ERF.
upper-bound	number	The upper bound for integrating ERF. If omitted, the value of the upper bound is *lower-bound*, and the lower bound becomes zero.

Return Type and Value: number – The error function integrated between *lower-bound* and *upper-bound*.

However, if

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- *lower-bound* is negative, #NUM! is returned.
- *upper-bound* is negative, #NUM! is returned.

[*Example*:

ERF(1.234,4.5432) results in 0.08096060
ERF(0,1.345) results in 0.94284416
ERF(0,1.345) results in 0.94284416

end example]

18.17.7.109 ERFC

Syntax:

ERFC (*lower-bound*)

Description: Computes the complementary error function integrated between *lower-bound* and ∞.

Mathematical Formula:

$$ERFC(x) = \frac{2}{\sqrt{\pi}} \int_{x}^{\infty} e^{-t^2}\, dt = 1 - ERF(x)$$

where:

- x = argument *lower-bound*

Arguments:

Name	Type	Description
lower-bound	number	The lower bound for integrating ERFC.

Return Type and Value: number – The complementary error function integrated between *lower-bound* and ∞.

However, if *lower-bound* is negative

lower-bound or *upper-bound* is negative, #NUM! is returned.

[*Example*:

ERFC(1.234) results in 0.08096060
ERFC(0) results in 1.00000000

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.110 ERROR.TYPE

Syntax:

ERROR.TYPE (*value*)

Description: Determines the kind of the error value designated by *value*.

Arguments:

Name	Type	Description
value	any	A value whose type is to be determined. No conversion shall take place on the argument passed to this function.

Return Type and Value: number – The kind of the error value designated by *value*, as follows:

value	Return Value
#NULL!	1
#DIV/0!	2
#VALUE!	3
#REF!	4
#NAME?	5
#NUM!	6
#N/A	7
#GETTING_DATA	8
Anything else	#N/A

[*Example*:

ERROR.TYPE(A1) results in 2 if A1 evaluates to #DIV/0!
ERROR.TYPE(A1) results in 4 if A1 evaluates to #REF/0!
ERROR.TYPE(A1) results in 7 if A1 evaluates to #N/A
ERROR.TYPE(A1) results in #N/A if A1 evaluates to a non-error value, such as a number or text

end example]

18.17.7.111 EVEN

Syntax:

EVEN (*x*)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Description: Computes *x* rounded to the nearest even integer, away from zero. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
x	number	The value to be rounded.

Return Type and Value: number – The rounded value of *x*. If *x* is zero, the result is zero.

[*Example*:

`EVEN(1.5)` rounds 1.5 up to the nearest even integer; that is, to 2.
`EVEN(3)` rounds 3 up to the nearest even integer; that is, to 4.
`EVEN(2)` rounds 2 up to the nearest even integer; that is, to 2.
`EVEN(-1)` rounds -1 up to the nearest even integer; that is, to `-2`.

end example]

18.17.7.112 EXACT

Syntax:

EXACT (*string-1* , *string-2*)

Description: Performs a case-sensitive, character-by-character, lexical comparison of *string-1* and *string-2*.

Arguments:

Name	Type	Description
string-1	text	The two strings to be compared.
string-2	text	

Return Type and Value: logical – TRUE if *string-1* and *string-2* have the exact same length and contents; otherwise, FALSE.

[*Example*:

`EXACT("ABC","ABC")` results in TRUE
`EXACT("ABC","ABCD")` results in FALSE
`EXACT("Abc","aBC")` results in FALSE
`EXACT("","")` results in TRUE

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.113 EXP

Syntax:

```
EXP ( x )
```

Description: Computes e^x, where the constant *e* is the base of the natural logarithm.

Arguments:

Name	Type	Description
x	number	The exponent to which *e* is to be raised.

Return Type and Value: number – e^x.

However, if x is too large for the result to be representable, `#NUM!` is returned.

[*Example*:

`EXP(-1)` results in `0.367879441`
`EXP(0)` results in `1`
`EXP(1)` results in `2.718281828`
`EXP(2)` results in `7.389056099`

end example]

18.17.7.114 EXPONDIST

Syntax:

```
EXPONDIST ( x , lambda , cumulative-flag )
```

Description: Computes the exponential distribution.

Mathematical Formula:

The equation for the probability density function is:

$$f(x,\lambda) = \lambda e^{-\lambda x}$$

The equation for the cumulative distribution function is:

$$F(x,\lambda) = 1 - e^{-\lambda x}$$

where:

- x = argument x
- λ = argument *lambda*

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Arguments:

Name	Type	Description
x	number	The value at which the function is evaluated.
lambda	number	The inverse of the mean.
cumulative-flag	logical	Determines the form of the function. If TRUE, EXPONDIST returns the cumulative distribution function; if FALSE, EXPONDIST returns the probability density function.

Return Type and Value: number – The exponential distribution.

However, if

- *x* < 0, #NUM! is returned.
- *lambda* ≤ 0, #NUM! is returned.

[*Example*:

EXPONDIST(0.2,10,FALSE) results in 1.353352832
EXPONDIST(2.3,1.5,TRUE) results in 0.968254364

end example]

18.17.7.115 FACT

Syntax:

FACT (*x*)

Description: Computes the factorial of *x*.

Arguments:

Name	Type	Description
x	number	The non-negative value whose factorial is to be computed. *x* is truncated to an integer.

Return Type and Value: number – The factorial of *x*.

However, if

- *x* is negative, #NUM! is returned.
- *x* is too large for the result to be representable, #NUM! is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*:

FACT(5) results in 120
FACT(3.5) results in 6
FACT(0) results in 1

end example]

18.17.7.116 FACTDOUBLE

Syntax:

FACTDOUBLE (*n*)

Description: Computes the double factorial of n.

Mathematical Formula:

If n is even:

$$n!! = n(n-2)(n-4)\dots(4)(2)$$

If n is odd:

$$n!! = n(n-2)(n-4)\dots(3)(1)$$

where:

- n = argument n

Arguments:

Name	Type	Description
n	number	The non-negative value whose double factorial is to be computed. n is truncated to an integer.

Return Type and Value: number – The double factorial of n.

However, if

- n is negative, #NUM! is returned.
- n is too large for the result to be representable, #NUM! is returned.

[*Example*:

FACTDOUBLE(5) results in 15
FACTDOUBLE (3.5) results in 3

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

FACTDOUBLE (0) results in 1

end example]

18.17.7.117 FALSE

Syntax:

FALSE ( )

Description: Computes the value FALSE. (A call to function FALSE is equivalent to using the *logical-constant* FALSE.)

Arguments: None.

Return Type and Value: logical – The value FALSE.

[*Example*:

FALSE() results in FALSE

end example]

18.17.7.118 FDIST

Syntax:

FDIST (*x* , *degrees-freedom-1* , *degrees-freedom-2*)

Description: Computes the F probability distribution.

Mathematical Formula:

$$FDIST = P(F > x)$$

where:

- F is a random variable that has an F distribution with degrees of freedom *degrees-freedom-1* and *degrees-freedom-2*
- x is argument x

Arguments:

Name	Type	Description
x	number	The value at which the function is to be evaluated.
degrees-freedom-1	number	The number of degrees of freedom for the numerator, truncated to an integer.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
degrees-freedom-2	number	The number of degrees of freedom for the denominator, truncated to an integer.

Return Type and Value: number – The F probability distribution.

However, if

- *x* is negative, `#NUM!` is returned.
- *degrees-freedom-1* < 1 or *degrees-freedom-1* ≥ 10^{10}, `#NUM!` is returned.
- *degrees-freedom-2* < 1 or *degrees-freedom-2* ≥ 10^{10}, `#NUM!` is returned.

[*Example*:

`FDIST(12.345,3,4)` results in `0.017226183`

end example]

18.17.7.119 FIND

Syntax:

```
FIND ( string-1 , string-2 [ , start-pos ] )
```

Description: Performs a case-sensitive search using a lexical comparison for the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. (`FIND` is intended for use with languages that use the single-byte character set (SBCS), whereas `FINDB` (§18.17.7.120) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string-1	text	Designate the string to be searched for within the string designated by *string-2*.
string-2	text	
start-pos	number	The number of the start position within *string-2* for which *string-1* is to be searched. The start position of the first character is 1. If omitted, a position of 1 shall be assumed. *start-pos* shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[*Example*:

`FIND("de","abcdef")` results in 4
`FIND(A10,B10)` results in 4, when A10 contains `de`, and B10 contains `abcdef`

end example]

18.17.7.120 FINDB

Syntax:

`FINDB ( string-1 , string-2 , [ start-pos ] )`

Description: Performs a case-sensitive search using a lexical comparison for the first occurrence of *string-1* in *string-2*, starting at byte position *start-pos* within *string-2*. (`FINDB` is intended for use with languages that use the double-byte character set (DBCS), whereas `FIND` (§18.17.7.119) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string-1	text	Designate the string to be searched for within the string designated by *string-2*.
string-2	text	
start-pos	number	The number of the start position within *string-2* for which *string-1* is to be searched. The start position of the first byte is 1. If omitted, a position of 1 shall be assumed. *start-pos* shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[*Example*: Assuming 1-byte characters

`FINDB("de","abcdef")` results in 4
`FINDB(A10,B10)` results in 4, when `A10` contains `de`, and `B10` contains `abcdef`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.121 FINV

Syntax:

FINV (*probability* , *degrees-freedom-1* , *degrees-freedom-2*)

Description: Computes the inverse of the F probability distribution. Given a value for *probability*, FINV seeks that value *x* such that FDIST(*x*, *degrees-freedom1*, *degrees-freedom2*) = *probability*. Thus, precision of FINV depends on precision of FDIST.

Arguments:

Name	Type	Description
probability	number	A probability associated with the F cumulative distribution.
degrees-freedom-1	number	The number of degrees of freedom for the numerator, truncated to an integer.
degrees-freedom-2	number	The number of degrees of freedom for the denominator, truncated to an integer.

Return Type and Value: number – The inverse of the F probability distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *degrees-freedom-1* < 1 or *degrees-freedom-1* ≥ 10^{10}, #NUM! is returned.
- *degrees-freedom-2* < 1 or *degrees-freedom-2* ≥ 10^{10}, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned

[*Example*:

FINV(0.5,3,4) results in 0.940534076

end example]

18.17.7.122 FISHER

Syntax:

FISHER (*x*)

Description: Computes the Fisher transformation at *x*.

Mathematical Formula:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

$$z' = \frac{1}{2}\ln\left(\frac{1+x}{1-x}\right)$$

where:

- x = argument x

Arguments:

Name	Type	Description
x	number	The number for which the transformation is wanted.

Return Type and Value: number – The Fisher transformation at x.

However, if

- $x \leq -1$, `#NUM!` is returned.
- $x \geq 1$, `#NUM!` is returned.

[*Example*:

`FISHER(-0.43)` results in `-0.459896681`
`FISHER(0.578)` results in `0.659454094`

end example]

18.17.7.123 FISHERINV

Syntax:

```
FISHERINV ( y )
```

Description: Computes the inverse of the Fisher transformation.

Mathematical Formula:

$$x = \frac{e^{2y} - 1}{e^{2y} + 1}$$

where:

- y = argument y

Arguments:

Name	Type	Description
y	number	The number for which the inverse of the transformation

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		is wanted.

Return Type and Value: number – The inverse of the Fisher transformation.

[*Example*:

`FISHERINV(-0.43)` results in `0.405321309`
`FISHERINV(0.578)` results in `0.521210269`

end example]

18.17.7.124 FIXED

Syntax:

`FIXED ( number [ , [ num-decimal ] [ , suppress-commas-flag ] ] )`

Description: Produces a string containing *number* rounded to *num-decimal* decimal places, using the same rounding algorithm as ROUND (§18.17.7.278). Thousands separator commas are included as determined by *suppress-commas-flag*.

Arguments:

Name	Type	Description
number	number	Designate the number that is to be formatted, truncated to integer.
num-decimal	number	Designate the number of decimal places to be used in the resulting string. If negative, *number* is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.
suppress-commas-flag	logical	If TRUE, commas are not included; if FALSE or omitted, commas are included.

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places.

[*Example*:

`FIXED(1234567)` results in `1,234,567.00`
`FIXED(1234567.555555,4,TRUE)` results in `1234567.5556`
`FIXED(.555555,10)` results in `0.5555550000`
`FIXED(1234567,-3)` results in `1,235,000`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

end example]

18.17.7.125 FLOOR

Syntax:

FLOOR (*x* , *significance*)

Description: Computes *x* rounded down, toward zero, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded down when adjusted away from zero.

Arguments:

Name	Type	Description
x	number	The value to be rounded,
significance	number	The multiple to which *x* is to be rounded.

Return Type and Value: number – The rounded-down value of *x*.

However, if *x* and *significance* have different signs, `#NUM!` is returned.

[*Example*:

`FLOOR(2.5,1)` rounds 2.5 down to nearest multiple of 1; that is, to 2
`FLOOR(-2.5,-2)` rounds -2.5 down to nearest multiple of -2; that is, to `-2`
`FLOOR(1.5,0.1)` rounds 1.5 down to the nearest multiple of 0.1; that is, to `1.5`
`FLOOR(0.234,0.01)` rounds 0.234 down to the nearest multiple of 0.01; that is, to 0.23

end example]

18.17.7.126 FORECAST

Syntax:

FORECAST (*x* , *known-ys* , *known-xs*)

Description: Calculates, or predicts, a future value by using existing values. The predicted value is a y-value for a given x-value. The known values are existing x-values and y-values, and the new value is predicted by using linear regression.

Mathematical Formula:

FORECAST=a+bx, where:

$a = \bar{y} - b\bar{x}$

and:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

$$b = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

where:

- x = a sample value
- $\bar{x}$ is the sample mean AVERAGE(known-xs)
- y = a sample value
- $\bar{y}$ is the sample mean AVERAGE(known-ys)

Arguments:

Name	Type	Description
x	number	The data point for which a value is to be predicted.
known-xs	array, reference	The independent data.
known-ys	array, reference	The dependent data.

Return Type and Value: number – The future value.

However, if

- *known-xs* and *known-ys* are empty or contain a different number of data points, the return value is unspecified.
- The variance of *known-xs* equals zero, the return value is unspecified.

[*Example*:

FORECAST(30,{6,7,9,15,21},{20,28,31,38,40}) results in 10.60725309

end example]

18.17.7.127 FREQUENCY

Syntax:

FREQUENCY (*data-array* , *bins-array*)

Description: Calculates how often values occur within a range of values. A call to FREQUENCY shall be an array formula.

Arguments:

Name	Type	Description
data-array	array, reference to number	Set of values for which frequencies are to be computed. If *data-array* contains no values, FREQUENCY returns an

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		array of zeros. Cells containing text or that are empty are ignored.
bins-array	array, reference	Set of intervals into which the values in *data-array* are to be grouped. If *bins-array* contains no values, FREQUENCY returns the number of elements in *data-array*.

Return Type and Value: vertical array of numbers – The frequency at which values occur within a range of values. The number of elements in the returned array is one more than the number of elements in *bins-array*. The extra element contains the count of any values above the highest interval.

[*Example*:

If the cells A2:A10 contain 79, 85, 78, 85, 50, 81, 95, 88, and 97, and the cells B2:B4 contain 70, 79, and 89, `FREQUENCY(A2:A10,B2:B4)` results in a vertical array containing 1 (50), 2 (79, 78), 4 (85, 85, 81, 88), and 2 (95, 97).

end example]

18.17.7.128 FTEST

Syntax:

`FTEST ( array-1 , array-2 )`

Description: Computes the result of an F-test.

Arguments:

Name	Type	Description
array-1	number, name, array, reference to number	If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
array-2		

Return Type and Value: number – The two-tailed probability that the variances in *array-1* and *array-2* are not significantly different.

However, if

- The number of data points in *array-1* or *array-2* is less than 2, the return value is unspecified.
- The variance of *array-1* or *array-2* is zero, the return value is unspecified.

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

If the cells D6:D10 contain 6, 7, 9, 15, and 21, and the cells E6:E10 contain 20, 28, 31, 38, and 40, `FTEST(D6:D10,E6:E10)` results in `0.648317847`

end example]

18.17.7.129 FV

Syntax:

FV (*rate* , *nper* , *pmt* [, [*pv*] [, [*type*]]])

Description: Computes the future value of an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description
rate	number	The interest rate.
nper	number	The total number of payment periods, truncated to integer.
pmt	number	The payment made each period; it cannot change over the life of the annuity. [*Note*: Typically, *pmt* contains principal and interest, but no other fees or taxes. *end note*] If omitted, *pv* shall be provided.
pv	number	The the present value, or the lump-sum amount that a series of future payments is worth right now. If omitted, it is assumed to be 0, and *pmt* shall be provided.
type	number	The timing of the payment, truncated to integer, as follows:

Value	Timing
`0`	Payment at the end of the period
`1`	Payment at the beginning of the period

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The future value of an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, `#NUM!` is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Example*:

`FV(0.06/12,10,-200,-500,1)` `2,581.40`
`FV(0.12/12,12,-1000)` results in `12,682.50`
`FV(0.11/12,35,-2000,,1)` results in `82,846.25`
`FV(0.06/12,12,-100,-1000,1)` results in `2,301.40`

end example]

18.17.7.130 FVSCHEDULE

Syntax:

`FVSCHEDULE ( principal , schedule )`

Description: Computes the future value of an initial principal after applying a series of compound interest rates. [*Note*: This function can be used to calculate the future value of an investment with a variable or adjustable rate. *end note*]

Arguments:

Name	Type	Description
principal	number	The present value.
schedule	array	Set of interest rates to apply. The values in this array can be numbers or blank cells. Blank cells are taken as zeros (i.e., no interest).

Return Type and Value: number – The future value of an initial principal after applying a series of compound interest rates.

However, if any element of the array *schedule* is not a number and not blank, #VALUE! is returned.

[*Example*:

`FVSCHEDULE(1,{0.09,0.11,0.1})` results in `1.33089`

end example]

18.17.7.131 GAMMADIST

Syntax:

`GAMMADIST ( x , alpha , beta , cumulative-flag )`

Description: Computes the gamma distribution.

Mathematical Formula:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

The equation for the gamma probability density function is:

$$f(x,\alpha,\beta) = \frac{1}{\beta^{\alpha}\Gamma(\alpha)} x^{\alpha-1} e^{-\frac{x}{\beta}}$$

$$f(x;\alpha,\beta) = \frac{1}{\beta^{\alpha}\Gamma(\alpha)} x^{\alpha-1} e^{-\frac{x}{\beta}}$$

The standard gamma probability density function is:

$$f(x,\alpha) = \frac{x^{\alpha-1}e^{-x}}{\Gamma(\alpha)}$$

When *alpha* = 1, GAMMADIST returns the exponential distribution with:

$$\lambda = \frac{1}{\beta}$$

where:

- α = argument *alpha*
- β = argument *beta*
- x = argument x

For a positive integer n, when *alpha* = n/2, *beta* = 2, and cumulative = TRUE, GAMMADIST returns (1-CHIDIST(x)) with n degrees of freedom.

When *alpha* is a positive integer, GAMMADIST is also known as the Erlang distribution.

Arguments:

Name	Type	Description
x	number	The value at which the distribution is to be evaluated.
alpha	number	A parameter of the distribution.
beta	number	A parameter of the distribution. If *beta* = 1, GAMMADIST returns the standard gamma distribution.
cumulative-flag	logical	Determines the form of the function. If TRUE, GAMMADIST returns the cumulative distribution function; if FALSE, it returns the probability density function.

Return Type and Value: number – The gamma distribution.

However, if

- $x < 0$, #NUM! is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- *alpha* ≤ 0 or *beta* ≤ 0, `#NUM!` is returned.

[*Example*:

`GAMMADIST(10,9,2,FALSE)` results in `0.03263902`
`GAMMADIST(10,9,2,TRUE)` results in `0.068093631`

end example]

18.17.7.132 GAMMAINV

Syntax:

`GAMMAINV ( probability , alpha , beta )`

Description: Computes the inverse of the gamma distribution. Given a value for *probability*, `GAMMAINV` seeks that value *x* such that `GAMMADIST(`*x*`,` *alpha*`,` *beta*`, TRUE)` = *probability*. Thus, the precision of `GAMMAINV` depends on the precision of `GAMMADIST`.

Arguments:

Name	Type	Description
probability	number	The probability associated with the gamma distribution.
alpha	number	A parameter of the distribution.
beta	number	A parameter of the distribution. If *beta* = 1, `GAMMAINV` returns the standard gamma distribution.

Return Type and Value: number – The inverse of the gamma distribution.

However, if

- *probability* < 0 or *probability* > 1, `#NUM!` is returned.
- *alpha* ≤ 0 or *beta* ≤ 0, `#NUM!` is returned.
- the implementation determines that a return value cannot be computed, `#N/A` is returned.

[*Example*:

`GAMMAINV(0.068,9,2)` results in `9.997130086`

end example]

18.17.7.133 GAMMALN

Syntax:

`GAMMALN ( x )`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Description: Computes the natural logarithm of the gamma function.

Mathematical Formula:

$$GAMMALN = LN\big(\Gamma(x)\big)$$

where:

$$\Gamma(x) = \int_0^\infty e^{-u} u^{x-1}\, du$$

where:

- x = argument x

Arguments:

Name	Type	Description
x	number	The value for which the gamma function is to be calculated.

Return Type and Value: number – The natural logarithm of the gamma function.

However, if $x \leq 0$, `#NUM!` is returned.

[*Example*:

`GAMMALN(4.5)` results in `2.453736571`

end example]

18.17.7.134 GCD

Syntax:

GCD (*argument-list*)

Description: Computes the greatest common divisor of the one or more numbers, designated by *arguments* in *argument-list*.

Arguments:

Name	Type	Description
argument-list	numbers	The *arguments* in *argument-list* designate the values. Each argument is truncated to an integer.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The greatest common divisor of one or more numbers.

However, if any *argument* is negative, `#NUM!` is returned.

[*Example*:

`GCD(5)` results in 5
`GCD(5,2)` results in 1
`GCD(100,50,28)` results in 2
`GCD(24.5,36.3)` results in 12
`GCD(7,1)` results in 1
`GCD(5,0)` results in 5

end example]

18.17.7.135 GEOMEAN

Syntax:

GEOMEAN (*argument-list*)

Description: Computes the geometric mean of an array or range of positive data.

Mathematical Formula:

$GM_{\bar{y}} = \sqrt[n]{y_1 y_2 y_3 \ldots y_n}$

where:

- n is the number of elements in *argument-list*.
- $y_1, y_2, y_3, \cdots, y_n$ are the values of the n-th element in *argument-list*.

Arguments:

Name	Type	Description
argument-list	logical, number, name, array, or reference to number.	The *argument*s in *argument-list* designate the values to be averaged. Logical values and text representations of numbers that entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The geometric mean of an array or range of positive data.

However, if the value of any data point ≤ 0, `#NUM!` is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*:

GEOMEAN(10.5,5.3,2.9) results in 5.444454702
GEOMEAN(10.5,{5.3,2.9},"12") results in 6.633780588

end example]

18.17.7.136 GESTEP

Syntax:

GESTEP (*number* [, *step*])

Description: Tests if the value of *number* is greater than or equal to that of *step*.

Arguments:

Name	Type	Description
number	number	*number* is the value to test against *step*. If *step* is omitted, zero is used.
step	number	

Return Type and Value: number – 1 if *number* ≥ *step*; otherwise, 0.

[*Example*:

GESTEP(5.6,-4.3) results in 1
GESTEP(5.6,5.6) results in 1
GESTEP(-5.6) results in 0

end example]

18.17.7.137 GETPIVOTDATA

Syntax:

GETPIVOTDATA (*data-field* , *pivot-table* , *field-1* , *item-1*
[, *field-2* , *item-2* [, …]])

Description: Retrieves data stored in a PivotTable report. Calculated fields or items and custom calculations are included in GETPIVOTDATA calculations.

Arguments:

Name	Type	Description
data-field	text	The name of the data field that contains the data to be retrieved.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
pivot-table	reference to any cell, range of cells, or named range of cells in a PivotTable report	This information is used to determine which PivotTable report contains the data to be retrieved. If *pivot-table* is a range that includes two or more PivotTable reports, data shall be retrieved from whichever report was created most recently in the range.
field-1 through *field-n*	text	Argument pairs *field-1* and *item-1*, *field-2* and *item-2* through *field-n* and *item-n* are field names and item names that describe the data to be retrieved. The pairs can be in any order. Field names and names for items other than dates/times (which shall be expressed as numbers) and numbers shall be enclosed in quotation marks. For OLAP PivotTable reports, items can contain the source name of the dimension as well as the source name of the item. [*Example*: A field and item pair for an OLAP PivotTable might look like this: `"[Product]","[Product].[All Products].[Foods].[Baked Goods]"` *end example*] If the field and item arguments describe a single cell, the value of that cell is returned regardless of its value.
item-1 through *item-n*	text	

Return Type and Value: any – The data stored in a PivotTable report.

However, if

- *pivot-table* is not a range in which a PivotTable report is found, the return value is unspecified.
- The arguments do not describe a visible field, the return value is unspecified.
- The arguments include a page field that is not displayed, the return value is unspecified.

[*Example*: Given the following data:

	A	B	C	D	E
2	Region	North			
3					
4	Sum of Sales		Product		
5	Month	Salesperson	Beverages	Produce	Grand Total
6	March	Buchanan	$ 3,522	$ 10,201	$ 13,723
7		Davolio	$ 8,725	$ 7,889	$ 16,614
8	March Total		$ 12,247	$ 18,090	$ 30,337
9	April	Buchanan	$ 5,594	$ 7,265	$ 12,859
10		Davolio	$ 5,461	$ 668	$ 6,129
11	April Total		$ 11,055	$ 7,933	$ 18,988
12	Grand Total		$ 23,302	$ 26,023	$ 49,325

`GETPIVOTDATA("Sales",$A$4)` returns the grand total of the Sales field, `$49,325`.

`GETPIVOTDATA("Sum of Sales",$A$4)` also returns the grand total of the Sales field, `$49,325`; the field name can be entered exactly as it looks on the sheet, or as its root (without "Sum of," "Count of," and so forth).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

`GETPIVOTDATA("Sales",$A$4,"Month","March")` returns the grand total for March, `$30,337`.

`GETPIVOTDATA("Sales",$A$4,"Month","March","Product","Produce","Salesperson","Buchanan")` returns `$10,201`.

`GETPIVOTDATA("Sales",$A$4,"Region","South")` is unspecified because the South region data is not visible.

`GETPIVOTDATA("Sales",$A$4,"Product","Beverages","Salesperson","Davolio")` is unspecified because there is no total value of beverage sales for Davolio.

end example]

18.17.7.138 GROWTH

Syntax:

`GROWTH` (*known-ys* [, [*known-xs*] [, [*new-xs*] [, *const-flag*]])

Description: Computes predicted exponential growth by using existing data. `GROWTH` can also fit an exponential curve to existing x-values and y-values.

Arguments:

Name	Type	Description
known-ys	array	Set of y-values already known in the relationship $y=b*m^x$. If the array *known-ys* is a single column, then each column of *known-xs* is interpreted as a separate variable. If the array *known-ys* is a single row, then each row of *known-xs* is interpreted as a separate variable.
known-xs	array	Set of x-values that might already be know in the relationship $y=b*m^x$. The array *known-xs* can include one or more sets of variables. If only one variable is used, *known-ys* and *known-xs* can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, *known-ys* shall be a vector (that is, a *known-ys* with a height of one row or a width of one column). If *known-xs* is omitted, it is assumed to be the array {1,2,3,…} that is the same size as *known-ys*.
new-xs	array	A set of new x-values for which `GROWTH` is to return corresponding y-values. *new-xs* shall include a column (or row) for each independent variable, just as *known-xs* does. So, if *known-ys* is in a single column, *known-xs* and *new-xs* shall have the same number of columns. If *known-ys* is in a single row, *known-xs* and *new-xs* shall have the same number of rows. If *new-xs* are omitted, it is assumed to be the array {1,2,3,…} that is the same size as

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
		known-ys.
const-flag	logical	Specifies whether to force the constant b to equal 1. If TRUE or omitted, *b* is calculated normally. If FALSE, *b* is set equal to 1 and the m-values are adjusted so that y= m^x.

Return Type and Value: array – The y-values for a series of new x-values.

However, if any of the numbers in *known-ys* are zero or negative, `#NUM!` is returned.

[*Example*: Given the following data:

	A	B	C
1	Month	Units	Formula (corresponding units)
2	11	33,100	32618.20377
3	12	47,300	47729.42261
4	13	69,000	69841.30086
5	14	102,000	102197.0734
6	15	150,000	149542.4867
7	16	220,000	218821.8762
8	Month	Formula (Predicted Units)	
9	17	320,196.72	
10	18	468,536.05	

When `GROWTH(A2:B4,A6:B8)` is an array formula spanning cells C2:C7, those cells take on the results shown. When `GROWTH(A2:B4,A6:B8,A9:A10)` is an array formula spanning cells B9:B10, those cells take on the results shown.

end example]

18.17.7.139 HARMEAN

Syntax:

HARMEAN (*argument-list*)

Description: Computes the harmonic mean of a data set.

Mathematical Formula:

$$\frac{1}{H_y} = \frac{1}{n}\sum\frac{1}{Y_i}$$

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

where:

- n = number of elements in *argument-list*
- Y_i = each element in *argument-list*

Arguments:

Name	Type	Description
argument-list	logical, text, number, name, array, or reference to number.	The *argument*s in *argument-list* designate the values to be averaged. Argument values can be numbers, or names, arrays, or references that contain numbers. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The harmonic mean of a data set.

However, if the value of any data point ≤ 0, `#NUM!` is returned.

[*Example*:

`HARMEAN(4.6,5.8,8.3,7)` results in `6.124222`
`HARMMEAN(10.5,{5.3,2.9},"12")` results in `5.617360`

end example]

18.17.7.140 HEX2BIN

Syntax:

`HEX2BIN (` *number* `[ , ` *num-bin-digits* `] )`

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

Name	Type	Description
number	text	A 10-digit hexadecimal number in a string that is to be converted to a binary string. *number* is not case-sensitive. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
num-bin-digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-bin-digits* is ignored and the result has 10 digits. If *num-bin-digits* is omitted, the minimum number of digits is used in the result. *num-bin-digits* is truncated to an integer.

Return Type and Value: text – The binary equivalent of *number*.

However, if

- *number* is outside the range `"FFFFFFFE00"` (1111111111111111111111111111111000000000 binary, -512 decimal) to `"1FF"` (0000000000000000000000000000000111111111 binary, 511 decimal), inclusive, `#NUM!` is returned.
- *number* contains one or more non-hexadecimal digits, `#NUM!` is returned.
- *number* contains more than 10 hexadecimal digits, `#NUM!` is returned.
- *number* needs more digits that *num-bin-digits*, `#NUM!` is returned.
- *num-bin-digits* is negative or > 10, `#NUM!` is returned.

[*Example*:

`HEX2BIN("fE")` results in `11111110`
`HEX2BIN("FFFFFFFFFE")` results in `1111111110`
`HEX2BIN("2")` results in `10`
`HEX2BIN("F",6)` results in `001111`

end example]

18.17.7.141 HEX2DEC

Syntax:

HEX2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

Name	Type	Description
number	string	A 10-digit hexadecimal number in a string that is to be converted to a decimal number. *number* is not case-sensitive. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		left-most bit (40th bit from the right) representing the sign bit.

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-hexadecimal digits, `#NUM!` is returned.
- *number* contains more than 10 hexadecimal digits; that is, *number* is outside the range `"8000000000"` (-548,755,813,888 decimal) to `"7FFFFFFFFF"` (548,755,813,887 decimal), inclusive, `#NUM!` is returned.

[*Example*:

`HEX2DEC("FE")` results in `254`
`HEX2DEC("FFFFFFFFFE")` results in `-2`
`HEX2DEC("F000000000")` results in `-68719476736`

end example]

18.17.7.142 HEX2OCT

Syntax:

HEX2OCT (*number* [, *num-oct-digits*])

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

Name	Type	Description
number	text	A 10-digit hexadecimal number in a string that is to be converted to an octal string. *number* is not case-sensitive. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.
num-oct-digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-oct-digits* is ignored and the result has 10 digits. If *num-oct-digits* is omitted, the minimum number of digits is used in the result. *num-oct-digits* is truncated to an integer.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Return Type and Value: text – The octal equivalent of *number*.

However, if

- *number* is outside the range "FFE0000000" (17774000000000 octal, -536,870,912 decimal) to "1FFFFFFF" (00003777777777 octal, 536,870,911 decimal), inclusive, #NUM! is returned.
- *number* contains one or more non-hexadecimal digits, #NUM! is returned.
- *number* contains more than 10 hexadecimal digits, #NUM! is returned.
- *number* needs more digits that *num-oct-digits*, #NUM! is returned.
- *num-oct-digits* is negative or > 10, #NUM! is returned.

[*Example*:

HEX2OCT("fE") results in 376
HEX2OCT("FFFFFFFFFE") results in 7777777776
HEX2OCT("2") results in 2
HEX2OCT("F",6) results in 000017

end example]

18.17.7.143 HLOOKUP

Syntax:

HLOOKUP (*lookup-value* , *table-array* , *row-index-num* [, [*range-lookup-flag*]])

Description: Performs a horizontal search for a value in the top row of a table or an array, noting the column in which the matching value is found. From that column, the value from a given row is returned.

Arguments:

Name	Type	Description
lookup-value	value or reference.	The value to be located in the first row of the table. If *range-lookup* is FALSE and *lookup-value* is a string, the wildcard characters, question mark (?) and asterisk (*), can be included in *lookup-value*. A question mark matches any single character; an asterisk matches any sequence of characters. To find a question mark or asterisk, use a tilde (~) before the character.
table-array	array, reference, name	Designates the table of information to be searched. The values in the first row of *table-array* can be text, numbers, or logical values. If *range-lookup-flag* is TRUE, the values in the first row of *table-array* shall be placed in "ascending order", as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. If *range-lookup-flag* is FALSE, *table-array*'s values need not be sorted. Uppercase and lowercase text

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		is treated as equivalent.
row-index-num	number	The row number in *table-array* from which the matching value is to be returned. (A *row-index-num* of 1 returns the first row value in *table-array*, a *row-index-num* of 2 returns the second row value in *table-array*, and so on.)
range-lookup-flag	logical	Specifies whether HLOOKUP is to find an exact or approximate match. If TRUE or omitted, an approximate match is returned. That is, if an exact match is not found, the next largest value that is less than *lookup-value* is returned. If FALSE, an exact match is performed.

Return Type and Value: any – The value from a given row number, where the column is determined by a search of the top row looking for a match with a given value.

However, if

- An exact match is performed, but no match is found, #N/A is returned.
- *row-index-num* is less than 1, #VALUE! is returned.
- *row-index-num* is greater than the number of rows in *table-array*, #REF! is returned.
- *lookup-value* is smaller than the smallest value in the first row of *table-array*, #N/A is returned.

[*Example*: Given the following data:

	A	B	C
1	Axles	Bearings	Bolts
2	4	6	9
3	5	7	10
4	6	8	11

HLOOKUP("Axles",A1:C4,2,TRUE) results in 4
HLOOKUP("Bearings",A1:C4,3,FALSE) results in 7
HLOOKUP("B",A1:C4,3,TRUE) results in 5
HLOOKUP("Bolts",A1:C4,4) results in 11
HLOOKUP(3,{1,2,3;"a","b","c";"d","e","f"},2,TRUE) results in c

end example]

18.17.7.144 HOUR

Syntax:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

HOUR (*time-value*)

Description: Computes the hour for the date and/or time having the given *time-value*.

Arguments:

Name	Type	Description
time-value	number	The date and/or time whose hour is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a *string-constant* having any date and/or time format, in which case, any date information shall be ignored.

Return Type and Value: number – The hour for the date and/or time having the given *time-value*. The returned value shall be in the range 0–23.

However, if *time-value* is out of range for the current date base value, #NUM! is returned.

[*Example*:

HOUR(DATE(2006,2,26)+TIME(2,10,20)) results in 2
HOUR(TIME(22,56,34)) results in 22
HOUR(0) results in 0, since serial value 0 represents 00:00:00
HOUR(10.5) results in 12, since serial value .5 represents 12:00:00
HOUR("22-Oct-2001 10:53:12") results in 10
HOUR("10:53:12 pm") results in 22
HOUR("22:53:12") results in 22

end example]

18.17.7.145 HYPERLINK

Syntax:

HYPERLINK (*link-location* [, [*friendly-name*]])

Description: Creates a shortcut that opens a document stored on a network server, an intranet, or the Internet. When the cell that contains the HYPERLINK function call is clicked, the file stored at *link-location* is opened.

Arguments:

Name	Type	Description
link-location	text	The location to be opened as text. *link-location* can refer to a place in a document—such as a specific cell or named range in a SpreadsheetML worksheet or workbook, or to a bookmark in a WordprocessingML

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		document. The *link-location* can be to a location on a local hard disk drive, the path to a location on a server or a Uniform Resource Locator (URL) to a location on the Internet or an intranet. [*Note*: Using a URL is the preferred way of specifying *link-location*. *end note*] If the location specified in *link-location* does not exist or cannot be navigated, an unspecified error is produced when the cell is clicked. *link-location* can be a string or a reference to a cell containing a string.
friendly-name	text, number, name	The value that is displayed in the cell. If omitted, the cell displays *link-location*. *friendly-name* can be a value, a text string, a name, or a cell that contains the jump text or value. If the evaluation of *friendly-name* results in an error value, the cell displays that error value rather than the jump text.

Return Type and Value: text – The value of *friendly-name*, if it is specified; otherwise, the value of *link-location*.

[*Example*:

`HYPERLINK("http://example.openxmlformats.org/report/budget report.xls","Click for report")`, which opens a worksheet named "budget report.xls" that is stored on the Internet at the location example.openxmlformats.org/report, and displays the text "Click for report".

`HYPERLINK("D:\FINANCE\1stqtr.xls",H10)`, which opens the file 1stqtr.xls that is stored in a directory named Finance on drive D, and displays the numeric value stored in cell H10.

end example]

18.17.7.146 HYPGEOMDIST

Syntax:

HYPGEOMDIST (*sample-successes* , *number-sample* , *population-successes* , *number-population*)

Description: Computes the hypergeometric distribution; that is, the probability of a given number of sample successes, given the sample size, population successes, and population size.

Mathematical Formula:

$$P(X = x) = h(x, n, M, N) = \frac{\binom{M}{x}\binom{N-M}{n-x}}{\binom{N}{n}}$$

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

where:

- *M* = *population-successes* argument
- *N* = *number-population* argument
- *x* = *sample-successes* argument
- *n* = *number-sample* argument

Arguments:

Name	Type	Description
sample-successes	number	The number of successes in the sample, truncated to integer.
number-sample	number	The size of the sample, truncated to integer.
population-successes	number	The number of successes in the population, truncated to integer.
number-population	number	The population size, truncated to integer.

Return Type and Value: number – The hypergeometric distribution.

However, if

- *sample-successes* < 0 or *sample-successes* is greater than the lesser of *number-sample* and *population-successes*, `#NUM!` is returned.
- *sample-successes* is less than the larger of 0 or (*number-sample* - *number-population* + *population-successes*), `#NUM!` is returned.
- *number-sample* ≤ 0 or *number-sample* > *number-population*, `#NUM!` is returned.
- *population-successes* ≤ 0 or *population-successes* > *number-population*, `#NUM!` is returned.
- *number-population* ≤ 0, `#NUM!` is returned.

[*Example*:

`HYPGEOMDIST(1,4,8,20)` results in `0.363261`

end example]

18.17.7.147 IF

Syntax:

`IF (` *logical-value* `, [` *value-if-true* `][ , [` *value-if-false* `]] )`

Description: Tests *logical-value*, and if it is TRUE, *value-if-true* is evaluated and returned; otherwise, *value-if-false* is evaluated and returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Arguments:

Name	Type	Description
logical-value	logical	The value to be tested.
value-if-true	any	The value returned if *logical-value* is TRUE. If *logical-value* is TRUE and *value-if-true* is omitted, this argument evaluates to 0. *value-if-true* can contain up to seven levels of nested IF function calls. [*Note*: *value-if-true* and *value-if-false* need not evaluate to results of the same type. *end note*]
value-if-false	any	The value returned if *logical-value* is FALSE. If *logical-value* is FALSE and *value-if-false* and its preceding comma is omitted, this argument evaluates to FALSE. If *logical-value* is FALSE and *value-if-false* is omitted, but its preceding comma is present, this argument evaluates to 0. *value-if-false* can contain at least seven levels of nested IF function calls. [*Note*: *value-if-true* and *value-if-false* need not evaluate to results of the same type. *end note*]

If any argument is an array, every element of that array shall be evaluated when that argument is evaluated.

Return Type and Value: any – *value-if-true*, if *logical-value* is TRUE; otherwise, *value-if-false*.

[*Example*:

```
IF(10>5,"Yes","No") results in Yes
IF(10>5,"Yes") results in Yes
IF(10>5,"Yes",) results in Yes
IF(10<5,"Yes") results in FALSE
IF(10<5,"Yes",) results in 0

IF(10>5,,"No") results in 0
IF(10>5,,) results in 0
IF(10>5,"Yes",20) results in Yes
IF(10<5,"Yes",20) results in 20
```

end example]

18.17.7.148 IFERROR

Syntax:

```
IFERROR ( value , value-if-error )
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Description: Provides a simpler and more efficient way of trapping and handling errors. It allows the generation of user-defined error text for a function call that can result in an error.

Arguments:

Name	Type	Description
value	any	The value that is checked for an error (i.e., any of the following: `#N/A`, `#VALUE!`, `#REF!`, `#DIV/0!`, `#NUM!`, `#NAME?`, or `#NULL!`). If *value* is an empty cell, it is treated as an empty string.
value-if-error	any	The value to return if *value* evaluates to an error. If *value-if-error* is an empty cell, it is treated as an empty string.

Return Type and Value: any – *value*, if *value* is not an error; otherwise, *value-if-error*. If *value* is an array formula, an array of results for each cell in the range specified in value, is returned.

[*Example*: Consider the case in which A3 contains 55, and B3 contains 0:

A3/B3 results in `#DIV/0`

`IFERROR(A3/B3,"Error in calculation")` results in `Error in calculation`

end example]

18.17.7.149 IMABS

Syntax:

`IMABS (` *complex-number* `)`

Description: Computes the absolute value of *complex-number*.

Mathematical Formula:

$IMABS(z) = |z| = \sqrt{x^2 + y^2}$

where:

- z = argument *complex-number*, expressed in the form x + yi

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the absolute value is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The absolute value of *complex-number*.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMABS("3+4i")` results in 5
`IMABS("-2.5-34.6j")` results in `34.69020035`

end example]

18.17.7.150 IMAGINARY

Syntax:

`IMAGINARY ( complex-number )`

Description: Computes the imaginary coefficient of *complex-number*.

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the imaginary coefficient is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: number – The imaginary coefficient of *complex-number*.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMAGINARY("3+4i")` results in 4
`IMAGINARY("-2.5-34.6j")` results in `34.6`

end example]

18.17.7.151 IMARGUMENT

Syntax:

`IMARGUMENT ( complex-number )`

Description: Computes the argument θ, an angle expressed in radians, such that for a complex number *complex-number* having the form *x+yi*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

$x + yi = |x + yi| \times e^{\theta} = |x + yi|(\cos\theta + i\sin\theta)$

Mathematical Formula:

$$IMARGUMENT(z) = \tan^{-1}\left(\frac{y}{x}\right) = \theta$$

where:

- $\theta \in (-\pi; \pi]$
- z = argument *complex-number*, expressed in the form x + yi

Arguments:

Name	Type	Description
complex-number	text	The complex number in *x + yi* or *x + yj* text format.

Return Type and Value: number – The angle θ, expressed in radians.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMARGUMENT("13+4i")` results in `0.298498932`
`IMARGUMENT("-2.5-5j")` results in `-2.034443936`

end example]

18.17.7.152 IMCONJUGATE

Syntax:

`IMCONJUGATE (` *complex-number* `)`

Description: Computes the complex conjugate of the complex number *complex-number*.

Mathematical Formula:

$$ICONJUGATE(x + yi) = \bar{z} = (x - yi)$$

where:

- $\bar{z}$ = conjugate of the argument *complex-number*, expressed in the form x + yi

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
complex-number	text	The complex number for which the complex conjugate is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the complex conjugate of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMCONJUGATE("2.3+4.5i")` results in `2.3-4.5i`
`IMCONJUGATE("-1-4j")` results in `-1+4j`

end example]

18.17.7.153 IMCOS

Syntax:

`IMCOS` (*complex-number*)

Description: Computes the cosine of the complex number *complex-number*.

Mathematical Formula:

$$\cos(x + yi) = \cos(x)\cosh(y) - \sin(x)\sinh(y)i$$

where:

- the argument *complex-number is* expressed in the form x + yi

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the cosine is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the cosine of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

`IMCOS("2.3+4.5i")` results in `-29.9918288739746-33.5589799796873i`
`IMCOS("-1-4j")` results in `14.7547011704838-22.963673499193j`

end example]

18.17.7.154 IMDIV

Syntax:

`IMDIV (` *complex-number-1* `,` *complex-number-2* `)`

Description: Computes the quotient from dividing two complex numbers.

Mathematical Formula:

$$IMDIV(z_1, z_2) = \frac{(a+bi)}{(c+di)} = \frac{(ac+bd)+(bc-ad)i}{c^2+d^2}$$

where:

- z_1 = argument *complex-number-1* expressed in the form of a + bi
- z_2 = argument *complex-number-2* expressed in the form of c + di

Arguments:

Name	Type	Description
complex-number-1	text	Complex numbers in *x + yi* or *x + yj* text format; they designate the dividend and divisor, respectively.
complex-number-2	text	

Return Type and Value: text – A string containing the quotient from *number-1 / number-2*, in *x+yi* or *x+yj* text format.

However, if *complex-number-1* or *complex-number-2* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMDIV("13+4i","5+3i")` results in `2.26470588235294-0.558823529411765i`
`IMDIV("-3-3.5i","5+3i")` results in `-0.75-0.25i`

end example]

18.17.7.155 IMEXP

Syntax:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

`IMEXP ( complex-number )`

Description: Computes the exponential of the complex number *complex-number*.

Mathematical Formula:

$$IMEXP(\ \ ) = e^{(x+yi)} = e^x e^{yi} = e^x(\cos y + i \sin y)$$

where:

- z = the argument *complex-number*, expressed in the form x + yi

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the exponential is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the exponential of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMEXP("2.3+4.5i")` results in `-2.10251576423113-9.75006374866818i`
`IMEXP("-1-4j")` results in `-0.240462049968584+0.278412079051034j`

end example]

18.17.7.156 IMLN

Syntax:

`IMLN ( complex-number )`

Description: Computes the natural logarithm of *complex-number*.

Mathematical Formula:

$$\ln(x + yi) = \ln\sqrt{x^2 + y^2} + i \tan^{-1}\left(\frac{y}{x}\right)$$

where:

- the argument *complex-number* is expressed in the form x + yi

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
complex-number	text	The complex number for which the natural logarithm is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – The natural logarithm of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMLN("3+4i")` results in `1.6094379124341+0.927295218001612i`
`IMLN("-2.5-34.6j")` results in `3.54645723627033-1.64292531532225j`

end example]

18.17.7.157 IMLOG10

Syntax:

`IMLOG10 ( complex-number )`

Description: Computes the base-10 logarithm of *complex-number*.

Mathematical Formula:

The common logarithm of a complex number can be calculated from the natural logarithm as follows:

$$\log_{10}(x + yi) = (\log_{10} e)\ln(x + yi)$$

where:

- the argument *complex-number* is expressed in the form x + yi

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the base-10 logarithm is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – The base-10 logarithm of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*:

`IMLOG10("3+4i")` results in `10.698970004336019+0.402719196273373i`
`IMLOG10("-2.5-34.6j")` results in `11.54020680801806-0.713513398623614j`

end example]

18.17.7.158 IMLOG2

Syntax:

`IMLOG2 ( complex-number )`

Description: Computes the base-2 logarithm of *complex-number*.

Mathematical Formula:

The base-2 logarithm of a complex number can be calculated from the natural logarithm as follows:

$$\log_2(x + yi) = (\log_2 e)\ln(x + yi)$$

where:

- the argument *complex-number* is expressed in the form x + yi

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the base-2 logarithm is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – The base-2 logarithm of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

IMLOG2("3+4i") results in `2.32192809506607+1.33780421255394i`
IMLOG2("-2.5-34.6j") results in `5.11645626788577-2.37024020514877j`

end example]

18.17.7.159 IMPOWER

Syntax:

`IMPOWER ( complex-number , y )`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Description: Computes the complex number *complex-number* raised to the power *y*.

Mathematical Formula:

$(x + yi)^n = r^n e^{in\theta} = r^n \cos\theta + ir^n \sin n$

where:

$r = \sqrt{x^2 + y^2}$

and:

$= \tan^{-1}\left(\frac{y}{x}\right)$

and:

$\theta \in (-\pi; \pi]$

where:

- argument *complex-number* is expressed in the form x + yi
- *n* = argument *y*

Arguments:

Name	Type	Description
complex-number	text	The complex number in *x + yi* or *x + yj* text format.
y	number	The exponent to which *complex-number* is to be raised.

Return Type and Value: text – A string containing *complex-number*^{y}, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMPOWER("2.3+4.5i",2.5)` results in `-52.9752689709953+22.138528463954i`
`IMPOWER("-1-4j",-3.56)` results in `6.34818926783845E-003+1.16156377299512E-003j`

end example]

18.17.7.160 IMPRODUCT

Syntax:

```
IMPRODUCT ( argument-list )
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Description: Multiplies the values of its complex number arguments.

Mathematical Formula:

$(a + bi)(c + di) = (ac - bd) + (ad + bc)i$

where:

- Each element of *argument-list* is a complex number expressed in the form x + yi

Arguments:

Name	Type	Description
argument-list	text	Each *argument* in *argument-list* is a complex number string in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the product of the values of its arguments, in *x+yi* or *x+yj* text format.

However, if any *argument* in *argument-list* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMPRODUCT("13+4i")` results in `13+4i`
`IMPRODUCT("-3-3.5i","5+3i")` results in `-4.5-26.5i`
`IMPRODUCT("1.3-2j","-3.4+3j","2.3-6j")` results in `67.834+15.13j`

end example]

18.17.7.161 IMREAL

Syntax:

`IMREAL ( complex-number )`

Description: Computes the real coefficient of *complex-number*.

where:

- argument *complex-number* is expressed in the form x + yi

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the real coefficient is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: number – The real coefficient of *complex-number*.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMREAL("3+4i")` results in 3
`IMREAL("-2.5-34.6j")` results in `-2.5`

end example]

18.17.7.162 IMSIN

Syntax:

`IMSIN ( complex-number )`

Description: Computes the sine of the complex number *complex-number*.

Mathematical Formula:

$$\sin(x + yi) = \sin(x)\cosh(y) - \cos(x)\sinh(y)i$$

where:

- argument *complex-number* is expressed in the form x + yi

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the sine is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the sine of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMSIN("2.3+4.5i")` results in `33.567264016308-29.9844272159606i`
`IMSIN("-1-4j")` results in `-22.9790855778861-14.7448051885587j`

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.163 IMSQRT

Syntax:

`IMSQRT ( complex-number )`

Description: Computes the square root of the complex number *complex-number*.

Mathematical Formula:

$$\sqrt{x+yi} = \sqrt{r}\cos\left(\frac{\theta}{2}\right) + i\sqrt{r}\sin\left(\frac{\theta}{2}\right)$$

where:

$$r = \sqrt{x^2+y^2}$$

and:

$$\theta = \tan^{-1}\left(\frac{y}{x}\right)$$

and:

$$\theta \in (-\pi;\pi]$$

where:

- argument *complex-number* is expressed in the form x + yi

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the square root is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the square root of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example:*

`IMSQRT("2.3+4.5i")` results in `1.91751290835255+1.17339496918073i`
`IMSQRT("-1-4j")` results in `1.24962106768765-1.60048518044024j`

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

18.17.7.164 IMSUB

Syntax:

`IMSUB ( complex-number-1 , complex-number-2 )`

Description: Computes the difference of two complex numbers.

Mathematical Formula:

$(a + bi) - (c + di) = (a - c) + (b - d)i$

$(a+bi)-(c+di)=(a-c)+(b-d)i$

where:

- argument *complex-number-1* is expressed in the form a + bi
- argument *complex-number-2* is expressed in the form c + di

Arguments:

Name	Type	Description
complex-number-1	text	Complex numbers in *x + yi* or *x + yj* text format; they designate the minuend and subtrahend, respectively.
complex-number-2	text	

Return Type and Value: text – A string containing *number-1 - number-2*, in *x+yi* or *x+yj* text format.

However, if *complex-number-1* or *complex-number-2* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMSUB("13+4i","5+3i")` results in `8+i`
`IMSUB("-3-3.5i","5+3i")` results in `-8-6.5i`

end example]

18.17.7.165 IMSUM

Syntax:

`IMSUM ( argument-list )`

Description: Adds the values of its arguments.

Mathematical Formula:

$(a + bi) + (c + di) = (a + c) + (b + d)i$

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

where:

- Each element of *argument-list* is a complex number expressed in the form x + yi

Arguments:

Name	Type	Description
argument-list	text	Each *argument* in *argument-list* is a complex number string in *x + yi* or *x + yj* text format.

Return Type and Value: text – The sum of the values of its arguments, in *x+yi* or *x+yj* text format.

However, if any *argument* in *argument-list* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMSUM("3+4i")` results in `3+4i`
`IMSUM("3+4i","5-3i")` results in `8+i`

end example]

18.17.7.166 INDEX

Syntax:

array form: `INDEX ( array , [ row-number ][ , [ column-number ]] )`

reference form: `INDEX ( reference [ , [ row-number ][ , [ column-number ]`
`[ , [ area-number ]]]] )`

Description: Locates a value or the reference to a value from within a table or range. There are two forms of the `INDEX` function: the array form and the reference form.

Arguments:

Name	Type	Description
array	array, reference	Table or range to be searched. If *array* contains only one row, the corresponding *row-number* argument is optional. If *array* contains only one column, the corresponding *column-number* argument is optional.
reference	reference	A reference to one or more cell ranges. If each area (§18.17.2.3) in *reference* contains only one row, *row-number* is optional. If each area contains only one column, *column-number* is optional.
row-number	number	*row-number* indicates the row in *array* (or *reference*) from which to return a value (or reference). If *row-*
column-	number	

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
number		*number* is omitted, *column-number* shall be present. *column-number* indicates the column in *array* (or *reference*) from which to return a value (or *reference*). If *column-number* is omitted, *row-number* shall be present. If both the *row-number* and *column-number* arguments are used, `INDEX` returns the value (or *reference*) in the cell at the intersection of *row-number* and *column-number*. If *array* has more than one row and more than one column, and only *row-number* or *column-number* is used, `INDEX` returns an array of the entire row or column in array. If *row-number* or *column-number*, but not both, is 0, `INDEX` returns the array of values for the entire column or row, respectively. In the reference form, if *row-number* and *column-number* are both omitted, `INDEX` returns the area in reference specified by *area-number*.
area-number	number	Indicates a range in *reference* from which to return the intersection of *row-number* and *column-number*. The first area selected or entered is numbered 1, the second 2, and so on. If *area-number* is omitted, 1 is assumed. [*Example*: If *reference* describes the cells `(A1:B4, D1:E4, G1:H4)`, then area-number 1 is the range `A1:B4`, *area-number* 2 is the range `D1:E4`, and *area-number* 3 is the range `G1:H4`. *end example*]

Return Type and Value: various – For the array form, returns a single value, a whole row, or a whole column from a table or an array, depending on the presence and values of the row and column number indexes.

For the reference form, returns a single reference, a whole row, or a whole column from a reference, depending on the presence and values of the row and column number indexes, and the area number.

However, for the array form

- *row-number* is outside the bounds of *array*, `#REF!` is returned.
- *column-number* is outside the bounds of *array*, `#REF!` is returned.

For the reference form

- *row-number* is outside the bounds of *reference*, `#REF!` is returned.
- *column-number* is outside the bounds of *reference*, `#REF!` is returned.
- *area-number* is outside the bounds of *reference*, `#REF!` is returned.

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

`INDEX({"Apples","Lemons";"Bananas","Pears"},2,2)` results in `Pears`
`INDEX({"Apples","Lemons";"Bananas","Pears"},2,1)` results in `Bananas`
`INDEX({"Apples","Lemons"},,2)` results in `Lemons`
`INDEX({"Apples";"Bananas"},1)` results in `Apples`

Given the following data:

	A	B	C
1	Fruit	Price	Count
2	Apples	0.69	40
3	Bananas	0.34	38
4	Lemons	0.55	15
5	Oranges	0.25	25
6	Pears	0.59	40
7	Almonds	2.8	10

`INDEX(A2:C7,2,3)` results in `38`
`INDEX((A2:C4,A6:C7),2,2,2)` results in `2.8`
`INDEX((A2:C4,A6:C7),2,2,1)` results in `0.34`

end example]

18.17.7.167 INDIRECT

Syntax:

`INDIRECT ( ` *ref-text* `[ , [ ` *A1-ref-style-flag* `] ] )`

Description: Locates the reference specified by *ref-text* and evaluates that reference to get to its underlying value. [*Note*: This function should be used when the reference to a cell within a formula is to be changed without changing the formula itself. *end note*]

Arguments:

Name	Type	Description
ref-text	An A1-style reference, an R1C1-style reference, a name defined as a reference, or a reference to a cell as a string.	If *ref-text* refers to another workbook (i.e., it's an external reference), that other workbook shall be open.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
A1-ref-style-flag	logical	Specifies the kind of reference that is contained in the cell *ref-text*. If TRUE or omitted, *ref-text* is interpreted as an A1-style reference (§18.17.2.3.1); otherwise, *ref-text* is interpreted as an R1C1-style reference (§18.17.2.3.2).

Return Type and Value: any – The underlying value of the location referred to by *ref-text*.

However, if

- *ref-text* is not a cell reference, `#REF!` is returned.
- *ref-text* refers to another workbook yet that other workbook is not currently open, the return value is unspecified.
- *ref-text* is a name, then the content of the named expression can have implementation-defined constraints.

[*Example*:

Given the following data:

	A	B
1	Data	Data
2	B2	1.333
3	B3	45
4	George	10
5	5	62

where A2 contains a reference to B2, A3 contains a reference to B3, A4 contains the defined name George that refers to B4, and A5 contains the row number of B5:

`INDIRECT($A$2)` results in `1.333`
`INDIRECT($A$3)` results in `45`
`INDIRECT($A$4)` results in `10`
`INDIRECT("B"&$A$5)` results in 62

`INDIRECT("R[-1]C",FALSE)` uses the cell in the previous row and current column.
end example]

18.17.7.168 INFO

Syntax:

```
INFO ( category )
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Description: Retrieves the operating environment value that corresponds to *category*.

Arguments:

Name	Type	Description
category	text	The string designated by *category* is not case-sensitive. The permitted strings are shown in the table below.

category	Meaning	Result Type
`"directory"`	Path of the current directory or folder.	text
`"memavail"`	Amount of memory available, in bytes.	number
`"memused"`	Amount of memory being used for data.	number
`"numfile"`	Number of active worksheets in the open workbooks.	number
`"origin"`	The absolute cell reference of the top and leftmost cell visible in the window, based on the current scrolling position, prefixed with `"$A:"`. [*Example*: Using cell D9 as an example, the return value would be $A:$D$9. *end example*]	text
`"osversion"`	Current operating system version.	text
`"recalc"`	Current recalculation mode: `"Automatic"` or `"Manual"`	text
`"release"`	Version of the implementation.	text
`"system"`	Name of the operating environment.	text
`"totmem"`	Total memory available, including memory already in use, in bytes.	number

Return Type and Value: text – The operating environment value that corresponds to *category*.

However, if *category* is not one of the values defined above, `#VALUE!` is returned.

[*Example*:

`INFO("directory")` might result in `e:\My Documents\`
`INFO(A10)` might result in `e:\My Documents\`, where A10 contains `directory`
`INFO("memavail")` might result in `1048576`

`INFO("memused")` might result in `1474464`
`INFO("numfile")` might result in `5`
`INFO("origin")` might result in `$A:$C$536`

`INFO("osversion")` might result in `Windows (32-bit) NT 5.01`
`INFO("recalc")` might result in `Automatic`
`INFO("release")` might result in `11.0`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

`INFO("system")` might result in `pcdos`
`INFO("totmem")` might result in `2523040`

end example]

18.17.7.169 INT

Syntax:

`INT ( x )`

Description: Computes x rounded down to an integer.

Arguments:

Name	Type	Description
x	number	The value to be rounded down.

Return Type and Value: number – The rounded-down value of x.

[*Example*:

`INT(8.9)` results in `8`
`INT(-8.9)` results in `-9`

end example]

18.17.7.170 INTERCEPT

Syntax:

`INTERCEPT ( known-ys , known-xs )`

Description: Computes the point at which a line intersects the y-axis by using existing x-values and y-values. The intercept point is based on a best-fit regression line plotted through the known x-values and known y-values.

Mathematical Formula:

The equation for the intercept of the regression line, a, is:

$$a = \bar{y} - b\bar{x}$$

where the slope, b, is calculated as:

$$b = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

where:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*known-xs*)
- y = a sample value
- $\bar{y}$ = the sample mean AVERAGE(*known-ys*)

Arguments:

Name	Type	Description
known-ys	number, name, array, reference to number	The dependent set of observations or data. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
known-xs	number, name, array, reference to number	The independent set of observations or data. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The point at which a line intersects the y-axis by using existing x-values and y-values.

However, if

- *known-ys* and *known-xs* contain a different number of data points, the return value is unspecified.
- *known-ys* or *known-xs* contain no data points, the return value is unspecified.

[*Example*:

`INTERCEPT({2,3,9,1,8},{6,5,11,7,5})` results in `0.048387097`

end example]

18.17.7.171 INTRATE

Syntax:

`INTRATE` (*settlement* , *maturity* , *investment* , *redemption* [, [*basis*]])

Description: Computes the interest rate for a fully invested security.

Mathematical Formula:

$$INTRATE = \frac{redemption - nvestment}{investment} \times \frac{B}{DIM}$$

where:

- B = number of days in a year, depending on the year basis

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- *DIM* = number of days from settlement to maturity.
- *investment* = argument *investment*
- *redemption* = argument *redemption*

Arguments:

<table>
<tr><th>Name</th><th>Type</th><th>Description</th></tr>
<tr><td>settlement</td><td>number</td><td>The security's settlement date.</td></tr>
<tr><td>maturity</td><td>number</td><td>The security's maturity date.</td></tr>
<tr><td>investment</td><td>number</td><td>The amount invested in the security.</td></tr>
<tr><td>redemption</td><td>number</td><td>The amount to be received at maturity.he security's annual yield.</td></tr>
<tr><td>basis</td><td>number</td><td>The truncated integer type of day count basis to use, as follows:
<table>
<tr><th>Value</th><th>Day Count Basis</th></tr>
<tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:
If the date is 28 or 29 February, it is adjusted to 30 February.
For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr>
</table>
</td></tr>
</table>

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		1 — Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. 2 — Actual/360. Similar to Basis 1, but only has 360 days per year. 3 — Actual/365. Similar to Basis 1, but always has 365 days per year. 4 — European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 Februar

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		y.

Time information in the date arguments is ignored.

Return Type and Value: number – The interest rate for a fully invested security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *investment* or *redemption* ≤ 0, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`INTRATE(DATE(2008,2,15),DATE(2008,5,15),1000000,1014420,2)` results in `5.7680%`

end example]

18.17.7.172 IPMT

Syntax:

`IPMT ( rate , per, nper , pv , [ fv ] [ , [ type ] ] )`

Description: Computes the interest payment for a given period for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description
rate	number	The interest rate.
per	number	The period for which the interest is to be found, and shall be in the range 1–*nper*.
nper	number	The total number of payment periods in an annuity.
pv	number	The present value, or the lump-sum amount that a series of future payments is worth right now.
fv	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
type	number	The timing of the payment, truncated to integer, as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The interest payment for a given period for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`IPMT(0.1/12,1*3,3,8000)` results in `-22.41`
`IPMT(0.1,3,3,8000)` results in `-292.45`

end example]

18.17.7.173 IRR

`IRR ( values [ , [ guess ] ] )`

Description: Computes the internal rate of return for a series of cash flows represented by the numbers in *values*. (These cash flows do not have to be even, as they would be for an annuity. However, the cash flows shall occur at regular intervals, such as monthly or annually. The internal rate of return is the interest rate received for an investment consisting of payments (negative values) and income (positive values) that occur at regular periods.)

Arguments:

Name	Type	Description
values	array, reference, text, logical	The set of numbers for which the internal rate of return is to be calculated. *values* shall contain at least one positive value and one negative value to calculate the internal rate of return. The order of numbers in *values* is significant, so be sure payment and income numbers are in the desired sequence. If *values* contains elements that are text, logical values, or empty cells, those elements are ignored.
guess	number	An estimate of the result of `IRR`. If omitted, it is assumed

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		to be 0.1 (i.e., 10 percent).

Return Type and Value: number – The internal rate of return for a series of cash flows.

However, if the implementation determines that a return value cannot be computed, `#NUM!` is returned.

[*Example*:

`IRR({-70000,12000,15000,18000,21000})` results in `-2.1245%`
`IRR({-70000,12000,15000,18000,21000,26000})` results in `8.6631%`
`IRR({-70000,12000,15000},-0.1)` results in `-44.3507%`

end example]

18.17.7.174 ISBLANK

Syntax:

`ISBLANK ( value )`

Description: Determines if *value* refers to an empty cell.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* refers to an empty cell; otherwise, FALSE.

[*Example*:

`ISBLANK(A10)` results in TRUE, when A10 is empty
`ISBLANK(A10)` results in FALSE, when A10 contains 123

end example]

18.17.7.175 ISERR

Syntax:

`ISERR ( value )`

Description: Determines if *value* is any of the error values other than `#N/A`.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* is one of the error values, excluding #N/A; otherwise, FALSE.

[*Example*:

ISERR(A1) results in TRUE if A1 evaluates to #DIV/0!, for example
ISERR(B1) results in FALSE if B1 evaluates to #N/A

end example]

18.17.7.176 ISERROR

Syntax:

ISERROR (*value*)

Description: Determines if *value* is any of the error values.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* is one of the error values; otherwise, FALSE.

[*Example*:

ISERROR(A1) results in TRUE if A1 evaluates to #DIV/0!, for example

end example]

18.17.7.177 ISEVEN

Syntax:

ISEVEN (*value*)

Description: Determines if *value* is an even number or refers to a cell containing an even number.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
value	number	The value to be tested. It is truncated to an integer.

Return Type and Value: logical – TRUE if *value* is an even number or refers to a cell containing an even number; otherwise, FALSE.

[*Example*:

`ISEVEN(12.456)` results in TRUE
`ISEVEN(A10)` results in FALSE, when A10 contains -15

end example]

18.17.7.178 ISLOGICAL

Syntax:

`ISLOGICAL ( value )`

Description: Determines if *value* contains a logical value or refers to a cell containing a logical value.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* contains a logical value or refers to a cell containing a logical value; otherwise, FALSE.

[*Example*:

`ISLOGICAL(TRUE)` results in TRUE
`ISLOGICAL(A10)` results in FALSE, when A10 contains 123
`ISLOGICAL({TRUE,2})` results in TRUE
`ISLOGICAL({2,TRUE})` results in FALSE

end example]

18.17.7.179 ISNA

Syntax:

`ISNA ( value )`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Description: Determines if *value* is the error value #N/A.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* is #N/A; otherwise, FALSE.

[*Example*:

ISERR(A1) results in TRUE if A1 evaluates to #N/A
ISERR(B1) results in TRUE if B1 evaluates to #DIV/0!, for example

end example]

18.17.7.180 ISNONTEXT

Syntax:

```
ISNONTEXT ( value )
```

Description: Determines if *value* does not contain text or does not refer to a cell containing text. An empty cell is not text.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* does not contain text or does not refer to a cell containing text; otherwise, FALSE.

[*Example*:

ISNONTEXT("ABC") results in FALSE
ISNONTEXT(A10) results in TRUE, when A10 contains 123
ISNONTEXT({1,"ABC"}) results in TRUE
ISNONTEXT({"ABC",1}) results in FALSE

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

18.17.7.181 ISNUMBER

Syntax:

```
ISNUMBER ( value )
```

Description: Determines if *value* contains a number or refers to a cell that contains a number.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* contains a number or refers to a cell that contains a number; otherwise, FALSE.

[*Example*:

`ISNUMBER(10.56)` results in TRUE
`ISNUMBER(A10)` results in FALSE, when A10 contains ABC
`ISNUMBER({1,"ABC"})` results in TRUE
`ISNUMBER({"ABC",1})` results in FALSE

end example]

18.17.7.182 ISO.CEILING

Syntax:

```
ISO.CEILING ( x , [ significance ] )
```

Description: Computes a value that is x rounded-up, to the nearest multiple of *significance*. Regardless of the sign of x, a value is rounded up.

Arguments:

Name	Type	Description
x	number	The value to be rounded
significance	number	The optional multiple to which x is to be rounded. If *significance* is omitted, its default value is 1. [*Note*: The absolute value of the multiple is used, so the CEILING function will return the mathematical ceiling irrespective of the signs of x and *significance*. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The rounded-up value of x.

However, if x and/or *significance* is zero, zero is returned.

[*Example*:

`ISO.CEILING(4.3)` rounds 4.3 up to nearest multiple of 1; that is, to 5
`ISO.CEILING(-4.3)` rounds -4.3 up to nearest multiple of 1; that is, to -4
`ISO.CEILING(4.3, 2)` rounds 4.3 up to the nearest multiple of 2; that is, to 6
`ISO.CEILING(4.3,-2)` rounds 4.3 up to the nearest multiple of -2; that is, to 6
`ISO.CEILING(-4.3,2)` rounds -4.3 up to the nearest multiple of 2; that is, to -4
`ISO.CEILING(-4.3,-2)` rounds -4.3 up to the nearest multiple of -2; that is, to -4

end example]

18.17.7.183 ISODD

Syntax:

`ISODD ( value )`

Description: Determines if *value* is an odd number or refers to a cell containing an odd number.

Arguments:

Name	Type	Description
value	number	The value to be tested. It is truncated to an integer.

Return Type and Value: logical – TRUE if *value* is an odd number or refers to a cell containing an odd number; otherwise, FALSE.

[*Example*:

`ISODD(12.456)` results in FALSE
`ISODD(A10)` results in TRUE, when A10 contains -15

end example]

18.17.7.184 ISPMT

Syntax:

`ISPMT ( rate , per, nper , pv )`

Description: Computes the interest paid during a specific period of an investment.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
rate	number	The interest rate for the investment.
per	number	The period for which the interest is to be found, and shall be in the range 1–*nper*.
nper	number	The total number of payment periods for the investment.
pv	number	The present value the investment.

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The interest paid during a specific period of an investment.

[*Example*:

`ISPMT(0.1/12,1,3*12,8000000)` results in `-64814.81`
`ISPMT(0.1,1,3,8000000)` results in `-533333.33`

end example]

18.17.7.185 ISREF

Syntax:

```
ISREF ( value )
```

Description: Determines if *value* is a cell reference.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* is a cell reference; otherwise, FALSE.

[*Example*:

`ISREF("ABC")` results in FALSE
`ISREF(A10)` results in TRUE

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.186 ISTEXT

Syntax:

```
ISTEXT ( value )
```

Description: Determines if *value* contains text or refers to a cell containing text.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* contains text or refers to a cell containing text; otherwise, FALSE.

[*Example*:

`ISTEXT("ABC")` results in TRUE
`ISTEXT(A10)` results in FALSE, when A10 contains 123
`ISTEXT({1,"ABC"})` results in FALSE
`ISTEXT({"ABC",1})` results in TRUE

end example]

18.17.7.187 JIS

Syntax:

```
JIS ( string )
```

Description: Creates a string that is the conversion of half-width (single-byte) letters within *string* to full-width (double-byte) characters.

Arguments:

Name	Type	Description
string	text	Designates the string to be converted. If *string* does not contain any half-width English letters or katakana, nothing in *string* is converted.

Return Type and Value: text – The string resulting from the conversion.

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

JIS("ABC") results in ABC
JIS("ｴｸｾﾙ") results in エクセル

end example]

18.17.7.188 KURT

Syntax:

KURT (*argument-list*)

Description: Computes the kurtosis of a data set. Kurtosis characterizes the relative peakedness or flatness of a distribution compared with the normal distribution. Positive kurtosis indicates a relatively peaked distribution. Negative kurtosis indicates a relatively flat distribution.

Mathematical Formula:

Kurtosis is defined as:

$$\left\{\frac{n(n+1)}{(n-1)(n-2)(n-3)}\sum\left(\frac{x_i-\bar{x}}{s}\right)^4\right\}-\frac{3(n-1)^2}{(n-2)(n-3)}$$

where:

n is the number of elements in *argument-list*.
xj is the value of the j-th element in *argument-list*.
$\bar{x}$ is the mean of the values in *argument-list*.
s is the standard deviation of the values in *argument-list*.

Arguments:

Name	Type	Description
argument-list	array reference to an array, number, name, or reference to number.	The *arguments* in *argument-list* are the values for which kurtosis is to be calculated. Any *argument* in *argument-list* can be an array or a reference to an array. Logical values and text representations of numbers that are directly entered into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The kurtosis of a data set.

However, if

- There are fewer than four data points, the return value is unspecified.
- The standard deviation of the sample equals zero, the return value is unspecified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*:

KURT(10.5,12.4,19.4,23.2) results in -3.644621343
KURT(10.5,{12.4,19.4},23.2) results in -3.644621343

end example]

18.17.7.189 LARGE

Syntax:

LARGE (*array* , *k*)

Description: Computes the k^{th} largest value in a data set.

Arguments:

Name	Type	Description
array	array, reference	The set of numbers from which the k^{th}-largest value is to be determined.
k	number	The position (from the largest) in the array or cell range of data to return.

Return Type and Value: number – The k^{th} largest value in a data set.

However, if

- *array* is empty, the return value is unspecified.
- $k \leq 0$, #NUM! is returned.
- *k* is greater than the number of data points, #NUM! is returned.

[*Example*:

LARGE({3,5,3,5,4,4,2,4,6,7},3) results in 5
LARGE({3,5,3,5,4,4,2,4,6,7},7) results in 4

end example]

18.17.7.190 LCM

Syntax:

LCM (*argument-list*)

Description: Computes the least common multiple of the one or more *argument*s in *argument-list*.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
argument-list	number	*argument-list* specifies the *argument*s. Each argument is truncated to an integer.

Return Type and Value: number – The least common multiple of one or more numbers.

However, if any *argument* is negative, `#NUM!` is returned.

[*Example*:

`LCM(5)` results in `5`
`LCM(5,2)` results in `10`
`LCM(24.99,36.45)` results in `72`
`LCM(24,36,15)` results in `360`

end example]

18.17.7.191 LEFT

Syntax:

`LEFT ( string [ , number-chars ] )`

Description: Extracts the left-most *number-chars* characters from *string*. (`LEFT` is intended for use with languages that use the single-byte character set (SBCS), whereas `LEFTB` (§18.17.7.192) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-chars	number	The number of characters to be extracted. If omitted, a count of 1 shall be assumed. *number-chars* shall be at least 0. If *number-chars* exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing the left-most *number-chars* characters from *string*.

However, if *number-chars* is negative, `#VALUE!` is returned.

[*Example*:

`LEFT("abcdef",2)` results in `ab`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

`LEFT(A10,4)` results in `xyz1`, when A10 contains `xyz123`

end example]

18.17.7.192 LEFTB

Syntax:

`LEFTB ( string [ , number-bytes ] )`

Description: Extracts the left-most *number-bytes*-worth of characters from *string*. (LEFTB is intended for use with languages that use the double-byte character set (DBCS), whereas LEFT (§18.17.7.192) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-bytes	number	The number of bytes to be extracted. If omitted, a count of 1 shall be assumed. *number-bytes* shall be at least 0. If *number-bytes* exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing the left-most *number-bytes*-worth of characters from *string*.

However, if *number-bytes* is negative, #VALUE! is returned.

[*Example*: Assuming 1-byte characters:

`LEFTB("abcdef",2)` results in `ab`
`LEFTB(A10,4)` results in `xyz1`, when A10 contains `xyz123`

end example]

18.17.7.193 LEN

Syntax:

`LEN ( string )`

Description: Determines the number of characters in *string*. (LEN is intended for use with languages that use the single-byte character set (SBCS), whereas LENB (§18.17.7.194) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
string	text	Designates the string whose length is to be found.

Return Type and Value: number – The number of characters in *string*.

[*Example*:

`LEN("abc")` results in 3
`LEN(A10)` results in 3, when A1 contains `abc`

end example]

18.17.7.194 LENB

Syntax:

```
LENB ( string )
```

Description: Determines the number of bytes in *string*. (LENB is intended for use with languages that use the double-byte character set (DBCS), whereas LEN (§18.17.7.193) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string	text	Designates the string whose length is to be found.

Return Type and Value: number – The number of bytes in *string*.

[*Example*: Assuming 1-byte characters:

`LENB("abc")` results in 3
`LENB(A10)` results in 3, when A1 contains `abc`

end example]

18.17.7.195 LINEST

Syntax:

```
LINEST ( known-ys [ , [ known-xs ] [ , [ const-flag ] [ , stats-flag ] ] )
```

Description: Calculates the statistics for a line by using the "least squares" method to calculate a straight line that best fits the data, and returns an array that describes the line.

Mathematical Formula:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

The equation for the line is:

$$y = mx + b$$

or

…

$y = m_1x_1 + m_2x_2 + \ldots + b$ (if there are multiple ranges of x-values)

where the dependent y-value is a function of the independent x-values. The m-values are coefficients corresponding to each x-value, and b is a constant value. y, x, and m can be vectors.

When there is only one independent x-variable, the slope and y-intercept values can be obtained directly by using the following formulas:

Slope: `INDEX(LINEST(`*known-ys*`,`*known-xs*`),1)`

Y-intercept: `INDEX(LINEST(`*known-ys*`,`*known-xs*`),2)`

The accuracy of the line calculated by `LINEST` depends on the degree of scatter in the data. The more linear the data, the more accurate the `LINEST` model. `LINEST` uses the method of least squares for determining the best fit for the data. When there is only one independent x-variable, the calculations for m and b are based on the following formulas:

$$m = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

$$b = \bar{y} - m\bar{x}$$

where:

- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*known-xs*)
- y = a sample value
- $\bar{y}$ = the sample mean AVERAGE(*known-ys*)

Arguments:

Name	Type	Description
known-ys	array	The set of y-values already known in the relationship y=mx+b. If the array *known-ys* is a single column, then each column of *known-xs* is interpreted as a separate

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		variable. If the array *known-ys* is a single row, then each row of *known-xs* is interpreted as a separate variable.
known-xs	array	An optional set of x-values that might already be known in the relationship y=mx+b. The array *known-xs* can include one or more sets of variables. If only one variable is used, *known-ys* and *known-xs* can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, *known-ys* shall be a vector (that is, a range with a height of one row or a width of one column). If *known-xs* is omitted, it is assumed to be the array {1,2,3,…} that is the same size as *known-ys*.
const-flag	logical	Specifies whether to force the constant *b* to be zero. If TRUE or omitted, *b* is calculated normally. If FALSE, *b* is set to zero, and the m-values are adjusted to fit y=mx.
stats-flag	logical	Specifies whether to return additional regression statistics. If TRUE, LINEST returns the additional regression statistics (see table below), so the returned array is {mn, mn-1, …, m1, b; sen, sen-1, …, se1, seb; r2, sey; F, df; ssreg, ssresid}. If FALSE or omitted, LINEST returns only the m-coefficients and the constant b.

The additional regression statistics are as follows:

Statistic	Description
se1, se2, …, se*n*	The standard error values for the coefficients m1, m2, …, m*n*.
seb	The standard error value for the constant b.
r2	The coefficient of determination.
sey	The standard error for the y estimate.
F	The F statistic, or the F-observed value.
df	The degrees of freedom.
ssreg	The regression sum of squares.
ssresid	The residual sum of squares.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: array – The array that describes the line, in the form {mn, mn-1, …, m1, b}. The following illustration shows the order in which the additional regression statistics are returned.

[*Example*:

`LINEST({1,9,5,7},{0,4,2,3},,FALSE)` results in a slope of 2 and a y-intercept of 1

©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.196 LN

Syntax:

```
LN ( x )
```

Description: Computes the natural logarithm of x.

Arguments:

Name	Type	Description
x	number	The positive real number for which the natural logarithm is being computed.

Return Type and Value: number – The natural logarithm of x.

However, if x is zero or negative, `#NUM!` is returned.

[*Example*:

`LN(86)` results in `4.454347296`
`LN(2.7182818)` results in `0.99999999`
`LN(EXP(3))` results in 3

end example]

18.17.7.197 LOG

Syntax:

```
LOG ( x [ , base ] )
```

Description: Computes the logarithm of x to the base *base*.

Arguments:

Name	Type	Description
x	number	The positive real number for which the logarithm is being computed.
base	number	The base of the logarithm. If omitted, base 10 is assumed.

Return Type and Value: number – The logarithm of x.

However, if

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- *x* is zero or negative, `#NUM!` is returned.
- *base* is zero or negative, `#NUM!` is returned.

[*Example*:

`LOG(10)` results in `1`
`LOG(8,2)` results in `3`
`LOG(86,2.7182818)` results in `4.454347343`

end example]

18.17.7.198 LOG10

Syntax:

`LOG10 ( x )`

Description: Computes the base-10 logarithm of *x*.

Arguments:

Name	Type	Description
x	number	The positive real number for which the logarithm is being computed.

Return Type and Value: number – The base-10 logarithm of *x*.

However, if *x* is zero or negative, `#NUM!` is returned.

[*Example*:

`LOG10(86)` results in `1.934498451`
`LOG10(10)` results in `1`
`LOG10(1E5)` results in `5`
`LOG10(10^5)` results in `5`

end example]

18.17.7.199 LOGEST

Syntax:

`LOGEST ( known-ys [ , [ known-xs ] [ , [ const-flag ] [ , stats-flag ] ] )`

Description: Calculates an exponential curve that fits the data, and returns an array of values that describes the curve.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Mathematical Formula:

The equation for the curve is:

$$y = b \times m^x$$

or

$$y = b \times {m_1}^{x_1} \times {m_2}^{x_2}$$ … (if there are multiple x-values)

where the dependent y-value is a function of the independent x-values. The m-values are bases corresponding to each exponent x-value, and b is a constant value. [*Note*: y, x, and m can be vectors. *end note*]

When there is only one independent x-variable, the y-intercept (b) values can be obtained directly by using the following formula:

Y-intercept (b): `INDEX(LOGEST(`*known-ys*`,`*known-xs*`),2)`

Arguments:

Name	Type	Description
known-ys	array	The set of y-values already known in the relationship $y=b*m^x$. If the array *known-ys* is a single column, then each column of *known-xs* is interpreted as a separate variable. If the array *known-ys* is a single row, then each row of *known-xs* is interpreted as a separate variable.
known-xs	array	An optional set of x-values that might already be known in the relationship $y=b*m^x$. The array *known-xs* can include one or more sets of variables. If only one variable is used, *known-ys* and *known-xs* can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, *known-ys* shall be a vector (that is, a range with a height of one row or a width of one column). If *known-xs* is omitted, it is assumed to be the array {1,2,3,…} that is the same size as *known-ys*.
const-flag	logical	Specifies whether to force the constant *b* to be 1. If TRUE or omitted, *b* is calculated normally. If FALSE, *b* is set to 1, and the m-values are adjusted to fit $y=m^x$.
stats-flag	logical	Specifies whether to return additional regression statistics. If TRUE, LOGEST returns the additional regression statistics, so the returned array is {mn, mn-1, …, m1, b; sen, sen-1, …, se1, seb; r2, sey; F, df; ssreg,

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		ssresid}. If FALSE or omitted, LOGEST returns only the m-coefficients and the constant b.

The additional regression statistics are described in §18.17.7.195.

Return Type and Value: array – The array that describes the line, in the form {mn, mn-1, …, m1, b}. The order in which the additional regression statistics are returned is described in §18.17.7.195.

[*Example*: Given the following data:

	A	B
1	Month	Units
2	11	33,100
3	12	47,300
4	13	69,000
5	14	102,000
6	15	150,000
7	16	220,000
8	Formula	
9	1.463275628	495.3047702

When `LOGEST(B2:B7,A2:A7,TRUE,FALSE)` is an array formula spanning cells A9:B9, those cells take on the results shown.

end example]

18.17.7.200 LOGINV

Syntax:

`LOGINV` (*probability* , *mean* , *standard-dev*)

Description: Calculates the inverse of the lognormal cumulative distribution function of x, where ln(x) is normally distributed with parameters *mean* and *standard-dev*.

Mathematical Formula:

$$LOGINV(p, \mu, \sigma) = e^{[\mu+\sigma\times(NORMSINV(p))]}$$

where:

- p = argument *probability*

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

Name	Type	Description
probability	number	A probability associated with the lognormal distribution.
mean	number	The mean of ln(x).
standard-dev	number	The standard deviation of ln(x).

Return Type and Value: number – The inverse of the lognormal cumulative distribution function of x.

However, if

- *probability* < 0 or *probability* > 1, `#NUM!` is returned.
- *standard-dev* ≤ 0, `#NUM!` is returned.

[*Example*:

`LOGINV(0.039084,3.5,1.2)` results in `4.000025219`

end example]

18.17.7.201 LOGNORMDIST

Syntax:

`LOGNORMDIST ( x , mean , standard-dev )`

Description: Calculates the cumulative lognormal distribution of x, where ln(x) is normally distributed with parameters *mean* and *standard-dev*.

Mathematical Formula:

$$LOGNORMDIST(x,\mu,\sigma) = NORMSDIST\left(\frac{\ln(x)-\mu}{\sigma}\right)$$

where:

- x = argument x
- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
x	number	The value at which to evaluate the function.
mean	number	The mean of ln(x).
standard-dev	number	The standard deviation of ln(x).

Return Type and Value: number – The inverse of the lognormal cumulative distribution function of x.

However, if

- *x* ≤ 0, `#NUM!` is returned.
- *standard-dev* ≤ 0, `#NUM!` is returned.

[*Example*:

`LOGNORMDIST(4,3.5,1.2)` results in `0.039083556`

end example]

18.17.7.202 LOOKUP

Syntax:

vector form: `LOOKUP` (*lookup-value* , *lookup-vector* , *result-vector*)

array form: `LOOKUP` (*lookup-value* , *array*)

Description: The vector form looks in a vector for a value, and returns a value from the same position in a second vector. The array form looks in the first row or column of an array for the specified value and returns a value from the same position in the last row or column of that array.

Arguments:

Name	Type	Description
lookup-value	number, string, logical, name, reference	The value to search for in *lookup-vector* (or *array*).
lookup-vector	reference	A range that contains only one row or one column. The values in *lookup-vector* can be strings, numbers, or logical values. These values shall be placed in "ascending" order, as follows: …, -2, -1, 0, 1, 2, …, A–Z, FALSE, TRUE. Upper- and lowercase strings are equivalent. If LOOKUP can't find the *lookup-value*, it matches the largest value in *lookup-vector* (or *array*) that is less than or equal to *lookup-value*.
result-vector	reference	A range that contains only one row or column. It shall be

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		the same size as *lookup-vector*.
array	text, number, logical	A range of cells whose values are to be compared with *lookup-value*. These values shall be placed in "ascending" order, as follows: …, -2, -1, 0, 1, 2, …, A–Z, FALSE, TRUE. Upper- and lowercase strings are equivalent. If *array* covers an area that has more columns than rows, *lookup-value* is searched for in the first row. If *array* is square or has more rows than columns, *lookup-value* is searched for in the first column.

Return Type and Value: any – The vector form looks in a vector for a value, and returns a value from the same position in a second vector. The array form looks in the first row or column of an array for the specified value and returns a value from the same position in the last row or column of that array.

However, if

- *lookup-value* is smaller than the smallest value in *lookup-vector* (or the first row or column of *array*), the return value is unspecified.
- The size of the range specified by *result-vector* is not the same as that specified by *lookup-vector*, the return value is unspecified.
- The values in *lookup-vector* (or *array*) are not in "ascending" order, the return value is unspecified.

[*Example*: Given the following data:

	A	B
1	Frequency	Color
2	4.14	red
3	4.19	orange
4	5.17	yellow
5	5.77	green
6	6.39	blue

`LOOKUP(4.19,A2:A6,B2:B6)` results in `orange`
`LOOKUP(5,A2:A6,B2:B6)` results in `orange`
`LOOKUP(7.66,A2:A6,B2:B6)` results in `blue`

`LOOKUP("C",{"a","b","c","d";1,2,3,4})` results in 3
`LOOKUP("bump",{"a",1;"b",2;"c",3})` results in 2

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.203 LOWER

Syntax:

```
LOWER ( string )
```

Description: Makes a lowercase version of *string* by doing a character-by-character conversion of *string* to lowercase, except as noted below. [*Note*: The conversion of characters in *string* is not dependent on position/context of the character within the string, except as noted below. *end note*]

Arguments:

Name	Type	Description
string	text	Designates the string to be converted.

Return Type and Value: text – The lowercase version of *string* after doing a character-by-character conversion to lowercase. However, there is one exception; when Σ (U+03A3) is found in a word-final position, it is converted to ς (U+03C2) instead of σ (U+03C3).

[*Example*:

`LOWER("AbCd123#$%^")` results in `abcd123#$%^`
`LOWER(A10)` results in `234frtqwc$#%`, when A10 contains `234FRTqwc$#%`

end example]

18.17.7.204 MATCH

Syntax:

```
MATCH ( lookup-value , lookup-array [ , [ match-type ] ] )
```

Description: Locates the relative position of an array item that matches a specified value in a specified order. MATCH shall not distinguish between uppercase and lowercase letters when matching strings.

Arguments:

Name	Type	Description
lookup-value	number, string, logical, name, reference	The value to search for in *lookup-array*. If *match-type* is 0 and *lookup-value* is a string, the wildcard characters, question mark (?) and asterisk (*), can be used in *lookup-value*. A question mark matches any single character; an asterisk matches any sequence of characters. To locate a question mark or asterisk, precede that character with a

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		tilde (~).
lookup-array	array, reference	A contiguous range of cells containing possible lookup values.
match-type	number	Specifies how *lookup-value* is matched with values in *lookup-array*, as follows:

Value	Meaning
-1	Finds the smallest value that is greater than or equal to *lookup-value*. The values in *lookup-array* shall be placed in "descending" order: TRUE, FALSE, Z–A, …, 2, 1, 0, -1, -2, …
0	Finds the first value that is exactly equal to *lookup-value*. The values in *lookup-array* can be in any order.
1 or omitted	Finds the largest value that is less than or equal to *lookup-value*. The values in *lookup-array* shall be placed in "ascending" order: …, -2, -1, 0, 1, 2, …, A–Z, FALSE, TRUE.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: number – The relative position of an array item that matches a specified value in a specified order.

However, if

- No match is found, #N/A is returned.
- *match-type*'s value is out-of-bounds, `#NUM!` is returned.

[*Example*:

`MATCH(39,{25,38,40,41},1)` results in 2
`MATCH(41,{25,38,40,41},0)` results in 4

end example]

18.17.7.205 MAX

Syntax:

MAX (*argument-list*)

Description: Computes the largest of a set of numbers.

Arguments:

Name	Type	Description
argument-list	logical, number, name, arrays, reference to number. Any *argument* can be an array or a reference to an array.	The *argument*s in *argument-list* designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. However, logical values and numbers in strings and are ignored inside references. [*Note*: To include these, use MAXA (§18.17.7.206). *end note*] If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The largest of a set of numbers; however, if the arguments contain no numbers, zero is returned.

[*Example*:

`MAX(10.4,-3.5,12.6)` results in `12.6`
`MAX(10.4,{-3.5,12.6})` results in `12.6`
`MAX({"ABC",TRUE})` results in `0`

Consider the case in which cell `B3` contains `0`:
`MAX(-10,-12,-15,B3)` results in `-10`
`MAXA(-10,-12,-15,B3)` results in `0`

end example]

18.17.7.206 MAXA

Syntax:

MAXA (*argument-list*)

Description: Computes the largest of a set of numbers.

Arguments:

Name	Type	Description
argument-list	logical, number, name, arrays, reference to	The *argument*s in *argument-list* designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
	number. Any *argument* can be an array or a reference to an array.	the list of arguments are included. Logical values and numbers in strings inside references are also included. [*Note*: To ignore these, use MAX (§18.17.7.205). *end note*] If an array or reference argument contains non-numeric text or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The largest of a set of numbers; however, if the arguments contain no numbers, zero is returned.

[*Example*:

`MAXA(10.4,-3.5,12.6)` results in `12.6`
`MAXA(10.4,{-3.5,12.6})` results in `12.6`
`MAXA({"ABC",TRUE})` results in `0`

Consider the case in which cell `B3` contains `0`:
`MAX(-10,-12,-15,B3)` results in `-10`
`MAXA(-10,-12,-15,B3)` results in `0`

end example]

18.17.7.207 MDETERM

Syntax:

```
MDETERM ( array )
```

Description: Computes the determinant of the square matrix of numbers designated by *array*. The determinant is calculated with an accuracy of at least 15 digits, which can lead to a small numeric error when the calculation is not complete. [*Example*: The determinant of a singular matrix can differ from zero by 1E-16. *end example*]

Arguments:

Name	Type	Description
array	array, reference	Designate a square matrix of numbers.

Return Type and Value: number – The determinant of *array*. Some square matrices cannot be inverted. The determinant of a non-invertible matrix is 0.

However, if

- Any cells in *array* are empty or contain text, the return value is unspecified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- The matrix designated by *array* is not square, #VALUE! is returned.

[*Example*:

`MDETERM(A2:D5)` results in the determinant of the 4x4 array designated by the cell range
`MDETERM({3,6,1;1,1,0;3,10,2})` results in `1`
`MDETERM({3,6;1,1})` results in `-3`

end example]

18.17.7.208 MDURATION

Syntax:

`MDURATION ( `*settlement*` , `*maturity*` , `*coupon*` , `*yld*` , `*frequency*` [ , [ `*basis*` ] ] )`

Description: Computes the modified Macaulay duration for a security with an assumed par value of 100.

Mathematical Formula:

$$MDURATION = \frac{DURATION}{1 + \left(\frac{Market\ yield}{Coupon\ payments\ per\ yea}\right)}$$

where:

- *Coupon payments per year* = argument *frequency*
- *DURATION* = `DURATION(settlement, maturity, coupon, yld, frequency, [basis])`
- *Market yield* = argument *yld*

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
coupon	number	The security's annual coupon rate.
yld	number	The security's annual yield.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.) *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description	
		0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description		
			4	European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 Februar y.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Time information in the date arguments is ignored.

Return Type and Value: number – The modified Macaulay duration for a security with an assumed par value of 100.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *coupon* or *yld* < 0, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

©ISO/IEC 2011 – All rights reserved

[*Example*:

`MDURATION(DATE(2008,1,1),DATE(2016,1,1),0.08,0.09,2,1)` results in `5.7357`

end example]

18.17.7.209 MEDIAN

Syntax:

`MEDIAN ( argument-list )`

Description: Computes the median of the numeric values of its arguments. The median of a set of values is the value for which half the numbers in the set are greater, and half the values are less. For sets with an odd number of values, the median is calculated by finding the value whose rank in the ordered set of all values is equal to half the number of items (n) in the set plus one half (i.e., n/2 + 1/2). If the number of values in the set is even, then the median is defined to be the average of the values of rank n/2 and n/2 + 1.

Arguments:

Name	Type	Description
argument-list	logical, number, name, arrays, reference to number.	The *argument*s in *argument-list* designate the values whose median is to be computed. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The median of the values of its arguments.

[*Example*:

`MEDIAN(10,20)` results in `15`
`MEDIAN(-3.5,1.4,6.9,-4.5)` results in `-1.05`
`MEDIAN({-3.5,1.4,6.9},-4.5)` results in `-1.05`

end example]

18.17.7.210 MID

Syntax:

`MID ( string , start-pos , number-chars )`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Description: Extracts *number-chars* characters from *string*, starting at character position *start-pos*. (MID is intended for use with languages that use the single-byte character set (SBCS), whereas MIDB (§18.17.7.211) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-chars	number	The number of characters to be extracted. *number-chars* shall be at least 0.
start-pos	number	The starting position within *string*, where the first character is position 1. If *start-pos* is greater than the length of *string*, or if *start-pos* and *number-chars* combined exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing *number-chars* characters from *string*, starting at character position *start-pos*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-chars* < 0, #VALUE! is returned.

[*Example*:

```
MID("abcdef",3,2) results in cd
MID(A10,4,1) results in 1, when A10 contains xyz123
MID("abcdef",4,5) results in def
```

end example]

18.17.7.211 MIDB

Syntax:

```
MIDB ( string , start-pos , number-bytes )
```

Description: Extracts *number-bytes*-worth of characters from *string*, starting at character position *start-pos*. (MIDB is intended for use with languages that use the double-byte character set (DBCS), whereas MID (§18.17.7.210) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-bytes	number	The number of characters to be extracted. *number- bytes* shall be at least 0.
start-pos	number	The starting position within *string*, where the first byte is position 1. If *start-pos* is greater than the length of *string*, or if *start-pos* and *number- bytes* combined exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing *number-bytes*-worth of characters from *string*, starting at character position *start-pos*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-bytes* < 0, #VALUE! is returned.

[*Example*: Assuming 1-byte characters:

`MIDB("abcdef",3,2)` results in `cd`
`MIDB(A10,4,1)` results in `1`, when A10 contains `xyz123`
`MIDB("abcdef",4,5)` results in `def`

end example]

18.17.7.212 MIN

Syntax:

`MIN (` *argument-list* `)`

Description: Computes the smallest of a set of numbers.

Arguments:

Name	Type	Description
argument-list	logical, number, name, arrays, reference to number. Any *argument* can be an array or a reference to an array.	The *argument*s in *argument-list* designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. However, logical values and numbers in strings and are ignored inside references. [*Note*: To include these, use `MINA` (§18.17.7.213). *end note*] If an array or reference argument contains text, logical values, or empty cells,

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
		those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The smallest of a set of numbers; however, if the *argument*s contain no numbers, zero is returned.

[*Example*:

`MIN(10.4,-3.5,12.6)` results in `-3.5`
`MIN(10.4,{-3.5,12.6})` results in `-3.5`
`MIN({"ABC",TRUE})` results in `0`

Consider the case in which cell `B3` contains `0`:
`MIN(10,12,15,B3)` results in `10`
`MINA(10,12,15,B3)` results in `0`

end example]

18.17.7.213 MINA

Syntax:

`MINA` (*argument-list*)

Description: Computes the smallest of a set of numbers.

Arguments:

Name	Type	Description
argument-list	logical, number, name, arrays, reference to number. Any *argument* can be an array or a reference to an array.	The *argument*s in *argument-list* designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. Logical values and numbers in strings inside references are also included. [*Note*: To ignore these, use `MIN` (§18.17.7.212). *end note*] If an array or reference argument contains non-numeric text or empty cells, those values are ignored; however, cells with the value 0 are included.

Any *argument* in *argument-list* can be an array or a reference to an array.

Return Type and Value: number – The smallest of a set of numbers; however, if the *argument*s contain no numbers, zero is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*:

`MINA(10.4,-3.5,12.6)` results in `-3.5`
`MINA(10.4,{-3.5,12.6})` results in `-3.5`
`MINA({"ABC",TRUE})` results in `0`

Consider the case in which cell `B3` contains `0`:
`MIN(10,12,15,B3)` results in `10`
`MINA(10,12,15,B3)` results in `0`

end example]

18.17.7.214 MINUTE

Syntax:

`MINUTE (` *time-value* `)`

Description: Computes the minute for the date and/or time having the given *time-value*.

Arguments:

Name	Type	Description
time-value	number	The date and/or time whose minute is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a *string-constant* having any date and/or time format, in which case, any date information shall be ignored.

Return Type and Value: number – The minute for the date and/or time having the given *time-value*. The returned value shall be in the range 0–59.

However, if *time-value* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`MINUTE(DATE(2006,2,26)+TIME(2,10,20))` results in `10`
`MINUTE(TIME(22,56,34))` results in `56`
`MINUTE(0)` results in 0, since serial value 0 represents `00:00:00`
`MINUTE(10.5)` results in 0, since serial value .5 represents `12:00:00`
`MINUTE("22-Oct-2001 10:53:12")` results in `53`
`MINUTE("10:53:12 pm")` results in `53`
`MINUTE("22:53:12")` results in `53`

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.17.7.215 MINVERSE

Syntax:

`MINVERSE ( array )`

Description: Computes the inverse of the square matrix of numbers designated by *array*. The inverse matrix is calculated with an accuracy of at least 15 digits, which can lead to a small numeric error when the cancellation is not complete.

Arguments:

Name	Type	Description
array	array, reference	Designate a square matrix of numbers.

Return Type and Value: number – The inverse of the square matrix designated by *array*.

However, if

- Any cells in *array* are empty or contain text, the return value is unspecified.
- The matrix designated by *array* is not square, #VALUE! is returned.
- The matrix cannot be inverted, the return value is unspecified.

[*Example*:

`MINVERSE({3,6,1;1,1,0;3,10,2})` results in `2`
`MINVERSE({3,6;1,1})` results in `-0.333333333`

end example]

18.17.7.216 MIRR

`MIRR ( values , finance-rate , reinvest-rate )`

Description: Computes the modified internal rate of return for a series of periodic cash flows. (Both the cost of the investment and the interest received on reinvestment of cash are considered.)

Mathematical Formula:

The formula for `MIRR` is:

$$\left(\frac{-NPV(rrate, values[positive]) * (1 + rrate)^{n}}{NPV(frate, values[negative]) * (1 + frate)}\right)^{\frac{1}{n-1}} - 1$$

where:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- *frate* = argument *finance-rate*
- *n* = number of cash flows in argument *values*
- *rrate* = argument *reinvest-rate*
- *values* = argument *values*

Arguments:

Name	Type	Description
values	array, reference	Designates a set of numbers for which the rate of return is to be calculated. *values* shall contain at least one positive value and one negative value to calculate the internal rate of return. The order of numbers in *values* is significant, so be sure payment and income numbers are in the desired sequence. If *values* contains elements that are text, logical values, or empty cells, those elements are ignored.
finance-rate	number	The interest rate paid pay on the money used in the cash flows.
reinvest-rate	number	The interest rate received on the cash flows as they are reinvested.

Return Type and Value: number – The modified internal rate of return for a series of periodic cash flows.

However, if *values* does not contain at least one positive value and one negative value, `#DIV/0!` is returned.

[*Example*:

`MIRR({-120000,39000,30000,21000,37000,46000},0.1,0.12)` results in `12.6094%`
`MIRR({-120000,39000,30000,21000},0.1,0.12)` results in `-4.8045%`
`MIRR({-120000,39000,30000,21000,37000,46000},0.1,0.14)` results in `13.4759%`

end example]

18.17.7.217 MMULT

Syntax:

`MMULT ( array-1 , array-2 )`

Description: Computes the product of the matrices of numbers designated by *array-1* and *array-2*.

Mathematical Formula:

The matrix product array *a* of two arrays *b* and *c* is:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

$$a_{ij} = \sum_{k=1}^{n} b_{ik}\, c_{kj}$$

Where:

- b_{ik} = the element in the i-th row and k-th column in argument *array-1*
- c_{kj} = the element in the k-th row and j-th column in argument *array-2*
- i = the row number
- j = the column number

Arguments:

Name	Type	Description
array-1	array, reference, name	Designate the matrices of numbers to be multiplied.
array-2		

Return Type and Value: number – The product of the matrices of numbers designated by *array-1* and *array-2*.

However, if

- Any cells in *array-1* or *array-2* are empty or contain text, the return value is unspecified.
- The number of columns in *array-1* is different from the number of rows in *array-2*, #VALUE! is returned.

[*Example*:

`MMULT({3,6,1;1,1,0},{5,7;4,6;2,5})` results in `41`

end example]

18.17.7.218 MOD

Syntax:

`MOD ( x , y )`

Description: Computes the remainder when *x* is divided by *y*. The result has the same sign as *y*.

Arguments:

Name	Type	Description
x	number	The number for which the remainder is being sought.
y	number	The number by which *x* is to be divided.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The remainder when x is divided by y. The result has the same sign as y. If y is 0, the return value is unspecified.

[*Example*:

```
MOD(3,2) results in 1
MOD(-3,2) results in 1
MOD(3,-2) results in -1
MOD(-3,-2) results in -1
```

end example]

18.17.7.219 MODE

Syntax:

MODE (*argument-list*)

Description: Computes the most frequently occurring of the numeric values of its arguments. If the set of values contains more than one most-frequent value, the first occurrence of any most-frequent value in the list is used as the result.

Arguments:

Name	Type	Description
argument-list	logical, number, name, arrays, reference to number. Any *argument* can be an array or a reference to an array.	The *arguments* in *argument-list* designate the values whose mode is to be computed. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The most frequently occurring of the values of its arguments.

However, if the data set contains no duplicate data points, #N/A is returned.

[*Example*:

```
MODE(9,1,5,1,9,5,6,6) results in  9
MODE(1,9,5,1,9,5,6,6) results in  1
MODE(5,1,9,5,1,9,6,6) results in  5
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

18.17.7.220 MONTH

Syntax:

MONTH (*date-value*)

Description: Computes the numeric month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, taking into account the current date base value. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any date and/or time format, in which case, any time information shall be ignored.

Arguments:

Name	Type	Description
date-value	number, text	The date and/or time whose month is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any date and/or time format, in which case, any time information shall be ignored.

Return Type and Value: number – The month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, in the range 1–12.

However, if *date-value* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`MONTH(DATE(2006,1,2))` results in `1`
`MONTH(DATE(2006,0,2))` results in `12`
`MONTH("2006/1/2 10:45 AM")` results in `1`
`MONTH(30000)` results in 2 for both the 1900 and 1904 date base systems

end example]

18.17.7.221 MROUND

Syntax:

MROUND (*x* , *multiple*)

Description: Computes *x* rounded to *multiple*, away from zero. It rounds up if the remainder of dividing *x* by *multiple* is greater than or equal to half the value of *multiple*; otherwise, it rounds down.

Arguments:

Name	Type	Description
x	number	The value to round.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
multiple	number	The multiple to which *x* is to be rounded.

Return Type and Value: number – *x* rounded to *multiple*.

However, if *x* and *multiple* have different signs, `#NUM!` is returned.

[*Example*:

`MROUND(10,3)` rounds 10 to a nearest multiple of 3; that is, to 9
`MROUND(-10,-3)` rounds -10 to a nearest multiple of -3; that is, to `-9`
`MROUND(1.3,0.2)` rounds 1.3 to a nearest multiple of 0.2; that is, to `1.4`

end example]

18.17.7.222 MULTINOMIAL

Syntax:

`MULTINOMIAL (` *argument-list* `)`

Description: Computes the ratio of the factorial of the sum of the values in *argument-list* to the product of the factorials.

Mathematical Formula:

The multinomial is:

$$MULTINOMIAL(a,b,c) = \frac{(a+b+c)!}{a!\,b!\,c!}$$

where:

- a, b, c, … = the elements in *argument-list*

Arguments:

Name	Type	Description
argument-list	number	The *argument*s in *argument-list* designate the numerical values for which the multinomial is desired.

Return Type and Value: number – The ratio of the factorial of the sum of the values in *argument-list* to the product of the factorials.

However, if any *argument* is less than zero, `#NUM!` is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Example*:

`MULTINOMIAL(2)` results in `1`
`MULTINOMIAL(2,3)` results in `10`
`MULTINOMIAL(2,3,4)` results in `1260`

end example]

18.17.7.223 N

Syntax:

`N ( value )`

Description: Converts *value* to a number or, if *value* is a reference to a single cell, converts the value of that cell to a number.

Arguments:

Name	Type	Description
value	any	Value to be converted.

Return Type and Value: number or error – An integer that is the converted value of *value*, or, if *value* is a reference to a single cell, the converted value of that cell, as follows:

value	Value Returned
number	That number
TRUE	1
FALSE	0
error value	That error value
Anything else (including array and text)	0

[*Example*:

`N(10.5)` results in `10.5`
`N(A10)` results in `-1234`, when A10 contains the number `-1234`
`N("ABC")` results in `0`
`N(A10)` results in `0`, when A10 contains the string ABC
`N(TRUE)` results in `1`
`N(A10)` results in `0`, when A10 contains FALSE
`N(A10)` results in `#N/A`, when A10 contains `#N/A`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

`N({12.5,13.6,56.9}` results in `12.50`
`N(A10:A11)` results in `0`, when A10 contains FALSE, and A11 contains 321

end example]

18.17.7.224 NA

Syntax:

`NA ( )`

Description: Gets the error value `#N/A`. (The error value `#N/A` can be used instead of a call to this function; the result is the same.)

Arguments: None.

Return Type and Value: error – The error value `#N/A`.

[*Example*:

`NA()` results in `#N/A`
`IF(ISNA(NA()),"T","F")` results in `T`

end example]

18.17.7.225 NEGBINOMDIST

Syntax:

`NEGBINOMDIST (` *number-failures* `,` *number-successes* `,` *success-probability* `)`

Description: Computes the negative binomial distribution. `NEGBINOMDIST` returns the probability that there are *number-failures* failures before the *number-successes*th success, when the constant probability of a success is *success-probability*.

Mathematical Formula:

$$nb(x,r,p) = \binom{x+r-1}{r-1} p^r (1-p)^x$$

where:

- p = the argument *success-probability*.
- r = the argument *number-successes*
- x = the argument *number-failures*

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
number-failures	number	The number of failures, truncated to integer.
number-successes	number	The threshold number of successes, truncated to integer.
success-probability	number	The probability of a success.

Return Type and Value: number – The negative binomial distribution.

However, if

- *number-failures* < 0 or *number-successes* < 1, `#NUM!` is returned.
- *success-probability* < 0 or *success-probability* > 1, `#NUM!` is returned.

[*Example*:

`NEGBINOMDIST(6,10,0.5)` results in `0.076370239`

end example]

18.17.7.226 NETWORKDAYS

Syntax:

`NETWORKDAYS ( start-date , end-date [ , holidays ] )`

Description: Computes the number of whole working days between *start-date* and *end-date*. Weekend days (Saturday, Sunday) and any holidays specified by *holidays* are not considered as working days.

Arguments:

Name	Type	Description
start-date	number	The dates for which the difference is to be computed. *start-date* can be earlier than, the same as, or later than *end-date*.
end-date	number	
holidays	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. *holidays* shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. The ordering of dates or serial values in *holidays* can be arbitrary.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The number of whole working days between *start-date* and *end-date*, excluding the specified holidays. If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the number of whole working days.

However, if

- *start-date* is out of range for the current date base value, `#NUM!` is returned.
- *end-date* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`NETWORKDAYS(DATE(2006,1,1),DATE(2006,1,31))` results in 23
`NETWORKDAYS(DATE(2006,1,31),DATE(2006,1,1))` results in -23
`NETWORKDAYS(DATE(2006,1,1),DATE(2006,2,1),{"2006/1/2","2006/1/16"})` results in 21

end example]

18.17.7.227 NETWORKDAYS.INTL

Syntax:

Number form: `NETWORKDAYS.INTL` (*start-date* , *end-date* [, [*weekend-number*][, *holidays*]])

String form: `NETWORKDAYS.INTL` (*start-date* , *end-date* [, [*weekend-string*][, *holidays*]])

Description: Computes the number of whole working days between *start-date* and *end-date*. Weekend days and any holidays specified by *holidays* are not considered as working days.

Arguments:

Name	Type	Description
start-date	Number	The dates for which the difference is to be computed. *start-date* can be earlier than, the same as, or later than *end-date*.
end-date	Number	
weekend-number	Number	Indicates the days of the week that are weekend days and are not included in the number of whole working days between *start-date* and *end-date*. Values are shown in the table below.
weekend-string	String	Indicates the days of the week that are weekend days and are not included in the number of whole working days between *start-date* and *end-date*. Values of *weekend-string* are seven characters long and each character in the string represents a day of the week, beginning with Monday. [*Example*: "0000011" would result in a weekend that is Saturday and Sunday. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
holidays	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. *holidays* shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. The ordering of dates or serial values in *holidays* can be arbitrary.

weekend-number	Weekend days
1 or omitted	Saturday, Sunday
2	Sunday, Monday
3	Monday, Tuesday
4	Tuesday, Wednesday
5	Wednesday, Thursday
6	Thursday, Friday
7	Friday, Saturday
11	Sunday only
12	Monday only
13	Tuesday only
14	Wednesday only
15	Thursday only
16	Friday only
17	Saturday only

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: number – The number of whole working days between *start-date* and *end-date*, excluding the specified weekend days and holidays. If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the number of whole working days.

However, if

- *start-date* is out of range for the current date base value, `#NUM!` is returned.
- *end-date* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`NETWORKDAYS.INTL(DATE(2006,1,1),DATE(2006,1,31))` results in 23
`NETWORKDAYS.INTL(DATE(2006,1,31),DATE(2006,1,1))` results in -23
`NETWORKDAYS.INTL(DATE(2006,1,1),DATE(2006,2,1),7,{"2006/1/2","2006/1/16"})` results in 21

 ©ISO/IEC 2011 – All rights reserved

`NETWORKDAYS.INTL(DATE(2006,1,1),DATE(2006,2,1),"0000110",{"2006/1/2","2006/1/16"})` results in 21

end example]

18.17.7.228 NOMINAL

`NOMINAL` (*effect-rate* , *npery*)

Description: Computes the nominal annual interest rate, given the effective rate and the number of compounding periods per year.

Mathematical Formula:

NOMINAL is related to EFFECT:

$$EFFECT = \left(1 + \frac{Nominal_rate}{Npery}\right)^{Npery} - 1$$

where:

- $Nominal_rate$ = argument *effect-rate*
- $Npery$ = argument *npery*

Arguments:

Name	Type	Description
effect-rate	number	The effective interest rate.
npery	number	The number of compounding periods per year, truncated to integer.

Return Type and Value: number – The nominal annual interest rate.

However, if

- *effect-rate* ≤ 0, `#NUM!` is returned.
- *npery* < 1, `#NUM!` is returned.

[*Example*:

`NOMINAL(0.053543,4)` results in `5.2500%`

end example]

18.17.7.229 NORMDIST

Syntax:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

NORMDIST (*x* , *mean* , *standard-deviation* , *cumulative-flag*)

Description: Computes the normal distribution for the specified mean and standard deviation.

Mathematical Formula:

The equation for the normal density function (*cumulative-flag* = FALSE) is:

$$f(x,\mu,\sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\left(\frac{(x-\mu)^2}{2\sigma^2}\right)}$$

When *cumulative-flag* = TRUE, the formula is the integral from negative infinity to x of the given formula.

where:

- x = argument x
- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

Name	Type	Description
x	number	The value for which the distribution is to be computed.
mean	number	The arithmetic mean of the distribution.
standard-deviation	number	The standard deviation of the distribution.
cumulative-flag	logical	Determines the form of the function. If TRUE, then the cumulative distribution function is returned; if FALSE, the probability mass function is returned.

Return Type and Value: number – The normal distribution for the specified mean and standard deviation.

However, if *standard-deviation* ≤ 0, `#NUM!` is returned.

[*Example*:

`NORMDIST(42,40,1.5,TRUE)` results in `0.90878878`
`NORMDIST(42,40,1.5,FALSE)` results in `0.10934005`

end example]

18.17.7.230 NORMINV

Syntax:

NORMINV (*probability* , *mean* , *standard-deviation*)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Description: Computes the inverse of the normal distribution for the specified mean and standard deviation.**Arguments:**

Name	Type	Description
probability	number	The probability corresponding to the normal distribution.
mean	number	The arithmetic mean of the distribution.
standard-deviation	number	The standard deviation of the distribution.

Return Type and Value: number – The inverse of the normal distribution for the specified mean and standard deviation.

However, if

- *probability* < 0 or if *probability* > 1, `#NUM!` is returned.
- *standard-deviation* ≤ 0, `#NUM!` is returned.
- the implementation determines that a return value cannot be computed, `#N/A` is returned.

[*Example*:

`NORMINV(0.908789,40,1.5)` results in `42.00000201`

end example]

18.17.7.231 NORMSDIST

Syntax:

```
NORMSDIST ( z )
```

Description: Computes the standard normal distribution for the specified mean and standard deviation.

Mathematical Formula:

$$f(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}}$$

where:

- z = argument z

Arguments:

Name	Type	Description
z	number	The value for which the distribution is to be computed.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: number – The standard normal distribution for the specified mean and standard deviation.

[*Example*:

`NORMSDIST(1.333333)` results in `0.90878873`
`NORMSDIST(-1.5)` results in `0.06680720`

end example]

18.17.7.232 NORMSINV

Syntax:

`NORMSINV` (*probability*)

Description: Computes the inverse of the standard normal distribution. The distribution has a mean of zero and a standard deviation of 1.

Arguments:

Name	Type	Description
probability	number	The probability corresponding to the normal distribution.

Return Type and Value: number – The inverse of the standard normal distribution.

However, if

- *probability* < 0 or if *probability* > 1, `#NUM!` is returned.
- the implementation determines that a return value cannot be computed, `#N/A` is returned.

[*Example*:

`NORMSINV(0.945)` results in `1.59819314`
`NORMSINV(0.13)` results in `-1.12639113`

end example]

18.17.7.233 NOT

Syntax:

`NOT` (*logical-value*)

Description: Computes the logical negation of *logical-value*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Arguments:

Name	Type	Description
logical-value	logical	The value to be negated.

Return Type and Value: logical – The logical negation of *logical-value*; that is, it returns TRUE if *logical-value* is FALSE, and FALSE if *logical-value* is TRUE.

[*Example*:

NOT(TRUE) results in FALSE
NOT(FALSE) results in TRUE
NOT(10>5) results in FALSE
NOT(16.567) results in FALSE

end example]

18.17.7.234 NOW

Syntax:

NOW ( )

Description: Computes the serial value of the current date and time, taking into account the current date base value.

Arguments: None.

Return Type and Value: number – The serial value of the current date and time.

[*Example*: On February 26, 2006, between 23:01 and 23:02, NOW() resulted in 38774.95958611110 for the 1900 date base system. On February 26, 2006, between 23:02 and 23:03, NOW() resulted in 37312.95982569440 for the 1904 date base system. *end example*]

18.17.7.235 NPER

Syntax:

NPER (*rate* , *pmt* , *pv* [, [*fv*] [, [*type*]]])

Description: Computes the number of periods for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description
rate	number	The interest rate per period.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
pmt	number	The payment made each period; it cannot change over the life of the annuity. Typically, *pmt* contains principal and interest but no other fees or taxes.
pv	number	The present value, or the lump-sum amount that a series of future payments is worth right now.
fv	number	The future value, or a cash balance to be attained after the last payment is made. If *fv* is omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
type	number	The timing of the payment, truncated to integer, as follows:

Value	Timing
`0`	Payment at the end of the period
`1`	Payment at the beginning of the period

Return Type and Value: number – The number of periods for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`NPER(0.12/12,-100,-1000,10000,1)` results in `59.67`
`NPER(0.12/12,-100,-1000)` results in `-9.58`

end example]

18.17.7.236 NPV

Syntax:

NPV (*rate* , *argument-list*)

Description: Calculates the net present value of an investment by using a discount rate and a series of future payments and income.

The NPV investment begins one period before the date of the first *argument* cash flow and ends with the last cash flow in the list. The calculation is based on future cash flows. If the first cash flow occurs at the beginning of the first period, the first value shall be added to the NPV result, not included in *argument-list*.

Mathematical Formula:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

If n is the number of cash flows in the list of values:

$$NPV = \sum_{i=1}^{n} \frac{values_i}{(1 + rate)^i}$$

where:

n is the number of elements in *argument-list*.
values$_i$valuesj is the value of the i-th element in *argument-list*.
rate is the *rate* argument.

Arguments:

Name	Type	Description
rate	number	The rate of discount over the length of one period.
argument-list	number	The *argument*s in *argument-list* designate the series of future payments (negative values) and income (positive values). *argument*s shall be equally spaced in time and occur at the end of each period. The order of *argument*s is significant. *argument*s that are numbers, empty cells, logical values, or text representations of numbers are included; *argument*s that are error values or text that cannot be translated into numbers are ignored. If an *argument* is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – Net present value of an investment by using a discount rate and a series of future payments and income.

[*Example*:

`NPV(0.1,-10000,3000,4200,6800)` results in `1188.44`

end example]

18.17.7.237 OCT2BIN

Syntax:

`OCT2BIN ( number [ , num-bin-digits ] )`

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Arguments:

Name	Type	Description
number	text	A 10-digit octal number in a string that is to be converted to a binary string. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.
num-bin-digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-bin-digits* is ignored and the result has 10 digits. If *num-bin-digits* is omitted, the minimum number of digits is used in the result. *num-bin-digits* is truncated to an integer.

Return Type and Value: text – The binary equivalent of *number*.

However, if

- *number* is outside the range `"7777777000"` (1111111111111111111111000000000 binary, -512 decimal) to `"777"` (00000000000000000000000111111111 binary, 511 decimal), inclusive, `#NUM!` is returned.
- *number* contains one or more non-octal digits, `#NUM!` is returned.
- *number* contains more than 10 octal digits, `#NUM!` is returned.
- *number* needs more digits that *num-bin-digits*, `#NUM!` is returned.
- *num-bin-digits* ≤ 0 or > 10, `#NUM!` is returned.

[*Example*:

`OCT2BIN("67")` results in `110111`
`OCT2BIN("7777777776")` results in `1111111110`
`OCT2BIN("7",5)` results in `00111`

end example]

18.17.7.238 OCT2DEC

Syntax:

`OCT2DEC ( number )`

Description: Makes the decimal equivalent of *number*.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
number	number	A 10-digit octal number in a string that is to be converted to a decimal number. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-octal digits, `#NUM!` is returned.
- *number* contains more than 10 octal digits; that is, *number* is outside the range `"4000000000"` (-536,870,912 decimal) to `"3777777777"` (536,870,911 decimal), inclusive, `#NUM!` is returned.

[*Example*:

```
OCT2DEC("67") results in  55
OCT2DEC("7777777776") results in  -2
OCT2DEC("7000000000") results in  -134217728
```

end example]

18.17.7.239 OCT2HEX

Syntax:

OCT2HEX (*number* [, *num-hex-digits*])

Description: Makes the hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

Name	Type	Description
number	text	A 10-digit octal number in a string that is to be converted to a hexadecimal string. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.
num-hex-digits	number	*num-hex-digits* is the number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-hex-digits* is ignored and the result has 10 digits. If *num-hex-digits* is omitted, the minimum number of digits is used in the result. *num-hex-digits* is

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		truncated to an integer.

Return Type and Value: text – The hexadecimal equivalent of *number*.

However, if

- *number* contains one or more non-octal digits, `#NUM!` is returned.
- *number* contains more than 10 octal digits; that is, *number* is outside the range `"4000000000"` (20000000 hex, -536,870,912 decimal) to `"3777777777"` (1FFFFFFF hex, 536,870,911 decimal), inclusive, `#NUM!` is returned.
- *number* needs more digits that *num-hex-digits*, `#NUM!` is returned.
- *num-hex-digits* ≤ 0or > 10, `#NUM!` is returned.

[*Example*:

`OCT2HEX("777")` results in `1FF`
`OCT2HEX("7777777776")` results in `FFFFFFFFFE`
`OCT2HEX("7",5)` results in `00007`

end example]

18.17.7.240 ODD

Syntax:

ODD (*x*)

Description: Computes *x* rounded to the nearest odd integer, away from zero. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
x	number	The value to be rounded.

Return Type and Value: number – The rounded value of *x*.

[*Example*:

`ODD(1.5)` rounds 1.5 up to the nearest odd integer; that is, to 3
`ODD(3)` rounds 3 up to the nearest odd integer; that is, to 3
`ODD(2)` rounds 2 up to the nearest odd integer; that is, to 3
`ODD(-1)` rounds -1 up to the nearest odd integer; that is, to `-1`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

`ODD(-2)` rounds -2 up to the nearest odd integer; that is, to `-3`

end example]

18.17.7.241 ODDFPRICE

Syntax:

```
ODDFPRICE ( settlement , maturity , issue , first-coupon , rate , yld , redemption ,
    frequency [ , [ basis ] ] )
```

Description: Computes the price per $100 face value of a security having an odd (short or long) first period.

Mathematical Formula:

Odd short first coupon:

$$ODDFPRICE = \left[\frac{redemption}{\left(1+\frac{yld}{frequency}\right)^{\left(N-1+\frac{DSC}{E}\right)}}\right] + \left[\frac{100\times\frac{rate}{frequency}\times\frac{DFC}{E}}{\left(1+\frac{yld}{frequency}\right)^{\frac{DSC}{E}}}\right] + \left[\sum_{k=2}\frac{100\times\frac{rate}{frequency}}{\left(1+\frac{yld}{frequency}\right)^{\left(k-1+\frac{DSC}{E}\right)}}\right] - \left[100\times\frac{rate}{frequency}\times\frac{A}{E}\right]$$

where:

- A = number of days from the beginning of the coupon period to the settlement date (accrued days).
- DFC = number of days from the beginning of the odd first coupon to the first coupon date.
- DSC = number of days from the settlement to the next coupon date.
- E = number of days in the coupon period.
- *frequency* = argument *frequency*
- N = number of coupons payable between the settlement date and the redemption date. (If this number contains a fraction, it is raised to the next whole number.)
- *rate* = argument *rate*
- *redemption* = argument *redemption*
- *yld* = argument *yld*

Odd long first coupon:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

$$\text{ODDFPRICE} = \left[\frac{\text{redemption}}{\left(1+\frac{\text{yld}}{\text{frequency}}\right)^{\left(\text{N}+\text{N}_\text{q}+\frac{\text{DSC}}{\text{E}}\right)}}\right] + \left[\frac{100\times\frac{\text{rate}}{\text{frequency}}\times\left[\sum_{\text{i}=1}^{\text{NC}}\frac{\text{DC}_\text{i}}{\text{NL}_\text{i}}\right]}{\left(1+\frac{\text{yld}}{\text{frequency}}\right)^{\text{N}_\text{q}+\frac{\text{DSC}}{\text{E}}}}\right] + \left[\sum_{\text{k}=1}^{\text{N}}\frac{100\times\frac{\text{rate}}{\text{frequency}}}{\left(1+\frac{\text{yld}}{\text{frequency}}\right)^{\left(\text{k}-\text{N}_\text{q}+\frac{\text{DSC}}{\text{E}}\right)}}\right] - \left[100\times\frac{\text{rate}}{\text{frequency}}\times\sum_{\text{i}=1}^{\text{NC}}\frac{\text{A}_\text{i}}{\text{NL}_\text{i}}\right]$$

where:

- A_i = number of days from the beginning of the ith, or last, quasi-coupon period within odd period.
- DC_i = number of days from dated date (or issue date) to first quasi-coupon (i = 1) or number of days in quasi-coupon (i = 2,…, i = NC).
- *DSC* = number of days from settlement to next coupon date.
- *E* = number of days in coupon period.
- *frequency* = argument *frequency*
- *N* = number of coupons payable between the first real coupon date and redemption date. (If this number contains a fraction, it is raised to the next whole number.)
- *NC* = number of quasi-coupon periods that fit in odd period. (If this number contains a fraction, it is raised to the next whole number.)
- NL_i = normal length in days of the full ith, or last, quasi-coupon period within odd period.
- N_q = number of whole quasi-coupon periods between settlement date and first coupon.
- *rate* = argument *rate*
- *redemption* = argument *redemption*
- *yld* = argument *yld*

…**Arguments**:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
issue	number	The security's issue date.
first-coupon	number	The security's first coupon date.
rate	number	The security's interest rate.
yld	number	The security's annual yield.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments,

Similar to Basis 1, but always has 365 days per year.</td></tr><tr><td>4</td><td>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: - If the date is 28 or 29 February, it is adjusted to 30 February. - For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 Februar y.. </td></tr></table>

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Time information in the date arguments is ignored.

Return Type and Value: number – The price per $100 face value of a security having an odd (short or long) first period.

However, if

 ©ISO/IEC 2011 – All rights reserved

- *settlement*, *maturity*, *issue*, or *first-coupon* is out of range for the current date base value, `#NUM!` is returned.
- The following is not true: *maturity* is later than *first-coupon*, which is later than *settlement*, which is later than *issue*, so `#NUM!` is returned.
- *rate* or *yld* < 0, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`ODDFPRICE(DATE(2008,11,11),DATE(2021,3,1),DATE(2008,10,15),DATE(2009,3,1), 0.0785,0.0625,100,2,1)` results in `113.5977`

end example]

18.17.7.242 ODDFYIELD

Syntax:

`ODDFYIELD (` *settlement* `,` *maturity* `,` *issue* `,` *first-coupon* `,` *rate* `,` *pr* `,` *redemption* `,` *frequency* `[ , [` *basis* `] ] )`

Description: Computes the yield of a security that has an odd (short or long) first period.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
issue	number	The security's issue date.
first-coupon	number	The security's first coupon date.
rate	number	The security's interest rate.
pr	number	The security's price.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.)
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
`0` or omitted	US (NASD) 30/360. Assumes that each

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description		
				adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The yield of a security that has an odd (short or long) first period.

However, if

- *settlement*, *maturity*, *issue*, or *first-coupon* is out of range for the current date base value, `#NUM!` is returned.
- The following is not true: *maturity* is later than *first-coupon*, which is later than *settlement*, which is later than *issue*, so `#NUM!` is returned.
- *rate* or *pr* < 0, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

```
ODDFYIELD(DATE(2008,11,11),DATE(2021,3,1),DATE(2008,10,15),DATE(2009,3,1),
  0.0575,84.5,100,2,0) results in  7.7246%
```

end example]

18.17.7.243 ODDLPRICE

Syntax:

```
ODDLPRICE ( settlement , maturity , last-interest , rate , yld , redemption ,
    frequency [ , [ basis ] ] )
```

Description: Computes the price per $100 face value of a security having an odd (short or long) last coupon period.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
last-interest	number	The security's last coupon date.
rate	number	The security's interest rate.
yld	number	The security's annual yield.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.)
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** `0` or omitted / US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February.

  0.0785,0.0625,100,2,1) results in  99.8783
```

end example]

18.17.7.244 ODDLYIELD

Syntax:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

ODDLYIELD (*settlement* , *maturity* , *last-interest* , *rate* , *pr* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the yield of a security that has an odd (short or long) last period.

Mathematical Formula:

$$ODDLYIELD = \left[\frac{\left(redemption + \left(\left(\sum_{i=1}^{NC}\frac{DC_i}{NL_i}\right) \times \frac{100 \times rate}{frequency}\right)\right) - \left(par + \left(\left(\sum_{i=1}^{NC}\frac{A_i}{NL_i}\right) \times \frac{100 \times rate}{frequency}\right)\right)}{pr + \left(\left(\sum_{i=1}^{NC}\frac{A_i}{NL_i}\right) \times \frac{100 \times rate}{frequency}\right)}\right] \times \left[\frac{frequency}{\left(\sum_{i=1}^{NC}\frac{DSC_i}{NL_i}\right)}\right]$$

where:

- A_i = number of accrued days for the i^{th}, or last, quasi-coupon period within odd period counting forward from last interest date before redemption.
- DC_i = number of days counted in the i^{th}, or last, quasi-coupon period as delimited by the length of the actual coupon period.
- *frequency* = argument *frequency*
- *NC* = number of quasi-coupon periods that fit in odd period; if this number contains a fraction it is raised to the next whole number.
- NL_i = normal length in days of the i^{th}, or last, quasi-coupon period within odd coupon period.
- *par* = argument *par*
- *rate* = argument *rate*
- *redemption* = argument *redemption*
-

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
last-interest	number	The security's last coupon date.
rate	number	The security's interest rate.
pr	number	The security's price.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.)

  0.0575,84.5,100,2,0) results in  4.5192%
```

end example]

18.17.7.245 OFFSET

Syntax:

```
OFFSET ( reference , rows , cols [ , [ height ] [ , [ width ] ] ] )
```

Description: Gets a reference to a range that is a specified number of rows and columns from a cell or range of cells. The reference that is returned can be a single cell or a range of cells. You can specify the number of rows and the number of columns to be returned.

Arguments:

Name	Type	Description
reference	reference	Designates the base. *reference* shall refer to a cell or range of adjacent cells.
rows	number	The number of rows, up or down, that indicates the upper-left cell of the result to refer to. A positive value means below the starting reference; a negative value means above the starting reference.
cols	number	The number of columns, to the left or right, that the upper-left cell of the result to refer to. A positive value means to the right of the starting reference; a negative value means to the left of the starting reference.
height	number	The height, in rows, of the set of cells referred to by the resulting reference. This height shall be positive. If omitted, it is the same as the height of *reference*.
width	number	The width, in columns, of the set of cells referred to by the resulting reference. The width shall be positive. If omitted, it is the same as the width of *reference*.

Return Type and Value: reference – A reference to a range that is a specified size and number of rows and columns from a cell or range of cells.

However, if

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- *reference* does not refer to a cell or range of adjacent cells, #VALUE! is returned.
- The combination of *rows* and *cols* results outside the worksheet, #REF! is returned.

[*Example*:

OFFSET(C3,2,3,1,1) results in the value in cell F5
SUM(OFFSET(C3:E5,-1,0,3,3)) results in the sum of the range C2:E4

end example]

18.17.7.246 OR

Syntax:

OR (*argument-list*)

Description: Tests if any one or more *argument*s in *argument-list* are TRUE. The function evaluates all arguments prior to returning a value.

Arguments:

Name	Type	Description
argument-list	logical, array, reference.	The *argument*s in *argument-list* designate the values to be tested. For an array or cell reference, a cell that contains text or is empty shall be ignored.

Return Type and Value: logical – TRUE if any one or more *argument*s in *argument-list* are TRUE; otherwise, FALSE.

However, if no logical values are found, the return value is unspecified.

[*Example*:

OR(TRUE) results in TRUE
OR(FALSE,FALSE) results in FALSE
OR(10=5,3=1+2,0) results in TRUE
OR({10,5,6,7},TRUE,E6:F6) results in TRUE, when E6 contains FALSE and F6 contains 0

end example]

18.17.7.247 PEARSON

Syntax:

PEARSON (*array-1* , *array-2*)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Description: Computes the Pearson product moment correlation coefficient, a dimensionless index that ranges from -1.0 to 1.0, inclusive, and reflects the extent of a linear relationship between two data sets.

Mathematical Formula:

The formula for the Pearson product moment correlation coefficient, r, is:

$$r = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sqrt{\sum(x - \bar{x})^2 \sum(y - \bar{y})^2}}$$

where:

- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*array-1*)
- y = a sample value
- $\bar{y}$ = the sample mean AVERAGE(*array-2*)

Arguments:

Name	Type	Description
array-1	number, name, array, reference to number	The set of independent numerical values. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
array-2	number, name, array, reference to number	The set of dependent numerical values. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The Pearson product moment correlation coefficient.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* or *array-2* is empty, the return value is unspecified.

[*Example*:

`PEARSON({9,7,5,3,1},{10,6,1,5,3})` results in `0.699378606`

end example]

18.17.7.248 PERCENTILE

Syntax:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

PERCENTILE (*array* , *k*)

Description: Computes the k^{th} percentile of a set of values in a range.

Arguments:

Name	Type	Description
array	array, reference	The set of numerical data that defines relative standing.
k	number	The percentile value in the range 0–1, inclusive. If *k* is not a multiple of 1/(n - 1), PERCENTILE interpolates to determine the value at the k^{th} percentile.

Return Type and Value: number – The k^{th} percentile of a set of values in a range.

However, if

- *array* is empty, the return value is unspecified.
- *k* is < 0 or *k* > 1, #NUM! is returned.

[*Example*:

PERCENTILE({1,3,2,4},0.3) results in 1.9
PERCENTILE({1,3,2,4},0.75) results in 3.25

end example]

18.17.7.249 PERCENTRANK

Syntax:

PERCENTRANK (*array* , *x* [, *significance*])

Description: Computes the rank of a value in a data set as a percentage of the data set.

Arguments:

Name	Type	Description
array	array, reference	*array* is the set of numerical data that defines relative standing.
x	number	The value for which the rank is to be computed. If *x* does not match one of the values in *array*, PERCENTRANK interpolates to return the correct percentage rank.
significance	number	The number of significant digits for the returned percentage value. If omitted, a value of 3 is used.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The rank of a value in a data set as a percentage of the data set.

However, if

- *array* is empty, the return value is unspecified.
- *significance* < 1, `#NUM!` is returned.

[*Example*:

`PERCENTRANK({12,6,7,9,3,8},4)` results in `0.066`
`PERCENTRANK({12,6,7,9,3,8},5)` results in `0.133`

end example]

18.17.7.250 PERMUT

Syntax:

`PERMUT` (*number* , *number-chosen*)

Description: Computes the number of permutations for *number-chosen* objects that can be selected from *number* objects. [*Note*: A permutation is any set or subset of objects or events where internal order is significant. Permutations are different from combinations, for which the internal order is not significant. Use this function for lottery-style probability calculations. *end note*]

Mathematical Formula:

$$P_{k,n} = \frac{n!}{(n-k)!}$$

where:

- k = argument *number-chosen*
- n = argument *number*

Arguments:

Name	Type	Description
number	number	The total number of items available, truncated to integer.
number-chosen	number	The number of items in each permutation, truncated to integer.

Return Type and Value: number – The number of different permutations of *number-chosen* in *number*.

However, if

- *number* < 0, `#NUM!` is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- *number-chosen* < 0, #NUM! is returned.
- *number* < *number-chosen*, #NUM! is returned.

[*Example*:

PERMUT(8,2) results in 56
PERMUT(10,4) results in 5040
PERMUT(6,5) results in 720

end example]

18.17.7.251 PHONETIC

Syntax:

PHONETIC (*string*)

Description: Extracts the phonetic (furigana) characters from *string*. [*Note*: Furigana are aids used to indicate correct pronunciation of Japanese text. *end note*]

Arguments:

Name	Type	Description
string	text, reference	Designates a furigana string. If *string* is a cell range, the furigana string in the upper-left corner cell of that range is returned.

Return Type and Value: text – The phonetic (furigana) characters from *string*.

However, if *string* is a range of non-contiguous cells, #N/A is returned.

18.17.7.252 PI

Syntax:

PI ()

Description: Computes the value π.

Arguments: None.

Return Type and Value: number – The value π.

[*Example*: The following results are displayed using 10 significant digits

PI() results in 3.141592654
PI()/2 results in 1.570796327
PI()*(2.5^2) results in 19.63495408

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.253 PMT

Syntax:

PMT (*rate* , *nper* , *pv* [, [*fv*] [, [*type*]]])

Description: Computes the payment for a loan based on constant payments and a constant interest rate.

Arguments:

Name	Type	Description
rate	number	The interest rate for the loan.
nper	number	The total number of payment for the loan.
pv	number	The present value, or the total amount that a series of future payments is worth now; also known as the principal.
fv	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
type	number	The timing of the payment, truncated to integer, as follows:

Value	Timing
0	Payment at the end of the period
1	Payment at the beginning of the period

Return Type and Value: number – The payment for a loan based on constant payments and a constant interest rate. (The payment returned by PMT includes principal and interest but no taxes, reserve payments, or fees sometimes associated with loans.)

Howver, if *type* is any number other than 0 or 1, #NUM! is returned.

[*Example*:

PMT(0.08/12,10,10000) results in -1,037.03
PMT(0.08/12,10,10000,0,1) results in -1,030.16

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.254 POISSON

Syntax:

POISSON (*x* , *mean* , *cumulative-flag*)

Description: Computes the Poisson distribution.

Mathematical Formula:

For *cumulative-flag* = FALSE:

$$POISSON = \frac{e^{-\lambda}\lambda^{x}}{x!}$$

For *cumulative-flag* = TRUE:

$$CUMPOISSON = \sum_{k=0}^{x} \frac{e^{-\lambda}\lambda^{k}}{k!}$$

where:

- x = argument x
- λ = argument *mean*

Arguments:

Name	Type	Description
x	number	The number of events, truncated to an integer.
mean	number	The expected numeric value.
cumulative-flag	logical	Determines the form of the function. If TRUE, POISSON returns the cumulative Poisson probability that the number of random events occurring are between zero and x, inclusive; if FALSE, it returns the Poisson probability mass function that the number of events occurring is exactly x.

Return Type and Value: number – The Poisson distribution.

However, if

- $x < 0$, #NUM! is returned.
- *mean* ≤ 0, #NUM! is returned.

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

`POISSON(2,5,TRUE)` results in `0.124652019`
`POISSON(2,5,FALSE)` results in `0.084224337`

end example]

18.17.7.255 POWER

Syntax:

`POWER ( x , y )`

Description: Computes x raised to the power y.

Arguments:

Name	Type	Description
x	number	The base and the number y is the exponent to which that base is raised.
y	number	The exponent to which the base is raised.

Return Type and Value: number – x^y.

However, if

- The value of x is negative and y is not a whole number, `#NUM!` is returned.
- x is zero and y is less than or equal to zero, `#DIV/0!` is returned.
- The result cannot be represented as a number, `#NUM!` is returned.

[*Example*:

`POWER(2,3)` results in `8`
`POWER(2,0.5)` results in `1.414213562`
`POWER(-1.234,5.0)` results in `-2.861381721`
`POWER(1.234,5.1)` results in `2.922182358`

end example]

18.17.7.256 PPMT

Syntax:

`PPMT ( rate , per , nper , pv [ , [ fv ][ , [ type ]]] )`

Description: Computes the payment on the principal for a given period for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
rate	number	The interest rate per period.
per	number	The the period and shall be in the range 1–*nper*.
nper	number	The total number of payment in an annuity.
pv	number	The present value, or the total amount that a series of future payments is worth now.
fv	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
type	number	The timing of the payment, truncated to integer, as follows:

Value	Timing
`0`	Payment at the end of the period
`1`	Payment at the beginning of the period

Return Type and Value: number – The payment on the principal for a given period for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`PPMT(0.1/12,1,2*12,2000)` results in `-75.62`
`PPMT(0.08,10,10,200000)` results in `-27,598.05`

end example]

18.17.7.257 PRICE

Syntax:

`PRICE` (*settlement* , *maturity* , *rate* , *yld* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the price per $100 face value of a security that pays periodic interest.

Mathematical Formula:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

$$PRICE = \left[\frac{reemption}{\left(1+\frac{yld}{frequency}\right)^{\left(N-1+\frac{DSC}{E}\right)}}\right] + \left[\sum_{k=1}^{N}\frac{100\times\frac{rate}{frequency}}{\left(1+\frac{yld}{frequency}\right)^{\left(k-1+\frac{DSC}{E}\right)}}\right] - \left(100\times\frac{rate}{frequency}\times\frac{A}{E}\right)$$

where:

- *A* = number of days from beginning of coupon period to settlement date.
- *DSC* = number of days from settlement to next coupon date.
- *E* = number of days in coupon period in which the settlement date falls.
- *frequency* = argument *frequency*
- *N* = number of coupons payable between settlement date and redemption date.
- *rate* = argument *rate*
- *redemption* = argument *redemption*
- *yld* = argument *yld*

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
rate	number	The security's interest rate.
yield	number	The security's annual yield.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.) *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description		
				30 February. • For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
			1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
			2	Actual/360. Similar to Basis 1, but only has 360 days per year.
			3	Actual/365. Similar to Basis 1, but always has 365 days per year.
			4	European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 Februar y.

Time information in the date arguments is ignored.

Return Type and Value: number – The price per $100 face value of a security that pays periodic interest.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *rate* or *yld* < 0, `#NUM!` is returned.
- *redemption* ≤ 0, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`PRICE(DATE(2008,2,15),DATE(2017,11,15),0.0575,0.065,100,2,0)` results in `94.6344`

end example]

18.17.7.258 PRICEDISC

Syntax:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

`PRICEDISC ( `*settlement*` , `*maturity*` , `*discount*` , `*redemption*` [ , [ `*basis*` ] ] )`

Description: Computes the price per $100 face value of a discounted security.

Mathematical Formula:

$$PRICEDISC = redemption - discount \times redemption \times \frac{DSM}{B}$$

where:

- B = number of days in year, depending on year basis.
- DSM = number of days from settlement to maturity.
- *discount* = argument *discount*
- *redemption* = argument *redemption*

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
discount	number	The security's discount rate.
redemption	number	The security's redemption value per $100 face value.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** `0` or omitted / US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date

- *discount* or *redemption* ≤ 0, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`PRICEDISC(DATE(2008,2,16),DATE(2008,3,1),0.0525,100,2)` results in `99.7958`

end example]

18.17.7.259 PRICEMAT

Syntax:

`PRICEMAT` (*settlement* , *maturity* , *issue* , *rate* , *yld* [, [*basis*]])

Description: Computes the price per $100 face value of a security that pays interest at maturity.

Mathematical Formula:

$$PRICEMAT = \frac{100 + \left(\frac{IM}{B} \times rate \times 100\right)}{1 + \left(\frac{DSM}{B} \times yld\right)} - \left(\frac{A}{B} \times rate \times 100\right)$$

where:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- *A* = number of days from issue to settlement.
- *B* = number of days in year, depending on year basis.
- *DIM* = number of days from issue to maturity.
- *DSM* = number of days from settlement to maturity.
- *rate* = argument *rate*
- *yld* = argument *yld*

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
issue	number	The security's issue date.
rate	number	The security's interest rate.
yld	number	The security's annual yield.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
`0` or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or

Name	Type	Description
		where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The price per $100 face value of a security that pays interest at maturity.

However, if

- *settlement*, *maturity*, or *issue* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *rate* or *yld* < 0, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

```
PRICEMAT(DATE(2008,2,15),DATE(2008,4,13),DATE(2007,11,11),0.061,0.061,0)
```
results in `99.9845`

end example]

18.17.7.260 PROB

Syntax:

PROB (*x-range* , *probability-range* , *lower-limit* [, *upper-limit*])

Description: Computes the probability that values in a range are between two limits.

Arguments:

Name	Type	Description
x-range	array, reference	The set of numeric values of *x* with which there are associated probabilities.
probability-range	array, reference	A set of numeric probabilities associated with the values in *x-range*.
lower-limit	number	The lower bound on the value for which the probability is to be computed.
upper-limit	number	The upper bound on the value for which the probability is to be computed. If omitted, the probability that values in *x-range* are equal to *lower-limit* is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The probability that values in a range are between two limits.

However, if

- Any value in *probability-range* ≤ 0 or any value in *probability-range* > 1, `#NUM!` is returned.
- The sum of the values in *probability-range* < 1, `#NUM!` is returned.
- *x-range* and *probability-range* contain a different number of data points, the return value is unspecified.

[*Example*:

`PROB({0,1,2,3},{0.2,0.3,0.1,0.4},2)` results in `0.1`
`PROB({0,1,2,3},{0.2,0.3,0.1,0.4},1,4)` results in `0.8`

end example]

18.17.7.261 PRODUCT

Syntax:

PRODUCT (*argument-list*)

Description: Multiplies the numeric values of *argument*s in *argument-list*.

Arguments:

Name	Type	Description
argument-list	logical, number, text, array, reference	The *argument*s in *argument-list* designate the numbers to be multiplied. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

Return Type and Value: number – The product of the values of its arguments.

[*Example*:

`PRODUCT(1)` results in `1`
`PRODUCT(1,2,3,4,5)` results in `120`
`PRODUCT({1,2;3,4})` results in `24`
`PRODUCT({2,3},4,"5")` results in `120`

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.17.7.262 PROPER

Syntax:

PROPER (*string*)

Description: Makes a lowercase version of *string* except that the first letter in *string* and any other letters in *string* that immediately follow a character that is not a letter, are converted to uppercase.

Arguments:

Name	Type	Description
string	text, reference	Designates the string to be converted.

Return Type and Value: text – A version of *string* such that the first letter in *string* and any other letters in *string* that immediately follow a character that is not a letter, are converted to uppercase. All other letters are converted to lowercase, and all other non-letters are unchanged.

[*Example*:

`PROPER("12aBC d123aD#$%sd^")` results in `12Abc D123Ad#$%Sd^`
`PROPER(A10)` results in `12Abc D123Ad#$%Sd^`, when A10 contains `12aBC d123aD#$%sd^`

end example]

18.17.7.263 PV

Syntax:

PV (*rate* , *nper* , *pmt* [, [*fv*] [, [*type*]]])

Description: Computes the present value of an investment. (The present value is the total amount that a series of future payments is worth now.)

Mathematical Formula:

If *rate* is not 0, then:

$$pv * (1 + rate)^{nper} + pmt(1 + rate * type) * \left(\frac{(1 + rate)^{nper} - 1}{rate}\right) + fv = 0$$

If *rate* is 0, then:

$(\text{pmt} \times \text{nper}) + \text{pv} + \text{fv} = 0$(pmt * nper) + pv + fv = 0

where:

- *fv* = *fv* argument

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- *nper* = *nper* argument
- *pmt* = *pmt* argument
- *rate* = *rate* argument
- *type* = *type* argument

Arguments:

Name	Type	Description
rate	number	The interest rate per period.
nper	number	The total number of payment in an annuity.
pmt	number	The payment made each period and cannot change over the life of the annuity. If is omitted, *fv* shall be provided. [*Note*: Typically, *pmt* includes principal and interest but no other fees or taxes. *end note*]
fv	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, *pmt* shall be provided.
type	number	The timing of the payment, truncated to integer, as follows:

Value	Timing
0	Payment at the end of the period
1	Payment at the beginning of the period

Return Type and Value: number – The present value of an investment.

However, if *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`PV(0.08/12,12*20,500,,0)` results in `-59,777.15`

end example]

18.17.7.264 QUARTILE

Syntax:

`QUARTILE` (*array* , *result-category*)

Description: Computes the quartile of a data set.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Arguments:

Name	Type	Description
array	array, reference	The set of numeric values for which the quartile value is to be computed.
result-category	number	When truncated to an integer, specifies which value is to be returned, as follows: 0 – Minimum value 1 – First quartile (25th percentile) 2 – Median value (50th percentile) 3 – Third quartile (75th percentile) 4 – Maximum value

Return Type and Value: number – The quartile of a data set.

However, if

- *array* is empty, the return value is unspecified.
- *result-category* < 0 or *result-category* > 4, #NUM! is returned.

[*Example*:

`QUARTILE({1,2,4,7,8,9,10,12},1)` results in `3.5`

end example]

18.17.7.265 QUOTIENT

Syntax:

`QUOTIENT` (*dividend* , *divisor*)

Description: Computes the integer portion of the division of *dividend* by *divisor*.

Arguments:

Name	Type	Description
dividend	number	The dividend
divisor	number	The divisor.

Return Type and Value: number – The integer portion of the division of *dividend* by *divisor*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*:

`QUOTIENT(5,2)` results in 2
`QUOTIENT(4.5,3.1)` results in 1
`QUOTIENT(-10,3)` results in -3

end example]

18.17.7.266 RADIANS

Syntax:

RADIANS (*angle*)

Description: Converts *angle* in degrees into radians.

Arguments:

Name	Type	Description
angle	number	The angle expressed in degrees that is to be converted into radians.

Return Type and Value: number – *angle* in radians.

[*Example*:

`RADIANS(360)` results in `6.283185307`
`RADIANS(270)` results in `4.71238898`
`RADIANS(45)` results in `0.785398163`
`RADIANS(8.5)` results in `0.148352986`

end example]

18.17.7.267 RAND

Syntax:

RAND ( )

Description: Computes an evenly distributed random real number greater than or equal to 0 and less than 1. A new random real number is returned every time the cell's value is calculated.

Arguments: None.

Return Type and Value: number – An evenly distributed random real number greater than or equal to 0 and less than 1.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Example*:

`RAND()` results in `0.437337454`
`INT(RAND()*(6-1)+1)` might result in `3`

end example]

18.17.7.268 RANDBETWEEN

Syntax:

RANDBETWEEN (*lower-bound* , *upper-bound*)

Description: Computes a random integer number in the range *lower-bound*–*upper-bound*. A new random integer number is returned every time the cell's value is calculated.

Arguments:

Name	Type	Description
lower-bound	number	The smallest integer that is returned.
upper-bound	number	The largest integer that is returned.

Return Type and Value: number – A random integer number in the range specified.

However, if *lower-bound* is greater than *upper-bound*, `#NUM!` is returned.

[*Example*:

`RANDBETWEEN(1,6)` results in an integer between `1` and `6`, inclusive
`RANDBETWEEN(-10,10)` results in an integer between `-10` and `10`, inclusive

end example]

18.17.7.269 RANK

Syntax:

RANK (*number* , *number-list* [, *order*])

Description: Computes the rank of a number in a list of numbers. RANK gives duplicate numbers the same rank. However, the presence of duplicate numbers affects the ranks of subsequent numbers.

Arguments:

Name	Type	Description
number	number	The number whose rank is to be found.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
number-list	reference	Designates the list of numbers. Non-numeric values in this list are ignored.
order	number	Specifies how *number* is to be ranked. If zero or omitted, *number* is ranked as if the list were sorted in descending order. If *order* is any non-zero value, *number* is ranked as if the list were sorted in ascending order.

Return Type and Value: number – The rank of a number in a list of numbers.

[*Example*:

When the cells `E1:I1` contain 7, 3.5, 3.5, 1, and 2

`RANK(E2,E1:I1,1)` results in 3
`RANK(E2,E1:I1,1,0)` results in 2
`RANK(E2,E1:I1,1)` results in 2
`RANK(E1,E1:I1,1)` results in 5, as the two 3.5 values both have a rank of 3; no value has rank 4.

end example]

18.17.7.270 RATE

Syntax:

RATE (*nper* , *pmt* , *pv* [, [[*fv*] [, [[*type*][, [*guess*]]]]]])

Description: Computes the interest rate per period of an annuity, using iteration, which can result in zero or more solutions.

Arguments:

Name	Type	Description
nper	number	The total number of payment periods.
pmt	number	The payment made each period and cannot change over the life of the annuity. (Typically, *pmt* includes principal and interest but no other fees or taxes.) If omitted, *fv* shall be present.
pv	number	The present value.
fv	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
type	number	The timing of the payment, truncated to integer, as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>
guess	number	A guess for what the rate are. If omitted, it is assumed to be 10 percent.

Return Type and Value: number – The interest rate per period of an annuity.

However, if

- *type* is any number other than 0 or 1, `#NUM!` is returned.
- The result has not converged after an implementation-defined number of iterations, `#NUM!` is returned.

[*Example*:

`RATE(4*12,-200,8000)` results in `0.7701%`
`RATE(4*12,-200,8000)*12` results in `9.2418%`

end example]

18.17.7.271 RECEIVED

Syntax:

`RECEIVED ( settlement , maturity , investment , discount [ , [ basis ] ] )`

Description: Computes the amount received at maturity for a fully invested security.

Mathematical Formula:

$$RECEIVED = \frac{investment}{1 - \left(discount \times \frac{DIM}{B}\right)}$$

where:

- B = number of days in a year, depending on the year basis.
- DIM = number of days from issue to maturity.
- $discount$ = argument *discount*
- $investment$ = argument *investment*

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

<table>
<tr><th>Name</th><th>Type</th><th>Description</th></tr>
<tr><td>settlement</td><td>number</td><td>The security's settlement date.</td></tr>

If the date is 28 or 29 February, it is adjusted to 30 February.
For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr>
<tr><td>1</td><td>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the</td></tr>
</table>
</td></tr>
</table>

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		year is 366 days; otherwise it is 365 days.
		2 — Actual/360. Similar to Basis 1, but only has 360 days per year.
		3 — Actual/365. Similar to Basis 1, but always has 365 days per year.
		4 — European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The amount received at maturity for a fully invested security.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* ≥ *maturity*, #NUM! is returned.
- *investment* or *discount* ≤ 0, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[*Example*:

`RECEIVED(DATE(2008,2,15),DATE(2008,5,15),1000000,0.0575,2)` results in `1014584.65`

end example]

18.17.7.272 REPLACE

Syntax:

REPLACE (*string-1* , *start-pos* , *number-chars* , *string-2*)

Description: Produces a new string that is *string-1* with *number-chars* characters starting at position *start-pos*, replaced by *string-2*. (REPLACE is intended for use with languages that use the single-byte character set (SBCS), whereas REPLACEB (§18.17.7.273) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string-1	text	Designates a string.
start-pos	number	The number of the start position within *string-1* from which characters in *string-1* are to be replaced. The start position of the first character is 1. *start-pos* shall be at least 0. If *start-pos* is beyond the end of *string-1*, the result is a new string that is *string-2* appended to *string-1*. If *start-pos* is within the bounds of *string-1*, but *number-chars* goes beyond the end of *string-1*, the characters starting at position *start-pos* through to the end of *string-1* shall be replaced by *string-2*.
number-chars	number	The number of characters within *string-1* that are to be replaced by the string designated by *string-2*.
string-2	text	Designates a string.

Return Type and Value: text – A copy of *string-1* with replacement characters from *string-2*.

However, if

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- *start-pos* < 0, #VALUE! is returned.
- *number-chars* < 0, #VALUE! is returned.

[*Example*:

REPLACE("abcdefghijk",3,4,"XY") results in abXYghijk
REPLACE("abcdefghijk",3,1,"12345") results in ab12345defghijk
REPLACE("abcdefghijk",15,4,"XY") results in abcdefghijkXY

end example]

18.17.7.273 REPLACEB

Syntax:

REPLACEB (*string-1* , *start-pos* , *number-bytes* , *string-2*)

Description: Produces a new string that is *string-1* with *number-bytes* bytes starting at position *start-pos*, replaced by *string-2*. (REPLACEB is intended for use with languages that use the double-byte character set (DBCS), whereas REPLACE (§18.17.7.272) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string-1	text	Designates a string.
start-pos	number	The number of the start position within *string-1* from which characters in *string-1* are to be replaced. The start position of the first character is 1. *start-pos* shall be at least 0. If *start-pos* is beyond the end of *string-1*, the result is a new string that is *string-2* appended to *string-1*. If *start-pos* is within the bounds of *string-1*, but *number- bytes* goes beyond the end of *string-1*, the characters starting at position *start-pos* through to the end of *string-1* shall be replaced by *string-2*.
number-bytes	number	The number of characters within *string-1* that are to be replaced by the string designated by *string-2*.
string-2	text	Designates a string.

Return Type and Value: text – A copy of *string-1* with replacement characters from *string-2*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-bytes* < 0, #VALUE! is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*: Assuming 1-byte characters:

`REPLACEB("abcdefghijk",3,4,"XY")` results in `abXYghijk`
`REPLACEB("abcdefghijk",3,1,"12345")` results in `ab12345defghijk`
`REPLACEB("abcdefghijk",15,4,"XY")` results in `abcdefghijkXY`

end example]

18.17.7.274 REPT

Syntax:

`REPT ( string , replication-count )`

Description: Creates a string that is *replication-count* number of occurrences of *string* concatenated together.

Arguments:

Name	Type	Description
string	text	Designate the string to be replicated.
replication-count	number	The number of times *string* is to be replicated, truncated to integer. If *replication-count* is 0, the resulting string is empty.

Return Type and Value: text – The final replicated string.

However, if *replication-count* < 0, `#VALUE!` is returned.

[*Example*:

`REPT("ABC",3)` results in `ABCABCABC`
`LEN(REPT("ABC",0))` results in `0`

end example]

18.17.7.275 RIGHT

Syntax:

`RIGHT ( string [ , number-chars ] )`

Description: Extracts the right-most *number-chars* characters from *string*. (`RIGHT` is intended for use with languages that use the single-byte character set (SBCS), whereas `RIGHTB` (§18.17.7.276) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-chars	number	The number of characters to be extracted. If omitted, a count of 1 shall be assumed. *number-chars* shall be at least 0. If *number-chars* exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing the right-most *number-chars* characters from *string*.

However, if *number-chars* < 0, #VALUE! is returned.

[*Example*:

`RIGHT("abcdef",2)` results in `ef`
`RIGHT(A10,4)` results in `z123`, when A10 contains `xyz123`

end example]

18.17.7.276 RIGHTB

Syntax:

```
RIGHTB ( string , [ number-bytes ] )
```

Description: Extracts the right-most *number-bytes*-worth of characters from *string*. (`RIGHTB` is intended for use with languages that use the double-byte character set (DBCS), whereas `RIGHT` (§18.17.7.275) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-bytes	number	The number of bytes to be extracted. If omitted, a count of 1 shall be assumed. *number-bytes* shall be at least 0. If *number-bytes* exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing the right-most *number-bytes*-worth of characters from *string*.

However, if *number-bytes* < 0, #VALUE! is returned.

[*Example*: Assuming 1-byte characters:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

`RIGHTB("abcdef",2)` results in `ef`
`RIGHTB(A10,4)` results in `z123`, when A10 contains `xyz123`

end example]

18.17.7.277 ROMAN

Syntax:

ROMAN (*number* , *form*)

Description: Converts the Arabic number, *number*, to a Roman number according to *form*.

Arguments:

Name	Type	Description
number	number	The Arabic number to be converted.
form	number	Specifies the type of Roman numeral to be produced. The Roman numeral style ranges from Classic to Simplified, becoming more concise as the value of *form* increases, as follows:

Value	Type
0, omitted, or TRUE	Classic. Only subtract powers of ten (but not L or V). Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.
1	Concise. Allow subtractraction of L and V as well as powers of ten. Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.
2	More concise. Allow subtractraction of L (but not V) as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.
3	Most concise. Allow subtractraction of L and V as well as powers of ten. Allow subtraction of a number from one that

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
			is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.
		4 or FALSE	Simplified. Produce the fewest Roman digits.

Return Type and Value: text – The corresponding Roman number.

However, if

- *number* < 0 or > 3999, #VALUE! is returned.
- *form* is not one of the values listed above, #VALUE! is returned.

[*Example*:

`ROMAN(499,0)` results in `CDXCIX`, which is 100 less than 500, plus 10 less than 100, plus one less than 10.
`ROMAN(499,1)` results in `LDVLIV`, which is 50 less than 500, plus 5 less than 50, plus one less than 5.
`ROMAN(499,2)` results in `XDIX`, which is 10 less than 500, plus one less than 10.
`ROMAN(499,3)` results in `VDIV`, which is 5 less than 500, plus one less than 5.
`ROMAN(499,4)` results in `ID`, which is 1 less than 500.
`ROMAN(2013,0)` results in `MMXIII`, which is 2,000, plus 10, plus 3.

end example]

18.17.7.278 ROUND

Syntax:

ROUND (*x* , *number-digits*)

Description: Rounds *x* to the number of digits specified by *number-digits*.

Arguments:

Name	Type	Description
x	number	The value to be rounded.
number-digits	number	The number of digits to which *x* is to be rounded. If *number-digits* is greater than 0, *x* is rounded to the specified number of decimal places. If *number-digits* is 0, *x* is rounded to the nearest integer. If *number-digits* is less than 0, *x* is rounded to the left of the decimal point.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The rounded value of *x*. When rounding, digits 0–4 round down, while digits 5–9 round up.

[*Example*:

`ROUND(2.15,1)` results in `2.2`
`ROUND(2.149,1)` results in `2.1`
`ROUND(-1.475,2)` results in `-1.48`
`ROUND(21.5,-1)` results in `20`

end example]

18.17.7.279 ROUNDDOWN

Syntax:

ROUNDDOWN (*x* , *number-digits*)

Description: Computes *x* rounded down, toward zero, to the number of digits specified by *number-digits*. [*Note*: ROUNDDOWN behaves like ROUND (§18.17.7.278), except that ROUNDDOWN always rounds a number down. *end note*]

Arguments:

Name	Type	Description
x	number	The value to be rounded down.
number-digits	number	The number of digits to which *x* is to be rounded. If *number-digits* is greater than 0, *x* is rounded to the specified number of decimal places. If *number-digits* is 0, *x* is rounded to the nearest integer. If *number-digits* is less than 0, *x* is rounded to the left of the decimal point.

Return Type and Value: number – The rounded-down value of *x*.

[*Example*:

`ROUNDDOWN(3.2,0)` rounds 3.2 down to zero decimal places; that is, to 3
`ROUNDDOWN(76.9,0)` rounds 76.9 down to zero decimal places; that is, to 76
`ROUNDDOWN(3.14159,3)` rounds 3.14159 down to three decimal places; that is, to `3.141`
`ROUNDDOWN(-3.14159,1)` rounds -3.14159 down to one decimal place; that is, to `-3.1`
`ROUNDDOWN(31415.92654,-2)` rounds 31415.92654 down to two decimal places to the left of the decimal; that is, to `31400`

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.17.7.280 ROUNDUP

Syntax:

ROUNDUP (*x* , *number-digits*)

Description: Computes *x* rounded up, away from zero, to the number of digits specified by *number-digits*. [*Note*: ROUNDUP behaves like ROUND (§18.17.7.278), except that ROUNDUP always rounds a number up. *end note*]

Arguments:

Name	Type	Description
x	number	The value to be rounded up.
number-digits	number	The number of digits to which *x* is to be rounded. If *number-digits* is greater than 0, *x* is rounded up to the specified number of decimal places. If *number-digits* is 0, *x* is rounded up to the nearest integer. If *number-digits* is less than 0, *x* is rounded up to the left of the decimal point.

Return Type and Value: number – The rounded-up value of *x*.

[*Example*:

`ROUNDDOWN(3.2,0)` rounds 3.2 down to zero decimal places; that is, to 4
`ROUNDDOWN(76.9,0)` rounds 76.9 down to zero decimal places; that is, to 77
`ROUNDDOWN(3.14159,3)` rounds 3.14159 down to three decimal places; that is, to `3.142`
`ROUNDDOWN(-3.14159,1)` rounds -3.14159 down to one decimal place; that is, to `-3.2`
`ROUNDDOWN(31415.92654,-2)` rounds 31415.92654 down to two decimal places to the left of the decimal; that is, to `31500`

end example]

18.17.7.281 ROW

Syntax:

ROW ([*reference*])

Description: Finds the number of the row(s) corresponding to *reference*.

Arguments:

Name	Type	Description
reference	reference to a single cell or to a range of	If omitted, the behavior is as if *reference* referred to the cell containing the formula.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
	contiguous cells	

Return Type and Value: number – If *reference* refers to a single cell or to a single row of cells, the corresponding row is returned. If *reference* refers to a range of cells involving multiple rows, a vertical array of the corresponding rows as numbers is returned.

However, if the range of cells referred to by *reference* is not contiguous, `#REF!` is returned.

[*Example*:

`ROW()` results in 16, when the cell containing the formula is in row 16
`ROW(E17:G17)` results in 17
`ROW(E16:G17)` results in a vertical array containing 16 and 17, respectively

end example]

18.17.7.282 ROWS

Syntax:

`ROWS ( array )`

Description: Finds the number of rows corresponding to *array*.

Arguments:

Name	Type	Description
array	array, reference to a single cell, or a reference to a range of contiguous cells	A set of rows.

Return Type and Value: number – The number of rows corresponding to *array*.

However, if the range of cells referred to by *array* is not contiguous, `#NULL!` is returned.

[*Example*:

`ROWS(E16:H16)` results in 1
`ROWS(E16:G18)` results in 3
`ROWS({1,2;3,4})` results in 2

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.283 RSQ

Syntax:

RSQ (*known-ys* , *known-xs*)

Description: Computes the square of the Pearson product moment correlation coefficient through data points in known ys and known xs.

Mathematical Formula:

The equation for the Pearson product moment correlation coefficient, r, is:

$$r = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sqrt{\sum(x - \bar{x})^2 \sum(y - \bar{y})^2}}$$

where:

- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*known-xs*)
- y = a sample value
- $\bar{y}$ = the sample mean AVERAGE(*known-ys*)

Arguments:

Name	Type	Description
known-xs	number, name, array, or reference to number, text, logical	Designate a set of numeric data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
known-ys	number, name, array, or reference to number, text, logical	Designate a set of numeric data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The square of the Pearson product moment correlation coefficient.

However, if

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- *known-ys* and *known-xs* are empty or have a different number of data points, the return value is unspecified.
- *known-ys* and *known-xs* contain only one data point, the return value is unspecified.

[*Example*:

`RSQ({2,3,9,1,8,7,5},{6,5,11,7,5,4,4})` results in `0.057950192`

end example]

18.17.7.284 RTD

Syntax:

RTD (*progID* , [*rtd-server*] , *argument-list*)

Description: Retrieves data from a program in real-time. Periodically, this function returns new values and causes recalculation of the expression containing the call to it.

Arguments:

Name	Type	Description
progID	text	The name of the program from which the data is to be retrieved.
rtd-server	text	An optional string that is specific to the program with which RTD is communicating.
argument list	any	The presence and meaning of each *argument* in *argument-list* is specific to the program with which RTD is communicating.

Return Type and Value: array – The set of values returned by the program with which RTD is communicating.

[*Example*: Consider a stockprice program that is called as follows:

```
RTD("stockprice.rtd","NASD","MSFT")
```

The result it returns—the price of the stock MSFT according to NASD—changes over time, often every few seconds.

The *rtd-server* program could also be written to accept multiple arguments, allowing calls like the following::

```
RTD("stockprice.rtd","NASD","MSFT","GOOG","AMZN")
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

where three stock values are requested.

end example]

18.17.7.285 SEARCH

Syntax:

SEARCH (*string-1* , *string-2* [, *start-pos*])

Description: Performs a case-insensitive search, using a lexical comparison, for the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. (SEARCH is intended for use with languages that use the single-byte character set (SBCS), whereas SEARCHB (§18.17.7.286) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string-1	text	Designate the string to be searched for within the string designated by *string-2*. *string-1* can contain the following wildcard characters: question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for an actual question mark or asterisk, that character shall be preceded by a tilde (~).
string-2	text	
start-pos	number	The number of the start position within *string-2* for which *string-1* is to be searched. The start position of the first character is 1. If omitted, a position of 1 shall be assumed. *start-pos* shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[*Example*:

SEARCH("de","abcdEF") results in 4
SEARCH("?c*e","abcdEF") results in 2

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.286 SEARCHB

Syntax:

SEARCHB (*string-1* , *string-2* [, *start-pos*])

Description: Performs a case-insensitive search, using a lexical comparison, for the first occurrence of *string-1* in *string-2*, starting at byte position *start-pos* within *string-2*. (SEARCHB is intended for use with languages that use the double-byte character set (DBCS), whereas SEARCH (§18.17.7.285) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string-1	text	Designate the string to be searched for within the string designated by *string-2*. *string-1* can contain the following wildcard characters: question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for an actual question mark or asterisk, that character shall be preceded by a tilde (~).
string-2	text	
start-pos	number	The number of the start position within *string-2* for which *string-1* is to be searched. The start position of the first byte is 1. If omitted, a position of 1 shall be assumed. *start-pos* shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[*Example*: Assuming 1-byte characters

SEARCHB("de","abcdEF") results in 4
SEARCHB("?c*e","abcdEF") results in 2

end example]

18.17.7.287 SECOND

Syntax:

SECOND (*time-value*)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Description: Computes the second for the date and/or time having the given *time-value*.

Arguments:

Name	Type	Description
time-value	number	The date and/or time whose second is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a *string-constant* having any date and/or time format, in which case, any date information shall be ignored.

Return Type and Value: number – The second for the date and/or time having the given *time-value*.

However, if *time-value* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`SECOND(DATE(2006,2,26)+TIME(2,10,20))` results in `20`
`SECOND(TIME(22,56,34))` results in `34`
`SECOND(0)` results in `0`, since serial value 0 represents `00:00:00`
`SECOND(10.5)` results in `0`, since serial value .5 represents `12:00:00`
`SECOND("22-Oct-2001 10:53:12")` results in `12`
`SECOND("10:53:12 pm")` results in `12`
`SECOND("22:53:12")` results in `12`

end example]

18.17.7.288 SERIESSUM

Syntax:

`SERIESSUM ( `*input-value*` , `*initial-power*` , `*step*` , `*coefficients*` )`

Description: Computes the sum of a power series.

Mathematical Formula:

The sum of a power series is based on the formula:

$$SERIES(x, n, m, a) = a_1 x^n + a_2 x^{(n+m)} + a_3 x^{(n+2m)} + \cdots + a_i x^{(n+(i-1)m)}$$

where:

- a = argument *coefficients*
- m = argument *step*
- n = argument *initial-power*

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- *x* = argument *input-value*

Arguments:

Name	Type	Description
input-value	number	The input value to the power series;
initial-power	number	The initial power to which *input-value* is to be raised.
step	number	The step by which to increase *initial-power* for each term in the series;
coefficients	reference	A set of coefficients by which each successive power of *input-value* is multiplied. The number of values in *coefficients* determines the number of terms in the power series.

Return Type and Value: number – The sum of a power series.

[*Example*: Given the following data:

	A
1	1
2	=-1/FACT(2)
3	=1/FACT(4)
4	=-1/FACT(6)

`SERIESSUM(PI()/4,0,2,A1:A4)` results in `0.707103`, an approximation to the cosine of π/4 radians

end example]

18.17.7.289 SIGN

Syntax:

```
SIGN ( x )
```

Description: Determines the sign of *x*.

Arguments:

Name	Type	Description
x	number	The number whose sign is to be determined.

Return Type and Value: number – 1 if *x* is positive, 0 if *x* is 0, and -1 if *x* is negative.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Example*:

`SIGN(10.5)` results in `1`
`SIGN(0)` results in `0`
`SIGN(-5.4)` results in `-1`

end example]

18.17.7.290 SIN

Syntax:

```
SIN ( x )
```

Description: Computes the sine of x.

Arguments:

Name	Type	Description
x	number	The number, in radians, whose sine is to be computed.

Return Type and Value: number – The sine of x.

[*Example*:

`SIN(-1)` results in `-0.841470985`
`SIN(0)` results in `0`
`SIN(1)` results in `0.841470985`

end example]

18.17.7.291 SINH

Syntax:

```
SINH ( x )
```

Description: Computes the hyperbolic sine of x.

Arguments:

Name	Type	Description
x	number	The number whose hyperbolic sine is to be computed.

Return Type and Value: number – The hyperbolic sine of x.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

However, if the magnitude of *x* is too large for the result to be represented, `#NUM!` is returned.

[*Example*:|

`SINH(1)` results in `1.175201194`
`SINH(10)` results in `11013.23287`
`SINH(100)` results in `1.34406E+43`

end example]

18.17.7.292 SKEW

Syntax:

`SKEW` (*argument-list*)

Description: Computes the skewness of a distribution. [*Note*: Skewness characterizes the degree of asymmetry of a distribution around its mean. Positive skewness indicates a distribution with an asymmetric tail extending toward more positive values. Negative skewness indicates a distribution with an asymmetric tail extending toward more negative values. *end note*]

Mathematical Formula:

$$\frac{n}{(n-1)(n-2)}\sum\left(\frac{x_i-\bar{x}}{s}\right)^3$$

where:

- n = the number of elements in *argument-list*
- s = standard deviation of the values in *argument-list*
- xi = value of each element in *argument-list*
- $\bar{x}$ = mean of the values in *argument-list*

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers for which the skewness is to be computed. Logical values and text representations of numbers that are entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The skewness of a distribution.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

However, if

- There are fewer than three data points, the return value is unspecified.
- The sample standard deviation is zero, the return value is unspecified.

[*Example*:

`SKEW(3,4,5,2,3,4,5,6,4,7)` results in `0.359543071`

end example]

18.17.7.293 SLN

`SLN ( cost , salvage , life )`

Description: Computes the straight-line depreciation of an asset for one period.

Arguments:

Name	Type	Description
cost	number	The number *cost* is the initial cost of the asset.
salvage	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
life	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)

Return Type and Value: number – The straight-line depreciation of an asset for one period.

[*Example*:

`SLN(30000,7500,10)` results in `2,250.00`

end example]

18.17.7.294 SLOPE

Syntax:

`SLOPE ( known-ys , known-xs )`

Description: Computes the slope of the linear regression line through data points in known ys and known xs. The slope is the vertical distance divided by the horizontal distance between any two points on the line, which is the rate of change along the regression line.

Mathematical Formula:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

$$b = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

where:

- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*known-xs*)
- y = a sample value
- $\bar{y}$ = the sample mean AVERAGE(*known-ys*)

Arguments:

Name	Type	Description
known-xs	number, name, array, or reference to number, text, logical	Designate a set of numeric dependent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
known-ys	number, name, array, or reference to number, text, logical	Designate a set of numeric independent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The slope of the linear regression line through data points in known ys and known xs.

However, if

- *known-ys* and *known-xs* are empty, the return value is unspecified.
- *known-ys* and *known-xs* have a different number of data points, the return value is unspecified.

[*Example*:

`SLOPE({2,3,9,1,8,7,5},{6,5,11,7,5,4,4})` results in `0.305555556`

end example]

18.17.7.295 SMALL

Syntax:

```
SMALL ( array , k )
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Description: Computes the k^{th} smallest value in a data set.

Arguments:

Name	Type	Description
array	array, reference	The set of numbers from which the k^{th}-smallest value is to be determined.
k	number	The position (from the smallest) in the array or cell range of data to return.

Return Type and Value: number – The k^{th} smallest value in a data set.

However, if

- *array* is empty, the return value is unspecified.
- $k \leq 0$ or k is greater than the number of data points, `#NUM!` is returned.

[*Example*:

`SMALL({3,5,3,5,4;4,2,4,6,7},3)` results in `3`
`SMALL({3,5,3,5,4;4,2,4,6,7},7)` results in `5`

end example]

18.17.7.296 SQRT

Syntax:

`SQRT ( x )`

Description: Computes the positive square root of x.

Arguments:

Name	Type	Description
x	number	The number whose positive root is to be found.

Return Type and Value: number – The positive square root of x.

However, if x is negative, `#NUM!` is returned.

[*Example*:

`SQRT(2)` results in `1.414213562`
`SQRT(5)` results in `2.236067977`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.297 SQRTPI

Syntax:

```
SQRTPI ( x )
```

Description: Computes the positive square root of $x \times \pi$.

Arguments:

Name	Type	Description
x	number	The number, which when multiplied by π, whose positive root is to be found.

Return Type and Value: number – The positive square root of $x \times \pi$.

However, if x is negative, `#NUM!` is returned.

[*Example*:

`SQRTPI(1)` results in `1.772453851`
`SQRTPI(2)` results in `2.506628275`

end example]

18.17.7.298 STANDARDIZE

Syntax:

```
STANDARDIZE ( x , mean , standard-dev )
```

Description: Computes a normalized value from a distribution characterized by *mean* and *standard-dev*.

Mathematical Formula:

$$Z = \frac{X - \mu}{\sigma}$$

where:

- X = argument x
- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
x	number	The number whose value is to be normalized. Represented by X in the mathematical formula presented.
mean	number	The arithmetic mean of the distribution. Represented by mu (μ) in the mathematical formula presented.
standard-dev	number	The standard deviation of the distribution. Represented by sigma (σ) in the mathematical formula presented.

Return Type and Value: number – A normalized value from a distribution.

However, if *standard-dev* ≤ 0, `#NUM!` is returned.

[*Example*:

`STANDARDIZE(42,40,1.5)` results in `1.333333333`

end example]

18.17.7.299 STDEV

Syntax:

STDEV (*argument-list*)

Description: Makes an estimate of the standard deviation based on a sample, using the "unbiased" or "n-1" method. [*Note*: STDEV assumes that its arguments are a sample of the population. If the data represents the entire population, STDEVP should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use STDEVA instead. *end note*]

Mathematical Formula:

$$\sqrt{\frac{\sum(x-\bar{x})^2}{(n-1)}}$$

where:

- n = the sample size
- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*argument-1*, *argument-2*, …, *argument-n*)

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers that are samples of the population. *argument-list* can also be an array of numbers. Logical values and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – An estimate of the standard deviation based on a sample.

[*Example*:

STDEV(123,134,143,173,112,109) results in 23.72902583

end example]

18.17.7.300 STDEVA

Syntax:

STDEVA (*argument-list*)

Description: Makes an estimate of the standard deviation based on a sample, using the "unbiased" or "n-1" method. [*Note*: STDEVA assumes that its arguments are a sample of the population. If the data represents the entire population, STDEVPA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use STDEV instead. *end note*]

Mathematical Formula:

$$\sqrt{\frac{\sum(x-\bar{x})^2}{(n-1)}}$$

where:

- n = the sample size
- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*argument-1*, *argument-2*, …, *argument-n*)

Arguments:

Name	Type	Description
argument-list	logical, number,	The *argument*s in *argument-list* designate the numbers

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
	name, text, array, reference. The argument list can also be an array of numbers.	that are samples of the population. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

Return Type and Value: number – An estimate of the standard deviation based on a sample.

[*Example*:

`STDEVA(123,134,143,173,112,109)` results in `23.72902583`

end example]

18.17.7.301 STDEVP

Syntax:

STDEVP (*argument-list*)

Description: Computes the standard deviation of an entire population, using the "biased" or "n" method. [*Note*: STDEVP assumes that its arguments are the total population. If the data represents a population sample only, STDEVA should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use STDEVPA instead. *end note*]

Mathematical Formula:

$$\sqrt{\frac{\sum(x-\bar{x})^2}{n}}$$

where:

- n = the sample size
- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*argument-1*, *argument-2*, …, *argument-n*)

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference.	The *argument*s in *argument-list* designate the numbers that are the members of the population. Logical values, and text representations of numbers that are entered

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
	The argument list can also be an array of numbers.	directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – The standard deviation of an entire population.

[*Example*:

STDEVP(123,134,143,173,112,109) results in 21.66153785

end example]

18.17.7.302 STDEVPA

Syntax:

STDEVPA (*argument-list*)

Description: Computes the standard deviation of an entire population, using the "biased" or "n" method. [*Note*: STDEVPA assumes that its arguments are the total population. If the data represents a population sample only, STDEVA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use STDEVP instead. *end note*]

Mathematical Formula:

$$\sqrt{\frac{\sum(x-\bar{x})^2}{n}}$$

where:

- n = the sample size
- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*argument-1*, *argument-2*, …, *argument-n*)

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference. The argument list can also be an	The *argument*s in *argument-list* designate the numbers that are the members of the population.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
	array of numbers.	

Return Type and Value: number – The standard deviation of an entire population.

Arguments can be numbers; names, arrays, or references that contain numbers; text representations of numbers; or logical values, in a reference. Text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[*Example*:

`STDEVPA(123,134,143,173,112,109)` results in `21.66153785`

end example]

18.17.7.303 STEYX

Syntax:

STEYX (*known-ys* , *known-xs*)

Description: Computes the standard error of the predicted y-value for each x in the regression. The standard error is a measure of the amount of error in the prediction of y for an individual x.

Mathematical Formula:

$$\sqrt{\frac{1}{(n-2)}\left[\sum(y-\bar{y})^2-\frac{[\sum(x-\bar{x})(y-\bar{y})]^2}{\sum(x-\bar{x})^2}\right]}$$

where:

- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*known-xs*)
- y = a sample value
- $\bar{y}$ = the sample mean AVERAGE(*known-ys*)

Arguments:

Name	Type	Description
known-xs	number, name, array, or reference to	Designate a set of numeric dependent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
	number, text, logical	an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
known-ys	number, name, array, or reference to number, text, logical	Designate a set of numeric independent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The standard error of the predicted y-value for each *x* in the regression.

However, if

- *known-ys* and *known-xs* have a different number of data points, the return value is unspecified.
- *known-ys* and *known-xs* are empty or have less than three data points, the return value is unspecified.

[*Example*:

`STEYX({2,3,9,1,8,7,5},{6,5,11,7,5,4,4})` results in `3.30571895`

end example]

18.17.7.304 SUBSTITUTE

Syntax:

`SUBSTITUTE ( string , old-string , new-string [ , occurence ] )`

Description: Produces a new string that is *string* with one or all occurrences of *old-string* replaced by *new-string*.

Arguments:

Name	Type	Description
string	text	Designates a string.
old-string	text	Designates a string.
new string	text	Designates a string.
occurence	number	The occurrence number of the *old-string* characters within *string-1* that is to be replaced by the string designated by *new-string*. If omitted, all occurrences of *old-string* characters shall be replaced.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: text – A string that is *string* with one or all occurrences of *old-string* replaced by *new-string*.

However, if *occurance* < 0, #VALUE! is returned.

[*Example*:

`SUBSTITUTE("abcaaabca","a","xx")` results in `xxbcxxxxxxbcxx`
`SUBSTITUTE("abcaaabca","a","",10)` results in `bcbc`
`SUBSTITUTE("abcaaabca","a","xx",3)` results in `abcaxxabca`

end example]

18.17.7.305 SUBTOTAL

Syntax:

SUBTOTAL (*function-number* , *argument-list*)

Description: Computes a value using the function designated by *function-number*, using the *argument*s in *argument-list*.

Arguments:

Name	Type	Description
function-number	number	Indicates the function to be called, as shown in the table below.
argument-list	number	Each *argument* in *argument-list* is passed to the called function, in the order specified. That shall be no more than 254 *argument*s.

function-number (includes hidden values)	*function-number* (excludes hidden values)	Function
1	101	AVERAGE
2	102	COUNT
3	103	COUNTA
4	104	MAX
5	105	MIN
6	106	PRODUCT
7	107	STDEV
8	108	STDEVP
9	109	SUM

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

function-number (includes hidden values)	*function-number* (excludes hidden values)	Function
10	110	VAR
11	111	VARP

If any argument contains a SUBTOTAL function call, that call shall be ignored to avoid double counting.

For the *function-number* values 1–11, the values of hidden rows are included. For the *function-number* values 101–111, the values of hidden rows are excluded.

The SUBTOTAL function shall ignore any rows that are not included in the result of a filter, regardless of which *function-number* value is used.

The SUBTOTAL function is designed for columns of data, or vertical ranges. It is not designed for rows of data, or horizontal ranges. [*Example*: When a horizontal range is subtotaled using a *function-number* of 101 or greater, hiding a column does not affect the subtotal. However, hiding a row in a subtotal of a vertical range does affect the subtotal. *end example*]

Return Type and Value: number – The result from calling the function designated by *function-number*, using the *argument*s in *argument-list*.

However, if *function-number* does not have one of the values specified above, `#NUM!` is returned.

[*Example*:

`SUBTOTAL(2,E5:E15)` counts the number of values in the cell range E5:E15, including hidden values
`SUBTOTAL(4,E5:E15)` finds the maximum value of the values in the cell range E5: E15, including hidden values
`SUBTOTAL(106,E5:E15)` finds the product of the values in the cell range E5: E15, excluding hidden values

end example]

18.17.7.306 SUM

Syntax:

`SUM` (*argument-list*)

Description: Adds the numeric values of *argument*s in *argument-list*.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference.	The *argument*s in *argument-list* designate the numeric values to be added. Arguments that are numbers, logical values, or text representations of numbers shall be

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

Return Type and Value: number – The sum of the values of its arguments.

[*Example*:

`SUM(1,2,3,4,5)` results in `15`
`SUM({1,2;3,4})` results in `10`
`SUM({1,2,3,4,5},6,"7")` results in `28`
`SUM({1,"2",TRUE,4})` results in `5`, as the logical value and numeric text are ignored

end example]

18.17.7.307 SUMIF

Syntax:

`SUMIF ( `*cell-range*` , `*selection-criteria*` [ , `*sum-range*` ] )`

Description: Applies selection criteria on the values in one range of cells and sums the values of the cells in a corresponding range.

Arguments:

Name	Type	Description
cell-range	reference	Designates the range of cells to be inspected.
selection-criteria	number, expression, reference, text	Defines which cells are counted. In the case of text, *selection-criteria* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. *selection-criteria* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
sum-range	reference	If present, *sum-range* designates the cells whose values are summed. In this case, *sum-range* does not have to have the same size and shape as *cell-range*. The actual cells that are added are determined by using the top, left cell in *sum-range* as the beginning cell, and then including cells that correspond in size and shape to *cell-range*. If

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		omitted, *cell-range* also designates the cells whose values are summed.

Return Type and Value: number – The sum of the cells corresponding to those selected.

[*Example*: Given that A1, B1, C1, and D1, respectively, contain the values 3, 10, 7, and 10

`SUMIF(A1:D1,"=10")` results in `20`
`SUMIF(A1:D1,">5")` results in 27
`SUMIF(A1:D1,"<>10")` results in `10`

Given that A2, B2, C2, and D2, respectively, contain the values `apples`, `melons`, `10`, and `15`
`SUMIF(A2:B2,"*es",C2:D2)` results in `10`

end example]

18.17.7.308 SUMIFS

Syntax:

```
SUMIFS ( sum-range , cell-range-1 , selection-criteria-1
   [ , cell-range-2 , selection-criteria-2 [ , ... ] ] )
```

Description: Adds the cells in a range that meet multiple criteria.

Arguments:

Name	Type	Description
sum-range	reference	Designates the cells whose values are summed. In this case, *sum-range* does not have to have the same size and shape as *cell-range-1* through *cell-range-n*. The actual cells that are added are determined by using the top, left cell in *sum-range* as the beginning cell, and then including cells that correspond in size and shape to *cell-range-1* through *cell-range-n*. Each cell in *sum-range* is summed only if all of the corresponding criteria specified are true for that cell. Cells in *sum-range* that contain TRUE evaluate to 1; cells in sum-range that contain FALSE evaluate to 0.
cell-range-1	reference	Designates the first range of cells to be inspected.
selection-criteria-1	number, expression, reference, text	Specifies the criteria for the first range of cells that is counted. In the case of text, *selection-criteria-1* can consist of any comparison operator followed by the operand against which each cell's value is to be

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		compared. *selection-criteria-1* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
cell-range-n	reference	The optional arguments *selection-criteria-2* through *selection-criteria-n* have corresponding arguments *cell-range-2* through *cell-range-n*, and have the same semantics as *selection-criteria-1* and *cell-range-1*, respectively.
selection-criteria-n	number, expression, reference, text	

Return Type and Value: number – The sum of the cells corresponding to those selected.

[*Example*: Given the following data:

	A	B	C	D
1	Sales Person	Tables	Chairs	Desks
2	Emilio	34	85	97
3	Julie	353	23	18
4	Hans	13	67	14
5	Frederique	0	98	0

`SUMIFS(B2:C5,A2:A5,"=Julie")` results in 353 (the sum of the number of tables and chairs sold by Julie)

`SUMIFS(B2:B5,A2:A5,"=Julie",A2:A5,"=Hans")` results in `0` (the sum of the number of tables sold by Julie and Hans)

`SUMIFS(B2:B5,A3,"=Julie",A4,"=Hans")` results in 34 (the sum of the the number of tables sold by Julie and Hans)

`SUMIFS(B2:D5,A2:A5,"<>Emilio")` results in 768 (the sum of the number of tables, chairs, and desks sold by all sales persons except Emilio)

end example]

18.17.7.309 SUMPRODUCT

Syntax:

SUMPRODUCT (*argument-list*)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Description: Multiplies the corresponding elements in the array *argument*s in *argument-list*, and returns the sum of those products. An array element that is not numeric is treated as if it contained 0.

Arguments:

Name	Type	Description
argument-list	array of numbers	The *argument*s in *argument-list* designate the numeric values to be multiplied.

Return Type and Value: number – The sum of the products of the corresponding elements in the *argument*s in *argument-list*.

However, if the array arguments do not have the same dimensions, `#NUM!` is returned.

[*Example*:

`SUMPRODUCT({2,3})` results in 5
`SUMPRODUCT({2,3},{4,5})` results in 23
`SUMPRODUCT({2,3},{4,5},{2,2})` results in 46
`SUMPRODUCT({2,3;4,5},{2,2;3,4})` results in 42

end example]

18.17.7.310 SUMSQ

Syntax:

`SUMSQ` (*argument-list*)

Description: Adds the squares of *argument*s in *argument-list*.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the values whose squares are to be summed. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

Return Type and Value: number – The sum of the squares of its arguments.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Example*:

SUMSQ(2) results in 4
SUMSQ(2.5,-3.6)) results in 19.21
SUMSQ({2.5,-3.6)},2.4) results in 24.97

end example]

18.17.7.311 SUMX2MY2

Syntax:

SUMX2MY2 (*array-1* , *array-2*)

Description: Computes the sum of the difference of squares of the corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$SUMX2MY2 = \sum(x^2 - y^2)$$

where:

- *array-1* contains the x values
- *array-2* contains the y values

Arguments:

Name	Type	Description
array-1	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
array-2		

Return Type and Value: number – The sum of the difference of squares of the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[*Example*:

SUMX2MY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 55
SUMX2MY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in -64
end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.312 SUMX2PY2

Syntax:

SUMX2PY2 (*array-1* , *array-2*)

Description: Computes the sum of the sum of the squares of the corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$SUMX2PY2 = \sum(x^2 + y^2)$$

where:

- *array-1* contains the x values
- *array-2* contains the y values

Arguments:

Name	Type	Description
array-1	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
array-2		

Return Type and Value: number – The sum of the sum of the squares of the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[*Example*:

SUMX2PY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 521
SUMX2PY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in 480

end example]

18.17.7.313 SUMXMY2

Syntax:

SUMXMY2 (*array-1* , *array-2*)

Description: Computes the sum of the squares of the difference between corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Mathematical Formula:

$$SUMXMY2 = \sum (x - y)^2$$

where:

- *array-1* contains the *x* values
- *array-2* contains the *y* values

Arguments:

Name	Type	Description
array-1	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
array-2		

Return Type and Value: number – The sum of the squares of the difference between the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[*Example*:

`SUMXMY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4})` results in 79
`SUMXMY2({2,3,9;1,8,7},{6,5,11;7,5,4})` results in 78

end example]

18.17.7.314 SYD

SYD (*cost* , *salvage* , *life* , *per*)

Description: Computes the sum-of-years' digits depreciation of an asset for a specified period.

Mathematical Formula:

$$SYD = \frac{(cost - salvage) * (life - per + 1) * 2}{(life)(life + 1)}$$

where:

- *cost* = argument *cost*
- *life* = argument *life*
- *per* = argument *per*
- *salvage* = argument *salvage*

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Arguments:

Name	Type	Description
cost	number	The initial cost of the asset.
salvage	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
life	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
per	number	The period and shall have the same units as *life*.

Return Type and Value: number – The sum-of-years' digits depreciation of an asset for a specified period.

[*Example*:

`SYD(30000,7500,10,1)` results in `4,090.91`
`SYD(30000,7500,10,10)` results in `409.09`

end example]

18.17.7.315 T

Syntax:

`T` (*value*)

Description: Retrieves the text referencedby *value*.

Arguments:

Name	Type	Description
value	any	The value to be tested for text. No conversion to text shall take place on an argument passed to this function.

Return Type and Value: text – *value* if *value* designates text; otherwise, `""`. [*Note*: T cannot differentiate between text that is an empty string, and any *value* of non-text type. *end note*]

[*Example*:

`T("Hello")` results in `Hello`
`T(123)` results in an empty string
`LEN(T(123))` results in `0`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

end example]

18.17.7.316 TAN

Syntax:

```
TAN ( x )
```

Description: Computes the tangent of x.

Arguments:

Name	Type	Description
x	number	The number, in radians, whose tangent is to be computed.

Return Type and Value: number – The tangent of x.

[*Example*:

`TAN(-1)` results in `-1.557407725`
`TAN(0)` results in `0`
`TAN(1)` results in `1.557407725`

end example]

18.17.7.317 TANH

Syntax:

```
TANH ( x )
```

Description: Computes the hyperbolic tangent of x.

Arguments:

Name	Type	Description
x	number	The number whose hyperbolic tangent is to be computed.

Return Type and Value: number – The hyperbolic tangent of x

[*Example*:

`TANH(-1)` results in `-0.761594156`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

TANH(0) results in 0
TANH(1) results in 0.761594156

end example]

18.17.7.318 TBILLEQ

TBILLEQ (*settlement* , *maturity* , *discount*)

Description: Computes the bond-equivalent yield for a U.S. Treasury bill.

Arguments:

Name	Type	Description
settlement	number	The Treasury bill's settlement date. Any time information in the date is ignored.
maturity	number	The Treasury bill's maturity date. Any time information in the date is ignored.
discount	number	The Treasury bill's discount rate.

Return Type and Value: number – The bond-equivalent yield for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* > *maturity*, #NUM! is returned.
- *maturity* is more than one year after *settlement*, #NUM! is returned.
- *discount* ≤ 0, #NUM! is returned.

[*Example*:

TBILLEQ(DATE(2008,3,31),DATE(2008,6,1),0.0914) results in 9.4151%

end example]

18.17.7.319 TBILLPRICE

TBILLPRICE (*settlement* , *maturity* , *discount*)

Description: Computes the price per $100 face value for a U.S. Treasury bill.

Mathematical Formula:

$$TBILLPRCE = 100 \times \left(1 - \frac{discunt \times DSM}{360}\right)$$

where:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- *discount* = argument *discount*
- *DSM* = number of days from settlement to maturity, excluding any maturity date that is more than one calendar year after the settlement date.

Arguments:

Name	Type	Description
settlement	number	The Treasury bill's settlement date. Any time information in the date is ignored.
maturity	number	The Treasury bill's maturity date. Any time information in the date is ignored.
discount	number	The Treasury bill's discount rate.

Return Type and Value: number – The price per $100 face value for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* > *maturity*, `#NUM!` is returned.
- *maturity* is more than one year after *settlement*, `#NUM!` is returned.
- *discount* ≤ 0, `#NUM!` is returned.

[*Example*:

`TBILLPRICE(DATE(2008,3,31),DATE(2008,6,1),0.09)` results in `98.4500`

end example]

18.17.7.320 TBILLYIELD

`TBILLYIELD` (*settlement* , *maturity* , *pr*)

Description: Computes the yield for a U.S. Treasury bill.

Mathematical Formula:

$$TBILLYIELD = \frac{100 - pr.}{pr.} \times \frac{360}{DSM}$$

where:

- *DSM* = number of days from settlement to maturity, excluding any maturity date that is more than one calendar year after the settlement date.
- *pr.* = argument *pr*

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
settlement	number	The Treasury bill's settlement date. Any time information in the date is ignored.
maturity	number	The Treasury bill's maturity date. Any time information in the date is ignored.
pr	number	The Treasury bill's price per $100 face value.

Return Type and Value: number – The yield for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* > *maturity*, `#NUM!` is returned.
- *maturity* is more than one year after *settlement*, `#NUM!` is returned.
- *pr* ≤ 0, `#NUM!` is returned.

[*Example*:

`TBILLYIELD(DATE(2008,3,31),DATE(2008,6,1),98.45)` results in `9.1417%`

end example]

18.17.7.321 TDIST

Syntax:

`TDIST (` *x* `,` *degrees-freedom* `,` *distribution-tails* `)`

Description: Computes the Percentage Points (probability) for the Student t-distribution where a numeric value, *x*, is a calculated value of *t* for which the Percentage Points are to be computed.

Mathematical Formula:

If *distribution-tails* = 1, $TDIST = P(X > x)$, where X is a random variable that follows the t-distribution.

If *distribution-tails* = 2, $TDIST = P(|X| > x) = P(X > x \text{ or } X < -x)$

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the distribution.
degrees-freedom	number	The number of degrees of freedom, truncated to an integer.
distribution-tails	number	The number of distribution tails to return, truncated to an integer. If 1, `TDIST` returns the one-tailed distribution.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
		If 2, TDIST returns the two-tailed distribution.

Return Type and Value: number – The Percentage Points (probability) for the Student t-distribution.

However, if

- *degrees-freedom* < 1, #NUM! is returned.
- *tails* has any value other than 1 or 2, #NUM! is returned.
- *x* < 0, #NUM! is returned.

[*Example*:

TDIST(1.959999998,60,1) results in 0.027322464
TDIST(1.959999998,60,2) results in 0.054644927

end example]

18.17.7.322 TEXT

Syntax:

TEXT (*value* , *format*)

Description: Produces a string containing *value* formatted according to *format*.

Arguments:

Name	Type	Description
value	number	The number that is to be formatted.
format	text	Designates the number, currency, date, or time format to be used. (See §18.8.31 for the set of formats.)

Return Type and Value: text – The string containing *number* formatted according to *format*.

[*Example*:

TEXT(1234.567,"$0.00") results in $1234.57
TEXT(.125,"$0.0%") results in 12.5%
TEXT(1234.567,"YYYY-MM-DD HH:MM:SS") results in 1903-05-18 13:36:29 in the 1900 date-base system.

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.323 TIME

Syntax:

```
TIME ( hour , minute , second )
```

Description: Computes the serial value for the given time.

Arguments:

Name	Type	Description
hour	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the hour. Any value greater than 23 shall be divided by 24 and the remainder shall be treated as the hour value.
minute	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the minute. Any value greater than 59 shall be converted to the corresponding number of hours and minutes.
second	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the second. Any value greater than 59 shall be converted to the corresponding number of hours, minutes, and seconds.

Return Type and Value: number – The serial value for the given time, as a value greater than or equal to 0 and less than or equal to 1.

However, if *hour*, *minute*, or *second* are out of range, `#NUM!` is returned.

[*Example*: The following serial values are displayed with 16 decimal places.

`TIME(0,0,0)` results in a serial value of `0.0000000000000000`
`TIME(0,0,1)` results in a serial value of `0.0000115740740741`
`TIME(0,0,2)` results in a serial value of `0.0000231481481481`
`TIME(0,0,20)` results in a serial value of `0.0002314814814815`
`TIME(2,3,20)` results in a serial value of `0.0856481481481481`
`TIME(12,0,0)` results in a serial value of `0.5000000000000000`
`TIME(23,59,59)` results in a serial value of `0.9999884259259260`
`TIME(26,120,240)` results in a serial value of `0.1694444444444450`

end example]

18.17.7.324 TIMEVALUE

Syntax:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

TIMEVALUE (*date-time-string*)

Description: Computes the serial value of the time represented by the string *date-time-string*.

Arguments:

Name	Type	Description
date-time-string	text	The date and/or time whose time component serial value is to be computed. *date-time-string* can have any date and/or time format. Any date information in *date-time-string* shall be ignored.

Return Type and Value: number – The serial value of the time represented by the string *date-time-string*, as a value greater than or equal to 0 and less than or equal to 1.

However, if *date-time-string* is ill-formed, #VALUE ! is returned.

[*Example*: The following serial values are displayed with 16 decimal places:

TIMEVALUE("10:02:34 ") results in 0.4184490740740740
TIMEVALUE("01-Feb-2006 10:15:29 AM") results in 0.4274189814823330
TIMEVALUE("22:02") results in 0.9180555555555560

end example]

18.17.7.325 TINV

Syntax:

TINV (*probability* , *degrees-freedom*)

Description: Computes the t-value of the Student's t-distribution as a function of the probability and the degrees of freedom.

Arguments:

Name	Type	Description
probability	number	A probability associated with the two-tailed Student's t-distribution.
degrees-freedom	number	The number of degrees of freedom with which to characterize the distribution, truncated to an integer.

Return Type and Value: number – The t-value of the Student's t-distribution.

However, if

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- *probability* < 0 or *probability* > 1, `#NUM!` is returned.
- *degrees-freedom* < 1, `#NUM!` is returned.

[*Example*:

`TINV(0.054644927,60)` results in `1.95999999`

end example]

18.17.7.326 TODAY

Syntax:

```
TODAY ( )
```

Description: Computes the serial value of the current date, taking into account the current date base value.

Arguments: None.

Return Type and Value: number – The serial value of the current date.

[*Example*:

On February 25, 2006, `TODAY()` results in `38773` for the 1900 date base system, or `37311` for the 1904 date base system

end example]

18.17.7.327 TRANSPOSE

Syntax:

```
TRANSPOSE ( array )
```

Description: Creates a new array that is the transpose of an existing array, by copying the first row of the existing array to the first column of the new array, the second row of the existing array as the second column of the new array, and so on. The formula containing the call to `TRANSPOSE` shall be an array formula in a range that has the same number of rows and columns, respectively, as *array* has columns and rows.

Arguments:

Name	Type	Description
array	array, reference	The set of values to be transposed.

Return Type and Value: array – The new array.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Example*:

`TRANSPOSE({10,20,30})` results in the array `{10;20;30}`

end example]

18.17.7.328 TREND

Syntax:

TREND (*known-ys* [, [*known-xs*] [, [*new-xs*] [, *const-flag*]])

Description: Computes values along a linear trend. Fits a straight line (using the method of least squares) to the arrays *known-ys* and *known-xs*. The y-values along that line for the array of *new-xs* specified.

Arguments:

Name	Type	Description
known-ys	array	The set of y-values already known in the relationship *y=mx+b*. If that array is in a single column, each column of *known-xs* is interpreted as a separate variable. If that array is in a single row, each row of *known-xs* is interpreted as a separate variable.
known-xs	array	An optional set of x-values that might already be known in the relationship *y=mx+b*. The array *known-xs* can include one or more sets of variables. If only one variable is used, *known-ys* and *known-xs* can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, *known-ys* shall be a vector. If *known-xs* is omitted, it is assumed to be the array {1,2,3,…} that is the same size as *known-ys*.
new-xs	array	New x-values for which TREND is to return corresponding y-values. *new-xs* shall include a column (or row) for each independent variable, just as *known-xs* does. So, if *known-ys* is in a single column, *known-xs* and *new-xs* shall have the same number of columns. If *known-ys* is in a single row, *known-xs* and *new-xs* shall have the same number of rows. If *new-xs* is omitted, it is assumed to be the same as *known-xs*. If both *known-xs* and *new-xs* are omitted, they are assumed to be the array {1,2,3,…} that is the same size as *known-ys*.
const-flag	logical	Specifies whether to force the constant b to equal 0. If TRUE or omitted, *b* is calculated normally. If FALSE, *b* is set equal to 0 and the m-values are adjusted so that *y=mx*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: array – The values along a linear trend, as an array of numbers.

18.17.7.329 TRIM

Syntax:

```
TRIM ( string )
```

Description: Makes a string that is a copy of *string* with the leading and trailing space characters removed, and each sequence of embedded spaces reduced to a single space. The space character referred to here is character U+0020.

Arguments:

Name	Type	Description
string	text	Designates the string to be trimmed.

Return Type and Value: text – The trimmed copy of *string*.

[*Example*:

`TRIM("  abc  def  ")` results in `abc def`

end example]

18.17.7.330 TRIMMEAN

Syntax:

```
TRIMMEAN ( array , percent )
```

Description: Computes the mean of the interior of a data set by excluding a percentage of data points from the top and bottom tails of a data set. TRIMMEAN rounds the number of excluded data points down to the nearest multiple of 2. For symmetry, TRIMMEAN excludes a single value from the top and bottom of the data set.

Arguments:

Name	Type	Description
array	array, reference	The numeric values to trim and average.
percent	number	The fractional number of data points to exclude from the calculation. [*Example*: If *percent* = 0.2, 4 points are trimmed from a data set of 20 points (20x0.2): 2 from the top and 2 rom the bottom of the set. *end example*]

Return Type and Value: number – The mean of the interior of a data set.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

However, if *percen* < 0 or *percen* > 1, `#NUM!` is returned.

[*Example*:

`TRIMMEAN({4,6,2,5,7,8,9},0.2)` results in `5.857142857`

end example]

18.17.7.331 TRUE

Syntax:

```
TRUE ( )
```

Description: Computes the value TRUE. (A call to function TRUE is equivalent to using the *logical-constant* TRUE.)

Arguments: None.

Return Type and Value: logical – The value TRUE.

[*Example*:

`TRUE()` results in TRUE

end example]

18.17.7.332 TRUNC

Syntax:

```
TRUNC ( x [ , number-digits ] )
```

Description: Truncates *x* to the number of fractional digits by *number-digits*.

Arguments:

Name	Type	Description
x	array, reference	The value to be rounded down.
number-digits	number	The number of fractional digits to which *x* is to be truncated. The default value for *number-digits* is 0.

Return Type and Value: number – The truncated value of *x*.

[*Example*:

`TRUNC(PI())` results in 3

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

`TRUNC(PI(),1)` results in `3.1`
`TRUNC(PI(),3)` results in `3.141`
`TRUNC(PI(),5)` results in `3.14159`

end example]

18.17.7.333 TTEST

Syntax:

`TTEST` (*array-1* , *array-2* , *distribution-tails* , *test-type*)

Description: Computes the probability associated with a Student's t-Test.

Arguments:

Name	Type	Description
array-1	array, reference	The first numerical data set.
array-1	array, reference	The first numerical data set.
distribution-tails	number	Specifies the number of distribution tails, truncated to an integer. If 1, TTEST uses the one-tailed distribution. If 2, TTEST uses the two-tailed distribution.
test-type	number	The truncated-to-integer kind of t-Test to perform, as follows:

Value	Test Performed
1	Paired
2	Two-sample equal variance (homoscedastic)
3	Two-sample unequal variance (heteroscedastic)

Return Type and Value: number – The probability associated with a Student's t-Test.

However, if

- *array-1* and *array-2* have a different number of data points, and *test-type* is 1, the return value is unspecified.
- *distribution-tails* is any value other than 1 or 2, `#NUM!` is returned.

[*Example*: Given the following data:

	A	B
1	Data 1	Data 2

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

	A	B
2	3	6
3	4	19
4	5	3
5	8	2
6	9	14
7	1	4
8	2	5
9	4	17
10	5	1

`TTEST(A2:A10,B2:B10,2,1)` results in `0.196016`

end example]

18.17.7.334 TYPE

Syntax:

TYPE (*value*)

Description: Computes the type of *value* or, if *value* is a reference to a single cell, the type of the value in that cell.

Arguments:

Name	Type	Description
value	any	The value whose type is to be determined. No conversion shall take place on an argument passed to this function.

Return Type and Value: number – An integer that indicates the type of *value* or, if *value* is a reference to a single cell, the type of the value in that cell, as follows:

Type of *value*	Value Returned
number	1
text	2
logical	4
error value	16
array of any kind	64

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*:

TYPE(10.5) results in 1
TYPE(A10) results in 1, when A10 contains a number
TYPE("ABC") results in 2
TYPE(A10) results in 2, when A10 contains a string
TYPE(TRUE) results in 4
TYPE(A10) results in 4, when A10 contains a logical value

TYPE(5/0) results in 16
TYPE(A10) results in 16, when A10 contains any error value
TYPE({1,2,3}) results in 64
TYPE({TRUE,2.5,#N/A}) results in 64
TYPE(IF(10>5,"Yes",20)) results in 2
TYPE(IF(10<5,"Yes",20)) results in 1

end example]

18.17.7.335 UPPER

Syntax:

UPPER (*string*)

Description: Makes an uppercase version of *string*.

Arguments:

Name	Type	Description
string	text	Designates the string to be converted.

Return Type and Value: text – The uppercase version of *string*.

[*Example*:

UPPER("AbCd123#$%^") results in ABCD123#$%^
UPPER(A10) results in 234FRTQWC$#%, when A10 contains 234FRTqwc$#%

end example]

18.17.7.336 USDOLLAR

Syntax:

USDOLLAR (*number* [, *num-decimal*])

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Description: Produces a string containing *number* rounded to *num-decimal* decimal places. The thousands separator is the comma, the radix point is the period, and the currency symbol is "$". The format used is $#,##0.00;($#,##0.00).

Arguments:

Name	Type	Description
number	number	The number that is to be formatted.
num-decimal	number	Designate the number of decimal places to be used in the resulting string; it is truncated to an integer. If *num-decimal* is negative, *number* is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places, and have a currency symbol and thousands separators.

[*Example*:

`USDOLLAR(1234.567)` results in `$1,234.57`
`USDOLLAR(1234.567,-2)` results in `$1,200`
`USDOLLAR(-1234.567,4)` results in `($1,234.5670)`

end example]

18.17.7.337 VALUE

Syntax:

VALUE (*string*)

Description: Converts *string* to a number.

Arguments:

Name	Type	Description
string	text	Designates a string that contains a number formatted using any number, currency, date, or time format. (See §18.8.31 for the set of formats.) Date and time strings are converted to their equivalent serial value.

Return Type and Value: number – The number represented by *string*.

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

VALUE("123.456") results in 123.456
VALUE("$1,000") results in 1000
VALUE("23-Mar-2002") results in the corresponding serial value
VALUE("16:48:00")-VALUE("12:17:12") results in 0.188056

end example]

18.17.7.338 VAR

Syntax:

VAR (*argument-list*)

Description: Makes an estimate of the variance based on a sample. [*Note*: VAR assumes that its arguments are a sample of the population. If the data represents the entire population, VARP should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use VARA instead. *end note*]

Mathematical Formula:

$$\frac{\sum(x-\bar{x})^2}{(n-1)}$$

where:

- n = the sample size
- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*argument-1*, *argument-1*,…, *argument-n*)

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers that are samples of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – An estimate of the variance based on a sample.

[*Example*:

VAR(1202,1220,1323,1254,1302) results in 2683.2

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

end example]

18.17.7.339 VARA

Syntax:

VARA (*argument-list*)

Description: Makes an estimate of the variance based on a sample. [*Note*: VARA assumes that its arguments are a sample of the population. If the data represents the entire population, VARPA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use VAR instead. *end note*]

Mathematical Formula:

$$\frac{\sum(x-\bar{x})^2}{(n-1)}$$

where:

- n = the sample size
- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*argument-1*, *argument-1*, …, *argument-n*)

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *arguments* in *argument-list* designate the numbers that are samples of the population. Logical values and text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

Return Type and Value: number – An estimate of the variance based on a sample.

[*Example*:

VARA(1202,1220,1323,1254,1302) results in 2683.2

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.17.7.340 VARP

Syntax:

VARP (*argument-list*)

Description: Computes the variance of an entire population. [*Note*: VARP assumes that its arguments are the total population. If the data represents a population sample only, VAR should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use VARPA instead. *end note*]

Mathematical Formula:

$$\frac{\sum(-\bar{x})^2}{n}$$

where:

- n = the sample size
- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*argument-1*, *argument-1*,…, *argument-n*)

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers that are the members of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – The variance of an entire population.

[*Example*:

VARP(1202,1220,1323,1254,1302) results in 2146.56

end example]

18.17.7.341 VARPA

Syntax:

VARPA (*argument-list*)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Description: Makes the variance of an entire population. [*Note*: VARPA assumes that its arguments are the total population. If the data represents a population sample only, VARA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use VARP instead. *end note*]

Mathematical Formula:

$$\frac{\sum(x-\bar{x})^2}{n}$$

where:

- n = the sample size
- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*argument-1*, *argument-1*,…, *argument-n*)

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers that are the members of the population.

Return Type and Value: number – The variance of an entire population.

Arguments can be numbers; names, arrays, or references that contain numbers; text representations of numbers; or logical values, in a reference. Text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[*Example*:

`VARPA(1202,1220,1323,1254,1302)` results in `2146.56`

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.17.7.342 VDB

VDB (*cost* , *salvage* , *life* , *start-period* , *end-period* [, [[*factor*] [, [*no-switch-flag*]]]]])

Description: Computes the depreciation of an asset for the period specified, including partial periods, using the double-declining balance or some other specified method.

Arguments:

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
cost	number	The number *cost* is the initial cost of the asset.
salvage	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.) This value can be 0.
life	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
start-period	number	The starting period for which the depreciation is to be calculated. (*start-period* shall use the same units as *life*.)
end-period	number	The ending period for which the depreciation is to be calculated. (*end-period* shall use the same units as *life*.)
factor	number	The rate at which the balance declines. If omitted, it is assumed to be 2 (the double-declining balance method).
no-switch-flag	logical	Specifies whether to switch to straight-line depreciation when depreciation is greater than the declining balance calculation. If TRUE, straight-line depreciation is not used even when the depreciation is greater than the declining balance calculation. If FALSE or omitted, the straight-line depreciation is used when depreciation is greater than the declining balance calculation.

Return Type and Value: number – The depreciation of an asset for the period specified.

However, if any numerical argument value is non-positive, `#NUM!` is returned.

[*Example*:

`VDB(2400,300,10*365,0,1)` results in `1.32`
`VDB(2400,300,10*12,0,1)` results in `40.00`
`VDB(2400,300,10*12,6,18)` results in `396.31`

end example]

18.17.7.343 VLOOKUP

Syntax:

VLOOKUP (*lookup-value* , *table-array* , *col-index-num* [, [*range-lookup-flag*]])

Description: Performs a vertical search for a value in the left-most column of a table or an array, noting the row in which the matching value is found. From that row, the value from a given column is returned.

Arguments:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
lookup-value	value of any type or a reference to a value of any type.	The value to be located in the left-most column of the table. If *range-lookup* is FALSE and *lookup-value* is a string, the wildcard characters, question mark (?) and asterisk (*), can be included in *lookup-value*. A question mark matches any single character; an asterisk matches any sequence of characters. To find a question mark or asterisk, use a tilde (~) before the character.
table-array	array, reference, name	Designates the table of information to be searched. The values in the left-most column of *table-array* can be text, numbers, or logical values. The values in the left-most column of *table-array* shall be placed in "ascending order", as follows: …, -2, -1, 0, 1, 2, …, A–Z, FALSE, TRUE. Uppercase and lowercase text is treated as equivalent.
col-index-num	number	The column number in *table-array* from which the matching value is to be returned. (A *col-index-num* of 1 returns the left-most column value in *table-array*, a *col-index-num* of 2 returns the next column in *table-array*, and so on.)
range-lookup-flag	logical	Specifies whether HLOOKUP is to find an exact or approximate match. If TRUE or omitted, an approximate match is returned. That is, if an exact match is not found, the next largest value that is less than *lookup-value* is returned. If FALSE, an exact match is performed, in which case, the values in the left-most column of *table-array* need not be sorted. If there are two or more values in the left-most column of *table-array* that match *lookup-value*, the top-most value found is used.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: any – The value from a given row number, where the column is determined by a search of the top row looking for a match with a given value.

However, if

- An exact match is performed, but no match is found, #N/A is returned.
- *col-index-num* is less than 1, #VALUE! is returned.
- *col-index-num* is greater than the number of columns in *table-array*, #REF! is returned.
- *lookup-value* is smaller than the smallest value in the left-most column of *table-array*, #N/A is returned.

[*Example*: Given the following data:

	A	B	C
1	Density	Bearings	Bolts
2	0.457	3.55	500

©ISO/IEC 2011 – All rights reserved

	A	B	C
3	0.525	3.25	400
4	0.616	2.93	300
5	0.675	2.75	250
6	0.746	2.57	200
7	0.835	2.38	150
8	0.946	2.17	100
9	1.09	1.95	50
10	1.29	1.71	0

`VLOOKUP(1,A2:C10,2)` results in `2.17`
`VLOOKUP(1,A2:C10,3,TRUE)` results in `100.00`
`VLOOKUP(2,A2:C10,2,TRUE)` results in `1.71`

end example]

18.17.7.344 WEEKDAY

Syntax:

`WEEKDAY ( serial-value [ , weekday-start-flag ] )`

Description: Computes the weekday number for the date having the given *serial-value*, taking into account the current date base value and *weekday-start-flag*, if present. See §18.17.4.1 for special handling of certain days in 1900.

Arguments:

Name	Type	Description
serial-value	number	The date whose weekday number is to be computed. The value of *serial-value* is truncated to an integer.
weekday-start-flag	number	When truncated to integer, indicates the weekday numbering convention to be used, as follows:

Value	Meaning
1 or omitted	1 (Sunday) through 7 (Saturday)
2	1 (Monday) through 7 (Sunday)
3	0 (Monday) through 6 (Sunday)
11	1 (Monday) through 7 (Sunday)
12	1 (Tuesday) through 7 (Monday)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		13 — 1 (Wednesday) through 7 (Tuesday) 14 — 1 (Thursday) through 7 (Wednesday) 15 — 1 (Friday) through 7 (Thursday) 16 — 1 (Saturday) through 7 (Friday) 17 — 1 (Sunday) through 7 (Saturday)

Return Type and Value: number – The weekday number for the date having the given serial value.

However, if

- *serial-value* is out of range for the current date base value, `#NUM!` is returned.
- *weekday-start-flag* is out of the range specified in the table above, `#NUM!` is returned.

[*Example*:

`WEEKDAY(DATE(2006,2,1))` results in 4 (Wednesday)
`WEEKDAY(DATE(2006,2,1),11)` results in 3 (Wednesday)
`WEEKDAY(DATE(2006,2,1),12)` results in 2 (Wednesday)
`WEEKDAY(DATE(2006,2,1),3)` results in 2 (Wednesday)

end example]

18.17.7.345 WEEKNUM

Syntax:

`WEEKNUM ( serial-value [ , weekday-start-flag ] )`

Description: Computes the week number of the date corresponding to *serial-value*. The function allows two number systems:

- System 1: The week containing January 1 is the first week of the year, and is numbered week 1.
- System 2: The week containing the first Thursday of the year is the first week of the year, and is numbered as week 1 [ISO 8601].

Arguments:

Name	Type	Description
serial-value	number	The date whose week number is to be computed. The value of *serial-value* is truncated to an integer.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

<table>
<tr><th>Name</th><th>Type</th><th>Description</th></tr>
<tr><td>weekday-start-flag</td><td>number</td><td>When truncated to integer, indicates the weekday on which the week begins, as follows:
<table>
<tr><th>weekday-start-flag</th><th>Meaning</th><th>Number System</th></tr>
<tr><td>1 or omitted</td><td>Week begins on Sunday.</td><td>System 1</td></tr>
<tr><td>2</td><td>Week begins on Monday.</td><td>System 1</td></tr>
<tr><td>11</td><td>Week begins on Monday.</td><td>System 1</td></tr>
<tr><td>12</td><td>Week begins on Tuesday.</td><td>System 1</td></tr>
<tr><td>13</td><td>Week begins on Wednesday.</td><td>System 1</td></tr>
<tr><td>14</td><td>Week begins on Thursday.</td><td>System 1</td></tr>
<tr><td>15</td><td>Week begins on Friday.</td><td>System 1</td></tr>
<tr><td>16</td><td>Week begins on Saturday.</td><td>System 1</td></tr>
<tr><td>17</td><td>Week begins on Sunday.</td><td>System 1</td></tr>
<tr><td>21</td><td>Week begins on Monday.</td><td>System 2</td></tr>
</table></td></tr>
</table>

Return Type and Value: number – The week number of the date corresponding to *serial-value*.

However, if

- *serial-value* is out of range for the current date base value, `#NUM!` is returned.
- *weekday-start-flag* is out of the range specified in the table above, `#NUM!` is returned.

[*Example:*

`WEEKNUM(DATE(2006,1,1)` results in `1`
`WEEKNUM(DATE(2006,1,1),1)` results in `1`
`WEEKNUM(DATE(2006,1,1),17)` results in `1`
`WEEKNUM(DATE(2006,1,1),21)` results in `1`
`WEEKNUM(DATE(2006,2,1),1)` results in `5`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

`WEEKNUM(DATE(2006,2,1),2)` results in 6
`WEEKNUM(DATE(2006,2,1),11)` results in 6

end example]

18.17.7.346 WEIBULL

Syntax:

`WEIBULL ( x , alpha , beta , cumulative-flag )`

Description: Computes the Weibull distribution.

Mathematical Formula:

The equation for the Weibull cumulative distribution function is:

$$F(x, \alpha, \beta) = 1 - e^{-(x/\beta)^{\alpha}}$$

The equation for the Weibull probability density function is:

$$f(x, \alpha, \beta) = \frac{}{\beta^{\alpha}} x^{\alpha-1} e^{-(x/\beta)^{\alpha}}$$

When *alpha* = 1, `WEIBULL` returns the exponential distribution with:

$$\lambda = \frac{1}{\beta}$$

where:

- x = argument x
- α = argument *alpha*
- β = argument *beta*

Arguments:

Name	Type	Description
x	number	The value at which the distribution is to be evaluated.
alpha	number	A parameter of the distribution.
beta	number	A parameter of the distribution.
cumulative-flag	logical	Determines the form of the function. If `TRUE`, `GAMMADIST` returns the cumulative distribution function; if `FALSE`, it returns the probability density function.

Return Type and Value: number – The Weibull distribution.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

However, if

- *x* < 0, #NUM! is returned.
- *alpha* ≤ 0, #NUM! is returned.
- *beta* ≤ 0, #NUM! is returned.

[*Example*:

WEIBULL(105,20,100,TRUE) results in 0.92958139
WEIBULL(105,20,100,FALSE) results in 0.035588864

end example]

18.17.7.347 WORKDAY

Syntax:

WORKDAY (*start-date* , *day-offset* [, *holidays*])

Description: Computes the serial value of the date that is *day-offset* working days offset from *start-date*. Weekend days (Saturday and Sunday) and any holidays specified by *holidays* are not considered as working days.

Arguments:

Name	Type	Description
start-date	number	The start date, truncated to integer.
day-offset	number	The number of working days before or after *start-date*. A positive value yields a future date; a negative value yields a past date; a zero value yields the date *start-date*. *day-offset* is truncated to an integer.
holidays	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. *holidays* shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. The ordering of dates or serial values in *holidays* can be arbitrary.

Return Type and Value: number – The serial value of the date that is *day-offset* working days offset from *start-date*, excluding the specified holidays.

However, if

- *start-date* is out of range for the current date base value, #NUM! is returned.
- Any date in *holidays* is out of range for the current date base value, #NUM! is returned.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

- *start-date* plus *day-offset* does not yield a date, `#NUM!` is returned.

[*Example*:

`WORKDAY(DATE(2006,1,1),0)` results in a serial value corresponding to 1-Jan-2006
`WORKDAY(DATE(2006,1,1),10)` results in a serial value corresponding to 13-Jan-2006
`WORKDAY(DATE(2006,1,1),-10)` results in a serial value corresponding to 19-Dec-2005
`WORKDAY(DATE(2006,1,1),20,{"2006/1/2","2006/1/16"})` results in a serial value corresponding to 31-Jan-2006

end example]

18.17.7.348 WORKDAY.INTL

Syntax:

Number form: `WORKDAY.INTL` (*start-date* , *day-offset* [, [*weekend-number*] [, *holidays*]])

String form: `WORKDAY.INTL` (*start-date* , *day-offset* [, [*weekend-string*] [, *holidays*]])

Description: Computes the serial value of the date that is *day-offset* working days offset from *start-date*. Weekend days and any holidays specified by *holidays* are not considered as working days.

Arguments:

Name	Type	Description
start-date	number	The start date, truncated to integer.
day-offset	number	The number of working days before or after *start-date*. A positive value yields a future date; a negative value yields a past date; a zero value yields the date *start-date*. *day-offset* is truncated to an integer.
weekend-number	number	Indicates the days of the week that are weekend days and are not considered working days. Values are shown in the table below
weekend-string	string	Indicates the days of the week that are weekend days and are not considered working days. Values of *weekend-string* are seven characters long and each character in the string represents a day of the week, beginning with Monday. [*Example*: "0000011" would result in a weekend that is Saturday and Sunday. *end example*]
holidays	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. *holidays* shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		The ordering of dates or serial values in *holidays* can be arbitrary.

weekend-number	Weekend days
1 or omitted	Saturday, Sunday
2	Sunday, Monday
3	Monday, Tuesday
4	Tuesday, Wednesday
5	Wednesday, Thursday
6	Thursday, Friday
7	Friday, Saturday
11	Sunday only
12	Monday only
13	Tuesday only
14	Wednesday only
15	Thursday only
16	Friday only
17	Saturday only

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Return Type and Value: number – The serial value of the date that is *day-offset* working days offset from *start-date*, excluding the specified weekend days and holidays.

However, if

- *start-date* is out of range for the current date base value, `#NUM!` is returned.
- Any date in *holidays* is out of range for the current date base value, `#NUM!` is returned.
- *start-date* plus *day-offset* does not yield a date, `#NUM!` is returned.

[*Example*:

`WORKDAY.INTL(DATE(2006,1,1),0)` results in a serial value corresponding to 1-Jan-2006
`WORKDAY.INTL(DATE(2006,1,1),10)` results in a serial value corresponding to 13-Jan-2006
`WORKDAY.INTL(DATE(2006,1,1),10,7)` results in a serial value corresponding to 13-Jan-2006
`WORKDAY.INTL(DATE(2006,1,1),-10)` results in a serial value corresponding to 19-Dec-2005
`WORKDAY.INTL(DATE(2006,1,1),20,1,{"2006/1/2","2006/1/16"})` results in a serial value corresponding to 31-Jan-2006
`WORKDAY.INTL(DATE(2006,1,1),20,"0000011",{"2006/1/2","2006/1/16"})` results in a serial value

©ISO/IEC 2011 – All rights reserved

corresponding to 31-Jan-2006

end example]

18.17.7.349 XIRR

`XIRR ( values , dates [ , [ guess ] ] )`

Description: Computes the internal rate of return for a schedule of cash flows that is not necessarily periodic. `XIRR` uses an iterative calculation technique that cycles through the calculation until the result is accurate within 0.000001 percent.

Mathematical Formula:

Using a changing rate (starting with *guess*), `XIRR` cycles through the calculation until the result is accurate within 0.000001 percent. The rate is changed until:

$$0 = \sum_{i=1}^{N} \frac{P_i}{(1 + rate)^{\frac{(d_i - d_1)}{365}}}$$

where:

- d_i = the i^{th}, or last, payment date.
- d_1 = the 0^{th} payment date.
- P_i = the i^{th}, or last, payment.

Arguments:

Name	Type	Description
values	array, reference	A series of cash flows that corresponds to a schedule of payment dates specified in *dates*. The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it shall have a negative value. All succeeding payments are discounted based on a 365-day year. The series of values shall contain at least one positive and one negative value.
dates	reference	A schedule of payment dates that corresponds to the cash flow payments in *values*. The first payment date indicates the beginning of the schedule of payments. All other dates shall be later than this date, but they can occur in any order. Time information in the date arguments is ignored.
guess	number	An estimate of the result of `XIRR`. If omitted, it is assumed to be 0.1 (i.e., 10 percent).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The internal rate of return for a schedule of cash flows that is not necessarily periodic.

However, if

- Any date in *dates* is out of range for the current date base value, `#NUM!` is returned.
- Any date in *dates* precedes the starting date, `#NUM!` is returned.
- *values* and *dates* contain different numbers of values, `#NUM!` is returned.
- The calculation has not converged after an implementation-defined number of tries, `#NUM!` is returned.

[*Example*: When the cells `F2397:J2397`contain the dates January 1, 2008; March 1,2008; October 30, 2008; February 15, 2009, and April 1, 2009:

`XIRR({-10000,2750,4250,3250,2750},F2397:J2397,0.1)` results in `37.34%`

end example]

18.17.7.350 XNPV

XNPV (*rate* , *values* , *dates*)

Description: Computes the net present value for a schedule of cash flows that is not necessarily periodic.

Mathematical Formula:

$$XNPV = \sum_{i=1}^{N} \frac{P_i}{(1 + rte)^{\frac{(d_i - d_1)}{365}}}$$

where:

- d_i = the i^{th}, or last, payment date.
- d_1 = the 0^{th} payment date.
- P_i = the i^{th}, or last, payment.

Arguments:

Name	Type	Description
rate	number	The discount rate to apply to the cash flows.
values	array, reference	A series of cash flows that corresponds to a schedule of payment dates specified in *dates*. The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it shall have a negative value. All succeeding payments are discounted based on a 365-day year. The series of values shall contain at least one positive and one negative value.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Name	Type	Description
dates	reference	A schedule of payment dates that corresponds to the cash flow payments in *values*. The first payment date indicates the beginning of the schedule of payments. All other dates shall be later than this date, but they can occur in any order. Time information in the date arguments is ignored.

Return Type and Value: number – The net present value for a schedule of cash flows that is not necessarily periodic.

However, if

- Any date in *dates* is out of range for the current date base value, `#NUM!` is returned.
- Any date in *dates* precedes the starting date, `#NUM!` is returned.
- *values* and *dates* contain different numbers of values, `#NUM!` is returned.

[*Example*: When the cells `F2397:J2397` contain the dates January 1, 2008; March 1,2008; October 30, 2008; February 15, 2009, and April 1, 2009:

`XNPV(0.09,{-10000,2750,4250,3250,2750},F2397:J2397)` results in `2086.65`

end example]

18.17.7.351 YEAR

Syntax:

YEAR (*date-value*)

Description: Computes the numeric year in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, taking into account the current date base value. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any date and/or time format, in which case, any time information shall be ignored.

Arguments:

Name	Type	Description
date-value	number, text	The date and/or time whose year is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any date and/or time format, in which case, any time information shall be ignored.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Return Type and Value: number – The year in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*. The range of return values is determined by the date base currently in use (§18.17.4).

However, if *date-value* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`YEAR(DATE(2006,1,2))` results in `2006`
`YEAR(DATE(2006,0,2))` results in `2005`
`YEAR("2006/1/2 10:45 AM")` results in `2006`
`YEAR(30000)` results in `1982` for the 1900 date base system, or `1986` for the 1904 date base system

end example]

18.17.7.352 YEARFRAC

Syntax:

YEARFRAC (*start-date* , *end-date* [, *basis*])

Description: Computes the fractional number of years represented by the number of whole days between two dates, *start-date* and *end-date*., according to *basis*.

Arguments:

Name	Type	Description
start-date	number	The period's starting date. *start-date* can be earlier than, the same as, or later than *end-date*.
end-date	number	The period's ending date.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
`0` or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description	
			with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Name	Type	Description
		is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 Februar y.

All arguments are truncated to integers.

Return Type and Value: number – The fractional number of years represented by the number of whole days between two dates, *start-date* and *end-date*., according to *basis*. If the Actual/actual basis is used, the year length used is the average length of the years that the range crosses, regardless of where *start-date* and *end-date* fall in their respective years.

However, if the value of *basis* is out of range, `#NUM!` is returned.

[*Example*:

`YEARFRAC(DATE(2006,1,1),DATE(2006,3,26))` results in `0.236111111`
`YEARFRAC(DATE(2006,3,26),DATE(2006,1,1))` results in `0.236111111`
`YEARFRAC(DATE(2006,1,1),DATE(2006,7,1))` results in `0.5`
`YEARFRAC(DATE(2006,1,1),DATE(2007,9,1))` results in `1.666666667`
`YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),0)` results in `0.5`
`YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),1)` results in `0.495890411`
`YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),2)` results in `0.502777778`
`YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),3)` results in `0.495890411`
`YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),4)` results in `0.5`
`YEARFRAC(DATE(2004,3,1),DATE(2006,3,1),1)` results in 1.998175 (because 2004 is a leap year and Actual/actual basis is used, the average year length is 365.3333)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

end example]

18.17.7.353 YIELD

Syntax:

`YIELD ( `*settlement*` , `*maturity*` , `*rate*` , `*pr*` , `*redemption*` , `*frequency*` [ , [ `*basis*` ] ] )`

Description: Computes the yield on a security that pays periodic interest.

Mathematical Formula:

If there is one coupon period or less until redemption, YIELD is calculated as follows:

$$YIELD = \frac{\left(\frac{redempion}{100} + \frac{rate}{frequency}\right) - \left(\frac{par}{100} + \left(\frac{A}{E} \times \frac{rate}{frequency}\right)\right)}{\frac{par}{100} + \left(\frac{A}{E} \times \frac{rate}{frequency}\right)} \times \frac{frequency \times E}{DSR}$$

where:

- A = number of days from the beginning of the coupon period to the settlement date (accrued days).
- DSR = number of days from the settlement date to the redemption date.
- E = number of days in the coupon period.
- *frequency* = argument *frequency*
- *par* = argument *pr*
- *rate* = argument *rate*
- *redemption* = argument *redemption*

If there is more than one coupon period until redemption, YIELD is calculated through some number of iterations. The resolution uses the Newton method, based on the formula used for the function PRICE. The yield is changed until the estimated price given the yield is close to price.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
rate	number	The security's interest rate.
pr	number	The security's price.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.) *frequency* is truncated to an integer.

- *pr* or *redemption* ≤ 0, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`YIELD(DATE(2008,2,15),DATE(2016,11,15),0.0575,95.04287,100,2,0)` results in `6.5000%`

end example]

18.17.7.354 YIELDDISC

Syntax:

`YIELDDISC ( `*settlement*` , `*maturity*` , `*pr*` , `*redemption*` [ , [ `*basis*` ] ] )`

Description: Computes the annual yield for a discounted security.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
pr	number	The security's price.
redemption	number	The security's redemption value per $100 face value.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
`0` or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, if the first date has a day value of 31, the date

[*Example*:

```
YIELDMAT(DATE(2008,3,15),DATE(2008,11,3),DATE(2007,11,8),0.0625,
  100.0123,0) results in 6.0954%
```

end example]

18.17.7.356 ZTEST

Syntax:

ZTEST (*array* , *test-value* [, *sigma*])

Description: Computes the one-tailed probability-value of a z-test. For a given hypothesized population mean, *test-value*, ZTEST returns the probability that the sample mean would be greater than the average of observations in the data set *array*; that is, the observed sample mean.

Mathematical Formula:

When *sigma* is present:

$$ZTEST(array, \mu_0) = 1 - NORMSDIST\left((\bar{x} - \mu_0)/(sigma/\sqrt{n})\right)$$

When *sigma* is omitted:

$$ZTEST(array, \mu_0) = 1 - NORMSDIST\left((\bar{x} - \mu_0)/(s/\sqrt{n})\right)$$

where:

- n = the number of observations in the sample COUNT(*array*)
- s = the sample standard deviation STDEV(*array*)
- x = a sample value
- $\bar{x}$ = the sample mean AVERAGE(*array*)
- μ_0 = the argument *test-value*

Arguments:

Name	Type	Description
array	array	The set of numerical data against which to test *test-value*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Name	Type	Description
test-value	number	The number to test.
sigma	number	The number is the population (known) standard deviation. If omitted, the sample standard deviation is used.

Return Type and Value: number – The one-tailed probability-value of a z-test.

However, if *array* is empty, the return value is unspecified.

[*Example*:

`ZTEST({3,6,7,8,6,5,4,2,1,9},4)` results in `0.090574197`
`ZTEST({3,6,7,8,6,5,4,2,1,9},6)` results in `0.863043389`

end example]

18.18 Simple Types

This is the complete list of simple types dedicated to SpreadsheetML.

18.18.1 ST_Axis (PivotTable Axis)

This simple type defines the axes for a PivotTable selection.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
axisCol (Column Axis)	Column axis
axisPage (Include Count Filter)	Page axis
axisRow (Row Axis)	Row axis
axisValues (Values Axis)	Values axis

Referenced By
pivotArea@axis (§18.3.1.68); pivotField@axis (§18.10.1.69); pivotSelection@axis (§18.3.1.69)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Axis) is located in §A.2. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.18.2 ST_BorderId (Border Id)

Zero-based index of the border record used by this cell format.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

Referenced By
xf@borderId (§18.8.45)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BorderId) is located in §A.2. *end note*]

18.18.3 ST_BorderStyle (Border Line Styles)

The line style of a border in a cell.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dashDot (Dash Dot)	The line style of a border is dash-dot. [*Example*:  *end example*]
dashDotDot (Dash Dot Dot)	The line style of a border is dash-dot-dot. [*Example*:  *end example*]
dashed (Dashed)	The line style of a border is dashed. [*Example*:  *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
dotted (Dotted)	The line style of a border is dotted. [*Example*:  *end example*]
double (Double Line)	The line style of a border is double line. [*Example*:  *end example*]
hair (Hairline Border)	The line style of a border is hairline. [*Example*: *end example*]
medium (Medium Border)	The line style of a border is medium. [*Example*:  *end example*]
mediumDashDot (Medium Dash Dot)	The line style of a border is medium dash-dot. [*Example*:  *end example*]
mediumDashDotDot (Medium Dash Dot Dot)	The line style of a border is medium dash-dot-dot. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	 *end example*]
mediumDashed (Medium Dashed)	The line style of a border is medium dashed. [*Example*:  *end example*]
none (None)	The line style of a border is none (no border visible). [*Example*: *end example*]
slantDashDot (Slant Dash Dot)	The line style of a border is slant-dash-dot. [*Example*:  *end example*]
thick (Thick Line Border)	The line style of a border is 'thick'. [*Example*:  *end example*]
thin (Thin Border)	The line style of a border is thin. [*Example*: 
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	end example]

Referenced By
bottom@style (§18.8.6); diagonal@style (§18.8.13); end@style (§18.8.16); horizontal@style (§18.8.25); start@style (§18.8.37); top@style (§18.8.43); vertical@style (§18.8.44)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BorderStyle) is located in §A.2. *end note*]

18.18.4 ST_CalcMode (Calculation Mode)

This simple type defines the supported modes for performing calculations on workbook data.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Automatic)	Indicates that calculations in the workbook are performed automatically when cell values change. The application recalculates those cells that are dependent on other cells that contain changed values. This mode of calculation helps to avoid unnecessary calculations.
autoNoTable (Automatic Calculation (No Tables))	Indicates tables be excluded during automatic calculation.
manual (Manual Calculation Mode)	Indicates that calculations in the workbook be triggered manually by the user. For example, the application might expose a command in the user interface.

Referenced By
calcPr@calcMode (§18.2.2)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CalcMode) is located in §A.2. *end note*]

18.18.5 ST_CellComments (Cell Comments)

These enumerations specify how cell comments shall be displayed for paper printing purposes.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
asDisplayed (Print Comments As Displayed)	Print cell comments as displayed.
atEnd (Print At End)	Print cell comments at end of document.
none (None)	Do not print cell comments.

Referenced By
pageSetup@cellComments (§18.3.1.63)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CellComments) is located in §A.2. *end note*]

18.18.6 ST_CellFormulaType (Formula Type)

Indicates the type of formula in the cell.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
array (Array Formula)	Formula is an array formula.
dataTable (Table Formula)	Formula is a data table formula.
normal (Normal)	Formula is a regular cell formula.
shared (Shared Formula)	Formula is part of a shared formula.

Referenced By
f@t (§18.3.1.40)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CellFormulaType) is located in §A.2. *end note*]

18.18.7 ST_CellRef (Cell Reference)

Represents a single cell reference in a SpreadsheetML document.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CellRef) is located in §A.2. *end note*]

18.18.8 ST_CellSpan (Cell Span Type)

A single cell span item.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

Referenced By
ST_CellSpans (§18.18.9)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CellSpan) is located in §A.2. *end note*]

18.18.9 ST_CellSpans (Cell Spans)

List of the cell spans of the item.

This simple type allows a list of items of the ST_CellSpan simple type (§18.18.8).

Referenced By
row@spans (§18.3.1.73)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CellSpans) is located in §A.2. *end note*]

18.18.10 ST_CellStyleXfId (Cell Style Format Id)

Used by xf records and cellStyle records to reference xf records defined in the cellStyleXfs collection.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

Referenced By
cellStyle@xfId (§18.8.7); xf@xfId (§18.8.45)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CellStyleXfId) is located in §A.2. *end note*]

18.18.11 ST_CellType (Cell Type)

Indicates the cell's data type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Boolean)	Cell containing a boolean.
d (Date)	Cell contains a date in the ISO 8601 format.
e (Error)	Cell containing an error.
inlineStr (Inline String)	Cell containing an (inline) rich string, i.e., one not in the shared string table. If this cell type is used, then the cell value is in the is element rather than the v element in the cell (c element).
n (Number)	Cell containing a number.
s (Shared String)	Cell containing a shared string.
str (String)	Cell containing a formula string.

Referenced By
c@t (§18.3.1.4); cell@t (§18.14.1); nc@t (§18.11.1.3); oc@t (§18.11.1.5)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CellType) is located in §A.2. *end note*]

18.18.12 ST_CfType (Conditional Format Type)

Conditional format rule type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
aboveAverage (Above or Below Average)	This conditional formatting rule highlights cells that are above or below the average for all values in the range.
beginsWith (Begins With)	This conditional formatting rule highlights cells in the range that begin with the given text. Equivalent to using the LEFT() sheet function and comparing values.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
cellIs (Cell Is)	This conditional formatting rule compares a cell value to a formula calculated result, using an operator.
colorScale (Color Scale)	This conditional formatting rule creates a gradated color scale on the cells.
containsBlanks (Contains Blanks)	This conditional formatting rule highlights cells that are completely blank. Equivalent of using LEN(TRIM()). This means that if the cell contains only characters that TRIM() would remove, then it is considered blank. An empty cell is also considered blank.
containsErrors (Contains Errors)	This conditional formatting rule highlights cells with formula errors. Equivalent to using ISERROR() sheet function to determine if there is a formula error.
containsText (Contains Text)	This conditional formatting rule highlights cells containing given text. Equivalent to using the SEARCH() sheet function to determine whether the cell contains the text.
dataBar (Data Bar)	This conditional formatting rule displays a gradated data bar in the range of cells.
duplicateValues (Duplicate Values)	This conditional formatting rule highlights duplicated values.
endsWith (Ends With)	This conditional formatting rule highlights cells ending with given text. Equivalent to using the RIGHT() sheet function and comparing values.
expression (Expression)	This conditional formatting rule contains a formula to evaluate. When the formula result is true, the cell is highlighted.
iconSet (Icon Set)	This conditional formatting rule applies icons to cells according to their values.
notContainsBlanks (Contains No Blanks)	This conditional formatting rule highlights cells that are not blank. Equivalent of using LEN(TRIM()). This means that if the cell contains only characters that TRIM() would remove, then it is considered blank. An empty cell is also considered blank.
notContainsErrors (Contains No Errors)	This conditional formatting rule highlights cells without formula errors. Equivalent to using ISERROR() sheet function to determine if there is a formula error.
notContainsText (Does Not Contain Text)	This conditional formatting rule highlights cells that do not contain given text. Equivalent to using the SEARCH() sheet function.
timePeriod (Time Period)	This conditional formatting rule highlights cells containing dates in the specified time period. The

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	underlying value of the cell is evaluated, therefore the cell does not need to be formatted as a date to be evaluated. For example, with a cell containing the value 38913 the conditional format shall be applied if the rule requires a value of 7/14/2006.
top10 (Top 10)	This conditional formatting rule highlights cells whose values fall in the top N or bottom N bracket, as specified.
uniqueValues (Unique Values)	This conditional formatting rule highlights unique values in the range.

Referenced By
cfRule@type (§18.3.1.10)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CfType) is located in §A.2. *end note*]

18.18.13 ST_CfvoType (Conditional Format Value Object Type)

This simple type expresses the type of the conditional formatting value object (cfvo). In general the cfvo specifies one value used in the gradated scale (max, min, midpoint, etc).

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
formula (Formula)	The minimum/ midpoint / maximum value for the gradient is determined by a formula.
max (Maximum)	Indicates that the maximum value in the range shall be used as the maximum value for the gradient.
min (Minimum)	Indicates that the minimum value in the range shall be used as the minimum value for the gradient.
num (Number)	Indicates that the minimum / midpoint / maximum value for the gradient is specified by a constant numeric value.
percent (Percent)	Value indicates a percentage between the minimum and maximum values in the range shall be used as the minimum / midpoint / maximum value for the gradient.
percentile (Percentile)	Value indicates a percentile ranking in the range shall

Enumeration Value	Description
	be used as the minimum / midpoint / maximum value for the gradient.

Referenced By
cfvo@type (§18.3.1.11)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CfvoType) is located in §A.2. *end note*]

18.18.14 ST_Comments (Comment Display Types)

This simple type defines options for displaying comments in the user interface.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
commIndAndComment (Show Comment & Indicator)	Indicates that both the comment indicator and comment text be show in the user interface.
commIndicator (Show Comment Indicator)	Indicates that only the comment indicator be shown in the user interface.
commNone (No Comments)	Indicates that comments not be shown in the user interface.

Referenced By
customWorkbookView@showComments (§18.2.3)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Comments) is located in §A.2. *end note*]

18.18.15 ST_ConditionalFormattingOperator (Conditional Format Operators)

These conditional format operators are used for "Highlight Cells That Contain..." rules. For example, "highlight cells that begin with "M2" and contain "Mountain Gear"".

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
beginsWith (Begins With)	'Begins with' operator
between (Between)	'Between' operator
containsText (Contains)	'Contains' operator
endsWith (Ends With)	'Ends with' operator
equal (Equal)	'Equal to' operator
greaterThan (Greater Than)	'Greater than' operator
greaterThanOrEqual (Greater Than Or Equal)	'Greater than or equal to' operator
lessThan (Less Than)	'Less than' operator
lessThanOrEqual (Less Than Or Equal)	'Less than or equal to' operator
notBetween (Not Between)	'Not between' operator
notContains (Does Not Contain)	'Does not contain' operator
notEqual (Not Equal)	'Not equal to' operator

Referenced By
cfRule@operator (§18.3.1.10)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ConditionalFormattingOperator) is located in §A.2. *end note*]

18.18.16 ST_CredMethod (Credentials Method)

Credentials method used for server access.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
integrated (Integrated Authentication)	Integrated authentication.
none (No Credentials)	Use no credentials at all.
prompt (Prompt Credentials)	Prompt for credentials.
stored (Stored Credentials)	Use stored credentials.

Referenced By
connection@credentials (§18.13.1)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CredMethod) is located in §A.2. *end note*]

18.18.17 ST_DataConsolidateFunction (Data Consolidation Functions)

Data consolidation functions specified by the user and used to consolidate ranges of data.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
average (Average)	The average of the values.
count (Count)	The number of data values. The count consolidation function works the same as the COUNTA worksheet function.
countNums (CountNums)	The number of data values that are numbers. The Count Nums consolidation function works the same as the COUNT worksheet function.
max (Maximum)	The largest value.
min (Minimum)	The smallest value.
product (Product)	The product of the values.
stdDev (StdDev)	An estimate of the standard deviation of a population, where the sample is a subset of the entire population.
stdDevp (StdDevP)	The standard deviation of a population, where the population is all of the data to be summarized.
sum (Sum)	The sum of the values.
var (Variance)	An estimate of the variance of a population, where the sample is a subset of the entire population.
varp (VarP)	The variance of a population, where the population is all of the data to be summarized.

Referenced By
dataConsolidate@function (§18.3.1.29); dataField@subtotal (§18.10.1.22)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DataConsolidateFunction) is located in §A.2. *end note*]

18.18.18 ST_DataValidationErrorStyle (Data Validation Error Styles)

The style of data validation error alert.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

©ISO/IEC 2011 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
information (Information Icon)	This data validation error style uses an information icon in the error alert.
stop (Stop Icon)	This data validation error style uses a stop icon in the error alert.
warning (Warning Icon)	This data validation error style uses a warning icon in the error alert.

Referenced By
dataValidation@errorStyle (§18.3.1.32)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DataValidationErrorStyle) is located in §A.2. *end note*]

18.18.19 ST_DataValidationImeMode (Data Validation IME Mode)

These values specify that the IME (input method editor) mode is controlled by data validation.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
disabled (Disabled IME Mode)	IME mode is disabled. Forces the IME control to be disabled when this cell is selected.
fullAlpha (Full-Width Alpha-Numeric IME Mode)	Forces the IME control to be on and in full-width alph-numeric input mode when the cell is first selected.
fullHangul (Full Width Hangul)	Forces the IME control to be on and in full-width Hangul input mode when first selecting the cell. Applies when the application's language is Korean and a Korean IME control is selected.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
fullKatakana (Full Katakana IME Mode)	Forces the IME control to be on and in full-width Katakana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected.
halfAlpha (Half Alpha IME)	Forces the IME control to be on and in half-width alph-numeric input mode when the cell is first selected.
halfHangul (Half-Width Hangul IME Mode)	Forces the IME control to be on and in half-width Hangul input mode when first selecting the cell. Applies when the application's language is Korean and a Korean IME control is selected.
halfKatakana (Half-Width Katakana)	Forces the IME control to be on and in half-width Katakana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected.
hiragana (Hiragana IME Mode)	Forces the IME control to be on and in Hiragana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected
noControl (IME Mode Not Controlled)	Data validation does not control the IME control's mode.
off (IME Off)	Forces the IME control to be off when first selecting the cell (goes to direct cell input mode).
on (IME On)	Forces the IME control to be on when first selecting the cell.

Referenced By
dataValidation@imeMode (§18.3.1.32)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DataValidationImeMode) is located in §A.2. *end note*]

18.18.20 ST_DataValidationOperator (Data Validation Operator)

The relational operator used in data validation.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
between (Between)	Data validation which checks if a value is between two

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
	other values.
equal (Equal)	Data validation which checks if a value is equal to a specified value.
greaterThan (Greater Than)	Data validation which checks if a value is greater than a specified value.
greaterThanOrEqual (Greater Than Or Equal)	Data validation which checks if a value is greater than or equal to a specified value.
lessThan (Less Than)	Data validation which checks if a value is less than a specified value.
lessThanOrEqual (Less Than Or Equal)	Data validation which checks if a value is less than or equal to a specified value.
notBetween (Not Between)	Data validation which checks if a value is not between two other values.
notEqual (Not Equal)	Data validation which checks if a value is not equal to a specified value.

Referenced By
dataValidation@operator (§18.3.1.32)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DataValidationOperator) is located in §A.2. *end note*]

18.18.21 ST_DataValidationType (Data Validation Type)

Specifies the type of data validation used to validate user input.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
custom (Custom)	Data validation which uses a custom formula to check the cell value.
date (Date)	Data validation which checks for date values satisfying the given condition.
decimal (Decimal)	Data validation which checks for decimal values satisfying the given condition.
list (List)	Data validation which checks for a value matching one of list of values.
none (None)	No data validation.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
textLength (Text Length)	Data validation which checks for text values, whose length satisfies the given condition.
time (Time)	Data validation which checks for time values satisfying the given condition.
whole (Whole Number)	Data validation which checks for whole number values satisfying the given condition.

Referenced By
dataValidation@type (§18.3.1.32)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DataValidationType) is located in §A.2. *end note*]

18.18.22 ST_DateTimeGrouping (Date Time Grouping)

Specifies how to group dateTime values.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
day (Day)	Group by day
hour (Group by Hour)	Group by hour
minute (Group by Minute)	Group by minute
month (Month)	Group by month
second (Second)	Group by second
year (Group by Year)	Group by year

Referenced By
dateGroupItem@dateTimeGrouping (§18.3.2.4)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DateTimeGrouping) is located in §A.2. *end note*]

18.18.23 ST_DdeValueType (DDE Value Types)

This simple type indicates the type of the DDE value.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Boolean)	Indicates that the value is a boolean.
e (Error)	Indicates that the value is an error.
n (Real Number)	Indicates that the value is a real number.
nil (Nil)	Indicates that the value is nil.
str (String)	Indicates that the value is a string.

Referenced By
value@t (§18.14.18)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DdeValueType) is located in §A.2. *end note*]

18.18.24 ST_DvAspect (Data View Aspect Type)

Specifies the desired data or view aspect of the object when drawing or getting data.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
DVASPECT_CONTENT (Object Display Content)	Provides a representation of an object so it can be displayed as an embedded object inside of a container.
DVASPECT_ICON (Object Display Icon)	Provides an iconic representation of an object.

Referenced By
oleObject@dvAspect (§18.3.1.59)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DvAspect) is located in §A.2. *end note*]

18.18.25 ST_DxfId (Format Id)

This simple type defines the identifier to CT_Dxfs in the styles part. This a zero-based index. See §18.8.30 in Style for more information on formats.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Referenced By
cfRule@dxfId (§18.3.1.10); colorFilter@dxfId (§18.3.2.1); format@dxfId (§18.10.1.35); sortCondition@dxfId (§18.3.1.91); table@dataDxfId (§18.5.1.2); table@headerRowBorderDxfId (§18.5.1.2); table@headerRowDxfId (§18.5.1.2); table@tableBorderDxfId (§18.5.1.2); table@totalsRowBorderDxfId (§18.5.1.2); table@totalsRowDxfId (§18.5.1.2); tableColumn@dataDxfId (§18.5.1.3); tableColumn@headerRowDxfId (§18.5.1.3); tableColumn@totalsRowDxfId (§18.5.1.3); tableStyleElement@dxfId (§18.8.41)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DxfId) is located in §A.2. *end note*]

18.18.26 ST_DynamicFilterType (Dynamic Filter)

These are the dynamic filter types. A dynamic filter returns a result set which might vary due to a change in the data itself or a change in the date on which the filter is being applied. For example, for a set of data {1,1,2,3}, the aboveAverage filter would return or highlight the last two values in the set. If the data is refreshed or changed to {1,1,1,2}, then only the last value would be highlighted. Similarly, the meaning of "lastQuarter" shall be the same for the dates in January, February, and March, but shall change meaning once the date advances from March to April.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
aboveAverage (Above Average)	Shows values that are above average.
belowAverage (Below Average)	Shows values that are below average.
lastMonth (Last Month)	Shows last month's dates.
lastQuarter (Last Quarter)	Shows last calendar quarter's dates.
lastWeek (Last Week)	Shows last week's dates, using Sunday as the first weekday.
lastYear (Last Year)	Shows last year's dates.
M1 (1st Month)	Shows the dates that are in January, regardless of year.
M10 (10th Month)	Shows the dates that are in October, regardless of year.
M11 (11th Month)	Shows the dates that are in November, regardless of year.
M12 (12th Month)	Shows the dates that are in December, regardless of year.
M2 (2nd Month)	Shows the dates that are in February, regardless of year.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
M3 (3rd Month)	Shows the dates that are in March, regardless of year.
M4 (4th Month)	Shows the dates that are in April, regardless of year.
M5 (5th Month)	Shows the dates that are in May, regardless of year.
M6 (6th Month)	Shows the dates that are in June, regardless of year.
M7 (7th Month)	Shows the dates that are in July, regardless of year.
M8 (8th Month)	Shows the dates that are in August, regardless of year.
M9 (9th Month)	Shows the dates that are in September, regardless of year.
nextMonth (Next Month)	Shows next month's dates.
nextQuarter (Next Quarter)	Shows next calendar quarter's dates.
nextWeek (Next Week)	Shows next week's dates, using Sunday as the first weekday.
nextYear (Next Year)	Shows next year's dates.
null (Null)	Common filter type not available.
Q1 (1st Quarter)	Shows the dates that are in the 1st calendar quarter, regardless of year.
Q2 (2nd Quarter)	Shows the dates that are in the 2nd calendar quarter, regardless of year.
Q3 (3rd Quarter)	Shows the dates that are in the 3rd calendar quarter, regardless of year.
Q4 (4th Quarter)	Shows the dates that are in the 4th calendar quarter, regardless of year.
thisMonth (This Month)	Shows this month's dates.
thisQuarter (This Quarter)	Shows this calendar quarter's dates.
thisWeek (This Week)	Shows this week's dates, using Sunday as the first weekday.
thisYear (This Year)	Shows this year's dates.
today (Today)	Shows today's dates.
tomorrow (Tomorrow)	Shows tomorrow's dates.
yearToDate (Year To Date)	Shows the dates between the beginning of the year and today, inclusive.
yesterday (Yesterday)	Shows yesterday's dates.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DynamicFilterType) is located in §A.2. *end note*]

18.18.27 ST_ExternalConnectionType (Text Field Datatype)

These are the possible data types to use when importing text into the SpreadsheetML document. Strings are converted to these data types in the worksheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
DMY (Day Month Year)	Field contains a date in the order: day, month, year.
DYM (Day Year Month)	Field contains a date in the order: day, year, month.
EMD (East Asian Year Month Day)	Field contains an East Asian date in the order: EA era year, month, day.
general (General)	The SpreadsheetML application decides the best fit data type based on the content.
MDY (Month Day Year)	Field contains a date in the order: month, day, year.
MYD (Month Day Year)	Field contains a date in the order: month, year, day.
skip (Skip Field)	Don't import this field at all.
text (Text)	Field contains text.
YDM (Year Day Month)	Field contains a date in the order: year, day, month.
YMD (Year Month Day)	Field contains a date in the order: year, month, day.

Referenced By
textField@type (§18.13.10)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ExternalConnectionType) is located in §A.2. *end note*]

18.18.28 ST_FieldSortType (Field Sort Type)

This simple type defines the sort orders that can be applied to fields in a PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ascending (Ascending)	Indicates the field is sorted in ascending order.
descending (Descending)	Indicates the field is sorted in descending order.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
manual (Manual Sort)	Indicates the field is sorted manually.

Referenced By
pivotField@sortType (§18.10.1.69)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FieldSortType) is located in §A.2. *end note*]

18.18.29 ST_FileType (File Type)

The file type being used for text import.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dos (DOS)	DOS (PC-8).
lin (Linux)	Linux.
mac (Macintosh)	Macintosh.
other (Other Non-Specified Values)	Other non-specified values at the time of writing.
win (Windows (ANSI))	Windows (ANSI).

Referenced By
textPr@fileType (§18.13.12)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FileType) is located in §A.2. *end note*]

18.18.30 ST_FillId (Fill Id)

Zero-based index used to reference a fill record.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

Referenced By
xf@fillId (§18.8.45)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FillId) is located in §A.2. *end note*]

18.18.31 ST_FilterOperator (Filter Operator)

Operator enumerations for filtering.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
equal (Equal)	Show results which are equal to criteria.
greaterThan (Greater Than)	Show results which are greater than criteria.
greaterThanOrEqual (Greater Than Or Equal)	Show results which are greater than or equal to criteria.
lessThan (Less Than)	Show results which are less than criteria.
lessThanOrEqual (Less Than Or Equal)	Show results which are less than or equal to criteria.
notEqual (Not Equal)	Show results which are not equal to criteria.

Referenced By
customFilter@operator (§18.3.2.2)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FilterOperator) is located in §A.2. *end note*]

18.18.32 ST_FontId (Font Id)

An integer that represents a zero based index into the <fonts> collection in the style sheet.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

Referenced By
phoneticPr@fontId (§18.4.3); xf@fontId (§18.8.45)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FontId) is located in §A.2. *end note*]

18.18.33 ST_FontScheme (Font scheme Styles)

Defines the font scheme, if any, to which this font belongs.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
major (Major Font)	This font is the major font for this theme.
minor (Minor Font)	This font is the minor font for this theme.
none (None)	This font is not a theme font.

Referenced By
scheme@val (§18.8.35)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FontScheme) is located in §A.2. *end note*]

18.18.34 ST_FormatAction (PivotTable Format Types)

This simple type defines the type of formats that can be applied to PivotTables.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
blank (Blank)	Indicates no format is applied to the PivotTable. This value is used when formatting is cleared from already formatted cells in the PivotTable.
drill (Drill Type)	Indicates the PivotTable has drill-through format.
formatting (Formatting)	Indicates the PivotTable has formatting.
formula (Formula Type)	Indicates the PivotTable has formulas.

Referenced By
format@action (§18.10.1.35)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FormatAction) is located in §A.2. *end note*]

18.18.35 ST_Formula (Formula)

A formula

This simple type's contents are a restriction of the ST_Xstring datatype (§22.9.2.19).

 ©ISO/IEC 2011 – All rights reserved

Referenced By
calculatedColumnFormula (§18.5.1.1); controlPr@linkedCell (§18.3.1.20); controlPr@listFillRange (§18.3.1.20); controlPr@macro (§18.3.1.20); definedName (§18.2.5); f (§18.3.1.40); formula (§18.3.1.43); formula1 (§18.3.1.44); formula2 (§18.3.1.45); objectPr@macro (§18.3.1.56); oldFormula (§18.11.1.7); totalsRowFormula (§18.5.1.6)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Formula) is located in §A.2. *end note*]

18.18.36 ST_FormulaExpression (Formula Expression Type)

This simple type specifies an expression type that can comprise a formula.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
area (Area)	Reference to a range of cells.
areaError (Area Error)	Reference to a range of cells that now evaluates to an error.
computedArea (Computed Area)	Computed area reference.
ref (Reference)	Single cell reference.
refError (Reference Is Error)	Single cell reference that now evaluates to an error.

Referenced By
undo@exp (§18.11.1.25)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FormulaExpression) is located in §A.2. *end note*]

18.18.37 ST_GradientType (Gradient Type)

Type of gradient fill being used, either linear or path.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
linear (Linear Gradient)	This gradient fill is of linear gradient type. Linear gradient type means that the transition from one color to the next is along a line (e.g., horizontal, vertical,

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
	diagonal, etc.).
path (Path)	This gradient fill is of path gradient type. Path gradient type means the that the boundary of transition from one color to the next is a rectangle, defined by top, bottom, left, and right attributes on the gradientFill element.

Referenced By
gradientFill@type (§18.8.24)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_GradientType) is located in §A.2. *end note*]

18.18.38 ST_GroupBy (Values Group By)

This simple type defines types of data grouping that can be performed on a PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
days (Days)	Indicates a grouping on "days" for date values.
hours (Hours)	Indicates a grouping on "hours" for date values.
minutes (Minutes)	Indicates a grouping on "minutes" for date values.
months (Months)	Indicates a grouping on "months" for date values.
quarters (Quarters)	Indicates a grouping on "quarters" for date values.
range (Group By Numeric Ranges)	Indicates a grouping by numeric ranges for numeric values.
seconds (Seconds)	Indicates a grouping on "seconds" for date values.
years (Years)	Indicates a grouping on "years" for date values.

Referenced By
rangePr@groupBy (§18.10.1.78)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_GroupBy) is located in §A.2. *end note*]

 ©ISO/IEC 2011 – All rights reserved

18.18.39 ST_GrowShrinkType (Grow Shrink Type)

This type enumerates behavior patterns for refreshing external data in a query table.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
insertClear (Insert & Clear On Refresh)	Insert entire rows for new data, clear unused cells.
insertDelete (Insert & Delete On Refresh)	Insert cells for new data, delete unused cells.
overwriteClear (Overwrite & Clear On Refresh)	Overwrite existing cells with new data, clear unused cells.

Referenced By
queryTable@growShrinkType (§18.12.2)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_GrowShrinkType) is located in §A.2. *end note*]

18.18.40 ST_HorizontalAlignment (Horizontal Alignment Type)

The enumeration value indicating the portion of Cell Alignment in a cell format (XF) that is horizontal alignment, i.e., whether it is aligned general, left, right, horizontally centered, filled (replicated), justified, centered across multiple cells, or distributed.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Centered Horizontal Alignment)	The horizontal alignment is centered, meaning the text is centered across the cell.
centerContinuous (Center Continuous Horizontal Alignment)	The horizontal alignment is centered across multiple cells. The information about how many cells to span is expressed in the Sheet Part, in the row of the cell in question. For each cell that is spanned in the alignment, a cell element needs to be written out, with the same style Id which references the `centerContinuous` alignment. [*Example*: This shows the value of A1 centered across A1:C1:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description

		
	The XML from the Sheet Part:
	
	`<row r="1" spans="1:3">`
	`<c r="A1" s="1" t="s">`
	`<v>0</v>`
	`</c>`
	`<c r="B1" s="1"/>`
	`<c r="C1" s="1"/>`
	`</row>`
	The XML from the Styles Part:
	
	`<cellXfs count="2">`
	`<xf numFmtId="0" fontId="0" fillId="0" borderId="0" xfId="0"/>`
	`<xf numFmtId="0" fontId="0" fillId="0" borderId="0" xfId="0" applyAlignment="1">`
	`<alignment horizontal="centerContinuous"/>`
	`</xf>`
	`</cellXfs>`
	
	end example]

distributed (Distributed Horizontal Alignment)	I/ndicates that each 'word' in each line of text inside the cell is evenly distributed across the width of the cell, with flush right and left margins. When there is also an indent value to apply, both the left and right side of the cell are padded by the indent value. A 'word' is a set of characters with no space character in them. Two lines inside a cell are separated by a carriage return. [*Example*: This shows three lines of text evenly distributed horizontally across the cell. The first line is

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	"abc def ghi", the second line is blank, and the third line is "jkl mno".  This shows the same example, with an indent value of 2:  There is no vertical component to the alignment being shown here. The row has been manually adjusted to display the text. *end example*]
fill (Fill)	Indicates that the value of the cell should be filled across the entire width of the cell. If blank cells to the right also have the fill alignment, they are also filled with the value, using a convention similar to `centerContinuous`. Additional rules: • Only whole values can be appended, not partial values. • The column will not be widened to 'best fit' the filled value • If appending an additional occurrence of the value exceeds the boundary of the cell left/right edge, don't append the additional occurrence of the value. • The display value of the cell is filled, not the underlying raw number. [*Example*: This cell is filled with the value 1.2345 and has a width of 15 characters:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	 This cell is filled with the value abc and has width of 15 characters:  • *end example*] •
general (General Horizontal Alignment)	The horizontal alignment is general-aligned. Text data is left-aligned. Numbers, dates, and times are right-aligned. Boolean types are centered. Changing the alignment does not change the type of data. [*Example*: These cells are `general` aligned:  *end example*]
justify (Justify)	The horizontal alignment is justified (flush left and right). For each line of text, aligns each line of the wrapped text in a cell to the right and left (except the last line). If no single line of text wraps in the cell, then the text is not justified. [*Example*: There are two lines of text in this cell, and the cell's horizontal alignment is `justify`:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	one two three four five six seven eight nine ten eleven twelve thirteen fourteen fifteen sixteen seventeen eighteen nineteen six seven eight nine ten eleven twelve *end example*]
left (Left Horizontal Alignment)	The horizontal alignment is left-aligned, even in Right-to-Left mode. Aligns contents at the left edge of the cell. If an indent amount is specified, the contents of the cell is indented from the left by the specified number of character spaces. The character spaces are based on the default font and font size for the workbook.
right (Right Horizontal Alignment)	The horizontal alignment is right-aligned, meaning that cell contents are aligned at the right edge of the cell, even in Right-to-Left mode.

Referenced By
alignment@horizontal (§18.8.1)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_HorizontalAlignment) is located in §A.2. *end note*]

18.18.41 ST_HtmlFmt (HTML Formatting Handling)

How to handle formatting from the HTML source.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Transfer all HTML formatting into the worksheet along with data.
none (No Formatting)	Bring data in as unformatted text (setting data types still occurs).
rtf (Honor Rich Text)	Translate HTML formatting to rich text formatting on

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
	the data brought into the worksheet.

Referenced By
webPr@htmlFormat (§18.13.13)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_HtmlFmt) is located in §A.2. *end note*]

18.18.42 ST_IconSetType (Icon Set Type)

Icon set type for conditional formatting. The threshold values for triggering the different icons within a set are configurable, and the icon order is reversible. See element iconSet for more information.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
3Arrows (3 Arrows)	3 arrows icon set.
3ArrowsGray (3 Arrows (Gray))	3 gray arrows icon set.
3Flags (3 Flags)	3 flags icon set.
3Signs (3 Signs)	3 signs icon set.
3Symbols (3 Symbols Circled)	3 symbols icon set.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
3Symbols2 (3 Symbols)	3 Symbols icon set.
3TrafficLights1 (3 Traffic Lights)	3 traffic lights icon set (#1).
3TrafficLights2 (3 Traffic Lights Black)	3 traffic lights icon set with thick black border.
4Arrows (4 Arrows)	4 arrows icon set.
4ArrowsGray (4 Arrows (Gray))	4 gray arrows icon set.
4Rating (4 Ratings)	4 ratings icon set.
4RedToBlack (4 Red To Black)	4 'red to black' icon set.
4TrafficLights (4 Traffic Lights)	4 traffic lights icon set.
5Arrows (5 Arrows)	5 arrows icon set.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
5ArrowsGray (5 Arrows (Gray))	5 gray arrows icon set.
5Quarters (5 Quarters)	5 quarters icon set.
5Rating (5 Ratings Icon Set)	5 rating icon set.

Referenced By
iconFilter@iconSet (§18.3.2.9); iconSet@iconSet (§18.3.1.49); sortCondition@iconSet (§18.3.1.91)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_IconSetType) is located in §A.2. *end note*]

18.18.43 ST_ItemType (PivotItem Type)

This simple type defines the pivot type for a pivotItem.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
avg (Average)	Indicates the pivot item represents an "average" aggregate function.
blank (Blank Pivot Item)	Indicates the pivot item represents a blank line.
count (Count)	Indicates the pivot item represents custom the "count" aggregate."
countA (CountA)	Indicates the pivot item represents the "count

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	numbers" aggregate function.
data (Data)	Indicate the pivot item represents data.
default (Default)	Indicates the pivot item represents the default type for this PivotTable. The default pivot item type is the "total" aggregate function.
grand (Grand Total Item)	Indicates the pivot items represents the grand total line.
max (Max)	Indicates the pivot item represents the "maximum" aggregate function.
min (Min)	Indicates the pivot item represents the "minimum" aggregate function.
product (Product)	Indicates the pivot item represents the "product" function.
stdDev (stdDev)	Indicates the pivot item represents the "standard deviation" aggregate function.
stdDevP (StdDevP)	Indicates the pivot item represents the "standard deviation population" aggregate function.
sum (Sum)	Indicates the pivot item represents the "sum" aggregate value.
var (Var)	Indicates the pivot item represents the "variance" aggregate value.
varP (VarP)	Indicates the pivot item represents the "variance population" aggregate value.

Referenced By
i@t (§18.10.1.44); item@t (§18.10.1.45)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ItemType) is located in §A.2. *end note*]

18.18.44 ST_MdxFunctionType (MDX Function Type)

This simple type is an enumeration representing different MDX function types.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
c (Cube Set Count)	CUBESETCOUNT

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
k (Cube KPI Member)	CUBEKPIMEMBER
m (Cube Member)	CUBEMEMBER
p (Cube Member Property)	CUBEMEMBERPROPERTY
r (Cube Ranked Member)	CUBERANKEDMEMBER
s (Cube Set)	CUBESET
v (Cube Value)	CUBEVALUE

Referenced By
mdx@f (§18.9.6)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_MdxFunctionType) is located in §A.2. *end note*]

18.18.45 ST_MdxKPIProperty (MDX KPI Property)

An enumeration representing the different types of KPI properties.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
g (Goal)	Goal.
m (Current Time Member)	Current time member.
s (Status)	Status.
t (Trend)	Trend.
v (Value)	Value.
w (Weight)	Weight.

Referenced By
k@p (§18.9.5)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_MdxKPIProperty) is located in §A.2. *end note*]

18.18.46 ST_MdxSetOrder (MDX Set Order)

This simple type represents an enumeration specifying an MDX set order.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
a (Ascending)	Sort ascending.
aa (Alpha Ascending Sort Order)	Sorted alphabetically in ascending order by the caption.
ad (Alpha Descending Sort Order)	Sort in descending order alphabetically by the caption.
d (Descending)	Sort descending.
na (Natural Ascending)	Sorted in ascending order by the natural order of the data - usually by the key. For instance if there is a list of accounts in a general ledger, this might be in order of account number.
nd (Natural Descending)	Sorted in descending order by the natural order of the data - usually by the key. For instance if there is a list of accounts in a general ledger, this might be in order of account number.
u (Unsorted)	Unsorted.

Referenced By
ms@o (§18.9.12)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_MdxSetOrder) is located in §A.2. *end note*]

18.18.47 ST_NumFmtId (Number Format Id)

This simple type defines the identifier to a style sheet number format entry in CT_NumFmts. Number formats are written to the styles part. See §18.8.31 for more information on number formats.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

Referenced By
cacheField@numFmtId (§18.10.1.3); dataField@numFmtId (§18.10.1.22); inputCells@numFmtId (§18.3.1.52); numFmt@numFmtId (§18.8.30); pivotField@numFmtId (§18.10.1.69); rcc@numFmtId (§18.11.1.9); xf@numFmtId (§18.8.45)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.18.48 ST_Objects (Object Display Types)

This simple type defines how the application displays objects in this workbook. Objects might include charts, images, and other object data that the application supports.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Indicates that all objects be shown in the workbook.
none (None)	Indicates that all objects be hidden in the workbook.
placeholders (Show Placeholders)	Indicates that the application show placeholders for objects in the workbook.

Referenced By
customWorkbookView@showObjects (§18.2.3); workbookPr@showObjects (§18.2.28)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Objects) is located in §A.2. *end note*]

18.18.49 ST_OleUpdate (OLE Update Types)

Indicates whether the linked object updates the cached data for the linked object automatically or only when the container calls IOleObject::Update or IOleLink::Update methods.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
OLEUPDATE_ALWAYS (Always Update OLE)	Update the link object whenever possible, this option corresponds to the 'automatic update' option in the Links dialog box.
OLEUPDATE_ONCALL (Update OLE On Call)	Update the link object only when IOleObject::Update or IOleLink::Update is called, this option coresponds to the Manual update option in the Links dialog box.

Referenced By
oleObject@oleUpdate (§18.3.1.59)

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_OleUpdate) is located in §A.2. *end note*]

18.18.50 ST_Orientation (Orientation)

Print orientation for this sheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
default (Default)	Orientation not specified, use the default.
landscape (Landscape)	Landscape orientation.
portrait (Portrait)	Portrait orientation.

Referenced By
pageSetup@orientation (§18.3.1.64); pageSetup@orientation (§18.3.1.63)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Orientation) is located in §A.2. *end note*]

18.18.51 ST_PageOrder (Page Order)

Specifies printed page order.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
downThenOver (Down Then Over)	Order pages vertically first, then move horizontally.
overThenDown (Over Then Down)	Order pages horizontally first, then move vertically

Referenced By
pageSetup@pageOrder (§18.3.1.63)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PageOrder) is located in §A.2. *end note*]

18.18.52 ST_Pane (Pane Types)

Defines the names of the four possible panes into which the view of a workbook in the application can be split.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bottomLeft (Bottom Left Pane)	Bottom left pane, when both vertical and horizontal splits are applied. This value is also used when only a horizontal split has been applied, dividing the pane into upper and lower regions. In that case, this value specifies the bottom pane.
bottomRight (Bottom Right Pane)	Bottom right pane, when both vertical and horizontal splits are applied.
topLeft (Top Left Pane)	Top left pane, when both vertical and horizontal splits are applied. This value is also used when only a horizontal split has been applied, dividing the pane into upper and lower regions. In that case, this value specifies the top pane. This value is also used when only a vertical split has been applied, dividing the pane into right and left regions. In that case, this value specifies the left pane
topRight (Top Right Pane)	Top right pane, when both vertical and horizontal splits are applied. This value is also used when only a vertical split has been applied, dividing the pane into right and left regions. In that case, this value specifies the right pane.

Referenced By
pane@activePane (§18.3.1.66); pivotSelection@pane (§18.3.1.69); selection@pane (§18.3.1.78)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Pane) is located in §A.2. *end note*]

18.18.53 ST_PaneState (Pane State)

State of the sheet's pane.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
frozen (Frozen)	Panes are frozen, but were not split being frozen. In this state, when the panes are unfrozen again, a single pane results, with no split. In this state, the split bars are not adjustable.
frozenSplit (Frozen Split)	Panes are frozen and were split before being frozen. In this state, when the panes are unfrozen again, the split remains, but is adjustable.
split (Split)	Panes are split, but not frozen. In this state, the split bars are adjustable by the user.

Referenced By
pane@state (§18.3.1.66)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PaneState) is located in §A.2. *end note*]

18.18.54 ST_ParameterType (Parameter Type)

Parameter Type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cell (Parameter From Cell)	Get the parameter value from a cell on each refresh.
prompt (Prompt on Refresh)	Prompt the user on each refresh for a parameter value.
value (Value)	Use a constant value on each refresh for the parameter value.

Referenced By
parameter@parameterType (§18.13.6)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ParameterType) is located in §A.2. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.18.55 ST_PatternType (Pattern Type)

Indicates the style of fill pattern being used for a cell format.

The examples below use yellow background and black foreground colors.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
darkDown (Dark Down)	The fill style is 'dark down'. [*Example*: *end example*]
darkGray (Dary Gray)	The fill style is 'dark gray'. [*Example*:  *end example*]
darkGrid (Dark Grid)	The fill style is 'dark grid'. [*Example*: *end example*]
darkHorizontal (Dark Horizontal)	The fill style is dark horizontal. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	 *end example*]
darkTrellis (Dark Trellis)	The fill style is 'dark trellis'. [*Example*:  *end example*]
darkUp (Dark Up)	The fill style is 'dark up'. [*Example*: *end example*]
darkVertical (Dark Vertical)	The fill style is 'dark vertical'. [*Example*: *end example*]
gray0625 (Gray 0.0625)	The fill style is grayscale of 0.0625 (1/16) value. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	 *end example*]
gray125 (Gray 0.125)	The fill style is grayscale of 0.125 (1/8) value. [*Example*:  *end example*]
lightDown (Light Down)	The fill style is 'light down'. [*Example*: *end example*]
lightGray (Light Gray)	The fill style is light gray. [*Example*:  *end example*]
lightGrid (Light Grid)	The fill style is 'light grid'. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	 *end example*]
lightHorizontal (Light Horizontal)	The fill style is light horizontal. [*Example*: *end example*]
lightTrellis (Light Trellis)	The fill style is 'light trellis'. [*Example*: *end example*]
lightUp (Light Up)	The fill style is light up. [*Example*: *end example*]
lightVertical (Light Vertical)	The fill style is light vertical.
mediumGray (Medium Gray)	The fill style is medium gray. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
	 *end example*]
none (None)	The fill style is none (no fill). When foreground and/or background colors are specified, a pattern of 'none' overrides and means the cell has no fill. [*Example*: *end example*]
solid (Solid)	The fill style is solid. When solid is specified, the foreground color (fgColor) is the only color rendered, even when a background color (bgColor) is also specified. [*Example*: *end example*]

Referenced By
patternFill@patternType (§18.8.32)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PatternType) is located in §A.2. *end note*]

18.18.56 ST_PhoneticAlignment (Phonetic Alignment Types)

Phonetic alignment settings. These specify how to align the phonetic text, which represent the sounds, above the base text or base word.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Center Alignment)	Center the phonetic characters over the base word, per word.
distributed (Distributed)	Each phonetic character is distributed above each base word character, per word.
left (Left Alignment)	Each phonetic character is left justified with respect to the base text., per word.
noControl (No Control)	Each phonetic character is left justified without respect to the base text (so it is not per word).

Referenced By
phoneticPr@alignment (§18.4.3)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PhoneticAlignment) is located in §A.2. *end note*]

18.18.57 ST_PhoneticType (Phonetic Type)

Represents the different East Asian character sets that shall be used for displaying phonetic hints.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
fullwidthKatakana (Full-Width Katakana)	Full-width Katakana is used
halfwidthKatakana (Half-Width Katakana)	Half-width Katakana is used, this is the same Katakana character set, just half as wide so it takes up less space.
Hiragana (Hiragana)	Hiragana is used
noConversion (No Conversion)	Any characters are allowed. In this case the spreadsheet application shall leave the text as entered.

Referenced By
phoneticPr@type (§18.4.3)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PhoneticType) is located in §A.2. *end note*]

18.18.58 ST_PivotAreaType (Rule Type)

Indicates the type of rule being used to describe an area or aspect of the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Refers to the whole PivotTable.
button (Field Button)	Refers to a field button.
data (Data)	Refers to something in the data area.
none (None)	Refers to no Pivot area.
normal (Normal)	Refers to a header or item.
origin (Origin)	Refers to the blank cells at the top-left of the PivotTable (top-left to LTR sheets, top-right for RTL sheets).
topEnd (Top End)	Refers to the blank cells at the top of the PivotTable, on its trailing edge (top-right for LTR sheets, top-left for RTL sheets).

Referenced By
pivotArea@type (§18.3.1.68)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PivotAreaType) is located in §A.2. *end note*]

18.18.59 ST_PivotFilterType (Pivot Filter Types)

This simple type defines filters that can be applied to PivotTables.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
captionBeginsWith (Caption Begins With)	Indicates the "begins with" filter for field captions.
captionBetween (Caption Is Between)	Indicates the "is between" filter for field captions.
captionContains (Caption Contains)	Indicates the "contains" filter for field captions.
captionEndsWith (Caption Ends With)	Indicates the "ends with" filter for field captions.
captionEqual (Caption Equals)	Indicates the "equal" filter for field captions.
captionGreaterThan (Caption Is Greater Than)	Indicates the "is greater than" filter for field captions.
captionGreaterThanOrEqual (Caption Is Greater Than Or Equal To)	Indicates the "is greater than or equal to" filter for field captions.
captionLessThan (Caption Is Less Than)	Indicates the "is less than" filter for field captions.
captionLessThanOrEqual (Caption Is Less Than Or Equal To)	Indicates the "is less than or equal to" filter for field captions.
captionNotBeginsWith (Caption Does Not Begin With)	Indicates the "does not begin with" filter for field captions.
captionNotBetween (Caption Is Not Between)	Indicates the "is not between" filter for field captions.
captionNotContains (Caption Does Not Contain)	Indicates the "does not contain" filter for field captions.
captionNotEndsWith (Caption Does Not End With)	Indicates the "does not end with" filter for field captions.
captionNotEqual (Caption Not Equal)	Indicates the "not equal" filter for field captions.
count (Count)	Indicates the "count" filter.
dateBetween (Date Between)	Indicates the "between" filter for date values.
dateEqual (Date Equals)	Indicates the "equals" filter for date values.
dateNewerThan (Date Newer Than)	Indicates the "newer than" filter for date values.
dateNewerThanOrEqual (Date Newer Than or Equal To)	Indicates the "newer than or equal to" filter for date values.
dateNotBetween (Date Not Between)	Indicates the "not between" filter for date values.
dateNotEqual (Date Does Not Equal)	Indicates the "does not equal" filter for date values.
dateOlderThan (Date Older Than)	Indicates the "older than" filter for date values.
dateOlderThanOrEqual (Date Older Than Or Equal)	Indicates the "older than or equal to" filter for date values.
lastMonth (Last Month)	Indicates the "last month" filter for date values.
lastQuarter (Last Quarter)	Indicates the "last quarter" filter for date values.
lastWeek (Last Week)	Indicates the "last week" filter for date values.
lastYear (Last Year)	Indicates the "last year" filter for date values.
M1 (January)	Indicates the "January" filter for date values.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
M10 (Dates in October)	Indicates the "October" filter for date values.
M11 (Dates in November)	Indicates the "November" filter for date values.
M12 (Dates in December)	Indicates the "December" filter for date values.
M2 (Dates in February)	Indicates the "February" filter for date values.
M3 (Dates in March)	Indicates the "March" filter for date values.
M4 (Dates in April)	Indicates the "April" filter for date values.
M5 (Dates in May)	Indicates the "May" filter for date values.
M6 (Dates in June)	Indicates the "June" filter for date values.
M7 (Dates in July)	Indicates the "July" filter for date values.
M8 (Dates in August)	Indicates the "August" filter for date values.
M9 (Dates in September)	Indicates the "September" filter for date values.
nextMonth (Next Month)	Indicates the "next month" filter for date values.
nextQuarter (Next Quarter)	Indicates the "next quarter" for date values.
nextWeek (Next Week)	Indicates the "next week" for date values.
nextYear (Next Year)	Indicates the "next year" filter for date values.
percent (Percent)	Indicates the "percent" filter for numeric values.
Q1 (First Quarter)	Indicates the "first quarter" filter for date values.
Q2 (Second Quarter)	Indicates the "second quarter" filter for date values.
Q3 (Third Quarter)	Indicates the "third quarter" filter for date values.
Q4 (Fourth Quarter)	Indicates the "fourth quarter" filter for date values.
sum (Sum)	Indicates the "sum" filter for numeric values.
thisMonth (This Month)	Indicates the "this month" filter for date values.
thisQuarter (This Quarter)	Indicates the "this quarter" filter for date values.
thisWeek (This Week)	Indicates the "this week" filter for date values.
thisYear (This Year)	Indicate the "this year" filter for date values.
today (Today)	Indicates the "today" filter for date values.
tomorrow (Tomorrow)	Indicates the "tomorrow" filter for date values.
unknown (Unknown)	Indicates the PivotTable filter is unknown to the application.
valueBetween (Value Between)	Indicates the "Value between" filter for text and numeric values.
valueEqual (Value Equal)	Indicates the "value equal" filter for text and numeric values.
valueGreaterThan (Value Greater Than)	Indicates the "value greater than" filter for text and numeric values.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
valueGreaterThanOrEqual (Value Greater Than Or Equal To)	Indicates the "value greater than or equal to" filter for text and numeric values.
valueLessThan (Value Less Than)	Indicates the "value less than" filter for text and numeric values.
valueLessThanOrEqual (Value Less Than Or Equal To)	Indicates the "value less than or equal to" filter for text and numeric values
valueNotBetween (Value Not Between)	Indicates the "value not between" filter for text and numeric values.
valueNotEqual (Value Not Equal)	Indicates the "value not equal" filter for text and numeric values.
yearToDate (Year-To-Date)	Indicates the "year-to-date" filter for date values.
yesterday (Yesterday)	Indicates the "yesterday" filter for date values.

Referenced By
filter@type (§18.10.1.33)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PivotFilterType) is located in §A.2. *end note*]

18.18.60 ST_PrintError (Print Errors)

This enumeration specifies how to display cells with errors when printing the worksheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
blank (Show Cell Errors As Blank)	Display cell errors as blank.
dash (Dash Cell Errors)	Display cell errors as dashes.
displayed (Display Cell Errors)	Display cell errors as displayed on screen.
NA (NA)	Display cell errors as #N/A.

Referenced By
pageSetup@errors (§18.3.1.63)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PrintError) is located in §A.2. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.18.61 ST_Qualifier (Qualifier)

Qualifier to use to denote string data types in when text is imported from an external file.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
doubleQuote (Double Quote)	Quotation mark -- double quote (").
none (No Text Qualifier)	No text string qualifier used.
singleQuote (Single Quote)	Apostrophe mark -- single quote (').

Referenced By
textPr@qualifier (§18.13.12)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Qualifier) is located in §A.2. *end note*]

18.18.62 ST_Ref (Cell References)

This simple type defines a reference to a range of cells within a sheet in the workbook. A reference identifies a cell or a range of cells on a worksheet and tells the application where to look for the values or data you want to use in a formula. With references, you can use data contained in different parts of a worksheet in one formula or use the value from one cell in several formulas. You can also refer to cells on other sheets in the same workbook, and to other workbooks. References to cells in other workbooks are called links.

SpreadsheetML defines two reference styles defined in the ST_RefMode simple type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

Referenced By
autoFilter@ref (§18.3.1.2); comment@ref (§18.7.3); dataRef@ref (§18.3.1.30); dimension@ref (§18.3.1.35); f@ref (§18.3.1.40); hyperlink@ref (§18.3.1.47); location@ref (§18.10.1.49); mergeCell@ref (§18.3.1.54); oleSize@ref (§18.2.16); pivotArea@offset (§18.3.1.68); raf@ref (§18.11.1.8); rangeSet@ref (§18.10.1.79); rm@destination (§18.11.1.19); rm@source (§18.11.1.19); rqt@ref (§18.11.1.20); rrc@ref (§18.11.1.21); sheetPr@syncRef (§18.3.1.82); sortCondition@ref (§18.3.1.91); sortState@ref (§18.3.1.92); ST_Sqref (§18.18.76); table@ref (§18.5.1.2); webPublishItem@sourceRef (§18.3.1.97); worksheetSource@ref (§18.10.1.95)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Ref) is located in §A.2. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

18.18.63 ST_RefA (Single Cell Reference)

This simple type specifies a single cell reference that might be absolute.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

Referenced By
undo@dr (§18.11.1.25)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_RefA) is located in §A.2. *end note*]

18.18.64 ST_RefMode (Reference Mode)

This simple type defines the supported reference styles or modes for a workbook in SpreadsheetML.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
A1 (A1 Mode)	Indicates that the workbook uses A1 reference style. This is the default for SpreadsheetML. A1 reference style refers to columns with letters and refers to rows with numbers. For example, A1 refers to the cell at the intersection of column A and row 1.
R1C1 (R1C1 Reference Mode)	Indicates that the workbook uses the R1C1 reference style. R1C1 reference style refers to both the rows and the columns on the worksheet with numbers. The location of a cell is indicated with an "R" followed by a row number and a "C" followed by a column number. For example, R1C1 refers to the cell at the intersection of row R1 and column C1.

Referenced By
calcPr@refMode (§18.2.2)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_RefMode) is located in §A.2. *end note*]

18.18.65 ST_RevisionAction (Revision Action Types)

Identifies what kind of action the user performed. Applies to Comment and Custom View revision record.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
add (Add)	Add action.
delete (Delete)	Delete action.

Referenced By
rcmt@action (§18.11.1.11); rcv@action (§18.11.1.12)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_RevisionAction) is located in §A.2. *end note*]

18.18.66 ST_rwColActionType (Row Column Action Type)

Identifies what kind of an action was applied to a row or column.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
deleteCol (Delete Column)	Column delete revision.
deleteRow (Delete Row)	Row delete revision.
insertCol (Column Insert)	Column insert revision.
insertRow (Insert Row)	Row insert revision.

Referenced By
rrc@action (§18.11.1.21)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_rwColActionType) is located in §A.2. *end note*]

18.18.67 ST_Scope (Conditional Formatting Scope)

This simple type defines the scope of conditional formatting applied in the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
data (Data Fields)	Indicates that conditional formatting is applied to the

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	selected data fields.
field (Field Intersections)	Indicates that conditional formatting is applied to the selected PivotTable field intersections.
selection (Selection)	Indicates that conditional formatting is applied to the selected cells.

Referenced By
conditionalFormat@scope (§18.10.1.18)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Scope) is located in §A.2. *end note*]

18.18.68 ST_SheetState (Sheet Visibility Types)

This simple type defines the possible states for sheet visibility.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
hidden (Hidden)	Indicates the workbook window is hidden, but can be shown by the user via the user interface.
veryHidden (Very Hidden)	Indicates the sheet is hidden and cannot be shown in the user interface (UI). This state is only available programmatically.
visible (Visible)	Indicates the sheet is visible.

Referenced By
customSheetView@state (§18.3.1.24); customSheetView@state (§18.3.1.25); sheet@state (§18.2.19)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SheetState) is located in §A.2. *end note*]

18.18.69 ST_SheetViewType (Sheet View Type)

Defines the view setting of the sheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
normal (Normal View)	Normal view
pageBreakPreview (Page Break Preview)	Page break preview
pageLayout (Page Layout View)	Page Layout View

Referenced By
customSheetView@view (§18.3.1.25); sheetView@view (§18.3.1.87)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SheetViewType) is located in §A.2. *end note*]

18.18.70 ST_ShowDataAs (Show Data As)

This simple type defines the data formats for a field in the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
difference (Difference)	Indicates the field is shown as the "difference from" a value.
index (Index)	Indicates the field is shown as the "index.
normal (Normal Data Type)	Indicates that the field is shown as its normal data type.
percent (Percentage Of)	Indicates the field is show as the "percentage of
percentDiff (Percentage Difference)	Indicates the field is shown as the "percentage difference from" a value.
percentOfCol (Percent of Column)	Indicates the field is shown as the percentage of column.
percentOfRow (Percentage of Row)	Indicates the field is shown as the percentage of row
percentOfTotal (Percentage of Total)	Indicates the field is shown as percentage of total.
runTotal (Running Total)	Indicates the field is shown as running total in the table.

Referenced By
dataField@showDataAs (§18.10.1.22)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ShowDataAs) is located in §A.2. *end note*]

18.18.71 ST_SmartTagShow (Smart Tag Display Types)

This simple type defines options for displaying smart tags in the user interface.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Indicates that smart tags are enabled and shown in the user interface.
noIndicator (No Smart Tag Indicator)	Indicates that the smart tags are enabled but the indicator not be shown in the user interface.
none (None)	Indicates that smart tags are disabled and not displayed in the user interface.

Referenced By
smartTagPr@show (§18.2.21)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SmartTagShow) is located in §A.2. *end note*]

18.18.72 ST_SortBy (Sort By)

Specifies what to sort by. In many cases a range of cells are sorted by their values. However, cells can also be sorted by their background color, font color, and type of icon in the cell.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cellColor (Sort by Cell Color)	Sort by cell color
fontColor (Sort by Font Color)	Sort by font color
icon (Sort by Icon)	Sort by icon
value (Value)	Sort by value

Referenced By
sortCondition@sortBy (§18.3.1.91)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SortBy) is located in §A.2. *end note*]

18.18.73 ST_SortMethod (Sort Method)

Sort method. Chinese Simplified, Chinese Traditional, and Japanese support alternate sort methods (multiple sort options are available). All other languages support only 1 sort option. In that case, the value `pinYin` is used.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
none (None)	Not specified, use default sort method.
pinYin (PinYin Sort)	Default sort method. This is the only sort option for most languages. For Chinese Simplified, Chinese Traditional, and Japanese, `pinYin` means sort by phonetic value. •
stroke (Sort by Stroke)	Sort by stroke count of the characters. Only applies to Chinese Simplified, Chinese Traditional, and Japanese.

Referenced By
sortState@sortMethod (§18.3.1.92)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SortMethod) is located in §A.2. *end note*]

18.18.74 ST_SortType (Set Sort Order)

This simple type defines the possible sort order for the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ascending (Ascending)	Indicates that the PivotTable data is sorted in ascending order.
ascendingAlpha (Ascending Alpha)	Indicates that the PivotTable data is sorted in alphabetic order with ascending values.
ascendingNatural (Ascending Natural)	Indicates that the PivotTable data is sorted in natural order with ascending.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
descending (Descending)	Indicates that the PivotTable data is sorted in descending.
descendingAlpha (Alphabetic Order Descending)	Indicates that the PivotTable data is sorted in alphabetic order with descending values.
descendingNatural (Natural Order Descending)	Indicates that the PivotTable data is sorted in natural order with descending values.
none (None)	Indicates that the PivotTable data is not sorted.

Referenced By
set@sortType (§18.10.1.88)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SortType) is located in §A.2. *end note*]

18.18.75 ST_SourceType (PivotCache Type)

This simple type defines the cache types for PivotTables.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
consolidation (Consolidation Ranges)	Indicates that the cache contains data that consolidates ranges.
external (External)	Indicates that the cache contains data from an external data source.
scenario (Scenario Summary Report)	Indicates that the cache contains a scenario summary report
worksheet (Worksheet)	Indicates that the cache contains worksheet data.

Referenced By
cacheSource@type (§18.10.1.7)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SourceType) is located in §A.2. *end note*]

18.18.76 ST_Sqref (Reference Sequence)

A sequence of cell references, space delimited.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type allows a list of items of the ST_Ref simple type (§18.18.62).

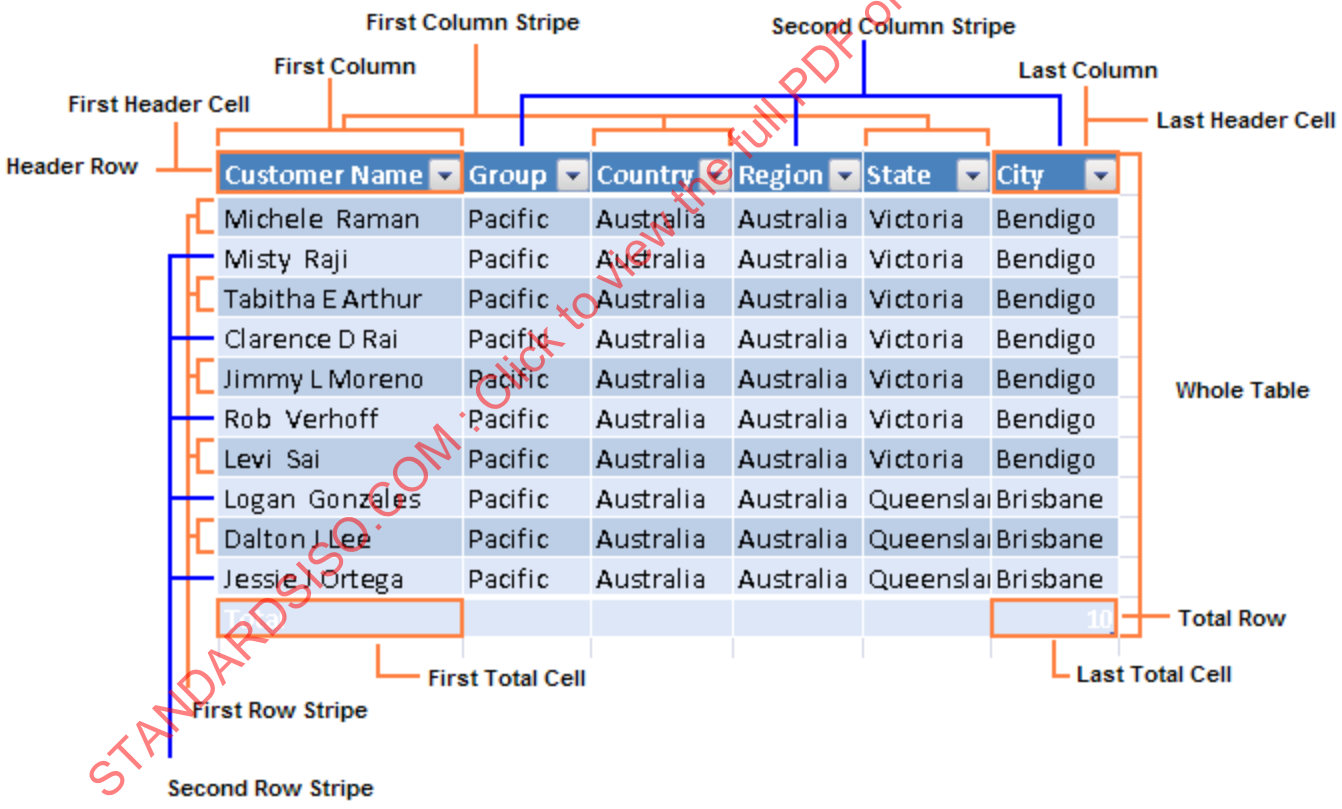
Referenced By
conditionalFormatting@sqref (§18.3.1.18); dataValidation@sqref (§18.3.1.32); ignoredError@sqref (§18.3.1.50); protectedRange@sqref (§18.3.1.71); rfmt@sqref (§18.11.1.17); scenarios@sqref (§18.3.1.76); selection@sqref (§18.3.1.78)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Sqref) is located in §A.2. *end note*]

18.18.77 ST_TableStyleType (Table Style Type)

Enumeration of the different structured regions of a Table or PivotTable which can be formatted. Specifies which region is being formatted by this table style element.

Table Regions



PivotTable Regions

Blank Row

Only applies when "Insert blank row after each item" is ON.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
blankRow (Blank Row Style)	Table style element that applies to PivotTable's blank rows.
firstColumn (First Column Style)	Table style element that applies to table's first column.
firstColumnStripe (First Column Stripe Style)	Table style element that applies to table's first column stripes.
firstColumnSubheading (First Column Subheading Style)	Table style element that applies to PivotTable's first column subheading.
firstHeaderCell (First Header Row Style)	Table style element that applies to table's first header row cell.
firstRowStripe (First Row Stripe Style)	Table style element that applies to table's first row stripes.
firstRowSubheading (First Row Subheading Style)	Table style element that applies to PivotTable's first row subheading.
firstSubtotalColumn (First Subtotal Column Style)	Table style element that applies to PivotTable's first subtotal column.
firstSubtotalRow (First Subtotal Row Style)	Table style element that applies to pivot table's first subtotal row.
firstTotalCell (First Total Row Style)	Table style element that applies to table's first total row cell.

Enumeration Value	Description
headerRow (Header Row Style)	Table style element that applies to table's header row.
lastColumn (Last Column Style)	Table style element that applies to table's last column.
lastHeaderCell (Last Header Style)	Table style element that applies to table's last header row cell.
lastTotalCell (Last Total Row Style)	Table style element that applies to table's last total row cell.
pageFieldLabels (Page Field Labels Style)	Table style element that applies to pivot table's page field labels.
pageFieldValues (Page Field Values Style)	Table style element that applies to pivot table's page field values.
secondColumnStripe (Second Column Stipe Style)	Table style element that applies to table's second column stripes.
secondColumnSubheading (Second Column Subheading Style)	Table style element that applies to pivot table's second column subheading.
secondRowStripe (Second Row Stripe Style)	Table style element that applies to table's second row stripes.
secondRowSubheading (Second Row Subheading Style)	Table style element that applies to pivot table's second row subheading.
secondSubtotalColumn (Second Subtotal Column Style)	Table style element that applies to PivotTable's second subtotal column.
secondSubtotalRow (Second Subtotal Row Style)	Table style element that applies to PivotTable's second subtotal row.
thirdColumnSubheading (Third Column Subheading Style)	Table style element that applies to PivotTable's third column subheading.
thirdRowSubheading (Third Row Subheading Style)	Table style element that applies to PivotTable's third row subheading.
thirdSubtotalColumn (Third Subtotal Column Style)	Table style element that applies to pivot table's third subtotal column.
thirdSubtotalRow (Third Subtotal Row Style)	Table style element that applies to PivotTable's third subtotal row.
totalRow (Total Row Style)	Table style element that applies to table's total row.
wholeTable (Whole Table Style)	Table style element that applies to table's entire content.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TableStyleType) is located in §A.2. *end note*]

18.18.78 ST_TableType (Table Type)

An enumeration that specifies what the table data is based on.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
queryTable (Query Table)	A table based on an external data query.
worksheet (Worksheet)	A table based on a worksheet data range.
xml (XML)	A table based on an XML mapping.

Referenced By
table@tableType (§18.5.1.2)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TableType) is located in §A.2. *end note*]

18.18.79 ST_TargetScreenSize (Target Screen Size Types)

This simple type defines the collection of screen resolutions that are supported for this workbook.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
1024x768 (1024 x 768 Resolution)	Sets the target screen resolution to 1024x768 pixels.
1152x882 (1152 x 882 Resolution)	Sets the target screen resolution to 1152x882 pixels.
1152x900 (1152 x 900 Resolution)	Sets the target screen resolution to 1152x900 pixels
1280x1024 (1280 x 1024 Resolution)	Sets the target screen resolution to 1280x1024 pixels.
1600x1200 (1600 x 1200 Resolution)	Sets the target screen resolution to 1600x1200 pixels.
1800x1440 (1800 x 1440 Resolution)	Sets the target screen resolution to 1800x1440 pixels.
1920x1200 (1920 x 1200 Resolution)	Sets the target screen resolution to 1920x1200 pixels.
544x376 (544 x 376 Resolution)	Sets the target screen resolution to 544x376 pixels.
640x480 (640 x 480 Resolution)	Sets the target screen resolution to 640x480 pixels.
720x512 (720 x 512 Resolution)	Sets the target screen resolution to 720x512 pixels.
800x600 (800 x 600 Resolution)	Sets the target screen resolution to 800x600 pixels.

18.18.80 ST_TextHAlign (Comment Text Horizontal Alignment)

This simple type specifies the horizontal alignment of the text within a comment text field.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Center Alignment)	Specifies that the text is centered horizontally.
distributed (Distributed Alignment)	Specifies that the text is distributed horizontally.
justify (Justify Alignment)	Specifies that the text is justified horizontally.
left (Left Alignment)	Specifies that the text is left-aligned.
right (Right Alignment)	Specifies that the text is right-aligned.

Referenced By
commentPr@textHAlign (§18.7.5)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextHAlign) is located in §A.2. *end note*]

18.18.81 ST_TextVAlign (Comment Text Vertical Alignment)

This simple type specifies the vertical alignment of the text within a comment text field.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bottom (Bottom Alignment)	Specifies that the text is bottom-aligned.
center (Center Alignment)	Specifies that the text is centered vertically.
distributed (Distributed Alignment)	Specifies that the text is distributed vertically.
justify (Justify Alignment)	Specifies that the text is justified vertically.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
top (Top Alignment)	Specifies that the text is top-aligned.

Referenced By
commentPr@textVAlign (§18.7.5)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextVAlign) is located in §A.2. *end note*]

18.18.82 ST_TimePeriod (Time Period Types)

Used in a "contains dates" conditional formatting rule. These are dynamic time periods, which change based on the date the conditional formatting is refreshed / applied.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
last7Days (Last 7 Days)	A date in the last seven days.
lastMonth (Last Month)	A date occuring in the last calendar month.
lastWeek (Last Week)	A date occuring last week.
nextMonth (Next Month)	A date occuring in the next calendar month.
nextWeek (Next Week)	A date occuring next week.
thisMonth (This Month)	A date occuring in this calendar month.
thisWeek (This Week)	A date occuring this week.
today (Today)	Today's date.
tomorrow (Tomorrow)	Tomorrow's date.
yesterday (Yesterday)	Yesterday's date.

Referenced By
cfRule@timePeriod (§18.3.1.10)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TimePeriod) is located in §A.2. *end note*]

18.18.83 ST_TotalsRowFunction (Totals Row Function Types)

An enumeration that specifies what function is used to aggregate the data in a column before it is displayed in the totals row.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
average (Average)	Represents the arithmetic mean.
count (Non Empty Cell Count)	Represents a count of the number of non-empty cells.
countNums (Count Numbers)	Represents the number of cells that contain numbers.
custom (Custom Formula)	Represents the formula provided in `totalsRowFormula`.
max (Maximum)	Represents the largest value.
min (Minimum)	Represents the smallest value.
none (None)	No total row.
stdDev (StdDev)	Represents the estimated standard deviation.
sum (Sum)	Represents the arithmetic sum.
var (Var)	Represents the estimated variance.

Referenced By
tableColumn@totalsRowFunction (§18.5.1.3)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TotalsRowFunction) is located in §A.2. *end note*]

18.18.84 ST_Type (Top N Evaluation Type)

This simple type defines the values for the Top N conditional formatting evaluation for the PivotTable. For more information on Top N conditional formatting, see the Sheet (§18.3.1) reference material.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Indicates that Top N conditional formatting is evaluated across the entire scope range.
column (Column Top N)	Indicates that Top N conditional formatting is evaluated for each column.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
none (Top N None)	Indicates that Top N conditional formatting is not evaluated
row (Row Top N)	Indicates that Top N conditional formatting is evaluated for each row.

Referenced By
conditionalFormat@type (§18.10.1.18)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Type) is located in §A.2. *end note*]

18.18.85 ST_UnderlineValues (Underline Types)

Represents the different types of possible underline formatting.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
double (Double Underline)	Double-line underlining under each character in the cell. underlines are drawn through the descenders of characters such as g and p. 1.23
doubleAccounting (Accounting Double Underline)	Double-line accounting underlining under each character in the cell. The underlines are drawn under the descenders of characters such as g and p. 1.23
none (None)	No underline.
single (Single Underline)	Single-line underlining under each character in the cell. The underline is drawn through the descenders of characters such as g and p. 1.23
singleAccounting (Accounting Single Underline)	Single-line accounting underlining under each character in the cell. The underline is drawn under the descenders of characters such as g and p. 1.23

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_UnderlineValues) is located in §A.2. *end note*]

18.18.86 ST_UnsignedIntHex (Hex Unsigned Integer)

This simple type represents the Hex representation of an unsigned integer.

This simple type's contents are a restriction of the W3C XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a length of exactly 8 hexadecimal digit(s).

Referenced By
bgColor@rgb (§18.8.3); color@rgb (§18.3.1.15); e@bc (§18.10.1.27); e@fc (§18.10.1.27); fgColor@rgb (§18.8.19); m@bc (§18.10.1.50); m@fc (§18.10.1.50); n@bc (§18.10.1.60); n@fc (§18.10.1.60); rgbColor@rgb (§18.8.34); s@bc (§18.10.1.85); s@fc (§18.10.1.85); t@bc (§18.9.16); t@fc (§18.9.16); tabColor@rgb (§18.3.1.93)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_UnsignedIntHex) is located in §A.2. *end note*]

18.18.87 ST_UpdateLinks (Update Links Behavior Types)

This simple type defines when the application updates links to other workbooks when the workbook is opened.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
always (Always Update Links)	Indicates that links to other workbooks are always updated when the workbook is opened. The application will not display an alert in the user interface (UI).
never (Never Update Links)	Indicates that links to other workbooks are never updated when the workbook is opened. The application will not display an alert in the user interface.
userSet (User Set)	Indicates that the end-user specified whether they receive an alert to update links to other workbooks when the workbook is opened. [*Example*: The application can expose this option in an application settings dialog. *end example*]

workbookPr@updateLinks (§18.2.28)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_UpdateLinks) is located in §A.2. *end note*]

18.18.88 ST_VerticalAlignment (Vertical Alignment Types)

This enumeration value indicates the type of vertical alignment for a cell, i.e., whether it is aligned top, bottom, vertically centered, justified or distributed.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bottom (Aligned To Bottom)	The vertical alignment is aligned-to-bottom.
center (Centered Vertical Alignment)	The vertical alignment is centered across the height of the cell.
distributed (Distributed Vertical Alignment)	When text direction is horizontal: the vertical alignment of lines of text is distributed vertically, where each line of text inside the cell is evenly distributed across the height of the cell, with flush top and bottom margins. When text direction is vertical: behaves exactly as distributed horizontal alignment. The first words in a line of text (appearing at the top of the cell) are flush with the top edge of the cell, and the last words of a line of text are flush with the bottom edge of the cell, and the line of text is distributed evenly from top to bottom. [*Example*: Horizontal text: this first example shows four lines of text (read horizontally from left to right) distributed vertically across the height of the cell. The first line is "abc", the second line is "def", the third line is "ghi" and the fourth line is "jkl".

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	 Vertical text: this second example shows three lines of text (read vertically from top to bottom) distributed vertically across the height of the cell. The lines of text are: abcd efg hijklmnop qrs tuv wx yzabc defg hijk lmnop The rendering looks like this:  *end example*]
justify (Justified Vertically)	When text direction is horizontal: the vertical alignment of lines of text is distributed vertically, where each line of text inside the cell is evenly distributed across the height of the cell, with flush top

Enumeration Value	Description
	and bottom margins. When text direction is vertical: similar behavior as horizontal justification. The alignment is justified (flush top and bottom in this case). For each line of text, each line of the wrapped text in a cell is aligned to the top and bottom (except the last line). If no single line of text wraps in the cell, then the text is not justified. [*Example*: Horizontal text: this first example shows four lines of text (read horizontally from left to right) justified vertically across the height of the cell. The first line is "abc", the second line is "def", the third line is "ghi" and the fourth line is "jkl". Vertical text: this second example shows three lines of text (read vertically from top to bottom) distributed vertically across the height of the cell. The lines of text are: abcd efg hijklmnop qrs tuv wx yzabc defg hijk lmnop The rendering looks like this:

Enumeration Value	Description
	 *end example*]
top (Align Top)	The vertical alignment is aligned-to-top.

Referenced By
alignment@vertical (§18.8.1)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_VerticalAlignment) is located in §A.2. *end note*]

18.18.89 ST_Visibility (Visibility Types)

This simple type defines the possible states for sheet visibility.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
hidden (Hidden)	Indicates the workbook window is hidden, but can be shown by the user via the user interface.
veryHidden (Very Hidden)	Indicates the sheet is hidden and cannot be shown in the user interface (UI). This state is only available programmatically.
visible (Visible)	Indicates the workbook window is visible.

Referenced By
workbookView@visibility (§18.2.30)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Visibility) is located in §A.2. *end note*]

18.18.90 ST_VolDepType (Volatile Dependency Types)

This simple type defines the dependency types available for this workbook.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
olapFunctions (OLAP Formulas)	Indicates that the type is Cube Functions.
realTimeData (Real Time Data)	Indicates that the type is Real Time Data (RTD).

Referenced By
volType@type (§18.15.5)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_VolDepType) is located in §A.2. *end note*]

18.18.91 ST_VolValueType (Volatile Dependency Value Types)

This simple type defines the data type of the values in the dependency cache.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Boolean)	Indicates topic value is a boolean.
e (Error)	Indicates topic value is an error.
n (Real Number)	Indicates topic value is a real number.
s (String)	Indicates topic value is a string.

Referenced By
tp@t (§18.15.3)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_VolValueType) is located in §A.2. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

18.18.92 ST_WebSourceType (Web Source Type)

This is an enumeration of types of objects which can be selected from the workbook to be published as HTML. For example, the entire sheet can be published, or a narrower set of objects on the sheet can be published, like a chart or a range.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
autoFilter (AutoFilter)	Auto filter
chart (Chart)	Chart
label (Label)	Label
pivotTable (PivotTable)	PivotTable
printArea (Print Area)	Print area
query (QueryTable)	Query Table
range (Range)	Range of cells
sheet (All Sheet Content)	All content of a sheet

Referenced By
webPublishItem@sourceType (§18.3.1.97)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_WebSourceType) is located in §A.2. *end note*]

18.18.93 ST_XmlDataType (XML Data Types)

Represents a W3C XML built-in datatype name (http://www.w3.org/TR/xmlschema-2/). The values permitted by this type are the names of the simple datatypes defined by the XMLSchema Library, http://www.w3.org/2001/XML-Schema-datatypes.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

Referenced By
xmlColumnPr@xmlDataType (§18.5.1.7); xmlPr@xmlDataType (§18.5.2.4)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_XmlDataType) is located in §A.2. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

18.18.94 ST_FontFamily (Font Family)

This simple type specifies a font family. A font family is a set of fonts having common stroke width and serif characteristics. This is system-level font information.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type is restricted to the values listed in the following table:

Value	Font Family
0	Not applicable.
1	Roman
2	Swiss
3	Modern
4	Script
5	Decorative
6	Reserved for future use
7	Reserved for future use
8	Reserved for future use
9	Reserved for future use
10	Reserved for future use
11	Reserved for future use
12	Reserved for future use
13	Reserved for future use
14	Reserved for future use

Referenced By
fontFamily@val (§18.8.18)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FontFamily) is located in §A.2. *end note*]

19. PresentationML Reference Material

The subordinate subclauses specify the semantics for the XML markup comprising a PresentationML document, as defined by §13 of this Part of ISO/IEC 29500.

19.1 Table of Contents

This subclause is informative.

19.2 Presentation 2767
19.2.1 Presentation Properties 2767
19.2.1.1 bold (Bold Embedded Font) 2767
19.2.1.2 boldItalic (Bold Italic Embedded Font) 2768
19.2.1.3 browse (Browse Slide Show Mode) 2769
19.2.1.4 clrMru (Color MRU) 2770
19.2.1.5 custShow (Custom Show) 2770
19.2.1.6 custShow (Custom Show) 2771
19.2.1.7 custShowLst (List of Custom Shows) 2772
19.2.1.8 defaultTextStyle (Presentation Default Text Style) 2773
19.2.1.9 embeddedFont (Embedded Font) 2773
19.2.1.10 embeddedFontLst (Embedded Font List) 2774
19.2.1.11 ext (Extension) 2774
19.2.1.12 extLst (Extension List) 2775
19.2.1.13 font (Embedded Font Name) 2776
19.2.1.14 handoutMasterId (Handout Master ID) 2779
19.2.1.15 handoutMasterIdLst (List of Handout Master IDs) 2779
19.2.1.16 italic (Italic Embedded Font) 2780
19.2.1.17 kinsoku (Kinsoku Settings) 2781
19.2.1.18 kiosk (Kiosk Slide Show Mode) 2781
19.2.1.19 modifyVerifier (Modification Verifier) 2782
19.2.1.20 notesMasterId (Notes Master ID) 2786
19.2.1.21 notesMasterIdLst (List of Notes Master IDs) 2786
19.2.1.22 notesSz (Notes Slide Size) 2787
19.2.1.23 penClr (Pen Color for Slide Show) 2788
19.2.1.24 photoAlbum (Photo Album Information) 2788
19.2.1.25 present (Presenter Slide Show Mode) 2790
19.2.1.26 presentation (Presentation) 2790
19.2.1.27 presentationPr (Presentation-wide Properties) 2793
19.2.1.28 prnPr (Printing Properties) 2793
19.2.1.29 regular (Regular Embedded Font) 2794
19.2.1.30 showPr (Presentation-wide Show Properties) 2795
19.2.1.31 sld (Presentation Slide) 2796

19.7.55 ST_ViewType (List of View Types) 3014

End of informative text.

19.2 Presentation

The Presentation portion of the PresentationML framework houses a set of elements that describe the storing of presentation-wide and view-specific properties. The presentation-wide properties are those that pertain to the entire presentation. The view-specific properties assist the generating application and viewing application by storing parameters that pertain to the final delivery of the presentation.

19.2.1 Presentation Properties

This section contains all presentation-level properties that pertain to a presentation document:

19.2.1.1 bold (Bold Embedded Font)

This element specifies a bold embedded font that is linked to a parent typeface. Once specified, this bold version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a bold version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:bold r:id="rId2"/>
</p:embeddedFont>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§19.2.1.9)

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_EmbeddedFontDataId) is located in §A.3. *end note*]

19.2.1.2 boldItalic (Bold Italic Embedded Font)

This element specifies a bold italic embedded font that is linked to a parent typeface. Once specified, this bold italic version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a bold italic version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:boldItalic r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§19.2.1.9)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_EmbeddedFontDataId) is located in §A.3. *end note*]

19.2.1.3 browse (Browse Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a single window or browse mode, instead of full screen.

[*Example*: Consider the following presentation that is set to be viewed in a browse mode.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  <p:showPr>
    …
    <p:browse showScrollbar="0"/>
    …
  </p:showPr>
</p:presentationPr>
```

end example]

Parent Elements
showPr (§19.2.1.30)

Attributes	Description
showScrollbar (Show Scroll Bar in Window)	Specifies whether to show the scroll bar in the viewing window. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShowInfoBrowse) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

19.2.1.4 clrMru (Color MRU)

This specifies the most recently used user-selected colors within the presentation. This list contains custom user-selected colors outside the presentation's theme colors, enabling the application to expose these additional color choices for easy reuse. The first item in the list is the most recently used color.

[*Example*: Consider the following presentation with two user-selected colors in the color MRU list.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  …
  <p:clrMru>
    <a:srgbClr val="5361EB"/>
    <a:srgbClr val="CCECFF"/>
  </p:clrMru>
  …
</p:presentationPr>
```

end example]

Parent Elements
presentationPr (§19.2.1.27)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorMRU) is located in §A.4.1. *end note*]

19.2.1.5 custShow (Custom Show)

This element specifies a custom show which is an ordered list of a group of slides that are contained within the presentation. The custom show element allows for the specification of a presentation order that is different from the order in which the slides themselves are stored.

[*Example*: Consider the following custom show list that outlines a couple custom shows for a given set of slides.

```
<p:custShowLst>
  <p:custShow name="Custom Show 1" id="0">
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
      <p:sldLst>
        <p:sld r:id="rId4"/>
        <p:sld r:id="rId3"/>
        <p:sld r:id="rId2"/>
        <p:sld r:id="rId5"/>
      </p:sldLst>
    </p:custShow>
    <p:custShow name="Custom Show 2" id="1">
      <p:sldLst>
        <p:sld r:id="rId4"/>
        <p:sld r:id="rId5"/>
      </p:sldLst>
    </p:custShow>
  </p:custShowLst>
```

In the above example there are two custom shows specified. The first specifies to present the slides in the order of 4, 3, 2 then 5 while the second specifies to play only slide 4 then 5. *end example*]

Parent Elements
showPr (§19.2.1.30)

Attributes	Description
id (Custom Show Identifier)	This attribute specifies the custom show identification number. This is a number given that should be unique within the presentation document. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_CustomShowId) is located in §A.3. *end note*]

19.2.1.6 custShow (Custom Show)

This element specifies a custom show that defines a specific slide sequence that the slides are displayed in. This allows for many variants of the same set of slides to be presented.

[*Example*: Consider the following custom show using three slides.

```
<p:custShow name="Custom Show 1" id="0">
  <p:sldLst>
    <p:sld r:id="rId5"/>
    <p:sld r:id="rId2"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
      <p:sld r:id="rId4"/>
    </p:sldLst>
  </p:custShow>
```

Notice here that the custom show specifies a show, or presentation, where slide 5 is shown first, then slide 2 and finally slide 4. *end example*]

Parent Elements
custShowLst (§19.2.1.7)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12
sldLst (List of Presentation Slides)	§19.2.1.35

Attributes	Description
id (Custom Show ID)	Specifies the identification number for this custom show. This should be unique among all the custom shows within the corresponding presentation. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
name (Custom Show Name)	Specifies a name for the custom show. The possible values for this attribute are defined by the ST_Name simple type (§19.7.5).

[*Note*: The W3C XML Schema definition of this element's content model (CT_CustomShow) is located in §A.3. *end note*]

19.2.1.7 custShowLst (List of Custom Shows)

This element specifies a list of all custom shows that are available within the corresponding presentation. A custom show is a defined slide sequence that allows for the displaying of the slides with the presentation in any arbitrary order.

Parent Elements
presentation (§19.2.1.26)

Child Elements	Subclause
custShow (Custom Show)	§19.2.1.6

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_CustomShowList) is located in §A.3. *end note*]

19.2.1.8 defaultTextStyle (Presentation Default Text Style)

This element specifies the default text styles that are to be used within the presentation. The text style defined here can be referenced when inserting a new slide if that slide is not associated with a master slide or if no styling information has been otherwise specified for the text within the presentation slide.

Parent Elements
presentation (§19.2.1.26)

Child Elements	Subclause
defPPr (Default Paragraph Style)	§21.1.2.2.2
extLst (Extension List)	§20.1.2.2.15
lvl1pPr (List Level 1 Text Style)	§21.1.2.4.13
lvl2pPr (List Level 2 Text Style)	§21.1.2.4.14
lvl3pPr (List Level 3 Text Style)	§21.1.2.4.15
lvl4pPr (List Level 4 Text Style)	§21.1.2.4.16
lvl5pPr (List Level 5 Text Style)	§21.1.2.4.17
lvl6pPr (List Level 6 Text Style)	§21.1.2.4.18
lvl7pPr (List Level 7 Text Style)	§21.1.2.4.19
lvl8pPr (List Level 8 Text Style)	§21.1.2.4.20
lvl9pPr (List Level 9 Text Style)	§21.1.2.4.21

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextListStyle) is located in §A.4.1. *end note*]

19.2.1.9 embeddedFont (Embedded Font)

This element specifies an embedded font. Once specified, this font is available for use within the presentation. Within a font specification there can be regular, bold, italic and boldItalic versions of the font specified. The actual font data for each of these is referenced using a relationships file that contains links to all available fonts. This font data contains font information for each of the characters to be made available in each version of the font.

[*Example*: Consider the following embedded font.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFontLst (§19.2.1.10)

Child Elements	Subclause
bold (Bold Embedded Font)	§19.2.1.1
boldItalic (Bold Italic Embedded Font)	§19.2.1.2
font (Embedded Font Name)	§19.2.1.13
italic (Italic Embedded Font)	§19.2.1.16
regular (Regular Embedded Font)	§19.2.1.29

[*Note*: The W3C XML Schema definition of this element's content model (CT_EmbeddedFontListEntry) is located in §A.3. *end note*]

19.2.1.10 embeddedFontLst (Embedded Font List)

This element specifies a list of fonts that are embedded within the corresponding presentation. The font data for these fonts is stored alongside the other document parts within the document container. The actual font data is referenced within the embeddedFont element.

Parent Elements
presentation (§19.2.1.26)

Child Elements	Subclause
embeddedFont (Embedded Font)	§19.2.1.9

[*Note*: The W3C XML Schema definition of this element's content model (CT_EmbeddedFontList) is located in §A.3. *end note*]

19.2.1.11 ext (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements for later versions of generating applications.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

Parent Elements
extLst (§19.2.1.12); extLst (§19.3.1.20)

Child Elements	Subclause
Zero or more elements in any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	This attribute specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag. The possible values for this attribute are defined by the W3C XML Schema token datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Extension) is located in §A.3. *end note*]

19.2.1.12 extLst (Extension List)

This element specifies the extension list within which all future extensions of element type ext are defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the PresentationML framework. This allows for various new kinds of data to be stored natively within the framework.

Parent Elements
bgPr (§19.3.1.2); cmAuthor (§19.4.2); control (§19.3.2.1); cSld (§19.3.1.16); custShow (§19.2.1.6); embed (§19.3.2.2); handoutMasterId (§19.2.1.14); link (§19.3.2.3); normalViewPr (§19.2.2.6); notesMasterId (§19.2.1.20); notesTextViewPr (§19.2.2.7); notesViewPr (§19.2.2.8); nvPr (§19.3.1.33); outlineViewPr (§19.2.2.10); photoAlbum (§19.2.1.24); presentation (§19.2.1.26); presentationPr (§19.2.1.27); prnPr (§19.2.1.28); showPr (§19.2.1.30); sldId (§19.2.1.33); sldLayoutId (§19.3.1.40); sldMasterId (§19.2.1.36); sldSyncPr (§19.6.1); slideViewPr (§19.2.2.16); sorterViewPr (§19.2.2.17); txStyles (§19.3.1.52); viewPr (§19.2.2.18)

Child Elements	Subclause
ext (Extension)	§19.2.1.11

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExtensionList) is located in §A.3. *end note*]

19.2.1.13 font (Embedded Font Name)

This element specifies specific properties describing an embedded font. Once specified, this font is available for use within the presentation. Within a font specification there can be regular, bold, italic and boldItalic versions of the font specified. The actual font data for each of these is referenced using a relationships file that contains links to all available fonts. This font data contains font information for each of the characters to be made available in each version of the font.

[*Example*: Consider the following embedded font.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
</p:embeddedFont>
```

end example]

Font Substitution Logic:

If the specified font is not available on a system being used for rendering, then the attributes of this element are to be utilized in selecting an alternate font.

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§19.2.1.9)

Attributes	Description
charset (Similar Character Set) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the character set which is supported by the parent font. This information can be used in font substitution logic to locate an appropriate substitute font when this font is not available. This information is determined by querying the font when present and shall not be modified when the font is not available. The value of this attribute shall be interpreted as follows:

Value	Description
0x00	Specifies the ANSI character set. (IANA name iso-8859-1)
0x01	Specifies the default character set.
0x02	Specifies the Symbol character set. This value specifies that the characters in the Unicode private use area (U+FF00 to U+FFFF) of the

19.2.1.14 handoutMasterId (Handout Master ID)

This element specifies a handout master that is available within the corresponding presentation. A handout master is a slide that is specifically designed for printing as a handout.

[*Example*: Consider the following specification of a handout master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  …
  <p:handoutMasterIdLst>
    <p:handoutMasterId r:id="rId8"/>
  </p:handoutMasterIdLst>
  …
</p:presentation>
```

end example]

Parent Elements
handoutMasterIdLst (§19.2.1.15)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the handoutMaster element defining this handout master. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_HandoutMasterIdListEntry) is located in §A.3. *end note*]

19.2.1.15 handoutMasterIdLst (List of Handout Master IDs)

This element specifies a list of identification information for the handout master slides that are available within the corresponding presentation. A handout master is a slide that is specifically designed for printing as a handout.

[*Note*: The W3C XML Schema definition of this element's content model (CT_HandoutMasterIdList) is located in §A.3. *end note*]

19.2.1.16 italic (Italic Embedded Font)

This element specifies an italic embedded font that is linked to a parent typeface. Once specified, this italic version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a italic version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:italic r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§19.2.1.9)

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_EmbeddedFontDataId) is located in §A.3. *end note*]

19.2.1.17 kinsoku (Kinsoku Settings)

This element specifies the presentation-wide kinsoku settings that define the line breaking behaviour of East Asian text within the corresponding presentation.

Parent Elements
presentation (§19.2.1.26)

Attributes	Description
invalEndChars (Invalid Kinsoku End Characters)	Specifies the characters that cannot end a line of text. The possible values for this attribute are defined by the W3C XML Schema string datatype.
invalStChars (Invalid Kinsoku Start Characters)	Specifies the characters that cannot start a line of text. The possible values for this attribute are defined by the W3C XML Schema string datatype.
lang (Language)	Specifies the corresponding East Asian language that these settings apply to. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Kinsoku) is located in §A.3. *end note*]

19.2.1.18 kiosk (Kiosk Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a full-screen kiosk mode. A presentation viewed in kiosk mode should have user input disabled and restarts after a specified interval.

[*Example*: Consider the following presentation that is set to be viewed in a looping kiosk mode.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  <p:showPr loop="1" showNarration="1">
    …
    <p:kiosk/>
    …
  </p:showPr>
</p:presentationPr>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
showPr (§19.2.1.30)

Attributes	Description
restart (Restart Show)	Specifies the time length that the presentation should run until it is to be restarted. That is, the presentation should loop back to the first slide specified in the presentation or custom show. This value is specified in 1/1000ths of a second and measured from the most recent time the presentation started or restarted. [*Note*: The counter is reset when a presentation is restarted due to automatic looping at the end of a show, if specified by the loop attribute of showPr. *end note*] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShowInfoKiosk) is located in §A.3. *end note*]

19.2.1.19 modifyVerifier (Modification Verifier)

This element specifies the write protection settings which have been applied to a PresentationML document. *Write protection* refers to a mode in which the document's contents should not be modified, and the document should not be resaved using the same file name.

When present, the application shall require a password to enable modifications to the document. If the supplied password does not match the hash value in this attribute, then write protection shall be enabled. If this element is omitted, then no write protection shall be applied to the current document. Since this protection does not encrypt the document, malicious applications might circumvent its use.

The password supplied to the algorithm is to be a UTF-16LE encoded string; strings longer than 510 octets are truncated to 510 octets. If there is a leading BOM character (U+FEFF) in the encoded password it is removed before hash calculation. The attributes of this element specify the algorithm to be used to verify the password provided by the user.

[*Example*: Consider a PresentationML document that can only be opened in a write protected state unless a password is provided, in which case the file would be opened in an editable state. This requirement would be specified using the following PresentationML:

```
<p:modifyVerifier p:algorithmName="SHA-512" …
p:hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" … />
```

…In order for the hosting application to enable edits to the document, the hosting application would have to be provided with a password that the hosting application would then hash using the algorithm specified by the

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

algorithm attributes and compare to the value of the hashValue attribute (`9oN7nWkCAyEZib1RomSJTjmPpCY=`). If the two values matched, the file would be opened in an editable state. *end example*]

Parent Elements
presentation (§19.2.1.26)

Attributes	Description
algorithmName (Cryptographic Algorithm Name)	Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and input password in order to compute the hash value. The following values are reserved:

Value	Algorithm
`MD2`	Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used. [*Note*: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. *end note*]
`MD4`	Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used. [*Note*: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. *end note*]
`MD5`	Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used. [*Note*: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. *end note*]
`RIPEMD-128`	Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. [*Note*: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. *end note*]
`RIPEMD-160`	Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
`SHA-1`	Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
`SHA-256`	Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>SHA-384</td><td>Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</td></tr>
<tr><td>SHA-512</td><td>Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</td></tr>
<tr><td>WHIRLPOOL</td><td>Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</td></tr>
</table>
[Example: Consider an Office Open XML document with the following information stored in one of its protection elements:
<pre>< … algorithmName="SHA-1"
hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre>
The algorithmName attribute value of “SHA-1” specifies that the SHA-1 hashing algorithm must be used to generate a hash from the user-defined password. end example]
The possible values for this attribute are defined by the W3C XML Schema string datatype.
</td></tr>
<tr><td>hashValue (Password Hash Value)</td><td>
Specifies the hash value for the password required to edit this chartsheet. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.
If this value is omitted, then the reservationPassword attribute shall contain the password hash for the workbook.
[Example: Consider an Office Open XML document with the following information stored in one of its protection elements:
<pre><… algorithmName="SHA-1"
hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre>
The hashValue attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the algorithmName attribute value of SHA-1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. end example]
The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.
</td></tr>
<tr><td>saltValue (Salt Value for Password Verifier)</td><td>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hashValue attribute, and which shall also be prepended to the user-supplied</td></tr>
</table>

Attributes	Description
	password before attempting to generate a hash value for comparison. A *salt* is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those pre-calculated values (often referred to as a "dictionary attack"). If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value. [*Example*: Consider an Office Open XML document with the following information stored in one of its protection elements: `<… saltValue="ZUdHa+D8F/OAKP3I7ssUnQ==" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The saltValue attribute value of `ZUdHa+D8F/OAKP3I7ssUnQ==` specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. *end example*] The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.
spinValue (Iterations to Run Hashing Algorithm)	Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hashValue attribute. [*Rationale*: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). *end rationale*] [*Example*: Consider an Office Open XML document with the following information stored in one of its protection elements: `<… spinCount="100000" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The spinCount attribute value of `100000` specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the hashValue attribute. *end example*] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ModifyVerifier) is located in §A.3. *end note*]

19.2.1.20 notesMasterId (Notes Master ID)

This element specifies a notes master that is available within the corresponding presentation. A notes master is a slide that is specifically designed for the printing of the slide along with any attached notes.

[*Example*: Consider the following specification of a notes master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  …
  <p:notesMasterIdLst>
    <p:notesMasterId r:id="rId8"/>
  </p:notesMasterIdLst>
  …
</p:presentation>
```

end example]

Parent Elements
notesMasterIdLst (§19.2.1.21)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the notesMaster element defining this notes master. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_NotesMasterIdListEntry) is located in §A.3. *end note*]

19.2.1.21 notesMasterIdLst (List of Notes Master IDs)

This element specifies a list of identification information for the notes master slides that are available within the corresponding presentation. A notes master is a slide that is specifically designed for the printing of the slide along with any attached notes.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
presentation (§19.2.1.26)

Child Elements	Subclause
notesMasterId (Notes Master ID)	§19.2.1.20

[*Note*: The W3C XML Schema definition of this element's content model (CT_NotesMasterIdList) is located in §A.3. *end note*]

19.2.1.22 notesSz (Notes Slide Size)

This element specifies the size of slide surface used for notes slides and handout slides. Objects within a notes slide can be specified outside these extents, but the notes slide has a background surface of the specified size when presented or printed. This element is intended to specify the region to which content is fitted in any special format of printout the application might choose to generate, such as an outline handout.

[*Example*: Consider the following specifying of the size of a notes slide.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  …
  <p:notesSz cx="9144000" cy="6858000"/>
  …
</p:presentation>
```

end example]

Parent Elements
presentation (§19.2.1.26)

Attributes	Description
cx (Extent Length) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
cy (Extent Width) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositiveSize2D) is located in §A.4.1. *end note*]

19.2.1.23 penClr (Pen Color for Slide Show)

This element specifies the pen color that should be used to make markings on the slides while in a presentation.

Parent Elements
showPr (§19.2.1.30)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

19.2.1.24 photoAlbum (Photo Album Information)

This element specifies that the corresponding presentation contains a photo album. A photo album specifies a list of images within the presentation that spread across one or more slides, all of which share a consistent layout. Each image in the album is formatted with a consistent style. This functionality enables the application to manage all of the images together and modify their ordering, layout, and formatting as a set.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This element does not enforce the specified properties on individual photo album images; rather, it specifies common settings that should be applied by default to all photo album images and their containing slides. Images that are part of the photo album are identified by the presence of the isPhoto element in the definition of the picture.

[*Example*: Consider the following presentation that has been specified as a photo album

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  …
  <p:photoAlbum bw="1" layout="2pic"/>
  …
</p:presentation>
```

end example]

Parent Elements
presentation (§19.2.1.26)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
bw (Black and White)	Specifies whether all pictures in the photo album are to be displayed as black and white. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
frame (Frame Type)	Specifies the frame type that is to be used on all the pictures in the photo album. The possible values for this attribute are defined by the ST_PhotoAlbumFrameShape simple type (§19.7.7).
layout (Photo Album Layout)	Specifies the layout that is to be used to arrange the pictures in the photo album on individual slides. The possible values for this attribute are defined by the ST_PhotoAlbumLayout simple type (§19.7.8).
showCaptions (Show/Hide Captions)	Specifies whether to show captions for pictures in the photo album. Captions are text boxes grouped with each image, with the group set to not allow ungrouping. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_PhotoAlbum) is located in §A.3. *end note*]

19.2.1.25 present (Presenter Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a full-screen presenter mode. In this mode, the presentation is displayed on one monitor while a different monitor displays notes and provides navigation controls intended to be viewed only by the presenter.

[*Example*: Consider the following presentation that is set to be viewed in a present mode.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  <p:showPr>
    …
    <p:present/>
    …
  </p:showPr>
</p:presentationPr>
```

end example]

Parent Elements
showPr (§19.2.1.30)

[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.3. *end note*]

19.2.1.26 presentation (Presentation)

This element specifies within it fundamental presentation-wide properties.

[*Example*: Consider the following presentation with a single slide master and two slides. In addition to these commonly used elements there can also be the specification of other properties such as slide size, notes size and default text styles.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="">
    <p:sldMasterIdLst>
        <p:sldMasterId id="2147483648" r:id="rId1"/>
    </p:sldMasterIdLst>
    <p:sldIdLst>
        <p:sldId id="256" r:id="rId3"/>
        <p:sldId id="257" r:id="rId4"/>
    </p:sldIdLst>
    <p:sldSz cx="9144000" cy="6858000" type="screen4x3"/>
    <p:notesSz cx="6858000" cy="9144000"/>
    <p:defaultTextStyle>
      …
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
autoCompressPictures (Automatically Compress Pictures)	Specifies whether the generating application should automatically compress all pictures for this presentation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
bookmarkIdSeed (Bookmark ID Seed)	Specifies a seed for generating bookmark IDs to ensure IDs remain unique across the document. This value specifies the number to be used as the ID for the next new bookmark created. The possible values for this attribute are defined by the ST_BookmarkIdSeed simple type (§19.7.1).
compatMode	Specifies whether the generating application is to be in a compatibility mode which

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
(Compatibility Mode)	serves to inform the user of any loss of content or functionality when working with older formats. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

conformance (Document Conformance Class)	Specifies the conformance class (§2.4) to which the PresentationML document conforms.
	
	If this attribute is omitted, its default value is `transitional`.
	
	[*Example*: Consider the following PresentationML Presentation part markup:
	
	`<p:presentation conformance="strict">`
	`…`
	`</p:presentation>`
	
	This document has a conformance attribute value of `strict`, therefore it conforms to the PML Strict conformance class. *end example*]
	
	The possible values for this attribute are defined by the ST_ConformanceClass simple type (§22.9.2.2).

embedTrueTypeFonts (Embed True Type Fonts)	Specifies whether the generating application should automatically embed true type fonts or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
firstSlideNum (First Slide Number)	Specifies the first slide number in the presentation. The possible values for this attribute are defined by the W3C XML Schema int datatype.
removePersonalInfoOnSave (Remove Personal Information on Save)	Specifies whether to automatically remove personal information when the presentation document is saved. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rtl (Right-To-Left Views)	Specifies if the current view of the user interface is oriented right-to-left or left-to-right. The view is right-to-left is this value is set to true, and left-to-right otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
saveSubsetFonts (Save Subset Fonts)	Specifies to save only the subset of characters used in the presentation when a font is embedded. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
serverZoom (Server	Specifies the scaling to be used when the presentation is embedded in another

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
Zoom)	document. The embedded slides are to be scaled by this percentage. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
showSpecialPlsOnTitleSld (Show Header and Footer Placeholders on Titles)	Specifies whether to show the header and footer placeholders on the title slides. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
strictFirstAndLastChars (Strict First and Last Characters)	Specifies whether to use strict characters for starting and ending lines of Japanese text. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Presentation) is located in §A.3. *end note*]

19.2.1.27 presentationPr (Presentation-wide Properties)

This element functions as a parent element within which additional presentation-wide document properties are contained. All properties and their corresponding settings are defined within the child elements.

Parent Elements
Root element of PresentationML Presentation Properties part

Child Elements	Subclause

[*Note*: The W3C XML Schema definition of this element's content model (CT_PresentationProperties) is located in §A.3. *end note*]

19.2.1.28 prnPr (Printing Properties)

This element specifies the default printing properties associated with this presentation document.

Parent Elements
presentationPr (§19.2.1.27)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
clrMode (Print Color Mode)	Specifies the color mode to be used when printing. The possible values for this attribute are defined by the ST_PrintColorMode simple type (§19.7.11).
frameSlides (Frame slides when printing)	Specifies whether slides should be framed when printing. When framed, an outline border is printed for each slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
hiddenSlides (Print Hidden Slides)	Specifies whether hidden slides should be printed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
prnWhat (Print Output)	Specifies what the default print output is in terms of content layout. The possible values for this attribute are defined by the ST_PrintWhat simple type (§19.7.12).
scaleToFitPaper (Scale to Fit Paper when printing)	Specifies whether the print output should be scaled to fit the paper being used. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PrintProperties) is located in §A.3. *end note*]

19.2.1.29 regular (Regular Embedded Font)

This element specifies a regular embedded font that is linked to a parent typeface. Once specified, this regular version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a regular version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§19.2.1.9)

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_EmbeddedFontDataId) is located in §A.3. *end note*]

19.2.1.30 showPr (Presentation-wide Show Properties)

sldAll (All Slides)	§19.2.1.32
sldRg (Slide Range)	§19.2.1.38

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
loop (Loop Slide Show)	Specifies whether the slide show should be set to loop at the end. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showAnimation (Show Animation in Slide Show)	Specifies whether slide show animation should be shown when presenting. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showNarration (Show Narration in Slide Show)	Specifies whether slide show narration should be played when presenting. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
useTimings (Use Timings in Slide Show)	Specifies whether slide transition timings should be used to advance slides when presenting. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShowProperties) is located in §A.3. *end note*]

19.2.1.31 sld (Presentation Slide)

This element specifies a slide within a slide list. The slide list is used to specify an ordering of slides.

[*Example*: Consider the following custom show with an ordering of slides.

```
<p:custShowLst>
  <p:custShow name="Custom Show 1" id="0">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId3"/>
      <p:sld r:id="rId2"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
</p:custShowLst>
```

In the above example the order specified to present the slides is slide 4, then 3, 2 and finally 5. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
sldLst (§19.2.1.35)

Attributes	Description
id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	This attribute specifies the relationship id that is used to reference to the actual slide XML file that contains all the information to the slide listed within the slide list. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideRelationshipListEntry) is located in §A.3. *end note*]

19.2.1.32 sldAll (All Slides)

This attribute specifies all slides instead of a given range of slides for use within the html publishing properties as well as the show properties.

Parent Elements
showPr (§19.2.1.30)

[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.3. *end note*]

19.2.1.33 sldId (Slide ID)

This element specifies a presentation slide that is available within the corresponding presentation. A slide contains the information that is specific to a single slide such as slide-specific shape and text information.

[*Example*: Consider the following specification of a slide master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  ..
  <p:sldIdLst>
    <p:sldId id="256" r:id="rId3"/>
    <p:sldId id="257" r:id="rId4"/>
    <p:sldId id="258" r:id="rId5"/>
    <p:sldId id="259" r:id="rId6"/>
    <p:sldId id="260" r:id="rId7"/>
  </p:sldIdLst>
  ..
</p:presentation>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

end example]

Parent Elements
sldIdLst (§19.2.1.34)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sld element defining this slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
id (Slide Identifier)	Specifies the slide identifier that is to contain a value that is unique throughout the presentation. The possible values for this attribute are defined by the ST_SlideId simple type (§19.7.13).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideIdListEntry) is located in §A.3. *end note*]

19.2.1.34 sldIdLst (List of Slide IDs)

This element specifies a list of identification information for the slides that are available within the corresponding presentation. A slide contains the information that is specific to a single slide such as slide-specific shape and text information.

Parent Elements
presentation (§19.2.1.26)

Child Elements	Subclause
sldId (Slide ID)	§19.2.1.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideIdList) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

19.2.1.35 sldLst (List of Presentation Slides)

This element specifies a list of presentation slides. A presentation slide contains the information that is specific to a single slide such as slide-specific shape and text information.

Parent Elements
custShow (§19.2.1.6)

Child Elements	Subclause
sld (Presentation Slide)	§19.2.1.31

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideRelationshipList) is located in §A.3. *end note*]

19.2.1.36 sldMasterId (Slide Master ID)

This element specifies a slide master that is available within the corresponding presentation. A slide master is a slide that is specifically designed to be a template for all related child layout slides.

[*Example*: Consider the following specification of a slide master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  …
  <p:sldMasterIdLst>
    <p:sldMasterId id="2147483648" r:id="rId1"/>
  </p:sldMasterIdLst>
  …
</p:presentation>
```

end example]

Parent Elements
sldMasterIdLst (§19.2.1.37)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
id (Relationship Identifier)	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sldMaster element defining this slide master.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
id (Slide Master Identifier)	Specifies the slide master identifier that is to contain a value that is unique throughout the presentation. The possible values for this attribute are defined by the ST_SlideMasterId simple type (§19.7.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideMasterIdListEntry) is located in §A.3. *end note*]

19.2.1.37 sldMasterIdLst (List of Slide Master IDs)

This element specifies a list of identification information for the slide master slides that are available within the corresponding presentation. A slide master is a slide that is specifically designed to be a template for all related child layout slides.

Parent Elements
presentation (§19.2.1.26)

Child Elements	Subclause
sldMasterId (Slide Master ID)	§19.2.1.36

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideMasterIdList) is located in §A.3. *end note*]

19.2.1.38 sldRg (Slide Range)

This element specifies a slide range for use within the html publishing properties as well as the show properties.

[*Note*: The indexes used here correlate directly with the presentation slide numbers which they reference to. That is the slide range must be greater than or equal to 1 and also less than or equal to the number of slides in the presentation document. *end note*]

Parent Elements
showPr (§19.2.1.30)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
end (End)	This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).
st (Start)	This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_IndexRange) is located in §A.3. *end note*]

19.2.1.39 sldSz (Presentation Slide Size)

This element specifies the size of the presentation slide surface. Objects within a presentation slide can be specified outside these extents, but this is the size of background surface that is shown when the slide is presented or printed..

[*Example*: Consider the following specifying of the size of a presentation slide.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  …
  <p:sldSz cx="9144000" cy="6858000" type="screen4x3"/>
  …
</p:presentation>
```

end example]

Parent Elements
presentation (§19.2.1.26)

Attributes	Description
cx (Extent Length)	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_SlideSizeCoordinate simple type (§19.7.17).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
cy (Extent Width)	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_SlideSizeCoordinate simple type (§19.7.17).
type (Type of Size)	Specifies the kind of slide size that should be used. This identifies in particular the expected delivery platform for this presentation. The possible values for this attribute are defined by the ST_SlideSizeType simple type (§19.7.18).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideSize) is located in §A.3. *end note*]

19.2.1.40 smartTags (Smart Tags)

This element specifies that references to smart tags exist within this document. [*Note*: For a complete definition of smart tags, which are semantically identical throughout Office Open XML, see §17.5.1. *end note*] To denote the location of smart tags on individual runs of text, there smart tag identifier attributes are specified for each run to which a smart tag applies. These are further specified in the run property attributes within DrawingML.

[*Example*: Consider the following PresentationML markup:

```
<p:presentation>
  …
  <p:smartTags r:id="rId1"/>
</p:presentation>
```

The presence of the smartTags element specifies that there is smart tag information within the PresentationML package. Individual runs are then inspected for the value of the smtId attribute to determine where smart tags might apply, for example:

```
<p:txBody>
  <a:bodyPr/>
  <a:lstStyle/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
    <a:p>
      <a:r>
        <a:rPr lang="en-US" dirty="0" smtId="1"/>
        <a:t>CNTS</a:t>
      </a:r>
      <a:endParaRPr lang="en-US" dirty="0"/>
    </a:p>
  </p:txBody>
```

In the sample above there is a smart tag identifier of 1 specified for this run of text to denote that the text should be inspected for smart tag information. *end example*]

Parent Elements
presentation (§19.2.1.26)

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this smart tag. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SmartTags) is located in §A.3. *end note*]

19.2.2 View Properties

This section contains all properties that pertain to the viewing of the presentation.

19.2.2.1 cSldViewPr (Common Slide View Properties)

This element functions as a container for slide view properties that are common across multiple view property elements. The specific properties and associated values for these view properties reside within the child elements and attributes.

Parent Elements
notesViewPr (§19.2.2.8); slideViewPr (§19.2.2.16)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
cViewPr (Common View Properties)	§19.2.2.2
guideLst (List of Guides)	§19.2.2.5

Attributes	Description
showGuides (Show Guides in View)	Specifies whether to show guides when editing the presentation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
snapToGrid (Snap Objects to Grid)	Specifies whether objects should snap to underlying presentation grid when editing. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
snapToObjects (Snap Objects to Objects)	Specifies whether objects should snap to other objects when editing the presentation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_CommonSlideViewProperties) is located in §A.3. *end note*]

19.2.2.2 cViewPr (Common View Properties)

This element specifies the view properties that are common across multiple view property elements.

Parent Elements
cSldViewPr (§19.2.2.1); notesTextViewPr (§19.2.2.7); outlineViewPr (§19.2.2.10); sorterViewPr (§19.2.2.17)

Child Elements	Subclause
origin (View Origin)	§19.2.2.9
scale (View Scale)	§19.2.2.13

Attributes	Description
varScale (Variable Scale)	Specifies that the view content should automatically scale to best fit the current window size. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_CommonViewProperties) is located in §A.3. *end note*]

19.2.2.3 gridSpacing (Grid Spacing)

This element specifies the grid spacing that should be used for the grid underlying the presentation document. The grid can be used to align objects on the slide and to display visual positioning cues.

Parent Elements
viewPr (§19.2.2.18)

Attributes	Description
cx (Extent Length) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
cy (Extent Width) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositiveSize2D) is located in §A.4.1. *end note*]

19.2.2.4 guide (A Guide)

This element specifies a guide within the presentation. Guides are lines used for arranging layouts and content and never appear except as an aid in editing slides.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
guideLst (§19.2.2.5)

Attributes	Description
orient (Guide Orientation)	Specifies the orientation for a guide. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).
pos (Guide Position)	Specifies the position information for a guide. The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Guide) is located in §A.3. *end note*]

19.2.2.5 guideLst (List of Guides)

This element specifies a list of guides for a particular view of the presentation.

Parent Elements
cSldViewPr (§19.2.2.1)

Child Elements	Subclause
guide (A Guide)	§19.2.2.4

[*Note*: The W3C XML Schema definition of this element's content model (CT_GuideList) is located in §A.3. *end note*]

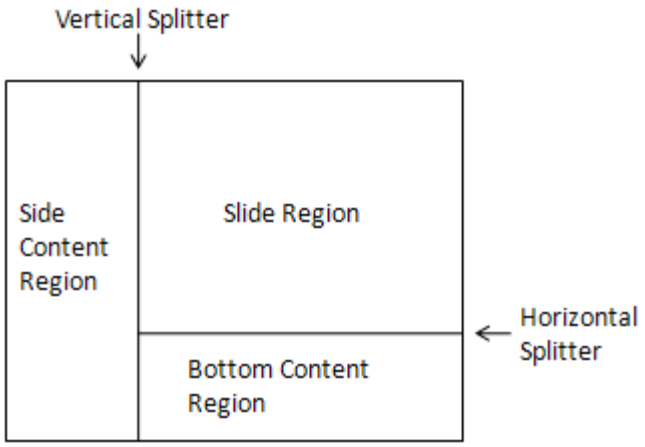
19.2.2.6 normalViewPr (Normal View Properties)

This element specifies the view properties associated with the normal view mode. The normal view consists of three content regions: the slide itself, a side content region, and a bottom content region. The content of the side content region and bottom content region is determined by the generating application. Properties pertaining to the positioning of the different content regions are stored in this element. This information allows the application to save its view state to the file, so that when reopened the view is in the same state as when the presentation was last saved.

A vertical splitter bar separates the slide from the side content region. A horizontal splitter bar separates the slide from the content region below the slide. If the presentation is set to left-to-right, the side content region is to the left of the slide. If the presentation is set to right-to-left, the side content region is to the right of the slide.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved



Parent Elements
viewPr (§19.2.2.18)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12
restoredLeft (Normal View Restored Left Properties)	§19.2.2.11
restoredTop (Normal View Restored Top Properties)	§19.2.2.12

Attributes	Description
horzBarState (State of the Horizontal Splitter Bar)	Specifies the state that the horizontal splitter bar should be in when in normal view mode. The region to be maximized or minimized is the side content region. The possible values for this attribute are defined by the ST_SplitterBarState simple type (§19.7.19).
preferSingleView (Prefer Single View)	Specifies whether the user prefers to see a full-window single-content region over the standard normal view with three content regions. If enabled, the application can choose to display one of the content regions in the entire window. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showOutlineIcons (Show Outline Icons in Normal View)	Specifies whether the application should show icons if displaying outline content in any of the content regions of normal view mode. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
snapVertSplitter (Snap Vertical Splitter)	Specifies whether the vertical splitter should snap to a minimized state when the side region is sufficiently small. The specific parameters of this behaviour are left to the generating application.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
vertBarState (State of the Vertical Splitter Bar)	Specifies the state that the vertical splitter bar should be in when in normal view mode. The region to be maximized or minimized is the slide region. The possible values for this attribute are defined by the ST_SplitterBarState simple type (§19.7.19).

[*Note*: The W3C XML Schema definition of this element's content model (CT_NormalViewProperties) is located in §A.3. *end note*]

19.2.2.7 notesTextViewPr (Notes Text View Properties)

This element functions as a parent element within which all properties associated with the notes text view are contained. All properties are defined within the child elements.

Parent Elements
viewPr (§19.2.2.18)

Child Elements	Subclause
cViewPr (Common View Properties)	§19.2.2.2
extLst (Extension List)	§19.2.1.12

[*Note*: The W3C XML Schema definition of this element's content model (CT_NotesTextViewProperties) is located in §A.3. *end note*]

19.2.2.8 notesViewPr (Notes View Properties)

This element functions as a parent element within which all view properties associated with notes are contained. All properties are defined within the child elements.

Parent Elements
viewPr (§19.2.2.18)

Child Elements	Subclause
cSldViewPr (Common Slide View Properties)	§19.2.2.1
extLst (Extension List)	§19.2.1.12

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_NotesViewProperties) is located in §A.3. *end note*]

19.2.2.9 origin (View Origin)

This element specifies the origin of the slide when it is being viewed with various scaling factors using the scale element.

Parent Elements
cViewPr (§19.2.2.2)

Attributes	Description
x (X-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The x attribute defines an x-coordinate of 0. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
y (Y-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The y attribute defines a y-coordinate of 100. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Point2D) is located in §A.4.1. *end note*]

19.2.2.10 outlineViewPr (Outline View Properties)

This element functions as a parent element within which all view properties associated with the outline view mode are contained. All properties are defined within the child elements.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Outline view displays only the textual content of a presentation. The presentation is formatted as an outline, with slide titles as the first level of the outline. Body text on slides is indented below the slide title.

Parent Elements
viewPr (§19.2.2.18)

Child Elements	Subclause
cViewPr (Common View Properties)	§19.2.2.2
extLst (Extension List)	§19.2.1.12
sldLst (List of Presentation Slides)	§19.2.2.15

[*Note*: The W3C XML Schema definition of this element's content model (CT_OutlineViewProperties) is located in §A.3. *end note*]

19.2.2.11 restoredLeft (Normal View Restored Left Properties)

This element specifies the sizing of the side content region of the normal view, when the region is of a variable restored size (neither minimized nor maximized).

Parent Elements
normalViewPr (§19.2.2.6)

Attributes	Description
autoAdjust (Auto Adjust Normal View)	Specifies whether the size of the side content region should compensate for the new size when resizing the window containing the view within the application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sz (Normal View Dimension Size)	Specifies the size of the slide region (width when a child of restoredTop, height when a child of restoredLeft). The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_NormalViewPortion) is located in §A.3. *end note*]

19.2.2.12 restoredTop (Normal View Restored Top Properties)

This element specifies the sizing of the top slide region of the normal view, when the region is of a variable restored size (neither minimized nor maximized).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
normalViewPr (§19.2.2.6)

Attributes	Description
autoAdjust (Auto Adjust Normal View)	Specifies whether the size of the side content region should compensate for the new size when resizing the window containing the view within the application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sz (Normal View Dimension Size)	Specifies the size of the slide region (width when a child of restoredTop, height when a child of restoredLeft). The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_NormalViewPortion) is located in §A.3. *end note*]

19.2.2.13 scale (View Scale)

This element specifies the view scaling factors that the presentation was last viewed with.

Parent Elements
cViewPr (§19.2.2.2)

Child Elements	Subclause
sx (Horizontal Ratio)	§20.1.2.2.38
sy (Vertical Ratio)	§20.1.2.2.39

[*Note*: The W3C XML Schema definition of this element's content model (CT_Scale2D) is located in §A.4.1. *end note*]

19.2.2.14 sld (Presentation Slide)

This element specifies a presentation slide and properties specific to the slide's appearance in outline view.

[*Example*: Consider the following presentation slide that has been collapsed in outline view.

```
<p:viewPr xmlns:a="" xmlns:r="" xmlns:p="" lastView="outlineView">
  …
  <p:outlineViewPr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
      …
      <p:sldLst>
        <p:sld r:id="rId1" collapse="1"/>
      </p:sldLst>
      …
    </p:outlineViewPr>
    …
  </p:viewPr>
```

end example]

Parent Elements
sldLst (§19.2.2.15)

Attributes	Description
collapse (Collapsed)	Specifies whether this presentation slide is to be shown as collapsed within outline view. That is, all text other than the slide title is not shown to the user. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this presentation slide within a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OutlineViewSlideEntry) is located in §A.3. *end note*]

19.2.2.15 sldLst (List of Presentation Slides)

This element specifies a list of presentation slides. A presentation slide contains the information that is specific to a single slide such as slide-specific shape and text information.

Parent Elements
outlineViewPr (§19.2.2.10)

Child Elements	Subclause
sld (Presentation Slide)	§19.2.2.14

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_OutlineViewSlideList) is located in §A.3. *end note*]

19.2.2.16 slideViewPr (Slide View Properties)

This element functions as a parent element within which all view properties associated with the slide view mode are contained. All properties are defined within the child elements.

Parent Elements
viewPr (§19.2.2.18)

Child Elements	Subclause
cSldViewPr (Common Slide View Properties)	§19.2.2.1
extLst (Extension List)	§19.2.1.12

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideViewProperties) is located in §A.3. *end note*]

19.2.2.17 sorterViewPr (Slide Sorter View Properties)

This element functions as a parent element within which all view properties associated with the slide sorter view mode are contained. All properties are defined within the child elements.

The slide sorter view displays thumbnails of multiple slides at once; the number of slides and size of thumbnails depends on the scaling factor of the view.

Parent Elements
viewPr (§19.2.2.18)

Child Elements	Subclause
cViewPr (Common View Properties)	§19.2.2.2
extLst (Extension List)	§19.2.1.12

Attributes	Description
showFormatting (Show Formatting)	Specifies whether to show associated slide formatting when in slide sorter view mode. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideSorterViewProperties) is located in §A.3. *end note*]

19.2.2.18 viewPr (Presentation-wide View Properties)

This element functions as a parent element within which all presentation-wide view properties are contained. All properties and their corresponding settings are defined within the child elements.

Parent Elements
Root element of PresentationML View Properties part

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12
gridSpacing (Grid Spacing)	§19.2.2.3
normalViewPr (Normal View Properties)	§19.2.2.6
notesTextViewPr (Notes Text View Properties)	§19.2.2.7
notesViewPr (Notes View Properties)	§19.2.2.8
outlineViewPr (Outline View Properties)	§19.2.2.10
slideViewPr (Slide View Properties)	§19.2.2.16
sorterViewPr (Slide Sorter View Properties)	§19.2.2.17

Attributes	Description
lastView (Last View)	Specifies the view mode that was used when the presentation document was last saved. The possible values for this attribute are defined by the ST_ViewType simple type (§19.7.55).
showComments (Show Comments)	Specifies whether the slide comments should be shown. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ViewProperties) is located in §A.3. *end note*]

19.3 Slides

The Slides portion of the PresentationML framework stores all information pertaining specifically to slides of various slide types. These slide types and corresponding parts can be broken down into three distinct parts, namely slides, embedded objects, and programmable tags.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

19.3.1 Slides

Being the main segment of this section of PresentationML, the slides elements encompass all data that is to be contained within a slide. The best way to think of a slide is a container for all data that is to be on that slide. The specific shapes, images and relations within a slide do not come into play here. The elements here pertain to the six different slide types that can be described within PresentationML, namely slide, slide layout, slide master, handout master, notes master and notes slide.

19.3.1.1 bg (Slide Background)

This element specifies the background appearance information for a slide. The slide background covers the entire slide and is visible where no objects exist and as the background for transparent objects.

Parent Elements
cSld (§19.3.1.16)

Child Elements	Subclause
bgPr (Background Properties)	§19.3.1.2
bgRef (Background Style Reference)	§19.3.1.3

Attributes	Description
bwMode (Black and White Mode)	Specifies that the background should be rendered using only black and white coloring. That is, the coloring information for the background should be converted to either black or white when rendering the picture. [*Note*: No gray is to be used in rendering this background, only stark black and stark white. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Background) is located in §A.3. *end note*]

19.3.1.2 bgPr (Background Properties)

This element specifies visual effects used to render the slide background. This includes any fill, image, or effects that are to make up the background of the slide.

Parent Elements
bg (§19.3.1.1)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
blipFill (Picture Fill)	§20.1.8.14
effectDag (Effect Container)	§20.1.8.25
effectLst (Effect Container)	§20.1.8.26
extLst (Extension List)	§19.2.1.12
gradFill (Gradient Fill)	§20.1.8.33
grpFill (Group Fill)	§20.1.8.35
noFill (No Fill)	§20.1.8.44
pattFill (Pattern Fill)	§20.1.8.47
solidFill (Solid Fill)	§20.1.8.54

Attributes	Description
shadeToTitle (Shade to Title)	Specifies whether the background of the slide is of a shade to title background type. This kind of gradient fill is on the slide background and changes based on the placement of the slide title placeholder. An example is shown below. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_BackgroundProperties) is located in §A.3. *end note*]

19.3.1.3 bgRef (Background Style Reference)

This element specifies the slide background is to use a fill style defined in the style matrix. The idx attribute refers to the index of a background fill style or fill style within the presentation's style matrix, defined by the fmtScheme element. A value of 0 or 1000 indicates no background, values 1-999 refer to the index of a fill style within the fillStyleLst element, and values 1001 and above refer to the index of a background fill style within

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

the bgFillStyleLst element. The value 1001 corresponds to the first background fill style, 1002 to the second background fill style, and so on.

[*Example*:

```
<p:bgRef idx="2">
  <a:schemeClr val="bg2"/>
</p:bgRef>
```

The above code indicates a slide background with the style's second fill style using the second background color of the color scheme.

end example]

[*Example*:

```
<p:bgRef idx="1001">
  <a:schemeClr val="bg2"/>
</p:bgRef>
```

The above code indicates a slide background with the style's first background fill style using the second background color of the color scheme.

end example]

Parent Elements
bg (§19.3.1.1)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

Attributes	Description
idx (Style Matrix Index) Namespace: http://purl.oclc.or	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§20.1.10.56).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
g/ooxml/drawingml/main	

[*Note*: The W3C XML Schema definition of this element's content model (CT_StyleMatrixReference) is located in §A.4.1. *end note*]

19.3.1.4 blipFill (Picture Fill)

This element specifies the kind of picture fill that the picture object has. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[*Example*: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<p:pic>
  …
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
  …
</p:pic>
```

The above picture object is shown as an example of this fill type. *end example*]

[*Example*: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<p:pic>
  …
  <p:blipFill>
    <a:blip r:embed="rId2"/>

The above picture object is shown as an example of this double fill type. *end example*]

Parent Elements
pic (§19.3.1.37)

Child Elements	Subclause
blip (Blip)	§20.1.8.13
srcRect (Source Rectangle)	§20.1.8.55
stretch (Stretch)	§20.1.8.56
tile (Tile)	§20.1.8.58

Attributes	Description
dpi (DPI Setting) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [*Note*: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. *end note*] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_BlipFillProperties) is located in §A.4.1. *end note*]

19.3.1.5 bodyStyle (Slide Master Body Text Style)

This element specifies the text formatting style for all body text within a master slide. This formatting is used on all body text within presentation slides related to this master. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the bodyStyle element there can be many different style types defined as there are different kinds of text stored within the body of a slide.

Parent Elements
txStyles (§19.3.1.52)

Child Elements	Subclause
defPPr (Default Paragraph Style)	§21.1.2.2.2
extLst (Extension List)	§20.1.2.2.15
lvl1pPr (List Level 1 Text Style)	§21.1.2.4.13

lvl8pPr (List Level 8 Text Style)	§21.1.2.4.20
lvl9pPr (List Level 9 Text Style)	§21.1.2.4.21

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextListStyle) is located in §A.4.1. *end note*]

19.3.1.6 clrMap (Color Scheme Map)

This element specifies the mapping layer that transforms one color scheme definition to another. Each attribute represents a color name that can be referenced in this master, and the value is the corresponding color in the theme.

[*Example*: Consider the following mapping of colors that applies to a slide master:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
<p:clrMap bg1="dk1" tx1="lt1" bg2="dk2" tx2="lt2" accent1="accent1"
accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

end example]

Parent Elements

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorMapping) is located in §A.4.1. *end note*]

19.3.1.7 clrMapOvr (Color Scheme Map Override)

This element provides a mechanism with which to override the color schemes listed within the ClrMap element. If the masterClrMapping element is present, the color scheme defined by the master is used. If the overrideClrMapping element is present, it defines a new color scheme specific to the parent notes slide, presentation slide, or slide layout.

Parent Elements
notes (§19.3.1.26); sld (§19.3.1.38); sldLayout (§19.3.1.39)

Child Elements	Subclause
masterClrMapping (Master Color Mapping)	§20.1.6.6
overrideClrMapping (Override Color Mapping)	§20.1.6.8

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorMappingOverride) is located in §A.4.1. *end note*]

19.3.1.8 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual drawing properties specific to a connector shape. This includes information specifying the shapes to which the connector shape is connected.

Parent Elements
nvCxnSpPr (§19.3.1.29)

Child Elements	Subclause
cxnSpLocks (Connection Shape Locks)	§20.1.2.2.11
endCxn (Connection End)	§20.1.2.2.13
extLst (Extension List)	§20.1.2.2.15
stCxn (Connection Start)	§20.1.2.2.36

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualConnectorProperties) is located in §A.4.1. *end note*]

19.3.1.9 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
nvGraphicFramePr (§19.3.1.30)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
graphicFrameLocks (Graphic Frame Locks)	§20.1.2.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualGraphicFrameProperties) is located in §A.4.1. *end note*]

19.3.1.10 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGrpSpPr (§19.3.1.31)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
grpSpLocks (Group Shape Locks)	§20.1.2.2.21

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualGroupDrawingShapeProps) is located in §A.4.1. *end note*]

19.3.1.11 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  …
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
    <p:nvPr/>
  </p:nvPicPr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
  …
</p:pic>
```

end example]

Parent Elements
nvPicPr (§19.3.1.32)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
picLocks (Picture Locks)	§20.1.2.2.31

Attributes	Description
preferRelativeResize (Relative Resize Preferred) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size. [*Example*: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked. If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualPictureProperties) is located in §A.4.1. *end note*]

19.3.1.12 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  …
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
    </p:nvPicPr>
    …
  </p:pic>
```

end example]

Parent Elements
nvCxnSpPr (§19.3.1.29); nvGraphicFramePr (§19.3.1.30); nvGrpSpPr (§19.3.1.31); nvPicPr (§19.3.1.32); nvSpPr (§19.3.1.34)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
hlinkClick (Click Hyperlink)	§21.1.2.3.5
hlinkHover (Hyperlink for Hover)	§20.1.2.2.23

Attributes	Description
descr (Alternative Text for Object) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object. If this element is omitted, then no alternative text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">` The descr attribute contains alternative text which can be used in place of the actual DrawingML object. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
hidden (Hidden) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [*Note*: An application can have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden). [*Example*: Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
id (Unique Identifier) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant. [*Example*: Consider a DrawingML object defined as follows: `<… id="10" … >` The id attribute has a value of `10`, which is the unique identifier for this DrawingML object. *end example*] The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).
name (Name) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the name of the object. [*Note*: Typically, this is used to store the original file name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: `< … name="foo.jpg" >` The name attribute has a value of `foo.jpg`, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
title (Title) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the title (caption) of the current DrawingML object. If this attribute is omitted, then no title text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… title="Process Flow Diagram">` *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

.

19.3.1.13 cNvSpPr (Non-Visual Drawing Properties for a Shape)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with

[*Example*: Consider the shape that has a shape lock applied to it.

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 1"/>
    <p:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </p:cNvSpPr>
   </p:nvSpPr>
   …
</p:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. *end example*]

Parent Elements
nvSpPr (§19.3.1.34)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
spLocks (Shape Locks)	§20.1.2.2.34

Attributes	Description
txBox (Text Box) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box. [*Note*: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. *end note*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualDrawingShapeProps) is located in §A.4.1. *end note*]

19.3.1.14 contentPart (Content Part)

This element specifies a reference to XML content in a format not defined by ISO/IEC 29500. [*Note*: This part allows the native use of other commonly used interchange formats, such as:

- MathML (http://www.w3.org/TR/MathML2/)
- SMIL (http://www.w3.org/TR/REC-smil/)
- SVG (http://www.w3.org/TR/SVG11/)

end note]

The relationship type of the explicit relationship specified by this element shall be http://purl.oclc.org/ooxml/officeDocument/relationships/customXml and have a TargetMode attribute value of `Internal`. If an application cannot process content of the content type specified by the targeted part, then it should continue to process the file. If possible, it should also provide some indication that unknown content was not imported.

[*Note*: For better interoperability, only standard XML formats should be used. *end note*]

[*Example*: Consider a PresentationML document which includes the following SMIL markup in a part named smil1.xml:

```
<!--
            Copyright: Copyright 1998-2001 W3C (MIT, INRIA, Keio), All Rights
Reserved.
See http://www.w3.org/Consortium/Legal/.
Author: Aaron Cohen (Intel)
           Version: February 7, 2001
            Module: Animation Module
           Feature: animation
         File Name: animation-add-BE-05.smil
  Media Components: none
 Expected Behavior: Nine red rectangles numbered 1 to 9 shrink to squares
                    over 2s as follows:
                    at 2s #1 shrinks.
                    at 5s #2 shrinks, 1s after #1 completes
                    at 8s #3 shrinks.
                    #4 shrinks when it is clicked on.
                    #5 shrinks 1s after it is clicked on.
                    #6 shrinks 2s after it is clicked on.
                    #7 shrinks when the accesskey '1' is pressed.
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
                    #8 should be shrunk from 0s since it's wallclock time is in
the past.
                    #9 will not shrink unless a DOM call causes it to begin.

```

A Slide Part would reference this content as follows:

```
<p:spTree>
  …
  <p:contentPart r:id="smil01"/>
  …
</p:spTree>
```

The contentPart element specifies that the content targeted by the relationship with an ID of `smil01` is part of the PresentationML document. Examining the contents of the corresponding relationship part item, we can see the targets for that relationship:

```
<Relationships … >
  …
  <Relationship Id="smil01" TargetMode="Internal"
Type="http://purl.oclc.org/ooxml/officeDocument/relationships/customXml"
Target="smil1.xml" />
  …
</Relationships>
```

The corresponding relationship part item shows that the SMIL content is located next to the slide and is named `smil1.xml`. *end example*]

Parent Elements
grpSp (§19.3.1.22); spTree (§19.3.1.45)

Attributes	Description
id (Relationship to	Specifies the relationship ID to a content part.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	[*Example*: Consider an XML element which has the following id attribute: `<… r:id="rId1" />` The markup specifies the associated relationship part with relationship ID `rId1` contains the corresponding relationship information for the parent XML element. *end example*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Rel) is located in §A.3. *end note*]

19.3.1.15 controls (List of controls)

This element specifies a list of embedded controls for the corresponding slide. Custom embedded controls can be embedded on slides.

Parent Elements
cSld (§19.3.1.16)

Child Elements	Subclause
control (Embedded Control)	§19.3.2.1

[*Note*: The W3C XML Schema definition of this element's content model (CT_ControlList) is located in §A.3. *end note*]

19.3.1.16 cSld (Common Slide Data)

This element specifies a container for slide information that is relevant to all of the slide types. All slides share a common set of properties that is independent of the slide type; the description of these properties for any particular slide is stored within the slide's cSld container. Slide data specific to the slide type indicated by the parent element is stored elsewhere.

[*Note*: The actual data in cSld describe only the particular parent slide; it is only the kind of information stored that is common across all slides. *end note*]

[*Example*: Consider the following PresentationML slide

```
<p:sld>
  <p:cSld>
    <p:spTree>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
        …
      </p:spTree>
    </p:cSld>
    …
  </p:sld>
```

As the above example shows, the shape tree of a slide (spTree) is a child element of cSld because all slide types can contain a shape tree. Other slide properties specific to the slide type (such as transitions for sld slides) are specified elsewhere. *end example*]

Parent Elements
handoutMaster (§19.3.1.24); notes (§19.3.1.26); notesMaster (§19.3.1.27); sld (§19.3.1.38); sldLayout (§19.3.1.39); sldMaster (§19.3.1.42)

Child Elements	Subclause
bg (Slide Background)	§19.3.1.1
controls (List of controls)	§19.3.1.15
custDataLst (Customer Data List)	§19.3.1.18
extLst (Extension List)	§19.2.1.12
spTree (Shape Tree)	§19.3.1.45

Attributes	Description
name (Name)	Specifies the slide name property that is used to further identify this unique configuration of common slide data. This might be used to aid in distinguishing different slide layouts or various other slide types. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_CommonSlideData) is located in §A.3. *end note*]

19.3.1.17 custData (Customer Data)

This element specifies customer data which allows for the specifying and persistence of customer specific data within the presentation.

Parent Elements
custDataLst (§19.3.1.18)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	This attribute specifies the relationship id for referencing other resources outside the scope of the current PresentationML file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_CustomerData) is located in §A.3. *end note*]

19.3.1.18 custDataLst (Customer Data List)

This element allows for the specifying of customer defined data within the PresentationML framework. References to custom data or tags can be defined within this list.

Parent Elements
cSld (§19.3.1.16); nvPr (§19.3.1.33); presentation (§19.2.1.26)

Child Elements	Subclause
custData (Customer Data)	§19.3.1.17
tags (Customer Data Tags)	§19.3.1.47

[*Note*: The W3C XML Schema definition of this element's content model (CT_CustomerDataList) is located in §A.3. *end note*]

19.3.1.19 cxnSp (Connection Shape)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector takes. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[*Example*: Consider the following connector shape that connects two regular shapes.

```
<p:spTree>
  …
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
    <p:sp>
      <p:nvSpPr>
        <p:cNvPr id="1" name="Rectangle 1"/>
        <p:cNvSpPr/>
        <p:nvPr/>
      </p:nvSpPr>
      …
    </p:sp>
    <p:sp>
      <p:nvSpPr>
        <p:cNvPr id="2" name="Rectangle 2"/>
        <p:cNvSpPr/>
        <p:nvPr/>
      </p:nvSpPr>
      …
    </p:sp>
    <p:cxnSp>
      <p:nvCxnSpPr>
        <p:cNvPr id="3" name="Elbow Connector 3"/>
        <p:cNvCxnSpPr>
          <a:stCxn id="1" idx="3"/>
          <a:endCxn id="2" idx="1"/>
        </p:cNvCxnSpPr>
        <p:nvPr/>
      </p:nvCxnSpPr>
      …
    </p:cxnSp>
  </p:spTree>
```

end example]

Parent Elements
grpSp (§19.3.1.22); spTree (§19.3.1.45)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§19.3.1.20
nvCxnSpPr (Non-Visual Properties for a Connection Shape)	§19.3.1.29
spPr (Shape Properties)	§19.3.1.44
style (Shape Style)	§19.3.1.46

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_Connector) is located in §A.3. *end note*]

19.3.1.20 extLst (Extension List with Modification Flag)

This element specifies the extension list with modification ability within which all future extensions of element type ext are defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the PresentationML framework. This allows for various new kinds of data to be stored natively within the framework.

[*Note*: Using this extLst element allows the generating application to store whether this extension property has been modified. *end note*]

Parent Elements
cm (§19.4.1); cxnSp (§19.3.1.19); graphicFrame (§19.3.1.21); grpSp (§19.3.1.22); handoutMaster (§19.3.1.24); hf (§19.3.1.25); notes (§19.3.1.26); notesMaster (§19.3.1.27); ph (§19.3.1.36); pic (§19.3.1.37); sld (§19.3.1.38); sldLayout (§19.3.1.39); sldMaster (§19.3.1.42); sp (§19.3.1.43); spTree (§19.3.1.45); timing (§19.3.1.48); transition (§19.3.1.50)

Child Elements	Subclause
ext (Extension)	§19.2.1.11

Attributes	Description
mod (Modify)	This attribute specifies whether the data contained within this element has been modified and should thus be processed again by the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ExtensionListModify) is located in §A.3. *end note*]

19.3.1.21 graphicFrame (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

Parent Elements
grpSp (§19.3.1.22); spTree (§19.3.1.45)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§19.3.1.20
graphic (Graphic Object)	§20.1.2.2.16
nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)	§19.3.1.30
xfrm (2D Transform for Graphic Frame)	§19.3.1.53

Attributes	Description
bwMode (Black and White Mode) Namespace: …/drawingml/2006/main	Specifies how the graphical object should be rendered, using color, black or white, or grayscale. [*Note*: This does not mean that the graphical object itself is stored with only black and white or grayscale information. This attribute instead sets the rendering mode that the graphical object uses. *end note*] The possible values for th is attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

[*Note*: The W3C XML Schema definition of this element's content model (CT_GraphicalObjectFrame) is located in §A.3. *end note*]

19.3.1.22 grpSp (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[*Example*: Consider the following group shape.

```
<p:grpSp>
  <p:nvGrpSpPr>
    <p:cNvPr id="10" name="Group 9"/>
    <p:cNvGrpSpPr/>
    <p:nvPr/>
  </p:nvGrpSpPr>
  <p:grpSpPr>
    <a:xfrm>
      <a:off x="838200" y="990600"/>
      <a:ext cx="2426208" cy="978408"/>
      <a:chOff x="838200" y="990600"/>
      <a:chExt cx="2426208" cy="978408"/>
    </a:xfrm>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
    </p:grpSpPr>
    <p:sp>
      …
    </p:sp>
    <p:sp>
      …
    </p:sp>
    <p:sp>
      …
    </p:sp>
  </p:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. *end example*]

Parent Elements

text bodies. There are other properties within a handout master slide but cSld encompasses the majority of the intended purpose for a handoutMaster slide.

Parent Elements
Root element of PresentationML Handout Master part

Child Elements	Subclause
clrMap (Color Scheme Map)	§19.3.1.6
cSld (Common Slide Data)	§19.3.1.16
extLst (Extension List with Modification Flag)	§19.3.1.20
hf (Header/Footer information for a slide master)	§19.3.1.25

[*Note*: The W3C XML Schema definition of this element's content model (CT_HandoutMaster) is located in §A.3. *end note*]

19.3.1.25 hf (Header/Footer information for a slide master)

This element specifies the header and footer information for a slide. Headers and footers consist of placeholders for text that should be consistent across all slides and slide types, such as a date and time, slide numbering, and custom header and footer text.

Parent Elements
handoutMaster (§19.3.1.24); notesMaster (§19.3.1.27); sldLayout (§19.3.1.39); sldMaster (§19.3.1.42)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§19.3.1.20

Attributes	Description
dt (Date/Time Placeholder)	Specifies whether the Date/Time placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
ftr (Footer Placeholder)	Specifies whether the Footer placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
hdr (Header	Specifies whether the Header placeholder is enabled for this master. If this attribute is

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
Placeholder)	not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sldNum (Slide Number Placeholder)	Specifies whether the slide number placeholder is enabled. If this attribute is not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_HeaderFooter) is located in §A.3. *end note*]

19.3.1.26 notes (Notes Slide)

This element specifies the existence of a notes slide along with its corresponding data. Contained within a notes slide are all the common slide elements along with addition properties that are specific to the notes element.

[*Example*: Consider the following PresentationML notes slide

```
<p:notes>
  <p:cSld>
    …
  </p:cSld>
  …
</p:notes>
```

In the above example a notes element specifies the existence of a notes slide with all of its parts. Notice the cSld element, that specifies the common elements that can appear on any slide type and then any elements specify additional non-common properties for this notes slide. *end example*]

Parent Elements
Root element of PresentationML Notes Slide part

Child Elements	Subclause
clrMapOvr (Color Scheme Map Override)	§19.3.1.7

Attributes	Description
showMasterPhAnim (Show Master Placeholder Animations)	Specifies whether or not to display animations on placeholders from the master slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NotesSlide) is located in §A.3. *end note*]

19.3.1.27 notesMaster (Notes Master)

This element specifies an instance of a handout master slide. Within a handout master slide are contained all elements that describe the objects and their corresponding formatting for within a handout slide. Within a handout master slide the cSld element specifies the common slide elements such as shapes and their attached text bodies. There are other properties within a handout master slide but cSld encompasses the majority of the intended purpose for a handoutMaster slide.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NotesMaster) is located in §A.3. *end note*]

19.3.1.28 notesStyle (Notes Text Style)

This element specifies the text formatting style for the all other text within a notes slide. This formatting is used on all text within the corresponding notes slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the notesStyle element there can be many different style types defined as there are different kinds of text stored within a notes slide.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShapeNonVisual) is located in §A.3. *end note*]

19.3.1.35 otherStyle (Slide Master Other Text Style)

This element specifies the text formatting style for the all other text within a master slide. This formatting is used on all text not covered by the titleStyle or bodyStyle elements within related presentation slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the otherStyle element there can be many different style types defined as there are different kinds of text stored within a slide.

[*Note*: The otherStyle element is to be used for specifying the text formatting of text within a slide shape but not within a text box. Text box styling is handled from within the bodyStyle element. *end note*]

Parent Elements

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextListStyle) is located in §A.4.1. *end note*]

19.3.1.36 ph (Placeholder Shape)

This element specifies that the corresponding shape should be represented by the generating application as a placeholder. When a shape is considered a placeholder by the generating application it can have special properties to alert the user that they can enter content into the shape. Different placeholder types are allowed and can be specified by using the placeholder type attribute for this element.

Parent Elements
nvPr (§19.3.1.33)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§19.3.1.20

Attributes	Description
hasCustomPrompt (Placeholder has custom prompt)	Specifies whether the corresponding placeholder should have a custom prompt or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
idx (Placeholder Index)	Specifies the placeholder index. This is used when applying templates or changing layouts to match a placeholder on one template/master to another. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
orient (Placeholder Orientation)	Specifies the orientation of a placeholder. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).
sz (Placeholder Size)	Specifies the size of a placeholder. The possible values for this attribute are defined by the ST_PlaceholderSize simple type (§19.7.9).
type (Placeholder Type)	Specifies what content type a placeholder is intended to contain. The possible values for this attribute are defined by the ST_PlaceholderType simple type (§19.7.10).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Placeholder) is located in §A.3. *end note*]

19.3.1.37 pic (Picture)

This element specifies the existence of a picture object within the document.

[*Example*: Consider the following PresentationML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
      <p:cNvPicPr>
        <a:picLocks noChangeAspect="1"/>
      </p:cNvPicPr>

[*Note*: The W3C XML Schema definition of this element's content model (CT_Picture) is located in §A.3. *end note*]

19.3.1.38 sld (Presentation Slide)

This element specifies a slide within a slide list. The slide list is used to specify an ordering of slides.

[*Example*: Consider the following custom show with an ordering of slides.

```
  <p:custShowLst>
    <p:custShow name="Custom Show 1" id="0">
      <p:sldLst>
        <p:sld r:id="rId4"/>
        <p:sld r:id="rId3"/>
        <p:sld r:id="rId2"/>
        <p:sld r:id="rId5"/>
      </p:sldLst>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
    </p:custShow>
  </p:custShowLst>
```

In the above example the order specified to present the slides is slide 4, then 3, 2 and finally 5. *end example*]

Parent Elements

timing (Slide Timing Information for a Slide Layout)	§19.3.1.48
transition (Slide Transition for a Slide Layout)	§19.3.1.50

Attributes	Description
show (Show Slide in Slide Show)	Specifies that the current slide should be shown in slide show. If this attribute is omitted then a value of true is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showMasterPhAnim (Show Master Placeholder Animations)	Specifies whether or not to display animations on placeholders from the master slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Slide) is located in §A.3. *end note*]

19.3.1.39 sldLayout (Slide Layout)

This element specifies an instance of a slide layout. The slide layout contains in essence a template slide design that can be applied to any existing slide. When applied to an existing slide all corresponding content should be mapped to the new slide layout.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements

timing (Slide Timing Information for a Slide Layout)	§19.3.1.48
transition (Slide Transition for a Slide Layout)	§19.3.1.50

Attributes	Description
matchingName (Matching Name)	Specifies a name to be used in place of the name attribute within the cSld element. This is used for layout matching in response to layout changes and template applications. The possible values for this attribute are defined by the W3C XML Schema string datatype.
preserve (Preserve Slide Layout)	Specifies whether the corresponding slide layout is deleted when all the slides that follow that layout are deleted. If this attribute is not specified then a value of false should be assumed by the generating application. This would mean that the slide would in fact be deleted if no slides within the presentation were related to it. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showMasterPhAnim (Show Master Placeholder Animations)	Specifies whether or not to display animations on placeholders from the master slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
type (Slide Layout Type)	Specifies the slide layout type that is used by this slide. The possible values for this attribute are defined by the ST_SlideLayoutType simple type (§19.7.15).
userDrawn (Is User Drawn)	Specifies if the corresponding object has been drawn by the user and should thus not be deleted. This allows for the flagging of slides that contain user drawn data.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideLayout) is located in §A.3. *end note*]

19.3.1.40 sldLayoutId (Slide Layout Id)

This element specifies the relationship information for each slide layout that is used within the slide master. The slide master has relationship identifiers that it uses internally for determining the slide layouts that should be used. Then, to resolve what these slide layouts should be the sldLayoutId elements in the sldLayoutIdLst are utilized.

Parent Elements
sldLayoutIdLst (§19.3.1.41)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
id (ID Tag) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship id value that the generating application can use to resolve which slide layout is used in the creation of the slide. This relationship id is used within the relationship file for the master slide to expose the location of the corresponding layout file within the presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
id (ID Tag)	Specifies the identification number that uniquely identifies this slide layout within the presentation file. The possible values for this attribute are defined by the ST_SlideLayoutId simple type (§19.7.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideLayoutIdListEntry) is located in §A.3. *end note*]

19.3.1.41 sldLayoutIdLst (List of Slide Layouts)

This element specifies the existence of the slide layout identification list. This list is contained within the slide master and is used to determine which layouts are being used within the slide master file. Each layout within the

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

list of slide layouts has its own identification number and relationship identifier that uniquely identifies it within both the presentation document and the particular master slide within which it is used.

Parent Elements
sldMaster (§19.3.1.42)

Child Elements	Subclause
sldLayoutId (Slide Layout Id)	§19.3.1.40

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideLayoutIdList) is located in §A.3. *end note*]

19.3.1.42 sldMaster (Slide Master)

This element specifies an instance of a slide master slide. Within a slide master slide are contained all elements that describe the objects and their corresponding formatting for within a presentation slide. Within a slide master slide are two main elements. The cSld element specifies the common slide elements such as shapes and their attached text bodies. Then the txStyles element specifies the formatting for the text within each of these shapes. The other properties within a slide master slide specify other properties for within a presentation slide such as color information, headers and footers, as well as timing and transition information for all corresponding presentation slides.

Parent Elements
Root element of PresentationML Slide Master part

Child Elements	Subclause
clrMap (Color Scheme Map)	§19.3.1.6

Attributes	Description
	assumed by the generating application. This would mean that the slide would in fact be deleted if no slides within the presentation were related to it. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideMaster) is located in §A.3. *end note*]

19.3.1.43 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

[*Note*: Shapes are the preferred mechanism for specifying text on a slide. *end note*]

xfrm (2D Transform for Individual Objects)	§20.1.7.6

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShapeProperties) is located in §A.4.1. *end note*]

19.3.1.45 spTree (Shape Tree)

This element specifies all shape-based objects, either grouped or not, that can be referenced on a given slide. As most objects within a slide are shapes, this represents the majority of content within a slide. Text and effects are attached to shapes that are contained within the spTree element.

[*Example*: Consider the following PresentationML slide

```
<p:sld>
  <p:cSld>
    <p:spTree>
      <p:nvGrpSpPr>
        …
      </p:nvGrpSpPr>
      <p:grpSpPr>
        …
      </p:grpSpPr>
      <p:sp>
        …
      </p:sp>
    </p:spTree>
  </p:cSld>
  …
</p:sld>
```

In the above example the shape tree specifies all the shape properties for this slide. *end example*]

Each shape-based object within the shape tree, whether grouped or not, shall represent one unique level of z-ordering on the slide. The z-order for each shape-based object shall be determined by the lexical ordering of each shape-based object within the shape tree: the first shape-based object shall have the lowest z-order, while the last shape-based object shall have the highest z-order.

The z-ordering of shape-based objects within the shape tree shall also determine the navigation (tab) order of the shape-based objects: the shape-based object with the lowest z-order (the first shape in lexical order) shall be first in navigation order, with objects being navigated in ascending z-order.

[*Example*: Consider the following PresentationML slide with two shapes

```
<p:sld>
  <p:cSld>
    <p:spTree>
      …
      <p:sp>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
          <p:nvSpPr>
            <p:cNvPr id="5" name="Oval 4" />
            …
          </p:nvSpPr>
          …
        </p:sp>
        <p:sp>
          <p:nvSpPr>
            <p:cNvPr id="4" name="Isosceles Triangle 3" />
            …
          </p:nvSpPr>
          …
        </p:sp>
      </p:spTree>
    </p:cSld>
    …
  </p:sld>
```

In the above example the shape with name `Oval 4` has the lowest z-order value since that shape is the first shape in the shape tree. `Oval 4` is also the first shape in navigation order. The shape with name `Isosceles Triangle 3` has the highest z positioning value since that shape is the last shape in the shape tree. `Isosceles Triangle 3` is also the last shape in navigation order. *end example*]

Parent Elements
cSld (§19.3.1.16)

Child Elements	Subclause
contentPart (Content Part)	§19.3.1.14
cxnSp (Connection Shape)	§19.3.1.19
extLst (Extension List with Modification Flag)	§19.3.1.20
graphicFrame (Graphic Frame)	§19.3.1.21
grpSp (Group Shape)	§19.3.1.22
grpSpPr (Group Shape Properties)	§19.3.1.23
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§19.3.1.31
pic (Picture)	§19.3.1.37
sp (Shape)	§19.3.1.43

[*Note*: The W3C XML Schema definition of this element's content model (CT_GroupShape) is located in §A.3. *end note*]

19.3.1.46 style (Shape Style)

This element specifies the style information for a shape. This is used to define a shape's appearance in terms of the preset styles defined by the style matrix for the theme.

[*Example*:

```
<p:style>
  <a:lnRef idx="3">
    <a:schemeClr val="lt1"/>
  </a:lnRef>
  <a:fillRef idx="1">
    <a:schemeClr val="accent3"/>
  </a:fillRef>
  <a:effectRef idx="1">
    <a:schemeClr val="accent3"/>
  </a:effectRef>
  <a:fontRef idx="minor">
    <a:schemeClr val="lt1"/>
  </a:fontRef>
</p:style>
```

The parent shape of the above code is to have an outline that uses the third line style defined by the theme, use the first fill defined by the scheme, and be rendered with the first effect defined by the theme. Text inside the shape is to use the minor font defined by the theme.

end example]

Parent Elements
cxnSp (§19.3.1.19); pic (§19.3.1.37); sp (§19.3.1.43)

19.3.1.47 tags (Customer Data Tags)

This element specifies the existence of customer data in the form of tags. This allows for the storage of customer data within the PresentationML framework. While this is similar to the ext tag in that it can be used store information, this tag mainly focuses on referencing to other parts of the presentation document. This is accomplished via the relationship identification attribute that is required for all specified tags.

Parent Elements
custDataLst (§19.3.1.18)

Attributes	Description
id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	This attribute specifies the relationship identifier for the customer data tag. This allows for a link to a resource that is external from the current XML document but still contained within the presentation document. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TagsData) is located in §A.3. *end note*]

19.3.1.48 timing (Slide Timing Information for a Slide Layout)

This element specifies the timing information for handling all animations and timed events within the corresponding slide. This information is tracked via time nodes within the timing element. More information on the specifics of these time nodes and how they are to be defined can be found within the Animation section of the PresentationML framework.

Parent Elements
sld (§19.3.1.38); sldLayout (§19.3.1.39); sldMaster (§19.3.1.42)

Child Elements	Subclause
bldLst (Build List)	§19.5.14
extLst (Extension List with Modification Flag)	§19.3.1.20
tnLst (Time Node List)	§19.5.87

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideTiming) is located in §A.3. *end note*]

19.3.1.49 titleStyle (Slide Master Title Text Style)

This element specifies the text formatting style for the title text within a master slide. This formatting is used on all title text within related presentation slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within a title style there can be many different style types defined as there are different kinds of text stored within a slide title.

Parent Elements
txStyles (§19.3.1.52)

Child Elements	Subclause
defPPr (Default Paragraph Style)	§21.1.2.2.2
extLst (Extension List)	§20.1.2.2.15
lvl1pPr (List Level 1 Text Style)	§21.1.2.4.13

pull (Pull Slide Transition)	§19.5.58
push (Push Slide Transition)	§19.5.59
random (Random Slide Transition)	§19.5.60
randomBar (Random Bar Slide Transition)	§19.5.61
sndAc (Sound Action)	§19.5.69
split (Split Slide Transition)	§19.5.71
strips (Strips Slide Transition)	§19.5.74
wedge (Wedge Slide Transition)	§19.5.94
wheel (Wheel Slide Transition)	§19.5.95
wipe (Wipe Slide Transition)	§19.5.96
zoom (Zoom Slide Transition)	§19.5.97

Attributes	Description
advClick (Advance on Click)	Specifies whether a mouse click advances the slide or not. If this attribute is not specified then a value of true is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
advTm (Advance after time)	Specifies the time, in milliseconds, after which the transition should start. This setting can be used in conjunction with the advClick attribute. If this attribute is not specified then it is assumed that no auto-advance occurs. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
spd (Transition Speed)	Specifies the transition speed that is to be used when transitioning from the current slide to the next.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_TransitionSpeed simple type (§19.7.54).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideTransition) is located in §A.3. *end note*]

19.3.1.51 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

Parent Elements
sp (§19.3.1.43)

Child Elements	Subclause
bodyPr (Body Properties)	§21.1.2.1.1
lstStyle (Text List Styles)	§21.1.2.4.12
p (Text Paragraphs)	§21.1.2.2.6

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextBody) is located in §A.4.1. *end note*]

19.3.1.52 txStyles (Slide Master Text Styles)

This element specifies the text styles within a slide master. Within this element is the styling information for title text, the body text and other slide text as well. This element is only for use within the Slide Master and thus sets the text styles for the corresponding presentation slides.

[*Example*: Consider the case where we would like to specify the title text for a master slide.

```
<p:txStyles>
  <p:titleStyle>
    <a:lvl1pPr algn="ctr" rtl="0" latinLnBrk="0">
      <a:spcBef>
        <a:spcPct val="0"/>
      </a:spcBef>
      <a:buNone/>
      <a:defRPr sz="4400" kern="1200">
        <a:solidFill>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
            <a:schemeClr val="tx1"/>
          </a:solidFill>
          <a:latin typeface="+mj-lt"/>
          <a:ea typeface="+mj-ea"/>
          <a:cs typeface="+mj-cs"/>
        </a:defRPr>
      </a:lvl1pPr>
    </p:titleStyle>
  </p:txStyles>
```

In the above example the title text is set according to the above formatting for all related slides within the presentation. *end example*]

Parent Elements
sldMaster (§19.3.1.42)

Child Elements	Subclause
bodyStyle (Slide Master Body Text Style)	§19.3.1.5
extLst (Extension List)	§19.2.1.12
otherStyle (Slide Master Other Text Style)	§19.3.1.35
titleStyle (Slide Master Title Text Style)	§19.3.1.49

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideMasterTextStyles) is located in §A.3. *end note*]

19.3.1.53 xfrm (2D Transform for Graphic Frame)

This element specifies the transform to be applied to the corresponding graphic frame. This transformation is applied to the graphic frame just as it would be for a shape or group shape.

Parent Elements
graphicFrame (§19.3.1.21)

Child Elements	Subclause
ext (Extents)	§20.1.7.3
off (Offset)	§20.1.7.4

Attributes	Description
flipH (Horizontal	Specifies a horizontal flip. When true, this attribute defines that the shape is flipped

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
Flip) Namespace: http://purl.oclc.org/ooxml/drawingml/main	horizontally about the center of its bounding box. [*Example*: The following illustrates the effect of a horizontal flip. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
flipV (Vertical Flip) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box. [*Example*: The following illustrates the effect of a vertical flip. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rot (Rotation) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Transform2D) is located in §A.4.1. *end note*]

19.3.2 Embedded Objects

Within the slides portion of PresentationML, there are the embedded elements. These are objects that can be embedded within a slide. As we defined a slide to be a container it can be seen that it does not just contain shapes, pictures and text but embedded objects as well that are not necessarily native to the PresentationML platform.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

19.3.2.1 control (Embedded Control)

This element specifies the existence of an embedded control in the slide.

Parent Elements
controls (§19.3.1.15)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12
pic (Picture)	§19.3.1.37

Attributes	Description
id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship id that is used to identify this Embedded object from within a slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
imgH (Image Height)	Specifies the height of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42).
imgW (Image Width)	Specifies the width of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42).
name (Embedded Object Name)	Specifies the identifying name class used by scripting languages. This name is also used to construct the clipboard name. The possible values for this attribute are defined by the W3C XML Schema string datatype.
showAsIcon (Show Embedded Object As Icon)	Specifies whether the Embedded object shows as an icon or using its native representation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Control) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

19.3.2.2 embed (Embedded Object or Control)

This element specifies an Embedded object or Control that is embedded within the presentation.

Parent Elements
oleObj (§19.3.2.4)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
followColorScheme (Color Scheme Properties for Embedded object)	Specifies the Color Scheme Properties for the corresponding Embedded object being specified. The possible values for this attribute are defined by the ST_OleObjectFollowColorScheme simple type (§19.7.6).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OleObjectEmbed) is located in §A.3. *end note*]

19.3.2.3 link (Linked Object or Control)

This element specifies a link to an external Embedded object or Control.

Parent Elements
oleObj (§19.3.2.4)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
updateAutomatic (Update Linked Embedded Objects Automatically)	This attribute determines if linked embedded objects are automatically updated when the presentation is opened or printed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_OleObjectLink) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

19.3.2.4 oleObj (Global Element for Embedded objects and Controls)

This element specifies a global element to be used for an Embedded object and Control.

When the oleObject element contains a pic child element, the identifier specified by the pic/nvPicPr/cNvPr@id attribute shall be ignored and the identifier specified by the graphicFrame/nvGraphicFramePr/cNvPr@id attribute shall be used when deciding which identifier to use for the OLE object.

Child Elements	Subclause
embed (Embedded Object or Control)	§19.3.2.2
link (Linked Object or Control)	§19.3.2.3
pic (Picture)	§19.3.1.37

Attributes	Description
id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship id that is used to identify this Embedded object from within a slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
imgH (Image Height)	Specifies the height of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42).
imgW (Image Width)	Specifies the width of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42).
name (Embedded Object Name)	Specifies the identifying name class used by scripting languages. This name is also used to construct the clipboard name. The possible values for this attribute are defined by the W3C XML Schema string datatype.
progId (Embedded Object ProgID)	Specifies the progid for an Embedded object. The possible values for this attribute are defined by the W3C XML Schema string datatype.
showAsIcon (Show Embedded Object As Icon)	Specifies whether the Embedded object shows as an icon or using its native representation. The possible values for this attribute are defined by the W3C XML Schema boolean

Attributes	Description
	datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_OleObject) is located in §A.3. *end note*]

19.3.3 Programmable Tags

Within the slides portion of PresentationML there are the tag elements. These are extensibility names and values that assist in the storage of legacy variables from older file formats.

19.3.3.1 tag (Programmable Extensibility Tag)

This element specifies a programmable extensibility tag to be used for storage of legacy variables.

Parent Elements
tagLst (§19.3.3.2)

Attributes	Description
name (Name)	Specifies the name associated with this specific programmable tag. The possible values for this attribute are defined by the W3C XML Schema string datatype.
val (Value)	Specifies the value associated with this specific programmable tag. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_StringTag) is located in §A.3. *end note*]

19.3.3.2 tagLst (Programmable Tab List)

This element specifies the list of programmable extensibility tags that are used to store variables from legacy file formats.

Parent Elements
Root element of PresentationML User-Defined Tags part

Child Elements	Subclause
tag (Programmable Extensibility Tag)	§19.3.3.1

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_TagList) is located in §A.3. *end note*]

19.4 Comments

A comment is a text note attached to a slide, with the primary purpose of allowing readers of a presentation to provide feedback to the presentation author. Each comment contains an unformatted text string and information about its author, and is attached to a particular location on a slide. Comments can be visible while editing the presentation, but do not appear when a slide show is given. The displaying application decides when to display comments and determines their visual appearance.

19.4.1 cm (Comment)

This element specifies a single comment attached to a slide. It contains the text of the comment, its position on the slide, and attributes referring to its author and date.

[*Example:*

```
<p:cm authorId="0" dt="2006-08-28T17:26:44.129" idx="1">
  <p:pos x="10" y="10"/>
  <p:text>Add diagram to clarify.</p:text>
</p:cm>
```

end example]

Parent Elements
cmLst (§19.4.4)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§19.3.1.20
pos (Comment Position)	§19.4.5
text (Comment's Text Content)	§19.4.6

Attributes	Description
authorId (Comment Author ID)	This attribute specifies the author of the comment. It refers to the ID of an author in the comment author list for the document. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
dt (Comment Date/Time)	This attribute specifies the date and time this comment was last modified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.
idx (Comment Index)	This attribute specifies an identifier for this comment that is unique within a list of all comments by this author in this document. An author's first comment in a document has index 1. [*Note:* Because the index is unique only for the comment author, a document can contain multiple comments with the same index created by different authors. *end note*] The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Comment) is located in §A.3. *end note*]

19.4.2 cmAuthor (Comment Author)

This element specifies a single author with comments in the document. It contains a unique author ID, the author's name and initials, the index of the author's last comment, and the index of a color associated with the author.

[*Example:*

```
<p:cmAuthor id="0" name="Julie Lee" initials="JL" lastIdx="1" clrIdx="0"/>
```

end example]

Parent Elements
cmAuthorLst (§19.4.3)

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
clrIdx (Comment Author Color Index)	This attribute specifies an index into the generating application's comments color table to allow for visual (color) differentiation of different author's comments. This color is used for all comments by this author. If more authors exist than there are entries in the color table, the color index wraps around to the beginning of the table. [*Note:* It is left entirely up to the generating application to determine the amount of colors used in the comments color table and in what order these are used when rendering comments on a slide surface. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
id (Comment Author ID)	This attribute specifies a unique (within the document) zero-based identifier that refers to a single comment author. [*Note:* The method of generating an author id is determined by the application and need not be sequential, provided each id is unique within the list of comment authors for the document. *end note*] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
initials (Comment Author Initials)	This attribute specifies a string that represents the initials of this particular author. The value is not necessarily unique. It is intended for use by the application as an abbreviated version of the comment author's name. The possible values for this attribute are defined by the ST_Name simple type (§19.7.5).
lastIdx (Index of Comment Author's last comment)	Index of the last comment added to this document by this author. New comments by this author are counted starting with the value one greater than this index. [*Note:* The index of a deleted comment is not reused; therefore, this value is not an accurate count of the total number of comments by the author. *end note*] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
name (Comment Author Name)	This attribute specifies the full name of this particular author. As a string, it has no security or authentication data. This value is not guaranteed to be unique across all document authors. The possible values for this attribute are defined by the ST_Name simple type (§19.7.5).

[*Note*: The W3C XML Schema definition of this element's content model (CT_CommentAuthor) is located in §A.3. *end note*]

19.4.3 cmAuthorLst (List of Comment Authors)

This element specifies a list of authors with comments in the current document. Each comment in a document shall refer to an author in this list. To determine if a new author is in this list, the author's name and initials shall both match; otherwise, the new author is considered unique and a separate cmAuthor element is added.

[*Example:* A document contains comments left by two authors.

```
<p:cmAuthorLst>
    <p:cmAuthor id="0" name="Julie Lee" initials="JL" lastIdx="1" clrIdx="0"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
    <p:cmAuthor id="1" name="Fred Jones" initials="FJ" lastIdx="2" clrIdx="1"/>
</p:cmAuthorLst>
```

end example]

Parent Elements
Root element of PresentationML Comment Authors part

Child Elements	Subclause
cmAuthor (Comment Author)	§19.4.2

[*Note*: The W3C XML Schema definition of this element's content model (CT_CommentAuthorList) is located in §A.3. *end note*]

19.4.4 cmLst (Comment List)

This element specifies a list of comments for a particular slide.

[*Example:* A slide contains two comments, each left by a different author. This example demonstrates that two comments can have the same index if they are created by different authors.

```
<p:cmLst>
    <p:cm authorId="0" dt="2006-08-28T17:26:44.129" idx="1">

Parent Elements
Root element of PresentationML Comments part

Child Elements	Subclause
cm (Comment)	§19.4.1

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_CommentList) is located in §A.3. *end note*]

19.4.5 pos (Comment Position)

This element specifies the positioning information for the placement of a comment on a slide surface. In LTR versions of the generating application, this position information should refer to the upper left point of the comment shape. In RTL versions of the generating application, this position information should refer to the upper right point of the comment shape.

[*Note:* The anchoring point on the slide surface is unaffected by a right-to-left or left-to-right layout change. That is the anchoring point remains the same for all language versions. *end note*]

[*Note:* Because there is no specified size or formatting for comments, this UI widget used to display a comment can be any size and thus the lower right point of the comment shape is determined by how the viewing application chooses to display comments. *end note*]

[*Example:*

```
<p:pos x="1426" y="660"/>
```

end example]

Parent Elements
cm (§19.4.1)

Attributes	Description
x (X-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
y (Y-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawing	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
ml/main	<… x="0" y="100" /> The y attribute defines a y-coordinate of 100. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Point2D) is located in §A.4.1. *end note*]

19.4.6 text (Comment's Text Content)

This element specifies the content of a comment. This is the text with which the author has annotated the slide.

[*Example:*

```
<p:text>Add diagram to clarify.</p:text>
```

end example]

The possible values for this element are defined by the W3C XML Schema string datatype.

Parent Elements
cm (§19.4.1)

19.5 Animation

The Animation section of the PresentationML framework stores the movement and related information of objects.

This schema is loosely based on the syntax and concepts from the Synchronized Multimedia Integration Language (SMIL), a W3C Recommendation for describing multimedia presentations using XML.

The schema describes all the animations effects that reside on a slide and also the animation that occurs when going from slide to slide (slide transition).

Animations on a slide are inherently time-based and consist of an animation effects on an object or text. Slide transitions however do not follow this concept and always appear before any animation on a slide.

All elements described in this schema are contained within the slide XML file. More specifically they are in the <transition> and the <timing> element as shown below:

```
<p:sld>
  <p:cSld> … </p:cSld>
  <p:clrMapOvr> … </p:clrMapOvr>
  <p:transition> … </p:transition>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
    <p:timing> … </p:timing>
  </p:sld>
```

19.5.1 anim (Animate)

This element is a generic animation element that requires little or no semantic understanding of the attribute being animated. It can animate text within a shape or even the shape itself.

[*Example*: Consider trying to emphasize text within a shape by changing the size of its font by 150%. The <anim> element should be used as follows:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1">
        <p:txEl>
          <p:charRg st="1" end="4"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>style.fontSize</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:anim>
```

end example]

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§19.5.22
tavLst (Time Animated Value List)	§19.5.80

Attributes	Description
by (By)	This attribute specifies a relative offset value for the animation with respect to its position before the start of the animation. The possible values for this attribute are defined by the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
calcmode (Calculation Mode)	This attribute specifies the interpolation mode for the animation. The possible values for this attribute are defined by the ST_TLAnimateBehaviorCalcMode simple type (§19.7.20).
from (From)	This attribute specifies the starting value of the animation. The possible values for this attribute are defined by the W3C XML Schema string datatype.
to (To)	This attribute specifies the ending value for the animation as a percentage. The possible values for this attribute are defined by the W3C XML Schema string datatype.
valueType (Value Type)	This attribute specifies the type of property value. The possible values for this attribute are defined by the ST_TLAnimateBehaviorValueType simple type (§19.7.21).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimateBehavior) is located in §A.3. *end note*]

19.5.2 animClr (Animate Color Behavior)

This animation element is responsible for animating the color of an object.

[*Example*: Consider trying to emphasize a shape by changing its fill color to scheme color accent2. The <animClr> element should be used as follows:

```
<p:animClr clrSpc="rgb">
  <p:cBhvr>
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>fillcolor</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:to>
    <a:schemeClr val="accent2"/>
  </p:to>
</p:animClr>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
by (By)	§19.5.20
cBhvr (Common Behavior)	§19.5.22
from (From)	§19.5.43
to (To)	§19.5.90

Attributes	Description
clrSpc (Color Space)	This attribute specifies the color space in which to interpolate the animation. Values for example can be HSL & RGB. The values for from/to/by/etc. can still be specified in any supported color format without affecting the color space within which the animation happens. The RGB color space is best used for doing animations between two different colors since it doesn't require going through any other hues between the two colors specified. The HSL space is useful for animating through a rainbow of colors or for modifying just the saturation by 30% for example. The possible values for this attribute are defined by the ST_TLAnimateColorSpace simple type (§19.7.23).
dir (Direction)	This attribute specifies which direction to cycle the hue around the color wheel. Values are clockwise or counter clockwise. Default is clockwise. The possible values for this attribute are defined by the ST_TLAnimateColorDirection simple type (§19.7.22).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimateColorBehavior) is located in §A.3. *end note*]

19.5.3 animEffect (Animate Effect)

This animation behavior provides the ability to do image transform/filter effects on elements. Some visual effects are dynamic in nature and have a progress that animates from 0 to 1 over a period of time to do visual transitions between hidden and visible states. Other filters are static and apply a effects like a blur or drop-shadow which aren't inherently time-based.

[*Example*: Consider trying to emphasize a shape by creating an entrance animation using a "blinds" motion.

```
<p:animEffect transition="in" filter="blinds(horizontal)">
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
    <p:cBhvr>
      <p:cTn id="7" dur="500"/>
      <p:tgtEl>
        <p:spTgt spid="4"/>
      </p:tgtEl>
    </p:cBhvr>
  </p:animEffect>
```

end example]

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§19.5.22
progress (Progress)	§19.5.57

Attributes	Description
filter (Filter)	This attribute specifies the animation types and subtypes to be used for the effect. Multiple animations are allowed to be listed so that in the event that a superseding animation (leftmost) cannot be rendered, a fallback animation is available. That is, the rendering application parses the list from left to right until a supported animation is found. The syntax used for the filter attribute value is as follows: "type(subtype);type(subtype)". Subtype can be a string value such as "fromLeft" or a numerical value depending on the type specified. Reserved Animation Types(subtypes):

Value	Description
blinds(horizontal)	blinds(vertical)	
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description	
	box(in)		box(out)		checkerboard(across)		checkerboard(down)		circle		diamond		dissolve		fade		slide(fromTop)		slide(fromBottom)	
	slide(fromLeft)	
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description	
	slide(fromRight)		plus(in)		plus(out)		barn(inVertical)	
	barn(inHorizontal)		barn(outVertical)		barn(outHorizontal)		randomBars(horizontal)		randomBars(vertical)		strips(downLeft)		strips(upLeft)	

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description	
	strips(downRight)		strips(upRight)		wedge		wheel(1)		wheel(2)	
	wheel(3)	
	wheel(4)		wheel(8)		wipe(right)		wipe(left)	
	wipe(down)	
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	wipe(up) 	[*Note:* The renderings shown above are for example purposes only. Exact rendering of any animation is determined by the rendering application. As such, the same animation can have many variations, depending on the implementation. More detail for each rendering above can be found in transition (§19.3.1.50). *end note*]

	[*Example*: Consider the following animation effect:
	
	`<p:animEffect transition="in" filter="blinds(horizontal);blinds(vertical)">`
	`  <p:cBhvr>`
	`  <p:cTn id="7" dur="500"/>`
	`  <p:tgtEl>`
	`  <p:spTgtspid="5"/>`
	`  </p:tgtEl>`
	`  </p:cBhvr>`
	`</p:animEffect>`
	
	There are two animation filters shown in this example. The first is the blinds (horizontal), which the rendering application is to use as the primary animation effect. If, however, the rendering application does not support this animation, the blinds (vertical) animation is used. In this example there are only two animation filters listed, a primary and a fallback, but it is possible to list multiple fallback filters using the syntax defined above.
	
	end example]
	
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

prLst (Property List)	This attribute specifies a list of properties that coincide with the effect specified. Although there are many animation types allowed, this attribute allows the setting of specific property settings in order to describe an even wider variety of animation types. The syntax used for the prLst attribute value is as follows: “name:value;name:value”. When multiple animation types are listed in the filter attribute, the rendering application attempts to apply each property value even though some might not apply to it. Reserved Names(values): • opacity (float values of 0.0 - 1.0) [*Example*: Consider the following animation effect:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	<p:animEffect filter="image" prLst="opacity: 0.5"> <p:cBhvr rctx="IE"> <p:cTn id="7" dur="indefinite"/> <p:tgtEl> <p:spTgtspid="3"/> </p:tgtEl> </p:cBhvr> </p:animEffect> The animation filter specified is an image filter type that has a specific property called opacity set to a value of 0.5. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
transition (Transition)	This attribute specifies whether to transition the element in or out or treat it as a static filter. The values are "none", "in" and "out", and the default value is "in". When a value of "in" is specified, the element is not visible at the start of the animation and is completely visible be the end of the duration. When "out" is specified, the element is visible at the start and not visible at the end of the effect. This visibility is in addition to the effect of setting CSS visibility or display attributes. The possible values for this attribute are defined by the ST_TLAnimateEffectTransition simple type (§19.7.24).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimateEffectBehavior) is located in §A.3. *end note*]

19.5.4 animMotion (Animate Motion)

Animate motion provides an abstracted way to move positioned elements. It provides the ability to specify from/to/by motion as well as to use more detailed path descriptions for motion over polylines or bezier curves.

[*Example*: Consider animating a shape from its original position to the right.. The <animMotion> element should be used as follows:

```
<p:animMotion origin="layout" path="M 0 0 L 0.25 0 E" pathEditMode="relative">
  <p:cBhvr>
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1"/>
    </p:tgtEl>
    <p:attrNameLst>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
        <p:attrName>ppt_x</p:attrName>
        <p:attrName>ppt_y</p:attrName>
      </p:attrNameLst>
    </p:cBhvr>
  </p:animMotion>
```

end example]

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
by (By)	§19.5.21
cBhvr (Common Behavior)	§19.5.22
from (From)	§19.5.44
rCtr (Rotation Center)	§19.5.62
to (To)	§19.5.88

Attributes	Description
origin (Origin)	Specifies what the origin of the motion path is relative to such as the layout of the slide, or the parent. The possible values for this attribute are defined by the ST_TLAnimateMotionBehaviorOrigin simple type (§19.7.25).
path (Path)	Specifies the path primitive followed by coordinates for the animation motion. The allowed values that are understood within a path are as follows: M = move to, L = line to, C = curve to, Z=close loop, E=end UPPERCASE = absolute coords, lowercase = relative coords Thus total allowed set = {M,L,C,Z,E,m,l,c,z,e) [*Example*: The following string is a sample path. path: “M 0 0 L 1 1 c 1 2 3 4 4 4 Z” *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
pathEditMode (Path Edit Mode)	This attribute specifies how the motion path moves when the target element is moved. The possible values for this attribute are defined by the ST_TLAnimateMotionPathEditMode simple type (§19.7.26).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
ptsTypes (Points Types)	This attribute describes the point type of the points in the path attribute. The allowed values that are understood for the ptsTypes attribute are as follows: A = Auto, F = Corner, T = Straight, S = Smooth UPPERCASE = Straight Line follows point, lowercase = curve follows point. Thus, the total allowed set = {A,F,T,S,a,f,t,s} The possible values for this attribute are defined by the W3C XML Schema string datatype.
rAng (Relative Angle)	The attribute describes the relative angle of the motion path. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimateMotionBehavior) is located in §A.3. *end note*]

19.5.5 animRot (Animate Rotation)

This animation element is responsible for animating the rotation of an object. Rotation values set in the "by" , "to, and "from" attributes are specified in degrees measured to a 60,000th, i.e 1 degree is 60,000. Rotation values can be larger than 360°.

The sign of the rotation angle specifies the direction for rotation. A negative rotation specifies that the rotation should appear in the host to go counter-clockwise".

[*Example*: Consider trying to emphasize a shape by rotating it 360 degrees clockwise. The <animRot> element should be used as follows:

```
<p:animRot by="21600000">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="5"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>r</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:animRot>
```

end example]

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§19.5.22

Attributes	Description
by (By)	This attribute describes the relative offset value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).
from (From)	This attribute describes the starting value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).
to (To)	This attribute describes the ending value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimateRotationBehavior) is located in §A.3. *end note*]

19.5.6 animScale (Animate Scale)

This animation element is responsible for animating the scale of an object. When animating the scale, the element shall scale around the reference point of the element and the positioning system used should be consistent with the one used for motion paths. When animating the width and height of an element, all of the width/height animation values are calculated first then the scale animations are applied on top of that. So for example, an animation from 0 to 100 of the width with a concurrent scale from 100% to 200% would result in the element appearing to scale from 0 to 200.

[*Example*: Consider trying to emphasize a shape by scaling it larger by 150%. The <animScale> element should be used as follows:

```
<p:childTnLst>
  <p:animScale>
    <p:cBhvr>
      <p:cTn id="6" dur="2000" fill="hold"/>
      <p:tgtEl>
        <p:spTgt spid="5"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
        </p:tgtEl>
      </p:cBhvr>
      <p:by x="150000" y="150000"/>
    </p:animScale>
  </p:childTnLst>
```

end example]

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
by (By)	§19.5.21
cBhvr (Common Behavior)	§19.5.22
from (From)	§19.5.44
to (To)	§19.5.88

Attributes	Description
zoomContents (Zoom Content)	This attribute specifies whether to zoom the contents of an object when doing a scaling animation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimateScaleBehavior) is located in §A.3. *end note*]

19.5.7 attrName (Attribute Name)

This element is used to contain an attribute value for an Attribute Name List. This value defines the specific attribute that an animation should be applied to, such as fill, style, and shadow, etc. A specific property is defined by using a "property.sub-property" format which is often extended to multiple sub properties as seen in the allowed values below.

Allowed property values:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

style.opacity, style.rotation, style.visibility, style.color, style.fontSize, style.fontWeight, style.fontStyle, style.fontFamily, style.textEffectEmboss, style.textShadow, style.textTransform, style.textDecorationUnderline, style.textEffectOutline, style.textDecorationLineThrough, style.sRotation, imageData.cropTop, imageData.cropBottom, imageData.cropLeft, imageData.cropRight, imageData.cropRight, imageData.gain, imageData.blacklevel, imageData.gamma, imageData.grayscale, imageData.chromakey, fill.on, fill.type, fill.color, fill.opacity, fill.color2, fill.method, fill.opacity2, fill.angle, fill.focus, fill.focusposition.x, fill.focusposition.y, fill.focussize.x, fill.focussize.y, stroke.on, stroke.color, stroke.weight, stroke.opacity, stroke.linestyle, stroke.dashstyle, stroke.filltype, stroke.src, stroke.color2, stroke.imagesize.x, stroke.imagesize.y, stroke.startArrow, stroke.endArrow, stroke.startArrowWidth, stroke.startArrowLength, stroke.endArrowWidth, stroke.endArrowLength, shadow.on, shadow.type, shadow.color, shadow.color2, shadow.opacity, shadow.offset.x, shadow.offset.y, shadow.offset2.x, shadow.offset2.y, shadow.origin.x, shadow.origin.y, shadow.matrix.xtox, shadow.matrix.ytox, shadow.matrix.xtox, shadow.matrix.ytoy, shadow.matrix.perspectiveX, shadow.matrix.perspectiveY, skew.on, skew.offset.x, skew.offset.y, skew.origin.x, skew.origin.y, skew.matrix.xtox, skew.matrix.ytox, skew.matrix.xtox, skew.matrix.ytoy, skew.matrix.perspectiveX, skew.matrix.perspectiveY, extrusion.on, extrusion.type, extrusion.render, extrusion.viewpointorigin.x, extrusion.viewpointorigin.y, extrusion.viewpoint.x, extrusion.viewpoint.y, extrusion.viewpoint.z, extrusion.plane, extrusion.skewangle, extrusion.skewamt, extrusion.backdepth, extrusion.foredepth, extrusion.orientation.x, extrusion.orientation.y, extrusion.orientation.z, extrusion.orientationangle, extrusion.color, extrusion.rotationangle.x, extrusion.rotationangle.y, extrusion.lockrotationcenter, extrusion.autorotationcenter, extrusion.rotationcenter.x, extrusion.rotationcenter.y, extrusion.rotationcenter.z, and extrusion.colormode.

[*Example*: Consider trying to emphasize the txt font size within the body of a shape. The attribute would be 'style.fontSize' and this can be done by doing the following:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="4294967295" end="4294967295"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
```

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLBehaviorAttributeNameList) is located in §A.3. *end note*]

19.5.9 audio (Audio)

This element is used to include audio during an animation. This element specifies that this node within the animation tree triggers the playback of an audio file; the actual audio file used is specified by the sndTgt element (§19.5.70).

[*Example*: Consider adding applause sound to an animation sequence. The audio element is used as follows:

```
<p:cTn …>
  <p:stCondLst>…</p:stCondLst>
  <p:childTnLst>…</p:childTnLst>
  <p:subTnLst>
    <p:audio>
      <p:cMediaNode vol="50%">…
        <p:tgtEl>
          <p:sndTgt r:embed="rId2" />
        </p:tgtEl>
      </p:cMediaNode>
    </p:audio>
  </p:subTnLst>
</p:cTn>
```

The audio element specifies the location of the audio playback within the animation; its child sndTgt element specifies that the audio to be played is the target of the relationship with ID `rId2`.

end example]

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
cMediaNode (Common Media Node Properties)	§19.5.29

Attributes	Description
isNarration (Is Narration)	This attribute indicates whether the audio is a narration for the slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLMediaNodeAudio) is located in §A.3. *end note*]

19.5.10 bg (Background)

This element is used to specify animating the background of an object.

[*Example*: Consider adding animation to the background of Shape Id 3. The <bg> tag can be used as follows:

```
<p:tgtEl>
  <p:spTgt spid="3">
    <p:bg/>
  </p:spTgt>
</p:tgtEl>
```

end example]

Parent Elements
spTgt (§19.5.72)

[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.3. *end note*]

19.5.11 bldAsOne (Build As One)

This element specifies in the build list to build the entire graphical object as one entity.

[*Example*: Consider having a graph appear as on entity as opposed to by category. The <bldAsOne> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldAsOne/>
  </p:bldGraphic>
</p:bldLst>
```

end example]

Parent Elements
bldGraphic (§19.5.13)

[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.3. *end note*]

19.5.12 bldDgm (Build Diagram)

This element specifies how to build the animation for a diagram.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*: Consider the following example where a chart is specified to be animated by category rather than as one entity. Thus, the bldChart element should be used as follows:

```
<p:bdldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

Parent Elements
bldLst (§19.5.14)

Attributes	Description
bld (Diagram Build Types)	This attribute describes how the diagram is built. The animation animates the sub-elements in the container in the particular order defined by this attribute. The possible values for this attribute are defined by the ST_TLDiagramBuildType simple type (§19.7.33).
grpId (Group ID)	This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
spid (Shape ID)	This attribute describes the shape to which the build applies. The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).
uiExpand (Expand UI)	This attribute describes the view option indicating if the build should be displayed expanded. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLBuildDiagram) is located in §A.3. *end note*]

19.5.13 bldGraphic (Build Graphics)

This element specifies how to build a graphical element.

[*Example*: Consider having a chart graphical element appear as a whole as opposed to by a category. The <bldGraphic> element should be used as follows:

```
<p:bldLdst>
  <p:bldGraphic spid="3" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

Parent Elements
bldLst (§19.5.14)

Child Elements	Subclause
bldAsOne (Build As One)	§19.5.11
bldSub (Build Sub Elements)	§19.5.17

Attributes	Description
grpId (Group ID)	This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
spid (Shape ID)	This attribute describes the shape to which the build applies. The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).
uiExpand (Expand UI)	This attribute describes the view option indicating if the build should be displayed expanded. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

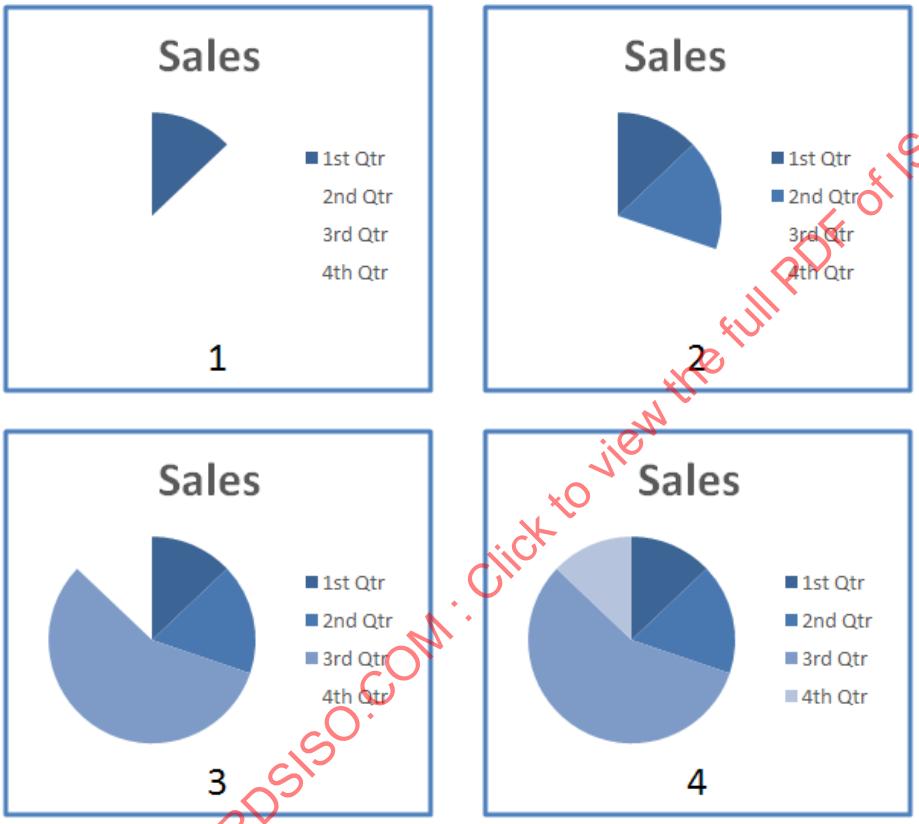
[*Note*: The W3C XML Schema definition of this element's content model (CT_TLGraphicalObjectBuild) is located in §A.3. *end note*]

19.5.14 bldLst (Build List)

This element specifies the list of graphic elements to build. This refers to how the different sub-shapes or sub-components of a object are displayed. The different objects that can have build properties are text, diagrams, and charts.

[*Example*: Consider animating a pie chart but based on category as shown below:



The <bldList> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="1" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

Attributes	Description
	attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
spid (Shape ID)	This attribute describes the shape to which the build applies. The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).
uiExpand (Expand UI)	This attribute describes the view option indicating if the build should be displayed expanded. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLOleBuildChart) is located in §A.3. *end note*]

19.5.16 bldP (Build Paragraph)

This element specifies how to build paragraph level properties.

[*Example*: Consider having animation applied only to 1st level paragraphs. The <bldP> element should be used as follows:

```
<p:bldLst>
  <p:bldP spid="3" grpId="0" build="p"/>
</p:bldLst>
```

end example]

Parent Elements
bldLst (§19.5.14)

Child Elements	Subclause
tmplLst (Template effects)	§19.5.85

Attributes	Description
advAuto (Auto Advance Time)	This attribute specifies time after which to automatically advance the build to the next step.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).
animBg (Animate Background)	This attribute indicates whether to animate the background of the shape associated with the text. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
autoUpdateAnimBg (Auto Update Animation Background)	This attribute indicates whether to automatically update the "animateBg" setting to true when the shape associated with the text has a fill or line. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
bldLvl (Build Level)	This attribute describes the build level for the paragraph. It is only supported in paragraph type builds i.e the build attribute shall also be set to "byParagraph" for this attribute to apply. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
build (Build Types)	This attribute describe the build types. The possible values for this attribute are defined by the ST_TLParaBuildType simple type (§19.7.36).
grpId (Group ID)	This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rev (Reverse)	This attribute is only supported in paragraph type builds. This specifies the direction of the build relative to the order of the elements in the container. When this is set to "true", the animations for the paragraphs are persisted in reverse order to the order of the paragraphs themselves such that the last paragraph animates first. Default value is "false". The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
spid (Shape ID)	This attribute describes the shape to which the build applies. The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
uiExpand (Expand UI)	This attribute describes the view option indicating if the build should be displayed expanded. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLBuildParagraph) is located in §A.3. *end note*]

19.5.17 bldSub (Build Sub Elements)

This element specifies the animation properties of a graphical object's sub-elements.

[*Example*: Consider applying animation to a graphical element consisting of a diagram. The <bldSub> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="5" grpId="0">
    <p:bldSub>
      <a:bldDgm bld="one"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

Parent Elements
bldGraphic (§19.5.13)

Child Elements	Subclause
bldChart (Build Chart)	§20.1.2.2.1
bldDgm (Build Diagram)	§20.1.2.2.2

[*Note*: The W3C XML Schema definition of this element's content model (CT_AnimationGraphicalObjectBuildProperties) is located in §A.4.1. *end note*]

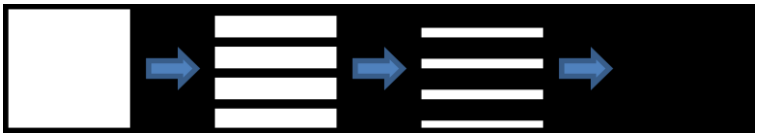
19.5.18 blinds (Blinds Slide Transition)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

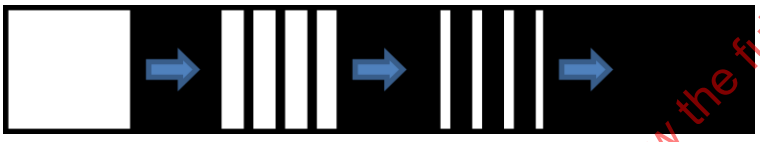
This element describes the blinds slide transition effect, which uses a set of horizontal or vertical bars and wipes them either left-to-right or top-to-bottom, respectively, until the new slide is fully shown. The rendering of this transition depends upon the attributes specified.

[*Example*: Consider the following cases in which the “blinds” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:blinds dir="horz"/>
</p:transition>
```



```
<p:transition>
  <p:blinds dir="vert"/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).

[*Note*: The W3C XML Schema definition of this element’s content model (CT_OrientationTransition) is located in §A.3. *end note*]

19.5.19 boolVal (Boolean Variant)

This element specifies a boolean value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

Parent Elements
progress (§19.5.57); to (§19.5.89); val (§19.5.92)

Attributes	Description
val (Value)	This attribute specifies the boolean value that this element contains and that should be used in evaluating this element. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimVariantBooleanVal) is located in §A.3. *end note*]

19.5.20 by (By)

This element describes the relative offset value for the color animation.

[*Example*: Consider a shape with a lightening emphasis animation applied to it. The <by> element should be used as follows:

```
<p:animClr clrSpc="hsl">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:by>
    <p:hsl h="0" s="0" l="0"/>
  </p:by>
</p:animClr>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
animClr (§19.5.2)

Child Elements	Subclause
hsl (HSL)	§19.5.46
rgb (RGB)	§19.5.63

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLByAnimateColorTransform) is located in §A.3. *end note*]

19.5.21 by (By)

This element describes the relative offset value for the animation.

[*Example*: Consider a shape with an animation effect that scales the size of an object by 150%. The <by> element should be used as follows:

```
<p:animScale>
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:by x="150.000%" y="150.000%"/>
</p:animScale>
```

end example]

Parent Elements
animMotion (§19.5.4); animScale (§19.5.6)

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
y (Y coordinate)	This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLPoint) is located in §A.3. *end note*]

19.5.22 cBhvr (Common Behavior)

This element describes the common behaviors of animations.

[*Example*: Consider trying to emphasize text within a shape by changing the size of its font. The <anim> element should be used as follows:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="4294967295" end="4294967295"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>style.fontSize</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:anim>
```

end example]

Parent Elements
anim (§19.5.1); animClr (§19.5.2); animEffect (§19.5.3); animMotion (§19.5.4); animRot (§19.5.5); animScale (§19.5.6); cmd (§19.5.28); set (§19.5.66)

Child Elements	Subclause
attrNameLst (Attribute Name List)	§19.5.8
cTn (Common Time Node Properties)	§19.5.33
tgtEl (Target Element)	§19.5.81

Attributes	Description
accumulate (Accumulate)	This attribute makes a repeating animation build with each iteration when set to "always."

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The possible values for this attribute are defined by the ST_TLBehaviorAccumulateType simple type (§19.7.27).
additive (Additive)	This attribute specifies how to apply the animation values to the original value for the property. The possible values for this attribute are defined by the ST_TLBehaviorAdditiveType simple type (§19.7.28).
by (By)	This attribute specifies a relative offset value for the animation.. The possible values for this attribute are defined by the W3C XML Schema string datatype.
from (From)	This attribute specifies the starting value of the animation. The possible values for this attribute are defined by the W3C XML Schema string datatype.
override (Override)	This attribute specifies how a behavior should override values of the attribute being animated on the target element. The "childStyle" clears the attributes on the children contained inside the target element. The possible values for this attribute are defined by the ST_TLBehaviorOverrideType simple type (§19.7.29).
rctx (Runtime Context)	This attribute describes the runtime context of the animation. The currently-understood values are “PPT” and “IE.” This is used to specify the behavior used when animating in the PPT slideshow vs. IE HTML runtime. An example can be seen with the transparency effect. In IE, the transparency is animated as a bitmap, where in PPT, the style.opacity property of a shape is used to animate the transparency. The possible values for this attribute are defined by the W3C XML Schema string datatype.
to (To)	This attribute specifies the ending value of the animation. The possible values for this attribute are defined by the W3C XML Schema string datatype.
xfrmType (Transform Type)	This attribute specifies the kind of transform to be used. The possible values for this attribute are defined by the ST_TLBehaviorTransformType simple type (§19.7.30).

[*Note*: The W3C XML Schema definition of this element’s content model (CT_TLCommonBehaviorData) is located in §A.3. *end note*]

19.5.23 charRg (Character Range)

This element specifies animation on a character range defined by a start and end character position.

[*Example*: Consider animating the first word (characters 1 through 9) within a sentence. The <charRg> element should be used as follows:

```
<p:animMotion>
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="0" end="9"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>ppt_x</p:attrName>
      <p:attrName>ppt_y</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:animMotion>
```

end example]

Parent Elements
txEl (§19.5.91)

Attributes	Description
end (End)	This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).
st (Start)	This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_IndexRange) is located in §A.3. *end note*]

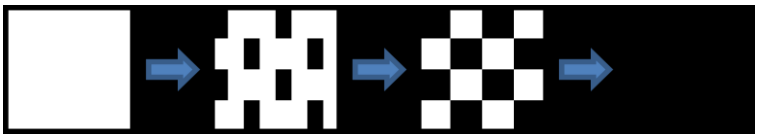
19.5.24 checker (Checker Slide Transition)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

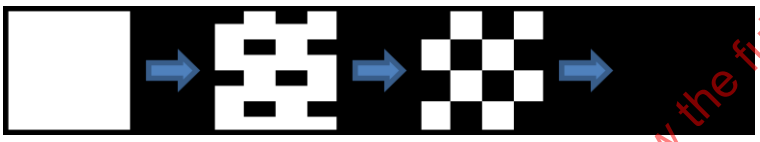
This element describes the checker slide transition effect, which uses a set of horizontal or vertical checkerboard squares and wipes them either left-to-right or top-to-bottom, respectively, until the new slide is fully shown. The rendering of this transition depends upon the attributes specified.

[*Example*: Consider the following cases in which the “checker” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:checker dir="horz"/>
</p:transition>
```



```
<p:transition>
  <p:checker dir="vert"/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

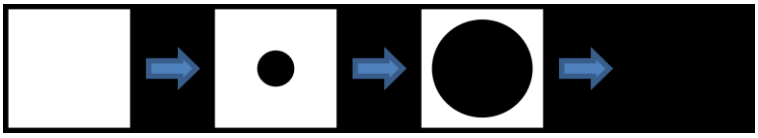
```
<p:transition>
  <p:circle/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.3. *end note*]

19.5.27 clrVal (Color Value)

This element describes the color variant. This is used to specify a color that is to be used for animating the color property of an object.

[*Example*: Consider trying to emphasize text within a shape by changing the color its font.

```
<p:set>
  <p:cBhvr override="childStyle">
    …
  </p:cBhvr>
  <p:to>
    <p:clrVal>
      <a:schemeClr val="accent2"/>
    </p:clrVal>
  </p:to>
</p:set>
```

end example]

Parent Elements
progress (§19.5.57); to (§19.5.89); val (§19.5.92)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

19.5.28 cmd (Command)

This element describes the several non-durational commands that can be executed within a timeline. This can be used to send events, call functions on elements, and send verbs to embedded objects. For example "Object Action" effects for Embedded objects and Media commands for sounds/movies such as "PlayFrom(0.0)" and "togglePause".

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§19.5.22

Attributes	Description
cmd (Command)	This attribute defines the actual command to be issued. Depending on the command specified, the actual command can be made to invoke a wide range of actions on the linked or embedded object. Reserved Values (when type = "`call`"):

Value	Description
`play`	play corresponding media
`playFrom(s)`	play corresponding media starting from `s`, where `s` is the number of seconds from the beginning of the clip
`pause`	pause corresponding media
`resume`	resume play of corresponding media
`stop`	stop play of corresponding media
`togglePause`	play corresponding media if media is already paused, pause

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	corresponding media if media is already playing. If the corresponding media is not active, this command restarts the media and plays from its beginning.

Reserved Values (when type = “evt”):

Value	Description
onstopaudio	stop play of all audio

Reserved Values (when type = “verb”):

Value	Description
0	Open the object for editing
1	Open the object for viewing

The value of the cmd attribute shall be the string representation of an integer that represents the embedded object verb number. This verb number determines the action that the rendering application should take corresponding to this object when this point in the animation is reached.

[*Example:* Consider the following command

```
<p:cmd type="evt" cmd="onstopaudio">
  <p:cBhvr>
    <p:cTn display="0" masterRel="sameClick">
      <p:stCondLst>
        <p:cond evt="begin" delay="0">
          <p:tn val="5"/>
        </p:cond>
      </p:stCondLst>
    </p:cTn>
    <p:tgtEl>
      <p:sldTgt/>
    </p:tgtEl>
  </p:cBhvr>
</p:cmd>
```

end example]

In the above example, the event of onstopaudio stops all audio from playing once this particular animation is reached in the timeline.

The possible values for this attribute are defined by the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
type (Command Type)	This attribute specifies the kind of command that is issued by the rendering application to the appropriate target application or object. There are three possible values, `call`, `evt`, and `verb`. A `call` command type is used to specify the class of commands that can then be issued. Call commands (type="`call`"): This command type is used to call methods on the object specified (`play`(), `pause`(), etc.) Event Commands (type="`evt`"): This command type is used to set an event for the object at this point in the timeline (`onstopaudio`, etc.) Verb Commands (type="`verb`"): This command type is used to set verbs for the object to occur at this point in the timeline (0, 1, etc.) The possible values for this attribute are defined by the ST_TLCommandType simple type (§19.7.32).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLCommandBehavior) is located in §A.3. *end note*]

19.5.29 cMediaNode (Common Media Node Properties)

This element is used to describe behavior of media elements, such as sound or movies, in an animation.

[*Example*: Consider a shape with a sound effect attached to its animation. The <cMediaNode> element should be used as follows:

```
<p:audio>
  <p:cMediaNode mute="1">
    <p:cTn display="0" masterRel="sameClick">
      <p:stCondLst> … </p:stCondLst>
      <p:endCondLst> … </p:endCondLst>
    </p:cTn>
    <p:tgtEl> … </p:tgtEl>
  </p:cMediaNode>
</p:audio>
```

end example]

Parent Elements
audio (§19.5.9); video (§19.5.93)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
cTn (Common Time Node Properties)	§19.5.33
tgtEl (Target Element)	§19.5.81

Attributes	Description
mute (Mute)	This attribute describes whether the media should be mute. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
numSld (Number of Slides)	This attribute describes the numbers of slides across which the media should play. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
showWhenStopped (Show When Stopped)	This attribute describes whether the media should be displayed when it is stopped. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
vol (Volume)	This attribute describes the volume of the media element. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLCommonMediaNodeData) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

19.5.30 comb (Comb Slide Transition)

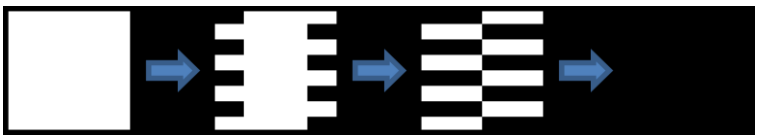
This element describes the comb slide transition effect, which uses a set of horizontal or vertical bars and wipes them from one end of the slide to the other until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example*: Consider the following cases in which the "comb" slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

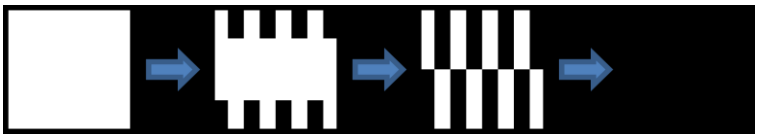
```
<p:transition>
```

©ISO/IEC 2011 – All rights reserved

```
  <p:comb dir="horz"/>
</p:transition>
```



```
<p:transition>
  <p:comb dir="vert"/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OrientationTransition) is located in §A.3. *end note*]

19.5.31 cond (Condition)

This element specifies conditions on time nodes in a timeline. It is used within a list of start condition or list of end condition elements.

[*Example*: For example, suppose we have a shape with a two second delay after the animation is started.

```
<p:cTn>
  <p:stCondLst>
    <p:cond delay="2000"/>
  </p:stCondLst>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
    <p:childTnLst>
      <p:set> … </p:set>
      <p:animEffect transition="in" filter="blinds(horizontal)">
        <p:cBhvr>
          <p:cTn id="7" dur="1000"/>
          <p:tgtEl>
            <p:spTgt spid="4"/>
          </p:tgtEl>
        </p:cBhvr>
      </p:animEffect>
    </p:childTnLst>
  </p:cTn>
```

end example]

Parent Elements
endCondLst (§19.5.37); nextCondLst (§19.5.51); prevCondLst (§19.5.55); stCondLst (§19.5.73)

Child Elements	Subclause
rtn (Runtime Node Trigger Choice)	§19.5.64
tgtEl (Target Element)	§19.5.81
tn (Time Node)	§19.5.86

Attributes	Description
delay (Trigger Delay)	This attribute describes the delay after an animation is triggered. The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).
evt (Trigger Event)	This attribute describes the event that triggers an animation. The possible values for this attribute are defined by the ST_TLTriggerEvent simple type (§19.7.48).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeCondition) is located in §A.3. *end note*]

19.5.32 cover (Cover Slide Transition)

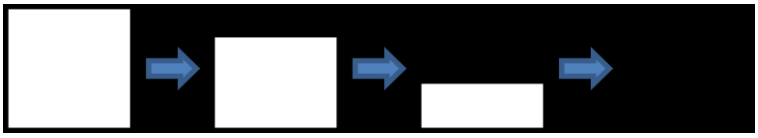
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This element describes the cover slide transition effect, which moves the new slide in from an off-screen location, continually covering more of the previous slide until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example*: Consider the following cases in which the “cover” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:cover dir="d"/>
</p:transition>
```



```
<p:transition>
  <p:cover dir="l"/>
</p:transition>
```

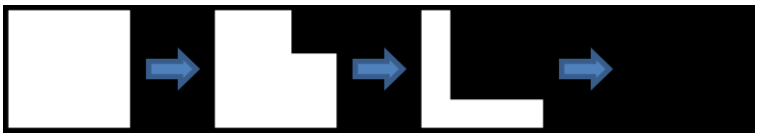
```
<p:transition>
  <p:cover dir="r"/>
</p:transition>
```

```
<p:transition>
  <p:cover dir="u"/>
</p:transition>
```

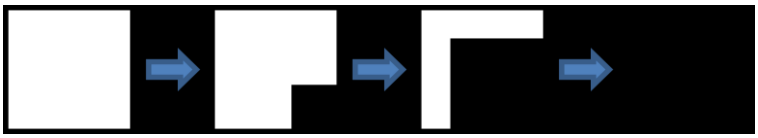
```
<p:transition>
  <p:cover dir="ld"/>
</p:transition>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

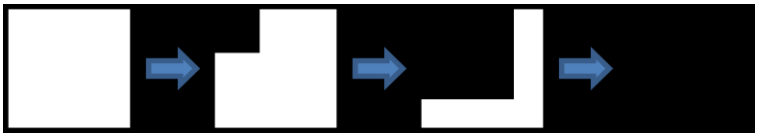
©ISO/IEC 2011 – All rights reserved



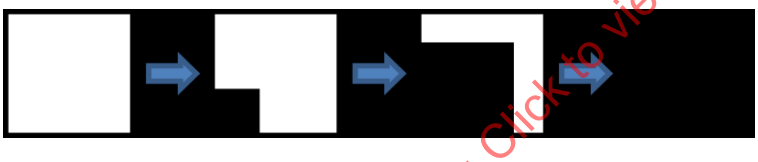
```
<p:transition>
  <p:cover dir="lu"/>
</p:transition>
```



```
<p:transition>
  <p:cover dir="rd"/>
</p:transition>
```



```
<p:transition>
  <p:cover dir="ru"/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
dir (Direction)	This attribute specifies if the direction of the transition. The possible values for this attribute are defined by the ST_TransitionEightDirectionType simple type (§19.7.51).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_EightDirectionTransition) is located in §A.3. *end note*]

19.5.33 cTn (Common Time Node Properties)

This element describes the properties that are common for time nodes.

Parent Elements
cBhvr (§19.5.22); cMediaNode (§19.5.29); excl (§19.5.40); par (§19.5.53); seq (§19.5.65)

Child Elements	Subclause
childTnLst (Children Time Node List)	§19.5.25
endCondLst (End Conditions List)	§19.5.37
endSync (EndSync)	§19.5.39
iterate (Iterate)	§19.5.49
stCondLst (Start Conditions List)	§19.5.73
subTnLst (Sub-TimeNodes List)	§19.5.78

Attributes	Description
accel (Acceleration)	This attribute describes the percentage of specified duration over which the element's time takes to accelerate from 0 up to the "run rate." The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).
afterEffect (After Effect)	This attribute specifies whether there is an after effect applied to the time node. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
autoRev (Auto Reverse)	This attribute describes whether to automatically play the animation in reverse after playing it in the forward direction. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
bldLvl (Build level)	This attribute describes the build level of the animation. The possible values for this attribute are defined by the W3C XML Schema int datatype.
decel (Deceleration)	This attribute describes the percentage of specified duration over which the element's time takes to decelerate from the "run rate" down to 0. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
display (Display)	This attribute describes whether the state of the time node is visible or hidden. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
dur (Duration)	This attribute describes the duration of the time node, expressed as unit time. The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).
evtFilter (Event Filter)	This attribute describes the event filter for this time node. The possible values for this attribute are defined by the W3C XML Schema string datatype.
fill (Fill)	This attribute describes the fill type for the time node. The possible values for this attribute are defined by the ST_TLTimeNodeFillType simple type (§19.7.41).
grpId (Group ID)	This attribute describes the Group ID of the time node. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
id (ID)	This attribute specifies the identifier for the timenode. The possible values for this attribute are defined by the ST_TLTimeNodeID simple type (§19.7.42).
masterRel (Master Relation)	This attribute specifies how the time node plays back relative to its master time node. The possible values for this attribute are defined by the ST_TLTimeNodeMasterRelation simple type (§19.7.43).
nodePh (Node Placeholder)	This attribute describes whether this node is a placeholder. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
nodeType (Node Type)	This attribute specifies the type of time node. The possible values for this attribute are defined by the ST_TLTimeNodeType simple type (§19.7.47).
presetClass (Preset Types)	This attribute descries the class of effect in which it belongs. The possible values for this attribute are defined by the ST_TLTimeNodePresetClassType simple type (§19.7.44).
presetID (Preset ID)	This attribute describes the preset identifier for the time node.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema int datatype.
presetSubtype (Preset SubType)	This attribute is a bitflag that specifies a direction or some other attribute of the effect. For example it can be set to specify a “From Bottom” for the Fly In effect, or “Bold” for the Change Font Style effect. The possible values for this attribute are defined by the W3C XML Schema int datatype.
repeatCount (Repeat Count)	This attribute describes the number of times the element should repeat, in units of thousandths. The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).
repeatDur (Repeat Duration)	This attribute describes the amount of time over which the element should repeat. If absent, the attribute is taken to be the same as the specified duration. The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).
restart (Restart)	This attribute specifies if a node is to restart when it completes its action. The possible values for this attribute are defined by the ST_TLTimeNodeRestartType simple type (§19.7.45).
spd (Speed)	This attribute specifies the percentage by which to speed up (or slow down) the timing. If negative, the timing is reversed. [*Example*: if speed is 200% and the specified duration is 10 seconds, the actual duration is 5 seconds. *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
syncBehavior (Synchronization Behavior)	This attribute specifies how the time node synchronizes to its group. The possible values for this attribute are defined by the ST_TLTimeNodeSyncType simple type (§19.7.46).
tmFilter (Time Filter)	This attribute specifies the time filter for the time node. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element’s content model (CT_TLCommonTimeNodeData) is located in §A.3. *end note*]

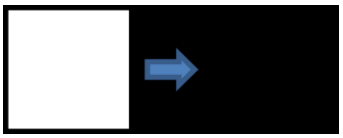
19.5.34 cut (Cut Slide Transition)

This element describes the cut slide transition effect, which simply replaces the previous slide with the new slide instantaneously. No animation is used, but an option exists to cut to a black screen before showing the new slide. The rendering of this transition depends upon the attributes specified which have been shown below.

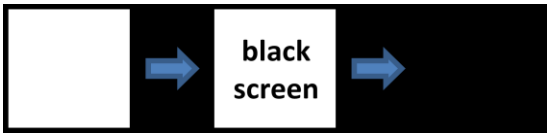
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Example*: Consider the following cases in which the “cut” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:cut thruBlk="0"/>
</p:transition>
```



```
<p:transition>
  <p:cut thruBlk="1"/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
thruBlk (Transition Through Black)	This attribute specifies if the transition starts from a black screen (and then transition the new slide over black). The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element’s content model (CT_OptionalBlackTransition) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

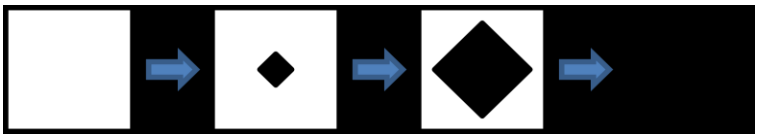
©ISO/IEC 2011 – All rights reserved

19.5.35 diamond (Diamond Slide Transition)

This element describes the diamond slide transition effect, which uses a diamond pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition has been shown below.

[*Example*: Consider the following case in which the “diamond” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:diamond/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

[*Note*: The W3C XML Schema definition of this element’s content model (CT_Empty) is located in §A.3. *end note*]

19.5.36 dissolve (Dissolve Slide Transition)

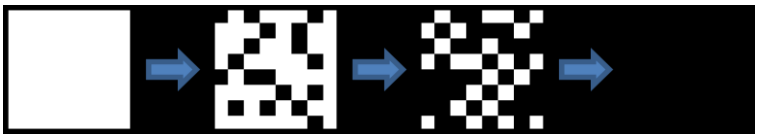
This element describes the dissolve slide transition effect, which uses a set of randomly placed squares on the slide that continue to be added to until the new slide is fully shown. The rendering of this transition has been shown below.

[*Example*: Consider the following case in which the “dissolve” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:dissolve/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.3. *end note*]

19.5.37 endCondLst (End Conditions List)

This element describes a list of the end conditions that shall be met in order to stop the time node.

[*Example*: Consider a shape a shape with an audio attached to the animation. The <endCondList> element should be used as follows to specifies when the sound is done:

```
<p:audio>
  <p:cMediaNode>
    <p:cTn display="0" masterRel="sameClick">
      <p:stCondLst> … </p:stCondLst>
      <p:endCondLst>
        <p:cond evt="onStopAudio" delay="0">
          <p:tgtEl>
            <p:sldTgt/>
          </p:tgtEl>
        </p:cond>
      </p:endCondLst>
    </p:cTn>
    <p:tgtEl> … </p:tgtEl>
  </p:cMediaNode>
</p:audio>
```

end example]

Parent Elements
cTn (§19.5.33)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
cond (Condition)	§19.5.31

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeConditionList) is located in §A.3. *end note*]

19.5.38 endSnd (Stop Sound Action)

This element stops all previous sounds during a slide transition.

[*Example*: Consider a slide transition that stops all previous sounds. The<endSnd> element should be used as follows:

```
<p:transition>
    <p:sndAc>
        <p:endSnd/>
    </p:sndAc>
</p:transition>
```

end example]

Parent Elements
sndAc (§19.5.69)

[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.3. *end note*]

19.5.39 endSync (EndSync)

This element is used to synchronizes the stopping of parallel elements in the timing tree. It is used on interactive timeline sequences to specify that the interactive sequence's duration ends when all of the child timenodes have ended. It is also used to make interactive sequences restart-able (so that the entire interactive sequence can be repeated if the trigger object is clicked on repeatedly).

[*Example*: Consider a shape with a fill change animation. The <endSync> element should be used as follows:

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn>
    <p:stCondLst/>
    <p:endSync evt="end" delay="0">
      <p:rtn val="all"/>
    </p:endSync>
    <p:childTnLst/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
    </p:cTn>
    <p:nextCondLst/>
  </p:seq>
```

end example]

Parent Elements
cTn (§19.5.33)

Child Elements	Subclause
rtn (Runtime Node Trigger Choice)	§19.5.64
tgtEl (Target Element)	§19.5.81
tn (Time Node)	§19.5.86

Attributes	Description
delay (Trigger Delay)	This attribute describes the delay after an animation is triggered. The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).
evt (Trigger Event)	This attribute describes the event that triggers an animation. The possible values for this attribute are defined by the ST_TLTriggerEvent simple type (§19.7.48).

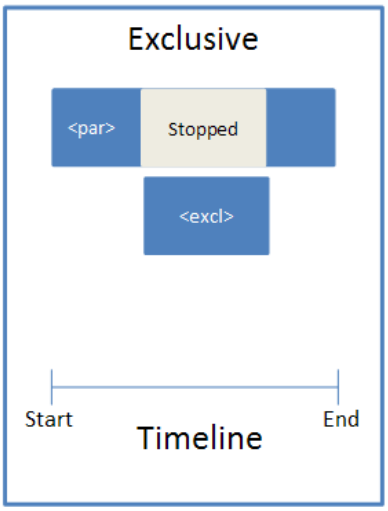
[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeCondition) is located in §A.3. *end note*]

19.5.40 excl (Exclusive)

This element describes the Exclusive time node. This time node is used to pause all other timelines when it is activated. Conceptually it can be though of as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved



Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
cTn (Common Time Node Properties)	§19.5.33

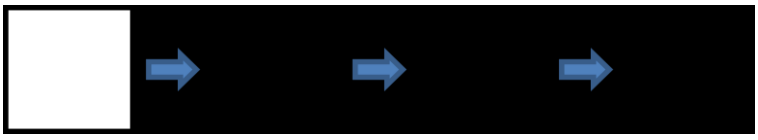
[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeNodeExclusive) is located in §A.3. *end note*]

19.5.41 fade (Fade Slide Transition)

This element describes the fade slide transition effect, which smoothly fades the previous slide either directly to the new slide or first to a black screen and then to the new slide. The rendering of this transition depends upon the attributes specified which have been shown below.

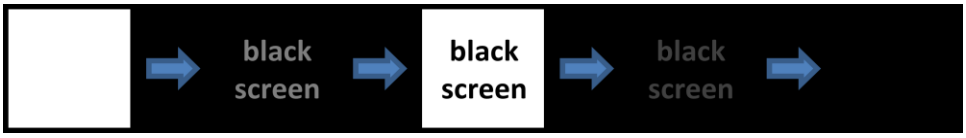
[*Example*: Consider the following cases in which the "fade" slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:fade thruBlk="0"/>
</p:transition>
```



STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<p:transition>
  <p:fade thruBlk="1"/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
thruBlk (Transition Through Black)	This attribute specifies if the transition starts from a black screen (and then transition the new slide over black). The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_OptionalBlackTransition) is located in §A.3. *end note*]

19.5.42 fltVal (Float Value)

This element specifies a floating point value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

Parent Elements
progress (§19.5.57); to (§19.5.89); val (§19.5.92)

Attributes	Description
val (Value)	This attribute specifies the floating point value that this element contains and that should be used in evaluating this element. The possible values for this attribute are defined by the W3C XML Schema float datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimVariantFloatVal) is located in §A.3. *end note*]

19.5.43 from (From)

This element is used to specify the starting color of the target element.

[*Example*: Consider a shape with an animation fill change from one accent color to another. The <from> element should be used as follows:

```
<p:animClr clrSpc="rgb" dir="cw">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl> … </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>fillcolor</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:from>
    <a:schemeClr val="accent3"/>
  </p:from>
  <p:to>
    <a:schemeClr val="accent2"/>
  </p:to>
</p:animClr>
```

end example]

Parent Elements
animClr (§19.5.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

19.5.44 from (From)

This element specifies an x/y co-ordinate to start the animation from.

[*Example*: Consider a shape with an animation sequence that needs to start at a certain coordinate. The <from> element should be used as follows:

```
<p:animScale>
  <p:cBhvr>
    <p:cTn> … </p:cTn>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:from x="100%" y="100%"/>
  <p:to x="80%" y="100%"/>
</p:animScale>
```

end example]

Parent Elements
animMotion (§19.5.4); animScale (§19.5.6)

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
y (Y coordinate)	This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLPoint) is located in §A.3. *end note*]

19.5.45 graphicEl (Graphic Element)

This element specifies a graphical element which to animate.

[*Example*: Consider a diagram with an animation effect applied to it. The <graphicEl> element should be used as follows:

```
<p:set>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
      <p:cBhvr>
        <p:cTn id="6" dur="1" fill="hold"> … </p:cTn>
        <p:tgtEl>
          <p:spTgt spid="4">
            <p:graphicEl>
              <a:dgm id="{87C2C707-C3F4-4E81-A967-A8B8AE13E575}"/>
            </p:graphicEl>
          </p:spTgt>
        </p:tgtEl>
        <p:attrNameLst> … </p:attrNameLst>
      </p:cBhvr>
      <p:to> … </p:to>
    </p:set>
```

end example]

Parent Elements
spTgt (§19.5.72)

Child Elements	Subclause
chart (Chart to Animate)	§20.1.2.2.3
dgm (Diagram to Animate)	§20.1.2.2.12

[*Note*: The W3C XML Schema definition of this element's content model (CT_AnimationElementChoice) is located in §A.4.1. *end note*]

19.5.46 hsl (HSL)

This element specifies an incremental HSL (Hue, Saturation, Lightness) value to add to a color animation.

[*Example*: Consider a shape with a lightening emphasis animation. The <hsl> element should be used as follows:

```
<p:animClr clrSpc="hsl">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:by>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
      <p:hsl h="0" s="0" l="0"/>
    </p:by>
  </p:animClr>
```

end example]

Parent Elements
by (§19.5.20)

Attributes	Description
h (Hue)	Specifies hue as an angle. The values range from [0, 360] degrees. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).
l (Lightness)	Specifies a lightness as a percentage. The values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).
s (Saturation)	Specifies a saturation as a percentage. The values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLByHslColorTransform) is located in §A.3. *end note*]

19.5.47 inkTgt (Ink Target)

This element specifies an animation target element that is represented by a sub-shape in a legacy graphical object.

[*Example*: Consider an ink diagram with an animation blinds transition effect applied to it. The <inkTgt> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="7" dur="500"/>
    <p:tgtEl>
      <p:inkTgt spid="_x0000_s2057"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

end example]

Parent Elements
tgtEl (§19.5.81)

Attributes	Description
spid (Shape ID)	This attribute specifies the shape identifier. The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLSubShapeId) is located in §A.3. *end note*]

19.5.48 intVal (Integer)

This element specifies an integer value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

Parent Elements
progress (§19.5.57); to (§19.5.89); val (§19.5.92)

Attributes	Description
val (Value)	This attribute specifies the integer value that this element contains and that should be used in evaluating this element. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimVariantIntegerVal) is located in §A.3. *end note*]

19.5.49 iterate (Iterate)

This element specifies how the animation should be successively applied to sub elements of the target element for a repeated effect. It can be applied to contained timing and animation structures over the letters, words, or shapes within a target element.

[*Example*: Consider a text animation where the words appear letter by letter. The <iterate> element should be used as follows:

```
<p:par>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
    <p:cTn id="1" >
      <p:stCondLst> … </p:stCondLst>
      <p:iterate type="lt">
        <p:tmPct val="10000"/>
      </p:iterate>
      <p:childTnLst> … </p:childTnLst>
    </p:cTn>
  </p:par>
```

end example]

Parent Elements
cTn (§19.5.33)

Child Elements	Subclause
tmAbs (Time Absolute)	§19.5.82
tmPct (Time Percentage)	§19.5.83

Attributes	Description
backwards (Backwards)	This attribute specifies whether to go backwards in the timeline to the previous node. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
type (Iterate Type)	This attribute specifies the iteration behavior and applies it to each letter, word or shape within a container element. Values are by word, by letter, or by element. If there is no text or block elements such as shapes within the container or a single word, letter, or shape (depending on iterate type) then no iteration happens and the behavior is applied to the element itself instead. The possible values for this attribute are defined by the ST_IterateType simple type (§19.7.4).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLIterateData) is located in §A.3. *end note*]

19.5.50 newsflash (Newsflash Slide Transition)

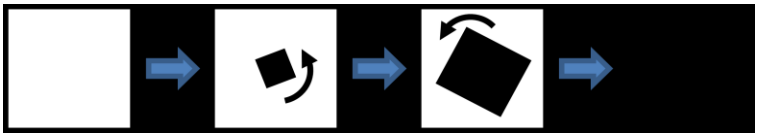
This element describes the newsflash slide transition effect, which grows and spins the new slide counter-clockwise into place over the previous slide. The rendering of this transition has been shown below.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*: Consider the following case in which the “newsflash” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:newsflash/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

[*Note*: The W3C XML Schema definition of this element’s content model (CT_Empty) is located in §A.3. *end note*]

19.5.51 nextCondLst (Next Conditions List)

This element describes a list of conditions that shall be met to advance to the next animation sequence.

[*Example*: Consider a shape with a text emphasis changing the size of its font.

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq"> … </p:cTn>
  <p:prevCondLst> … </p:prevCondLst>
  <p:nextCondLst>
    <p:cond evt="onNext" delay="0">
      <p:tgtEl>
        <p:sldTgt/>
      </p:tgtEl>
    </p:cond>
  </p:nextCondLst>
</p:seq>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
seq (§19.5.65)

Child Elements	Subclause
cond (Condition)	§19.5.31

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeConditionList) is located in §A.3. *end note*]

19.5.52 oleChartEl (Embedded Chart Element)

This element specifies the subelement of an embedded chart to animate.

[*Example*: Consider an embedded Chart with a entrance animation effect applied to each of the graph's categories. The <oldChartEl> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="12" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="19460">
        <p:oleChartEl type="category" lvl="1"/>
      </p:spTgt>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

Parent Elements
spTgt (§19.5.72)

Attributes	Description
lvl (Level)	This attribute describes the element levels to animate. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
type (Type)	This attribute specifies how to chart should be built during its animation. The possible values for this attribute are defined by the ST_TLChartSubelementType

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

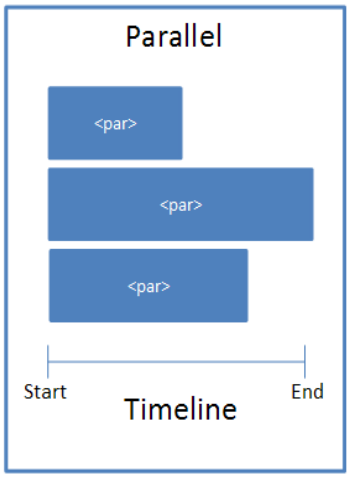
 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
	simple type (§19.7.31).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLOleChartTargetElement) is located in §A.3. *end note*]

19.5.53 par (Parallel Time Node)

This element describes the Parallel time node which can be activated along with other parallel time node containers. Conceptually it can be thought of as follows:



[*Example*: Consider a simple animation with a blind entrance. The <par> element should be used as follows:

```
<p:timing>
  <p:tnLst>
    <p:par>
      <p:cTn id="1" dur="indefinite" restart="never" nodeType="tmRoot">
        <p:childTnLst>
          <p:seq concurrent="1" nextAc="seek">
            …
          </p:seq>
        </p:childTnLst>
      </p:cTn>
    </p:par>
  </p:tnLst>
</p:timing>
```

end example]

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
cTn (Common Time Node Properties)	§19.5.33

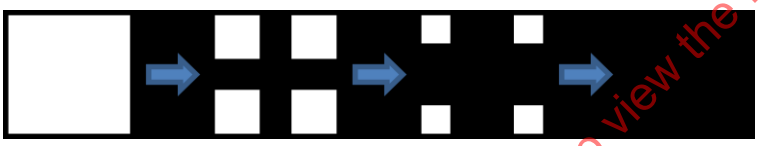
[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeNodeParallel) is located in §A.3. *end note*]

19.5.54 plus (Plus Slide Transition)

This element describes the plus slide transition effect, which uses a plus pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition has been shown below.

[*Example*: Consider the following case in which the "plus" slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:plus/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.3. *end note*]

19.5.55 prevCondLst (Previous Conditions List)

This element describes a list of conditions that shall be met in order to go backwards in an animation sequence.

[*Example*: Consider trying to emphasize text within a shape by changing the size of its font.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq">
  </p:cTn>
  <p:prevCondLst>
    <p:cond evt="onPrev" delay="0">
      <p:tgtEl>
        <p:sldTgt/>
      </p:tgtEl>
    </p:cond>
  </p:prevCondLst>
  <p:nextCondLst>
  </p:nextCondLst>
</p:seq>
```

end example]

Parent Elements
seq (§19.5.65)

Child Elements	Subclause
cond (Condition)	§19.5.31

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeConditionList) is located in §A.3. *end note*]

19.5.56 pRg (Paragraph Text Range)

This element specifies a text range to animate based on starting and ending paragraph number.

[*Example*: Consider an animation entrance of the first 3 text paragraphs. The <pRg> element should be used as follows:

```
<p:animEffect transition="in" filter="checkerboard(across)">
  <p:cBhvr>
    <p:cTn id="12" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:pRg st="0" end="2"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
  </p:cBhvr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
</p:animEffect>
```

end example]

Parent Elements
txEl (§19.5.91)

Attributes	Description
end (End)	This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).
st (Start)	This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_IndexRange) is located in §A.3. *end note*]

19.5.57 progress (Progress)

This element defines the progression of an animation. The default for the way animation progress happens through an animEffect is a linear ramp from 0 to 1, starting at the effect's begin time & ending at the effect's end time. When you specify a value for the progress attribute, you are overriding this default behaviour. The value between 0 and 1 represents a percentage through the effect, where 0 is 0% and 1 is 100%.

Each animEffect is in fact an object-based transition. These transitions can be specified as "In" (where the object is not visible at 0% and becomes completely visible at 100%) or "Out" (where the object is visible at 0% and becomes completely invisible at 100%). You would set the progress attribute if you want to use the animEffect as a "static" effect, where the transition properties do not actually change over time. As an alternative to using the progress attribute, you can use the tmFilter (time filter), which is a base attribute of any effect/timenode, to specify the way that progress through an effect should be performed dynamically.

Parent Elements
animEffect (§19.5.3)

Child Elements	Subclause
boolVal (Boolean Variant)	§19.5.19
clrVal (Color Value)	§19.5.27
fltVal (Float Value)	§19.5.42
intVal (Integer)	§19.5.48

Child Elements	Subclause
strVal (String Value)	§19.5.75

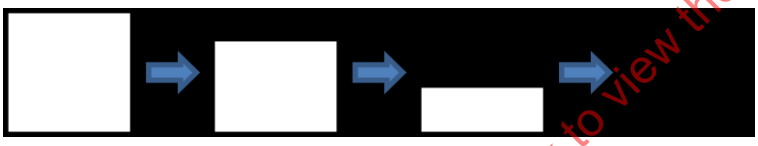
[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimVariant) is located in §A.3. *end note*]

19.5.58 pull (Pull Slide Transition)

This element describes the pull slide transition effect, which moves the previous slide to an off-screen location, continually revealing more of the new slide until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

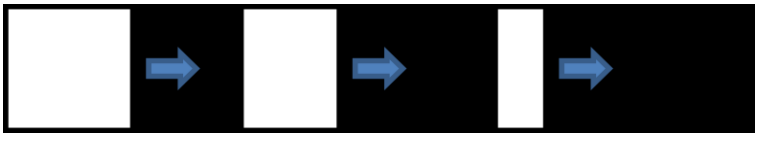
[*Example*: Consider the following cases in which the "pull" slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:pull dir="d"/>
</p:transition>
```



```
<p:transition>
  <p:pull dir="l"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="r"/>
</p:transition>
```



```
<p:transition>
  <p:pull dir="u"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
transition (§19.3.1.50)

Attributes	Description
dir (Direction)	This attribute specifies if the direction of the transition. The possible values for this attribute are defined by the ST_TransitionEightDirectionType simple type (§19.7.51).

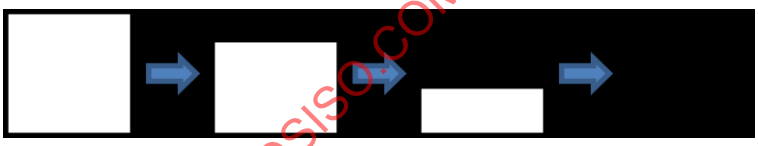
[*Note*: The W3C XML Schema definition of this element's content model (CT_EightDirectionTransition) is located in §A.3. *end note*]

19.5.59 push (Push Slide Transition)

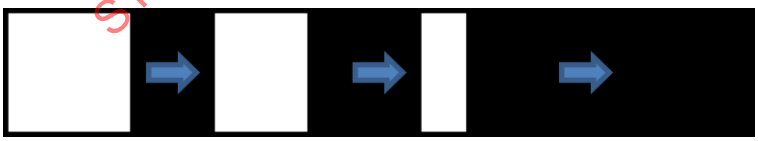
This element describes the push slide transition effect, which moves the new slide in from an off-screen location, continually pushing the previous slide to an opposite off-screen location until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example*: Consider the following cases in which the "push" slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:push dir="d"/>
</p:transition>
```

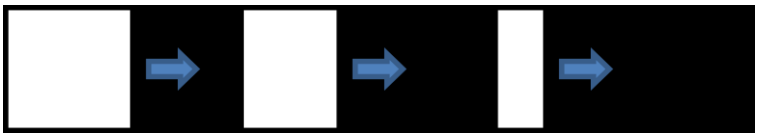


```
<p:transition>
  <p:push dir="l"/>
</p:transition>
```

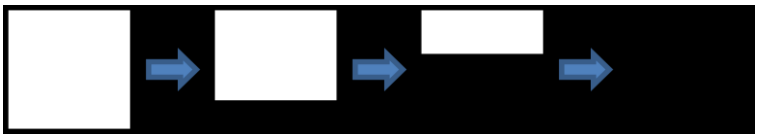


```
<p:transition>
  <p:push dir="r"/>
</p:transition>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011



```
<p:transition>
  <p:push dir="u"/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
dir (Direction)	This attribute specifies the direction of the slide transition. The possible values for this attribute are defined by the ST_TransitionSideDirectionType simple type (§19.7.53).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SideDirectionTransition) is located in §A.3. *end note*]

19.5.60 random (Random Slide Transition)

This element describes the random slide transition effect, which chooses a random transition from the set available in the rendering application. This transition thus can be different each time it is used.

[*Example*: Consider the following case in which the "random" slide transition is applied to a slide, along with a set of attributes. The proper usage is shown below:

```
<p:transition>
  <p:random/>
</p:transition>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

end example]

Parent Elements
transition (§19.3.1.50)

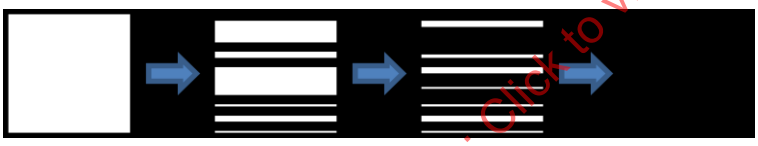
[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.3. *end note*]

19.5.61 randomBar (Random Bar Slide Transition)

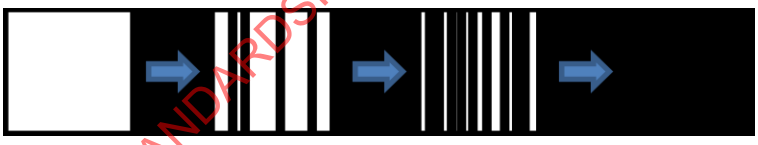
This element describes the randomBar slide transition effect, which uses a set of randomly-placed horizontal or vertical bars on the slide that continue to be added to until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example*: Consider the following cases in which the "randomBar" slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:randomBar dir="horz"/>
</p:transition>
```



```
<p:transition>
  <p:randomBar dir="vert"/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OrientationTransition) is located in §A.3. *end note*]

19.5.62 rCtr (Rotation Center)

This element describes the center of the rotation used to rotate a motion path by X angle.

[*Example*: For example, suppose we have a simple animation with a checkerbox text entrance.

```
<p:animMotion origin="layout" path="M 0 0  L 0.25 0.33333  E"
pathEditMode="relative" rAng="0" ptsTypes="">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>ppt_x</p:attrName>
      <p:attrName>ppt_y</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:rCtr x="56.7%" y="83.4%"/>
</p:animMotion>
```

end example]

Parent Elements
animMotion (§19.5.4)

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
y (Y coordinate)	This attribute describes the Y coordinate.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLPoint) is located in §A.3. *end note*]

19.5.63 rgb (RGB)

The element specifies an incremental RGB value to add to the color property.

[*Example*: Consider a shape with a color emphasis animation. The <rgb> element should be used as follows:

```
<p:animClr clrSpc="rgb">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:by>
    <p:rgb r="10" g="20" b="30"/>
  </p:by>
</p:animClr>
```

end example]

Parent Elements
by (§19.5.20)

Attributes	Description
b (Blue)	This attribute specifies a blue component luminance as a percentage. Values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).
g (Green)	This attribute specifies a green component luminance as a percentage.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	Values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).
r (Red)	This attribute specifies a red component luminance as a percentage. Values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLByRgbColorTransform) is located in §A.3. *end note*]

19.5.64 rtn (Runtime Node Trigger Choice)

This element specifies the child time node that triggers a time condition. References a child time node or all child nodes. Order is based on the child's end time.

[*Example*: Consider an animation which ends the synchronization of all parallel time nodes when all the child nodes have ended their animation. The <rtn> element should be used as follows:

```
<p:cTn>
  <p:stCondLst> … </p:stCondLst>
  <p:endSync evt="end" delay="0">
    <p:rtn val="all"/>
  </p:endSync>
  <p:childTnLst> … </p:childTnLst>
</p:cTn>
```

end example]

Parent Elements
cond (§19.5.31); endSync (§19.5.39)

Attributes	Description
val (Value)	This attribute describes the value that triggers the runtime node. The possible values for this attribute are defined by the ST_TLTriggerRuntimeNode simple type (§19.7.49).

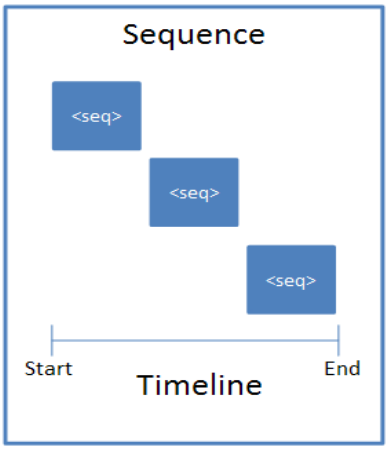
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTriggerRuntimeNode) is located in §A.3. *end note*]

19.5.65 seq (Sequence Time Node)

This element describes the Sequence time node and it can only be activated when the one before it finishes. Conceptually it can be though of as follows:



[*Example*: For example, suppose we have a simple animation with a blind entrance.

```
<p:timing>
  <p:tnLst>
    <p:par>
      <p:cTn id="1" dur="indefinite" restart="never" nodeType="tmRoot">
        <p:childTnLst>
          <p:seq concurrent="1" nextAc="seek">
            …
          </p:seq>
        </p:childTnLst>
      </p:cTn>
    </p:par>
  </p:tnLst>
</p:timing>
```

end example]

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
cTn (Common Time Node Properties)	§19.5.33

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
nextCondLst (Next Conditions List)	§19.5.51
prevCondLst (Previous Conditions List)	§19.5.55

Attributes	Description
concurrent (Concurrent)	This attribute specifies if concurrency is enabled or disabled. By default this attribute has a value of "disabled". When the value is set to "enabled", the previous element is left enabled when advancing to the next element in a sequence instead of being ended. This is only relevant for advancing via the next condition element being triggered. The only other way to advance to the next element would be to have the current element end, which implies it is no longer concurrent. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
nextAc (Next Action)	This attribute specifies what to do when going forward in sequence. By default this attribute has a value of "none". When this is set to seek it seeks the element to a natural end time (not necessarily the actual end time). The natural end position is defined as the latest non-infinite end time of the children. If a child loops forever, the end of its first loop is used as its "end time" for the purposes of this calculation. Some container elements can have infinite durations due to an infinite-duration child element. The engine needs to recurse down through all infinite duration containers to calculate their natural duration in case a child might have non-infinite duration within it that needs to be taken into account. The possible values for this attribute are defined by the ST_TLNextActionType simple type (§19.7.34).
prevAc (Previous Action)	This attribute specifies what to do when going backwards in a sequence. By default it is set to "none" and nothing special is done. When the value is "skipTimed", the sequence continues to go backwards until it reaches a sequence element that was defined to begin only on the next condition element. The possible values for this attribute are defined by the ST_TLPreviousActionType simple type (§19.7.37).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeNodeSequence) is located in §A.3. *end note*]

19.5.66 set (Set Time Node Behavior)

This element allows the setting of a particular property value to a fixed value while the behavior is active and restores the value when the behavior is reset or turned off.

[*Example*: For example, suppose we want to set certain properties during an animation effect. The <set> element should be used as follows:

```
<p:childTnLst>
  <p:set>
    <p:cBhvr>
      <p:cTn id="6" dur="1" fill="hold"> … </p:cTn>
      <p:tgtEl>
        <p:spTgt spid="4"/>
      </p:tgtEl>
      <p:attrNameLst>
        <p:attrName>style.visibility</p:attrName>
      </p:attrNameLst>
    </p:cBhvr>
    <p:to>
      <p:strVal val="visible"/>
    </p:to>
  </p:set>
  <p:animEffect transition="in" filter="blinds(horizontal)">
    …
  </p:animEffect>
</p:childTnLst>
```

end example]

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§19.5.22
to (To)	§19.5.89

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLSetBehavior) is located in §A.3. *end note*]

19.5.67 sldTgt (Slide Target)

This element specifies the slide as the target element.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Example*: For example, suppose we have a simple animation with a blind entrance.

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq"> … </p:cTn>
  <p:prevCondLst> … </p:prevCondLst>
  <p:nextCondLst>
    <p:cond evt="onNext" delay="0">
      <p:tgtEl>
        <p:sldTgt/>
      </p:tgtEl>
    </p:cond>
  </p:nextCondLst>
</p:seq>
```

end example]

Parent Elements
tgtEl (§19.5.81)

[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.3. *end note*]

19.5.68 snd (Sound)

This element specifies the audio information to play during a slide transition.

[*Example*: Consider a slide transition with an audio effect. The <snd> element should be used as follows:

```
<p:transition>
    <p:sndAc>
        <p:stSnd>
            <p:snd r:embed="rId2""/>
        </p:stSnd>
    </p:sndAc>
</p:transition>
```

end example]

Parent Elements
stSnd (§19.5.76)

Attributes	Description
embed (Embedded Audio File	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [*Note*: A list of

Attributes	Description
Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	suggested audio types is provided in §15.2.2. *end note*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Sound Name) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (ST_EmbeddedWAVAudioFile) is located in §A.4.1. *end note*]

19.5.69 sndAc (Sound Action)

This element describes a sound action for slide transition. This element specifies that the start of the slide transition is accompanied by the playback of an audio file; the actual audio file used is specified by the snd element (§19.5.68).

[*Example*: Consider a slide transition with a sound effect. The <sndAc> element should be used as follows:

```
<p:transition>
    <p:sndAc>
        <p:stSnd>
            <p:snd r:embed="rId2"/>
        </p:stSnd>
    </p:sndAc>
</p:transition>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_TransitionSoundAction) is located in §A.3. *end note*]

19.5.70 sndTgt (Sound Target)

This element describes the sound information for a target object.

[*Example*: Consider a shape with a sound effect animation. The <sndTgt> element should be used as follows:

```
<p:subTnLst>
  <p:audio>
    <p:cMediaNode>
      <p:cTn display="0" masterRel="sameClick"> … </p:cTn>
      <p:tgtEl>
        <p:sndTgt r:embed="rId2" r:link="rId3"/>
      </p:tgtEl>
    </p:cMediaNode>
  </p:audio>
</p:subTnLst>
```

end example]

Parent Elements
tgtEl (§19.5.81)

Attributes	Description
embed (Embedded Audio File Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [*Note*: A list of suggested audio types is provided in §15.2.2. *end note*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Sound Name) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the W3C XML Schema string datatype.

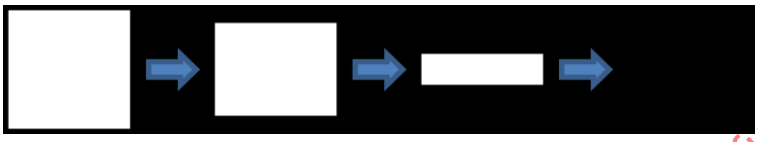
[*Note*: The W3C XML Schema definition of this element's content model (CT_EmbeddedWAVAudioFile) is located in §A.4.1. *end note*]

19.5.71 split (Split Slide Transition)

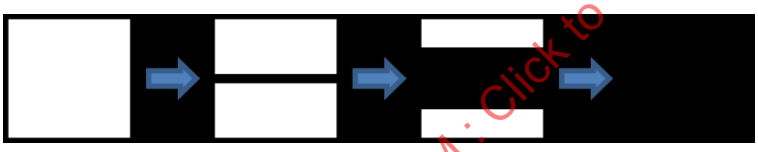
This element describes the split slide transition effect, which reveals the new slide directly on top of the previous one by wiping either horizontal or vertical from the outside in, or from the inside out, until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example*: Consider the following cases in which the "split" slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

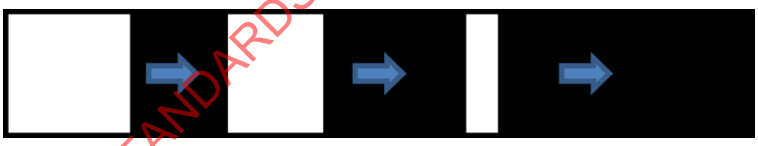
```
<p:transition>
  <p:split orient="horz" dir="in"/>
</p:transition>
```



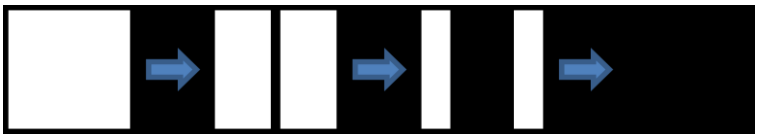
```
<p:transition>
  <p:split orient="horz" dir="out"/>
</p:transition>
```



```
<p:transition>
  <p:split orient="vert" dir="in"/>
</p:transition>
```



```
<p:transition>
  <p:split orient="vert" dir="out"/>
</p:transition>
```



STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
dir (Direction)	This attribute specifies the direction of a "split" slide transition. The possible values for this attribute are defined by the ST_TransitionInOutDirectionType simple type (§19.7.52).
orient (Orientation)	This attribute specifies the orientation of a "split" slide transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SplitTransition) is located in §A.3. *end note*]

19.5.72 spTgt (Shape Target)

The element specifies the shape in which to apply a certain animation to.

[*Example*: Consider a shape whose id is 3 in which we want to apply a fade animation effect. The <spTgt> should be used as follows:

```
<p:animEffect transition="in" filter="fade">
  <p:cBhvr>
    <p:cTn id="7" dur="2000"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
dir (Direction)	This attribute specifies if the direction of the transition. The possible values for this attribute are defined by the ST_TransitionCornerDirectionType simple type (§19.7.50).

[*Note*: The W3C XML Schema definition of this element's content model (CT_CornerDirectionTransition) is located in §A.3. *end note*]

19.5.75 strVal (String Value)

This element specifies a string value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

Parent Elements
progress (§19.5.57); to (§19.5.89); val (§19.5.92)

Attributes	Description
val (Value)	This attribute specifies the string value that this element contains and that should be used in evaluating this element. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimVariantStringVal) is located in §A.3. *end note*]

19.5.76 stSnd (Start Sound Action)

This element describes the sound that starts playing during a slide transition.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Example*: Consider a slide transition that starts with a sound effect. The <stSnd> element should be used as follows:

```
<p:transition>
    <p:sndAc>
        <p:stSnd>
            <p:snd r:embed="rId2"/>
        </p:stSnd>
    </p:sndAc>
</p:transition>
```

end example]

Parent Elements
sndAc (§19.5.69)

Child Elements	Subclause
snd (Sound)	§19.5.68

Attributes	Description
loop (Loop Sound)	This attribute specifies if the sound loops until the next sound event occurs in slideshow. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TransitionStartSoundAction) is located in §A.3. *end note*]

19.5.77 subSp (Subshape)

This element specifies the subshape of a legacy graphical object to animate.

[*Example*: Consider adding animation to a legacy diagram. The <subSp> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="7" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="2053">
        <p:subSp spid="_x0000_s70664"/>
      </p:spTgt>
    </p:tgtEl>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
      </p:cBhvr>
    </p:animEffect>
```

end example]

Parent Elements
spTgt (§19.5.72)

Attributes	Description
spid (Shape ID)	This attribute specifies the shape identifier. The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLSubShapeId) is located in §A.3. *end note*]

19.5.78 subTnLst (Sub-TimeNodes List)

This element describes time nodes that have a start time which is not based on the containing timenode. It is instead based on their master relationship (masterRel). At runtime, they are inserted dynamically into the timing tree as child timenodes for playback, based on the logic defined by the master relationship. These elements are used for animations such as "dim after" and "play sound effects"

[*Example*: Consider an animation with a "Fly In" effect on paragraphs so that each paragraph flies in on a separate click. Then the "Dim After" effect for paragraph 1 doe not happen until paragraph 2 flies in. The <subTnLst> element should be used as follows:

```
<p:par>
  <p:cTn id="5" grpId="0" nodeType="clickEffect">
    <p:stCondLst> … </p:stCondLst>
    <p:childTnLst> … </p:childTnLst>
    <p:subTnLst>
      <p:set>
        <p:cBhvr override="childStyle">
          <p:cTn fill="hold" masterRel="nextClick" afterEffect="1"/>
          <p:tgtEl> … </p:tgtEl>
          <p:attrNameLst> … </p:attrNameLst>
        </p:cBhvr>
        <p:to> … </p:to>
      </p:set>
    </p:subTnLst>
  </p:cTn>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
</p:par>
```

end example]

Parent Elements
cTn (§19.5.33)

```
        <p:val>
          <p:strVal val="#ppt_y"/>
        </p:val>
      </p:tav>
    </p:tavLst>
  </p:anim>
```

end example]

Parent Elements
tavLst (§19.5.80)

Child Elements	Subclause
val (Value)	§19.5.92

Attributes	Description

fmla (Formula)	This attribute allows for the specification of a formula to be used for describing a complex motion for an animated object. The formula manipulates the motion of the object by modifying a property of the object over a specified period of time. Each formula has zero or more inputs specified by the ($) symbol, zero or more variables specified by the (#) symbol pre-pended to the variable name and a target variable which is specified by the previously specified attrName element. The formula can contain one or more of any of the constants, operators or functions listed below. In addition to this, the formula can also contain floating point numbers and parentheses.
	
	Mathematical operations have the following order of precedence, listed from lowest to highest. Operators listed on the same line have equal precedence.
	• “+”, “-“
	• “*”, “/”, “%”
	• “^”
	• Unary minus, Unary plus (e.g. -2, meaning 3*-2 is the same as 3*(-2))
	• Variables, Constants (including numbers) and Functions (as listed previously)
	
	Language Description:
	
	`Digit = '0' | '1' | ‘2’ | ‘3’ | ‘4’ | ‘5’ | ‘6’ | ‘7’ | ‘8’ | '9' ;`
	`number = digit , { digit } ;`
	`exponent = [ '-' ] , ( 'e' | 'E' ) , number ;`

ppt_h	Pre-animation height of the object

Constants:

Name	Description
pi	Mathematical constant pi
e	Mathematical constant e

Operators:

Name	Description	Usage
+	Addition	“x+y”, adds x to the value y
-	Subtraction	“x-y”, subtracts y from the value x
*	Multiplication	“x*y”, multiplies x by the value y
/	Division	“x/y”, divides x by the value y

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description

%	Modulus	“x%y”, the remainder of x/y
^	Power	“x^y”, x raised to the power y

Functions:

Name	Description	Usage
abs	Absolute value	“abs(x)”, absolute value of x
acos	Arc Cosine	“acos(x)”, arc cosine of the value x
asin	Arc Sine	“asin(x)”, arc sine of the value x
atan	Arc Tangent	“atan(x)”, arc tangent of the value x
ceil	Ceil value	“ceil(x)”, value of x rounded up
cos	Cosine	“cos(x)”, cosine of the value of x
cosh	Hyperbolic Cosine	“cosh(x)", hyperbolic cosine of the value x
deg	Radiant to Degree convert	“deg(x)”, the degree value of radiant value x
exp	Exponent	“exp(x)”, value of constant e raised to the power of x
floor	Floor value	“floor(x)”, value of x rounded down
ln	Natural logarithm	“ln(x)”, natural logarithm of x
max	Maximum of two values	“max(x,y)”, returns x if (x > y) or returns y if (y > x)
min	Minimum of two values	“min(x,y)", returns x if (x < y) or returns y if (y < x)
rad	Degree to Radiant convert	“rad(x)”, the radiant value of degree value x
rand	Random value	“rand(x)”, returns a random floating point value between 0 and x
sin	Sine	“sin(x)”, sine of the value x
sinh	Hyperbolic Sine	"sinh(x)”, hyperbolic sine of the value x
sqrt	Square root	“sqrt(x)”, square root of the value x
tan	Tangent	“tan(x)”, tangent of the value x
tanh	Hyperbolic Tangent	“tanh(x)", hyperbolic tangent of the value x

[*Example:* Consider the following animation path:

```
<p:animcalcmode="lin" valueType="num">
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	<p:cBhvr> <p:cTn id="9" dur="664" tmFilter="0.0,0.0; 0.25,0.07; 0.50,0.2; 0.75,0.467; 1.0,1.0"> <p:stCondLst> <p:cond delay="0"/> </p:stCondLst> </p:cTn> <p:tgtEl> <p:spTgtspid="4"/> </p:tgtEl> <p:attrNameLst> <p:attrName>ppt_y</p:attrName> </p:attrNameLst> </p:cBhvr> <p:tavLst> <p:tav tm="0%" fmla="#ppt_y-sin(pi*$)/3"> <p:val> <p:fltValval="0.5"/> </p:val> </p:tav> <p:tav tm="100%"> <p:val> <p:fltValval="1"/> </p:val> </p:tav> </p:tavLst> </p:anim> The animation example above modifies the ppt_y variable of the object by subtracting sin(pi*$)/3 from the non-animated value of ppt_y. The start value is 0.5 and the end value is 1 specified in each of the val elements. The total time for this animation is specified within the dur attribute and the filtered time graph is specified by the tmFilter attribute. The end result is that the object moves from a point above its non-animated position back to its non-animated position. With the specification of the tmFilter it has a modified time graph such that it also appears to accelerate as it reaches its final position. [*Note*: For this example, the non-animated value of ppt_y is the value of this variable if the object were to be statically rendered on the slide without animation properties. *end note*] *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
tm (Time)	This attribute specifies the time at which the attribute being animated takes on the value. The possible values for this attribute are defined by the ST_TLTimeAnimateValueTime

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	simple type (§19.7.39).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeAnimateValue) is located in §A.3. *end note*]

19.5.80 tavLst (Time Animated Value List)

This element specifies a list of time animated value elements.

[*Example*: Consider a shape with a "fly-in" animation. The <tav> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
  <p:cBhvr additive="base"> … </p:cBhvr>
  <p:tavLst>
    <p:tav tm="0%">
      <p:val>
        <p:strVal val="1+#ppt_h/2"/>
      </p:val>
    </p:tav>
    <p:tav tm="100000">
      <p:val>
        <p:strVal val="#ppt_y"/>
      </p:val>
    </p:tav>
  </p:tavLst>
</p:anim>
```

end example]

Parent Elements
anim (§19.5.1)

Child Elements	Subclause
tav (Time Animate Value)	§19.5.79

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeAnimateValueList) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

19.5.81 tgtEl (Target Element)

This element specifies the target children elements which have the animation effects applied to.

[*Example*: Consider a shape with ID 3 with a fade effect animation applied to it. The <tgtEl> element should be used as follows:

```
<p:animEffect transition="in" filter="fade">
  <p:cBhvr>
    <p:cTn id="7" dur="2000"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

Parent Elements
cBhvr (§19.5.22); cMediaNode (§19.5.29); cond (§19.5.31); endSync (§19.5.39)

Child Elements	Subclause
inkTgt (Ink Target)	§19.5.47
sldTgt (Slide Target)	§19.5.67
sndTgt (Sound Target)	§19.5.70
spTgt (Shape Target)	§19.5.72

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTimeTargetElement) is located in §A.3. *end note*]

19.5.82 tmAbs (Time Absolute)

This element describes the duration of the iteration interval in absolute time.

[*Example*: Consider a text animation where the words appear letter by letter every 10 seconds. The <tmAbs> element should be used as follows:

```
<p:par>
  <p:cTn id="5" >
    <p:stCondLst> … </p:stCondLst>
    <p:iterate type="lt">
      <p:tmAbs val="10000"/>
    </p:iterate>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
      <p:childTnLst> … </p:childTnLst>
    </p:cTn>
  </p:par>
```

end example]

Parent Elements
iterate (§19.5.49)

Attributes	Description
val (Time)	This attribute describes an amount of time, in milliseconds. The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLIterateIntervalTime) is located in §A.3. *end note*]

19.5.83 tmPct (Time Percentage)

This element describes the duration of the iteration interval in a percentage of time.

[*Example*: Consider a text animation where the words appear letter by letter every 10th of the animation duration. The <tmPct> element should be used as follows:

```
  <p:par>
    <p:cTn id="5" >
      <p:stCondLst> … </p:stCondLst>
      <p:iterate type="lt">
        <p:tmPct val="10%"/>
      </p:iterate>
      <p:childTnLst> … </p:childTnLst>
    </p:cTn>
  </p:par>
```

end example]

Parent Elements
iterate (§19.5.49)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
val (Value)	This attribute specifies the time expressed as a percentage. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLIterateIntervalPercentage) is located in §A.3. *end note*]

19.5.84 tmpl (Template Effects)

This element specifies the "template" effects that are used by the build element. Template effects are used in text builds on the master slide. They define the rules of what effect should be applied to the 1st level paragraph, 2nd level paragraph, etc.

[*Example*: Consider a template with a fade in effect applied to it. The <tmpl> element should be used as follows:

```
<p:timing>
  <p:tnLst> … </p:tnLst>
  <p:bldLst>
    <p:bldP spid="3" grpId="0" build="p">
      <p:tmplLst>
        <p:tmpl lvl="1">
        </p:tmpl>
      </p:tmplLst>
    </p:bldP>
  </p:bldLst>
</p:timing>
```

end example]

Parent Elements
tmplLst (§19.5.85)

Child Elements	Subclause
tnLst (Time Node List)	§19.5.87

Attributes	Description
lvl (Level)	This attribute describes the paragraph indent level to which this template effect applies. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTemplate) is located in §A.3. *end note*]

19.5.85 tmplLst (Template effects)

This element describes a list of template effects that describe what kind of effects should be applied to a paragraph level properties.

[*Example*: Consider a template with a fade in effect applied to it. The <tmpl> element should be used as follows:

```
<p:timing>
  <p:tnLst> … </p:tnLst>
  <p:bldLst>
    <p:bldP spid="3" grpId="0" build="p">
      <p:tmplLst>
        <p:tmpl lvl="1">
        </p:tmpl>
      </p:tmplLst>
    </p:bldP>
  </p:bldLst>
</p:timing>
```

end example]

Parent Elements
bldP (§19.5.16)

Child Elements	Subclause
tmpl (Template Effects)	§19.5.84

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTemplateList) is located in §A.3. *end note*]

19.5.86 tn (Time Node)

This element describes the time node trigger choice.

[*Example*: Consider a time node with an event condition. The <tn> element should be used as follows:

```
<p:par>
  <p:cTn id="5">
    <p:stCondLst>
      <p:cond delay="0"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
      </p:stCondLst>
      <p:endCondLst>
        <p:cond evt="begin" delay="0">
          <p:tn val="5"/>
        </p:cond>
      </p:endCondLst>
      <p:childTnLst> … </p:childTnLst>
    </p:cTn>
  </p:par>
```

end example]

Parent Elements
cond (§19.5.31); endSync (§19.5.39)

Attributes	Description
val (Value)	This attribute specifies a time node identifier. The possible values for this attribute are defined by the ST_TLTimeNodeID simple type (§19.7.42).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTriggerTimeNodeID) is located in §A.3. *end note*]

19.5.87 tnLst (Time Node List)

This element specifies a list of time node elements used in an animation sequence.

[*Example*: Consider a simple animation sequence. The <tnLst> element should be used as follows:

```
<p:timing>
  <p:tnLst>
    <p:par> … </p:par>
  </p:tnLst>
</p:timing>
```

end example]

Parent Elements
timing (§19.3.1.48); tmpl (§19.5.84)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
anim (Animate)	§19.5.1
animClr (Animate Color Behavior)	§19.5.2
animEffect (Animate Effect)	§19.5.3
animMotion (Animate Motion)	§19.5.4
animRot (Animate Rotation)	§19.5.5
animScale (Animate Scale)	§19.5.6
audio (Audio)	§19.5.9
cmd (Command)	§19.5.28
excl (Exclusive)	§19.5.40
par (Parallel Time Node)	§19.5.53
seq (Sequence Time Node)	§19.5.65
set (Set Time Node Behavior)	§19.5.66
video (Video)	§19.5.93

[*Note*: The W3C XML Schema definition of this element's content model (CT_TimeNodeList) is located in §A.3. *end note*]

19.5.88 to (To)

This element specifies the target location for an animation motion or animation scale effect

[*Example*: Consider an animation with a "light speed" entrance effect.

```
<p:animScale>
  <p:cBhvr>
    <p:cTn id="9" dur="200" decel="10.5%" autoRev="1" fill="hold">
      <p:stCondLst>
        <p:cond delay="600"/>
      </p:stCondLst>
    </p:cTn>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:from x="100%" y="100%"/>
  <p:to x="80%" y="100%"/>
</p:animScale>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Parent Elements
animMotion (§19.5.4); animScale (§19.5.6)

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
y (Y coordinate)	This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLPoint) is located in §A.3. *end note*]

19.5.89 to (To)

The element specifies the certain attribute of a time node after an animation effect.

[*Example*: Consider an animation effect that leaves a string value visible afterwards. The <to> element should be used as follows:

```
<p:childTnLst>
  <p:set>
    <p:cBhvr> … </p:cBhvr>
    <p:to>
      <p:strVal val="visible"/>
    </p:to>
  </p:set>
  <p:anim calcmode="lin" valueType="num"> … </p:anim>
…</p:childTnLst>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
set (§19.5.66)

Child Elements	Subclause
boolVal (Boolean Variant)	§19.5.19

©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
clrVal (Color Value)	§19.5.27
fltVal (Float Value)	§19.5.42
intVal (Integer)	§19.5.48
strVal (String Value)	§19.5.75

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimVariant) is located in §A.3. *end note*]

19.5.90 to (To)

This element specifies the resulting color for the animation color change.

[*Example*: Consider emphasize a shape by changing its fill color from blue to red. The <to> element should be used as follows:

```
<p:childTnLst>
  <p:animClr clrSpc="rgb">
    <p:cBhvr> … </p:cBhvr>
    <p:to>
      <a:schemeClr val="accent2"/>
    </p:to>
  </p:animClr>
</p:childTnLst>
```

end example]

Parent Elements
animClr (§19.5.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

19.5.91 txEl (Text Element)

This element specifies a text element to animate.

[*Example*: Consider a shape containing text to be animated. The <txEl> should be used as follows:

```
<p:tgtEl>
  <p:spTgt spid="5">
    <p:txEl>
      <p:pRg st="1" end="1"/>
    </p:txEl>
  </p:spTgt>
</p:tgtEl>
```

end example]

Parent Elements
spTgt (§19.5.72)

Child Elements	Subclause
charRg (Character Range)	§19.5.23
pRg (Paragraph Text Range)	§19.5.56

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLTextTargetElement) is located in §A.3. *end note*]

19.5.92 val (Value)

The element specifies a value for a time animate.

[*Example*: Consider a shape with a fade in animation effect. The <val> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
  <p:cBhvr additive="base"> … </p:cBhvr>
  <p:tavLst>
    <p:tav tm="0%">
      <p:val>
        <p:strVal val="0-#ppt_w/2"/>
      </p:val>
    </p:tav>
    <p:tav tm="100%">
      <p:val>
        <p:strVal val="#ppt_x"/>
      </p:val>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
        </p:tav>
      </p:tavLst>
    </p:anim>
```

end example]

Parent Elements
tav (§19.5.79)

Child Elements	Subclause
boolVal (Boolean Variant)	§19.5.19
clrVal (Color Value)	§19.5.27
fltVal (Float Value)	§19.5.42
intVal (Integer)	§19.5.48
strVal (String Value)	§19.5.75

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLAnimVariant) is located in §A.3. *end note*]

19.5.93 video (Video)

This element specifies video information in an animation sequence. This element specifies that this node within the animation tree triggers the playback of a video file; the actual video file used is specified by the videoFile element (§20.1.3.6).

[*Example*: Consider a slide with an animated video content. The <video> element is used as follows:

```
<p:cSld>
  <p:spTree>
    <p:pic>
      <p:nvPicPr>
        <p:cNvPr id="4"/>
        …
        <p:nvPr>
          <a:videoFile r:link="rId1" contentType="video/ogg"/>
        </p:nvPr>
      </p:nvPicPr>
      …
    </p:pic>
  </p:spTree>
</p:cSld>
…
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<p:childTnLst>
  <p:seq concurrent="1" nextAc="seek">
   …
  </p:seq>
  <p:video>
    <p:cMediaNode>
      …
      <p:tgtEl>
        <p:spTgt spid="4"/>
      </p:tgtEl>
    </p:cMediaNode>
  </p:video>
</p:childTnLst>
```

The video element specifies the location of the video playback within the animation sequence; its child spTgt element specifies that the shape which contains the video to be played has a shape ID of 4. If we look at the shape with that ID value, its child videoFile element references an external video file of content type `video/ogg` located at the target of the relationship with ID `rId1`.*end example*]

Parent Elements
childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87)

Child Elements	Subclause
cMediaNode (Common Media Node Properties)	§19.5.29

Attributes	Description
fullScrn (Full Screen)	This attribute specifies if the video is displayed in full-screen. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TLMediaNodeVideo) is located in §A.3. *end note*]

19.5.94 wedge (Wedge Slide Transition)

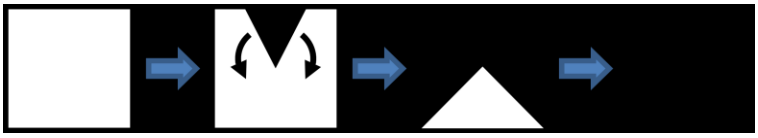
This element describes the wedge slide transition effect, which uses two radial edges that wipe from top to bottom in opposite directions until the new slide is fully shown. The rendering of this transition has been shown below.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*: Consider the following case in which the “wedge” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:wedge/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

[*Note*: The W3C XML Schema definition of this element’s content model (CT_Empty) is located in §A.3. *end note*]

19.5.95 wheel (Wheel Slide Transition)

This element describes the wheel slide transition effect, which uses a set of radial edges and wipes them in the clockwise direction until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example*: Consider the following cases in which the “wheel” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:wheel spokes="1"/>
</p:transition>
```

```
<p:transition>
  <p:wheel spokes="2"/>
```

```
</p:transition>
```

end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
dir (Direction)	This attribute specifies the direction of the slide transition. The possible values for this attribute are defined by the ST_TransitionSideDirectionType simple type (§19.7.53).

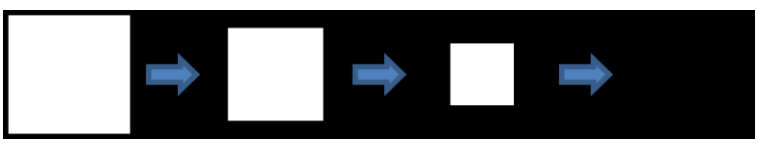
[*Note*: The W3C XML Schema definition of this element's content model (CT_SideDirectionTransition) is located in §A.3. *end note*]

19.5.97 zoom (Zoom Slide Transition)

This element describes the zoom slide transition effect, which uses a box pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example*: Consider the following cases in which the "zoom" slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

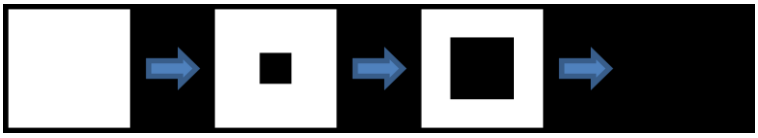
```
<p:transition>
  <p:zoom dir="in"/>
</p:transition>
```



STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<p:transition>
  <p:zoom dir="out"/>
</p:transition>
```



end example]

[*Note*: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

Parent Elements
transition (§19.3.1.50)

Attributes	Description
dir (Direction)	This attribute specifies the direction of an "in/out" slide transition. The possible values for this attribute are defined by the ST_TransitionInOutDirectionType simple type (§19.7.52).

[*Note*: The W3C XML Schema definition of this element's content model (CT_InOutTransition) is located in §A.3. *end note*]

19.6 Slide Synchronization Data

It is often the case that slides are repurposed from existing presentations to be used in other presentations. In such cases, it is often beneficial for there to be an association, or a pairing, between the original slide and all copied instances of it. In the presence of such a pairing, applications can enable a variety of time-saving features, including the automatic updates of copied slides when the original slide changes. The Slide Synchronization Data part is designed to enable such application-defined functionality.

This information is stored in the Slide Synchronization Data part, which is referenced via an implicit relationship from the associated Slide part.

19.6.1 sldSyncPr (Slide Synchronization Properties)

This element specifies the information needed to associate the original slide with all copied instances of it.

Parent Elements
Root element of PresentationML Slide Synchronization Data part

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
extLst (Extension List)	§19.2.1.12

Attributes	Description
clientInsertedTime (Client Slide Insertion date/time)	The date and time that the original slide was last updated in the current presentation. The date/time is stored in ISO 8601 format. [*Note*: This value can be used to inform the user of when the last synchronization was, as well as to determine when to next check for an updated version. *end note*] The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.
serverSldId (Server's Slide File ID)	A string that, when paired with the target of the Slide Synchronization Data part's external relationship, uniquely identifies the original slide. The possible values for this attribute are defined by the W3C XML Schema string datatype.
serverSldModifiedTime (Server's Slide File's modification date/time)	The date and time that the original slide was last modified in its location as defined by the target of the Slide Synchronization Data part's external relationship. The date and time are stored in ISO 8601 format. The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SlideSyncProperties) is located in §A.3. *end note*]

19.7 Simple Types

This is the complete list of simple types dedicated to PresentationML.

19.7.1 ST_BookmarkIdSeed (Bookmark ID Seed)

This simple type specifies constraints for value of the Bookmark ID seed.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than 2147483648.

Referenced By
presentation@bookmarkIdSeed (§19.2.1.26)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BookmarkIdSeed) is located in §A.3. *end note*]

19.7.2 ST_Direction (Direction)

This simple type defines a direction of either horizontal or vertical.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
horz (Horizontal)	Defines a horizontal direction.
vert (Vertical)	Defines a vertical direction.

Referenced By
blinds@dir (§19.5.18); checker@dir (§19.5.24); comb@dir (§19.5.30); guide@orient (§19.2.2.4); ph@orient (§19.3.1.36); randomBar@dir (§19.5.61); split@orient (§19.5.71)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Direction) is located in §A.3. *end note*]

19.7.3 ST_Index (Index)

This simple type defines the position of an object in an ordered list.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

Referenced By
charRg@end (§19.5.23); charRg@st (§19.5.23); cm@idx (§19.4.1); pRg@end (§19.5.56); pRg@st (§19.5.56); sldRg@end (§19.2.1.38); sldRg@st (§19.2.1.38)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Index) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

19.7.4 ST_IterateType (Iterate Type)

This simple type specifies how the animation is applied over subelements of the target element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
el (Element)	Iterate by element.
lt (Letter)	Iterate by Letter.
wd (Word)	Iterate by Word.

Referenced By
iterate@type (§19.5.49)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_IterateType) is located in §A.3. *end note*]

19.7.5 ST_Name (Name string)

This simple type specifies a name, such as for a comment author or custom show.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

Referenced By
cmAuthor@initials (§19.4.2); cmAuthor@name (§19.4.2); custShow@name (§19.2.1.6)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Name) is located in §A.3. *end note*]

19.7.6 ST_OleObjectFollowColorScheme (Embedded object to Follow Color Scheme)

This simple type determines if the Embedded object is re-colored to reflect changes to the color schemes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
full (Full)	Setting this enumeration causes the Embedded object to respond to all changes in the color scheme in the presentation.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
none (None)	Setting this enumeration causes the Embedded object to not respond to changes in the color scheme in the presentation.
textAndBackground (Text and Background)	Setting this enumeration causes the Embedded object to respond only to changes in the text and background colors of the color scheme in the presentation.

Referenced By
embed@followColorScheme (§19.3.2.2)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_OleObjectFollowColorScheme) is located in §A.3. *end note*]

19.7.7 ST_PhotoAlbumFrameShape (Photo Album Shape for Photo Mask)

This simple type specifies the values for photo frame types within a photo album presentation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
frameStyle1 (Rectangle Photo Frame)	
frameStyle2 (Rounded Rectangle Photo Frame)	
frameStyle3 (Simple White Photo Frame)	frameStyle4 (Simple Black Photo Frame)	frameStyle5 (Compound Black Photo Frame)	
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
frameStyle6 (Center Shadow Photo Frame)	
frameStyle7 (Soft Edge Photo Frame)	

Referenced By
photoAlbum@frame (§19.2.1.24)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PhotoAlbumFrameShape) is located in §A.3. *end note*]

19.7.8 ST_PhotoAlbumLayout (Photo Album Layout Definition)

This simple type specifies the values for photo layouts within a photo album presentation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
1pic (1 Photo per Slide)	Specifies that photo album slides should have a single picture, centered horizontally and vertically, on the slide with no title.
1picTitle (1 Photo per Slide with Titles)	Specifies that photo album slides should have a single picture and a single title text box, centered horizontally and vertically, on the slide.
2pic (2 Photos per Slide)	Specifies that photo album slides should have two pictures of the same size, positioned side-by-side,

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	centered horizontally and vertically, on the slide with no title.
2picTitle (2 Photos per Slide with Titles)	Specifies that photo album slides should have two pictures of the same size, positioned side-by-side, with a single title text box centered over them, collectively centered horizontally and vertically, on the slide.
4pic (4 Photos per Slide)	Specifies that photo album slides should have four pictures of the same size, positioned in a two-by-two matrix, centered horizontally and vertically, on the slide with no title.
4picTitle (4 Photos per Slide with Titles)	Specifies that photo album slides should have four pictures of the same size, positioned in a two-by-two matrix, with a single title text box centered over the matrix, centered horizontally and vertically, on the slide.
fitToSlide (Fit Photos to Slide)	Specifies that photo album slides should have a single picture, stretched to fit the entire slide size, with no title.

Referenced By
photoAlbum@layout (§19.2.1.24)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PhotoAlbumLayout) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

19.7.9 ST_PlaceholderSize (Placeholder Size)

This simple type facilitates the storing of the size of the placeholder. This size is described relative to the body placeholder on the master.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
full (Full)	Specifies that the placeholder should take the full size of the body placeholder on the master.
half (Half)	Specifies that the placeholder should take the half size of the body placeholder on the master. Half size vertically or horizontally? Needs a picture.
quarter (Quarter)	Specifies that the placeholder should take a quarter of the size of the body placeholder on the master. Picture would be helpful.

Referenced By
ph@sz (§19.3.1.36)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PlaceholderSize) is located in §A.3. *end note*]

19.7.10 ST_PlaceholderType (Placeholder IDs)

This simple type facilitates the storing of the content type a placeholder should contain.

[*Note*: Some placeholder types are not allowed for all SlideBase types. *end note*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
body (Body)	Contains body text. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master. Can be horizontal or vertical on Slide and Slide Layout.
chart (Chart)	Contains a chart or graph. Special type. Allowed for Slide and Slide Layout.
clipArt (Clip Art)	Contains a single clip art image. Special type. Allowed for Slide and Slide Layout.
ctrTitle (Centered Title)	Contains a title intended to be centered on the slide.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	Allowed for Slide and Slide Layout.
dgm (Diagram)	Contains a diagram. Special type. Allowed for Slide and Slide Layout.
dt (Date and Time)	Contains the date and time. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
ftr (Footer)	Contains text to be used as a footer in the document. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
hdr (Header)	Contains text to be used as a header for the document. Allowed for Notes, Notes Master, Handout Master .
media (Media)	Contains multimedia content such as audio or a movie clip. Special type. Allowed for Slide and Slide Layout.
obj (Object)	Contains any content type. Special type. Allowed for Slide and Slide Layout.
pic (Picture)	Contains a picture. Special type. Allowed for Slide and Slide Layout.
sldImg (Slide Image)	Contains an image of the slide. Allowed for Notes and Notes Master.
sldNum (Slide Number)	Contains the number of a slide. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
subTitle (Subtitle)	Contains a subtitle. Allowed for Slide and Slide Layout.
tbl (Table)	Contains a table. Special type. Allowed for Slide and Slide Layout.
title (Title)	Contains a slide title. Allowed for Slide, Slide Layout and Slide Master. Can be horizontal or vertical on Slide and Slide Layout.

Referenced By
ph@type (§19.3.1.36)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PlaceholderType) is located in §A.3. *end note*]

19.7.11 ST_PrintColorMode (Print Color Mode)

This simple type specifies the color mode that should be used when printing a presentation document.

©ISO/IEC 2011 – All rights reserved

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bw (Black and White Mode)	Print should be in Black and White only
clr (Color Mode)	Print should be in Full Color
gray (Grayscale Mode)	Print should be in Grayscale only

Referenced By
prnPr@clrMode (§19.2.1.28)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PrintColorMode) is located in §A.3. *end note*]

19.7.12 ST_PrintWhat (Default print output)

This simple type specifies the default print layout that should be used when printing

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
handouts1 (1 Slide / Handout Page)	1 Slide and Handout Page layout should be used.
handouts2 (2 Slides / Handout Page)	2 Slides and Handout Page layout should be used.
handouts3 (3 Slides / Handout Page)	3 Slides and Handout Page layout should be used.
handouts4 (4 Slides / Handout Page)	4 Slides and Handout Page layout should be used.
handouts6 (6 Slides / Handout Page)	6 Slides and Handout Page layout should be used.
handouts9 (9 Slides / Handout Page)	9 Slides and Handout Page layout should be used.
notes (Notes)	Notes layout should be used.
outline (Outline)	Outline layout should be used.
slides (Slides)	Slides layout should be used.

Referenced By
prnPr@prnWhat (§19.2.1.28)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PrintWhat) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

19.7.13 ST_SlideId (Slide Identifier)

This simple type specifies the allowed numbering for the slide identifier.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a maximum value of less than 2147483648.
- This simple type has a minimum value of greater than or equal to 256.

Referenced By
sldId@id (§19.2.1.33)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SlideId) is located in §A.3. *end note*]

19.7.14 ST_SlideLayoutId (Slide Layout ID)

This simple type sets the bounds for the slide layout id value. This layout id is used to identify the different slide layout designs.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2147483648.

Referenced By
sldLayoutId@id (§19.3.1.40)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SlideLayoutId) is located in §A.3. *end note*]

19.7.15 ST_SlideLayoutType (Slide Layout Type)

This simple type defines an arrangement of content on a slide. Each layout type is not tied to an exact positioning of placeholders, but rather provides a higher-level description of the content type and positioning of placeholders. This information can be used by the application to aid in mapping between different layouts. The application can choose which, if any, of these layouts to make available through its user interface.

Each layout contains zero or more placeholders, each with a specific content type. An "object" placeholder can contain any kind of data. Media placeholders are intended to hold video or audio clips. The enumeration value descriptions include illustrations of sample layouts for each value of the simple type.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
blank (Slide Layout Type Enumeration (Blank))	Blank
chart (Chart)	 Title and chart
chartAndTx (Slide Layout Type Enumeration (Chart and Text))	 Title, chart on left and text on right
clipArtAndTx (Clip Art and Text)	Title, clipart on left, text on right
clipArtAndVertTx (Clip Art and Vertical Text)	Title, clip art on left, vertical text on right
cust (Slide Layout Type Enumeration (Custom))	Custom layout defined by user
dgm (Slide Layout Type Enumeration (Diagram))	 Title and diagram
fourObj (Four Objects)	Title and four objects
mediaAndTx (Slide Layout Type Enumeration (Media and Text))	Title, media on left, text on right
obj (Title and Object)	Title and object
objAndTwoObj (Object and Two Object)	Title, one object on left, two objects on right
objAndTx (Slide Layout Type Enumeration (Object and Text))	Title, object on left, text on right
objOnly (Object)	Object only

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
objOverTx (Slide Layout Type Enumeration (Object over Text))	Title, object on top, text on bottom
objTx (Title, Object, and Caption)	Title, object and caption text
picTx (Picture and Caption)	Title, picture, and caption text
secHead (Section Header)	Section header title and subtitle text
tbl (Slide Layout Type Enumeration (Table))	Title and table
title (Slide Layout Type Enumeration (Title))	Title layout with centered title and subtitle placeholders
titleOnly (Slide Layout Type Enumeration (Title Only))	Title only
twoColTx (Slide Layout Type Enumeration (Two Column Text))	 Title, text on left, text on right
twoObj (Two Objects)	Title, object on left, object on right
twoObjAndObj (Two Objects and Object)	Title, two objects on left, one object on right
twoObjAndTx (Two Objects and Text)	Title, two objects on left, text on right

Referenced By
sldLayout@type (§19.3.1.39)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SlideLayoutType) is located in §A.3. *end note*]

19.7.16 ST_SlideMasterId (Slide Master ID)

This simple type specifies the allowed numbering for the slide master identifier.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2147483648.

Referenced By
sldMasterId@id (§19.2.1.36)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SlideMasterId) is located in §A.3. *end note*]

19.7.17 ST_SlideSizeCoordinate (Slide Size Coordinate)

This simple type specifies the slide size coordinate in EMUs (English Metric Units).

This simple type's contents are a restriction of the ST_PositiveCoordinate32 datatype (§20.1.10.42).

This simple type also specifies the following restrictions:

- This simple type has a maximum value of less than or equal to 51206400.
- This simple type has a minimum value of greater than or equal to 914400.

Referenced By
sldSz@cx (§19.2.1.39); sldSz@cy (§19.2.1.39)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SlideSizeCoordinate) is located in §A.3. *end note*]

19.7.18 ST_SlideSizeType (Slide Size Type)

This simple type specifies the kind of slide size that the slide should be optimized for.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
35mm (35mm Film)	Slide size should be optimized for 35mm film output
A3 (A3)	Slide size should be optimized for A3 output
A4 (A4)	Slide size should be optimized for A4 output
B4ISO (B4ISO)	Slide size should be optimized for B4ISO output
B4JIS (B4JIS)	Slide size should be optimized for B4JIS output
B5ISO (B5ISO)	Slide size should be optimized for B5ISO output
B5JIS (B5JIS)	Slide size should be optimized for B5JIS output
banner (Banner)	Slide size should be optimized for banner output
custom (Custom)	Slide size should be optimized for custom output
hagakiCard (Hagaki Card)	Slide size should be optimized for hagaki card output
ledger (Ledger)	Slide size should be optimized for ledger output
letter (Letter)	Slide size should be optimized for letter output
overhead (Overhead)	Slide size should be optimized for overhead output
screen16x10 (Screen 16x10)	Slide size should be optimized for 16x10 screen output
screen16x9 (Screen 16x9)	Slide size should be optimized for 16x9 screen output
screen4x3 (Screen 4x3)	Slide size should be optimized for 4x3 screen output

Referenced By
sldSz@type (§19.2.1.39)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SlideSizeType) is located in §A.3. *end note*]

19.7.19 ST_SplitterBarState (Splitter Bar State)

This simple type specifies the state that the splitter bar should be shown in. The splitter bar separates a primary and secondary region within a viewing area.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
maximized (Max)	The primary region occupies the greatest amount of the viewing area allowed by the application.
minimized (Min)	The primary region occupies the least amount of the viewing area allowed by the application.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
restored (Restored)	The primary region has a specific intermediate size.

Referenced By
normalViewPr@horzBarState (§19.2.2.6); normalViewPr@vertBarState (§19.2.2.6)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SplitterBarState) is located in §A.3. *end note*]

19.7.20 ST_TLAnimateBehaviorCalcMode (Time List Animate Behavior Calculate Mode)

This simple type specifies how the animation flows from point to point.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
discrete (Calc Mode Enum (Discrete))	Descrete
fmla (Calc Mode Enum (Formula))	Formula
lin (Calc Mode Enum (Linear))	Linear

Referenced By
anim@calcmode (§19.5.1)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLAnimateBehaviorCalcMode) is located in §A.3. *end note*]

19.7.21 ST_TLAnimateBehaviorValueType (Time List Animate Behavior Value Types)

This simple type specifies the type of property value.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
clr (Value Type Enum (Color))	Color
num (Value Type Enum (Number))	Number

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
str (Value Type Enum (String))	String

Referenced By
anim@valueType (§19.5.1)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLAnimateBehaviorValueType) is located in §A.3. *end note*]

19.7.22 ST_TLAnimateColorDirection (Time List Animate Color Direction)

This simple type specifies the direction in which to interpolate the animation (clockwise or counterclockwise).

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ccw (Counter-Clockwise)	Counter-Clockwise
cw (Direction Enum (Clockwise))	Clockwise

Referenced By
animClr@dir (§19.5.2)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLAnimateColorDirection) is located in §A.3. *end note*]

19.7.23 ST_TLAnimateColorSpace (Time List Animate Color Space)

This simple type specifies the color space of the animation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
hsl (Color Space Enum (HSL))	Hue, Saturation, Luminance
rgb (Color Space Enum (RGB))	Red, Green, Blue

Referenced By
animClr@clrSpc (§19.5.2)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLAnimateColorSpace) is located in §A.3. *end note*]

19.7.24 ST_TLAnimateEffectTransition (Time List Animate Effect Transition)

This simple type specifies whether the effect is a transition in, transition out, or neither.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
in (Transition Enum (In))	In
none (Transition Enum (None))	None
out (Transition Enum (Out))	Out

Referenced By
animEffect@transition (§19.5.3)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLAnimateEffectTransition) is located in §A.3. *end note*]

19.7.25 ST_TLAnimateMotionBehaviorOrigin (Time List Animate Motion Behavior Origin)

This simple type specifies what the origin of the motion path is relative to.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
layout (Origin Enum (Layout))	Layout
parent (Origin Enum (Parent))	Parent

Referenced By
animMotion@origin (§19.5.4)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLAnimateMotionBehaviorOrigin) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

19.7.26 ST_TLAnimateMotionPathEditMode (Time List Animate Motion Path Edit Mode)

This simple type specifies how the motion path moves when the target element is moved.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
fixed (Path Edit Mode Enum (Fixed))	Fixed
relative (Path Edit Mode Enum (Relative))	Relative

Referenced By
animMotion@pathEditMode (§19.5.4)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLAnimateMotionPathEditMode) is located in §A.3. *end note*]

19.7.27 ST_TLBehaviorAccumulateType (Behavior Accumulate Type)

This simple type makes a repeating animation build with each iteration when set to "always."

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
always (Accumulate Enum (Always))	Always
none (Accumulate Enum (None))	None

Referenced By
cBhvr@accumulate (§19.5.22)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLBehaviorAccumulateType) is located in §A.3. *end note*]

19.7.28 ST_TLBehaviorAdditiveType (Behavior Additive Type)

This simple type specifies how to apply the animation values to the original value for the property.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
base (Additive Enum (Base))	Base
mult (Additive Enum (Multiply))	Multiply
none (None)	None
repl (Additive Enum (Replace))	Replace
sum (Additive Enum (Sum))	Sum

Referenced By
cBhvr@additive (§19.5.22)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLBehaviorAdditiveType) is located in §A.3. *end note*]

19.7.29 ST_TLBehaviorOverrideType (Behavior Override Type)

This simple type specifies how a behavior should override values of the attribute being animated on the target element. The "childStyle" clears the attributes on the children contained inside the target element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
childStyle (Override Enum (Child Style))	Child Style
normal (Override Enum (Normal))	Normal

Referenced By
cBhvr@override (§19.5.22)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLBehaviorOverrideType) is located in §A.3. *end note*]

19.7.30 ST_TLBehaviorTransformType (Behavior Transform Type)

This simple type specifies how the behavior animates the target element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
img (Image)	Image transform
pt (Point)	Point transform

Referenced By
cBhvr@xfrmType (§19.5.22)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLBehaviorTransformType) is located in §A.3. *end note*]

19.7.31 ST_TLChartSubelementType (Chart Subelement Type)

This simple type defines an animation target element that is represented by a subelement of a chart.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
category (Category Axis)	Category
gridLegend (Grid Legend)	Background Element (Grid and Legend)
ptInCategory (Single Point in Category)	Category Element
ptInSeries (Single Point in Data Series)	Series Element
series (Data Series)	Series

Referenced By
oleChartEl@type (§19.5.52)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLChartSubelementType) is located in §A.3. *end note*]

19.7.32 ST_TLCommandType (Command Type)

This simple type specifies a command type.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
call (Command Type Enum (Call))	Call
evt (Command Type Enum (Event))	Event
verb (Command Type Enum (Verb))	Verb

Referenced By
cmd@type (§19.5.28)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLCommandType) is located in §A.3. *end note*]

19.7.33 ST_TLDiagramBuildType (Diagram Build Types)

This simple type specifies the different diagram build types.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allAtOnce (Diagram Build Type Enum (All At Once))	All At Once
breadthByLvl (Diagram Build Type Enum (Breadth By Level))	Breadth By Level
breadthByNode (Diagram Build Type Enum (Breadth By Node))	Breadth By Node
ccw (Diagram Build Type Enum (Counter-Clockwise))	Counter-Clockwise
ccwIn (Diagram Build Type Enum (Counter-Clockwise-In))	Counter-Clockwise-In
ccwOut (Diagram Build Type Enum (Counter-Clockwise-Out))	Counter-Clockwise-Out
cust (Diagram Build Type Enum (Custom))	Custom
cw (Diagram Build Type Enum (Clockwise))	Clockwise
cwIn (Diagram Build Type Enum (Clockwise-In))	Clockwise-In
cwOut (Diagram Build Type Enum (Clockwise-Out))	Clockwise-Out
depthByBranch (Diagram Build Type Enum (Depth By Branch))	Depth By Branch
depthByNode (Diagram Build Type Enum (Depth By Node))	Depth By Node
down (Diagram Build Type Enum (Down))	Down

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
inByRing (Diagram Build Type Enum (In-By-Ring))	In-By-Ring
outByRing (Diagram Build Type Enum (Out-By-Ring))	Out-By-Ring
up (Diagram Build Type Enum (Up))	Up
whole (Diagram Build Type Enum (Whole))	Whole

Referenced By
bldDgm@bld (§19.5.12)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLDiagramBuildType) is located in §A.3. *end note*]

19.7.34 ST_TLNextActionType (Next Action Type)

This simple type specifies what to do when going forward in a sequence. When the value is "seek," it seeks the current child element to its natural end time before advancing to the next element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
none (Next Action Type Enum (None))	None
seek (Next Action Type Enum (Seek))	Seek

Referenced By
seq@nextAc (§19.5.65)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLNextActionType) is located in §A.3. *end note*]

19.7.35 ST_TLOleChartBuildType (Embedded Chart Build Type)

This simple type describes how to build an embedded Chart.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allAtOnce (Chart Build Type Enum (All At Once))	All At Once

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
category (Chart Build Type Enum (Category))	By Category
categoryEl (Chart Build Type Enum (Category Element))	By Category Element
series (Chart Build Type Enum (Series))	By Series
seriesEl (Chart Build Type Enum (Series Element))	By Series Element

Referenced By
bldOleChart@bld (§19.5.15)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLOleChartBuildType) is located in §A.3. *end note*]

19.7.36 ST_TLParaBuildType (Paragraph Build Type)

This simple type describes how to build a paragraph.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allAtOnce (All At Once)	Specifies to animate all paragraphs at once.
cust (Custom)	Specifies the build has custom user settings.
p (Paragraph)	Specifies to animate paragraphs grouped by bullet level.
whole (Whole)	Specifies to animate the entire body of text as one block.

Referenced By
bldP@build (§19.5.16)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLParaBuildType) is located in §A.3. *end note*]

19.7.37 ST_TLPreviousActionType (Previous Action Type)

This simple type specifies what to do when going backwards in a sequence. When the value is "skipTimed," the sequence continues to go backwards until it reaches a sequence element that was defined to being only on a "next" event.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
none (Previous Action Type Enum (None))	None
skipTimed (Previous Action Type Enum (Skip Timed))	Skip Timed

Referenced By
seq@prevAc (§19.5.65)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLPreviousActionType) is located in §A.3. *end note*]

19.7.38 ST_TLTime (Time)

This simple type specifies time after which to automatically advance the build to the next step. An amount of time, in milliseconds.

This simple type is a union of the following types:

- The ST_TLTimeIndefinite simple type (§19.7.40).
- The W3C XML Schema unsignedInt datatype.

Referenced By
bldP@advAuto (§19.5.16); cond@delay (§19.5.31); cTn@dur (§19.5.33); cTn@repeatCount (§19.5.33); cTn@repeatDur (§19.5.33); endSync@delay (§19.5.39); tmAbs@val (§19.5.82)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTime) is located in §A.3. *end note*]

19.7.39 ST_TLTimeAnimateValueTime (Animation Time)

This simple type specifies a percentage within the time span of the element. A value of `indefinite` means the attribute should be ignored.

This simple type is a union of the following types:

- The ST_PositiveFixedPercentage simple type (§20.1.10.44).
- The ST_TLTimeIndefinite simple type (§19.7.40).

Referenced By
tav@tm (§19.5.79)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTimeAnimateValueTime) is located in §A.3. *end note*]

19.7.40 ST_TLTimeIndefinite (Indefinite Time Declaration)

This simple type specifies a value that designates an "indefinite" amount time -- typically means this property is subordinate to other, defined properties.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
indefinite (Indefinite Type Enum)	Specifies Indefinite Time

Referenced By
ST_TLTime (§19.7.38); ST_TLTimeAnimateValueTime (§19.7.39)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTimeIndefinite) is located in §A.3. *end note*]

19.7.41 ST_TLTimeNodeFillType (Time Node Fill Type)

This simple type specifies what modifications the effect leaves on the target element's properties when the effect ends.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
freeze (Freeze)	Freeze
hold (TimeNode Fill Type Enum (Hold))	Hold
remove (Remove)	Remove
transition (Transition)	Transition

Referenced By
cTn@fill (§19.5.33)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTimeNodeFillType) is located in §A.3. *end note*]

19.7.42 ST_TLTimeNodeID (Time Node ID)

This simple type represents a node or event on the timeline by its identifier.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

Referenced By
cTn@id (§19.5.33); tn@val (§19.5.86)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTimeNodeID) is located in §A.3. *end note*]

19.7.43 ST_TLTimeNodeMasterRelation (Time Node Master Relation)

This simple type specifies how the time node plays back relative to its master time node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
lastClick (TimeNode Master Relation Enum (Last Click))	Last Click
nextClick (TimeNode Master Relation Enum (Next Click))	Next Click
sameClick (TimeNode Master Relation Enum (Same Click))	Same Click

Referenced By
cTn@masterRel (§19.5.33)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTimeNodeMasterRelation) is located in §A.3. *end note*]

19.7.44 ST_TLTimeNodePresetClassType (Time Node Preset Class Type)

This simple type specifies the class of effect in which this effect belongs.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
emph (Preset Type Enum (Emphasis))	Emphasis Preset
entr (Preset Type Enum (Entrance))	Entrance Preset
exit (Exit)	Exit Preset
mediacall (Preset Type Enum (Media Call))	Media Call Preset
path (Preset Type Enum (Path))	Path Preset
verb (Preset Type Enum (Verb))	Verb Preset

Referenced By
cTn@presetClass (§19.5.33)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTimeNodePresetClassType) is located in §A.3. *end note*]

19.7.45 ST_TLTimeNodeRestartType (Time Node Restart Type)

This simple type determines whether an effect can play more than once.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
always (Restart Enum (Always))	Always restart node
never (Restart Enum (Never))	Never restart node
whenNotActive (Restart Enum (When Not Active))	Restart when node is not active

Referenced By
cTn@restart (§19.5.33)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTimeNodeRestartType) is located in §A.3. *end note*]

19.7.46 ST_TLTimeNodeSyncType (Time Node Sync Type)

This simple type specifies how the time node synchronizes to its group.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
canSlip (TimeNode Sync Enum (Can Slip))	Can Slip
locked (TimeNode Sync Enum (Locked))	Locked

Referenced By
cTn@syncBehavior (§19.5.33)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTimeNodeSyncType) is located in §A.3. *end note*]

19.7.47 ST_TLTimeNodeType (Time Node Type)

This simple type specifies time node types.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
afterEffect (Node Type Enum (After Effect))	After Effect
afterGroup (Node Type Enum (After Group))	After Group
clickEffect (Node Type Enum (Click Effect))	Click Effect
clickPar (Node Type Enum (Click Paragraph))	Click Paragraph
interactiveSeq (Node Type Enum (Interactive Sequence))	Interactive Sequence
mainSeq (Node Type Enum (Main Sequence))	Main Sequence
tmRoot (Node Type Enum (Timing Root))	Timing Root
withEffect (Node Type Enum (With Effect))	With Effect
withGroup (Node Type Enum (With Group))	With Group

Referenced By
cTn@nodeType (§19.5.33)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTimeNodeType) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

19.7.48 ST_TLTriggerEvent (Trigger Event)

This simple type specifies a particular event that causes the time condition to be true.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
begin (Trigger Event Enum (Begin))	Fire trigger at the beginning
end (Trigger Event Enum (End))	Fire trigger at the end
onBegin (Trigger Event Enum (On Begin))	Fire trigger at the beginning
onClick (Trigger Event Enum (On Click))	Fire trigger on a mouse click
onDblClick (Trigger Event Enum (On Double Click))	Fire trigger on double-mouse click
onEnd (Trigger Event Enum (On End))	Fire trigger at the end
onMouseOut (Trigger Event Enum (On Mouse Out))	Fire trigger on mouse out
onMouseOver (Trigger Event Enum (On Mouse Over))	Fire trigger on mouse over
onNext (Trigger Event Enum (On Next))	Fire trigger on next node
onPrev (Trigger Event Enum (On Previous))	Fire trigger on previous node
onStopAudio (Trigger Event Enum (On Stop Audio))	Fire trigger on stop audio

Referenced By
cond@evt (§19.5.31); endSync@evt (§19.5.39)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTriggerEvent) is located in §A.3. *end note*]

19.7.49 ST_TLTriggerRuntimeNode (Trigger RunTime Node)

This simple type specifies the child time node that triggers a time condition. References a child TimeNode or all child nodes. Order is based on the child's end time.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (Trigger RunTime Node Enum (All))	All
first (Trigger RunTime Node (First))	First
last (Trigger RunTime Node (Last))	Last

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Referenced By
rtn@val (§19.5.64)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLTriggerRuntimeNode) is located in §A.3. *end note*]

19.7.50 ST_TransitionCornerDirectionType (Transition Corner Direction Type)

This simple type specifies diagonal directions for slide transitions.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ld (Transition Corner Direction Enum (Left-Down))	Specifies the slide transition direction of left-down
lu (Transition Corner Direction Enum (Left-Up))	Specifies the slide transition direction of left-up
rd (Transition Corner Direction Enum (Right-Down))	Specifies the slide transition direction of right-down
ru (Transition Corner Direction Enum (Right-Up))	Specifies the slide transition direction of right-up

Referenced By
ST_TransitionEightDirectionType (§19.7.51); strips@dir (§19.5.74)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TransitionCornerDirectionType) is located in §A.3. *end note*]

19.7.51 ST_TransitionEightDirectionType (Transition Eight Direction)

This simple type specifies the direction of an animation.

This simple type is a union of the following types:

- The ST_TransitionCornerDirectionType simple type (§19.7.50).
- The ST_TransitionSideDirectionType simple type (§19.7.53).

Referenced By
cover@dir (§19.5.32); pull@dir (§19.5.58)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TransitionEightDirectionType) is located in §A.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

19.7.52 ST_TransitionInOutDirectionType (Transition In/Out Direction Type)

This simple type specifies if a slide transition should go in or out.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
in (Transition In/Out Direction Enum (In))	Specifies the slide transition should go in
out (Transition In/Out Direction Enum (Out))	Specifies the slide transition should go out

Referenced By
split@dir (§19.5.71); zoom@dir (§19.5.97)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TransitionInOutDirectionType) is located in §A.3. *end note*]

19.7.53 ST_TransitionSideDirectionType (Transition Side Direction Type)

This simple type defines a set of slide transition directions.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
d (Transition Side Direction Enum (Down))	Specifies that the transition direction is down
l (Transition Side Direction Enum (Left))	Specifies that the transition direction is left
r (Transition Side Direction (Right))	Specifies that the transition direction is right
u (Transition Side Direction Enum (Up))	Specifies that the transition direction is up

Referenced By
push@dir (§19.5.59); ST_TransitionEightDirectionType (§19.7.51); wipe@dir (§19.5.96)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TransitionSideDirectionType) is located in §A.3. *end note*]

19.7.54 ST_TransitionSpeed (Transition Speed)

This simple type defines the allowed transition speeds for transitioning from the current slide to the next.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
fast (Fast)	Fast slide transition.
med (Medium)	Medium slide transition.
slow (low)	Slow slide transition.

Referenced By
transition@spd (§19.3.1.50)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TransitionSpeed) is located in §A.3. *end note*]

19.7.55 ST_ViewType (List of View Types)

This simple type specifies the kind of view that should be used when displaying the presentation document to the user.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
handoutView (Handout View)	Handout View mode should be used.
notesMasterView (Notes Master View)	Notes Master View mode should be used.
notesView (Notes View)	Notes View mode should be used.
outlineView (Outline View)	Outline View mode should be used.
sldMasterView (Slide Master View)	Slide Master View mode should be used.
sldSorterView (Slide Sorter View)	Slide Sorter View mode should be used.
sldThumbnailView (Slide Thumbnail View)	Slide Thumbnail View mode should be used.
sldView (Normal Slide View)	Normal Slide View mode should be used.

Referenced By
viewPr@lastView (§19.2.2.18)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ViewType) is located in §A.3. *end note*]

20. DrawingML - Framework Reference Material

The subordinate subclauses specify the semantics for the XML markup comprising DrawingML content, which can be used within the contents of WordprocessingML, SpreadsheetML, or PresentationML documents.

This portion of DrawingML defines its core pieces.

20.1 DrawingML - Main

The DrawingML Main namespace defines all of the base constructs for all kinds of DrawingML objects (charts, diagrams, shapes, pictures, and so on). These constructs and primitives are defined below.

20.1.1 Table of Contents

This subclause is informative.

20.1.2 Basics 3023
20.1.2.1 EMU Unit of Measurement 3023
20.1.2.2 Core Drawing Object Information 3023
20.1.2.2.1 bldChart (Build Chart) 3023
20.1.2.2.2 bldDgm (Build Diagram) 3024
20.1.2.2.3 chart (Chart to Animate) 3025
20.1.2.2.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties) 3025
20.1.2.2.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties) 3026
20.1.2.2.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties) 3026
20.1.2.2.7 cNvPicPr (Non-Visual Picture Drawing Properties) 3027
20.1.2.2.8 cNvPr (Non-Visual Drawing Properties) 3028
20.1.2.2.9 cNvSpPr (Non-Visual Shape Drawing Properties) 3030
20.1.2.2.10 cxnSp (Connection Shape) 3031
20.1.2.2.11 cxnSpLocks (Connection Shape Locks) 3033
20.1.2.2.12 dgm (Diagram to Animate) 3034
20.1.2.2.13 endCxn (Connection End) 3035
20.1.2.2.14 ext (Extension) 3036
20.1.2.2.15 extLst (Extension List) 3036
20.1.2.2.16 graphic (Graphic Object) 3037
20.1.2.2.17 graphicData (Graphic Object Data) 3038
20.1.2.2.18 graphicFrame (Graphic Frame) 3038
20.1.2.2.19 graphicFrameLocks (Graphic Frame Locks) 3039
20.1.2.2.20 grpSp (Group shape) 3040
20.1.2.2.21 grpSpLocks (Group Shape Locks) 3042
20.1.2.2.22 grpSpPr (Visual Group Shape Properties) 3043
20.1.2.2.23 hlinkHover (Hyperlink for Hover) 3044
20.1.2.2.24 ln (Outline) 3046

20.1.10.86 ST_TextBulletSize (Bullet Size Percentage) 3456

End of informative text.

20.1.2 Basics

This section describes all the basic common elements associated with the DrawingML framework.

20.1.2.1 EMU Unit of Measurement

Throughout ISO/IEC 29500, the EMU is used as a unit of measurement for length. An *EMU* is defined as follows:

$$1 \text{ emu} = \frac{1}{914400} \text{US inch} = \frac{1}{360000} \text{cm}$$

[*Rationale*: The EMU was created in order to be able to evenly divide in both English and Metric units, in order to avoid rounding errors during the calculation. The usage of EMUs also facilitates a more seamless system switch and interoperability between different locales utilizing different units of measurement. EMUs define an integer based, high precision coordinate system. *end rationale*]

20.1.2.2 Core Drawing Object Information

Within DrawingML, there is the notion of core drawing elements. These are elements that both are vital to and common across the DrawingML framework. These elements denote the most integral pieces of the DrawingML document structure and thus are among the most widely used.

[*Note*: Measurement Units - Length units must be expressed in device-independent physical units: English Metric units (EMUs), points, picas, and inches. Device-dependent units such as pixels must not be used. *end note*]

20.1.2.2.1 bldChart (Build Chart)

This element specifies how to build the animation for a diagram.

[*Example*: Consider the following example where a chart is specified to be animated by category rather than as one entity. Thus, the bldChart element should be used as follows:

```
<p:bdldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
    <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
bldSub (§19.5.17)

Attributes	Description
animBg (Animate Background)	Specifies whether or not the chart background elements should be animated as well. [*Note*: An example of background elements are grid lines and the chart legend. *end note*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
bld (Build)	Specifies how the chart is built. The animation animates the sub-elements in the container in the particular order defined by this attribute. The possible values for this attribute are defined by the ST_AnimationChartBuildType simple type (§20.1.10.5).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AnimationChartBuildProperties) is located in §A.4.1. *end note*]

20.1.2.2.2 bldDgm (Build Diagram)

This element specifies how to build the animation for a diagram.

[*Example*: Consider having a diagram appear as on entity as opposed to by section. The bldDgm element should be used as follows:

```
<p:bdldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
      <a:bldDgm bld="one"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

Parent Elements
bldSub (§19.5.17)

Attributes	Description
bld (Build)	Specifies how the chart is built. The animation animates the sub-elements in the container in the particular order defined by this attribute.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_AnimationDgmBuildType simple type (§20.1.10.7).
rev (Reverse Animation)	Specifies whether the animation of the objects in this diagram should be reversed or not. If this attribute is not specified, a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_AnimationDgmBuildProperties) is located in §A.4.1. *end note*]

20.1.2.2.3 chart (Chart to Animate)

This element specifies a reference to a chart that should be animated within a sequence of slide animations. In addition to simply acting as a reference to a chart there is also animation build steps defined.

Parent Elements
graphicEl (§19.5.45)

Attributes	Description
bldStep (Animation Build Step)	Specifies which step this part of the chart should be built using. For instance the chart can be built as one object meaning it is animated as a single graphic. Alternatively the chart can be animated, or built as separate pieces. The possible values for this attribute are defined by the ST_ChartBuildStep simple type (§20.1.10.13).
categoryIdx (Category Index)	Specifies the index of the category within the corresponding chart that should be animated. The possible values for this attribute are defined by the W3C XML Schema int datatype.
seriesIdx (Series Index)	Specifies the index of the series within the corresponding chart that should be animated. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_AnimationChartElement) is located in §A.4.1. *end note*]

20.1.2.2.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual drawing properties for a connector shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
nvCxnSpPr (§20.1.2.2.25)

Child Elements	Subclause
cxnSpLocks (Connection Shape Locks)	§20.1.2.2.11
endCxn (Connection End)	§20.1.2.2.13
extLst (Extension List)	§20.1.2.2.15
stCxn (Connection Start)	§20.1.2.2.36

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualConnectorProperties) is located in §A.4.1. *end note*]

20.1.2.2.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGraphicFramePr (§20.1.2.2.26)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
graphicFrameLocks (Graphic Frame Locks)	§20.1.2.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualGraphicFrameProperties) is located in §A.4.1. *end note*]

20.1.2.2.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGrpSpPr (§20.1.2.2.27)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
grpSpLocks (Group Shape Locks)	§20.1.2.2.21

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualGroupDrawingShapeProps) is located in §A.4.1. *end note*]

20.1.2.2.7 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  …
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
    <p:nvPr/>
  </p:nvPicPr>
  …
</p:pic>
```

end example]

Parent Elements
nvPicPr (§20.1.2.2.28)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
picLocks (Picture Locks)	§20.1.2.2.31

Attributes	Description
preferRelativeResize (Relative Resize Preferred)	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size. [*Example*: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualPictureProperties) is located in §A.4.1. *end note*]

20.1.2.2.8 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  …
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  </p:nvPicPr>
  …
</p:pic>
```

end example]

Parent Elements
nvCxnSpPr (§20.1.2.2.25); nvGraphicFramePr (§20.1.2.2.26); nvGrpSpPr (§20.1.2.2.27); nvPicPr (§20.1.2.2.28); nvSpPr (§20.1.2.2.29)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
hlinkClick (Click Hyperlink)	§21.1.2.3.5
hlinkHover (Hyperlink for Hover)	§20.1.2.2.23

Attributes	Description
descr (Alternative Text for Object)	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object. If this element is omitted, then no alternative text is present for the parent object.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
	[*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">` The descr attribute contains alternative text which can be used in place of the actual DrawingML object. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
hidden (Hidden)	Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [*Note*: An application can have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden). [*Example*: Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />` The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
id (Unique Identifier)	Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant. [*Example*: Consider a DrawingML object defined as follows: `<… id="10" … >` The id attribute has a value of `10`, which is the unique identifier for this DrawingML object. *end example*] The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).
name (Name)	Specifies the name of the object. [*Note*: Typically, this is used to store the original file

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: `< … name="foo.jpg" >` The name attribute has a value of `foo.jpg`, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
title (Title)	Specifies the title (caption) of the current DrawingML object. If this attribute is omitted, then no title text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… title="Process Flow Diagram">` *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualDrawingProps) is located in §A.4.1. *end note*]

20.1.2.2.9 cNvSpPr (Non-Visual Shape Drawing Properties)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with

[*Example*: Consider the shape that has a shape lock applied to it.

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 1"/>
    <p:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </p:cNvSpPr>
  </p:nvSpPr>
…
</p:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
nvSpPr (§20.1.2.2.29)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
spLocks (Shape Locks)	§20.1.2.2.34

Attributes	Description
txBox (Text Box)	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box. [*Note*: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. *end note*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualDrawingShapeProps) is located in §A.4.1. *end note*]

20.1.2.2.10 cxnSp (Connection Shape)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector takes. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[*Example*: Consider the following connector shape that connects two regular shapes.

```
<p:spTree>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
…
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="1" name="Rectangle 1"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  …
</p:sp>
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 2"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  …
</p:sp>
<p:cxnSp>
  <p:nvCxnSpPr>
    <p:cNvPr id="3" name="Elbow Connector 3"/>
    <p:cNvCxnSpPr>
      <a:stCxn id="1" idx="3"/>
      <a:endCxn id="2" idx="1"/>
    </p:cNvCxnSpPr>
    <p:nvPr/>
  </p:nvCxnSpPr>
  …
</p:cxnSp>
</p:spTree>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_GvmlConnector) is located in §A.4.1. *end note*]

20.1.2.2.11 cxnSpLocks (Connection Shape Locks)

This element specifies all locking properties for a connection shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvCxnSpPr (§21.3.2.3); cNvCxnSpPr (§20.1.2.2.4); cNvCxnSpPr (§20.5.2.4); cNvCxnSpPr (§19.3.1.8)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeArrowheads (Disallow Arrowhead Changes)	Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeShapeType (Disallow Shape Type Change)	Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noEditPoints (Disallow Shape Point Editing)	Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noMove (Disallow Shape Movement)	Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noResize (Disallow Shape Resize)	Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noRot (Disallow Shape Rotation)	Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noSelect (Disallow Shape Selection)	Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ConnectorLocking) is located in §A.4.1. *end note*]

20.1.2.2.12 dgm (Diagram to Animate)

This element specifies a reference to a diagram that should be animated within a sequence of slide animations. In addition to simply acting as a reference to a diagram there is also animation build steps defined.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
graphicEl (§19.5.45)

Attributes	Description
bldStep (Animation Build Step)	Specifies which step this part of the diagram should be built using. For instance the diagram can be built as one object meaning it is animated as a single graphic. Alternatively the diagram can be animated, or built as separate pieces. The possible values for this attribute are defined by the ST_DgmBuildStep simple type (§20.1.10.20).
id (Identifier)	Specifies the GUID of the shape for this build step in the animation. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AnimationDgmElement) is located in §A.4.1. *end note*]

20.1.2.2.13 endCxn (Connection End)

This element specifies the ending connection that should be made by the corresponding connector shape. This connects the end tail of the connector to the final destination shape.

Parent Elements
cNvCxnSpPr (§21.3.2.3); cNvCxnSpPr (§20.1.2.2.4); cNvCxnSpPr (§20.5.2.4); cNvCxnSpPr (§19.3.1.8)

Attributes	Description
id (Identifier)	Specifies the id of the shape to make the final connection to. The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).
idx (Index)	Specifies the index into the connection site table of the final connection shape. That is there are many connection sites on a shape and it shall be specified which connection site the corresponding connector shape should connect to. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Connection) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.2.2.14 ext (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements in the future that is used for later versions of generating applications.

[*Note*: This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

Parent Elements
extLst (§21.4.2.13); extLst (§20.1.2.2.15)

Child Elements	Subclause
Zero or more elements in any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag. The possible values for this attribute are defined by the W3C XML Schema token datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_OfficeArtExtension) is located in §A.4.1. *end note*]

20.1.2.2.15 extLst (Extension List)

This element specifies the extension list within which all future extensions of element type ext is defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the DrawingML framework. This allows for various new types of data to be stored natively within the framework.

Parent Elements
audioCd (§20.1.3.1); audioFile (§20.1.3.2); backdrop (§20.1.5.2); blip (§20.1.8.13); bodyPr (§21.1.2.1.1); bodyStyle (§19.3.1.5); cell3D (§21.1.3.1); clrMap (§20.1.6.1); clrMap (§19.3.1.6); clrMapOvr (§21.2.2.30); clrScheme (§20.1.6.2); cNvCxnSpPr (§21.3.2.3); cNvCxnSpPr (§20.1.2.2.4); cNvCxnSpPr (§20.5.2.4); cNvCxnSpPr (§19.3.1.8); cNvGraphicFramePr (§21.3.2.4); cNvGraphicFramePr (§20.1.2.2.5); cNvGraphicFramePr (§20.5.2.5); cNvGraphicFramePr (§20.4.2.4); cNvGraphicFramePr (§19.3.1.9); cNvGrpSpPr (§21.3.2.5); cNvGrpSpPr (§20.1.2.2.6); cNvGrpSpPr (§20.5.2.6); cNvGrpSpPr (§19.3.1.10); cNvPicPr (§21.3.2.6); cNvPicPr (§20.1.2.2.7); cNvPicPr (§20.2.2.2); cNvPicPr (§20.5.2.7); cNvPicPr (§19.3.1.11); cNvPr (§21.3.2.7); cNvPr (§20.1.2.2.8); cNvPr (§20.2.2.3); cNvPr (§20.5.2.8); cNvPr (§19.3.1.12); cNvSpPr (§21.3.2.8); cNvSpPr (§20.1.2.2.9); cNvSpPr (§20.5.2.9); cNvSpPr (§19.3.1.13); cxnSp (§20.1.2.2.10); cxnSpLocks (§20.1.2.2.11); defaultTextStyle (§19.2.1.8); defPPr (§21.1.2.2.2); defRPr (§21.1.2.3.2); docPr

20.1.2.2.17 graphicData (Graphic Object Data)

This element specifies the reference to a graphic object within the document. This graphic object is provided entirely by the document authors who choose to persist this data within the document.

[*Note*: Depending on the kind of graphical object used not every generating application that supports the OOXML framework has the ability to render the graphical object. *end note*]

[*Note*: This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

Parent Elements
graphic (§20.1.2.2.16)

Child Elements	Subclause
Any element in any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag. The possible values for this attribute are defined by the W3C XML Schema token datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_GraphicalObjectData) is located in §A.4.1. *end note*]

20.1.2.2.18 graphicFrame (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

Parent Elements
grpSp (§20.1.2.2.20); lockedCanvas (§20.3.2.1)

Child Elements	Subclause

Child Elements	Subclause
xfrm (2D Transform for Individual Objects)	§20.1.7.6

[*Note*: The W3C XML Schema definition of this element's content model (CT_GvmlGraphicalObjectFrame) is located in §A.4.1. *end note*]

20.1.2.2.19 graphicFrameLocks (Graphic Frame Locks)

This element specifies all locking properties for a graphic frame. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvGraphicFramePr (§21.3.2.4); cNvGraphicFramePr (§20.1.2.2.5); cNvGraphicFramePr (§20.5.2.5); cNvGraphicFramePr (§20.4.2.4); cNvGraphicFramePr (§19.3.1.9)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15

Attributes	Description
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding graphic frame. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noDrilldown (Disallow Selection of Child Shapes)	Specifies that the generating application should not allow selecting of objects within the corresponding graphic frame but allow selecting of the graphic frame itself. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the generating application should not allow shape grouping for the corresponding graphic frame. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noMove (Disallow Shape Movement)	Specifies that the corresponding graphic frame cannot be moved. Objects that reside within the graphic frame can still be moved unless they also have been locked. If this attribute is not specified, then a value of false is assumed.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noResize (Disallow Shape Resize)	Specifies that the generating application should not allow size changes for the corresponding graphic frame. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noSelect (Disallow Shape Selection)	Specifies that the generating application should not allow selecting of the corresponding picture. That means also that no picture, shapes or text attached to this picture can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed. [*Note*: If this attribute is specified to be true then the graphic frame cannot be selected and the objects within the graphic frame cannot be selected as well. That is the entire graphic frame including all sub-parts are considered un-selectable. *end note*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_GraphicalObjectFrameLocking) is located in §A.4.1. *end note*]

20.1.2.2.20 grpSp (Group shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[*Example*: Consider the following group shape.

```
<p:grpSp>
  <p:nvGrpSpPr>
    <p:cNvPr id="10" name="Group 9"/>
    <p:cNvGrpSpPr/>
    <p:nvPr/>
  </p:nvGrpSpPr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<p:grpSpPr>
  <a:xfrm>
    <a:off x="838200" y="990600"/>
    <a:ext cx="2426208" cy="978408"/>
    <a:chOff x="838200" y="990600"/>
    <a:chExt cx="2426208" cy="978408"/>
  </a:xfrm>
</p:grpSpPr>
<p:sp>
…
</p:sp>
<p:sp>
…
</p:sp>
<p:sp>
…
</p:sp>
</p:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. *end example*]

20.1.2.2.21 grpSpLocks (Group Shape Locks)

This element specifies all locking properties for a connection shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvGrpSpPr (§21.3.2.5); cNvGrpSpPr (§20.1.2.2.6); cNvGrpSpPr (§20.5.2.6); cNvGrpSpPr (§19.3.1.10)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15

Attributes	Description
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the corresponding group shape cannot be grouped. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noMove (Disallow Moving Shape)	Specifies that the corresponding graphic frame cannot be moved. Objects that reside within the graphic frame can still be moved unless they also have been locked. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noResize (Disallow Shape Resizing)	Specifies that the corresponding group shape cannot be resized. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noRot (Disallow Shape Rotation)	Specifies that the corresponding group shape cannot be rotated Objects that reside within the group can still be rotated unless they also have been locked. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noSelect (Disallow	Specifies that the corresponding group shape cannot have any part of it be selected. That

Attributes	Description
Shape Selection)	means that no picture, shapes or attached text can be selected either if this attribute has been specified. If this attribute is not specified, then a value of false is assumed. [*Note*: This property is inherited by sub-elements and thus all shapes within the group shape cannot be selected when this attribute is set to a value of true. *end note*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noUngrp (Disallow Shape Ungrouping)	Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_GroupLocking) is located in §A.4.1. *end note*]

20.1.2.2.22 grpSpPr (Visual Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Parent Elements
grpSp (§20.1.2.2.20); lockedCanvas (§20.3.2.1)

Child Elements	Subclause
blipFill (Picture Fill)	§20.1.8.14
effectDag (Effect Container)	§20.1.8.25
effectLst (Effect Container)	§20.1.8.26
extLst (Extension List)	§20.1.2.2.15
gradFill (Gradient Fill)	§20.1.8.33
grpFill (Group Fill)	§20.1.8.35
noFill (No Fill)	§20.1.8.44
pattFill (Pattern Fill)	§20.1.8.47
scene3d (3D Scene Properties)	§20.1.4.1.26
solidFill (Solid Fill)	§20.1.8.54
xfrm (2D Transform for Grouped Objects)	§20.1.7.5

Attributes	Description
bwMode (Black and White Mode)	Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes use when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

[*Note*: The W3C XML Schema definition of this element's content model (CT_GroupShapeProperties) is located in §A.4.1. *end note*]

20.1.2.2.23 hlinkHover (Hyperlink for Hover)

This element specifies the hyperlink information to be activated when the user's mouse is hovered over the corresponding object. The operation of the hyperlink is to have the specified action be activated when the mouse of the user hovers over the object. When this action is activated then additional attributes can be used to specify other tasks that should be performed along with the action.

Parent Elements
cNvPr (§21.3.2.7); cNvPr (§20.1.2.2.8); cNvPr (§20.2.2.3); cNvPr (§20.5.2.8); cNvPr (§19.3.1.12); docPr (§20.4.2.5)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
snd (Hyperlink Sound)	§20.1.2.2.32

Attributes	Description
action (Action Setting)	Specifies an action that is to be taken when this hyperlink is activated. This can be used to specify a slide to be navigated to or a script of code to be run. The possible values for this attribute are defined by the W3C XML Schema string datatype.
endSnd (End Sounds)	Specifies if the URL in question should stop all sounds that are playing when it is clicked.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
highlightClick (Highlight Click)	Specifies if this attribute has already been used within this document. That is when a hyperlink has already been visited that this attribute would be utilized so the generating application can determine the color of this text. If this attribute is omitted, then a value of 0 or false is implied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
history (Add Hyperlink to Page History)	Specifies whether to add this URI to the history when navigating to it. This allows for the viewing of this presentation without the storing of history information on the viewing machine. If this attribute is omitted, then a value of `1` or `true` is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
id (Drawing Object Hyperlink Target) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship id that when looked up in this slides relationship file contains the target of this hyperlink. This attribute cannot be omitted. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
invalidUrl (Invalid URL)	Specifies the URL when it has been determined by the generating application that the URL is invalid. That is the generating application can still store the URL but it is known that this URL is not correct. The possible values for this attribute are defined by the W3C XML Schema string datatype.
tgtFrame (Target Frame)	Specifies the target frame that is to be used when opening this hyperlink. When the hyperlink is activated this attribute is used to determine if a new window is launched for viewing or if an existing one can be used. If this attribute is omitted, than a new window is opened. The possible values for this attribute are defined by the W3C XML Schema string datatype.
tooltip (Hyperlink Tooltip)	Specifies the tooltip that should be displayed when the hyperlink text is hovered over with the mouse. If this attribute is omitted, than the hyperlink text itself can be displayed. The possible values for this attribute are defined by the W3C XML Schema string datatype.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeArrowheads (Disallow Arrowhead Changes)	Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeShapeType (Disallow Shape Type Change)	Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noCrop (Disallow Crop Changes)	Specifies that the generating application should not allow cropping for the corresponding picture. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noEditPoints (Disallow Shape Point Editing)	Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noMove (Disallow Shape Movement)	Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

Attributes	Description
noResize (Disallow Shape Resize)	Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noRot (Disallow Shape Rotation)	Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noSelect (Disallow Shape Selection)	Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PictureLocking) is located in §A.4.1. *end note*]

20.1.2.2.32 snd (Hyperlink Sound)

This element specifies a sound to be played when a hyperlink within the document is activated. This sound is specified from within the parent hyperlink element.

Parent Elements
hlinkClick (§21.1.2.3.5); hlinkHover (§20.1.2.2.23); hlinkMouseOver (§21.1.2.3.6)

Attributes	Description
embed (Embedded Audio File Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [*Note*: A list of suggested audio types is provided in §15.2.2. *end note*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Sound	Specifies the original name or given short name for the corresponding sound. This is used

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
Name)	to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_EmbeddedWAVAudioFile) is located in §A.4.1. *end note*]

20.1.2.2.33 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

[*Note*: Shapes are the preferred mechanism for specifying text on a slide. *end note*]

Parent Elements

fontRef (Font Reference)	§20.1.4.1.17
lnRef (Line Reference)	§20.1.4.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShapeStyle) is located in §A.4.1. *end note*]

20.1.2.2.38 sx (Horizontal Ratio)

This element specifies the horizontal ratio for use within a scaling calculation.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Parent Elements
scale (§19.2.2.13)

Attributes	Description
d (Denominator)	Specifies the denominator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype.
n (Numerator)	Specifies the numerator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Ratio) is located in §A.4.1. *end note*]

20.1.2.2.39 sy (Vertical Ratio)

This element specifies the vertical ratio for use within a scaling calculation.

Parent Elements
scale (§19.2.2.13)

Attributes	Description
d (Denominator)	Specifies the denominator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype.
n (Numerator)	Specifies the numerator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Ratio) is located in §A.4.1. *end note*]

20.1.2.2.40 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

Parent Elements
tc (§21.1.3.16); txSp (§20.1.2.2.41)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.2.3 Colors

Given its own section within DrawingML Basics, colors are an integral part of the DrawingML framework. Colors are used in virtually every object to help describe it's appearance when it is rendered on the screen. Since not every generating application wishes to represent color in the same manner, it is possible to specify color in a number of different ways.

20.1.2.3.1 alpha (Alpha)

This element specifies its input color with the specific opacity, but with its color unchanged.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the opacity as expressed by a percentage value.
	
	[*Example*: The following represents a green solid fill which is 50% opaque
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:alpha val="50%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositiveFixedPercentage) is located in §A.4.1. *end note*]

20.1.2.3.2 alphaMod (Alpha Modulation)

This element specifies a more or less opaque version of its input color. An alpha modulate never increases the alpha beyond 100%. A 200% alpha modulate makes a input color twice as opaque as before. A 50% alpha modulate makes a input color half as opaque as before.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description

val (Value)	Specifies the opacity as expressed by a percentage relative to the input color.
	
	[*Example*: The following represents a green solid fill which is 50% opaque
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:alphaMod val="50%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositivePercentage) is located in §A.4.1. *end note*]

20.1.2.3.3 alphaOff (Alpha Offset)

This element specifies a more or less opaque version of its input color. Increases or decreases the input alpha percentage by the specified percentage offset. A 10% alpha offset increases a 50% opacity to 60%. A -10% alpha offset decreases a 50% opacity to 40%. The transformed alpha values are limited to a range of 0 to 100%. A 10% alpha offset increase to a 100% opaque object still results in 100% opacity.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the opacity as expressed by a percentage offset increase or decrease to the input color. Increases never increase the opacity beyond 100%, decreases never decrease the opacity below 0%.
	
	[*Example*: The following represents a green solid fill which is 90% opaque
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:alphaOff val="-10%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).

[*Note*: The W3C XML Schema definition of this element's content model (CT_FixedPercentage) is located in §A.4.1. *end note*]

20.1.2.3.4 blue (Blue)

This element specifies the input color with the specific blue component, but with the red and green color components unchanged.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.5 blueMod (Blue Modulation)

This element specifies the input color with its blue component modulated by the given percentage. A 50% blue modulate reduces the blue component by half. A 200% blue modulate doubles the blue component.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the blue component as expressed by a percentage relative to the input color component. Increases never increase the blue component beyond 100%, decreases never decrease the blue component below 0%.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, 00, FF) to value RRGGBB= (00, 00, 80)
	
	`<a:solidFill>`
	`  <a:srgbClr val="0000FF">`
	`  <a:blueMod val="50%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.6 blueOff (Blue Offset)

This element specifies the input color with its blue component shifted, but with its red and green color components unchanged.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description
val (Value)	Specifies the blue component as expressed by a percentage offset increase or decrease to the input color component. Increases never increase the blue component beyond 100%, decreases never decrease the blue component below 0%. [*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, 00, FF) to value RRGGBB= (00, 00, CC)

Attributes	Description
	<a:solidFill> <a:srgbClr val="00FF00"> <a:blueOff val="-20%"/> </a:srgbClr> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.7 comp (Complement)

This element specifies that the color rendered should be the complement of its input color with the complement being defined as such. Two colors are called complementary if, when mixed they produce a shade of grey. For instance, the complement of red which is RGB (255, 0, 0) is cyan which is RGB (0, 255, 255).

Primary colors and secondary colors are typically paired in this way:

- red and cyan (where cyan is the mixture of green and blue)
- green and magenta (where magenta is the mixture of red and blue)
- blue and yellow (where yellow is the mixture of red and green)

[*Example*:

The following represents the complement of red:

```
<a:solidFill>
  <a:srgbClr val="FF0000">
    <a:comp/>
  </a:srgbClr>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

[*Note*: The W3C XML Schema definition of this element's content model (CT_ComplementTransform) is located in §A.4.1. *end note*]

20.1.2.3.8 gamma (Gamma)

This element specifies that the output color rendered by the generating application should be the sRGB gamma shift of the input color.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

[*Note*: The W3C XML Schema definition of this element's content model (CT_GammaTransform) is located in §A.4.1. *end note*]

20.1.2.3.9 gray (Gray)

This element specifies a grayscale of its input color, taking into relative intensities of the red, green, and blue primaries.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

[*Note*: The W3C XML Schema definition of this element's content model (CT_GrayscaleTransform) is located in §A.4.1. *end note*]

20.1.2.3.10 green (Green)

This elements specifies the input color with the specified green component, but with its red and blue color components unchanged.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the value of the green component. The assigned value is specified as a percentage with 0% indicating minimal green and 100% indicating maximum green.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, 00, FF) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="0000FF">`
	`  <a:green val="100%"/>`
	`  </a:srgbClr>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	</a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.11 greenMod (Green Modulation)

This element specifies the input color with its green component modulated by the given percentage. A 50% green modulate reduces the green component by half. A 200% green modulate doubles the green component.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description
val (Value)	Specifies the green component as expressed by a percentage relative to the input color component. Increases never increase the green component beyond 100%, decreases never decrease the green component below 0%. [*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 80, 00) <a:solidFill> <a:srgbClr val="00FF00"> <a:greenMod val="50%"/> </a:srgbClr> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

20.1.2.3.12 greenOff (Green Offset)

This element specifies the input color with its green component shifted, but with its red and blue color components unchanged.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the green component as expressed by a percentage offset increase or decrease to the input color component. Increases never increase the green component beyond 100%, decreases never decrease the green component below 0%.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, CC, 00)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:greenOff val="-20%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.13 hslClr (Hue, Saturation, Luminance Color Model)

This element specifies a color using the HSL color model. A perceptual gamma of 2.2 is assumed.

Hue refers to the dominant wavelength of color, saturation refers to the purity of its hue, and luminance refers to its lightness or darkness.

As with all colors, colors defined with the HSL color model can have color transforms applied to it.

[*Example*:

The color blue having RGB value RRGGBB = (00, 00, 80) is equivalent to

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

tint (Tint)	§20.1.2.3.34

Attributes	Description
hue (Hue)	Specifies the angular value describing the wavelength. Expressed in 1/6000ths of a degree. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
lum (Luminance)	Specifies the luminance referring to the lightness or darkness of the color. Expressed as a percentage with 0% referring to maximal dark (black) and 100% referring to maximal white. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
sat (Saturation)	Specifies the saturation referring to the purity of the hue. Expressed as a percentage with 0% referring to grey, 100% referring to the purest form of the hue. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_HslColor) is located in §A.4.1. *end note*]

20.1.2.3.14 hue (Hue)

This element specifies the input color with the specified hue, but with its saturation and luminance unchanged.

[*Example*: The following two solid fills are equivalent.

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
</a:solidFill>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<a:solidFill>
  <a:hslClr hue="0" sat="100%" lum="50%">
    <a:hue val="14400000"/>
  <a:hslClr/>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description
val (Value)	Specifies the actual angle value to be used with the input color's hue component. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositiveFixedAngle) is located in §A.4.1. *end note*]

20.1.2.3.15 hueMod (Hue Modulate)

This element specifies the input color with its hue modulated by the given percentage. A 50% hue modulate decreases the angular hue value by half. A 200% hue modulate doubles the angular hue value.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the opacity as expressed by a percentage relative to the input color.
	
	[*Example*: The following represents a green solid fill which is 50% opaque
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:alphaMod val="50%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositivePercentage) is located in §A.4.1. *end note*]

20.1.2.3.16 hueOff (Hue Offset)

This element specifies the input color with its hue shifted, but with its saturation and luminance unchanged.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the actual angular value of the shift. The result of the shift shall be between 0 and 360 degrees. Shifts resulting in angular values less than 0 are treated as 0. Shifts resulting in angular values greater than 360 are treated as 360.
	
	[*Example*:
	The following increases the hue angular value by 10 degrees.
	
	`<a:solidFill>`
	`  <a:hslClr hue="0" sat="100%" lum="50%"/>`
	`  <a:hueOff val="600000"/>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Angle) is located in §A.4.1. *end note*]

20.1.2.3.17 inv (Inverse)

This element specifies the inverse of its input color.

[*Example*:

The inverse of red (1, 0, 0) is cyan (0, 1, 1).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

The following represents cyan, the inverse of red:

```
<a:solidFill>
  <a:srgbClr val="FF0000">
    <a:inv/>
  </a:srgbClr>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

[*Note*: The W3C XML Schema definition of this element's content model (CT_InverseTransform) is located in §A.4.1. *end note*]

20.1.2.3.18 invGamma (Inverse Gamma)

This element specifies that the output color rendered by the generating application should be the inverse sRGB gamma shift of the input color.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

[*Note*: The W3C XML Schema definition of this element's content model (CT_InverseGammaTransform) is located in §A.4.1. *end note*]

20.1.2.3.19 lum (Luminance)

This element specifies the input color with the specified luminance, but with its hue and saturation unchanged. Typically luminance values fall in the range [0%, 100%].

[*Example*:

The following two solid fills are equivalent:

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
</a:solidFill>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="0%">
    <a:lum val="50%"/>
  <a:hslClr/>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the value of the luminance. The assigned value is specified as a percentage with 0% indicating minimal luminance and 100% indicating maximum luminance.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 66, 00)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:lum val="20%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.20 lumMod (Luminance Modulation)

This element specifies the input color with its luminance modulated by the given percentage. A 50% luminance modulate reduces the luminance by half. A 200% luminance modulate doubles the luminance.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description

val (Value)	Specifies the luminance as expressed by a percentage relative to the input color. Increases never increase the luminance beyond 100%, decreases never decrease the luminance below 0%.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 75, 00)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:lumMod val="50%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.21 lumOff (Luminance Offset)

This element specifies the input color with its luminance shifted, but with its hue and saturation unchanged.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the luminance as expressed by a percentage offset increase or decrease to the input color. Increases never increase the luminance beyond 100%, decreases never decrease the luminance below 0%.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 99, 00)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:lumOff val="-20%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]

Attributes	Description
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.22 prstClr (Preset Color)

This element specifies a color which is bound to one of a predefined collection of colors.

[*Example*:

The following defines a solid fill bound to the "black" preset color.

```
<a:solidFill>
  <a:prstClr val="black">
</a:solidFill>
```

end example]

lum (Luminance)	§20.1.2.3.19
lumMod (Luminance Modulation)	§20.1.2.3.20
lumOff (Luminance Offset)	§20.1.2.3.21
red (Red)	§20.1.2.3.23
redMod (Red Modulation)	§20.1.2.3.24
redOff (Red Offset)	§20.1.2.3.25
sat (Saturation)	§20.1.2.3.26
satMod (Saturation Modulation)	§20.1.2.3.27
satOff (Saturation Offset)	§20.1.2.3.28
shade (Shade)	§20.1.2.3.31
tint (Tint)	§20.1.2.3.34

Attributes	Description
val (Value)	Specifies the actual preset color value. The possible values for this attribute are defined by the ST_PresetColorVal simple type (§20.1.10.47).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PresetColor) is located in §A.4.1. *end note*]

20.1.2.3.23 red (Red)

This element specifies the input color with the specified red component, but with its green and blue color components unchanged.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the value of the red component. The assigned value is specified as a percentage with 0% indicating minimal red and 100% indicating maximum red.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (FF, FF, 00)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:red val="100%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.24 redMod (Red Modulation)

This element specifies the input color with its red component modulated by the given percentage. A 50% red modulate reduces the red component by half. A 200% red modulate doubles the red component.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description
val (Value)	Specifies the red component as expressed by a percentage relative to the input color component. Increases never increase the red component beyond 100%, decreases never decrease the red component below 0%. [*Example*: The following manipulates the fill from having RGB value RRGGBB = (FF, 00, 00) to value RRGGBB= (80, 00, 00) `<a:solidFill>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	<a:srgbClr val="FF0000"> <a:redMod val="50%"/> </a:srgbClr> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.25 redOff (Red Offset)

This element specifies the input color with its red component shifted, but with its green and blue color components unchanged.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description
val (Value)	Specifies the red component as expressed by a percentage offset increase or decrease to the input color component. Increases never increase the red component beyond 100%, decreases never decrease the red component below 0%. [*Example*: The following manipulates the fill from having RGB value RRGGBB = (FF, 00, 00) to value RRGGBB= (CC, 00, 00) <a:solidFill> <a:srgbClr val="FF0000"> <a:redOff val="-20%"/> </a:srgbClr> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.26 sat (Saturation)

This element specifies the input color with the specified saturation, but with its hue and luminance unchanged. Typically saturation values fall in the range [0%, 100%].

[*Example*:

The following two solid fills are equivalent:

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
</a:solidFill>
<a:solidFill>
  <a:hslClr hue="14400000" sat="0%" lum="50%">
    <a:sat val="100000"/>
  <a:hslClr/>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the value of the saturation. The assigned value is specified as a percentage with 0% indicating minimal saturation and 100% indicating maximum saturation.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (40, C0, 40)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:sat val="50%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.27 satMod (Saturation Modulation)

This element specifies the input color with its saturation modulated by the given percentage. A 50% saturation modulate reduces the saturation by half. A 200% saturation modulate doubles the saturation.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the saturation as expressed by a percentage relative to the input color. Increases never increase the saturation beyond 100%, decreases never decrease the saturation below 0%.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (66, 99, 66)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:satMod val="20%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.28 satOff (Saturation Offset)

This element specifies the input color with its saturation shifted, but with its hue and luminance unchanged. A 10% offset to 20% saturation yields 30% saturation.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description

val (Value)	Specifies the saturation as expressed by a percentage offset increase or decrease to the input color. Increases never increase the saturation beyond 100%, decreases never decrease the saturation below 0%.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (19, E5, 19)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:satOff val="-20%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Percentage) is located in §A.4.1. *end note*]

20.1.2.3.29 schemeClr (Scheme Color)

This element specifies a color bound to a user's theme. As with all elements which define a color, it is possible to apply a list of color transforms to the base color defined.

Parent Elements
accent1 (§20.1.4.1.1); accent2 (§20.1.4.1.2); accent3 (§20.1.4.1.3); accent4 (§20.1.4.1.4); accent5 (§20.1.4.1.5); accent6 (§20.1.4.1.6); alphaInv (§20.1.8.4); bgClr (§20.1.8.10); bgRef (§19.3.1.3); buClr (§21.1.2.4.4); clrFrom (§20.1.8.17); clrMru (§19.2.1.4); clrRepl (§20.1.8.18); clrTo (§20.1.8.19); clrVal (§19.5.27); contourClr (§20.1.5.6); custClr (§20.1.4.1.8); dk1 (§20.1.4.1.9); dk2 (§20.1.4.1.10); duotone (§20.1.8.23); effectClrLst (§21.4.4.7); effectRef (§20.1.4.2.8); extrusionClr (§20.1.5.7); fgClr (§20.1.8.27); fillClrLst (§21.4.4.8); fillRef (§20.1.4.2.10); folHlink (§20.1.4.1.15); fontRef (§20.1.4.1.17); from (§19.5.43); glow (§20.1.8.32); gs (§20.1.8.36); highlight (§21.1.2.3.4); hlink (§20.1.4.1.19); innerShdw (§20.1.8.40); linClrLst (§21.4.4.9); lnRef (§20.1.4.2.19); lt1 (§20.1.4.1.22); lt2 (§20.1.4.1.23); outerShdw (§20.1.8.45); penClr (§19.2.1.23); prstShdw (§20.1.8.49); solidFill (§20.1.8.54); tcTxStyle (§20.1.4.2.30); to (§19.5.90); txEffectClrLst (§21.4.4.12); txFillClrLst (§21.4.4.13); txLinClrLst (§21.4.4.14)

Attributes	Description
	The possible values for this attribute are defined by the ST_SchemeColorVal simple type (§20.1.10.53).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SchemeColor) is located in §A.4.1. *end note*]

20.1.2.3.30 scrgbClr (RGB Color Model - Percentage Variant)

This element specifies a color using the red, green, blue RGB color model. Each component, red, green, and blue is expressed as a percentage from 0% to 100%. A linear gamma of 1.0 is assumed.

Specifies the level of red as expressed by a percentage offset increase or decrease relative to the input color.

[*Example*: The following represent the same color

```
<a:solidFill>
  <a:scrgbClr r="50%" g="50%" b="50%"/>
</a:solidFill>
<a:solidFill>
  <a:srgbClr val="BCBCBC"/>
</a:solidFill>
```

end example]

Parent Elements
accent1 (§20.1.4.1.1); accent2 (§20.1.4.1.2); accent3 (§20.1.4.1.3); accent4 (§20.1.4.1.4); accent5 (§20.1.4.1.5); accent6 (§20.1.4.1.6); alphaInv (§20.1.8.4); bgClr (§20.1.8.10); bgRef (§19.3.1.3); buClr (§21.1.2.4.4); clrFrom (§20.1.8.17); clrMru (§19.2.1.4); clrRepl (§20.1.8.18); clrTo (§20.1.8.19); clrVal (§19.5.27); contourClr (§20.1.5.6); custClr (§20.1.4.1.8); dk1 (§20.1.4.1.9); dk2 (§20.1.4.1.10); duotone (§20.1.8.23); effectClrLst (§21.4.4.7); effectRef (§20.1.4.2.8); extrusionClr (§20.1.5.7); fgClr (§20.1.8.27); fillClrLst (§21.4.4.8); fillRef (§20.1.4.2.10); folHlink (§20.1.4.1.15); fontRef (§20.1.4.1.17); from (§19.5.43); glow (§20.1.8.32); gs (§20.1.8.36); highlight (§21.1.2.3.4); hlink (§20.1.4.1.19); innerShdw (§20.1.8.40); linClrLst (§21.4.4.9); lnRef (§20.1.4.2.19); lt1 (§20.1.4.1.22); lt2 (§20.1.4.1.23); outerShdw (§20.1.8.45); penClr (§19.2.1.23); prstShdw (§20.1.8.49); solidFill (§20.1.8.54); tcTxStyle (§20.1.4.2.30); to (§19.5.90); txEffectClrLst (§21.4.4.12); txFillClrLst (§21.4.4.13); txLinClrLst (§21.4.4.14)

Attributes	Description
r (Red)	Specifies the percentage of red. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ScRgbColor) is located in §A.4.1. *end note*]

20.1.2.3.31 shade (Shade)

This element specifies a darker version of its input color. A 10% shade is 10% of the input color combined with 90% black.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the shade as expressed by a percentage value.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, BC, 00)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:shade val="50%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositiveFixedPercentage) is located in §A.4.1. *end note*]

20.1.2.3.32 srgbClr (RGB Color Model - Hex Variant)

This element specifies a color using the red, green, blue RGB color model. Red, green, and blue is expressed as sequence of hex digits, RRGGBB. A perceptual gamma of 2.2 is used.

Specifies the level of red as expressed by a percentage offset increase or decrease relative to the input color.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Example*: The following represent the same color

```
<a:solidFill>
  <a:scrgbClr r="50%" g="50%" b="50%"/>

tint (Tint)	§20.1.2.3.34

Attributes	Description
val (Value)	The actual color value. Expressed as a sequence of hex digits RRGGBB. The possible values for this attribute are defined by the ST_HexColorRGB simple type (§22.9.2.5).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SRgbColor) is located in §A.4.1. *end note*]

20.1.2.3.33 sysClr (System Color)

This element specifies a color bound to predefined operating system elements.

[*Example*: The following represents the default color used for displaying text in a window.

```
<a:solidFill>
  <a:sysClr val="windowText"/>
</a:solidFill>
```

end example]

Attributes	Description
lastClr (Last Color)	Specifies the color value that was last computed by the generating application. The possible values for this attribute are defined by the ST_HexColorRGB simple type (§22.9.2.5).
val (Value)	Specifies the system color value. The possible values for this attribute are defined by the ST_SystemColorVal simple type (§20.1.10.57).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SystemColor) is located in §A.4.1. *end note*]

20.1.2.3.34 tint (Tint)

This element specifies a lighter version of its input color. A 10% tint is 10% of the input color combined with 90% white.

Parent Elements
hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33)

Attributes	Description

val (Value)	Specifies the tint as expressed by a percentage value.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (BC, FF, BC)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:tint val="50%"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositiveFixedPercentage) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.3 Audio and Video

The Audio and Video portion of the DrawingML framework deals with all media of these two kinds that can be attached to objects within a document. Types of audio that can be represented within a file are CD audio, QuickTime audio, and any other generic audio. When dealing with generic audio there is the option for embedding it within the file and also linking it. The linking option is preferable if the size of the audio file is too large and thus increases the size of the document by an undesirable amount. For video there are two kinds that can be represented and that is either a QuickTime movie or any other generic movie. When dealing with generic video there is only the option of linking to the media as video is too large to embed within a document.

20.1.3.1 audioCd (Audio from CD)

This element specifies the existence of Audio from a CD. This element is specified within the non-visual properties of an object. The audio shall be attached to an object as this is how it is represented within the document. The actual playing of the sound however is done within the timing node list that is specified under the timing element.

[*Example*: Consider the following picture object that has an audio from a CD attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:audioCd>
        <a:st track="1"/>
        <a:end track="3" time="65"/>
      </a:audioCd>
    </p:nvPr>
  </p:nvPicPr>
  …
</p:pic>
```

In the above example, we see that there is a single audioCD element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this audioCD element from within the timing node list. For this example we see that the audio for this CD starts playing at the 0 second mark on the first track and ends on the 1 minute 5 second mark of the third track. *end example*]

Parent Elements
nvPr (§19.3.1.33)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
end (Audio End Time)	§20.1.3.3
extLst (Extension List)	§20.1.2.2.15
st (Audio Start Time)	§20.1.3.5

[*Note*: The W3C XML Schema definition of this element's content model (CT_AudioCD) is located in §A.4.1. *end note*]

20.1.3.2 audioFile (Audio from File)

This element specifies the existence of an audio file. This element is specified within the non-visual properties of an object. The audio shall be attached to an object as this is how it is represented within the document. The actual playing of the audio however is done within the timing node list that is specified under the timing element.

[*Example*: Consider the following picture object that has an audio file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:audioFile r:link="rId1"/>
    </p:nvPr>
  </p:nvPicPr>
  …
</p:pic>
```

In the above example, we see that there is a single audioFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this audioFile element from within the timing node list. The Linked relationship id is used to retrieve the actual audio file for playback purposes. *end example*]

Parent Elements
nvPr (§19.3.1.33)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15

Attributes	Description
contentType (Content Type of Linked Audio File)	Specifies the content type for the external file that is referenced by this element. Content types define a media type, a subtype, and an optional set of parameters, as defined in Part 2. If a rendering application cannot process external content of the content type specified, then the specified content can be ignored. [*Note*: A list of suggested audio types is provided in §15.2.2. *end note*] If this attribute is omitted, application should attempt to determine the content type by reading the contents of the relationship's target. A producer that wants interoperability should use the following standard format: • audio/mpeg ISO/IEC 11172-3 The possible values for this attribute are defined by the W3C XML Schema string datatype.
link (Linked Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AudioFile) is located in §A.4.1. *end note*]

20.1.3.3 end (Audio End Time)

This element specifies the end point for a CD Audio sound element. Encompassed within this element are the time and track at which the sound should halt its playback. This element is used in conjunction with an Audio Start Time element to specify the time span for an entire audioCD sound element.

[*Example*: Consider the following DrawingML.

```
<a:audioCd>
  <a:st track="1" time="2"/>
  <a:end track="3" time="65"/>
</a:audioCd>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

In the above example, the audioCD sound element shown specifies for a portion of audio spanning from 2 seconds into the first track to 1 minute, 5 seconds into the third track. *end example*]

Parent Elements
audioCd (§20.1.3.1)

Attributes	Description
time (Time)	Specifies the time in seconds that the CD Audio should be started at. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
track (Track)	Specifies which track of the CD this Audio begins playing on. This attribute is required and cannot be omitted. The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_AudioCDTime) is located in §A.4.1. *end note*]

20.1.3.4 quickTimeFile (QuickTime from File)

This element specifies the existence of a QuickTime file, as defined in the 2007-09-04 version of the QuickTime File Format Specification: http://developer.apple.com/documentation/QuickTime/QTFF/qtff.pdf. [*Note*: For more information on the QuickTime format: http://developer.apple.com/reference/QuickTime/. *end note*]. This element is specified within the non-visual properties of an object. The QuickTime file shall be attached to an object as this is how it is represented within the document. The actual playing of the QuickTime however is done within the timing node list that is specified under the timing element.

[*Example*: Consider the following picture object that has a QuickTime file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
      <p:nvPr>
        <a:quickTimeFile r:link="rId1"/>
      </p:nvPr>
    </p:nvPicPr>
    …
  </p:pic>
```

In the above example, we see that there is a single quickTimeFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this quickTimeFile element from within the timing node list. The Linked relationship id is used to retrieve the actual video file for playback purposes. *end example*]

Parent Elements
nvPr (§19.3.1.33)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15

Attributes	Description
link (Linked Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_QuickTimeFile) is located in §A.4.1. *end note*]

20.1.3.5 st (Audio Start Time)

This element specifies the start point for a CD Audio sound element. Encompassed within this element are the time and track at which the sound should begin its playback. This element is used in conjunction with an Audio End Time element to specify the time span for an entire audioCD sound element.

[*Example*: Consider the following DrawingML.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
<a:audioCd>
  <a:st track="1" time="2"/>
  <a:end track="3" time="65"/>
</a:audioCd>
```

In the above example, the audioCD sound element shown specifies for a portion of audio spanning from 2 seconds into the first track to 1 minute, 5 seconds into the third track. *end example*]

Parent Elements
audioCd (§20.1.3.1)

Attributes	Description
time (Time)	Specifies the time in seconds that the CD Audio should be started at. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
track (Track)	Specifies which track of the CD this Audio begins playing on. This attribute is required and cannot be omitted. The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_AudioCDTime) is located in §A.4.1. *end note*]

20.1.3.6 videoFile (Video from File)

This element specifies the existence of a video file. This element is specified within the non-visual properties of an object. The video shall be attached to an object as this is how it is represented within the document. The actual playing of the video however is done within the timing node list that is specified under the timing element.

[*Example*: Consider the following picture object that has a video attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
      <p:nvPr>
        <a:videoFile r:link="rId1"/>
      </p:nvPr>
    </p:nvPicPr>
    …
  </p:pic>
```

In the above example, we see that there is a single videoFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this videoFile element from within the timing node list. The Linked relationship id is used to retrieve the actual video file for playback purposes. *end example*]

Parent Elements
nvPr (§19.3.1.33)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15

Attributes	Description
contentType (Content Type of Linked Video File)	Specifies the content type for the external file that is referenced by this element. Content types define a media type, a subtype, and an optional set of parameters, as defined in Part 2. If a rendering application cannot process external content of the content type specified, then the specified content can be ignored. [*Note*: A list of suggested video types is provided in §15.2.17. *end note*] If this attribute is omitted, application should attempt to determine the content type by reading the contents of the relationship's target. The possible values for this attribute are defined by the W3C XML Schema string datatype.
link (Linked Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for a linked video file. This attribute is used to specify the location of an object that does not reside within this file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_VideoFile) is located in §A.4.1. *end note*]

20.1.3.7 wavAudioFile (Audio from WAV File)

This element specifies the existence of an audio WAV file. This element is specified within the non-visual properties of an object. The audio shall be attached to an object as this is how it is represented within the document. The actual playing of the audio however is done within the timing node list that is specified under the timing element.

[*Example*: Consider the following picture object that has an audio WAV file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:wavAudioFile r:embed="rId2"/>
    </p:nvPr>
  </p:nvPicPr>
  …
</p:pic>
```

In the above example, we see that there is a single wavAudioFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this wavAudioFile element from within the timing node list. The Embedded relationship id is used to retrieve the actual audio file for playback purposes. *end example*]

[*Note*: This element is generally used for the purposes of embedding audio files within the document. For linking to generic audio files the audioFile element should be used. *end note*]

Parent Elements
nvPr (§19.3.1.33)

Attributes	Description
embed (Embedded Audio File Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationshi	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [*Note*: A list of suggested audio types is provided in §15.2.2. *end note*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
ps	
name (Sound Name)	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_EmbeddedWAVAudioFile) is located in §A.4.1. *end note*]

20.1.4 Styles

Styles within DrawingML refer to the way a particular object (be it text or a shape, or anything else) is formatted. Different aspects, ranging from color, line type, fill, and effects applied to the object can be predefined within a theme. The main purpose of a theme is to define a style matrix from which a document can pull style information from in order to format the visual look of objects in a document.

20.1.4.1 Styles

The elements in this section compose the basic definition of a style, including its associated colors, effect styles, line styles, fill styles, background styles, and font scheme.

20.1.4.1.1 accent1 (Accent 1)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:

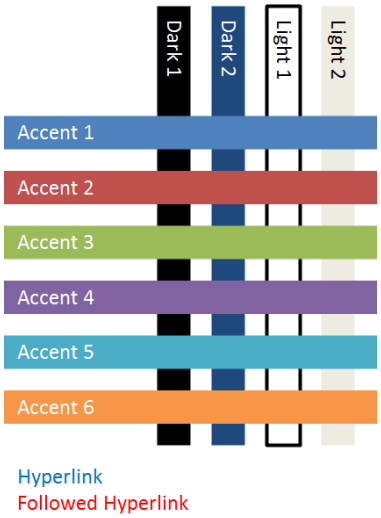
20.1.4.1.5 accent5 (Accent 5)

This element defines a color that happens to be the accent 5 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§20.1.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

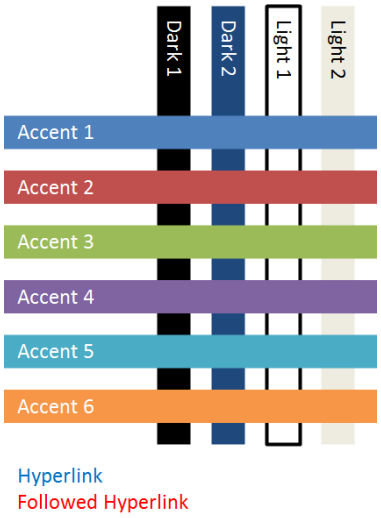
Child Elements	Subclause
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.4.1.6 accent6 (Accent 6)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§20.1.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.4.1.7 bgFillStyleLst (Background Fill Style List)

This element defines a list of background fills that are used within a theme. The background fills consist of three fills, arranged in order from subtle to moderate to intense.

[*Example*: Consider the following example of a background fill style list within DrawingML:

```
<bgFillStyleLst>
  <solidFill>
…
  </solidFill>
  <gradFill rotWithShape="1">
…
  </gradFill>
  <blipFill>
…
  </blipFill>
</bgFillStyleLst>
```

In this example, we see that the list contains a solid fill for the subtle fill, a gradient fill for the moderate fill and an image fill for the intense background fill. *end example*]

Parent Elements
fmtScheme (§20.1.4.1.14)

Child Elements	Subclause
blipFill (Picture Fill)	§20.1.8.14
gradFill (Gradient Fill)	§20.1.8.33
grpFill (Group Fill)	§20.1.8.35
noFill (No Fill)	§20.1.8.44
pattFill (Pattern Fill)	§20.1.8.47
solidFill (Solid Fill)	§20.1.8.54

[*Note*: The W3C XML Schema definition of this element's content model (CT_BackgroundFillStyleList) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

20.1.4.1.8 custClr (Custom color)

This element defines a custom color. The custom colors are used within a custom color list to define custom colors that are extra colors that can be appended to a theme. This is useful within corporate scenarios where there is a set corporate color palette from which to work.

Parent Elements
custClrLst (§20.1.6.3)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

Attributes	Description
name (Name)	The name of the color shown in the color picker. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_CustomColor) is located in §A.4.1. *end note*]

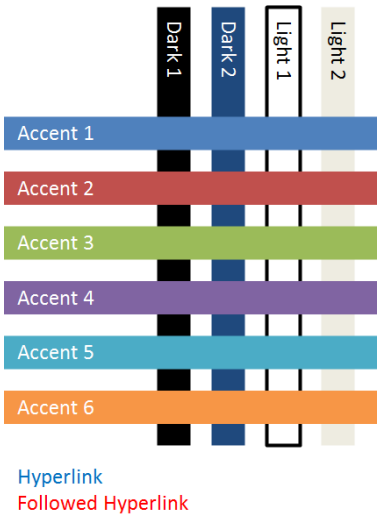
20.1.4.1.9 dk1 (Dark 1)

This element defines a color that happens to be the dark 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved



end example]

Parent Elements
clrScheme (§20.1.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

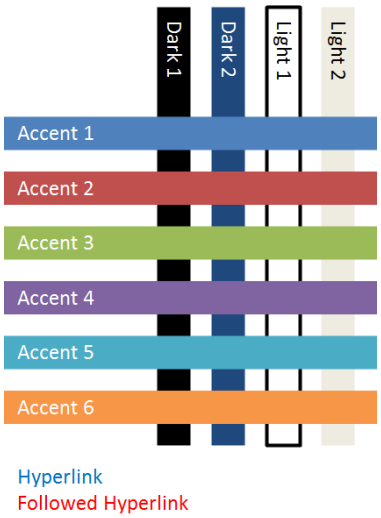
20.1.4.1.10 dk2 (Dark 2)

This element defines a color that happens to be the dark 2 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved



end example]

Parent Elements
clrScheme (§20.1.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

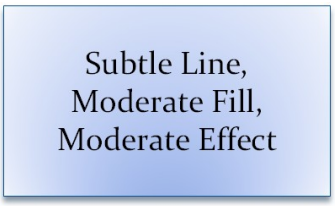
20.1.4.1.11 effectStyle (Effect Style)

This element defines a set of effects and 3D properties that can be applied to an object.

[*Example*: Consider the following example of an effect style within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<effectStyle>
  <effectLst>
    <outerShdw blurRad="57150" dist="38100" dir="5400000" algn="ctr"
      rotWithShape="0">
      <schemeClr val="phClr">
        <shade val="9000"/>
        <satMod val="105000"/>
        <alpha val="48000"/>
      </schemeClr>
    </outerShdw>
  </effectLst>
</effectStyle>
```



In this example, an outer shadow is being applied to a shape as the moderate effect. *end example*]

Parent Elements
effectStyleLst (§20.1.4.1.12)

Child Elements	Subclause
effectDag (Effect Container)	§20.1.8.25
effectLst (Effect Container)	§20.1.8.26
scene3d (3D Scene Properties)	§20.1.4.1.26
sp3d (Apply 3D shape properties)	§20.1.5.12

[*Note*: The W3C XML Schema definition of this element's content model (CT_EffectStyleItem) is located in §A.4.1. *end note*]

20.1.4.1.12 effectStyleLst (Effect Style List)

This element defines a set of three effect styles that create the effect style list for a theme. The effect styles are arranged in order of subtle to moderate to intense.

[*Example*: Consider the following example of an effect style list within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<effectStyleLst>
  <effectStyle>
    <effectLst>
      <outerShdw blurRad="57150" dist="38100" dir="5400000"
        algn="ctr" rotWithShape="0">
…
      </outerShdw>
    </effectLst>
  </effectStyle>
  <effectStyle>
    <effectLst>
      <outerShdw blurRad="57150" dist="38100" dir="5400000"
        algn="ctr" rotWithShape="0">
…
      </outerShdw>
    </effectLst>
  </effectStyle>
  <effectStyle>
    <effectLst>
      <outerShdw blurRad="57150" dist="38100" dir="5400000"
        algn="ctr" rotWithShape="0">
…
      </outerShdw>
    </effectLst>
    <scene3d>
…
    </scene3d>
    <sp3d prstMaterial="powder">
…
    </sp3d>
  </effectStyle>
</effectStyleLst>
```

In this example, we see three effect styles defined. The first two (subtle and moderate) define an outer shadow as the effect, while the third effect style (intense) defines an outer shadow along with 3D properties which are to be applied to the object as well. *end example*]

Parent Elements
fmtScheme (§20.1.4.1.14)

Child Elements	Subclause
effectStyle (Effect Style)	§20.1.4.1.11

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_EffectStyleList) is located in §A.4.1 *end note*]

20.1.4.1.13 fillStyleLst (Fill Style List)

This element defines a set of three fill styles that are used within a theme. The three fill styles are arranged in order from subtle to moderate to intense.

[*Example*: Consider the following example of a fill style list within DrawingML:

```
<fillStyleLst>
  <solidFill>
…
  </solidFill>
  <gradFill rotWithShape="1">
…
  </gradFill>
  <gradFill rotWithShape="1">
…
  </gradFill>
</fillStyleLst>
```

In this example, we see three fill styles being defined within the fill style list. The first style is the subtle style and defines simply a solid fill. The second and third styles (moderate and intense fills respectively) define gradient fills. *end example*]

Parent Elements
fmtScheme (§20.1.4.1.14)

Child Elements	Subclause
blipFill (Picture Fill)	§20.1.8.14
gradFill (Gradient Fill)	§20.1.8.33
grpFill (Group Fill)	§20.1.8.35
noFill (No Fill)	§20.1.8.44
pattFill (Pattern Fill)	§20.1.8.47
solidFill (Solid Fill)	§20.1.8.54

[*Note*: The W3C XML Schema definition of this element's content model (CT_FillStyleList) is located in §A.4.1. *end note*]

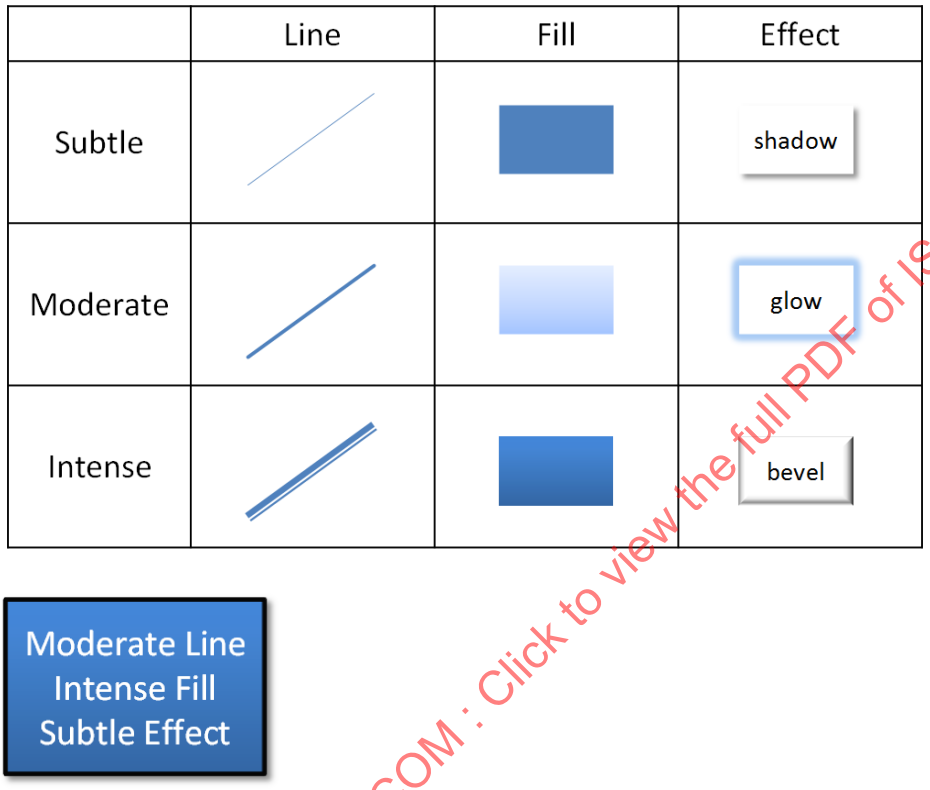
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

20.1.4.1.14 fmtScheme (Format Scheme)

This element contains the background fill styles, effect styles, fill styles, and line styles which define the style matrix for a theme. The style matrix consists of subtle, moderate, and intense fills, lines, and effects. The background fills are not generally thought of to directly be associated with the matrix, but do play a role in the style of the overall document. Usually, a given object chooses a single line style, a single fill style, and a single effect style in order to define the overall final look of the object.

[*Example*: Consider the following example of the style matrix in use within DrawingML:



In this example, we see a shape styled which utilizes different aspects from the above defined style matrix. *end example*]

Parent Elements
themeElements (§20.1.6.10); themeOverride (§20.1.6.12)

Child Elements	Subclause
bgFillStyleLst (Background Fill Style List)	§20.1.4.1.7
effectStyleLst (Effect Style List)	§20.1.4.1.12
fillStyleLst (Fill Style List)	§20.1.4.1.13
lnStyleLst (Line Style List)	§20.1.4.1.21

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

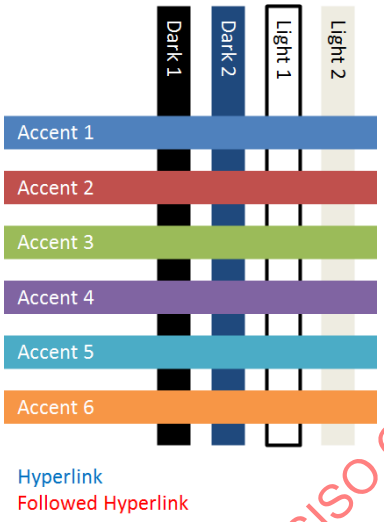
Attributes	Description
name (Name)	Defines the name for the format scheme. The name is simply a human readable string which identifies the format scheme in the user interface. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_StyleMatrix) is located in §A.4.1. *end note*]

20.1.4.1.15 folHlink (Followed Hyperlink)

This element defines a color that happens to be the followed hyperlink color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§20.1.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.4.1.16 font (Font)

This element defines a font within the styles area of DrawingML. A font is defined by a script along with a typeface.

[*Example*: Consider the following example of a font in DrawingML:

```
<font script="Thai" typeface="Cordia New"/>
```

In this example, we see that the script 'Thai' is supposed to use the font face 'Cordia New'. *end example*]

Parent Elements
font (§20.1.4.2.13); majorFont (§20.1.4.1.24); minorFont (§20.1.4.1.25)

Attributes	Description
script (Script)	Specifies the script, or language, in which the typeface is supposed to be used. The possible values for this attribute are defined by the W3C XML Schema string datatype.
typeface (Typeface)	Specifies the font face to use. The possible values for this attribute are defined by the ST_TextTypeface simple type (§20.1.10.80).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SupplementalFont) is located in §A.4.1. *end note*]

20.1.4.1.17 fontRef (Font Reference)

This element represents a reference to a themed font. When used it specifies which themed font to use along with a choice of color.

[*Example*: Consider the following example of a font reference within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<fontRef idx="minor">
  <schemeClr val="tx1"/>
</fontRef>
```

In this example, we see a font referencing the minor font defined within the theme. *end example*]

Parent Elements
style (§21.3.2.24); style (§21.4.2.28); style (§20.1.2.2.37); style (§20.5.2.31); style (§19.3.1.46); tcTxStyle (§20.1.4.2.30)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

Attributes	Description
idx (Identifier)	Specifies the identifier of the font to reference. The possible values for this attribute are defined by the ST_FontCollectionIndex simple type (§20.1.10.25).

[*Note*: The W3C XML Schema definition of this element's content model (CT_FontReference) is located in §A.4.1. *end note*]

20.1.4.1.18 fontScheme (Font Scheme)

This element defines the font scheme within the theme. The font scheme consists of a pair of major and minor fonts for which to use in a document. The major font corresponds well with the heading areas of a document, and the minor font corresponds well with the normal text or paragraph areas.

[*Example*: Consider the following example of a font scheme within DrawingML:

```
<fontScheme name="sample">
  <majorFont>
…
  </majorFont>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
    <minorFont>
…
    </minorFont>
</fontScheme>
```

In this example, we see the major and minor font lists within the font scheme that is named 'sample'. *end example*]

Parent Elements
themeElements (§20.1.6.10); themeOverride (§20.1.6.12)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
majorFont (Major Font)	§20.1.4.1.24
minorFont (Minor fonts)	§20.1.4.1.25

Attributes	Description
name (Name)	The name of the font scheme shown in the user interface. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_FontScheme) is located in §A.4.1. *end note*]

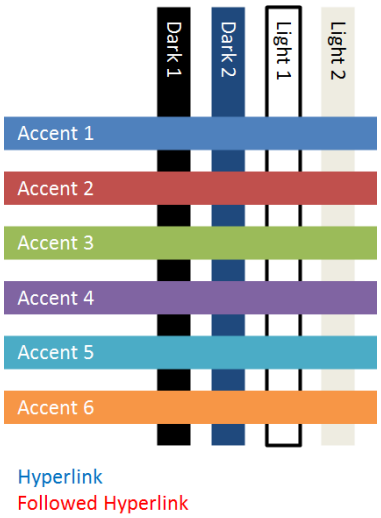
20.1.4.1.19 hlink (Hyperlink)

This element defines a color that happens to be the hyperlink color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved



end example]

Parent Elements
clrScheme (§20.1.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.4.1.20 lnDef (Line Default)

This element defines a default line that is used within a document.

[*Example*: Consider the following example of a default line defined in DrawingML:

```
<lnDef>
  <spPr/>
  <bodyPr/>
  <lstStyle/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
    <style>
      <lnRef idx="1">
        <schemeClr val="accent2"/>
      </lnRef>
      <fillRef idx="0">
        <schemeClr val="accent2"/>
      </fillRef>
      <effectRef idx="0">
        <schemeClr val="accent2"/>
      </effectRef>
      <fontRef idx="minor">
        <schemeClr val="tx1"/>
      </fontRef>
    </style>
  </lnDef>
```

In this example, we see that the default line for the document is being defined as a themed line which references the subtle line style with idx equal to 1. *end example*]

Parent Elements
objectDefaults (§20.1.6.7)

Child Elements	Subclause
bodyPr (Body Properties)	§21.1.2.1.1
extLst (Extension List)	§20.1.2.2.15
lstStyle (Text List Styles)	§21.1.2.4.12
spPr (Shape Properties)	§20.1.2.2.35
style (Shape Style)	§20.1.2.2.37

[*Note*: The W3C XML Schema definition of this element's content model (CT_DefaultShapeDefinition) is located in §A.4.1. *end note*]

20.1.4.1.21 lnStyleLst (Line Style List)

This element defines a list of three line styles for use within a theme. The three line styles are arranged in order from subtle to moderate to intense versions of lines. This list makes up part of the style matrix.

[*Example*: Consider the following example of a line style list within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<lnStyleLst>
  <ln w="9525" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr">
        <shade val="50000"/>
        <satMod val="103000"/>
      </schemeClr>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
  <ln w="25400" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr"/>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
  <ln w="38100" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr"/>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
</lnStyleLst>
```

In this example, we see three lines defined within a line style list. The first line corresponds to the subtle line, the second to the moderate, and the third corresponds to the intense line defined in the theme. *end example*]

Parent Elements
fmtScheme (§20.1.4.1.14)

Child Elements	Subclause
ln (Outline)	§20.1.2.2.24

[*Note*: The W3C XML Schema definition of this element's content model (CT_LineStyleList) is located in §A.4.1. *end note*]

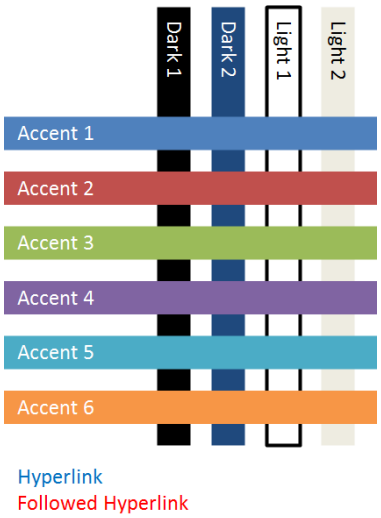
20.1.4.1.22 lt1 (Light 1)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved



end example]

Parent Elements
clrScheme (§20.1.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

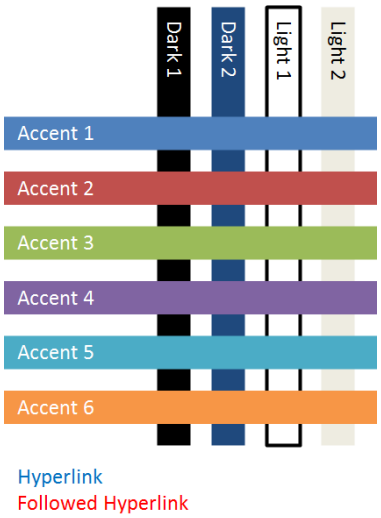
[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.4.1.23 lt2 (Light 2)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011



end example]

Parent Elements
clrScheme (§20.1.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.4.1.24 majorFont (Major Font)

This element defines the set of major fonts which are to be used under different languages or locals.

[*Example*: Consider the following example of the major fonts being defined within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<majorFont>
  <latin typeface="Calibri"/>
  <ea typeface="Arial"/>
  <cs typeface="Arial"/>
  <font script="Jpan" typeface="ＭＳ Ｐゴシック"/>
  <font script="Hang" typeface="HY중고딕"/>
  <font script="Hans" typeface="隶书"/>
  <font script="Hant" typeface="微軟正黑體"/>
  <font script="Arab" typeface="Traditional Arabic"/>
  <font script="Hebr" typeface="Arial"/>
  <font script="Thai" typeface="Cordia New"/>
  <font script="Ethi" typeface="Nyala"/>
  <font script="Beng" typeface="Vrinda"/>
  <font script="Gujr" typeface="Shruti"/>
  <font script="Khmr" typeface="DaunPenh"/>
  <font script="Knda" typeface="Tunga"/>
</majorFont>
```

In this example, we see the latin, east asian, and complex script fonts defined along with many fonts for different locals. *end example*]

Parent Elements
fontScheme (§20.1.4.1.18)

Child Elements	Subclause
cs (Complex Script Font)	§21.1.2.3.1
ea (East Asian Font)	§21.1.2.3.3
extLst (Extension List)	§20.1.2.2.15
font (Font)	§20.1.4.1.16
latin (Latin Font)	§21.1.2.3.7

[*Note*: The W3C XML Schema definition of this element's content model (CT_FontCollection) is located in §A.4.1. *end note*]

20.1.4.1.25 minorFont (Minor fonts)

This element defines the set of minor fonts that are to be used under different languages or locals.

[*Example*: Consider the following example of the minor fonts being defined within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<minorFont>
  <latin typeface="Calibri"/>
  <ea typeface="Arial"/>
  <cs typeface="Arial"/>
  <font script="Jpan" typeface="ＭＳ Ｐゴシック"/>
  <font script="Hang" typeface="HY중고딕"/>
  <font script="Hans" typeface="隶书"/>
  <font script="Hant" typeface="微軟正黑體"/>
  <font script="Arab" typeface="Traditional Arabic"/>
  <font script="Hebr" typeface="Arial"/>
  <font script="Thai" typeface="Cordia New"/>
  <font script="Ethi" typeface="Nyala"/>
  <font script="Beng" typeface="Vrinda"/>
  <font script="Gujr" typeface="Shruti"/>
  <font script="Khmr" typeface="DaunPenh"/>
  <font script="Knda" typeface="Tunga"/>
</minorFont>
```

In this example, we see the latin, east asian, and complex script fonts defined along with many fonts for different locals. *end example*]

Parent Elements
fontScheme (§20.1.4.1.18)

Child Elements	Subclause
cs (Complex Script Font)	§21.1.2.3.1
ea (East Asian Font)	§21.1.2.3.3
extLst (Extension List)	§20.1.2.2.15
font (Font)	§20.1.4.1.16
latin (Latin Font)	§21.1.2.3.7

[*Note*: The W3C XML Schema definition of this element's content model (CT_FontCollection) is located in §A.4.1. *end note*]

20.1.4.1.26 scene3d (3D Scene Properties)

This element defines optional scene-level 3D properties to apply to an object.

Parent Elements
bodyPr (§21.1.2.1.1); effectStyle (§20.1.4.1.11); grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
(§20.5.2.18); grpSpPr (§19.3.1.23); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44)

Child Elements	Subclause
backdrop (Backdrop Plane)	§20.1.5.2
camera (Camera)	§20.1.5.5
extLst (Extension List)	§20.1.2.2.15
lightRig (Light Rig)	§20.1.5.9

[*Note*: The W3C XML Schema definition of this element's content model (CT_Scene3D) is located in §A.4.1. *end note*]

20.1.4.1.27 spDef (Shape Default)

This element defines the formatting that is associated with the default shape. The default formatting can be applied to a shape when it is initially inserted into a document.

[*Example*: Consider the following example of a shape default being used within DrawingML:

```
<spDef>
  <spPr>
    <solidFill>
      <schemeClr val="accent2">
        <shade val="75000"/>
      </schemeClr>
    </solidFill>
  </spPr>
  <bodyPr rtlCol="0" anchor="ctr"/>
  <lstStyle>
    <defPPr algn="ctr">
      <defRPr/>
    </defPPr>
  </lstStyle>
  <style>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
    <fillRef idx="2">
      <schemeClr val="accent1"/>
    </fillRef>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
      <effectRef idx="1">
        <schemeClr val="accent1"/>
      </effectRef>
      <fontRef idx="minor">
        <schemeClr val="dk1"/>
      </fontRef>
    </style>
  </spDef>
```

In this example, we see a default shape which references a certain themed fill, line, effect, and font along with an override fill to these. *end example*]

Parent Elements
objectDefaults (§20.1.6.7)

Child Elements	Subclause
bodyPr (Body Properties)	§21.1.2.1.1
extLst (Extension List)	§20.1.2.2.15
lstStyle (Text List Styles)	§21.1.2.4.12
spPr (Shape Properties)	§20.1.2.2.35
style (Shape Style)	§20.1.2.2.37

[*Note*: The W3C XML Schema definition of this element's content model (CT_DefaultShapeDefinition) is located in §A.4.1. *end note*]

20.1.4.1.28 txDef (Text Default)

This element defines the default formatting which is applied to text in a document by default. The default formatting can and should be applied to the shape when it is initially inserted into a document.

[*Example*: Consider the following example of a text default being used within DrawingML:

```
<txDef>
  <spPr>
    <solidFill>
      <schemeClr val="accent2">
        <shade val="75000"/>
      </schemeClr>
    </solidFill>
  </spPr>
  <bodyPr rtlCol="0" anchor="ctr"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
    <lstStyle>
      <defPPr algn="ctr">
        <defRPr/>
      </defPPr>
    </lstStyle>
    <style>
      <lnRef idx="1">
        <schemeClr val="accent1"/>
      </lnRef>
      <fillRef idx="2">
        <schemeClr val="accent1"/>
      </fillRef>
      <effectRef idx="1">
        <schemeClr val="accent1"/>
      </effectRef>
      <fontRef idx="minor">
        <schemeClr val="dk1"/>
      </fontRef>
    </style>
  </txDef>
```

In this example, we see a default text which references a certain themed fill, line, effect, and font along with an override fill to these. *end example*]

Parent Elements
objectDefaults (§20.1.6.7)

Child Elements	Subclause
bodyPr (Body Properties)	§21.1.2.1.1
extLst (Extension List)	§20.1.2.2.15
lstStyle (Text List Styles)	§21.1.2.4.12
spPr (Shape Properties)	§20.1.2.2.35
style (Shape Style)	§20.1.2.2.37

[*Note*: The W3C XML Schema definition of this element's content model (CT_DefaultShapeDefinition) is located in §A.4.1. *end note*]

20.1.4.2 Table Styles

Table styles are responsible for the rapid formatting that can be applied to a table. This rapid formatting takes different parts of a table into account, such as if the first row or last row should be emphasized, or if there is

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

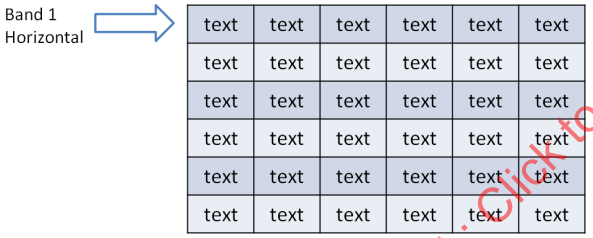
some type of banding (row for example) present on the table. All of these different types of formatting can be defined within a table style

20.1.4.2.1 band1H (Band 1 Horizontal)

This element describes the formatting for the first row in horizontal banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example*: Consider the following example of band 1 horizontal being used within DrawingML:

```
<band1H>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band1H>
```



In this example, we set the fill to be a solid fill referencing the accent 1 color defined in the theme. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

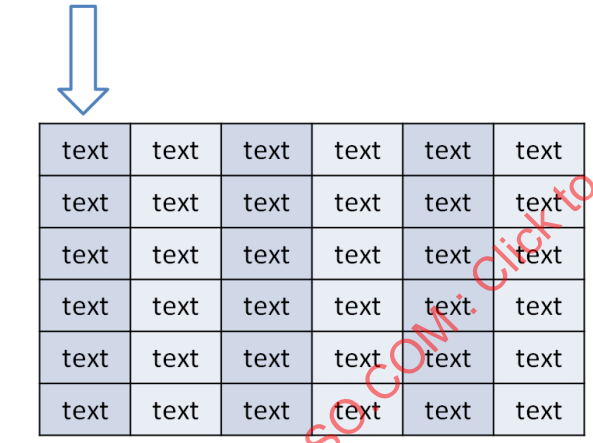
20.1.4.2.2 band1V (Band 1 Vertical)

This element describes the formatting for the first row in vertical banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example*: Consider the following example of band 1 vertical being used within DrawingML:

```
<band1V>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band1V>
```

Band 1 Vertical



In this example, we set the fill to be a solid fill referencing the accent 1 color defined in the theme. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

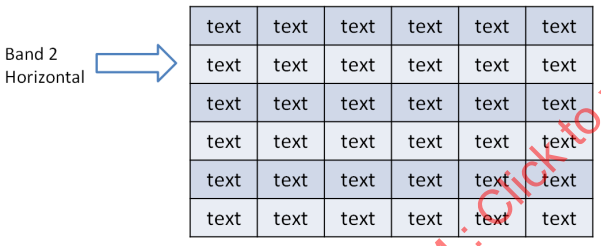
[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.3 band2H (Band 2 Horizontal)

This element describes the formatting for the second row in horizontal banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example*: Consider the following example of band 2 horizontal being used within DrawingML:

```
<band2H>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent2">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band2H>
```



In this example, we set the fill to be a solid fill referencing the accent 2 color defined in the theme. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

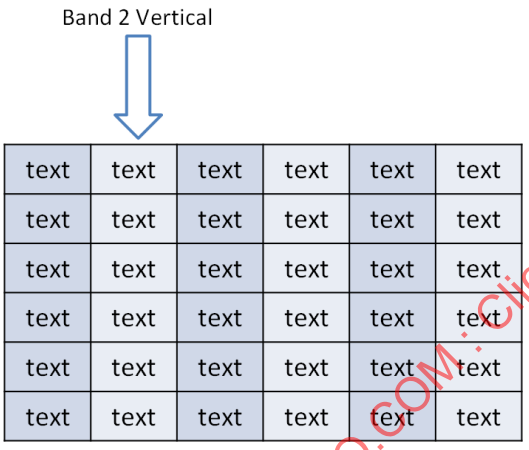
 ©ISO/IEC 2011 – All rights reserved

20.1.4.2.4 band2V (Band 2 Vertical)

This element describes the formatting for the second row in vertical banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example*: Consider the following example of band 2 vertical being used within DrawingML:

```
<band2V>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent2">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band2V>
```



In this example, we set the fill to be a solid fill referencing the accent 2 color defined in the theme. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.5 bevel (Bevel)

This element defines the properties of the bevel associated with the 3D effect applied to a cell in a table.

Parent Elements
cell3D (§21.1.3.1)

Attributes	Description
h (Height)	Specifies the height of the bevel, or how far above the shape it is applied. [*Example*: Consider the following example bevel  In this example, we see the height of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
prst (Preset Bevel)	Specifies the preset bevel type which defines the look of the bevel. The possible values for this attribute are defined by the ST_BevelPresetType simple type (§20.1.10.9).
w (Width)	Specifies the width of the bevel, or how far into the shape it is applied. [*Example*: Consider the following example bevel 
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
	In this example, we see the width of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Bevel) is located in §A.4.1. *end note*]

20.1.4.2.6 bottom (Bottom Border)

This element defines the line properties associated with the bottom border in a table cell.

[*Example*: Consider the following example of the bottom border in use within DrawingML:

```
<bottom>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</bottom>
```

In this example, we see the bottom border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§20.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§20.1.2.2.24
lnRef (Line Reference)	§20.1.4.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_ThemeableLineStyle) is located in §A.4.1. *end note*]

20.1.4.2.7 effect (Effect)

This element defines the effect that can be applied to a table as a whole through a table style.

[*Example*: Consider the following example of an effect in use within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<effect>
  <effectLst>
    <glow rad="228600">
      <schemeClr val="accent1">
        <satMod val="175000"/>
        <alpha val="40000"/>
      </schemeClr>
    </glow>
  </effectLst>
</effect>
```

In this example, we see a glow being defined within the table style that is applied to the table as a whole. *end example*]

Parent Elements
tblBg (§20.1.4.2.25)

Child Elements	Subclause
effectDag (Effect Container)	§20.1.8.25
effectLst (Effect Container)	§20.1.8.26

[*Note*: The W3C XML Schema definition of this element's content model (CT_EffectProperties) is located in §A.4.1. *end note*]

20.1.4.2.8 effectRef (Effect Reference)

This element defines a reference to an effect style within the style matrix. The idx attribute refers the index of an effect style within the effectStyleLst element.

Parent Elements
style (§21.3.2.24); style (§21.4.2.28); style (§20.1.2.2.37); style (§20.5.2.31); style (§19.3.1.46); tblBg (§20.1.4.2.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
idx (Style Matrix Index)	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§20.1.10.56).

[*Note*: The W3C XML Schema definition of this element's content model (CT_StyleMatrixReference) is located in §A.4.1. *end note*]

20.1.4.2.9 fill (Fill)

This element defines the fill that is applied to the table as a whole. The background of the table can contain a single fill that is the entire size of the table. This can allow for gradient fills, or image fills, which span the entire size of the table.

[*Example*: Consider the following example of a fill on a table background in DrawingML:

```
<fill>
  <gradFill flip="none" rotWithShape="1">
    <gsLst>
      <gs pos="0">
        <schemeClr val="accent2">
          <shade val="75000"/>
        </schemeClr>
      </gs>
      <gs pos="100000">
        <schemeClr val="accent2">
          <shade val="75000"/>
          <tint val="20000"/>
        </schemeClr>
      </gs>
    </gsLst>
    <lin ang="2700000" scaled="1"/>
    <tileRect/>
  </gradFill>
</fill>
```

In this example, we apply a gradient fill to the entire table on the background shape of the table. *end example*]

Parent Elements
tblBg (§20.1.4.2.25); tcStyle (§20.1.4.2.29)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
blipFill (Picture Fill)	§20.1.8.14
gradFill (Gradient Fill)	§20.1.8.33
grpFill (Group Fill)	§20.1.8.35
noFill (No Fill)	§20.1.8.44
pattFill (Pattern Fill)	§20.1.8.47
solidFill (Solid Fill)	§20.1.8.54

[*Note*: The W3C XML Schema definition of this element's content model (CT_FillProperties) is located in §A.4.1. *end note*]

20.1.4.2.10 fillRef (Fill Reference)

This element defines a reference to a fill style within the style matrix. The idx attribute refers to the index of a fill style or background fill style within the presentation's style matrix, defined by the fmtScheme element. A value of 0 or 1000 indicates no background, values 1-999 refer to the index of a fill style within the fillStyleLst element, and values 1001 and above refer to the index of a background fill style within the bgFillStyleLst element. The value 1001 corresponds to the first background fill style, 1002 to the second background fill style, and so on.

[*Example*:

```
<a:fillRef idx="2">
  <a:schemeClr val="accent2"/>
</a:fillRef>
```

The above code indicates the object is to have the style's second fill style using the accent2 color of the color scheme.

end example]

[*Example*:

```
<a:fillRef idx="1001">
  <a:schemeClr val="accent2"/>
</a:fillRef>
```

The above code indicates the object is to have the style's first background fill style using the accent2 color of the color scheme.

end example]

Parent Elements
style (§21.3.2.24); style (§21.4.2.28); style (§20.1.2.2.37); style (§20.5.2.31); style (§19.3.1.46); tblBg

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
(§20.1.4.2.25); tcStyle (§20.1.4.2.29)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

Attributes	Description
idx (Style Matrix Index)	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§20.1.10.56).

[*Note*: The W3C XML Schema definition of this element's content model (CT_StyleMatrixReference) is located in §A.4.1. *end note*]

20.1.4.2.11 firstCol (First Column)

This element defines the cell formatting which can be applied to the first column of the table.

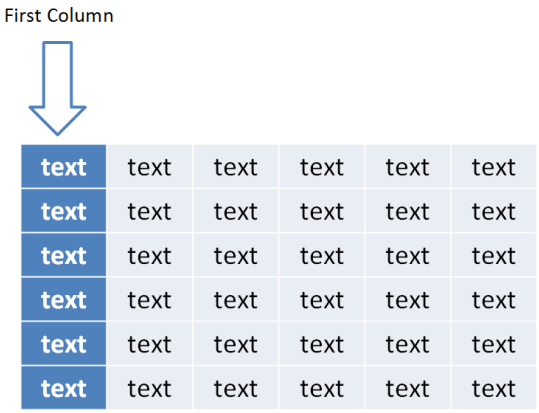
[*Example*: Consider the following example of first column formatting within DrawingML:

```
<firstCol>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
    <tcStyle>
      <tcBdr/>
      <fill>
        <solidFill>
          <schemeClr val="accent1"/>
        </solidFill>
      </fill>
    </tcStyle>
  </firstCol>
```



In this example, we define the first column cell fills to be accent 1 along with the text properties to be bold when first column formatting is enabled through the user interface. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.12 firstRow (First Row)

This element defines the cell formatting which can be applied to the first row of the table.

[*Example*: Consider the following example of first row formatting within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<firstRow>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</firstRow>
```

In this example, we define the first row cell fills to be accent 1 along with the text properties to be bold when first row formatting is enabled through the user interface. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.13 font (Font)

This element defines the font to be used within a given table cell text style. This element allows for exact definition of the font within the table style instead of referencing a themed font.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
tcTxStyle (§20.1.4.2.30)

Child Elements	Subclause
cs (Complex Script Font)	§21.1.2.3.1
ea (East Asian Font)	§21.1.2.3.3
extLst (Extension List)	§20.1.2.2.15
font (Font)	§20.1.4.1.16
latin (Latin Font)	§21.1.2.3.7

[*Note*: The W3C XML Schema definition of this element's content model (CT_FontCollection) is located in §A.4.1. *end note*]

20.1.4.2.14 insideH (Inside Horizontal Border)

This element defines the line properties associated with the inner horizontal borders in a table.

[*Example*: Consider the following example of the inner horizontal borders in use within DrawingML:

```
<insideH>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</insideH>
```

In this example, we see the inner horizontal borders in a table to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§20.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§20.1.2.2.24
lnRef (Line Reference)	§20.1.4.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_ThemeableLineStyle) is located in §A.4.1. *end note*]

20.1.4.2.15 insideV (Inside Vertical Border)

This element defines the line properties associated with the inner vertical borders in a table.

[*Example*: Consider the following example of the inside vertical borders in use within DrawingML:

```
<insideV>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</insideV>
```

In this example, we see the inner vertical borders in a table to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§20.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§20.1.2.2.24
lnRef (Line Reference)	§20.1.4.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_ThemeableLineStyle) is located in §A.4.1. *end note*]

20.1.4.2.16 lastCol (Last Column)

This element defines the cell formatting which can be applied to the last column of the table.

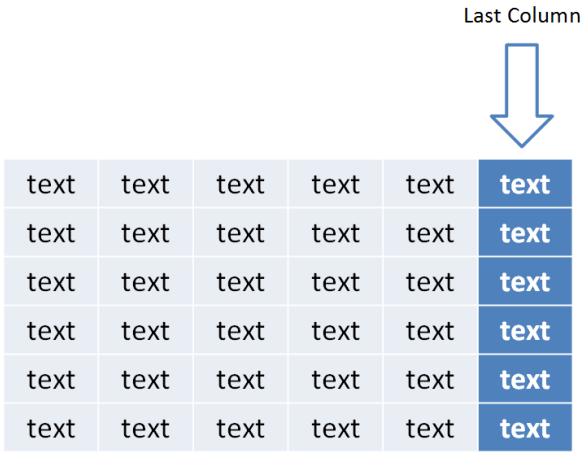
[*Example*: Consider the following example of last column formatting within DrawingML:

```
<lastCol>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
    <tcStyle>
      <tcBdr/>
      <fill>
        <solidFill>
          <schemeClr val="accent1"/>
        </solidFill>
      </fill>
    </tcStyle>
  </lastCol>
```



In this example, we define the last column cell fills to be accent 1 along with the text properties to be bold when last column formatting is enabled through the user interface. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.17 lastRow (Last Row)

This element defines the cell formatting which can be applied to the last row of the table.

[*Example*: Consider the following example of last row formatting within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<lastRow>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</lastRow>
```

In this example, we define the last row cell fills to be accent 1 along with the text properties to be bold when last row formatting is enabled through the user interface. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.18 left (Left Border)

This element defines the line properties associated with the left border in a table cell.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Example*: Consider the following example of the left border in use within DrawingML:

```
<left>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</left>
```

In this example, we see the left border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§20.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§20.1.2.2.24
lnRef (Line Reference)	§20.1.4.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_ThemeableLineStyle) is located in §A.4.1. *end note*]

20.1.4.2.19 lnRef (Line Reference)

This element defines a reference to a line style within the style matrix. The idx attribute refers the index of a line style within the fillStyleLst element.

Parent Elements
bottom (§20.1.4.2.6); insideH (§20.1.4.2.14); insideV (§20.1.4.2.15); left (§20.1.4.2.18); right (§20.1.4.2.22); style (§21.3.2.24); style (§21.4.2.28); style (§20.1.2.2.37); style (§20.5.2.31); style (§19.3.1.46); tl2br (§20.1.4.2.31); top (§20.1.4.2.32); tr2bl (§20.1.4.2.33)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
idx (Style Matrix Index)	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§20.1.10.56).

[*Note*: The W3C XML Schema definition of this element's content model (CT_StyleMatrixReference) is located in §A.4.1. *end note*]

20.1.4.2.20 neCell (Northeast Cell)

This element defies the formatting for the cell in the northeast corner of a table when both the first row formatting and last column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example*: Consider the following example of the northeast cell formatting within DrawingML:

```
<neCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</neCell>
```

In this example, we specifically set the northeast cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.21 nwCell (Northwest Cell)

This element defies the formatting for the cell in the northwest corner of a table when both the first row formatting and first column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example*: Consider the following example of the northwest cell formatting within DrawingML:

```
<nwCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</nwCell>
```

In this example, we specifically set the northwest cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.22 right (Right Border)

This element defines the line properties associated with the right border in a table cell.

[*Example*: Consider the following example of the right border in use within DrawingML:

```
<right>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</right>
```

In this example, we see the right border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§20.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§20.1.2.2.24
lnRef (Line Reference)	§20.1.4.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_ThemeableLineStyle) is located in §A.4.1. *end note*]

20.1.4.2.23 seCell (Southeast Cell)

This element defies the formatting for the cell in the southeast corner of a table when both the last row formatting and last column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example*: Consider the following example of the southeast cell formatting within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<seCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</seCell>
```

In this example, we specifically set the southeast cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.24 swCell (Southwest Cell)

This element defies the formatting for the cell in the southwest corner of a table when both the last row formatting and first column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example*: Consider the following example of the southwest cell formatting within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<swCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</swCell>
```

In this example, we specifically set the southwest cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.25 tblBg (Table Background)

This element defines the formatting options which can be applied to the table background shape. The background shape is the same size as the entire table and can hold a fill or an effect which spans the entire table.

[*Example*: Consider the following example of a table background in use within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<tblBg>
  <fillRef idx="2">
    <schemeClr val="accent1"/>
  </fillRef>
  <effectRef idx="1">
    <schemeClr val="accent1"/>
  </effectRef>
</tblBg>
```

In this example, we see that there is a themed fill and themed effect being applied to the table background through the table style. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
effect (Effect)	§20.1.4.2.7
effectRef (Effect Reference)	§20.1.4.2.8
fill (Fill)	§20.1.4.2.9
fillRef (Fill Reference)	§20.1.4.2.10

[*Note*: The W3C XML Schema definition of this element's content model (CT_TableBackgroundStyle) is located in §A.4.1. *end note*]

20.1.4.2.26 tblStyle (Table Style)

This is the root element for a table style. Within the table style are different formatting options available in order to apply a table.

Parent Elements
tblStyleLst (§20.1.4.2.27)

Child Elements	Subclause
band1H (Band 1 Horizontal)	§20.1.4.2.1
band1V (Band 1 Vertical)	§20.1.4.2.2
band2H (Band 2 Horizontal)	§20.1.4.2.3
band2V (Band 2 Vertical)	§20.1.4.2.4
extLst (Extension List)	§20.1.2.2.15
firstCol (First Column)	§20.1.4.2.11

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
firstRow (First Row)	§20.1.4.2.12
lastCol (Last Column)	§20.1.4.2.16
lastRow (Last Row)	§20.1.4.2.17
neCell (Northeast Cell)	§20.1.4.2.20
nwCell (Northwest Cell)	§20.1.4.2.21
seCell (Southeast Cell)	§20.1.4.2.23
swCell (Southwest Cell)	§20.1.4.2.24
tblBg (Table Background)	§20.1.4.2.25
wholeTbl (Whole Table)	§20.1.4.2.34

Attributes	Description
styleId (Style ID)	Specifies a GUID identifying the table style in a unique manner. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).
styleName (Name)	Specifies the name of the table style which can show up in the user interface identifying the style to a user. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TableStyle) is located in §A.4.1. *end note*]

20.1.4.2.27 tblStyleLst (Table Style List)

This element is simply a list of table styles which are used within a document.

[*Example*: Consider the following example of a table style list within DrawingML:

```
<tblStyleLst def="{5C22544A-7EE6-4342-B048-85BDC9FD1C3A}">
  <tblStyle styleId="{5C22544A-7EE6-4342-B048-85BDC9FD1C3A}"
    styleName="Medium Style 2 - Accent 1">
    …
  </tblStyle>
  <tblStyle styleId="{3C2FFA5D-87B4-456A-9821-1D502468CF0F}"
    styleName="Themed Style 1 - Accent 1">
    …
  </tblStyle>
</tblStyleLst>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

In this example, we see two table styles defined along with the default being specified. *end example*]

Parent Elements
Root element of DrawingML Table Styles part

Child Elements	Subclause
tblStyle (Table Style)	§20.1.4.2.26

Attributes	Description
def (Default)	The GUID corresponding to the default table style in the list of table styles. This default can be used when a table is initially inserted into a document. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TableStyleList) is located in §A.4.1. *end note*]

20.1.4.2.28 tcBdr (Table Cell Borders)

This element defines the borders for the cells within a table.

[*Example*: Consider the following example of table cell borders being used within DrawingML:

```
<tcBdr>
  <left>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </left>
  <right>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </right>
  <top>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </top>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
    <bottom>
      <lnRef idx="2">
        <schemeClr val="lt1"/>
      </lnRef>
    </bottom>
    <insideH>
      <ln>
        <noFill/>
      </ln>
    </insideH>
    <insideV>
      <ln>
        <noFill/>
      </ln>
    </insideV>
  </tcBdr>
```

In this example, we define borders for the bottom, top, right, and left borders of the table cells. *end example*]

Parent Elements
tcStyle (§20.1.4.2.29)

Child Elements	Subclause
bottom (Bottom Border)	§20.1.4.2.6
extLst (Extension List)	§20.1.2.2.15
insideH (Inside Horizontal Border)	§20.1.4.2.14
insideV (Inside Vertical Border)	§20.1.4.2.15
left (Left Border)	§20.1.4.2.18
right (Right Border)	§20.1.4.2.22
tl2br (Top Left to Bottom Right Border)	§20.1.4.2.31
top (Top Border)	§20.1.4.2.32
tr2bl (Top Right to Bottom Left Border)	§20.1.4.2.33

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_TableCellBorderStyle) is located in §A.4.1. *end note*]

20.1.4.2.29 tcStyle (Table Cell Style)

This element defines the style for a give cell in a table.

[*Example*: Consider the following example of a table cell style in use within DrawingML:

```
<tcStyle>
  <tcBdr>
    …
  </tcBdr>
  <fill>
    …
  </fill>
</tcStyle>
```

In this example, we see that a set of borders for the cell along with a cell fill are being defined. *end example*]

Parent Elements
band1H (§20.1.4.2.1); band1V (§20.1.4.2.2); band2H (§20.1.4.2.3); band2V (§20.1.4.2.4); firstCol (§20.1.4.2.11); firstRow (§20.1.4.2.12); lastCol (§20.1.4.2.16); lastRow (§20.1.4.2.17); neCell (§20.1.4.2.20); nwCell (§20.1.4.2.21); seCell (§20.1.4.2.23); swCell (§20.1.4.2.24); wholeTbl (§20.1.4.2.34)

Child Elements	Subclause
cell3D (Cell 3-D)	§21.1.3.1
fill (Fill)	§20.1.4.2.9
fillRef (Fill Reference)	§20.1.4.2.10
tcBdr (Table Cell Borders)	§20.1.4.2.28

[*Note*: The W3C XML Schema definition of this element's content model (CT_TableStyleCellStyle) is located in §A.4.1. *end note*]

20.1.4.2.30 tcTxStyle (Table Cell Text Style)

This element defines the text properties associated with the text contained within a table cell.

[*Example*: Consider the following example of a table cell text style in use within DrawingML:

```
<tcTxStyle b="on">
  <fontRef idx="minor">
    <scrgbClr r="0" g="0" b="0"/>
  </fontRef>
  <schemeClr val="lt1"/>
</tcTxStyle>
```

In this example, we define the text within the cell to be bold and reference the themed minor font and to also be the light 1 color. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
band1H (§20.1.4.2.1); band1V (§20.1.4.2.2); band2H (§20.1.4.2.3); band2V (§20.1.4.2.4); firstCol (§20.1.4.2.11); firstRow (§20.1.4.2.12); lastCol (§20.1.4.2.16); lastRow (§20.1.4.2.17); neCell (§20.1.4.2.20); nwCell (§20.1.4.2.21); seCell (§20.1.4.2.23); swCell (§20.1.4.2.24); wholeTbl (§20.1.4.2.34)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
font (Font)	§20.1.4.2.13
fontRef (Font Reference)	§20.1.4.1.17
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

Attributes	Description
b (Bold)	Specifies if the text is to be bolded. The possible values for this attribute are defined by the ST_OnOffStyleType simple type (§20.1.10.36).
i (Italic)	Specifies if the text is to be italicized. The possible values for this attribute are defined by the ST_OnOffStyleType simple type (§20.1.10.36).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TableStyleTextStyle) is located in §A.4.1. *end note*]

20.1.4.2.31 tl2br (Top Left to Bottom Right Border)

This element defines the line properties associated with the border which goes from the top-left to the bottom-right corner in a table cell.

[*Example*: Consider the following example of the top border in use within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<tl2br>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</tl2br>
```

In this example, we see the border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§20.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§20.1.2.2.24
lnRef (Line Reference)	§20.1.4.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_ThemeableLineStyle) is located in §A.4.1. *end note*]

20.1.4.2.32 top (Top Border)

This element defines the line properties associated with the top border in a table cell.

[*Example*: Consider the following example of the top border in use within DrawingML:

```
<top>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</top>
```

In this example, we see the top border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§20.1.4.2.28)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
ln (Outline)	§20.1.2.2.24
lnRef (Line Reference)	§20.1.4.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_ThemeableLineStyle) is located in §A.4.1. *end note*]

20.1.4.2.33 tr2bl (Top Right to Bottom Left Border)

This element defines the line properties associated with the border which goes from the top-right to the bottom-left corner in a table cell.

[*Example*: Consider the following example of the top border in use within DrawingML:

```
<tr2bl>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</tr2bl>
```

In this example, we see the border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§20.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§20.1.2.2.24
lnRef (Line Reference)	§20.1.4.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_ThemeableLineStyle) is located in §A.4.1. *end note*]

20.1.4.2.34 wholeTbl (Whole Table)

This element contains formatting options which are applied to the table as a whole when it is in its default state with no formatting options (first row, last row, etc) enabled.

[*Example*: Consider the following example of whole table being used within DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<wholeTbl>
  <tcTxStyle>
    …
  </tcTxStyle>
  <tcStyle>
    …
  </tcStyle>
</wholeTbl>
```

In this example, we see definitions for the text and the cells within the table. *end example*]

Parent Elements
tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§20.1.4.2.29
tcTxStyle (Table Cell Text Style)	§20.1.4.2.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.5 3D

The 3D portion of the DrawingML framework allows for the describing of a 3D scene to be placed within a document. This 3D scene can be described using text and shape objects along with various lighting, material and camera settings.

20.1.5.1 anchor (Anchor Point)

This element specifies a point in 3D space. This point is the point in space that anchors the backdrop plane. Please see the example in the backdrop (§20.1.5.2) definition for an in depth explanation of this element.

Parent Elements
backdrop (§20.1.5.2)

Attributes	Description
x (X-Coordinate in 3D)	X-Coordinate in 3D space. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
y (Y-Coordinate in	Y-Coordinate in 3D space.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

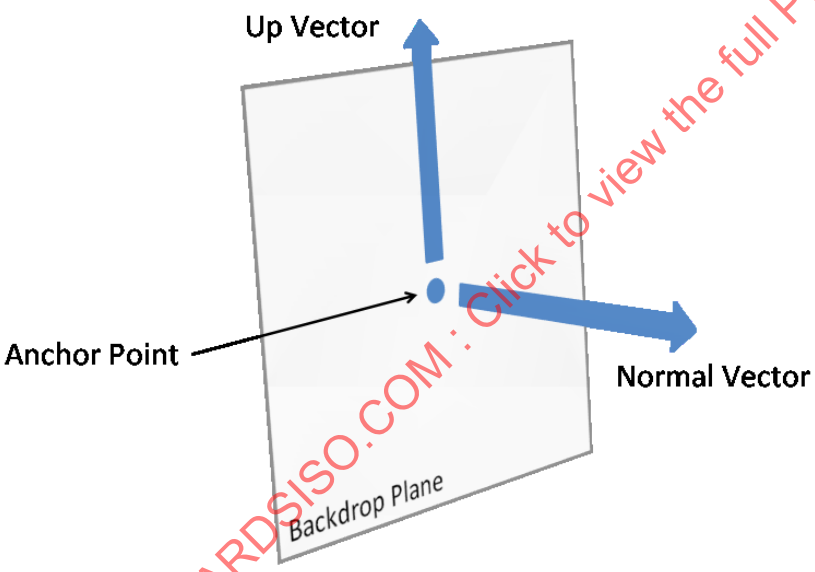
Attributes	Description
3D)	The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
z (Z-Coordinate in 3D)	Z-Coordinate in 3D space. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Point3D) is located in §A.4.1. *end note*]

20.1.5.2 backdrop (Backdrop Plane)

This element defines a plane in which effects, such as glow and shadow, are applied in relation to the shape they are being applied to. The points and vectors contained within the backdrop define a plane in 3D space.

[*Example*: Consider the following image as an explanation of the backdrop plane definition:



In this image we see a plane being defined by an anchor point, the vector normal to the face of the plane and a vector pointing up in relation to the plane. *end example*]

Parent Elements
scene3d (§21.4.5.5); scene3d (§20.1.4.1.26)

Child Elements	Subclause
anchor (Anchor Point)	§20.1.5.1

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
norm (Normal)	§20.1.5.10
up (Up Vector)	§20.1.5.13

[*Note*: The W3C XML Schema definition of this element's content model (CT_Backdrop) is located in §A.4.1. *end note*]

20.1.5.3 bevelB (Bottom Bevel)

This element holds the properties associated with defining a bevel on the bottom or back face of a shape.

[*Example*: Consider the following example of an sp3d containing a bottom bevel.

```
<a:sp3d>
  <a:bevelB w="139700" h="127000" prst="coolSlant"/>
</a:sp3d>
```

In this example, we see a bottom bevel being defined with a preset bevel type along with a custom width and height. *end example*]

Parent Elements
sp3d (§21.4.5.6); sp3d (§20.1.5.12)

Attributes	Description
h (Height)	Specifies the height of the bevel, or how far above the shape it is applied. [*Example*: Consider the following example bevel  In this example, we see the height of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
prst (Preset Bevel)	Specifies the preset bevel type which defines the look of the bevel.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_BevelPresetType simple type (§20.1.10.9).
w (Width)	Specifies the width of the bevel, or how far into the shape it is applied. [*Example*: Consider the following example bevel  In this example, we see the width of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Bevel) is located in §A.4.1. *end note*]

20.1.5.4 bevelT (Top Bevel)

This element holds the properties associated with defining a bevel on the top or front face of a shape.

[*Example*: Consider the following example of an sp3d containing a top bevel.

```
<a:sp3d>
  <a:bevelT w="139700" h="127000" prst="coolSlant"/>
</a:sp3d>
```

In this example, we see a top bevel being defined with a preset bevel type along with a custom width and height. *end example*]

Parent Elements
sp3d (§21.4.5.6); sp3d (§20.1.5.12)

Attributes	Description
h (Height)	Specifies the height of the bevel, or how far above the shape it is applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	[*Example*: Consider the following example bevel  In this example, we see the height of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
prst (Preset Bevel)	Specifies the preset bevel type which defines the look of the bevel. The possible values for this attribute are defined by the ST_BevelPresetType simple type (§20.1.10.9).
w (Width)	Specifies the width of the bevel, or how far into the shape it is applied. [*Example*: Consider the following example bevel In this example, we see the width of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_Bevel) is located in §A.4.1. *end note*]

20.1.5.5 camera (Camera)

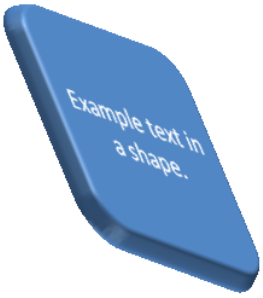
This element defines the placement and properties of the camera in the 3D scene. The camera position and properties modify the view of the scene.

 ©ISO/IEC 2011 – All rights reserved

[*Example*: Consider the following example of a camera in DrawingML:

```
<a:camera prst="orthographicFront">
  <a:rot lat="19902513" lon="17826689" rev="1362739"/>
</a:camera>
```

In this example, we see a preset camera being defined along with a rotation containing latitude, longitude, and revolution overrides provided that further rotate the camera around the scene. The effect of this camera can be seen on the following shape:



end example]

Parent Elements
scene3d (§21.4.5.5); scene3d (§20.1.4.1.26)

Child Elements	Subclause
rot (Rotation)	§20.1.5.11

Attributes	Description
fov (Field of View)	Provides an override for the default field of view for the camera. Different perspectives can be obtained by modifying this attribute. [*Example*: Consider the following example of a fov in DrawingML: `<a:camera prst="perspectiveContrastingRightFacing" fov="6900000"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> </a:camera>` In this example, we see a fov being defined which modifies the default fov for the preset camera. *end example*] The possible values for this attribute are defined by the ST_FOVAngle simple type (§20.1.10.26).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
prst (Preset Camera Type)	Defines the preset camera that is being used by the camera element. The preset camera defines a starting point for common preset rotations in space. [*Example*: Consider the following example of a prst in DrawingML: `<a:camera prst="perspectiveContrastingRightFacing" fov="6900000"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> </a:camera>` In this example, we see a prst being defined as `perspectiveContrastingRightFacing`. *end example*] The possible values for this attribute are defined by the ST_PresetCameraType simple type (§20.1.10.46).
zoom (Zoom)	Defines the zoom factor of a given camera element. The zoom modifies the scene as a whole and zooms in or out accordingly. [*Example*: Consider the following example of a zoom in DrawingML: `<a:camera prst="perspectiveContrastingRightFacing" fov="6900000" zoom="200%"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> /a:camera>` In this example, we see a zoom being used which zooms the scene by 200%. *end example*] The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Camera) is located in §A.4.1. *end note*]

20.1.5.6 contourClr (Contour Color)

This element defines the color for the contour on a shape. The contour of a shape is a solid filled line which surrounds the outer edges of the shape.

[*Example*: Consider the following example of a contour defined on a shape which includes a contourClr. Lighting characteristics applied to the shape are ignored when it comes to the contour on the shape.

```
<a:sp3d contourW="101600" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
  <a:contourClr>
    <a:schemeClr val="bg1"/>
  </a:contourClr>
</a:sp3d>
```

In this example, we see a contour defined on a shape with a top and bottom bevel defined. In the image below, the contour is the white ring around the shape.

end example]

Parent Elements
sp3d (§21.4.5.6); sp3d (§20.1.5.12)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.5.7 extrusionClr (Extrusion Color)

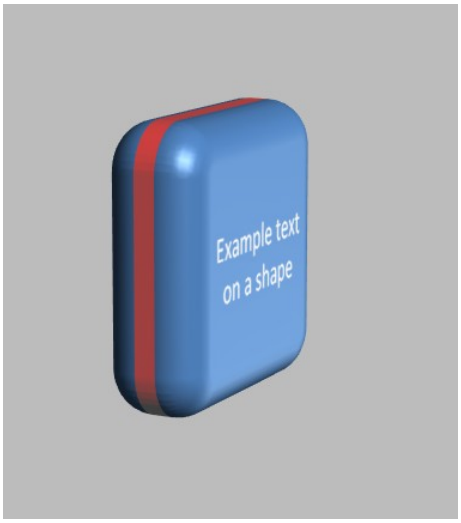
This element defines the color of the extrusion applied to a shape. The extrusion on a shape is an artificial height applied to the geometry.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Example*: Consider the following example of an extrusion which takes advantage of the extrusionClr. Lighting characteristics that are applied to the shape are also applied to the extrusion on the shape.

```
<a:sp3d extrusionH="139700" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
  <a:extrusionClr>
  <a:srgbClr val="FF0000"/>
  </a:extrusionClr>
</a:sp3d>
```

In this example, we see the extrusion color defined as red which can also be shown applied to the shape in the following image:



end example]

Parent Elements
sp3d (§21.4.5.6); sp3d (§20.1.5.12)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.5.8 flatTx (No text in 3D scene)

Keep text out of 3D scene entirely.

Parent Elements
bodyPr (§21.1.2.1.1); txPr (§21.4.5.12)

Attributes	Description
z (Z Coordinate)	Specifies the Z coordinate to be used in positioning the flat text within the 3D scene. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_FlatText) is located in §A.4.1. *end note*]

20.1.5.9 lightRig (Light Rig)

This element defines the light rig associated with the table. The light rig comes into play when there is a 3D bevel applied to a cell. When 3D is used, the light rig defines the lighting properties associated with the scene.

Parent Elements
cell3D (§21.1.3.1); scene3d (§21.4.5.5); scene3d (§20.1.4.1.26)

Child Elements	Subclause
rot (Rotation)	§20.1.5.11

Attributes	Description
dir (Direction)	Defines the direction from which the light rig is oriented in relation to the scene. [*Example*: Consider the following example of dir being used in a light rig: `<a:lightRig rig="threePt" dir="t"/>` In this example, we define the direction to be `top`. *end example*] The possible values for this attribute are defined by the ST_LightRigDirection simple type (§20.1.10.29).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

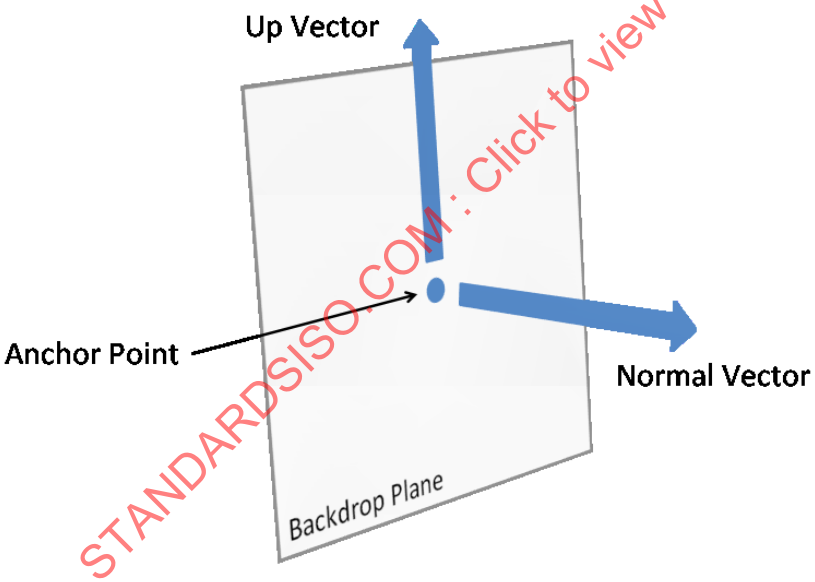
Attributes	Description
rig (Rig Preset)	Defines the preset type of light rig which is to be applied to the scene. [*Example*: Consider the following example of rig being used in a light rig: `<a:lightRig rig="threePt" dir="t"/>` In this example, we define the rig to be a `threePt` rig. *end example*] The possible values for this attribute are defined by the ST_LightRigType simple type (§20.1.10.30).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LightRig) is located in §A.4.1. *end note*]

20.1.5.10 norm (Normal)

This element defines a normal vector. To be more precise, this attribute defines a vector normal to the face of the backdrop plane.

[*Example*: Consider the following image as an example of what a normal vector is in relation to the backdrop plane:



end example]

Parent Elements
backdrop (§20.1.5.2)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
dx (Distance along X-axis in 3D)	Distance along X-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
dy (Distance along Y-axis in 3D)	Distance along Y-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
dz (Distance along Z-axis in 3D)	Distance along Z-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Vector3D) is located in §A.4.1. *end note*]

20.1.5.11 rot (Rotation)

This element defines a rotation in 3D space. A rotation in DrawingML is defined through the use of a latitude coordinate, a longitude coordinate, and a revolution about the axis as the latitude and longitude coordinates.

[*Example*: Consider the following example of a rotation defined by the rot elements being used in a lightRig in DrawingML:

```
<a:lightRig rig="twoPt" dir="t">
  <a:rot lat="0" lon="0" rev="6000000"/>
</a:lightRig>
```

In this example, we have only a revolution applied to the light rig which rotates it around it's center axis. *end example*]

Parent Elements
camera (§20.1.5.5), lightRig (§20.1.5.9)

Attributes	Description
lat (Latitude)	Defines the latitude value of the rotation. [*Example*: Consider the following example of a rot in DrawingML: `<a:rot lat="0" lon="0" rev="6000000"/>` In this example, we set the lat to be equal to `0`. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
lon (Longitude)	Defines the longitude value of the rotation. [*Example*: Consider the following example of a rot in DrawingML: `<a:rot lat="0" lon="0" rev="6000000"/>` In this example, we set the lon to be equal to `0`. *end example*] The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
rev (Revolution)	This attributes defines the revolution around the central axis in the rotation. [*Example*: Consider the following example of a rot in DrawingML: `<a:rot lat="0" lon="0" rev="6000000"/>` In this example, we set the rev to be equal to `6000000`. *end example*] The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SphereCoords) is located in §A.4.1. *end note*]

20.1.5.12 sp3d (Apply 3D shape properties)

This element defines the 3D properties associated with a particular shape in DrawingML. The 3D properties which can be applied to a shape are top and bottom bevels, a contour and an extrusion.

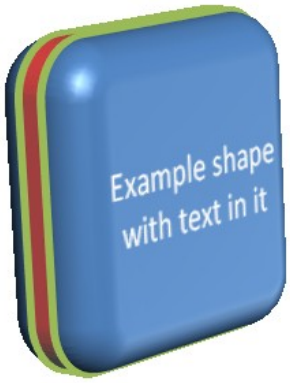
[*Example*: Consider the following example of an sp3d in DrawingML:

```
<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
  <a:extrusionClr>
    <a:srgbClr val="FF0000"/>
  </a:extrusionClr>
  <a:contourClr>
    <a:schemeClr val="accent3"/>
  </a:contourClr>
</a:sp3d>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

In this example, we see an sp3d defined which contains information defining both a top and bottom bevel, along with an extrusion and contour on the shape. The following image illustrates a shape with the applied sp3d:



end example]

Parent Elements
bodyPr (§21.1.2.1.1); effectStyle (§20.1.4.1.11); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); txPr (§21.4.5.12)

Child Elements	Subclause
bevelB (Bottom Bevel)	§20.1.5.3
bevelT (Top Bevel)	§20.1.5.4
contourClr (Contour Color)	§20.1.5.6
extLst (Extension List)	§20.1.2.2.15
extrusionClr (Extrusion Color)	§20.1.5.7

Attributes	Description
contourW (Contour Width)	Defines the width of the contour on the shape. [*Example*: Consider the following example of a contourW in use within the sp3d element: `<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	<a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> </a:sp3d> In this example, we see a countourW defined as 50800. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
extrusionH (Extrusion Height)	Defines the height of the extrusion applied to the shape. [*Example*: Consider the following example of an extrusionH in use within the sp3d element: <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> </a:sp3d> In this example, we see a extrusionH defined as 165100. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
prstMaterial (Preset Material Type)	Defines the preset material which is combined with the lighting properties to give the final look and feel of a shape. [*Example*: Consider the following example of a prstMaterial in use within the sp3d element: <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr>

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

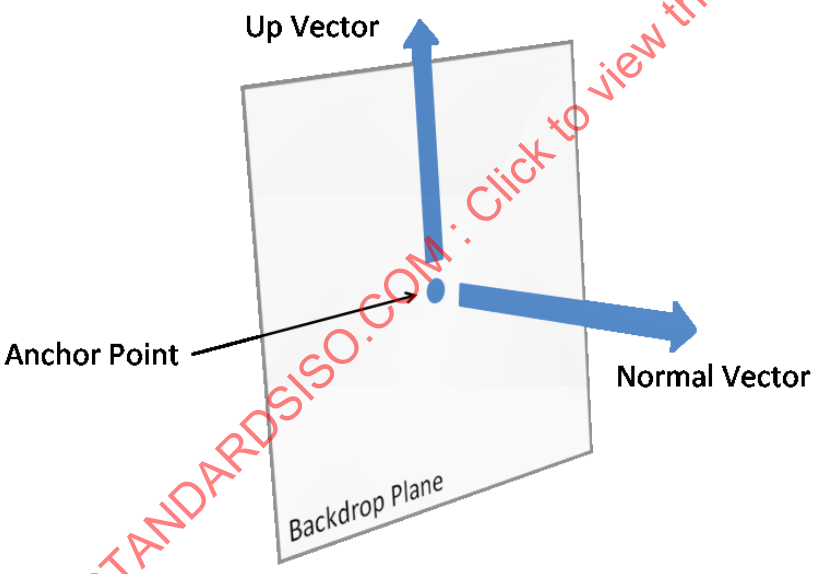
Attributes	Description
	</a:sp3d> In this example, we see a prstMaterial defined as `plastic`. *end example*] The possible values for this attribute are defined by the ST_PresetMaterialType simple type (§20.1.10.49).
z (Shape Depth)	Defines the z coordinate for the 3D shape. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Shape3D) is located in §A.4.1. *end note*]

20.1.5.13 up (Up Vector)

This element defines a vector representing up. To be more precise, this attribute defines a vector representing up in relation to the face of the backdrop plane.

[*Example*: Consider the following image as an example of what an up vector is in relation to the backdrop plane:



end example]

Parent Elements
backdrop (§20.1.5.2)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
dx (Distance along X-axis in 3D)	Distance along X-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
dy (Distance along Y-axis in 3D)	Distance along Y-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
dz (Distance along Z-axis in 3D)	Distance along Z-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Vector3D) is located in §A.4.1. *end note*]

20.1.6 Shared Style Sheet

The shared style sheet aspects contained within DrawingML are responsible for containing formatting options and styles which can be used by applications to define a certain look or feel to documents. The shared style sheet can be used by any document category ([*Note*: For example, a presentation. *end note*]) to pull visual information from which formats the document in a certain way, or theme. The shared style sheet contains information that is not document-category specific.

20.1.6.1 clrMap (Color Map)

This element specifics the color mapping layer which allows a user to define colors for background and text. This allows for swapping out of light/dark colors for backgrounds and the text on top of the background in order to maintain readability of the text. On a deeper level, this specifies exactly which colors the first 12 values refer to in the color scheme.

[*Example*: Consider the following example of a color map in use:

```
<clrMap bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
  accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
  accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

In this example, we see that bg1 is mapped to lt1, tx1 is mapped to dk1, and so on. *end example*]

Parent Elements
extraClrScheme (§20.1.6.4)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15

Attributes	Description
accent1 (Accent 1)	Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent2 (Accent 2)	Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent3 (Accent 3)	Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent4 (Accent 4)	Specifies a color defined which is associated as the accent 4 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent5 (Accent 5)	Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent6 (Accent 6)	Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
bg1 (Background 1)	A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
bg2 (Background 2)	Specifies a color defined which is associated as the second background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
folHlink (Followed Hyperlink)	Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
hlink (Hyperlink)	Specifies a color defined which is associated as the color for a hyperlink.

Attributes	Description
	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
tx1 (Text 1)	Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
tx2 (Text 2)	Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorMapping) is located in §A.4.1. *end note*]

20.1.6.2 clrScheme (Color Scheme)

This element defines a set of colors which are referred to as a color scheme. The color scheme is responsible for defining a list of twelve colors. The twelve colors consist of six accent colors, two dark colors, two light colors and a color for each of a hyperlink and followed hyperlink.

The Color Scheme Color elements appear in a sequence. The following listing shows the index value and corresponding Color Name.

Sequence Index	Element (Color) Name
0	dk1 (Dark 1)
1	lt1 (Light 1)
2	dk2 (Dark 2)
3	lt2 (Light 2)
4	accent1 (Accent 1)
5	accent2 (Accent 2)
6	accent3 (Accent 3)
7	accent4 (Accent 4)
8	accent5 (Accent 5)
9	accent6 (Accent 6)
10	hlink (Hyperlink)
11	folHlink (Followed Hyperlink)

[*Example*: Consider the following example of a color scheme defined in DrawingML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<clrScheme name="sample">
  <dk1>
    <sysClr val="windowText"/>
  </dk1>
  <lt1>
    <sysClr val="window"/>
  </lt1>
  <dk2>
    <srgbClr val="04617B"/>
  </dk2>
  <lt2>
    <srgbClr val="DBF5F9"/>
  </lt2>
  <accent1>
    <srgbClr val="0F6FC6"/>
  </accent1>
  <accent2>
    <srgbClr val="009DD9"/>
  </accent2>
  <accent3>
    <srgbClr val="0BD0D9"/>
  </accent3>
  <accent4>
    <srgbClr val="10CF9B"/>
  </accent4>
  <accent5>
    <srgbClr val="7CCA62"/>
  </accent5>
  <accent6>
    <srgbClr val="A5C249"/>
  </accent6>
  <hlink>
    <srgbClr val="FF9800"/>
  </hlink>
  <folHlink>
    <srgbClr val="F45511"/>
  </folHlink>
</clrScheme>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

In this example, are defined the 12 theme colors in the sample color scheme. *end example*]

Parent Elements
extraClrScheme (§20.1.6.4); themeElements (§20.1.6.10); themeOverride (§20.1.6.12)

©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
accent1 (Accent 1)	§20.1.4.1.1
accent2 (Accent 2)	§20.1.4.1.2
accent3 (Accent 3)	§20.1.4.1.3
accent4 (Accent 4)	§20.1.4.1.4
accent5 (Accent 5)	§20.1.4.1.5
accent6 (Accent 6)	§20.1.4.1.6
dk1 (Dark 1)	§20.1.4.1.9
dk2 (Dark 2)	§20.1.4.1.10
extLst (Extension List)	§20.1.2.2.15
folHlink (Followed Hyperlink)	§20.1.4.1.15
hlink (Hyperlink)	§20.1.4.1.19
lt1 (Light 1)	§20.1.4.1.22
lt2 (Light 2)	§20.1.4.1.23

Attributes	Description
name (Name)	The common name for this color scheme. This name can show up in the user interface in a list of color schemes. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorScheme) is located in §A.4.1. *end note*]

20.1.6.3 custClrLst (Custom Color List)

This element allows for a custom color palette to be created and which shows up alongside other color schemes. This can be very useful, for example, when someone would like to maintain a corporate color palette.

Parent Elements
theme (§20.1.6.9)

Child Elements	Subclause
custClr (Custom color)	§20.1.4.1.8

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_CustomColorList) is located in §A.4.1. *end note*]

20.1.6.4 extraClrScheme (Extra Color Scheme)

This element defines an auxiliary color scheme, which includes both a color scheme and color mapping. This is mainly used for backward compatibility concerns and roundtrips information required by earlier versions.

[*Example*: Consider the following example of an extra color scheme in use in DrawingML:

```
<extraClrScheme>
  <clrScheme name="extraColorSchemeSample">
    <dk1>
      <sysClr val="windowText"/>
    </dk1>
    <lt1>
      <sysClr val="window"/>
    </lt1>
    <dk2>
      <srgbClr val="04617B"/>
    </dk2>
    <lt2>
      <srgbClr val="DBF5F9"/>
    </lt2>
    <accent1>
      <srgbClr val="0F6FC6"/>
    </accent1>
    <accent2>
      <srgbClr val="009DD9"/>
    </accent2>
    <accent3>
      <srgbClr val="0BD0D9"/>
    </accent3>
    <accent4>
      <srgbClr val="10CF9B"/>
    </accent4>
    <accent5>
      <srgbClr val="7CCA62"/>
    </accent5>
    <accent6>
      <srgbClr val="A5C249"/>
    </accent6>
    <hlink>
      <srgbClr val="FF9800"/>
    </hlink>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
      <folHlink>
        <srgbClr val="F45511"/>
      </folHlink>
    </clrScheme>
    <clrMap bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
    accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
    accent6="accent6" hlink="hlink" folHlink="folHlink"/>
  </extraClrScheme>
```

In this example, the extra color scheme contains a color scheme and a color map for that color scheme. *end example*]

Parent Elements
extraClrSchemeLst (§20.1.6.5)

Child Elements	Subclause
clrMap (Color Map)	§20.1.6.1
clrScheme (Color Scheme)	§20.1.6.2

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorSchemeAndMapping) is located in §A.4.1. *end note*]

20.1.6.5 extraClrSchemeLst (Extra Color Scheme List)

This element is a container for the list of extra color schemes present in a document.

Parent Elements
theme (§20.1.6.9)

Child Elements	Subclause
extraClrScheme (Extra Color Scheme)	§20.1.6.4

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorSchemeList) is located in §A.4.1. *end note*]

20.1.6.6 masterClrMapping (Master Color Mapping)

This element is a part of a choice for which color mapping is used within the document. There is also defined an overrideClrMapping (§20.1.6.8) element which, when specified, the override is used rather than the color mapping defined in the master. If this element is specified, then we specifically use the color mapping defined in the master.

Parent Elements
clrMapOvr (§19.3.1.7)

[*Note*: The W3C XML Schema definition of this element's content model (CT_EmptyElement) is located in §A.4.1. *end note*]

20.1.6.7 objectDefaults (Object Defaults)

This element allows for the definition of default shape, line, and textbox formatting properties. An application can use this information to format a shape (or text) initially on insertion into a document.

Parent Elements
theme (§20.1.6.9)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
lnDef (Line Default)	§20.1.4.1.20
spDef (Shape Default)	§20.1.4.1.27
txDef (Text Default)	§20.1.4.1.28

[*Note*: The W3C XML Schema definition of this element's content model (CT_ObjectStyleDefaults) is located in §A.4.1. *end note*]

20.1.6.8 overrideClrMapping (Override Color Mapping)

This element provides an override for the color mapping in a document. When defined, this color mapping is used in place of the already defined color mapping, or master color mapping. This color mapping is defined in the same manner as the other mappings within this document.

[*Example*: Consider the following example of an override color mapping in DrawingML:

```
<overrideClrMapping bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
  accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
  accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

end example]

Attributes	Description
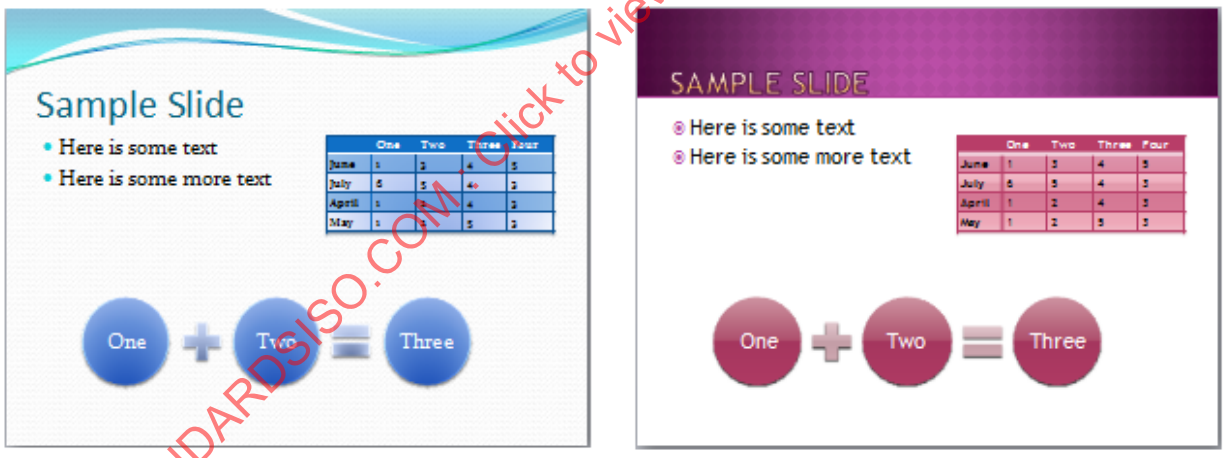
	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
tx1 (Text 1)	Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
tx2 (Text 2)	Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorMapping) is located in §A.4.1. *end note*]

20.1.6.9 theme (Theme)

This element defines the root level complex type associated with a shared style sheet (or theme). This element holds all the different formatting options available to a document through a theme and defines the overall look and feel of the document when themed objects are used within the document.

[*Example*: Consider the following image as an example of different themes in use applied to a presentation:



In this example, we see how a theme can affect font, colors, backgrounds, fills, and effects for different objects in a presentation. *end example*]

Parent Elements
Root element of DrawingML Theme part

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
custClrLst (Custom Color List)	§20.1.6.3
extLst (Extension List)	§20.1.2.2.15
extraClrSchemeLst (Extra Color Scheme List)	§20.1.6.5
objectDefaults (Object Defaults)	§20.1.6.7
themeElements (Theme Elements)	§20.1.6.10

Attributes	Description
name (Name)	Specifies the name given to the theme. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_OfficeStyleSheet) is located in §A.4.1. *end note*]

20.1.6.10 themeElements (Theme Elements)

This element defines the theme formatting options for the theme and is the workhorse of the theme. This is where the bulk of the shared theme information is contained and used by a document. This element contains the color scheme, font scheme, and format scheme elements which define the different formatting aspects of what a theme defines.

[*Example*: Consider the following example of a theme elements defined in DrawingML:

```
<themeElements>
  <clrScheme name="sample">
…
  </clrScheme>
  <fontScheme name="sample">
…
  </fontScheme>
  <fmtScheme name="sample">
    <fillStyleLst>
…
    </fillStyleLst>
    <lnStyleLst>
…
    </lnStyleLst>
    <effectStyleLst>
…
    </effectStyleLst>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
      <bgFillStyleLst>
…
      </bgFillStyleLst>
    </fmtScheme>
</themeElements>
```

In this example, we see the basic structure of how a theme elements is defined and have left out the true guts of each individual piece to save room. Each part (color scheme, font scheme, format scheme) is defined elsewhere within DrawingML. *end example*]

Parent Elements
theme (§20.1.6.9)

Child Elements	Subclause
clrScheme (Color Scheme)	§20.1.6.2
extLst (Extension List)	§20.1.2.2.15
fmtScheme (Format Scheme)	§20.1.4.1.14
fontScheme (Font Scheme)	§20.1.4.1.18

[*Note*: The W3C XML Schema definition of this element's content model (CT_BaseStyles) is located in §A.4.1. *end note*]

20.1.6.11 themeManager (Theme Manager)

The starting part for a theme file.

[*Note*: The W3C XML Schema definition of this element's content model (CT_EmptyElement) is located in §A.4.1. *end note*]

20.1.6.12 themeOverride (Theme Override)

This element allows for an override which changes just the colors, fonts, or effects of a single object, like a table for example. Currently it is used only to control overrides on the non-top-level masters within a presentation.

Parent Elements
Root element of DrawingML Theme Override part

Child Elements	Subclause
clrScheme (Color Scheme)	§20.1.6.2

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
fmtScheme (Format Scheme)	§20.1.4.1.14
fontScheme (Font Scheme)	§20.1.4.1.18

[*Note*: The W3C XML Schema definition of this element's content model (CT_BaseStylesOverride) is located in §A.4.1. *end note*]

20.1.7 Coordinate Systems and Transformations

The following elements are used to reflect dimensions, scaling, location, rotation, and flip information on groups and individual shapes respectively.

20.1.7.1 chExt (Child Extents)

This element specifies the size dimensions of the child extents rectangle and is used for calculations of grouping, scaling, and rotation behavior of shapes placed within a group.

Parent Elements
xfrm (§20.1.7.5)

Attributes	Description
cx (Extent Length)	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
cy (Extent Width)	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositiveSize2D) is located in §A.4.1. *end note*]

20.1.7.2 chOff (Child Offset)

This element specifies the location of the child extents rectangle and is used for calculations of grouping, scaling, and rotation behavior of shapes placed within a group.

Parent Elements
xfrm (§20.1.7.5)

Attributes	Description
x (X-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
y (Y-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The y attribute defines a y-coordinate of `100`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Point2D) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.7.3 ext (Extents)

This element specifies the size of the bounding box enclosing the referenced object.

Parent Elements
xfrm (§21.3.2.28); xfrm (§20.1.7.5); xfrm (§20.1.7.6); xfrm (§20.5.2.36); xfrm (§19.3.1.53)

Attributes	Description
cx (Extent Length)	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
cy (Extent Width)	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositiveSize2D) is located in §A.4.1. *end note*]

20.1.7.4 off (Offset)

This element specifies the location of the bounding box of an object. Effects on an object are not included in this bounding box.

Parent Elements
xfrm (§21.3.2.28); xfrm (§20.1.7.5); xfrm (§20.1.7.6); xfrm (§20.5.2.36); xfrm (§19.3.1.53)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
x (X-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
y (Y-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The y attribute defines a y-coordinate of `100`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Point2D) is located in §A.4.1. *end note*]

20.1.7.5 xfrm (2D Transform for Grouped Objects)

This element is nearly identical to the representation of 2-D transforms for ordinary shapes (§20.1.7.6). The only addition is a member to represent the Child offset and the Child extents.

Parent Elements
grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr (§20.5.2.18); grpSpPr (§19.3.1.23)

Child Elements	Subclause
chExt (Child Extents)	§20.1.7.1
chOff (Child Offset)	§20.1.7.2
ext (Extents)	§20.1.7.3
off (Offset)	§20.1.7.4

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
flipH (Horizontal Flip)	Horizontal flip. When true, this attribute defines that the group is flipped horizontally about the center of its bounding box. [*Example*: The following illustrates the effect of a horizontal flip.  *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
flipV (Vertical Flip)	Vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box. [*Example*: The following illustrates the effect of a vertical flip. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rot (Rotation)	Rotation. Specifies the clockwise rotation of a group in 1/64000 of a degree. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_GroupTransform2D) is located in §A.4.1. *end note*]

20.1.7.6 xfrm (2D Transform for Individual Objects)

This element represents 2-D transforms for ordinary shapes.

Parent Elements
graphicFrame (§20.1.2.2.18); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); txSp (§20.1.2.2.41)

[*Example*: The following illustrates the effect of a horizontal flip. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
flipV (Vertical Flip)	Specifies a vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box. [*Example*: The following illustrates the effect of a vertical flip. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rot (Rotation)	Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Transform2D) is located in §A.4.1. *end note*]

20.1.8 Shape Fills, Effects, and Line Properties

This portion of the DrawingML framework describes effects defining the visual appearance of shapes and lines. Shapes can be filled in a variety of ways, with images, solid colors, gradients, or pattern fills. In addition, several visual effects can alter the appearance of a shape, and multiple effects can be combined together. Lines also can have special properties defining how they are rendered, included a dashed appearance or decorations at the line ends. This section documents the elements that define these properties and effects for shapes and lines.

20.1.8.1 alphaBiLevel (Alpha Bi-Level Effect)

This element represents an Alpha Bi-Level Effect.

Alpha (Opacity) values less than the threshold are changed to 0 (fully transparent) and alpha values greater than or equal to the threshold are changed to 100% (fully opaque).

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
thresh (Threshold)	Specifies the threshold value for the alpha bi-level effect. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AlphaBiLevelEffect) is located in §A.4.1. *end note*]

20.1.8.2 alphaCeiling (Alpha Ceiling Effect)

This element represents an alpha ceiling effect.

Alpha (opacity) values greater than zero are changed to 100%. In other words, anything partially opaque becomes fully opaque.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

[*Note*: The W3C XML Schema definition of this element's content model (CT_AlphaCeilingEffect) is located in §A.4.1. *end note*]

20.1.8.3 alphaFloor (Alpha Floor Effect)

This element represents an alpha floor effect.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Alpha (opacity) values less than 100% are changed to zero. In other words, anything partially transparent becomes fully transparent.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

[*Note*: The W3C XML Schema definition of this element's content model (CT_AlphaFloorEffect) is located in §A.4.1. *end note*]

20.1.8.4 alphaInv (Alpha Inverse Effect)

This element represents an alpha inverse effect.

Alpha (opacity) values are inverted by subtracting from 100%.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_AlphaInverseEffect) is located in §A.4.1. *end note*]

20.1.8.5 alphaMod (Alpha Modulate Effect)

This element represents an alpha modulate effect.

Effect alpha (opacity) values are multiplied by a fixed percentage. The effect container specifies an effect containing alpha values to modulate.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
cont (Effect Container)	§20.1.8.20

[*Note*: The W3C XML Schema definition of this element's content model (CT_AlphaModulateEffect) is located in §A.4.1. *end note*]

20.1.8.6 alphaModFix (Alpha Modulate Fixed Effect)

This element represents an alpha modulate fixed effect.

Effect alpha (opacity) values are multiplied by a fixed percentage.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
amt (Amount)	Specifies the percentage amount to scale the alpha. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AlphaModulateFixedEffect) is located in §A.4.1. *end note*]

20.1.8.7 alphaOutset (Alpha Inset/Outset Effect)

This element specifies an alpha outset/inset effect.

This is equivalent to an alpha ceiling, followed by alpha blur, followed by either an alpha ceiling (positive radius) or alpha floor (negative radius).

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
rad (Radius)	Specifies the radius of outset/inset. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_AlphaOutsetEffect) is located in §A.4.1. *end note*]

20.1.8.8 alphaRepl (Alpha Replace Effect)

This element specifies an alpha replace effect.

Effect alpha (opacity) values are replaced by a fixed alpha.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
a (Alpha)	Specifies the new opacity value. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AlphaReplaceEffect) is located in §A.4.1. *end note*]

20.1.8.9 bevel (Line Join Bevel)

This element specifies a Bevel Line Join.

A bevel joint specifies that an angle joint is used to connect lines.

[*Example*:

end example]

Parent Elements
ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14)

[*Note*: The W3C XML Schema definition of this element's content model (CT_LineJoinBevel) is located in §A.4.1. *end note*]

20.1.8.10 bgClr (Background color)

This element specifies the background color of a Pattern fill.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
pattFill (§20.1.8.47)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.8.11 biLevel (Bi-Level (Black/White) Effect)

This element specifies a bi-level (black/white) effect. Input colors whose luminance is less than the specified threshold value are changed to black. Input colors whose luminance are greater than or equal the specified value are set to white. The alpha effect values are unaffected by this effect.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
thresh (Threshold)	Specifies the luminance threshold for the Bi-Level effect. Values greater than or equal to the threshold are set to white. Values lesser than the threshold are set to black. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_BiLevelEffect) is located in §A.4.1. *end note*]

20.1.8.12 blend (Blend Effect)

This element specifies a blend of several effects. The container specifies the raw effects to blend while the blend mode specifies how the effects are to be blended.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25)

Child Elements	Subclause
cont (Effect Container)	§20.1.8.20

Attributes	Description
blend (Blend Mode)	Specifies how to blend the two effects. The possible values for this attribute are defined by the ST_BlendMode simple type (§20.1.10.11).

[*Note*: The W3C XML Schema definition of this element's content model (CT_BlendEffect) is located in §A.4.1. *end note*]

20.1.8.13 blip (Blip)

This element specifies the existence of an image (binary large image or picture) and contains a reference to the image data.

Parent Elements
blipFill (§21.3.2.2); blipFill (§20.1.8.14); blipFill (§20.2.2.1); blipFill (§20.5.2.2); blipFill (§19.3.1.4); buBlip (§21.1.2.4.2)

Child Elements	Subclause
alphaBiLevel (Alpha Bi-Level Effect)	§20.1.8.1
alphaCeiling (Alpha Ceiling Effect)	§20.1.8.2
alphaFloor (Alpha Floor Effect)	§20.1.8.3
alphaInv (Alpha Inverse Effect)	§20.1.8.4
alphaMod (Alpha Modulate Effect)	§20.1.8.5
alphaModFix (Alpha Modulate Fixed Effect)	§20.1.8.6
alphaRepl (Alpha Replace Effect)	§20.1.8.8
biLevel (Bi-Level (Black/White) Effect)	§20.1.8.11
blur (Blur Effect)	§20.1.8.15
clrChange (Color Change Effect)	§20.1.8.16
clrRepl (Solid Color Replacement)	§20.1.8.18
duotone (Duotone Effect)	§20.1.8.23

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
fillOverlay (Fill Overlay Effect)	§20.1.8.29
grayscl (Gray Scale Effect)	§20.1.8.34
hsl (Hue Saturation Luminance Effect)	§20.1.8.39
lum (Luminance Effect)	§20.1.8.42
tint (Tint Effect)	§20.1.8.60

Attributes	Description
cstate (Compression State)	Specifies the compression state with which the picture is stored. This allows the application to specify the amount of compression that has been applied to a picture. The possible values for this attribute are defined by the ST_BlipCompression simple type (§20.1.10.12).
embed (Embedded Picture Reference) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for an embedded picture. This attribute is used to specify an image that resides locally within the file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
link (Linked Picture Reference) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for a linked picture. This attribute is used to specify an image that does not reside within this file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Blip) is located in §A.4.1. *end note*]

20.1.8.14 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object has. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[*Example*: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<p:pic>
  …
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
  …
</p:pic>
```

The above picture object is shown as an example of this fill type. *end example*]

[*Example*: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<p:pic>
  …
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
  <p:spPr>
    <a:gradFill>
      <a:gsLst>
        <a:gs pos="0">
          <a:schemeClr val="tx2">
            <a:shade val="50000"/>
          </a:schemeClr>
        </a:gs>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
          <a:gs pos="39999">
            <a:schemeClr val="tx2">
              <a:tint val="20000"/>
            </a:schemeClr>
          </a:gs>
          <a:gs pos="70000">
            <a:srgbClr val="C4D6EB"/>
          </a:gs>
          <a:gs pos="100000">
            <a:schemeClr val="bg1"/>
          </a:gs>
        </a:gsLst>
      </a:gradFill>
    </p:spPr>
    …
  </p:pic>
```

The above picture object is shown as an example of this double fill type. *end example*]

Parent Elements

Child Elements	Subclause
tile (Tile)	§20.1.8.58

Attributes	Description
dpi (DPI Setting)	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [*Note*: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. *end note*] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape)	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_BlipFillProperties) is located in §A.4.1. *end note*]

20.1.8.15 blur (Blur Effect)

This element specifies a blur effect that is applied to the entire shape, including its fill. All color channels, including alpha, are affected.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26)

Attributes	Description
grow (Grow Bounds)	Specifies whether the bounds of the object should be grown as a result of the blurring. True indicates the bounds are grown while false indicates that they are not. [*Example*: With grow set to false, the blur effect does not extend beyond the original bounds of the object:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	  With grow set to true, the blur effect can extend beyond the original bounds of the object: *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rad (Radius)	Specifies the radius of blur. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_BlurEffect) is located in §A.4.1. *end note*]

20.1.8.16 clrChange (Color Change Effect)

This element specifies a Color Change Effect. Instances of clrFrom are replaced with instances of clrTo.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Child Elements	Subclause
clrFrom (Change Color From)	§20.1.8.17
clrTo (Change Color To)	§20.1.8.19

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
useA (Consider Alpha Values)	Specifies whether alpha values are considered for the effect. Effect alpha values are considered if useA is true, else they are ignored. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorChangeEffect) is located in §A.4.1. *end note*]

20.1.8.17 clrFrom (Change Color From)

This element specifies a color getting removed in a color change effect. It is the "from" or source input color.

Parent Elements
clrChange (§20.1.8.16)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.8.18 clrRepl (Solid Color Replacement)

This element specifies a solid color replacement value. All effect colors are changed to a fixed color. Alpha values are unaffected.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22

fillOverlay (Fill Overlay Effect)	§20.1.8.29
glow (Glow Effect)	§20.1.8.32
grayscl (Gray Scale Effect)	§20.1.8.34
hsl (Hue Saturation Luminance Effect)	§20.1.8.39
innerShdw (Inner Shadow Effect)	§20.1.8.40
lum (Luminance Effect)	§20.1.8.42
outerShdw (Outer Shadow Effect)	§20.1.8.45
prstShdw (Preset Shadow)	§20.1.8.49
reflection (Reflection Effect)	§20.1.8.50
relOff (Relative Offset Effect)	§20.1.8.51
softEdge (Soft Edge Effect)	§20.1.8.53
tint (Tint Effect)	§20.1.8.60
xfrm (Transform Effect)	§20.1.8.61

Attributes	Description
name (Name)	Specifies an optional name for this list of effects, so that it can be referred to later. Shall be unique across all effect trees and effect containers. The possible values for this attribute are defined by the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
type (Effect Container Type)	Specifies the kind of container, either sibling or tree. The possible values for this attribute are defined by the ST_EffectContainerType simple type (§20.1.10.22).

[*Note*: The W3C XML Schema definition of this element's content model (CT_EffectContainer) is located in §A.4.1. *end note*]

20.1.8.21 custDash (Custom Dash)

This element specifies a custom dashing scheme. It is a list of dash stop elements which represent building block atoms upon which the custom dashing scheme is built.

Parent Elements
ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14)

Child Elements	Subclause
ds (Dash Stop)	§20.1.8.22

[*Note*: The W3C XML Schema definition of this element's content model (CT_DashStopList) is located in §A.4.1. *end note*]

20.1.8.22 ds (Dash Stop)

This element specifies a dash stop primitive. Dashing schemes are built by specifying an ordered list of dash stop primitive. A dash stop primitive consists of a dash and a space.

Parent Elements
custDash (§20.1.8.21)

Attributes	Description
d (Dash Length)	Specifies the length of the dash relative to the line width. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).
sp (Space Length)	Specifies the length of the space relative to the line width. The possible values for this attribute are defined by the ST_PositivePercentage simple

Attributes	Description
	type (§20.1.10.45).

[*Note*: The W3C XML Schema definition of this element's content model (CT_DashStop) is located in §A.4.1. *end note*]

20.1.8.23 duotone (Duotone Effect)

This element specifies a duotone effect.

For each pixel, combines clr1 and clr2 through a linear interpolation to determine the new color for that pixel.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_DuotoneEffect) is located in §A.4.1. *end note*]

20.1.8.24 effect (Effect)

This element specifies a reference to an existing effect container.

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
ref (Reference)	Specifies the reference. Its value can be the name of an effect container, or one of four special references: fill - refers to the fill effect line - refers to the line effect fillLine - refers to the combined fill and line effects children - refers to the combined effects from logical child shapes or text

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema token datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_EffectReference) is located in §A.4.1. *end note*]

20.1.8.25 effectDag (Effect Container)

This element specifies a list of effects. Effects are applied in the order specified by the container type (sibling or tree).

[*Note:* An effectDag element can contain multiple effect containers as child elements. Effect containers with different styles can be combined in an effectDag to define a directed acyclic graph (DAG) that specifies the order in which all effects are applied. *end note*]

softEdge (Soft Edge Effect)	§20.1.8.53
tint (Tint Effect)	§20.1.8.60
xfrm (Transform Effect)	§20.1.8.61

Attributes	Description
name (Name)	Specifies an optional name for this list of effects, so that it can be referred to later. Shall be unique across all effect trees and effect containers. The possible values for this attribute are defined by the W3C XML Schema token datatype.
type (Effect Container Type)	Specifies the kind of container, either sibling or tree. The possible values for this attribute are defined by the ST_EffectContainerType simple type (§20.1.10.22).

[*Note*: The W3C XML Schema definition of this element's content model (CT_EffectContainer) is located in §A.4.1. *end note*]

20.1.8.26 effectLst (Effect Container)

This element specifies a list of effects. Effects in an effectLst are applied in the default order by the rendering engine. The following diagrams illustrate the order in which effects are applied, both for shapes and for group shapes.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note:* The output of many effects does not include the input shape. For effects that should be applied to the result of previous effects as well as the original shape, a container is used to group the inputs together. *end note*]

[*Example:* Outer Shadow is applied both to the original shape and the original shape's glow. The result of blur contains the original shape, while the result of glow contains only the added glow. Therefore, a container that groups the blur result with the glow result is used as the input to Outer Shadow. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_FillEffect) is located in §A.4.1. *end note*]

20.1.8.29 fillOverlay (Fill Overlay Effect)

This element specifies a fill overlay effect. A fill overlay can be used to specify an additional fill for an object and blend the two fills together.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26)

Child Elements	Subclause
blipFill (Picture Fill)	§20.1.8.14
gradFill (Gradient Fill)	§20.1.8.33
grpFill (Group Fill)	§20.1.8.35
noFill (No Fill)	§20.1.8.44
pattFill (Pattern Fill)	§20.1.8.47
solidFill (Solid Fill)	§20.1.8.54

Attributes	Description
blend (Blend)	Specifies how to blend the fill with the base effect. The possible values for this attribute are defined by the ST_BlendMode simple type (§20.1.10.11).

[*Note*: The W3C XML Schema definition of this element's content model (CT_FillOverlayEffect) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

20.1.8.30 fillRect (Fill Rectangle)

This element specifies a fill rectangle. When stretching of an image is specified, a source rectangle, srcRect, is scaled to fit the specified fill rectangle.

Each edge of the fill rectangle is defined by a percentage offset from the corresponding edge of the shape's bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. [*Note*: For example, a left offset of 25% specifies that the left edge of the fill rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width. *end note*]

[*Example*:

```
<a:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
      <a:fillRect b="10000" r="25000"/>
  </a:stretch>
</a:blipFill>
```

The above image is stretched to fill the entire rectangle except for the bottom 10% and rightmost 25%.

end example]

Parent Elements
stretch (§20.1.8.56)

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
r (Right Offset)	Specifies the right edge of the rectangle.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

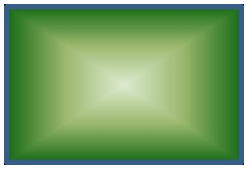
[*Note*: The W3C XML Schema definition of this element's content model (CT_RelativeRect) is located in §A.4.1. *end note*]

20.1.8.31 fillToRect (Fill To Rectangle)

This element defines the "focus" rectangle for the center shade, specified relative to the fill tile rectangle. The center shade fills the entire tile except the margins specified by each attribute.

Each edge of the center shade rectangle is defined by a percentage offset from the corresponding edge of the tile rectangle. A positive percentage specifies an inset, while a negative percentage specifies an outset. [*Note:* For example, a left offset of 25% specifies that the left edge of the center shade rectangle is located to the right of the tile rectangle's left edge by an amount equal to 25% of the tile rectangle's width. *end note*]

[*Example*:



```
<a:path path="rect">
  <a:fillToRect l="50000" r="50000" t="50000" b="50000"/>
</a:path>
```

In the above shape, the rectangle defined by fillToRect is a single point in the center of the shape. This creates the effect of the center shade focusing at a point in the center of the region.

end example]

[*Example*:

```
<a:path path="rect">
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
    <a:fillToRect l="25000" t="25000" r="25000" b="0"/>
  </a:path>
```

The center shade occupies the rectangle defined by excluding the topmost, leftmost, and rightmost 25% of the region. Therefore, the gradient fills the remaining leftmost 25%, topmost 25%, and rightmost 25% of the region.

end example]

Parent Elements
path (§20.1.8.46)

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
r (Right Offset)	Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_RelativeRect) is located in §A.4.1. *end note*]

20.1.8.32 glow (Glow Effect)

This element specifies a glow effect, in which a color blurred outline is added outside the edges of the object.

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

Attributes	Description
rad (Radius)	Specifies the radius of the glow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_GlowEffect) is located in §A.4.1. *end note*]

20.1.8.33 gradFill (Gradient Fill)

This element defines a gradient fill.

A gradient fill is a fill which is characterized by a smooth gradual transition from one color to the next. At its simplest, it is a fill which transitions between two colors; or more generally, it can be a transition of any number of colors.

The desired transition colors and locations are defined in the gradient stop list (gsLst) child element.

The other child element defines the properties of the gradient fill (there are two styles-- a linear shade style as well as a path shade style)

[*Example*:

The following is a sample gradient fill, varying from blue to white:

end example]

Parent Elements
bg (§21.4.3.1); bgFillStyleLst (§20.1.4.1.7); bgPr (§19.3.1.2); defRPr (§21.1.2.3.2); endParaRPr (§21.1.2.2.3); fill (§20.1.8.28); fill (§20.1.4.2.9); fillOverlay (§20.1.8.29); fillStyleLst (§20.1.4.1.13); grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr (§20.5.2.18); grpSpPr (§19.3.1.23); ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); rPr (§21.1.2.3.9); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); tblPr (§21.1.3.15); tcPr (§21.1.3.17); uFill (§21.1.2.3.12); uLn (§21.1.2.3.14)

Child Elements	Subclause
gsLst (Gradient Stop List)	§20.1.8.37
lin (Linear Gradient Fill)	§20.1.8.41
path (Path Gradient)	§20.1.8.46
tileRect (Tile Rectangle)	§20.1.8.59

Attributes	Description
flip (Tile Flip)	Specifies the direction(s) in which to flip the gradient while tiling. Normally a gradient fill encompasses the entire bounding box of the shape which contains the fill. However, with the tileRect element, it is possible to define a "tile" rectangle which is smaller than the bounding box. In this situation, the gradient fill is encompassed within the tile rectangle, and the tile rectangle is tiled across the bounding box to fill the entire area. The possible values for this attribute are defined by the ST_TileFlipMode simple type (§20.1.10.85).
rotWithShape (Rotate With Shape)	Specifies if a fill rotates along with a shape when the shape is rotated. [*Example*: The following is a fill with the flip attribute set to "x". The black interior rectangle indicates the tile rectangle. Notice that the adjacent rectangle to the right in the tile has been flipped along the x-axis.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

Attributes	Description
pos (Position)	Specifies where this gradient stop should appear in the color band. This position is

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	specified in the range [0%, 100%], which corresponds to the beginning and the end of the color band respectively. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_GradientStop) is located in §A.4.1. *end note*]

20.1.8.37 gsLst (Gradient Stop List)

The list of gradient stops that specifies the gradient colors and their relative positions in the color band.

Parent Elements
gradFill (§20.1.8.33)

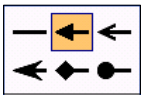
Child Elements	Subclause
gs (Gradient stops)	§20.1.8.36

[*Note*: The W3C XML Schema definition of this element's content model (CT_GradientStopList) is located in §A.4.1. *end note*]

20.1.8.38 headEnd (Line Head/End Style)

This element specifies decorations which can be added to the head of a line.

[*Example*:



end exmaple]

Parent Elements
ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14)

Attributes	Description
len (Length of Head/End)	Specifies the line end length in relation to the line width.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_LineEndLength simple type (§20.1.10.32).
type (Line Head/End Type)	Specifies the line end decoration, such as a triangle or arrowhead. The possible values for this attribute are defined by the ST_LineEndType simple type (§20.1.10.33).
w (Width of Head/End)	Specifies the line end width in relation to the line width. The possible values for this attribute are defined by the ST_LineEndWidth simple type (§20.1.10.34).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LineEndProperties) is located in §A.4.1. *end note*]

20.1.8.39 hsl (Hue Saturation Luminance Effect)

This element specifies a hue/saturation/luminance effect. The hue, saturation, and luminance can each be adjusted relative to its current value.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
hue (Hue)	Specifies the number of degrees by which the hue is adjusted. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
lum (Luminance)	Specifies the percentage by which the luminance is adjusted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).
sat (Saturation)	Specifies the percentage by which the saturation is adjusted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).

[*Note*: The W3C XML Schema definition of this element's content model (CT_HSLEffect) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.8.40 innerShdw (Inner Shadow Effect)

This element specifies an inner shadow effect. A shadow is applied within the edges of the object according to the parameters given by the attributes.

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26)

Child Elements	Subclause

20.1.8.41 lin (Linear Gradient Fill)

This element specifies a linear gradient.

Parent Elements
gradFill (§20.1.8.33)

Attributes	Description
ang (Angle)	Specifies the direction of color change for the gradient. To define this angle, let its value be x measured clockwise. Then (-sin x, cos x) is a vector parallel to the line of constant color in the gradient fill. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
scaled (Scaled)	Whether the gradient angle scales with the fill region. Mathematically, if this flag is true, then the gradient vector (cos x , sin x) is scaled by the width (w) and height (h) of the fill region, so that the vector becomes (w cos x, h sin x) (before normalization). Observe that now if the gradient angle is 45 degrees, the gradient vector is (w, h), which goes from top-left to bottom-right of the fill region. If this flag is false, the gradient angle is independent of the fill region and is not scaled using the manipulation described above. So a 45-degree gradient angle always give a gradient band whose line of constant color is parallel to the vector (1, -1). The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_LinearShadeProperties) is located in §A.4.1. *end note*]

20.1.8.42 lum (Luminance Effect)

This element specifies a luminance effect. Brightness linearly shifts all colors closer to white or black. Contrast scales all colors to be either closer or further apart.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
bright (Brightness)	Specifies the percent to change the brightness. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
contrast (Contrast)	Specifies the percent to change the contrast. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LuminanceEffect) is located in §A.4.1. *end note*]

20.1.8.43 miter (Miter Line Join)

This element specifies that a line join shall be mitered.

[*Example*: The following sample illustrated two lines which are joined using a mitered style

end example]

Parent Elements
ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14)

Attributes	Description
lim (Miter Join Limit)	Specifies the amount by which lines is extended to form a miter join - otherwise miter joins can extend infinitely far (for lines which are almost parallel). The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LineJoinMiterProperties) is located in §A.4.1. *end note*]

20.1.8.44 noFill (No Fill)

This element specifies that no fill is applied to the parent element.

Parent Elements
bg (§21.4.3.1); bgFillStyleLst (§20.1.4.1.7); bgPr (§19.3.1.2); defRPr (§21.1.2.3.2); endParaRPr (§21.1.2.2.3); fill (§20.1.8.28); fill (§20.1.4.2.9); fillOverlay (§20.1.8.29); fillStyleLst (§20.1.4.1.13); grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr (§20.5.2.18); grpSpPr (§19.3.1.23); ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
(§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); rPr (§21.1.2.3.9); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); tblPr (§21.1.3.15); tcPr (§21.1.3.17); uFill (§21.1.2.3.12); uLn (§21.1.2.3.14)

[*Note*: The W3C XML Schema definition of this element's content model (CT_NoFillProperties) is located in §A.4.1. *end note*]

20.1.8.45 outerShdw (Outer Shadow Effect)

This element specifies an Outer Shadow Effect.

[*Example*: The following is an example of an outer shadow effect.

end example]

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

Attributes	Description
algn (Shadow Alignment)	Specifies shadow alignment; alignment happens first, effectively setting the origin for scale, skew, and offset. The possible values for this attribute are defined by the ST_RectAlignment simple type

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	(§20.1.10.52).
blurRad (Blur Radius)	Specifies the blur radius of the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
dir (Shadow Direction)	Specifies the direction to offset the shadow. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
dist (Shadow Offset Distance)	Specifies the how far to offset the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
kx (Horizontal Skew)	Specifies the horizontal skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).
ky (Vertical Skew)	Specifies the vertical skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).
rotWithShape (Rotate With Shape)	Specifies whether the shadow rotates with the shape if the shape is rotated. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sx (Horizontal Scaling Factor)	Specifies the horizontal scaling factor; negative scaling causes a flip. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
sy (Vertical Scaling Factor)	Specifies the vertical scaling factor; negative scaling causes a flip. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OuterShadowEffect) is located in §A.4.1. *end note*]

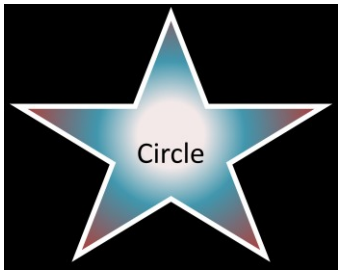
20.1.8.46 path (Path Gradient)

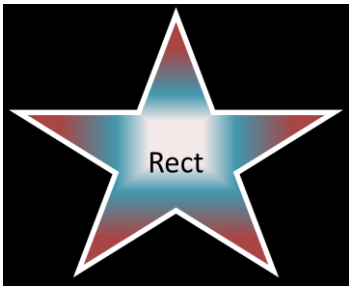
This element defines that a gradient fill follows a path vs. a linear line.

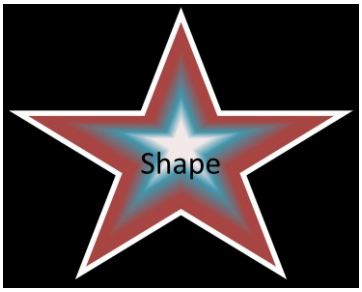
[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved







The examples above illustrate gradient fills following a circular, rectangular or shape path.

end example]

Parent Elements
gradFill (§20.1.8.33)

Child Elements	Subclause
fillToRect (Fill To Rectangle)	§20.1.8.31

Attributes	Description
path (Gradient Fill Path)	Specifies the shape of the path to follow. The possible values for this attribute are defined by the ST_PathShadeType simple type (§20.1.10.38).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PathShadeProperties) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.8.47 pattFill (Pattern Fill)

This element specifies a pattern fill. A repeated pattern is used to fill the object.

Parent Elements
bg (§21.4.3.1); bgFillStyleLst (§20.1.4.1.7); bgPr (§19.3.1.2); defRPr (§21.1.2.3.2); endParaRPr (§21.1.2.2.3); fill (§20.1.8.28); fill (§20.1.4.2.9); fillOverlay (§20.1.8.29); fillStyleLst (§20.1.4.1.13); grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr (§20.5.2.18); grpSpPr (§19.3.1.23); ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); rPr (§21.1.2.3.9); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); tblPr (§21.1.3.15); tcPr (§21.1.3.17); uFill (§21.1.2.3.12); uLn (§21.1.2.3.14)

Child Elements	Subclause
bgClr (Background color)	§20.1.8.10
fgClr (Foreground color)	§20.1.8.27

Attributes	Description
prst (Preset Pattern)	Specifies one of a set of preset patterns to fill the object. The possible values for this attribute are defined by the ST_PresetPatternVal simple type (§20.1.10.50).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PatternFillProperties) is located in §A.4.1. *end note*]

20.1.8.48 prstDash (Preset Dash)

This element specifies that a preset line dashing scheme should be used.

Parent Elements
ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14)

Attributes	Description
val (Value)	Specifies which preset dashing scheme is to be used. The possible values for this attribute are defined by the ST_PresetLineDashVal simple type (§20.1.10.48).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_PresetLineDashProperties) is located in §A.4.1. *end note*]

20.1.8.49 prstShdw (Preset Shadow)

This element specifies that a preset shadow is to be used. Each preset shadow is equivalent to a specific outer shadow effect. For each preset shadow, the color element, direction attribute, and distance attribute represent the color, direction, and distance parameters of the corresponding outer shadow. Additionally, the rotateWithShape attribute of corresponding outer shadow is always false. Other non-default parameters of the outer shadow are dependent on the prst attribute.

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

Attributes	Description
dir (Direction)	Specifies the direction to offset the shadow. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
dist (Distance)	Specifies how far to offset the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
prst (Preset Shadow)	Specifies which preset shadow to use. The possible values for this attribute are defined by the ST_PresetShadowVal simple type (§20.1.10.51).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PresetShadowEffect) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.8.50 reflection (Reflection Effect)

This element specifies a reflection effect.

[*Example*:

end example]

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26)

Attributes	Description
algn (Shadow Alignment)	Specifies shadow alignment. The possible values for this attribute are defined by the ST_RectAlignment simple type (§20.1.10.52).
blurRad (Blur Radius)	Specifies the blur radius. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
dir (Direction)	Specifies the direction of the alpha gradient ramp relative to the shape itself. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
dist (Distance)	Specifies how far to distance the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
endA (End Alpha)	Specifies the ending reflection opacity. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).
endPos (End	Specifies the end position (along the alpha gradient ramp) of the end alpha value.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
Position)	The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).
fadeDir (Fade Direction)	Specifies the direction to offset the reflection. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
kx (Horizontal Skew)	Specifies the horizontal skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).
ky (Vertical Skew)	Specifies the vertical skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).
rotWithShape (Rotate With Shape)	Specifies if the reflection rotates with the shape. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
stA (Start Opacity)	starting reflection opacity. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).
stPos (Start Position)	Specifies the start position (along the alpha gradient ramp) of the start alpha value. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).
sx (Horizontal Ratio)	Specifies the horizontal scaling factor. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
sy (Vertical Ratio)	Specifies the vertical scaling factor. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this element's content model (CT_ReflectionEffect) is located in §A.4.1. *end note*]

20.1.8.51 relOff (Relative Offset Effect)

This element specifies a relative offset effect. Sets up a new origin by offsetting relative to the size of the previous effect.

©ISO/IEC 2011 – All rights reserved

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
tx (Offset X)	Specifies the X offset. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
ty (Offset Y)	Specifies the Y offset. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_RelativeOffsetEffect) is located in §A.4.1. *end note*]

20.1.8.52 round (Round Line Join)

This element specifies that lines joined together have a round join.

[*Example*:

end example]

Parent Elements
ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14)

[*Note*: The W3C XML Schema definition of this element's content model (CT_LineJoinRound) is located in §A.4.1. *end note*]

20.1.8.53 softEdge (Soft Edge Effect)

This element specifies a soft edge effect. The edges of the shape are blurred, while the fill is not affected.

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
rad (Radius)	Specifies the radius of blur to apply to the edges. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SoftEdgesEffect) is located in §A.4.1. *end note*]

20.1.8.54 solidFill (Solid Fill)

This element specifies a solid color fill. The shape is filled entirely with the specified color.

Parent Elements
bg (§21.4.3.1); bgFillStyleLst (§20.1.4.1.7); bgPr (§19.3.1.2); defRPr (§21.1.2.3.2); endParaRPr (§21.1.2.2.3); fill (§20.1.8.28); fill (§20.1.4.2.9); fillOverlay (§20.1.8.29); fillStyleLst (§20.1.4.1.13); grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr (§20.5.2.18); grpSpPr (§19.3.1.23); ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); rPr (§21.1.2.3.9); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); tblPr (§21.1.3.15); tcPr (§21.1.3.17); uFill (§21.1.2.3.12); uLn (§21.1.2.3.14)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§20.1.2.3.13
prstClr (Preset Color)	§20.1.2.3.22
schemeClr (Scheme Color)	§20.1.2.3.29
scrgbClr (RGB Color Model - Percentage Variant)	§20.1.2.3.30
srgbClr (RGB Color Model - Hex Variant)	§20.1.2.3.32
sysClr (System Color)	§20.1.2.3.33

[*Note*: The W3C XML Schema definition of this element's content model (CT_SolidColorFillProperties) is located in §A.4.1. *end note*]

20.1.8.55 srcRect (Source Rectangle)

This element specifies the portion of the blip used for the fill.

Each edge of the source rectangle is defined by a percentage offset from the corresponding edge of the bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. [*Note:* For example, a left offset of 25% specifies that the left edge of the source rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Parent Elements
blipFill (§21.3.2.2); blipFill (§20.1.8.14); blipFill (§20.2.2.1); blipFill (§20.5.2.2); blipFill (§19.3.1.4)

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
r (Right Offset)	Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_RelativeRect) is located in §A.4.1. *end note*]

20.1.8.56 stretch (Stretch)

This element specifies that a BLIP should be stretched to fill the target rectangle. The other option is a tile where a BLIP is tiled to fill the available area.

Parent Elements
blipFill (§21.3.2.2); blipFill (§20.1.8.14); blipFill (§20.2.2.1); blipFill (§20.5.2.2); blipFill (§19.3.1.4)

Child Elements	Subclause
fillRect (Fill Rectangle)	§20.1.8.30

[*Note*: The W3C XML Schema definition of this element's content model (CT_StretchInfoProperties) is located in §A.4.1. *end note*]

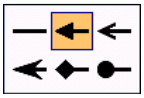
20.1.8.57 tailEnd (Tail line end style)

This element specifies decorations which can be added to the tail of a line.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Example*:



end example]

Parent Elements
ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14)

Attributes	Description
len (Length of Head/End)	Specifies the line end length in relation to the line width. The possible values for this attribute are defined by the ST_LineEndLength simple type (§20.1.10.32).
type (Line Head/End Type)	Specifies the line end decoration, such as a triangle or arrowhead. The possible values for this attribute are defined by the ST_LineEndType simple type (§20.1.10.33).
w (Width of Head/End)	Specifies the line end width in relation to the line width. The possible values for this attribute are defined by the ST_LineEndWidth simple type (§20.1.10.34).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LineEndProperties) is located in §A.4.1. *end note*]

20.1.8.58 tile (Tile)

This element specifies that a BLIP should be tiled to fill the available space. This element defines a "tile" rectangle within the bounding box. The image is encompassed within the tile rectangle, and the tile rectangle is tiled across the bounding box to fill the entire area.

[*Example*:

The following is a fill with the flip attribute set to "x". The black interior rectangle indicates the tile rectangle. Notice that the adjacent rectangle to the right in the tile has been flipped along the x-axis.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

end example]

Parent Elements
blipFill (§21.3.2.2); blipFill (§20.1.8.14); blipFill (§20.2.2.1); blipFill (§20.5.2.2); blipFill (§19.3.1.4)

Attributes	Description
algn (Alignment)	Specifies where to align the first tile with respect to the shape. Alignment happens after the scaling, but before the additional offset. The possible values for this attribute are defined by the ST_RectAlignment simple type (§20.1.10.52).
flip (Tile Flipping)	Specifies the direction(s) in which to flip the source image while tiling. Images can be flipped horizontally, vertically, or in both directions to fill the entire region. The possible values for this attribute are defined by the ST_TileFlipMode simple type (§20.1.10.85).
sx (Horizontal Ratio)	Specifies the amount to horizontally scale the srcRect. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
sy (Vertical Ratio)	Specifies the amount to vertically scale the srcRect. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
tx (Horizontal Offset)	Specifies additional horizontal offset after alignment. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
ty (Vertical Offset)	Specifies additional vertical offset after alignment. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_TileInfoProperties) is located in §A.4.1. *end note*]

20.1.8.59 tileRect (Tile Rectangle)

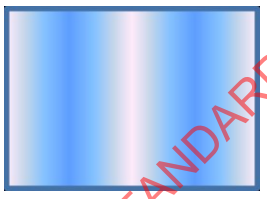
This element specifies a rectangular region of the shape to which the gradient is applied. This region is then tiled across the remaining area of the shape to complete the fill. The tile rectangle is defined by percentage offsets from the sides of the shape's bounding box.

Each edge of the tile rectangle is defined by a percentage offset from the corresponding edge of the bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. [*Note*: For example, a left offset of 25% specifies that the left edge of the tile rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width. *end note*]

[*Example*:

The image above depicts a horizontal gradient with no tileRect element.

The image above depicts the same gradient with a tileRect element specifying l="50000" (50%). The right half of the shape is the tile to which the gradient is applied, and the left half of the shape contains a tiled copy of that gradient fill.



The image above depicts the same gradient with a tileRect element specifying l="75000" (75%). The rightmost 25% of the shape contains the tile rectangle to which the gradient is applied. This gradient is tiled three times to cover the leftmost 75% of the shape. The tile rectangle is flipped horizontally when covering the shape.

end example]

Parent Elements
gradFill (§20.1.8.33)

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
r (Right Offset)	Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_RelativeRect) is located in §A.4.1. *end note*]

20.1.8.60 tint (Tint Effect)

This element specifies a tint effect. Shifts effect color values towards/away from hue by the specified amount.

Parent Elements
blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
amt (Amount)	Specifies by how much the color value is shifted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).
hue (Hue)	Specifies the hue towards which to tint. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TintEffect) is located in §A.4.1. *end note*]

20.1.8.61 xfrm (Transform Effect)

This element specifies a transform effect. The transform is applied to each point in the shape's geometry using the following matrix:

$$\begin{bmatrix} sx & \tan(kx) & tx \\ \tan(ky) & sy & ty \\ 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Parent Elements
cont (§20.1.8.20); effectDag (§20.1.8.25)

Attributes	Description
kx (Horizontal Skew)	Specifies the horizontal skew angle, defined as the angle between the top-left corner and bottom-left corner of the object's original bounding box. If positive, the bottom edge of the shape is positioned to the right relative to the top edge. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).
ky (Vertical Skew)	Specifies the vertical skew angle, defined as the angle between the top-left corner and top-right corner of the object's original bounding box. If positive, the right edge of the object is positioned lower relative to the left edge. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).
sx (Horizontal Ratio)	Specifies a percentage by which to horizontally scale the object. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
sy (Vertical Ratio)	Specifies a percentage by which to vertically scale the object. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
tx (Horizontal Shift)	Specifies an amount by which to shift the object along the x-axis. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
ty (Vertical Shift)	Specifies an amount by which to shift the object along the y-axis.

Attributes	Description
	The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TransformEffect) is located in §A.4.1. *end note*]

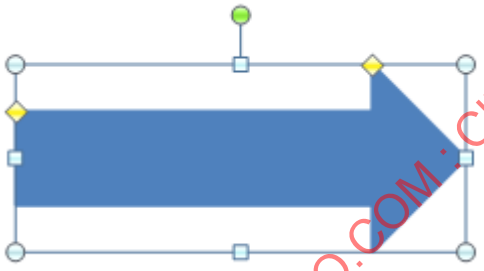
20.1.9 Shape Definitions and Attributes

The Shape Definitions and Attributes portion of the DrawingML framework deals with all geometric properties for shapes within a document. This includes both preset geometries that publicly are interpreted by the generating application and custom geometries that have their points and curves explicitly specified. In addition to the underlying geometry of the shape there are also other coordinate-based properties for each shape that this framework describes.

20.1.9.1 ahLst (List of Shape Adjust Handles)

This element specifies the adjust handles that are applied to a custom geometry. These adjust handles specify points within the geometric shape that can be used to perform certain transform operations on the shape.

[*Example*: Consider the scenario where a custom geometry, an arrow in this case, has been drawn and adjust handles have been placed at the top left corner of both the arrow head and arrow body. The user interface can then be made to transform only certain parts of the shape by using the corresponding adjust handle.



For instance if the user wished to change only the width of the arrow head then they would use the adjust handle located on the top left of the arrow head. The result of adjusting this transforms the shape as shown below.

[*Note*: The W3C XML Schema definition of this element's content model (CT_AdjustHandleList) is located in §A.4.1. *end note*]

20.1.9.2 ahPolar (Polar Adjust Handle)

This element specifies a polar adjust handle for a custom shape. The position of this adjust handle is specified by the corresponding pos child element. The allowed adjustment of this adjust handle are specified via it's min and max attributes. Based on the adjustment of this adjust handle certain corresponding guides are updated to contain these values.

Parent Elements
ahLst (§20.1.9.1)

Child Elements	Subclause
pos (Shape Position Coordinate)	§20.1.9.17

Attributes	Description
gdRefAng (Angle Adjustment Guide)	Specifies the name of the guide that is updated with the adjustment angle from this adjust handle. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).
gdRefR (Radial Adjustment Guide)	Specifies the name of the guide that is updated with the adjustment radius from this adjust handle. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).
maxAng (Maximum Angle Adjustment)	Specifies the maximum angle position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move angularly. That is the maxAng and minAng are equal.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).
maxR (Maximum Radial Adjustment)	Specifies the maximum radial position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move radially. That is the maxR and minR are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
minAng (Minimum Angle Adjustment)	Specifies the minimum angle position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move angularly. That is the maxAng and minAng are equal. The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).
minR (Minimum Radial Adjustment)	Specifies the minimum radial position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move radially. That is the maxR and minR are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PolarAdjustHandle) is located in §A.4.1. *end note*]

20.1.9.3 ahXY (XY Adjust Handle)

This element specifies an XY-based adjust handle for a custom shape. The position of this adjust handle is specified by the corresponding pos child element. The allowed adjustment of this adjust handle are specified via it's min and max type attributes. Based on the adjustment of this adjust handle certain corresponding guides are updated to contain these values.

Parent Elements
ahLst (§20.1.9.1)

Child Elements	Subclause
pos (Shape Position Coordinate)	§20.1.9.17

Attributes	Description
gdRefX (Horizontal Adjustment Guide)	Specifies the name of the guide that is updated with the adjustment x position from this adjust handle.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).
gdRefY (Vertical Adjustment Guide)	Specifies the name of the guide that is updated with the adjustment y position from this adjust handle. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).
maxX (Maximum Horizontal Adjustment)	Specifies the maximum horizontal position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the x direction. That is the maxX and minX are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
maxY (Maximum Vertical Adjustment)	Specifies the maximum vertical position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the y direction. That is the maxY and minY are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
minX (Minimum Horizontal Adjustment)	Specifies the minimum horizontal position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the x direction. That is the maxX and minX are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
minY (Minimum Vertical Adjustment)	Specifies the minimum vertical position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the y direction. That is the maxY and minY are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).

[*Note*: The W3C XML Schema definition of this element's content model (CT_XYAdjustHandle) is located in §A.4.1. *end note*]

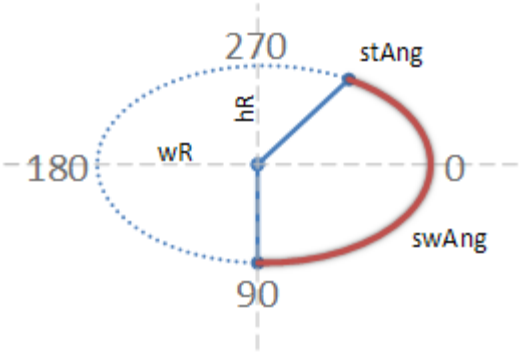
20.1.9.4 arcTo (Draw Arc To)

This element specifies the existence of an arc within a shape path. It draws an arc with the specified parameters from the current pen position to the new point specified. An arc is a line that is bent based on the shape of a supposed circle. The length of this arc is determined by specifying both a start angle and an ending angle that act together to effectively specify an end point for the arc.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

[*Example*: The diagram shown below represents a single arc that has a start angle of 300 degrees and a swing angle of 150 degrees. This arc is drawn using the supposed circle that is described using the hR and wR attributes as shown below. The degrees by which the stAng must abide is shown along the circumference of the circle. These degrees are to be specified in 60,000ths of a degree. If this arc were part of a shape the start angle point along the circle would be the starting point along the path and the ending point would be the ending of the angle swing along this supposed circle. That is any shape geometry coming before this arc in the shape path would be joined with the upper point of this arc and consequently any geometry coming after this arc in the path would be joined with the lower point of this arc.



end example]

Parent Elements
path (§20.1.9.15)

Attributes	Description
hR (Shape Arc Height Radius)	This attribute specifies the height radius of the supposed circle being used to draw the arc. This gives the circle a total height of (2 * hR). This total height could also be called it's vertical diameter as it is the diameter for the y axis only. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
stAng (Shape Arc Start Angle)	Specifies the start angle for an arc. This angle specifies what angle along the supposed circle path is used as the start position for drawing the arc. This start angle is locked to the last known pen position in the shape path. Thus guaranteeing a continuos shape path. The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).
swAng (Shape Arc Swing Angle)	Specifies the swing angle for an arc. This angle specifies how far angle-wise along the supposed cicle path the arc is extended. The extension from the start angle is always in the clockwise direction around the supposed circle.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).
wR (Shape Arc Width Radius)	This attribute specifies the width radius of the supposed circle being used to draw the arc. This gives the circle a total width of (2 * wR). This total width could also be called it's horizontal diameter as it is the diameter for the x axis only. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Path2DArcTo) is located in §A.4.1. *end note*]

20.1.9.5 avLst (List of Shape Adjust Values)

This element specifies the adjust values that are applied to the specified shape. An adjust value is simply a guide that has a value based formula specified. That is, no calculation takes place for an adjust value guide. Instead, this guide specifies a parameter value that is used for calculations within the shape guides.

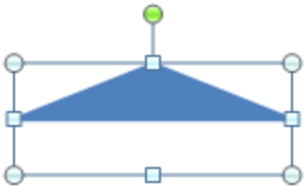
[*Example*: Consider the case where the user would like to specify a triangle with it's bottom edge defined not by static points but by using a varying parameter, namely an adjust value. Consider the diagrams and DrawingML shown below. This first triangle has been drawn with a bottom edge that is equal to the height, namely 2. Thus we see in the figure below that the bottom of the triangle matches the bottom of the shape bounding box.

```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst>
    <a:gd name="myGuide" fmla="val 2"/>
  </a:avLst>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
    <a:pathLst>
      <a:path w="2" h="2">
        <a:moveTo>
          <a:pt x="0" y="myGuide"/>
        </a:moveTo>
        <a:lnTo>
          <a:pt x="2" y="myGuide"/>
        </a:lnTo>
        <a:lnTo>
          <a:pt x="1" y="0"/>
        </a:lnTo>
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

If however we change the adjust value to half that, namely 1. Then we see the entire bottom edge of the triangle move to now be placed along the vertical midpoint within the shape bounding box. This is because both of the bottom points in this triangle depend on this adjust value for their coordinate positions. The triangle and corresponding DrawingML shown below illustrate this point.



```
  <a:avLst>
    <a:gd name="myGuide" fmla="val 1"/>
  </a:avLst>
```

end example]

Parent Elements
custGeom (§20.1.9.8); prstGeom (§20.1.9.18); prstTxWarp (§20.1.9.19)

Child Elements	Subclause
gd (Shape Guide)	§20.1.9.11

[*Note*: The W3C XML Schema definition of this element's content model (CT_GeomGuideList) is located in §A.4.1. *end note*]

20.1.9.6 close (Close Shape Path)

This element specifies the ending of a series of lines and curves in the creation path of a custom geometric shape. When this element is encountered, the generating application should consider the corresponding path closed. That is, any further lines or curves that follow this element should be ignored.

[*Note*: A path can be specified and not closed. A path such as this cannot however have any fill associated with it as it has not been considered a closed geometric path. *end note*]

[*Example*: Consider the following DrawingML.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*]

[*Note*: When the last point in the creation path does not meet with the first point in the creation path the generating application should connect the last point with the first via a straight line, thus creating a closed shape geometry. *end note*]

Parent Elements
path (§20.1.9.15)

[*Note*: The W3C XML Schema definition of this element's content model (CT_Path2DClose) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.9.7 cubicBezTo (Draw Cubic Bezier Curve To)

This element specifies to draw a cubic bezier curve along the specified points. To specify a cubic bezier curve there needs to be 3 points specified. The first two are control points used in the cubic bezier calculation and the last is the ending point for the curve. The coordinate system used for this kind of curve is the path coordinate system as this element is path specific.

Parent Elements
path (§20.1.9.15)

Child Elements	Subclause
pt (Shape Path Point)	§20.1.9.20

[*Note*: The W3C XML Schema definition of this element's content model (CT_Path2DCubicBezierTo) is located in §A.4.1. *end note*]

20.1.9.8 custGeom (Custom Geometry)

This element specifies the existence of a custom geometric shape. This shape consists of a series of lines and curves described within a creation path. In addition to this there can also be adjust values, guides, adjust handles, connection sites and an inscribed rectangle specified for this custom geometric shape.

[*Example*: Consider the scenario when a preset geometry does not accurately depict what must be displayed in the document. For this a custom geometry can be used to define most any 2-dimensional geometric shape. Shown below is an example of such a custom geometry.

```
<a:custGeom>
  <a:avLst/>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="2650602" h="1261641">
      <a:moveTo>
        <a:pt x="0" y="1261641"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="2650602" y="1261641"/>
      </a:lnTo>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
        <a:lnTo>
          <a:pt x="1226916" y="0"/>
        </a:lnTo>
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

The custom geometry above is drawn by first moving to a specific starting point with the moveTo element. Then a series of lnTo elements in the creation path specify the lines that make up the borders of the shape and finally a close element is used to specify the end of the creation path. The resulting shape is shown above. *end example*]

Parent Elements
spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44)

Child Elements	Subclause

rect (Shape Text Rectangle)	§20.1.9.22

[*Note*: The W3C XML Schema definition of this element's content model (CT_CustomGeometry2D) is located in §A.4.1. *end note*]

20.1.9.9 cxn (Shape Connection Site)

This element specifies the existence of a connection site on a custom shape. A connection site allows a cxnSp to be attached to this shape. This connection is maintained when the shape is repositioned within the document. It should be noted that this connection is placed within the shape bounding box using the transform coordinate

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

[*Note*: The transform coordinate system is different from a path coordinate system as it is per shape instead of per path within the shape. *end note*]

[*Example*: Consider the following custom geometry that has two connection sites specified. One connection is located at the bottom left of the shape and the other at the bottom right. The following DrawingML would describe such a custom geometry.

```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>

```
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

end example]

Parent Elements
cxnLst (§20.1.9.10)

Child Elements	Subclause
pos (Shape Position Coordinate)	§20.1.9.17

Attributes	Description
ang (Connection Site Angle)	Specifies the incoming connector angle. This angle is the angle around the connection site that an incoming connector tries to be routed to. This allows connectors to know where the shape is in relation to the connection site and route connectors so as to avoid any overlap with the shape. [*Example*: Consider a simple square. In order to not have any connectors routed over the shape, the following angles would be specified for their respective connection sites.  *end example*] The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ConnectionSite) is located in §A.4.1. *end note*]

20.1.9.10 cxnLst (List of Shape Connection Sites)

This element specifies all the connection sites that are used for this shape. A connection site is specified by defining a point within the shape bounding box that can have a cxnSp element attached to it. These connection sites are specified using the shape coordinate system that is specified within the ext transform element.

cxn (Shape Connection Site)	§20.1.9.9

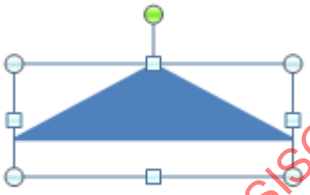
[*Note*: The W3C XML Schema definition of this element's content model (CT_ConnectionSiteList) is located in §A.4.1. *end note*]

20.1.9.11 gd (Shape Guide)

This element specifies the precense of a shape guide that is used to govern the geometry of the specified shape. A shape guide consists of a formula and a name that the result of the formula is assigned to. Recognized formulas are listed with the fmla attribute documentation for this element.

[*Note*: The order in which guides are specified determines the order in which their values are calculated. For instance it is not possible to specify a guide that uses another guides result when that guide has not yet been calculated. *end note*]

[*Example*: Consider the case where the user would like to specify a triangle with it's bottom edge defined not by static points but by using a varying parameter, namely a guide. Consider the diagrams and DrawingML shown below. This first triangle has been drawn with a bottom edge that is equal to the 2/3 the value of the shape height. Thus we see in the figure below that the triangle appears to occupy 2/3 of the vertical space within the shape bounding box.



```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>

```
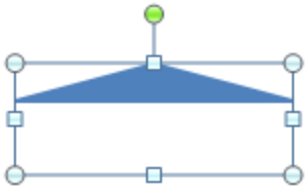
    <a:ahLst/>
    <a:cxnLst/>
    <a:rect l="0" t="0" r="0" b="0"/>
    <a:pathLst>
      <a:path w="1705233" h="679622">
        <a:moveTo>
          <a:pt x="0" y="myGuide"/>
        </a:moveTo>
        <a:lnTo>
          <a:pt x="1705233" y="myGuide"/>
        </a:lnTo>
        <a:lnTo>
          <a:pt x="852616" y="0"/>
        </a:lnTo>
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

If however we change the guide to half that, namely 1/3. Then we see the entire bottom edge of the triangle move to now only occupy 1/3 of the toal space within the shape bounding box. This is because both of the bottom points in this triangle depend on this guide for their coordinate positions. The triangle and corresponding DrawingML shown below illustrate this point.



```
  <a:gdLst>
    <a:gd name="myGuide" fmla="*/ h 1 3"/>
  </a:gdLst>
```

end example]

Attributes	Description
	Usage: "pin x y z" = if (y < x), then x = value of this guide else if (y > z), then z = value of this guide else y = value of this guide **('sat2') - Sine ArcTan Formula** Arguments: 3 (fmla="sat2 x y z") Usage: "sat2 x y z" = (x*sin(arctan(z / y))) = value of this guide **('sin') - Sine Formula** Arguments: 2 (fmla="sin x y") Usage: "sin x y" = (x * sin(y)) = value of this guide **('sqrt') - Square Root Formula** Arguments: 1 (fmla="sqrt x") Usage: "sqrt x" = sqrt(x) = value of this guide **('tan') - Tangent Formula** Arguments: 2 (fmla="tan x y") Usage: "tan x y" = (x * tan(y)) = value of this guide **('val') - Literal Value Formula** Arguments: 1 (fmla="val x") Usage: "val x" = x = value of this guide [*Note*: Guides that have a literal value formula specified via fmla="val x" above should only be used within the avLst as an adjust value for the shape. This however is not strictly enforced. *end note*] The possible values for this attribute are defined by the ST_GeomGuideFormula simple type (§20.1.10.27).
name (Shape Guide Name)	Specifies the name that is used to reference to this guide. This name can be used just as a variable would within an equation. That is this name can be substituted for literal values within other guides or the specification of the shape path. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).

[*Note*: The W3C XML Schema definition of this element's content model (CT_GeomGuide) is located in §A.4.1. *end note*]

20.1.9.12 gdLst (List of Shape Guides)

This element specifies all the guides that are used for this shape. A guide is specified by the gd element and defines a calculated value that can be used for the construction of the corresponding shape.

[*Note*: Guides that have a literal value formula specified via fmla="val x" above should only be used within the avLst as an adjust value for the shape. This however is not strictly enforced. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Parent Elements
custGeom (§20.1.9.8)

Child Elements	Subclause
gd (Shape Guide)	§20.1.9.11

[*Note*: The W3C XML Schema definition of this element's content model (CT_GeomGuideList) is located in §A.4.1. *end note*]

20.1.9.13 lnTo (Draw Line To)

This element specifies the drawing of a straight line from the current pen position to the new point specified. This line becomes part of the shape geometry, representing a side of the shape. The coordinate system used when specifying this line is the path coordinate system.

Parent Elements
path (§20.1.9.15)

Child Elements	Subclause
pt (Shape Path Point)	§20.1.9.20

[*Note*: The W3C XML Schema definition of this element's content model (CT_Path2DLineTo) is located in §A.4.1. *end note*]

20.1.9.14 moveTo (Move Path To)

This element specifies a set of new coordinates to move the shape cursor to. This element is only used for drawing a custom geometry. When this element is utilized the pt element is used to specify a new set of shape coordinates that the shape cursor should be moved to. This does not draw a line or curve to this new position from the old position but simply move the cursor to a new starting position. It is only when a path drawing element such as lnTo is used that a portion of the path is drawn.

[*Example*: Consider the case where a user wishes to begin drawing a custom geometry not at the default starting coordinates of x=0 , y=0 but at coordinates further inset into the shape coordinate space. The following DrawingML would specify such a case.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

Notice the moveTo element advances the y coordinates before any actual lines are drawn. *end example*]

Parent Elements
path (§20.1.9.15)

Child Elements	Subclause
pt (Shape Path Point)	§20.1.9.20

[*Note*: The W3C XML Schema definition of this element's content model (CT_Path2DMoveTo) is located in §A.4.1. *end note*]

20.1.9.15 path (Shape Path)

This element specifies a creation path consisting of a series of moves, lines and curves that when combined forms a geometric shape. This element is only utilized if a custom geometry is specified.

[*Note*: Since multiple paths are allowed the rules for drawing are that the path specified later in the pathLst is drawn on top of all previous paths. *end note*]

[*Example*: Consider the following DrawingML.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*]

lnTo (Draw Line To)	§20.1.9.13
moveTo (Move Path To)	§20.1.9.14
quadBezTo (Draw Quadratic Bezier Curve To)	§20.1.9.21

Attributes	Description
extrusionOk (3D Extrusion Allowed)	Specifies that the use of 3D extrusions are possible on this path. This allows the generating application to know whether 3D extrusion can be applied in any form. If this attribute is omitted then a value of 0, or false is assumed.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
fill (Path Fill)	Specifies how the corresponding path should be filled. If this attribute is omitted, a value of "norm" is assumed. The possible values for this attribute are defined by the ST_PathFillMode simple type (§20.1.10.37).
h (Path Height)	Specifies the height, or maximum y coordinate that should be used for within the path coordinate system. This value determines the vertical placement of all points within the corresponding path as they are all calculated using this height attribute as the max y coordinate. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
stroke (Path Stroke)	Specifies if the corresponding path should have a path stroke shown. This is a boolean value that affect the outline of the path. If this attribute is omitted, a value of true is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
w (Path Width)	Specifies the width, or maximum x coordinate that should be used for within the path coordinate system. This value determines the horizontal placement of all points within the corresponding path as they are all calculated using this width attribute as the max x coordinate. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Path2D) is located in §A.4.1. *end note*]

20.1.9.16 pathLst (List of Shape Paths)

This element specifies the entire path that is to make up a single geometric shape. The pathLst can consist of many individual paths within it.

[*Example*: Consider the following DrawingML.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
        <a:lnTo>
          <a:pt x="1620455" y="590309"/>
        </a:lnTo>
        <a:lnTo>
          <a:pt x="2824222" y="173620"/>
        </a:lnTo>
        <a:lnTo>
          <a:pt x="1562582" y="0"/>
        </a:lnTo>
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*]

[*Note*: A geometry with multiple paths within it should be treated visually as if each path were a distinct shape. That is each creation path has its first point and last point joined to form a closed shape. However, the generating application should then connect the last point to the first point of the new shape. If a close element is encountered at the end of the previous creation path then this joining line should not be rendered by the generating application. The rendering should resume with the first line or curve on the new creation path. *end note*]

Parent Elements
custGeom (§20.1.9.8)

Child Elements	Subclause
path (Shape Path)	§20.1.9.15

[*Note*: The W3C XML Schema definition of this element's content model (CT_Path2DList) is located in §A.4.1. *end note*]

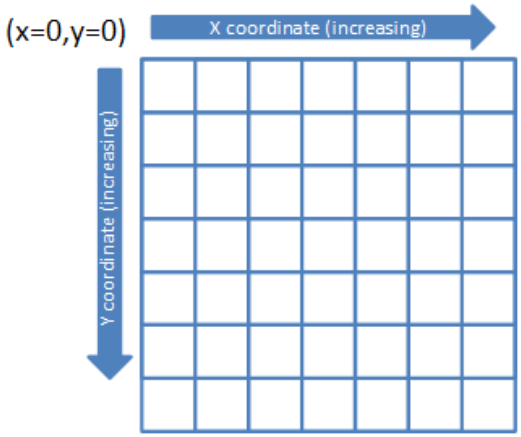
20.1.9.17 pos (Shape Position Coordinate)

Specifies a position coordinate within the shape bounding box. It should be noted that this coordinate is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

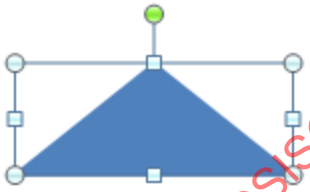
 ©ISO/IEC 2011 – All rights reserved

[*Note*: When specifying a point coordinate in path coordinate space it should be noted that the top left of the coordinate space is x=0, y=0 and the coordinate points for x grow to the right and for y grow down. This is illustrated in the diagram below.



end note]

[*Example*: To highlight the differences in the coordinate systems consider the drawing of the following triangle. Notice that the dimensions of the triangle are specified using the shape coordinate system with EMUs as the units via the ext transform element. Thus we see this shape is 1705233 EMUs wide by 679622 EMUs tall. However when looking at how the path for this shape is drawn we see that the x and y values fall between 0 and 2. This is because the path coordinate system has the arbitrary dimensions of 2 for the width and 2 for the height. Thus we see that a y coordinate of 2 within the path coordinate system specifies a y coordinate of 679622 within the shape coordinate system for this particular case.



```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
    <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
    <a:pathLst>
      <a:path w="2" h="2">
        <a:moveTo>
          <a:pt x="0" y="2"/>
        </a:moveTo>
        <a:lnTo>
          <a:pt x="2" y="2"/>
        </a:lnTo>
        <a:lnTo>
          <a:pt x="1" y="0"/>
        </a:lnTo>
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

end example]

Parent Elements
ahPolar (§20.1.9.2); ahXY (§20.1.9.3); cxn (§20.1.9.9)

Attributes	Description
x (X-Coordinate)	Specifies the x coordinate for this position coordinate. The units for this coordinate space are defined by the width of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
y (Y-Coordinate)	Specifies the y coordinate for this position coordinate. The units for this coordinate space are defined by the height of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).

Attributes	Description

	values in the enumerated list for ST_ShapeType. This attribute is required in order for a preset geometry to be rendered.
	
	[*Example*: Consider the sample DrawingML below.
	
	`<p:sp>`
	`<p:nvSpPr>`
	`<p:cNvPr id="4" name="Sun 3"/>`
	`<p:cNvSpPr/>`
	`<p:nvPr/>`
	`</p:nvSpPr>`
	`<p:spPr>`
	`<a:xfrm>`
	`<a:off x="1981200" y="533400"/>`
	`<a:ext cx="1143000" cy="1066800"/>`
	`</a:xfrm>`
	`<a:prstGeom prst="sun">`
	`</a:prstGeom>`
	`</p:spPr>`
	`</p:sp>`
	
	In the above example a preset geometry has been used to define a shape. The shape utilized here is the sun shape. *end example*]
	
	The possible values for this attribute are defined by the ST_ShapeType simple type (§20.1.10.55).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PresetGeometry2D) is located in §A.4.1. *end note*]

20.1.9.19 prstTxWarp (Preset Text Warp)

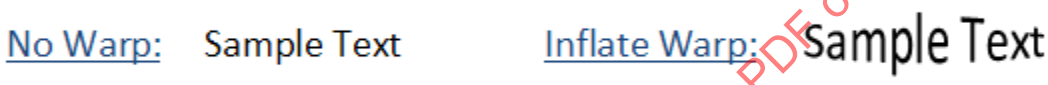
This element specifies when a preset geometric shape should be used to transform a piece of text. This operation is known formally as a text warp. The generating application should be able to render all preset geometries enumerated in the ST_TextShapeType list.

[*Example*: Consider the case where the user wishes to accent a piece of text by warping it's shape. For this to occur a preset shape is chosen from the ST_TextShapeType list and applied to the entire body of text.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<p:sp>
  <p:txBody>
    <a:bodyPr wrap="none" rtlCol="0">
      <a:prstTxWarp prst="textInflate">
      </a:prstTxWarp>
      <a:spAutoFit/>
    </a:bodyPr>
    <a:lstStyle/>
    <a:p>
…
      <a:t>Sample Text</a:t>
…
    </a:p>
  </p:txBody>
</p:sp>
```



The resulting text that has now had the Inflate text warp applied to it is shown above. *end example*]

Using any of the presets listed under the ST_TextShapeType list below it is possible to apply a text warp to a run of DrawingML text via the following steps.

If you look at any of the text warps in the file format you notice that each consists of two paths. This corresponds to a top path (first one specified) and a bottom path (second one specified). Now the top path and the bottom path represent the top line and base line that the text needs to be warped to. This is done in the following way:

1. Compute the rectangle that the unwarped text resides in. (tightest possible rectangle around text, no white space except for “space characters”)
2. Take each of the quadratic and cubic Bezier curves that are used to calculate the original character and change their end points and control points by the following method…
3. Move a vertical line horizontally along the original text rectangle and find the horizontal percentage that a given end point or control point lives at. (.5 for the middle for instance)
4. Now do the same thing for this point vertically. Find the vertical percentage that this point lives at with the top and bottom of this text rectangle being the respective top and bottom bounds. (0.0 and 1.0 respectively)
5. Now that we have the percentages for a given point in a Bezier equation we can map that to the new point in the warped text environment.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

6. Going back to the top and bottom paths specified in the file format we can take these and flatten them out to a straight arc (top and bottom might be different lengths)
7. After they are straight we can measure them both horizontally to find the same percentage point that we found within the original text rectangle. (0.5 let's say)
8. So then we measure 50% along the top path and 50% along the bottom path, putting the paths back to their original curvy shapes.
9. Once we have these two points we can draw a line between them that serves as our vertical line in the original text rectangle [*Note*: This might not be truly vertical as 50% on the top does not always line up with 50% on the bottom. *end note*]
10. Taking this new line we then follow it from top to bottom the vertical percentage amount that we got from step 4.
11. This is then the new point that should be used in place of the old point in the original text rectangle.
12. We then continue doing these same steps for each of the end points and control points within the body of text. (is applied to a whole body of text only)

[*Note*: Horizxontal percentages begin at 0.0 and continue to 1.0, left to right. Vertical percentages begin at 0.0 and continue to 1.0, top to bottom. *end note*]

[*Note*: Since this is a shape it does have both a shape coordinate system and a path coordinate system. *end note*]

Parent Elements
bodyPr (§21.1.2.1.1)

Child Elements	Subclause
avLst (List of Shape Adjust Values)	§20.1.9.5

Attributes	Description

prst (Preset Warp Shape)	Specifies the preset geometry that is used for a shape warp on a piece of text. This preset can have any of the values in the enumerated list for ST_TextShapeType. This attribute is required in order for a text warp to be rendered.
	
	[*Example*: Consider the sample DrawingML below.
	
	`<p:sp>`
	`<p:txBody>`
	`<a:bodyPr wrap="none" rtlCol="0">`
	`<a:prstTxWarp prst="textInflate">`

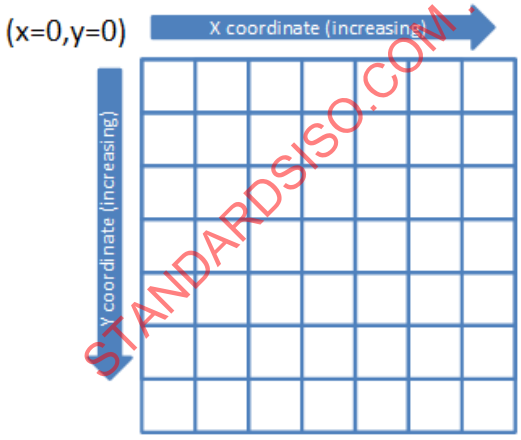
	… <a:t>Sample Text</a:t> … </a:p> </p:txBody> </p:sp> In the above example a preset text shape geometry has been used to define the warping shape. The shape utilized here is the sun shape. *end example*] The possible values for this attribute are defined by the ST_TextShapeType simple type (§20.1.10.75).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PresetTextShape) is located in §A.4.1. *end note*]

20.1.9.20 pt (Shape Path Point)

This element specifies an x-y coordinate within the path coordinate space. This coordinate space is determined by the width and height attributes defined within the path element. A point is utilized by one of it's parent elements to specify the next point of interest in custom geometry shape. Depending on the parent element used the point can either have a line drawn to it or the cursor can simply be moved to this new location.

[*Note*: When specifying a point coordinate in path coordinate space it should be noted that the top left of the coordinate space is x=0, y=0 and the coordinate points for x grow to the right and for y grow down. This is illustrated in the diagram below.



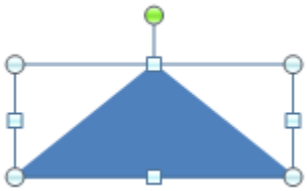
end note]

Specifies a position coordinate within the shape bounding box. It should be noted that this coordinate is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

[*Example*: To highlight the differences in the coordinate systems consider the drawing of the following triangle. Notice that the dimensions of the triangle are specified using the shape coordinate system with EMUs as the units via the ext transform element. Thus we see this shape is 1705233 EMUs wide by 679622 EMUs tall. However when looking at how the path for this shape is drawn we see that the x and y values fall between 0 and 2. This is because the path coordinate system has the arbitrary dimensions of 2 for the width and 2 for the height. Thus we see that a y coordinate of 2 within the path coordinate system specifies a y coordinate of 679622 within the shape coordinate system for this particular case.



```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
    <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="2" h="2">
      <a:moveTo>
        <a:pt x="0" y="2"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="2" y="2"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

end example]

Parent Elements
cubicBezTo (§20.1.9.7); lnTo (§20.1.9.13); moveTo (§20.1.9.14); quadBezTo (§20.1.9.21)

Attributes	Description
x (X-Coordinate)	Specifies the x coordinate for this position coordinate. The units for this coordinate space are defined by the width of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
y (Y-Coordinate)	Specifies the y coordinate for this position coordinate. The units for this coordinate space are defined by the height of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AdjPoint2D) is located in §A.4.1. *end note*]

20.1.9.21 quadBezTo (Draw Quadratic Bezier Curve To)

This element specifies to draw a quadratic bezier curve along the specified points. To specify a quadratic bezier curve there needs to be 2 points specified. The first is a control point used in the quadratic bezier calculation and the last is the ending point for the curve. The coordinate system used for this type of curve is the path coordinate system as this element is path specific.

Parent Elements
path (§20.1.9.15)

Child Elements	Subclause
pt (Shape Path Point)	§20.1.9.20

[*Note*: The W3C XML Schema definition of this element's content model (CT_Path2DQuadBezierTo) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.9.22 rect (Shape Text Rectangle)

This element specifies the rectangular bounding box for text within a custGeom shape. The default for this rectangle is the bounding box for the shape. This can be modified using this elements four attributes to inset or extend the text bounding box.

[*Note*: Text specified to reside within this shape text rectangle can flow outside this bounding box. Depending on the autofit options within the txBody element the text might not entirely reside within this shape text rectangle. *end note*]

Parent Elements
custGeom (§20.1.9.8)

Attributes	Description
b (Bottom Position)	Specifies the y coordinate of the bottom edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
l (Left)	Specifies the x coordinate of the left edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
r (Right)	Specifies the x coordinate of the right edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
t (Top)	Specifies the y coordinate of the top edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).

20.1.10 Simple Types

This is the complete list of simple types dedicated to DrawingML framework.

20.1.10.1 ST_AdjAngle (Adjustable Angle Methods)

This simple type is an adjustable angle, either an absolute angle or a reference to a geometry guide. The units for an adjustable angle are 60,000ths of a degree.

This simple type is a union of the following types:

- The ST_Angle simple type (§20.1.10.3).
- The ST_GeomGuideName simple type (§20.1.10.28).

Referenced By
ahPolar@maxAng (§20.1.9.2); ahPolar@minAng (§20.1.9.2); arcTo@stAng (§20.1.9.4); arcTo@swAng (§20.1.9.4); cxn@ang (§20.1.9.9)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AdjAngle) is located in §A.4.1. *end note*]

20.1.10.2 ST_AdjCoordinate (Adjustable Coordinate Methods)

This simple type is an adjustable coordinate is either an absolute coordinate position or a reference to a geometry guide.

This simple type is a union of the following types:

- The ST_Coordinate simple type (§20.1.10.16).
- The ST_GeomGuideName simple type (§20.1.10.28).

Referenced By
ahPolar@maxR (§20.1.9.2); ahPolar@minR (§20.1.9.2); ahXY@maxX (§20.1.9.3); ahXY@maxY (§20.1.9.3); ahXY@minX (§20.1.9.3); ahXY@minY (§20.1.9.3); arcTo@hR (§20.1.9.4); arcTo@wR (§20.1.9.4); pos@x (§20.1.9.17); pos@y (§20.1.9.17); pt@x (§20.1.9.20); pt@y (§20.1.9.20); rect@b (§20.1.9.22); rect@l (§20.1.9.22); rect@r (§20.1.9.22); rect@t (§20.1.9.22)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AdjCoordinate) is located in §A.4.1. *end note*]

20.1.10.3 ST_Angle (Angle)

This simple type represents an angle in 60,000ths of a degree. Positive angles are clockwise (i.e., towards the positive y axis); negative angles are counter-clockwise (i.e., towards the negative y axis).

This simple type's contents are a restriction of the W3C XML Schema int datatype.

Referenced By
animMotion@rAng (§19.5.4); animRot@by (§19.5.5); animRot@from (§19.5.5); animRot@to (§19.5.5); bodyPr@rot (§21.1.2.1.1); hsl@h (§19.5.46); hueOff@val (§20.1.2.3.16); ST_AdjAngle (§20.1.10.1); ST_FixedAngle (§20.1.10.23); ST_FOVAngle (§20.1.10.26); ST_PositiveFixedAngle (§20.1.10.43); xfrm@rot (§21.3.2.28); xfrm@rot (§20.1.7.5); xfrm@rot (§20.1.7.6); xfrm@rot (§20.5.2.36); xfrm@rot (§19.3.1.53)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Angle) is located in §A.4.1. *end note*]

20.1.10.4 ST_AnimationBuildType (Animation Build Type)

This simple type specifies the ways that an animation can be built, or animated.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allAtOnce (Animate At Once)	Animate all objects as one.

Referenced By
ST_AnimationChartBuildType (§20.1.10.5); ST_AnimationDgmBuildType (§20.1.10.7)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AnimationBuildType) is located in §A.4.1. *end note*]

20.1.10.5 ST_AnimationChartBuildType (Chart Animation Build Type)

This simple type specifies the ways that a chart animation can be built. That is, it specifies the way in which the objects within the chart should be animated.

This simple type is a union of the following types:

- The ST_AnimationBuildType simple type (§20.1.10.4).
- The ST_AnimationChartOnlyBuildType simple type (§20.1.10.6).

20.1.10.6 ST_AnimationChartOnlyBuildType (Chart only Animation Types)

This simple type specifies the build options available only for animating a chart. These options specify the manner in which the objects within the chart should be grouped and animated.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
category (Catefory)	Animate by each category
categoryEl (Category Element)	Animate by each element within the category
series (Series)	Animate by each series.
seriesEl (Series Element)	Animate by each element within the series

Referenced By
ST_AnimationChartBuildType (§20.1.10.5)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AnimationChartOnlyBuildType) is located in §A.4.1. *end note*]

20.1.10.7 ST_AnimationDgmBuildType (Diagram Animation Build Type)

This simple type specifies the ways that a diagram animation can be built. That is, it specifies the way in which the objects within the diagram graphical object should be animated.

This simple type is a union of the following types:

- The ST_AnimationBuildType simple type (§20.1.10.4).
- The ST_AnimationDgmOnlyBuildType simple type (§20.1.10.8).

Referenced By
bldDgm@bld (§20.1.2.2.2)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AnimationDgmBuildType) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.10.8 ST_AnimationDgmOnlyBuildType (Diagram only Animation Types)

This simple type specifies the build options available only for animating a diagram. These options specify the manner in which the objects within the chart should be grouped and animated.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
lvlAtOnce (Each Level at Once)	Animate the diagram one level at a time, animating the whole level as one object
lvlOne (Level One-by-One)	Animate the diagram by the elements within a level, animating them one level element at a time.
one (Elements One-by-One)	Animate the diagram by elements. For a tree diagram the animation occurs by branch within the diagram tree.

Referenced By
ST_AnimationDgmBuildType (§20.1.10.7)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AnimationDgmOnlyBuildType) is located in §A.4.1. *end note*]

20.1.10.9 ST_BevelPresetType (Bevel Presets)

Represents a preset for a type of bevel which can be applied to a shape in 3D. The bevel properties are applied differently depending on the type of bevel defined for a shape.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
angle (Angle)	[*Example*: Consider the following example of an `angle` bevel type applied to a shape:

20.1.10.10 ST_BlackWhiteMode (Black and White Mode)

This simple type specifies how an object should be rendered when specified to be in black and white mode.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Automatic)	Object rendered with automatic coloring
black (Black)	Object rendered with black-only coloring
blackGray (Black and Gray)	Object rendered with black and gray coloring
blackWhite (Black and White)	Object rendered within black and white coloring
clr (Color)	Object rendered with normal coloring
gray (Gray)	Object rendered with gray coloring
grayWhite (Gray and White)	Object rendered within gray and white coloring
hidden (Hidden)	Object rendered with hidden coloring
invGray (Inverse Gray)	Object rendered with inverse gray coloring
ltGray (Light Gray)	Object rendered with light gray coloring
white (White)	Object rendered within white coloirng

20.1.10.11 ST_BlendMode (Blend Mode)

This simple type describes how to render effects one on top of another.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
darken (Darken)	Darken
lighten (Lighten)	Lighten
mult (Multiply)	Multiply
over (Overlay)	Overlay
screen (Screen)	Screen

Referenced By
blend@blend (§20.1.8.12); fillOverlay@blend (§20.1.8.29)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BlendMode) is located in §A.4.1. *end note*]

20.1.10.12 ST_BlipCompression (Blip Compression Type)

This type specifies the amount of compression that has been used for a particular binary large image or picture (blip).

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
email (Email Compression)	Compression size suitable for inclusion with email
hqprint (High Quality Printing Compression)	Compression size suitable for high quality printing
none (No Compression)	No compression was used
print (Printing Compression)	Compression size suitable for printing
screen (Screen Viewing Compression)	Compression size suitable for viewing on screen

Referenced By
blip@cstate (§20.1.8.13)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BlipCompression) is located in §A.4.1. *end note*]

20.1.10.13 ST_ChartBuildStep (Chart Animation Build Step)

This simple type specifies an animation build step within a chart animation.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allPts (All Points)	Animate all points within the chart for this animation build step
category (Category)	Animate a chart category for this animation build step
gridLegend (Grid and Legend)	Animate the chart grid and legend for this animation build step
ptInCategory (Category Points)	Animate a point in a chart category for this animation build step
ptInSeries (Series Points)	Animate a point in a chart series for this animation build step
series (Series)	Animate a chart series for this animation build step

Referenced By
chart@bldStep (§20.1.2.2.3)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ChartBuildStep) is located in §A.4.1. *end note*]

20.1.10.14 ST_ColorSchemeIndex (Theme Color Reference)

A reference to a color in the color scheme.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
accent1 (Accent 1)	Represents the accent 1 color.
accent2 (Accent 2)	Represents the accent 2 color.
accent3 (Accent 3)	Represents the accent 3 color.
accent4 (Accent 4)	Represents the accent 4 color.
accent5 (Accent 5)	Represents the accent 5 color.
accent6 (Accent 6)	Represents the accent 6 color.
dk1 (Dark 1)	Represents the first dark color.
dk2 (Dark 2)	Represents the second dark color.
folHlink (Followed Hyperlink)	Represents the followed hyperlink color.
hlink (Hyperlink)	Represents the hyperlink color.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
lt1 (Light 1)	Represents the first light color.
lt2 (Light 2)	Represents the second light color.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ColorSchemeIndex) is located in §A.4.1. *end note*]

20.1.10.15 ST_CompoundLine (Compound Line Type)

This simple type specifies the compound line type that is to be used for lines with text such as underlines.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dbl (Double Lines)	Double lines of equal width
sng (Single Line)	Single line: one normal width
thickThin (Thick Thin Double Lines)	Double lines: one thick, one thin
thinThick (Thin Thick Double Lines)	Double lines: one thin, one thick
tri (Thin Thick Thin Triple Lines)	Three lines: thin, thick, thin

20.1.10.16 ST_Coordinate (Coordinate)

This simple type represents a one dimensional position or length as either:

- EMUs.
- A number followed immediately by a unit identifier.

This simple type is a union of the following types:

- The ST_CoordinateUnqualified simple type (§20.1.10.19).
- The ST_UniversalMeasure simple type (§22.9.2.15).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Coordinate) is located in §A.4.1. *end note*]

20.1.10.17 ST_Coordinate32 (Coordinate Point)

This simple type specifies a coordinate within the document. This can be used for measurements or spacing; its maximum size is 2147483647 EMUs.

Its contents can contain either:

- A whole number, whose contents consist of a measurement in EMUs (English Metric Units)
- A number immediately followed by a unit identifier

This simple type is a union of the following types:

- The ST_Coordinate32Unqualified simple type (§20.1.10.18).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.10.18 ST_Coordinate32Unqualified (Coordinate Point)

This simple type specifies a coordinate within the document. This can be used for measurements or spacing with the maximum size requirement being a 32 bit integer.

The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the W3C XML Schema int datatype.

Referenced By
ST_Coordinate32 (§20.1.10.17); ST_LineWidth (§20.1.10.35); ST_PositiveCoordinate32 (§20.1.10.42); ST_TextIndent (§20.1.10.69); ST_TextMargin (§20.1.10.71)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Coordinate32Unqualified) is located in §A.4.1. *end note*]

20.1.10.19 ST_CoordinateUnqualified (Coordinate)

This simple type represents a one dimensional position or length in EMUs.

This simple type's contents are a restriction of the W3C XML Schema long datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -27273042329600.
- This simple type has a maximum value of less than or equal to 27273042316900.

Referenced By

20.1.10.20 ST_DgmBuildStep (Diagram Animation Build Steps)

This simple type specifies an animation build step within a diagram animation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bg (Background)	Animate the diagram background for this animation build step
sp (Shape)	Animate a diagram shape for this animation build step

Referenced By
dgm@bldStep (§20.1.2.2.12)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DgmBuildStep) is located in §A.4.1. *end note*]

20.1.10.21 ST_DrawingElementId (Drawing Element ID)

This simple type specifies a unique integer identifier for each drawing element.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

Referenced By
cNvPr@id (§21.3.2.7); cNvPr@id (§20.1.2.2.8); cNvPr@id (§20.2.2.3); cNvPr@id (§20.5.2.8); cNvPr@id (§19.3.1.12); docPr@id (§20.4.2.5); endCxn@id (§20.1.2.2.13); stCxn@id (§20.1.2.2.36)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DrawingElementId) is located in §A.4.1. *end note*]

20.1.10.22 ST_EffectContainerType (Effect Container Type)

This simple type determines the relationship between effects in a container, either sibling or tree.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
sib (Sibling)	Each effect is separately applied to the parent object.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
	[*Example*: If the parent element contains an outer shadow and a reflection, the resulting effect is a shadow around the parent object and a reflection of the object. The reflection does not have a shadow. *end example*]
tree (Tree)	Each effect is applied to the result of the previous effect. [*Example*: If the parent element contains an outer shadow followed by a glow, the shadow is first applied to the parent object. Then, the glow is applied to the shadow (rather than the original object). The resulting effect would be a glowing shadow. *end example*]

20.1.10.24 ST_FixedPercentage (Fixed Percentage)

This simple type represents a fixed percentage from negative one hundred to positive one hundred percent. See the union's member types for details.

This simple type is a union of the following types:

- The ST_FixedPercentage simple type (§22.9.2.3).

Referenced By
alphaOff@val (§20.1.2.3.3); hsl@l (§19.5.46); hsl@lum (§20.1.8.39); hsl@s (§19.5.46); hsl@sat (§20.1.8.39); lum@bright (§20.1.8.42); lum@contrast (§20.1.8.42); rgb@b (§19.5.63); rgb@g (§19.5.63); rgb@r (§19.5.63); tint@amt (§20.1.8.60)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FixedPercentage) is located in §A.4.1. *end note*]

20.1.10.25 ST_FontCollectionIndex (Font Collection Index)

This simple type represents one of the fonts associated with the style.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
major (Major Font)	The major font of the style's font scheme.
minor (Minor Font)	The minor font of the style's font scheme.
none (None)	No font reference.

Referenced By
fontRef@idx (§20.1.4.1.17)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FontCollectionIndex) is located in §A.4.1. *end note*]

20.1.10.26 ST_FOVAngle (Field of View Angle)

Represents a positive angle in 60000ths of a degree. Range from [0, 180] degrees.

This simple type's contents are a restriction of the ST_Angle datatype (§20.1.10.3).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

- This simple type has a maximum value of less than or equal to 10800000.

Referenced By
camera@fov (§20.1.5.5)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FOVAngle) is located in §A.4.1. *end note*]

20.1.10.27 ST_GeomGuideFormula (Geometry Guide Formula Properties)

This simple type specifies a geometry guide formula.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

Referenced By
gd@fmla (§20.1.9.11)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_GeomGuideFormula) is located in §A.4.1. *end note*]

20.1.10.28 ST_GeomGuideName (Geometry Guide Name Properties)

This simple type specifies a geometry guide name.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

Referenced By
ahPolar@gdRefAng (§20.1.9.2); ahPolar@gdRefR (§20.1.9.2); ahXY@gdRefX (§20.1.9.3); ahXY@gdRefY (§20.1.9.3); gd@name (§20.1.9.11); ST_AdjAngle (§20.1.10.1); ST_AdjCoordinate (§20.1.10.2)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_GeomGuideName) is located in §A.4.1. *end note*]

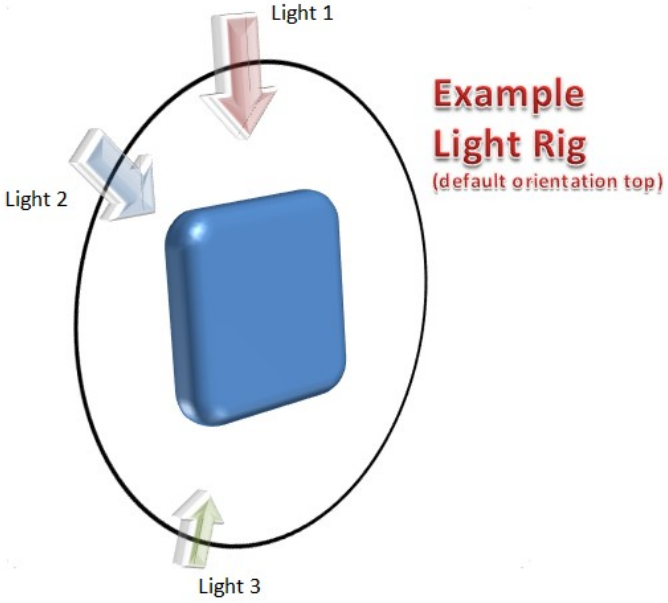
20.1.10.29 ST_LightRigDirection (Light Rig Direction)

Represents the direction from which the light rig is positioned relative to the scene. The light rig, itself, can be made up of multiple lights in any orientation around a given shape. This simple type defines the orientation of the light rig as a whole, and not the individual lights within the rig. This means that because the direction of the light rig is left, that does not guarantee the light is coming from the left side of the shape, but rather the orientation of the rig as a whole is rotated to the left.

[*Example*: Consider the following example as a visual representation of a light rig oriented from the top of the shape in the center:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved



In this example we see that the light rig defines three lights (all in a single plane as represented by the black circular line). The lights defined in this representation can all have different intensities, which means, for this example, Light 3 and Light 2 look to have a more intense effect (or could even be a different color) than Light 1. One can imagine rotating this rig to the so that Light 1 is to the right of the shape when the light rig direction is defined to be right. *end example*]

The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape
- Three Point light rig type
- Circle bevel type
- Plastic material type
- Camera type defined by the `orthographicFront` preset
- Bevel width and height each equal to `190500`

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	[*Example*: Consider the following example of a light direction from the bottom:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LightRigDirection) is located in §A.4.1. *end note*]

20.1.10.30 ST_LightRigType (Light Rig Type)

Represents a preset light right that can be applied to a shape. The light rig represents a group of lights oriented in a specific way relative to a 3D scene. The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

- Circle bevel type
- Warm Matte material type
- Camera type defined by the `perspectiveContrastingRightFacing` preset
- Bevel width and height each equal to `190500`

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
balanced (Light Rig Enum (Balanced))	Balanced
brightRoom (Bright Room)	[*Example*: Consider the following example of the `brightRoom` light rig applied to a basic shape: *end example*]
chilly (Chilly)	[*Example*: Consider the following example of the `chilly` light rig applied to a basic shape: *end example*]

20.1.10.31 ST_LineCap (End Line Cap)

This simple type specifies how to cap the ends of lines. This also affects the ends of line segments for dashed lines.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
flat (Flat Line Cap)	Line ends at end point.
rnd (Round Line Cap)	Rounded ends. Semi-circle protrudes by half line width.
sq (Square Line Cap)	Square protrudes by half line width.

Referenced By
ln@cap (§20.1.2.2.24); lnB@cap (§21.1.3.5); lnBlToTr@cap (§21.1.3.6); lnL@cap (§21.1.3.7); lnR@cap (§21.1.3.8); lnT@cap (§21.1.3.9); lnTlToBr@cap (§21.1.3.10); uLn@cap (§21.1.2.3.14)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LineCap) is located in §A.4.1. *end note*]

20.1.10.32 ST_LineEndLength (Line End Length)

This simple type represents the length of the line end decoration (e.g., arrowhead) relative to the width of the line itself.

[*Example*: See the example images below. These samples have an arrow line end type and medium line end width. *end example*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.10.33 ST_LineEndType (Line End Type)

This simple type represents the shape decoration that appears at the ends of lines. For example, one choice is an arrow head.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
arrow (Arrow Head)	Line arrow head
diamond (Diamond)	Diamond
none (None)	No end
oval (Oval)	Oval
stealth (Stealth Arrow)	Stealth arrow head
triangle (Triangle Arrow Head)	Triangle arrow head

Referenced By
headEnd@type (§20.1.8.38); tailEnd@type (§20.1.8.57)

20.1.10.34 ST_LineEndWidth (Line End Width)

This simple type represents the width of the line end decoration (e.g., arrowhead) relative to the width of the line itself.

[*Example:* See the example images below. These samples have an arrow line end type and medium line end length. *end example*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
lg (Large)	→ Large
med (Medium)	→ Medium
sm (Small)	→ Small

Referenced By
headEnd@w (§20.1.8.38); tailEnd@w (§20.1.8.57)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LineEndWidth) is located in §A.4.1. *end note*]

20.1.10.35 ST_LineWidth (Line Width)

This simple type specifies the width of a line in EMUs. 1 pt = 12700 EMUs.

This simple type's contents are a restriction of the ST_Coordinate32Unqualified datatype (§20.1.10.18).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 20116800.

Referenced By
ln@w (§20.1.2.2.24); lnB@w (§21.1.3.5); lnBlToTr@w (§21.1.3.6); lnL@w (§21.1.3.7); lnR@w (§21.1.3.8); lnT@w (§21.1.3.9); lnTlToBr@w (§21.1.3.10); uLn@w (§21.1.2.3.14)

20.1.10.36 ST_OnOffStyleType (On/Off Style Type)

This simple type represents whether a style property should be applied.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
def (Default)	Follow parent settings. For a themed property, follow the theme settings. For an unthemed property, follow the parent setting in the property inheritance chain.
off (Off)	Property is off.
on (On)	Property is on.

Referenced By
tcTxStyle@b (§20.1.4.2.30); tcTxStyle@i (§20.1.4.2.30)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_OnOffStyleType) is located in §A.4.1. *end note*]

20.1.10.37 ST_PathFillMode (Path Fill Mode)

This simple type specifies the manner in which a path should be filled. The lightening and darkening of a path allow for certain parts of the shape to be colored lighter of darker depending on user preference.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
darken (Darken Path Fill)	This specifies that the corresponding path should have a darker shaded color applied to it's fill.
darkenLess (Darken Path Fill Less)	This specifies that the corresponding path should have a slightly darker shaded color applied to it's fill.
lighten (Lighten Path Fill)	This specifies that the corresponding path should have a lightly shaded color applied to it's fill.
lightenLess (Lighten Path Fill Less)	This specifies that the corresponding path should have a slightly lighter shaded color applied to it's fill.
none (No Path Fill)	This specifies that the corresponding path should have no fill.
norm (Normal Path Fill)	This specifies that the corresponding path should have a normally shaded color applied to it's fill.

20.1.10.38 ST_PathShadeType (Path Shade Type)

This simple type describes the shape of path to follow for a path gradient shade.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
circle (Circle)	Gradient follows a circular path
rect (Rectangle)	Gradient follows a rectangular path
shape (Shape)	Gradient follows the shape

Referenced By
path@path (§20.1.8.46)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PathShadeType) is located in §A.4.1. *end note*]

20.1.10.39 ST_PenAlignment (Alignment Type)

This simple type specifies the Pen Alignment type for use within a text body.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Center Alignment)	Center pen (line drawn at center of path stroke).
in (Inset Alignment)	Inset pen (the pen is aligned on the inside of the edge of the path).

20.1.10.41 ST_PositiveCoordinate (Positive Coordinate)

This simple type represents a positive position or length in EMUs.

This simple type's contents are a restriction of the W3C XML Schema long datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 27273042316900.

20.1.10.46 ST_PresetCameraType (Preset Camera Type)

These enumeration values represent different algorithmic methods for setting all camera properties, including position. The following example images below are all based off the following shape:

In this image, we can see the shape has a camera pointing directly at the front face.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

20.1.10.47 ST_PresetColorVal (Preset Color Value)

This simple type represents a preset color value.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
aliceBlue (Alice Blue Preset Color)	Specifies a color with RGB value (240,248,255)
antiqueWhite (Antique White Preset Color)	Specifies a color with RGB value (250,235,215)
aqua (Aqua Preset Color)	Specifies a color with RGB value (0,255,255)
aquamarine (Aquamarine Preset Color)	Specifies a color with RGB value (127,255,212)
azure (Azure Preset Color)	Specifies a color with RGB value (240,255,255)
beige (Beige Preset Color)	Specifies a color with RGB value (245,245,220)
bisque (Bisque Preset Color)	Specifies a color with RGB value (255,228,196)
black (Black Preset Color)	Specifies a color with RGB value (0,0,0)
blanchedAlmond (Blanched Almond Preset Color)	Specifies a color with RGB value (255,235,205)
blue (Blue Preset Color)	Specifies a color with RGB value (0,0,255)
blueViolet (Blue Violet Preset Color)	Specifies a color with RGB value (138,43,226)
brown (Brown Preset Color)	Specifies a color with RGB value (165,42,42)
burlyWood (Burly Wood Preset Color)	Specifies a color with RGB value (222,184,135)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.1.10.48 ST_PresetLineDashVal (Preset Line Dash Value)

This simple type represents preset line dash values. The description for each style shows an illustration of the line style. Each style also contains a precise binary representation of the repeating dash style. Each 1 corresponds to a line segment of the same length as the line width, and each 0 corresponds to a space of the same length as the line width.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dash (Dash)	1111000
dashDot (Dash Dot)	11110001000
dot (Dot)	1000
lgDash (Large Dash)	11111111000
lgDashDot (Large Dash Dot)	111111110001000

20.1.10.49 ST_PresetMaterialType (Preset Material Type)

Describes surface appearance of a shape. The material type combines with lighting characteristics to create the final look and feel of a shape. The set of material properties which can be combined together to create the presets below consist of the following characteristics:

- Specular color – This defines the color of the highlight associated with the material.
- Specular power – This defines the size and how intense the highlight is. Smaller values provide a larger, but less intense highlight, while larger values provide a smaller, but more intense highlight.
- Diffuse color – This defines the perceived color of the material where an object is directly illuminated by a light source. Generally speaking, the default color here would be based on the shape fill color.
- Ambient color – This defines the perceived color of the material where an object is not directly illuminated by a light source. Generally speaking, the default color here would be based on the shape fill color.
- Emissive color – This defines the color of a light which is perceived to be given off by an object.
- Diffuse Fresnel effect – This is an effect that either darkens (approaches black) or lightens (approaches white) the diffuse color of the material type at glancing angles. Positive values cause the material to become brighter, negative values cause the material to become darker.
- Alpha Fresnel effect – This is an effect that either makes the material more opaque or more transparent at glancing angles. Positive values cause the material to become more opaque, negative values cause the material to become more transparent.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

In the following examples, the exact values given for certain properties should be understood to be relative values in order to provide a reference. These values could be different depending upon technologies used to render the material types. The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape
- Circle bevel type
- Three Point light rig type
- Camera type defined by the `perspectiveContrastingRightFacing` preset
- Bevel width and height each equal to `190500`

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
clear (Clear)	The `clear` material type has the following characteristics: • Specular Color: light gray • Diffuse Color: shape fill color with 90% alpha • Ambient Color: shape fill color with 90% alpha • Emissive Color: black • Diffuse Fresnel value: -8 • Alpha Fresnel value: 1 [*Example*: Consider the following example of the `clear` material type: *end example*]
dkEdge (Dark Edge)	The dkEdge material type has the following characteristics: • Specular Color: white • Specular Power value: 35 • Ambient Color: shape fill color • Emissive Color: black

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
	• Diffuse Fresnel value: -2 [*Example*: Consider the following example of the `dkEdge` material type: *end example*]
flat (Flat)	The `flat` material type has the following characteristics: • Specular Color: very light gray • Specular Power value: 50 • Diffuse Color: black • Ambient Color: black • Emissive Color: shape fill color • Diffuse Fresnel value: -4 [*Example*: Consider the following example of the `flat` material type: *end example*]
legacyMatte (Legacy Matte)	The `legacyMatte` material type has the following characteristics: • Specular Color: black

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	• Ambient Color: shape fill color • Emissive Color: black • Diffuse Fresnel value: -4 [*Example*: Consider the following example of the `legacyMatte` material type: *end example*]
legacyMetal (Legacy Metal)	The `legacyMetal` material type has the following characteristics: • Specular Color: shape fill color • Specular Power value: 32 • Diffuse Color: shape fill color darkened by adding black • Ambient Color: shape fill color darkened by adding black • Emissive Color: black [*Example*: Consider the following example of the `legacyMetal` material type: *end example*]
legacyPlastic (Legacy Plastic)	The `legacyPlastic` material type has the following

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PresetPatternVal) is located in §A.4.1. *end note*]

20.1.10.51 ST_PresetShadowVal (Preset Shadow Type)

This simple type indicates one of 20 preset shadow types. Each enumeration value description illustrates the type of shadow represented by the value. Each description contains the parameters to the outer shadow effect represented by the preset, in addition to those attributes common to all prstShdw effects.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
shdw1 (Top Left Drop Shadow)	 No additional attributes specified.
shdw10 (Top Left Large Drop Shadow)	 align = "br" sx = 125% sy = 125%
shdw11 (Back Left Long Perspective Shadow)	 align = "b" kx = 40.89° sy = 50%
shdw12 (Back Right Long Perspective Shadow)	 align = "b"

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Enumeration Value	Description
	kx = -40.89° sy = 50%
shdw13 (Top Left Double Drop Shadow)	 Equivalent to two outer shadow effects. Shadow 1: No additional attributes specified. Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dist = 2 * shadow 1's distance
shdw14 (Bottom Right Small Drop Shadow)	 No additional attributes specified.
shdw15 (Front Left Long Perspective Shadow)	 align = "b" kx = 40.89° sy = -50%
shdw16 (Front Right LongPerspective Shadow)	 align = "b" kx = -40.89° sy = -50%
shdw17 (3D Outer Box Shadow)	 Equivalent to two outer shadow effects. Shadow 1: No additional attributes specified. Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dir = shadow 1's direction + 180°
shdw18 (3D Inner Box Shadow)	 Equivalent to two outer shadow effects. Shadow 1: No additional attributes specified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
	Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dir = shadow 1's direction + 180°
shdw19 (Back Center Perspective Shadow)	 align = "b" sy = 50°
shdw2 (Top Right Drop Shadow)	 No additional attributes specified.
shdw20 (Front Bottom Shadow)	 align = "b" sy = -100°
shdw3 (Back Left Perspective Shadow)	 align = "b" ky = 40.89° sy = 50%
shdw4 (Back Right Perspective Shadow)	 align = "b" kx = -40.89° sy = 50%
shdw5 (Bottom Left Drop Shadow)	 No additional attributes specified.
shdw6 (Bottom Right Drop Shadow)	 No additional attributes specified.
shdw7 (Front Left Perspective Shadow)	 align = "b" kx = 40.89° sy = -50%
shdw8 (Front Right Perspective Shadow)	 align = "b" kx = -40.89° sy = -50%
shdw9 (Top Left Small Drop Shadow)	 align = "tl" sx = 75%

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PresetShadowVal) is located in §A.4.1. *end note*]

20.1.10.52 ST_RectAlignment (Rectangle Alignments)

This simple type describes how to position two rectangles relative to each other.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Rectangle Alignment Enum (Bottom))	Bottom
bl (Rectangle Alignment Enum (Bottom Left))	Bottom Left
br (Rectangle Alignment Enum (Bottom Right))	Bottom Right
ctr (Rectangle Alignment Enum (Center))	Center
l (Rectangle Alignment Enum (Left))	Left
r (Rectangle Alignment Enum (Right))	Right
t (Rectangle Alignment Enum (Top))	Top
tl (Rectangle Alignment Enum (Top Left))	Top Left
tr (Rectangle Alignment Enum (Top Right))	Top Right

20.1.10.53 ST_SchemeColorVal (Scheme Color)

This simple type represents a scheme color value.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
accent1 (Accent Color 1)	Extra scheme color 1
accent2 (Accent Color 2)	Extra scheme color 2
accent3 (Accent Color 3)	Extra scheme color 3
accent4 (Accent Color 4)	Extra scheme color 4
accent5 (Accent Color 5)	Extra scheme color 5
accent6 (Accent Color 6)	Extra scheme color 6
bg1 (Background Color 1)	Semantic background color
bg2 (Background Color 2)	Semantic additional background color
dk1 (Dark Color 1)	Main dark color 1
dk2 (Dark Color 2)	Main dark color 2
folHlink (Followed Hyperlink Color)	Followed Hyperlink Color
hlink (Hyperlink Color)	Regular Hyperlink Color
lt1 (Light Color 1)	Main Light Color 1
lt2 (Light Color 2)	Main Light Color 2
phClr (Style Color)	A color used in theme definitions which means to use the color of the style.
tx1 (Text Color 1)	Semantic text color
tx2 (Text Color 2)	Semantic additional text color

Referenced By
schemeClr@val (§20.1.2.3.29)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SchemeColorVal) is located in §A.4.1. *end note*]

20.1.10.54 ST_ShapeID (Shape ID)

Specifies the shape ID for legacy shape identification purposes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ShapeID) is located in §A.4.1. *end note*]

20.1.10.55 ST_ShapeType (Preset Shape Types)

This simple type specifies the preset shape geometry that is to be used for a shape. An enumeration of this simple type is used so that a custom geometry does not have to be specified but instead can be constructed automatically by the generating application. For each enumeration listed there is also the corresponding DrawingML code that would be used to construct this shape were it a custom geometry. Within the construction code for each of these preset shapes there are predefined guides that the generating application shall maintain for calculation purposes at all times. The necessary guides should have the following values.

3/4 of a Circle ('3cd4') - Constant value of "16200000.0"

The units here are in 60,000ths of a degree. This is equivalent to 270 degrees.

3/8 of a Circle ('3cd8') - Constant value of "8100000.0"

The units here are in 60,000ths of a degree. This is equivalent to 135 degrees.

5/8 of a Circle ('5cd8') - Constant value of "13500000.0"

The units here are in 60,000ths of a degree. This is equivalent to 225 degrees.

7/8 of a Circle ('7cd8') - Constant value of "18900000.0"

The units here are in 60,000ths of a degree. This is equivalent to 315 degrees.

Shape Bottom Edge ('b') - Constant value of "h"

This is the bottom edge of the shape and since the top edge of the shape is considered the 0 point, the bottom edge is thus the shape height.

1/2 of a Circle ('cd2') - Constant value of "10800000.0"

The units here are in 60,000ths of a degree. This is equivalent to 180 degrees.

1/4 of a Circle ('cd4') - Constant value of "5400000.0"

The units here are in 60,000ths of a degree. This is equivalent to 90 degrees.

1/8 of a Circle ('cd8') - Constant value of "2700000.0"

The units here are in 60,000ths of a degree. This is equivalent to 45 degrees.

Shape Height ('h')

This is the variable height of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

Horizontal Center ('hc') - Calculated value of "*/ w 1.0 2.0"

This is the horizontal center of the shape which is just the width divided by 2.

1/2 of Shape Height ('hd2') - Calculated value of "*/ h 1.0 2.0"

This is 1/2 the shape height.

1/4 of Shape Height ('hd4') - Calculated value of "*/ h 1.0 4.0"

This is 1/4 the shape height.

1/5 of Shape Height ('hd5') - Calculated value of "*/ h 1.0 5.0"

This is 1/5 the shape height.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

1/6 of Shape Height ('hd6') - Calculated value of "*/ h 1.0 6.0"

This is 1/6 the shape height.

1/8 of Shape Height ('hd8') - Calculated value of "*/ h 1.0 8.0"

This is 1/8 the shape height.

Shape Left Edge ('l') - Constant value of "0"

This is the left edge of the shape and the left edge of the shape is considered the horizontal 0 point.

Longest Side of Shape ('ls') - Calculated value of "max w h"

This is the longest side of the shape. This value is either the width or the height depending on which is greater.

Shape Right Edge ('r') - Constant value of "w"

This is the right edge of the shape and since the left edge of the shape is considered the 0 point, the right edge is thus the shape width.

Shortest Side of Shape ('ss') - Calculated value of "min w h"

This is the shortest side of the shape. This value is either the width or the height depending on which is smaller.

1/2 Shortest Side of Shape ('ssd2') - Calculated value of "*/ ss 1.0 2.0"

This is 1/2 the shortest side of the shape.

1/4 Shortest Side of Shape ('ssd4') - Calculated value of "*/ ss 1.0 4.0"

This is 1/4 the shortest side of the shape.

1/6 Shortest Side of Shape ('ssd6') - Calculated value of "*/ ss 1.0 6.0"

This is 1/6 the shortest side of the shape.

1/8 Shortest Side of Shape ('ssd8') - Calculated value of "*/ ss 1.0 8.0"

This is 1/8 the shortest side of the shape.

Shape Top Edge ('t') - Constant value of "0"

This is the top edge of the shape and the top edge of the shape is considered the vertical 0 point.

Vertical Center of Shape ('vc') - Calculated value of "*/ h 1.0 2.0"

This is the vertical center of the shape which is just the height divided by 2.

Shape Width ('w')

This is the variable width of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

1/2 of Shape Width ('wd2') - Calculated value of "*/ w 1.0 2.0"

This is 1/2 the shape width.

1/4 of Shape Width ('wd4') - Calculated value of "*/ w 1.0 4.0"

This is 1/4 the shape width.

1/5 of Shape Width ('wd5') - Calculated value of "*/ w 1.0 5.0"

This is 1/5 the shape width.

1/6 of Shape Width ('wd6') - Calculated value of "*/ w 1.0 6.0"

This is 1/6 the shape width.

1/8 of Shape Width ('wd8') - Calculated value of "*/ w 1.0 8.0"

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This is 1/8 the shape width.

1/10 of Shape Width ('wd10') - Calculated value of "*/ w 1.0 10.0"

This is 1/10 the shape width.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description

Enumeration Value	Description
chartPlus (Chart Plus Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in the chartPlus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
chartStar (Chart Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in the chartStar element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
chartX (Chart X Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in the chartX element in the preset shape geometries

	electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
chevron (Chevron Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in the chevron element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
chord (Chord Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in the chord element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
circularArrow (Circular Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in

Enumeration Value	Description
	the circularArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
cloud (Cloud Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in the cloud element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
cloudCallout (Callout Cloud Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in the cloudCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
corner (Corner Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in

Enumeration Value	Description
	the corner element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
cornerTabs (Corner Tabs Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in the cornerTabs element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
cube (Cube Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in the cube element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
curvedConnector2 (Curved Connector 2 Shape)	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
wedgeRoundRectCallout (Callout Wedge Round Rectangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which can be used to generate this preset shape definition is contained in the wedgeRoundRectCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Referenced By
prstGeom@prst (§20.1.9.18); ST_LayoutShapeType (§21.4.7.41)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ShapeType) is located in §A.4.1. *end note*]

20.1.10.56 ST_StyleMatrixColumnIndex (Style Matrix Column Index)

This simple type specifies an index into one of the lists in the style matrix specified by the fmtScheme element (bgFillStyleLst, effectStyleLst, fillStyleLst, or lnStyleLst).

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

Referenced By
bgRef@idx (§19.3.1.3); effectRef@idx (§20.1.4.2.8); fillRef@idx (§20.1.4.2.10); lnRef@idx (§20.1.4.2.19)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_StyleMatrixColumnIndex) is located in §A.4.1. *end note*]

20.1.10.57 ST_SystemColorVal (System Color Value)

This simple type specifies a system color value. This color is based upon the value that this color currently has within the system on which the document is being viewed.

Applications shall use the lastClr attribute to determine the absolute value of the last color used if system colors are not supported.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
3dDkShadow (3D Dark System Color)	Specifies a Dark shadow color for three-dimensional display elements.
3dLight (3D Light System Color)	Specifies a Light color for three-dimensional display elements (for edges facing the light source).
activeBorder (Active Border System Color)	Specifies an Active Window Border Color.
activeCaption (Active Caption System Color)	Specifies the active window title bar color. In particular the left side color in the color gradient of an active window's title bar if the gradient effect is enabled.
appWorkspace (Application Workspace System Color)	Specifies the Background color of multiple document interface (MDI) applications.
background (Background System Color)	Specifies the desktop background color.
btnFace (Button Face System Color)	Specifies the face color for three-dimensional display elements and for dialog box backgrounds.
btnHighlight (Button Highlight System Color)	Specifies the highlight color for three-dimensional display elements (for edges facing the light source).
btnShadow (Button Shadow System Color)	Specifies the shadow color for three-dimensional display elements (for edges facing away from the light source).
btnText (Button Text System Color)	Specifies the color of text on push buttons.
captionText (Caption Text System Color)	Specifies the color of text in the caption, size box, and scroll bar arrow box.
gradientActiveCaption (Gradient Active Caption System Color)	Specifies the right side color in the color gradient of an active window's title bar.
gradientInactiveCaption (Gradient Inactive Caption System Color)	Specifies the right side color in the color gradient of an inactive window's title bar.
grayText (Gray Text System Color)	Specifies a grayed (disabled) text. This color is set to 0 if the current display driver does not support a solid gray color.
highlight (Highlight System Color)	Specifies the color of Item(s) selected in a control.
highlightText (Highlight Text System Color)	Specifies the text color of item(s) selected in a control.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
hotLight (Hot Light System Color)	Specifies the color for a hyperlink or hot-tracked item.
inactiveBorder (Inactive Border System Color)	Specifies the color of the Inactive window border.
inactiveCaption (Inactive Caption System Color)	Specifies the color of the Inactive window caption. Specifies the left side color in the color gradient of an inactive window's title bar if the gradient effect is enabled.
inactiveCaptionText (Inactive Caption Text System Color)	Specifies the color of text in an inactive caption.
infoBk (Info Back System Color)	Specifies the background color for tooltip controls.
infoText (Info Text System Color)	Specifies the text color for tooltip controls.
menu (Menu System Color)	Specifies the menu background color.
menuBar (Menu Bar System Color)	Specifies the background color for the menu bar when menus appear as flat menus.
menuHighlight (Menu Highlight System Color)	Specifies the color used to highlight menu items when the menu appears as a flat menu.
menuText (Menu Text System Color)	Specifies the color of Text in menus.
scrollBar (Scroll Bar System Color)	Specifies the scroll bar gray area color.
window (Window System Color)	Specifies window background color.
windowFrame (Window Frame System Color)	Specifies the window frame color.
windowText (Window Text System Color)	Specifies the color of text in windows.

sysClr@val (§20.1.2.3.33)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SystemColorVal) is located in §A.4.1. *end note*]

20.1.10.58 ST_TextAlignType (Text Alignment Types)

This simple type specifies the text alignment types

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Text Alignment Enum (Center))	Align text in the center.
dist (Text Alignment Enum (Distributed))	Distributes the text words across an entire text line.
just (Text Alignment Enum (Justified))	Align text so that it is justified across the whole line. It

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
	is smart in the sense that it does not justify sentences which are short.
justLow (Text Alignment Enum (Justified Low))	Aligns the text with an adjusted kashida length for Arabic text.
l (Text Alignment Enum (Left))	Align text to the left margin.
r (Text Alignment Enum (Right))	Align text to the right margin.
thaiDist (Text Alignment Enum (Thai Distributed))	Distributes Thai text specially, because each character is treated as a word.

Referenced By
defPPr@algn (§21.1.2.2.2); lvl1pPr@algn (§21.1.2.4.13); lvl2pPr@algn (§21.1.2.4.14); lvl3pPr@algn (§21.1.2.4.15); lvl4pPr@algn (§21.1.2.4.16); lvl5pPr@algn (§21.1.2.4.17); lvl6pPr@algn (§21.1.2.4.18); lvl7pPr@algn (§21.1.2.4.19); lvl8pPr@algn (§21.1.2.4.20); lvl9pPr@algn (§21.1.2.4.21); pPr@algn (§21.1.2.2.7)

20.1.10.59 ST_TextAnchoringType (Text Anchoring Types)

This simple type specifies a list of available anchoring types for text.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Text Anchor Enum (Bottom))	Anchor the text at the bottom of the bounding rectangle.
ctr (Text Anchor Enum (Center))	Anchor the text at the middle of the bounding rectangle.
dist (Text Anchor Enum (Distributed))	Anchor the text so that it is distributed vertically. When text is horizontal, this spaces out the actual lines of text and is almost always identical in behavior to anchorJustified (special case: if only 1 line, then anchored in middle). When text is vertical, then it distributes the letters vertically. This is different than anchorJustified, because it always forces distribution of the words, even if there are only one or two words in a line.
just (Text Anchor Enum (Justified))	Anchor the text so that it is justified vertically. When text is horizontal, this spaces out the actual lines of

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
	text and is almost always identical in behavior to 'distrib' (special case: if only 1 line, then anchored at top). When text is vertical, then it justifies the letters vertically. This is different than anchorDistributed, because in some cases such as very little text in a line, it does not justify.
t (Text Anchoring Type Enum (Top))	Anchor the text at the top of the bounding rectangle.

Referenced By
bodyPr@anchor (§21.1.2.1.1); tcPr@anchor (§21.1.3.17)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextAnchoringType) is located in §A.4.1. *end note*]

20.1.10.60 ST_TextAutonumberScheme (Text Auto-number Schemes)

This simple type specifies a list of automatic numbering schemes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
alphaLcParenBoth (Autonumber Enum (alphaLcParenBoth))	(a), (b), (c), …
alphaLcParenR (Autonumbering Enum (alphaLcParenR))	a), b), c), …
alphaLcPeriod (Autonumbering Enum (alphaLcPeriod))	a., b., c., …
alphaUcParenBoth (Autonumbering Enum (alphaUcParenBoth))	(A), (B), (C), …
alphaUcParenR (Autonumbering Enum (alphaUcParenR))	A), B), C), …
alphaUcPeriod (Autonumbering Enum (alphaUcPeriod))	A., B., C., …
arabic1Minus (Autonumbering Enum (arabic1Minus))	Bidi Arabic 1 (AraAlpha) with ANSI minus symbol
arabic2Minus (Autonumbering Enum (arabic2Minus))	Bidi Arabic 2 (AraAbjad) with ANSI minus symbol
arabicDbPeriod (Autonumbering Enum (arabicDbPeriod))	Dbl-byte Arabic numbers w/ double-byte period

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
arabicDbPlain (Autonumbering Enum (arabicDbPlain))	Dbl-byte Arabic numbers
arabicParenBoth (Autonumbering Enum (arabicParenBoth))	(1), (2), (3), …
arabicParenR (Autonumbering Enum (arabicParenR))	1), 2), 3), …
arabicPeriod (Autonumbering Enum (arabicPeriod))	1., 2., 3., …
arabicPlain (Autonumbering Enum (arabicPlain))	1, 2, 3, …
circleNumDbPlain (Autonumbering Enum (circleNumDbPlain))	Dbl-byte circle numbers (1-10 circle[0x2460-], 11-arabic numbers)
circleNumWdBlackPlain (Autonumbering Enum (circleNumWdBlackPlain))	Wingdings black circle numbers
circleNumWdWhitePlain (Autonumbering Enum (circleNumWdWhitePlain))	Wingdings white circle numbers (0-10 circle[0x0080-], 11- arabic numbers)
ea1ChsPeriod (Autonumbering Enum (ea1ChsPeriod))	EA: Simplified Chinese w/ single-byte period
ea1ChsPlain (Autonumbering Enum (ea1ChsPlain))	EA: Simplified Chinese (TypeA 1-99, TypeC 100-)
ea1ChtPeriod (Autonumbering Enum (ea1ChtPeriod))	EA: Traditional Chinese w/ single-byte period
ea1ChtPlain (Autonumbering Enum (ea1ChtPlain))	EA: Traditional Chinese (TypeA 1-19, TypeC 20-)
ea1JpnChsDbPeriod (Autonumbering Enum (ea1JpnChsDbPeriod))	EA: Japanese w/ double-byte period
ea1JpnKorPeriod (Autonumbering Enum (ea1JpnKorPeriod))	EA: Japanese/Korean w/ single-byte period
ea1JpnKorPlain (Autonumbering Enum (ea1JpnKorPlain))	EA: Japanese/Korean (TypeC 1-)
hebrew2Minus (Autonumbering Enum (hebrew2Minus))	Bidi Hebrew 2 with ANSI minus symbol
hindiAlpha1Period (Autonumbering Enum (hindiAlpha1Period))	Hindi alphabet period - consonants
hindiAlphaPeriod (Autonumbering Enum (hindiAlphaPeriod))	Hindi alphabet period - vowels
hindiNumParenR (Autonumbering Enum (hindiNumParenR))	Hindi numerical parentheses - right
hindiNumPeriod (Autonumbering Enum (hindiNumPeriod))	Hindi numerical period
romanLcParenBoth (Autonumbering Enum (romanLcParenBoth))	(i), (ii), (iii), …
romanLcParenR (Autonumbering Enum (	i), ii), iii), …

20.1.10.61 ST_TextBulletSizePercent (Bullet Size Percentage)

This simple type specifies the range that the bullet percent can be. A bullet percent is the size of the bullet with respect to the text that should follow it.

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern: 0*((2[5-9])|([3-9][0-9])|([1-3][0-9][0-9])|400)%.

Referenced By
ST_TextBulletSize (§20.1.10.86)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextBulletSizePercent) is located in §A.4.1. *end note*]

20.1.10.62 ST_TextBulletStartAtNum (Start Bullet At Number)

This simple type specifies the range that the start at number for a bullet's auto-numbering sequence can begin at. When the numbering is alphabetical, then the numbers map to the appropriate letter. 1->a, 2->b, etc. If the numbers go above 26, then the numbers begin to double up. For example, 27->aa and 53->aaa.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 32767.

Referenced By
buAutoNum@startAt (§21.1.2.4.1)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextBulletStartAtNum) is located in §A.4.1. *end note*]

20.1.10.63 ST_TextCapsType (Text Cap Types)

This simple type specifies the cap types of the text.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (Text Caps Enum (All))	Apply all caps on the text. All lower case letters are converted to upper case even though they are stored differently in the backing store.
none (Text Caps Enum (None))	The reason we cannot implicitly have noCaps be the scenario where capitalization is not specified is because not being specified implies deriving from a particular style and the user might want to override that and make some text not have a capitalization scheme even though the style says otherwise.
small (Text Caps Enum (Small))	Apply small caps to the text. All letters are converted to lower case.

20.1.10.64 ST_TextColumnCount (Text Column Count)

This simple type specifies the number of columns.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 16.

Referenced By
bodyPr@numCol (§21.1.2.1.1)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextColumnCount) is located in §A.4.1. *end note*]

20.1.10.65 ST_TextFontAlignType (Font Alignment Types)

This simple type specifies the different kinds of font alignment.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Font Alignment Enum (Automatic))	When the text flow is horizontal or simple vertical same as fontBaseline but for other vertical modes same as fontCenter.
b (Font Alignment Enum (Bottom))	The letters are anchored to the very bottom of a single line. This is different than the bottom baseline because of letters such as "g," "q," "y," etc.
base (Font Alignment Enum (Baseline))	The letters are anchored to the bottom baseline of a single line.
ctr (Font Alignment Enum (Center))	The letters are anchored between the two baselines of a single line.
t (Font Alignment Enum (Top))	The letters are anchored to the top baseline of a single line.

20.1.10.68 ST_TextHorzOverflowType (Text Horizontal Overflow Types)

This simple type specifies the text horizontal overflow types

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
clip (Text Horizontal Overflow Enum (Clip))	When a big character does not fit into a line, clip it at the proper horizontal overflow.
overflow (Text Horizontal Overflow Enum (Overflow))	When a big character does not fit into a line, allow a horizontal overflow.

Referenced By
bodyPr@horzOverflow (§21.1.2.1.1); tcPr@horzOverflow (§21.1.3.17)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextHorzOverflowType) is located in §A.4.1. *end note*]

20.1.10.69 ST_TextIndent (Text Indentation)

This simple type specifies the text indentation amount to be used.

The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the ST_Coordinate32Unqualified datatype (§20.1.10.18).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -51206400.
- This simple type has a maximum value of less than or equal to 51206400.

Referenced By

20.1.10.74 ST_TextPointUnqualified (Text Point)

This simple type specifies a font size in hundredths of a point. This is restricted to the range [-400000, 400000], i.e from -4000 pt to 4000 pt.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -400000.
- This simple type has a maximum value of less than or equal to 400000.

Referenced By
ST_TextPoint (§20.1.10.73)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextPointUnqualified) is located in §A.4.1. *end note*]

20.1.10.75 ST_TextShapeType (Preset Text Shape Types)

This simple type specifies the preset text shape geometry that is to be used for a shape. An enumeration of this simple type is used so that a custom geometry does not have to be specified but instead can be constructed automatically by the generating application. For each enumeration listed there is also the corresponding DrawingML code that would be used to construct this shape were it a custom geometry. Within the construction code for each of these preset text shapes there are predefined guides that the generating application shall maintain for calculation purposes at all times. The necessary guides should have the following values.

3/4 of a Circle ('3cd4') - Constant value of "16200000.0"

The units here are in 60,000ths of a degree. This is equivalent to 270 degrees.

3/8 of a Circle ('3cd8') - Constant value of "8100000.0"

The units here are in 60,000ths of a degree. This is equivalent to 135 degrees.

5/8 of a Circle ('5cd8') - Constant value of "13500000.0"

The units here are in 60,000ths of a degree. This is equivalent to 225 degrees.

7/8 of a Circle ('7cd8') - Constant value of "18900000.0"

The units here are in 60,000ths of a degree. This is equivalent to 315 degrees.

Shape Bottom Edge ('b') - Constant value of "h"

This is the bottom edge of the shape and since the top edge of the shape is considered the 0 point, the bottom edge is thus the shape height.

1/2 of a Circle ('cd2') - Constant value of "10800000.0"

The units here are in 60,000ths of a degree. This is equivalent to 180 degrees.

1/4 of a Circle ('cd4') - Constant value of "5400000.0"

The units here are in 60,000ths of a degree. This is equivalent to 90 degrees.

1/8 of a Circle ('cd8') - Constant value of "2700000.0"

The units here are in 60,000ths of a degree. This is equivalent to 45 degrees.

Shape Height ('h')

This is the variable height of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

Horizontal Center ('hc') - Calculated value of "*/ w 1.0 2.0"

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

This is the horizontal center of the shape which is just the width divided by 2.

1/2 of Shape Height ('hd2') - Calculated value of "*/ h 1.0 2.0"

This is 1/2 the shape height.

1/4 of Shape Height ('hd4') - Calculated value of "*/ h 1.0 4.0"

This is 1/4 the shape height.

1/5 of Shape Height ('hd5') - Calculated value of "*/ h 1.0 5.0"

This is 1/5 the shape height.

1/6 of Shape Height ('hd6') - Calculated value of "*/ h 1.0 6.0"

This is 1/6 the shape height.

1/8 of Shape Height ('hd8') - Calculated value of "*/ h 1.0 8.0"

This is 1/8 the shape height.

Shape Left Edge ('l') - Constant value of "0"

This is the left edge of the shape and the left edge of the shape is considered the horizontal 0 point.

Longest Side of Shape ('ls') - Calculated value of "max w h"

This is the longest side of the shape. This value is either the width or the height depending on which is greater.

Shape Right Edge ('r') - Constant value of "w"

This is the right edge of the shape and since the left edge of the shape is considered the 0 point, the right edge is thus the shape width.

Shortest Side of Shape ('ss') - Calculated value of "min w h"

This is the shortest side of the shape. This value is either the width or the height depending on which is smaller.

1/2 Shortest Side of Shape ('ssd2') - Calculated value of "*/ ss 1.0 2.0"

This is 1/2 the shortest side of the shape.

1/4 Shortest Side of Shape ('ssd4') - Calculated value of "*/ ss 1.0 4.0"

This is 1/4 the shortest side of the shape.

1/6 Shortest Side of Shape ('ssd6') - Calculated value of "*/ ss 1.0 6.0"

This is 1/6 the shortest side of the shape.

1/8 Shortest Side of Shape ('ssd8') - Calculated value of "*/ ss 1.0 8.0"

This is 1/8 the shortest side of the shape.

Shape Top Edge ('t') - Constant value of "0"

This is the top edge of the shape and the top edge of the shape is considered the vertical 0 point.

Vertical Center of Shape ('vc') - Calculated value of "*/ h 1.0 2.0"

This is the vertical center of the shape which is just the height divided by 2.

Shape Width ('w')

This is the variable width of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

1/2 of Shape Width ('wd2') - Calculated value of "*/ w 1.0 2.0"

This is 1/2 the shape width.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

1/4 of Shape Width ('wd4') - Calculated value of "*/ w 1.0 4.0"

This is 1/4 the shape width.

1/5 of Shape Width ('wd5') - Calculated value of "*/ w 1.0 5.0"

This is 1/5 the shape width.

1/6 of Shape Width ('wd6') - Calculated value of "*/ w 1.0 6.0"

This is 1/6 the shape width.

1/8 of Shape Width ('wd8') - Calculated value of "*/ w 1.0 8.0"

This is 1/8 the shape width.

1/10 of Shape Width ('wd10') - Calculated value of "*/ w 1.0 10.0"

This is 1/10 the shape width.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
textArchDown (Downward Arch Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which can be used to achieve this effect is contained in the textArchDown element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textArchDownPour (Downward Pour Arch Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which can be used to achieve this effect is contained in the textArchDownPour element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textArchUp (Upward Arch Text Shape)

20.1.10.77 ST_TextSpacingPoint (Text Spacing Point)

This simple type specifies the Text Spacing that is used in terms of font point size.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 158400.

Referenced By
spcPts@val (§21.1.2.2.12)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextSpacingPoint) is located in §A.4.1. *end note*]

20.1.10.78 ST_TextStrikeType (Text Strike Type)

This simple type specifies the strike type.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dblStrike (Text Strike Enum (Double Strike))	A double strikethrough applied on the text
noStrike (Text Strike Enum (No Strike))	No strike is applied to the text
sngStrike (Text Strike Enum (Single Strike))	A single strikethrough is applied to the text

Referenced By

20.1.10.79 ST_TextTabAlignType (Text Tab Alignment Types)

This simple type specifies the text tab alignment types.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Text Tab Alignment Enum (Center))	The text at this tab stop is center aligned.
dec (Text Tab Alignment Enum (Decimal))	At this tab stop, the decimals are lined up. From a user's point of view, the text here behaves as right aligned until the decimal, and then as left aligned after the decimal.
l (Text Tab Alignment Enum (Left))	The text at this tab stop is left aligned.
r (Text Tab Alignment Enum (Right))	The text at this tab stop is right aligned.

Referenced By
tab@algn (§21.1.2.2.13)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextTabAlignType) is located in §A.4.1. *end note*]

20.1.10.80 ST_TextTypeface (Text Typeface)

This simple type specifies the way we represent a font typeface.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

Referenced By
buFont@typeface (§21.1.2.4.6); cs@typeface (§21.1.2.3.1); ea@typeface (§21.1.2.3.3); font@typeface (§20.1.4.1.16); font@typeface (§19.2.1.13); latin@typeface (§21.1.2.3.7); sym@typeface (§21.1.2.3.10)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextTypeface) is located in §A.4.1. *end note*]

20.1.10.81 ST_TextUnderlineType (Text Underline Types)

This simple type specifies the text underline types that is used.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dash (Text Underline Enum (Dashed))	Underline the text with a single, dashed line of normal thickness.
dashHeavy (Text Underline Enum (Heavy Dashed))	Underline the text with a single, dashed, thick line.
dashLong (Text Underline Enum (Long Dashed))	Underline the text with a single line consisting of long dashes of normal thickness.
dashLongHeavy (Text Underline Enum (Heavy Long Dashed))	Underline the text with a single line consisting of long, thick dashes.
dbl (Text Underline Enum (Double))	Underline the text with two lines of normal thickness.
dotDash (Text Underline Enum (Dot Dash))	Underline the text with a single line of normal thickness consisting of repeating dots and dashes.
dotDashHeavy (Text Underline Enum (Heavy Dot Dash))	Underline the text with a single, thick line consisting of repeating dots and dashes.
dotDotDash (Text Underline Enum (Dot Dot Dash))	Underline the text with a single line of normal thickness consisting of repeating two dots and dashes.
dotDotDashHeavy (Text Underline Enum (Heavy Dot Dot Dash))	Underline the text with a single, thick line consisting of repeating two dots and dashes.
dotted (Text Underline Enum (Dotted))	Underline the text with a single, dotted line of normal thickness.
dottedHeavy (Text Underline Enum (Heavy Dotted))	Underline the text with a single, thick, dotted line.
heavy (Text Underline Enum (Heavy))	Underline the text with a single, thick line.
none (Text Underline Enum (None))	The reason we cannot implicitly have noUnderline be the scenario where underline is not specified is because not being specified implies deriving from a particular style and the user might want to override that and make some text not be underlined even though the style says otherwise.
sng (Text Underline Enum (Single))	Underline the text with a single line of normal thickness.
wavy (Text Underline Enum (Wavy))	Underline the text with a single wavy line of normal thickness.
wavyDbl (Text Underline Enum (Double Wavy))	Underline the text with two wavy lines of normal thickness.
wavyHeavy (Text Underline Enum (Heavy Wavy))	Underline the text with a single, thick wavy line.
words (Text Underline Enum (Words))	Underline just the words and not the spaces between them.

defRPr@u (§21.1.2.3.2); endParaRPr@u (§21.1.2.2.3); rPr@u (§21.1.2.3.9)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextUnderlineType) is located in §A.4.1. *end note*]

20.1.10.82 ST_TextVerticalType (Vertical Text Types)

If there is vertical text, determines what kind of vertical text is going to be used.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
eaVert (Vertical Text Type Enum (East Asian Vertical))	A special version of vertical text, where some fonts are displayed as if rotated by 90 degrees while some fonts (mostly East Asian) are displayed vertical.
horz (Vertical Text Type Enum (Horizontal))	Horizontal text. This should be default.
mongolianVert (Vertical Text Type Enum (Mongolian Vertical))	A special version of vertical text, where some fonts are displayed as if rotated by 90 degrees while some fonts (mostly East Asian) are displayed vertical. The difference between this and the eastAsianVertical is the text flows top down then LEFT RIGHT, instead of RIGHT LEFT
vert (Vertical Text Type Enum (Vertical))	Determines if all of the text is vertical orientation (each line is 90 degrees rotated clockwise, so it goes from top to bottom; each next line is to the left from the previous one).
vert270 (Vertical Text Type Enum (Vertical 270))	Determines if all of the text is vertical orientation (each line is 270 degrees rotated clockwise, so it goes from bottom to top; each next line is to the right from the previous one).
wordArtVert (Vertical Text Type Enum (WordArt Vertical))	Determines if all of the text is vertical ("one letter on top of another").
wordArtVertRtl (Vertical WordArt Right to Left)	Specifies that vertical WordArt should be shown from right to left rather than left to right.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextVerticalType) is located in §A.4.1. *end note*]

20.1.10.83 ST_TextVertOverflowType (Text Vertical Overflow)

This simple type specifies the text vertical overflow.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
clip (Text Overflow Enum (Clip))	Pay attention to top and bottom barriers. Provide no indication that there is text which is not visible.
ellipsis (Text Overflow Enum (Ellipsis))	Pay attention to top and bottom barriers. Use an ellipsis to denote that there is text which is not visible.
overflow (Text Overflow Enum (Overflow))	Overflow the text and pay no attention to top and bottom barriers.

Referenced By
bodyPr@vertOverflow (§21.1.2.1.1)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextVertOverflowType) is located in §A.4.1. *end note*]

20.1.10.84 ST_TextWrappingType (Text Wrapping Types)

Text Wrapping Types

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
none (Text Wrapping Type Enum (None))	No wrapping occurs on this text body. Words spill out without paying attention to the bounding rectangle boundaries.
square (Text Wrapping Type Enum (Square))	Determines whether we wrap words within the bounding rectangle.

Referenced By
bodyPr@wrap (§21.1.2.1.1)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextWrappingType) is located in §A.4.1. *end note*]

20.1.10.85 ST_TileFlipMode (Tile Flip Mode)

This simple type indicates whether/how to flip the contents of a tile region when using it to fill a larger fill region.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
none (None)	Tiles are not flipped.
x (Horizontal)	 Tiles are flipped horizontally.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Enumeration Value	Description
xy (Horizontal and Vertical)	 Tiles are flipped both horizontally and vertically.
y (Vertical)	 Tiles are flipped vertically.

Referenced By
gradFill@flip (§20.1.8.33); tile@flip (§20.1.8.58)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TileFlipMode) is located in §A.4.1. *end note*]

20.1.10.86 ST_TextBulletSize (Bullet Size Percentage)

This simple type specifies the range that the bullet percent can be. A bullet percent is the size of the bullet with respect to the text that should follow it, with a minimum size of 25% and maximum size of 400%.

This simple type is a union of the following types:

- The ST_TextBulletSizePercent simple type (§20.1.10.62)

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextBulletSize) is located in § A.4.1. *end note*]

20.2 DrawingML - Picture

These elements encompass the definition of pictures within the DrawingML framework. While pictures are in many ways very similar to shapes they have specific properties that are unique in order to optimize for picture-specific scenarios. Some of these properties include Fill behavior, Border behavior and Resize behavior.

20.2.1 Table of Contents

This subclause is informative.

20.2.2 Elements 3457
20.2.2.1 blipFill (Picture Fill) 3457
20.2.2.2 cNvPicPr (Non-Visual Picture Drawing Properties) 3460
20.2.2.3 cNvPr (Non-Visual Drawing Properties) 3461
20.2.2.4 nvPicPr (Non-Visual Picture Properties) 3463
20.2.2.5 pic (Picture) 3464
20.2.2.6 spPr (Shape Properties) 3465

End of informative text.

20.2.2 Elements

The following section defines the Picture portion of the DrawingML framework.

20.2.2.1 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object has. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[*Example*: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<pic:pic>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
    …
    <pic:blipFill>
      <a:blip r:embed="rId2"/>
      <a:stretch>
        <a:fillRect/>
      </a:stretch>
    </pic:blipFill>
    …
  </pic:pic>
```

The above picture object is shown as an example of this fill type. *end example*]

[*Example*: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
  <pic:pic>
    …
    <pic:blipFill>
      <a:blip r:embed="rId2"/>
      <a:stretch>
        <a:fillRect/>
      </a:stretch>
    </pic:blipFill>
    <pic:spPr>
      <a:gradFill>
        <a:gsLst>
          <a:gs pos="0">
            <a:schemeClr val="tx2">
              <a:shade val="50000"/>
            </a:schemeClr>
          </a:gs>
          <a:gs pos="39999">
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

```
            <a:schemeClr val="tx2">
              <a:tint val="20000"/>
            </a:schemeClr>
          </a:gs>
          <a:gs pos="70000">
            <a:srgbClr val="C4D6EB"/>
          </a:gs>
          <a:gs pos="100000">
            <a:schemeClr val="bg1"/>
          </a:gs>
        </a:gsLst>
      </a:gradFill>
    </pic:spPr>
    …
</pic:pic>
```

The above picture object is shown as an example of this double fill type. *end example*]

Parent Elements
pic (§20.2.2.5)

Child Elements	Subclause
blip (Blip)	§20.1.8.13
srcRect (Source Rectangle)	§20.1.8.55
stretch (Stretch)	§20.1.8.56
tile (Tile)	§20.1.8.58

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
dpi (DPI Setting) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [*Note*: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. *end note*] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_BlipFillProperties) is located in §A.4.1. *end note*]

20.2.2.2 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example*: Consider the following DrawingML:

```
<pic:pic>
  …
  <pic:nvPicPr>
    <pic:cNvPr id="4" name="Lilly.jpg"/>
    <pic:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
    <pic:nvPr/>
  </pic:nvPicPr>
  …
</pic:pic>
```

end example]

Parent Elements
nvPicPr (§20.2.2.4)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
picLocks (Picture Locks)	§20.1.2.2.31

Attributes	Description
preferRelativeResize (Relative Resize Preferred) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size. [*Example*: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked. If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualPictureProperties) is located in §A.4.1. *end note*]

20.2.2.3 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<pic:pic>
  …
  <pic:nvPicPr>
    <p:cNvPr id="4" name="Lilly.jpg"/>
  </pic:nvPicPr>
  …
</pic:pic>
```

end example]

Parent Elements
nvPicPr (§20.2.2.4)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
hlinkClick (Click Hyperlink)	§21.1.2.3.5
hlinkHover (Hyperlink for Hover)	§20.1.2.2.23

Attributes	Description
descr (Alternative Text for Object) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object. If this element is omitted, then no alternative text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">` The descr attribute contains alternative text which can be used in place of the actual DrawingML object. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
hidden (Hidden) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [*Note*: An application can have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden). [*Example*: Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />` The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
id (Unique Identifier) Namespace: http://purl.oclc.org/ooxml/drawing	Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
ml/main	[*Example*: Consider a DrawingML object defined as follows: `<… id="10" … >` The id attribute has a value of 10, which is the unique identifier for this DrawingML object. *end example*] The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).
name (Name) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the name of the object. [*Note*: Typically, this is used to store the original file name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: `< … name="foo.jpg" >` The name attribute has a value of foo.jpg, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
title (Title) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the title (caption) of the current DrawingML object. If this attribute is omitted, then no title text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… title="Process Flow Diagram">` *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualDrawingProps) is located in §A.4.1. *end note*]

20.2.2.4 nvPicPr (Non-Visual Picture Properties)

This element specifies the non visual properties for a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<pic:pic>
  …
  <pic:nvPicPr>
    …
  </pic:nvPicPr>
  …
</pic:pic>
```

end example]

Parent Elements
pic (§20.2.2.5)

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§20.2.2.2
cNvPr (Non-Visual Drawing Properties)	§20.2.2.3

[*Note*: The W3C XML Schema definition of this element's content model (CT_PictureNonVisual) is located in §A.4.2. *end note*]

20.2.2.5 pic (Picture)

This element specifies the existence of a picture object within the document.

[*Example*: Consider the following DrawingML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<pic:pic>
  <pic:nvPicPr>
    <pic:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <pic:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </pic:cNvPicPr>
    <pic:nvPr/>
  </pic:nvPicPr>
  <pic:blipFill>
  …
  </pic:blipFill>
  <pic:spPr>
  …
  </pic:spPr>
</pic:pic>
```

end example]

Child Elements	Subclause
blipFill (Picture Fill)	§20.2.2.1
nvPicPr (Non-Visual Picture Properties)	§20.2.2.4
spPr (Shape Properties)	§20.2.2.6

[*Note*: The W3C XML Schema definition of this element's content model (CT_Picture) is located in §A.4.2. *end note*]

20.2.2.6 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a picture. These are the same properties that are allowed to describe the visual properties of a shape but are used here to describe the visual appearance of a picture within a document. This allows for a picture to have both the properties of a shape as well as picture specific properties that are allowed under the pic element.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShapeProperties) is located in §A.4.1. *end note*]

20.3 DrawingML - Locked Canvas

Within a DrawingML object, a *locked canvas* allows DrawingML objects to be placed in a format where they can be viewed but not edited by the hosting application. This allows DrawingML objects not supported by an application to be included and viewed in applications where they cannot be edited.

20.3.1 Table of Contents

This subclause is informative.

20.3.2 Basics 3466
20.3.2.1 lockedCanvas (Locked Canvas Container) 3466

End of informative text.

20.3.2 Basics

This section specifies a locked canvas within the basic DrawingML framework.

20.3.2.1 lockedCanvas (Locked Canvas Container)

The locked canvas element acts as a container for more advanced drawing objects. The notion of a locked canvas comes from the fact that the generating application opening the file cannot create this object and can thus not perform edits either. Thus the drawing object is locked from all UI adjustments that would normally take place.

Child Elements	Subclause
cxnSp (Connection Shape)	§20.1.2.2.10

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
graphicFrame (Graphic Frame)	§20.1.2.2.18
grpSp (Group shape)	§20.1.2.2.20
grpSpPr (Visual Group Shape Properties)	§20.1.2.2.22
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§20.1.2.2.27
pic (Picture)	§20.1.2.2.30
sp (Shape)	§20.1.2.2.33
txSp (Text Shape)	§20.1.2.2.41

[*Note*: The W3C XML Schema definition of this element's content model (CT_GvmlGroupShape) is located in §A.4.1. *end note*]

20.4 DrawingML - WordprocessingML Drawing

Within a WordprocessingML document, it is possible to include graphical DrawingML objects:

- Pictures (§20.2)
- Locked Canvases (§20.3)
- Diagrams (§21.4)
- Charts (§21.2)

When these objects are present in a word processing document, it is necessary to include information which specifies how the objects shall be positioned relative to the paginated document. [*Example*: Whether the object is displayed in line with text. *end example*]

The WordprocessingML Drawing namespace acts in this capacity, specifying all information necessary to anchor and display DrawingML objects within a word processing document.

[*Example*: Consider a DrawingML picture which must be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<w:r>
  <w:drawing>
    <wp:anchor relativeHeight="10" allowOverlap="true">
      <wp:positionH relativeFrom="margin">
        <wp:align>center</wp:align>
      </wp:positionH>
      <wp:positionV relativeFrom="margin">
        <wp:align>center</wp:align>
      </wp:positionV>
      <wp:extent cx="2441542" cy="1828800"/>
      <wp:wrapSquare wrapText="bothSides"/>
      <a:graphic>
        …
      </a:graphic>
    </wp:anchor>
  </w:drawing>
</w:r>
```

The anchor element (§20.4.2.3) specifies that this object is not positioned in line with text, and its child elements specify that the object is centered on the page horizontally and vertically (§20.4.2.10; §20.4.2.11), and that text can wrap around it in a square (§20.4.2.17). *end example*]

20.4.1 Table of Contents

This subclause is informative.

20.4.2 Elements 3469

20.4.2.1 align (Relative Horizontal Alignment) 3469
20.4.2.2 align (Relative Vertical Alignment) 3470
20.4.2.3 anchor (Anchor for Floating DrawingML Object) 3470
20.4.2.4 cNvGraphicFramePr (Common DrawingML Non-Visual Properties) 3478
20.4.2.5 docPr (Drawing Object Non-Visual Properties) 3478
20.4.2.6 effectExtent (Object Extents Including Effects) 3481
20.4.2.7 extent (Drawing Object Size) 3485
20.4.2.8 inline (Inline DrawingML Object) 3486

20.4.3.7 ST_WrapText (Text Wrapping Location) 3515

End of informative text.

20.4.2 Elements

The following elements define the contents of the WordprocessingML Drawing namespace:

20.4.2.1 align (Relative Horizontal Alignment)

This element specifies how a DrawingML object shall be horizontally aligned relative to the horizontal alignment base defined by the parent element. Once an alignment base is defined, this element shall determine how the DrawingML object shall be aligned relative to that location.

[*Example*: Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="page">
    <wp:align>left</wp:align>
  </wp:positionH>
  …
</wp:anchor>
```

The align element with a value of `left` specifies that for the horizontal positioning defined by the parent element (in this case, positioning relative to the page), the picture must be aligned to the left edge of the page. *end example*]

The possible values for this element are defined by the ST_AlignH simple type (§20.4.3.1).

Parent Elements
positionH (§20.4.2.10)

[*Note*: The W3C XML Schema definition of this element's content model (ST_AlignH) is located in §A.4.4. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

20.4.2.2 align (Relative Vertical Alignment)

This element specifies how a DrawingML object shall be vertically aligned relative to the vertical alignment base defined by the parent element. Once an alignment base is defined, this element shall determine how the DrawingML object shall be aligned relative to that location.

[*Example*: Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor … >
  <wp:positionV relativeFrom="page">
    <wp:align>top</wp:align>
  </wp:positionH>
  …
</wp:anchor>
```

The align element with a value of top specifies that for the vertical positioning defined by the parent element (in this case, positioning relative to the page), the picture must be aligned to the top edge of the page. *end example*]

The possible values for this element are defined by the ST_AlignV simple type (§20.4.3.2).

Parent Elements
positionV (§20.4.2.11)

[*Note*: The W3C XML Schema definition of this element's content model (ST_AlignV) is located in §A.4.4. *end note*]

20.4.2.3 anchor (Anchor for Floating DrawingML Object)

This element specifies that the DrawingML object located at this position in the document is a floating object. Within a WordprocessingML document, drawing objects can exist in two states:

- *Inline* - The drawing object is in line with the text, and affects the line height and layout of its line (like a character glyph of similar size).
- *Floating* - The drawing object is anchored within the text, but can be absolutely positioned in the document relative to the page.

When this element encapsulates the DrawingML object's information, then all child elements shall dictate the positioning of this object as a floating object on the page.

[*Example*: Consider a WordprocessingML document where the anchor for a floating DrawingML object must be the first piece of run content within a paragraph. That paragraph's content would be specified as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

```
<w:p>
  <w:r>
    <w:drawing>
      <wp:anchor … >
        …
      </wp:anchor>
    </w:drawing>
  </w:r>
</w:p>
```

The anchor element, when present as the child element of the drawing element, specifies that this DrawingML object must be positioned as a floating object based on the values of its child elements. *end example*]

Parent Elements
drawing (§17.3.3.9)

Child Elements	Subclause
cNvGraphicFramePr (Common DrawingML Non-Visual Properties)	§20.4.2.4
docPr (Drawing Object Non-Visual Properties)	§20.4.2.5
effectExtent (Object Extents Including Effects)	§20.4.2.6
extent (Drawing Object Size)	§20.4.2.7
graphic (Graphic Object)	§20.1.2.2.16
positionH (Horizontal Positioning)	§20.4.2.10
positionV (Vertical Positioning)	§20.4.2.11
simplePos (Simple Positioning Coordinates)	§20.4.2.13
wrapNone (No Text Wrapping)	§20.4.2.15
wrapSquare (Square Wrapping)	§20.4.2.17
wrapThrough (Through Wrapping)	§20.4.2.18
wrapTight (Tight Wrapping)	§20.4.2.19
wrapTopAndBottom (Top and Bottom Wrapping)	§20.4.2.20

Attributes	Description
allowOverlap (Allow Objects to Overlap)	Specifies whether a DrawingML object which intersects another DrawingML object at display time is allowed to overlap the contents of the other DrawingML object. If a DrawingML object cannot overlap other DrawingML object, it shall be repositioned when displayed to prevent this overlap as needed. [*Example*: Consider a document with two DrawingML objects which are allowed to overlap each other. This would be specified as follows within each object's anchor

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description

	markup:
	
	`<wp:anchor allowOverlap="true" … >`
	`…`
	`</wp:anchor>`
	
	The allowOverlap attribute has a value of `true`, which specifies that this object must be allowed to overlap other objects when it is displayed on the document. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

behindDoc (Display Behind Document Text)	Specifies whether this floating DrawingML object is displayed behind the text of the document when the document is displayed. When a DrawingML object is displayed within a WordprocessingML document, that object can intersect with text in the document. This attribute shall determine whether the text or the object is rendered on top in case of overlapping.
	
	[*Example*: Consider a floating DrawingML object which must be displayed above any text which it intersects within the document's content. This setting would be specified as follows:
	
	`<wp:anchor behindDoc="false" … >`
	`…`
	`</wp:anchor>`
	
	The behindDoc attribute has a value of `false`, which specifies that the DrawingML object is displayed above the text of the document in z-order. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

distB (Distance From Text on Bottom Edge)	Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents. The distance shall be measured in EMUs (English Metric Units). If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored. [*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	<wp:anchor distB="457200" … > … </wp:anchor> The distB attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. *end example*] The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).
distL (Distance From Text on Left Edge)	Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents. The distance shall be measured in EMUs (English Metric Units). If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored. [*Example*: Consider a floating DrawingML object which must have one-quarter of an inch of padding between its left edge and the nearest text. This setting would be specified as follows: <wp:anchor distL="228600" … > … </wp:anchor> The distL attribute specifies that the padding distance must be 228600 EMUs or one-quarter of an inch. *end example*] The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).
distR (Distance From Text on Right Edge)	Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents. The distance shall be measured in EMUs (English Metric Units). If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description

	[*Example*: Consider a floating DrawingML object which must have one-quarter of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distR="228600" … >`
	`…`
	`</wp:anchor>`
	
	The distR attribute specifies that the padding distance must be 228600 EMUs or one-quarter of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

distT (Distance From Text on Top Edge)	Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distT="457200" … >`
	`…`
	`</wp:anchor>`
	
	The distT attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

hidden (Hidden)	Specifies whether this floating DrawingML object is displayed. When a DrawingML object is displayed within a WordprocessingML document, that object can be hidden (i.e. present, but not visible). This attribute shall determine whether the object is rendered or made hidden. [*Note*: An application can have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e. not hidden).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description

	[*Example*: Consider a floating DrawingML object which must be hidden within the document's content. This setting would be specified as follows:
	
	`<wp:anchor hidden="true" … >`
	`…`
	`</wp:anchor>`
	
	The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

layoutInCell (Layout In Table Cell)	Specifies how this DrawingML object behaves when its anchor is located in a table cell; and its specified position would cause it to intersect with a table cell displayed in the document. That behavior shall be as follows:
	• When this attribute has a value of `true`, then the object shall be positioned within the existing table cell, causing the cell to be resized as needed. This means that all positioning shall be relative to the cell and not the line on which the table appears.
	• When this attribute has a value of false, then the object shall be positioned as specified, but the table shall be resized and/or relocated within the document as needed to accommodate the object. This means that all positioning shall be relative to the line on which the table appears and not the cell in which the anchor is present.
	
	[*Example*: Consider a DrawingML picture which must be displayed in the center of the document. If the object is contained within a table and is defined as follows:
	
	`<wp:anchor layoutInCell="true" … >`
	`…`
	`</wp:anchor>`
	
	The layoutInCell attribute has a value of `true`, which specifies that the object can be placed within the cell if needed, for example:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	 If the layoutInCell attribute was now set to `false`, the object must be laid out outside of the cell, causing the table to be repositioned:  *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

locked (Lock Anchor)	Specifies that the anchor location for this object shall not be modified at runtime when an application edits the contents of this document. [*Guidance*: An application might have automatic behaviors which reposition the anchor for a DrawingML object based on user interaction - for example, moving it from one page to another as needed. This element must tell applications not to perform any such behaviors. *end guidance*]
	
	[*Example*: Consider a floating DrawingML object which must have its anchor locked at the current location. This setting would be specified as follows:
	
	`<wp:anchor locked="true" … >`
	`…`
	`</wp:anchor>`
	
	The locked attribute has a value of `true`, which specifies that the DrawingML object's

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	current anchor location must not be changed by applications editing this content. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

relativeHeight (Relative Z-Ordering Position)	Specifies the relative Z-ordering of all DrawingML objects in this document. Each floating DrawingML object shall have a Z-ordering value, which determines which object is displayed when any two objects intersect. Higher values shall indicate higher Z-order; lower values shall indicate lower Z-order.
	
	This attribute shall only indicate the Z-order with respect to other objects in the document which have an identical behindDoc attribute value. All objects with a behindDoc value of `false` shall be displayed above elements with a value of `true`.
	
	[*Example*: Consider two floating DrawingML objects as follows:
	
	`<wp:anchor relativeHeight="5" … >`
	`…`
	`</wp:anchor>`
	
	`…`
	
	`<wp:anchor relativeHeight="8" … >`
	`…`
	`</wp:anchor>`
	
	The relativeHeight attribute of the second object is 8, which specifies that the second DrawingML object must be at a higher Z-order than the first and must be displayed whenever the two overlap. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

simplePos (Page Positioning)	Specifies that this object shall be positioned using the positioning information in the simplePos child element (§20.4.2.13). This positioning, when specified, positions the object on the page by placing its top left point at the x-y coordinates specified by that element.
	
	If this element is omitted, then this object shall not use the simple positioning information in the simplePos element, even when present.
	[*Example*: Consider a floating DrawingML object which must be positioned at the top left corner of the page using simple positioning. This setting would be specified as follows:
	
	`<wp:anchor simplePos="true" … >`
	`<wp:simplePos x="0" y="0" />`
	`…`
	`</wp:anchor>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	The simplePos attribute has a value of `true`, which specifies that the DrawingML object's current position must be dictated by the simplePos element, and hence placed at 0,0. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Anchor) is located in §A.4.4. *end note*]

20.4.2.4 cNvGraphicFramePr (Common DrawingML Non-Visual Properties)

This element specifies common non-visual DrawingML object properties for the parent DrawingML object. These properties are specified as child elements of this element.

[*Example*: Consider a DrawingML object in a WordprocessingML document defined as follows:

```
<wp:inline>
  …
  <wp:cNvGraphicFramePr>
    <a:graphicFrameLocks … />
  </wp:cNvGraphicFramePr>
</wp:inline>
```

The cNvGraphicFramePr element contains a set of common non-visual properties as defined by DrawingML. *end example*]

Parent Elements
anchor (§20.4.2.3); inline (§20.4.2.8)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
graphicFrameLocks (Graphic Frame Locks)	§20.1.2.2.19

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualGraphicFrameProperties) is located in §A.4.1. *end note*]

20.4.2.5 docPr (Drawing Object Non-Visual Properties)

This element specifies non-visual object properties for the parent DrawingML object. These properties are specified as child elements of this element.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

[*Example*: Consider a DrawingML object in a WordprocessingML document defined as follows:

```
<wp:inline>
  …
  <wp:docPr id="1" name="Example Object">
    <a:hlinkClick … />
    <a:hlinkHover … />
  </wp:docPr>
</wp:inline>
```

The docPr element contains a set of common non-visual properties for this object. *end example*]

Parent Elements
anchor (§20.4.2.3); inline (§20.4.2.8)

Child Elements	Subclause
extLst (Extension List)	§20.1.2.2.15
hlinkClick (Click Hyperlink)	§21.1.2.3.5
hlinkHover (Hyperlink for Hover)	§20.1.2.2.23

Attributes	Description
descr (Alternative Text for Object) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object. If this element is omitted, then no alternative text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">` The descr attribute contains alternative text which can be used in place of the actual DrawingML object. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
hidden (Hidden) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [*Note*: An application can have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	[*Example*: Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />` The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
id (Unique Identifier) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant. [*Example*: Consider a DrawingML object defined as follows: `<… id="10" … >` The id attribute has a value of `10`, which is the unique identifier for this DrawingML object. *end example*] The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).
name (Name) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the name of the object. [*Note*: Typically, this is used to store the original file name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: `< … name="foo.jpg" >` The name attribute has a value of `foo.jpg`, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
title (Title) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the title (caption) of the current DrawingML object. If this attribute is omitted, then no title text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	<… title="Process Flow Diagram"> *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

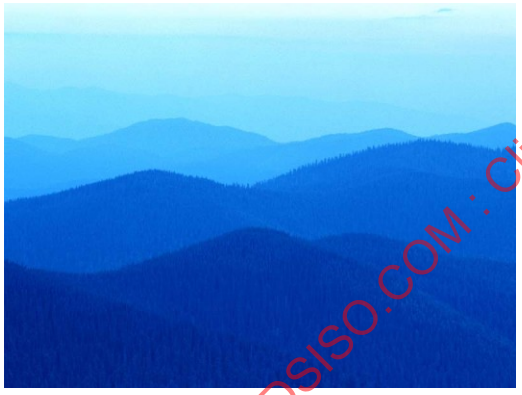
[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualDrawingProps) is located in §A.4.1. *end note*]

20.4.2.6 effectExtent (Object Extents Including Effects)

This element specifies the additional extent which shall be added to each edge of the image (top, bottom, left, right) in order to compensate for any drawing effects applied to the DrawingML object.

The extent element (§20.4.2.7) specifies the size of the actual DrawingML object; however, an object can have effects applied which change its overall size [*Example*: A reflection and/or shadow effect. *end example*]. The additional size for each edge of the shape shall be stored on this element, and used to calculate the appropriate wrapping for wrap types without a wrapping polygon and the appropriate line height for inline objects.

[*Example*: Consider the following DrawingML image:



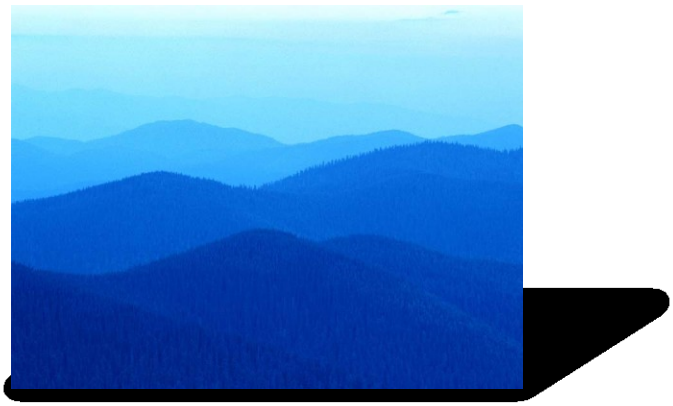
This object has no effects, and hence would have the following effect extents:

```
<wp:effectExtents b="0" t="0" l="0" r="0" />
```

However, if a shadow effect was applied which added effects to the right of the image:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved



Then the additional extent the right side would be specified in the r attribute on this element:

```
<wp:effectExtents b="0" t="0" l="0" r="695325" />
```

The r attribute has a value of 695325, specifying that that 695325 EMUs must be added to the right side of the image. *end example*]

Parent Elements
anchor (§20.4.2.3); inline (§20.4.2.8); wrapSquare (§20.4.2.17); wrapTopAndBottom (§20.4.2.20)

Attributes	Description
b (Additional Extent on Bottom Edge)	Specifies the additional length in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects. [*Example*: Consider the following DrawingML image: This image has an effect on all four sides, resulting in the following markup: `<wp:effectExtent l="504825" t="447675" r="771525" b="809625" />`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The b attribute value of 809625 specifies that 809625 additional EMUs must be added to the bottom of the image to compensate for the effects on the image. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
l (Additional Extent on Left Edge)	Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects. [*Example*: Consider the following DrawingML image: This image has an effect on all four sides, resulting in the following markup: `<wp:effectExtent l="504825" t="447675" r="771525" b="809625" />` The l attribute value of 504825 specifies that 504825 additional EMUs must be added to the bottom of the image to compensate for the effects on the image. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
r (Additional Extent on Right Edge)	Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects. [*Example*: Consider the following DrawingML image:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	 This image has an effect on all four sides, resulting in the following markup: `<wp:effectExtent l="504825" t="447675" r="771525" b="809625" />` The r attribute value of 771525 specifies that 771525 additional EMUs must be added to the bottom of the image to compensate for the effects on the image. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
t (Additional Extent on Top Edge)	Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects. [*Example*: Consider the following DrawingML image: This image has an effect on all four sides, resulting in the following markup:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	<wp:effectExtent l="504825" t="447675" r="771525" b="809625" /> The t attribute value of 447675 specifies that 447675 additional EMUs must be added to the bottom of the image to compensate for the effects on the image. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_EffectExtent) is located in §A.4.4. *end note*]

20.4.2.7 extent (Drawing Object Size)

This element specifies the extents of the parent DrawingML object within the document (i.e. its final height and width).

[*Example*: Consider a DrawingML picture which is present in a WordprocessingML document and has an equal height and width. This object would be specified as follows:

```
<wp:anchor relativeHeight="10" allowOverlap="true">
  …
  <wp:extent cx="1828800" cy="1828800"/>
  …
</wp:anchor>
```

The extent element specifies via its attributes that this object has a height and width of 1828800 EMUs (English Metric Units). *end example*]

Parent Elements
anchor (§20.4.2.3); inline (§20.4.2.8)

Attributes	Description
cx (Extent Length) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: <… cx="1828800" cy="200000"/> The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	type (§20.1.10.41).
cy (Extent Width) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of `200000` EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositiveSize2D) is located in §A.4.1. *end note*]

20.4.2.8 inline (Inline DrawingML Object)

This element specifies that the DrawingML object located at this position in the document is an inline object. Within a WordprocessingML document, drawing objects can exist in two states:

- *Inline* - The drawing object is in line with the text, and affects the line height and layout of its line (like a character glyph of similar size).
- *Floating* - The drawing object is anchored within the text, but can be absolutely positioned in the document relative to the page.

When this element encapsulates the DrawingML object's information, then all child elements shall dictate the positioning of this object in line with text.

[*Example*: Consider a WordprocessingML document where an inline DrawingML object must be the first piece of run content within a paragraph. That paragraph's content would be specified as follows:

```
<w:p>
  <w:r>
    <w:drawing>
      <wp:inline>
        …
      </wp:inline>
    </w:drawing>
  </w:r>
</w:p>
```

 ©ISO/IEC 2011 – All rights reserved

The inline element, when present as the child element of the drawing element, specifies that this DrawingML object must be positioned in line with the text of this paragraph, modifying line heights, etc. as necessary. *end example*]

Parent Elements
drawing (§17.3.3.9)

Child Elements	Subclause
cNvGraphicFramePr (Common DrawingML Non-Visual Properties)	§20.4.2.4
docPr (Drawing Object Non-Visual Properties)	§20.4.2.5
effectExtent (Object Extents Including Effects)	§20.4.2.6
extent (Drawing Object Size)	§20.4.2.7
graphic (Graphic Object)	§20.1.2.2.16

Attributes	Description

distB (Distance From Text on Bottom Edge)	Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distB="457200" … >`
	`…`
	`</wp:anchor>`
	
	The distB attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

distL (Distance From Text on Left	Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description

Edge)	is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which must have one-quarter of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distL="228600" … >`
	`…`
	`</wp:anchor>`
	
	The distL attribute specifies that the padding distance must be 228600 EMUs or one-quarter of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

distR (Distance From Text on Right Edge)	Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which must have one-quarter of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distR="228600" … >`
	`…`
	`</wp:anchor>`
	
	The distR attribute specifies that the padding distance must be 228600 EMUs or one-quarter of an inch. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

distT (Distance From Text on Top Edge)	Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distT="457200" … >`
	`…`
	`</wp:anchor>`
	
	The distT attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Inline) is located in §A.4.4. *end note*]

20.4.2.9 lineTo (Wrapping Polygon Line End Position)

This element specifies a single point on the wrapping polygon for a DrawingML object. This point shall be the termination of the edge of the wrapping polygon started by the previous start or lineTo element in document order, and shall be the origin of the next edge on the same polygon.

The attributes on this element shall dictate the position of the point relative to the upper-left corner of the actual object.

[*Example*: Consider the following basic wrapping polygon for a DrawingML object:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

```
<wp:wrapPolygon>
  <wp:start x="0" y="0" />
  <wp:lineTo x="0" y="100" />
  <wp:lineTo x="100" y="100" />
  <wp:lineTo x="100" y="0" />
  <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>
```

The lineTo element defines each point of the wrapping polygon (in this case, the four points of the wrapping square). *end example*]

Parent Elements
wrapPolygon (§20.4.2.16)

Attributes	Description
x (X-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
y (Y-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The y attribute defines a y-coordinate of `100`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Point2D) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

20.4.2.10 positionH (Horizontal Positioning)

This element specifies the horizontal positioning of a floating DrawingML object within a WordprocessingML document. This positioning is specified in two parts:

- Positioning Base - The relativeFrom attribute on this element specifies the part of the document from which the positioning shall be calculated.
- Positioning - The child element of this element (align or posOffset) specifies how the object is positioned relative to that base.

[*Example*: Consider a DrawingML picture which must be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionH>
  <wp:positionV relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionV>
</wp:anchor>
```

The positionH element specifies that the object is horizontally positioned relative to the margin via the relativeFrom attribute; and that the alignment relative to the margin is centered via the align element. *end example*]

Parent Elements
anchor (§20.4.2.3)

Child Elements	Subclause
align (Relative Horizontal Alignment)	§20.4.2.1
posOffset (Absolute Position Offset)	§20.4.2.12

Attributes	Description

relativeFrom (Horizontal Position Relative Base)	Specifies the base to which the relative horizontal positioning of this object shall be calculated.
	
	[*Example*: Consider a DrawingML picture which must be displayed at the bottom center of the page. This object would be specified as follows:
	
	`<wp:anchor … >`
	`  <wp:positionH relativeFrom="page">`
	`  <wp:align>center</wp:align>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
	</wp:positionH> … </wp:anchor> The relativeFrom attribute specifies that the object is horizontally positioned relative to the page. *end example*] The possible values for this attribute are defined by the ST_RelFromH simple type (§20.4.3.4).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PosH) is located in §A.4.4. *end note*]

20.4.2.11 positionV (Vertical Positioning)

This element specifies the vertical positioning of a floating DrawingML object within a WordprocessingML document. This positioning is specified in two parts:

- Positioning Base - The relativeFrom attribute on this element specifies the part of the document from which the positioning shall be calculated.
- Positioning - The child element of this element (align or posOffset) specifies how the object is positioned relative to that base.

[*Example*: Consider a DrawingML picture which must be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionH>
  <wp:positionV relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionV>
</wp:anchor>
```

The positionV element specifies that the object is vertically positioned relative to the margin via the relativeFrom attribute; and that the alignment relative to the margin is centered via the align element. *end example*]

Parent Elements
anchor (§20.4.2.3)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Child Elements	Subclause
align (Relative Vertical Alignment)	§20.4.2.2
posOffset (Absolute Position Offset)	§20.4.2.12

Attributes	Description
relativeFrom (Vertical Position Relative Base)	Specifies the base to which the relative vertical positioning of this object shall be calculated. [*Example*: Consider a DrawingML picture which must be displayed at the bottom center of the page margins. This object would be specified as follows: `<wp:anchor … > … <wp:positionV relativeFrom="margin"> <wp:align>bottom</wp:align> </wp:positionV> </wp:anchor>` The relativeFrom attribute specifies that the object is horizontally positioned relative to the `margin`. *end example*] The possible values for this attribute are defined by the ST_RelFromV simple type (§20.4.3.5).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PosV) is located in §A.4.4. *end note*]

20.4.2.12 posOffset (Absolute Position Offset)

This element specifies an absolute measurement for the positioning of a floating DrawingML object within a WordprocessingML document. This measurement shall be calculated relative to the top left edge of the positioning base specified by the parent element's relativeFrom attribute.

[*Example*: Consider a DrawingML picture which must be displayed one inch from the top of the page, and one-half of an inch from the left edge of the page. This object would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="page">
    <wp:posOffset>914400</wp:posOffset>
  </wp:positionH>
  <wp:positionV relativeFrom="page">
    <wp:posOffset>457200</wp:posOffset>
  </wp:positionV>
</wp:anchor>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

The posOffset element specifies the absolute positioning of the object relative to the top-left edge of the page in EMUs. *end example*]

The possible values for this element are defined by the ST_PositionOffset simple type (§20.4.3.3).

Parent Elements
positionH (§20.4.2.10); positionV (§20.4.2.11)

[*Note*: The W3C XML Schema definition of this element's content model (ST_PositionOffset) is located in §A.4.4. *end note*]

20.4.2.13 simplePos (Simple Positioning Coordinates)

This element specifies the coordinates at which a DrawingML object shall be positioned relative to the top-left edge of its page, when the simplePos attribute is specified on the anchor element (§20.4.2.3).

[*Example*: Consider a floating DrawingML object which must be positioned at the top left corner of the page using simple positioning. This setting would be specified as follows:

```
<wp:anchor simplePos="true" … >
  <wp:simplePos x="0" y="0" />
  …
</wp:anchor>
```

The simplePos attribute has a value of `true`, which specifies that the DrawingML object's current position must be dictated by the simplePos element, and hence placed at `0,0`. *end example*]

Parent Elements
anchor (§20.4.2.3)

Attributes	Description
x (X-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
y (Y-Axis	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Attributes	Description
Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The y attribute defines a y-coordinate of `100`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Point2D) is located in §A.4.1. *end note*]

20.4.2.14 start (Wrapping Polygon Start)

This element specifies the starting point on the wrapping polygon for a DrawingML object. This point shall be the start and termination of the wrapping polygon for the parent object.

The attributes on this element shall dictate the position of the point relative to the upper-left corner of the actual object.

[*Example*: Consider the following basic wrapping polygon for a DrawingML object:

```
<wp:wrapPolygon>
  <wp:start x="0" y="0" />
  <wp:lineTo x="0" y="100" />
  <wp:lineTo x="100" y="100" />
  <wp:lineTo x="100" y="0" />
  <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>
```

The start element defines the start and end of the wrapping polygon (in this case, the four points of the wrapping square). *end example*]

Parent Elements
wrapPolygon (§20.4.2.16)

Attributes	Description
x (X-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description
Namespace: http://purl.oclc.org/ooxml/drawingml/main	[*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
y (Y-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<… x="0" y="100" />` The y attribute defines a y-coordinate of `100`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Point2D) is located in §A.4.1. *end note*]

20.4.2.15 wrapNone (No Text Wrapping)

This element specifies that the parent DrawingML object shall not cause any text wrapping within the contents of the host WordprocessingML document based on its display location. In effect, this setting shall place the object in one of two locations:

- If the behindDoc attribute on the parent element is `true`, then the object shall be positioned behind the text as it is normally displayed.
- If the behindDoc attribute on the parent element is `false`, then the object shall be positioned in front of the text as it is normally displayed.

[*Example*: Consider a DrawingML picture which must be displayed in front of any text on the page. This object would be specified as follows:

```
<wp:anchor relativeHeight="10" behindDoc="false">
  …
  <wp:wrapNone/>
</wp:anchor>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

The wrapNone element specifies that the DrawingML object must not cause any text wrapping, and since the behindDoc attribute is `false`, the object must be displayed in front of the text of the document. *end example*]

Parent Elements
anchor (§20.4.2.3)

[*Note*: The W3C XML Schema definition of this element's content model (CT_WrapNone) is located in §A.4.4. *end note*]

20.4.2.16 wrapPolygon (Wrapping Polygon)

This element specifies the wrapping polygon which shall be used to determine the extents to which text can wrap around the specified object in the document. This polygon shall be defined by the following:

- The start element defines the coordinates of the origin of the wrap polygon
- Two or more lineTo elements define the point of the wrap polygon

If the set of child elements does not result in a closed polygon (the last lineTo element does not return to the position specified by the start element), then a single additional line shall be inferred as needed to close the wrapping polygon.

[*Example*: Consider the following basic wrapping polygon for a DrawingML object:

```
<wp:wrapPolygon>
  <wp:start x="0" y="0" />
  <wp:lineTo x="0" y="100" />
  <wp:lineTo x="100" y="100" />
  <wp:lineTo x="100" y="0" />
  <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>
```

The wrapPolygon element defines the object's text wrapping polygon (in this case, the four points of a square). *end example*]

Parent Elements
wrapThrough (§20.4.2.18); wrapTight (§20.4.2.19)

Child Elements	Subclause
lineTo (Wrapping Polygon Line End Position)	§20.4.2.9
start (Wrapping Polygon Start)	§20.4.2.14

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

Attributes	Description

edited (Wrapping Points Modified)	Specifies that the wrap points for the wrapping polygon have been edited, and the resulting extents shall be recalculated to compensate when the document is next opened.
	
	[*Example*: Consider the following basic wrapping polygon for a DrawingML object:
	
	`<wp:wrapPolygon edited="true">`
	`  <wp:start x="0" y="0" />`
	`  <wp:lineTo x="0" y="100" />`
	`  <wp:lineTo x="50" y="50" />`
	`  <wp:lineTo x="0" y="0" />`
	`</wp:wrapPolygon>`
	
	The edited attribute specifies that these wrap points have been changed since the document was last rendered. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_WrapPath) is located in §A.4.4. *end note*]

20.4.2.17 wrapSquare (Square Wrapping)

This element specifies that text shall wrap around a virtual rectangle bounding this object. The bounds of the wrapping rectangle shall be dictated by the extents including the addition of the effectExtent element as a child of this element (if present) or the effectExtent present on the parent element.

[*Example*: Consider a DrawingML object using square wrapping and defined as follows:

```
<wp:anchor … >
  …
  <wp:wrapSquare wrapText="bothSides" />
</wp:anchor>
```

The wrapSquare element specifies that text must wrap around both sides of a rectangle around this object which includes its effect extents. *end example*]

Parent Elements
anchor (§20.4.2.3)

Child Elements	Subclause
effectExtent (Object Extents Including Effects)	§20.4.2.6

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description

distB (Distance From Text on Bottom Edge)	Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapSquare distB="457200" … />`
	`</wp:anchor>`
	
	The distB attribute specifies that the padding distance must be `457200` EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

distL (Distance From Text on Left Edge)	Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapSquare distL="457200" … />`
	`</wp:anchor>`
	
	The distL attribute specifies that the padding distance must be `457200` EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

distR (Distance From Text on Right Edge)	Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

Attributes	Description

	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapSquare distR="457200" … />`
	`</wp:anchor>`
	
	The distR attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

distT (Distance From Text (Top))	Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapSquare distT="457200" … />`
	`</wp:anchor>`
	
	The distT attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

wrapText (Text Wrapping Location)	Specifies how text shall wrap around the object's left and right sides.
	
	[*Example*: Consider a floating DrawingML object which must allow text to wrap around its left side only. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapSquare wrapText="left" … />`
	`</wp:anchor>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

©ISO/IEC 2011 – All rights reserved

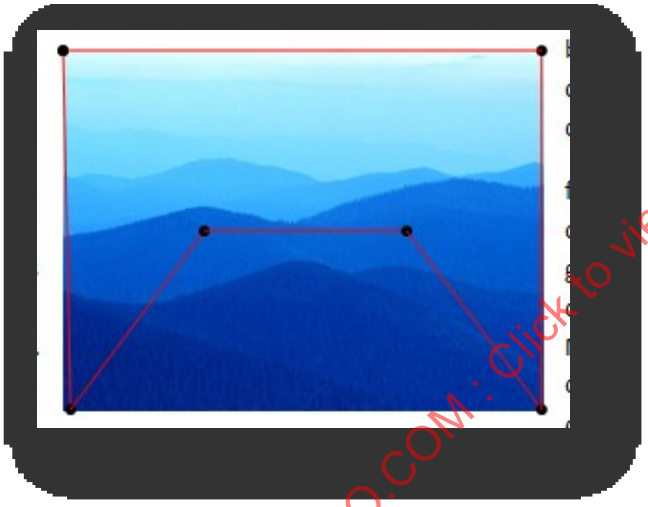
Attributes	Description
	The wrapText attribute value of `left` specifies that text must only wrap around the let side of the object. *end example*] The possible values for this attribute are defined by the ST_WrapText simple type (§20.4.3.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_WrapSquare) is located in §A.4.4. *end note*]

20.4.2.18 wrapThrough (Through Wrapping)

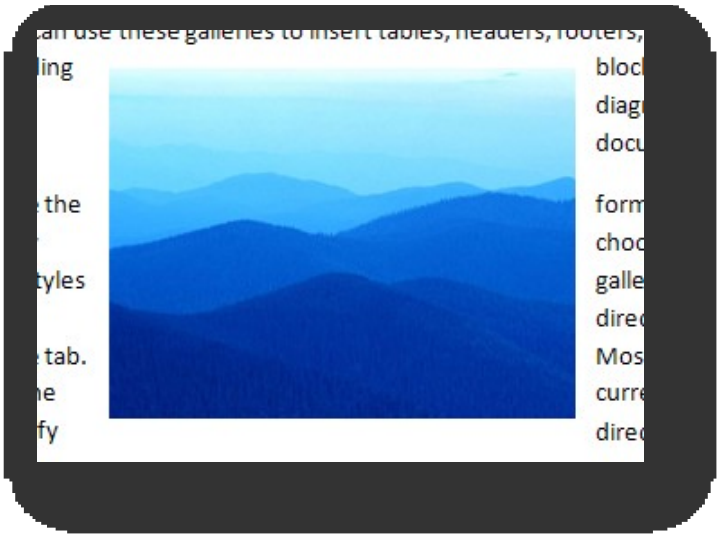
This element specifies that text shall wrap around the wrapping polygon bounding this object as defined by the child wrapPolygon element. When this element specifies a wrapping polygon, it shall allow text to wrap within the object's maximum left and right extents.

[*Example*: Consider an object with the following wrap points:

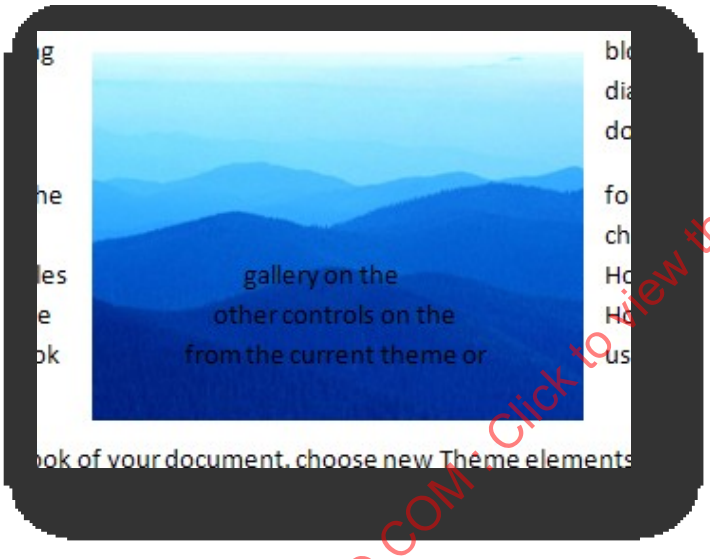


If this object uses tight wrapping, then text cannot be placed within the maximum left and right extents of the wrap polygon at any location:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011



However, with through wrapping:



end example]

[*Example*: Consider a DrawingML object using through wrapping and defined as follows:

```
<wp:anchor … >
  …
  <wp:wrapThrough wrapText="bothSides">
    …
  </wp:wrapThrough>
</wp:anchor>
```

The wrapThrough element specifies that text must wrap through this object as defined by its wrap polygon. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2011

 ©ISO/IEC 2011 – All rights reserved

Parent Elements
anchor (§20.4.2.3)

Child Elements	Subclause
wrapPolygon (Wrapping Polygon)	§20.4.2.16

Attributes	Description

distL (Distance From Text on Left Edge)	Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapThrough distL="457200" … />`
	`</wp:anchor>`
	
	The distL attribute specifies that the padding distance must be `457200` EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

distR (Distance From Text on Right Edge)	Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapThrough distR="457200" … />`
	`</wp:anchor>`
	
	The distR attribute specifies that the padding distance must be `457200` EMUs or one-half of an inch. *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).

wrapText (Text Wrapping Location)	Specifies how text shall wrap around the object's left and right sides.
	
	[*Example*: Consider a floating DrawingML object which must allow text to wrap around its left side only. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapThrough wrapText="left" … />`
	`</wp:anchor>`
	
	The wrapText attribute value of `left` specifies that text must only wrap around the let side of the object. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapText simple type (§20.4.3.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_WrapThrough) is located in §A.4.4. *end note*]

20.4.2.19 wrapTight (Tight Wrapping)

This element specifies that text shall wrap around the wrapping polygon bounding this object as defined by the child wrapPolygon element. When this element specifies a wrapping polygon, it shall not allow text to wrap within the object's maximum left and right extents.

[*Example*: Consider an object with the following wrap points:
