Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT), see the following URL: [Foreword — Supplementary information](#).

The committee responsible for this document is ISO/IEC JTC 1.

1 General

[general]

1.1 Scope

[general.scope]

- ¹ This technical specification describes extensions to the C++ Standard Library (1.2). These extensions are classes and functions that are likely to be used widely within a program and/or on the interface boundaries between libraries written by different organizations.
- ² This technical specification is non-normative. Some of the library components in this technical specification may be considered for standardization in a future version of C++, but they are not currently part of any C++ standard. Some of the components in this technical specification may never be standardized, and others may be standardized in a substantially changed form.
- ³ The goal of this technical specification is to build more widespread existing practice for an expanded C++ standard library. It gives advice on extensions to those vendors who wish to provide them.

1.2 Normative references

[general.references]

- ¹ The following referenced document is indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.
 - ISO/IEC 14882:2014, *Programming Languages — C++*
- ² ISO/IEC 14882:— is herein called the *C++ Standard*. References to clauses within the C++ Standard are written as "C++14 §3.2". The library described in ISO/IEC 14882:— clauses 17–30 is herein called the *C++ Standard Library*.
- ³ Unless otherwise specified, the whole of the C++ Standard's Library introduction (C++14 §17) is included into this Technical Specification by reference.

1.3 Namespaces, headers, and modifications to standard classes

[general.namespaces]

- ¹ Since the extensions described in this technical specification are experimental and not part of the C++ standard library, they should not be declared directly within namespace `std`. Unless otherwise specified, all components described in this technical specification either:
 - modify an existing interface in the C++ Standard Library in-place,
 - are declared in a namespace whose name appends `::experimental::fundamentals_v1` to a namespace defined in the C++ Standard Library, such as `std` or `std::chrono`, or
 - are declared in a subnamespace of a namespace described in the previous bullet, whose name is not the same as an existing subnamespace of namespace `std`.

[Example: This TS does not define `std::experimental::fundamentals_v1::chrono` because the C++ Standard Library defines `std::chrono`. This TS does not define `std::pmr::experimental::fundamentals_v1` because the C++ Standard Library does not define `std::pmr`. — end example]
- ² Each header described in this technical specification shall import the contents of `std::experimental::fundamentals_v1` into `std::experimental` as if by

```
namespace std {
    namespace experimental {
        inline namespace fundamentals_v1 {}
    }
}
```

- ³ This technical specification also describes some experimental modifications to existing interfaces in the C++ Standard Library. These modifications are described by quoting the affected parts of the standard and using underlining to represent added text and ~~strike-through~~ to represent deleted text.
- ⁴ Unless otherwise specified, references to other entities described in this technical specification are assumed to be qualified with `std::experimental::fundamentals_v1::`, and references to entities described in the standard are assumed to be qualified with `std::`.
- ⁵ Extensions that are expected to eventually be added to an existing header `<meow>` are provided inside the `<experimental/meow>` header, which shall include the standard contents of `<meow>` as if by
- ```
#include <meow>
```
- <sup>6</sup> New headers are also provided in the `<experimental/>` directory, but without such an `#include`.

Table 1 — C++ library headers

|                                                |                                                   |                                                 |
|------------------------------------------------|---------------------------------------------------|-------------------------------------------------|
| <code>&lt;experimental/algorithm&gt;</code>    | <code>&lt;experimental/map&gt;</code>             | <code>&lt;experimental/string_view&gt;</code>   |
| <code>&lt;experimental/any&gt;</code>          | <code>&lt;experimental/memory&gt;</code>          | <code>&lt;experimental/system_error&gt;</code>  |
| <code>&lt;experimental/chrono&gt;</code>       | <code>&lt;experimental/memory_resource&gt;</code> | <code>&lt;experimental/tuple&gt;</code>         |
| <code>&lt;experimental/deque&gt;</code>        | <code>&lt;experimental/optional&gt;</code>        | <code>&lt;experimental/type_traits&gt;</code>   |
| <code>&lt;experimental/forward_list&gt;</code> | <code>&lt;experimental/ratio&gt;</code>           | <code>&lt;experimental/unordered_map&gt;</code> |
| <code>&lt;experimental/functional&gt;</code>   | <code>&lt;experimental/regex&gt;</code>           | <code>&lt;experimental/unordered_set&gt;</code> |
| <code>&lt;experimental/future&gt;</code>       | <code>&lt;experimental/set&gt;</code>             | <code>&lt;experimental/utility&gt;</code>       |
| <code>&lt;experimental/list&gt;</code>         | <code>&lt;experimental/string&gt;</code>          | <code>&lt;experimental/vector&gt;</code>        |

## 1.4 Terms and definitions

[general.defns]

- <sup>1</sup> For the purposes of this document, the terms and definitions given in the C++ Standard and the following apply.

### 1.4.1

[general.defns.direct-non-list-init]

#### direct-non-list-initialization

A direct-initialization that is not list-initialization.

## 1.5 Future plans (Informative)

[general.plans]

- <sup>1</sup> This section describes tentative plans for future versions of this technical specification and plans for moving content into future versions of the C++ Standard.
- <sup>2</sup> The C++ committee intends to release a new version of this technical specification approximately every year, containing the library extensions we hope to add to a near-future version of the C++ Standard. Future versions will define their contents in `std::experimental::fundamentals_v2`, `std::experimental::fundamentals_v3`, etc., with the most recent implemented version inlined into `std::experimental`.
- <sup>3</sup> When an extension defined in this or a future version of this technical specification represents enough existing practice, it will be moved into the next version of the C++ Standard by removing the `experimental::fundamentals_vN` segment of its namespace and by removing the `experimental/` prefix from its header's path.

## 1.6 Feature-testing recommendations (Informative)

[general.feature.test]

- <sup>1</sup> For the sake of improved portability between partial implementations of various C++ standards, WG21 (the ISO technical committee for the C++ programming language) recommends that implementers and programmers follow the guidelines in this section concerning feature-test macros. [ Note: WG21's SD-6 makes similar recommendations for the C++ Standard itself. — end note ]

- <sup>2</sup> Implementers who provide a new standard feature should define a macro with the recommended name, in the same circumstances under which the feature is available (for example, taking into account relevant command-line options), to indicate the presence of support for that feature. Implementers should define that macro with the value specified in the most recent version of this technical specification that they have implemented. The recommended macro name is `"__cpp_lib_experimental_"` followed by the string in the "Macro Name Suffix" column.
- <sup>3</sup> Programmers who wish to determine whether a feature is available in an implementation should base that determination on the presence of the header (determined with `__has_include(<header/name>)`) and the state of the macro with the recommended name. (The absence of a tested feature may result in a program with decreased functionality, or the relevant functionality may be provided in a different way. A program that strictly depends on support for a feature can just try to use the feature unconditionally; presumably, on an implementation lacking necessary support, translation will fail.)

Table 2 — Significant features in this technical specification

| Doc. No.     | Title                                                                     | Primary Section | Macro Name Suffix                           | Value  | Header                                            |

## 2 Modifications to the C++ Standard Library

[mods]

- <sup>1</sup> Implementations that conform to this technical specification shall behave as if the modifications contained in this section are made to the C++ Standard.

### 2.1 Uses-allocator construction

[mods.allocator.uses]

- <sup>1</sup> The following changes to the `uses_allocator` trait and to the description of uses-allocator construction allow a `memory_resource` pointer act as an allocator in many circumstances. [ *Note*: Existing programs that use standard allocators would be unaffected by this change. — *end note* ]

#### 20.7.7 `uses_allocator` [allocator.uses]

##### 20.7.7.1 `uses_allocator` trait [allocator.uses.trait]

```
template <class T, class Alloc> struct uses_allocator;
```

*Remarks:* Automatically detects whether `T` has a nested `allocator_type` that is convertible from `Alloc`. Meets the `BinaryTypeTrait` requirements (C++14 §20.10.1). The implementation shall provide a definition that is derived from `true_type` if a type `T::allocator_type` exists and either `is_convertible_v<Alloc, T::allocator_type> != false` or `T::allocator_type` is an alias for `std::experimental::erased_type` (3.1.2), otherwise it shall be derived from `false_type`. A program may specialize this template to derive from `true_type` for a user-defined type `T` that does not have a nested `allocator_type` but nonetheless can be constructed with an allocator where either:

- the first argument of a constructor has type `allocator_arg_t` and the second argument has type `Alloc` or
- the last argument of a constructor has type `Alloc`.

##### 20.7.7.2 uses-allocator construction [allocator.uses.construction]

*Uses-allocator construction* with allocator `Alloc` refers to the construction of an object `obj` of type `T`, using constructor arguments `v1, v2, ..., vN` of types `V1, V2, ..., VN`, respectively, and an allocator `alloc` of type `Alloc`, where `Alloc` either (1) meets the requirements of an allocator (C++14 §17.6.3.5), or (2) is a pointer type convertible to `std::experimental::pmr::memory_resource*` (8.5), according to the following rules:

## 3 General utilities library

[\[utilities\]](#)

### 3.1 Utility components

[\[utility\]](#)

#### 3.1.1 Header <experimental/utility> synopsis

[\[utility.synop\]](#)

```
#include <utility>

namespace std {
namespace experimental {
inline namespace fundamentals_v1 {

 3.1.2, erased-type placeholder
 struct erased_type { };

} // namespace fundamentals_v1
} // namespace experimental
} // namespace std
```

#### 3.1.2 Class `erased_type`

[\[utility.erased.type\]](#)

```
1 struct erased_type { };
```

<sup>2</sup> The `erased_type` struct is an empty struct that serves as a placeholder for a type `T` in situations where the actual type `T` is determined at runtime. For example, the nested type, `allocator_type`, is an alias for `erased_type` in classes that use *type-erased allocators* (see 8.3).

## 3.2 Tuples

[\[tuple\]](#)

#### 3.2.1 Header <experimental/tuple> synopsis

[\[header.tuple.synop\]](#)

```
#include <tuple>

namespace std {
namespace experimental {
inline namespace fundamentals_v1 {

 // See C++14 §20.4.2.5, tuple helper classes
 template <class T> constexpr size_t tuple_size_v
 = tuple_size<T>::value;

 3.2.2, Calling a function with a tuple of arguments
 template <class F, class Tuple>
 constexpr decltype(auto) apply(F&& f, Tuple&& t);

} // namespace fundamentals_v1
} // namespace experimental
} // namespace std
```

### 3.2.2 Calling a function with a tuple of arguments

[tuple.apply]

```
1 template <class F, class Tuple>
 constexpr decltype(auto) apply(F&& f, Tuple&& t);
```

<sup>2</sup> *Effects:* Given the exposition only function

```
template <class F, class Tuple, size_t... I>
constexpr decltype(auto) apply_impl(// exposition only
 F&& f, Tuple&& t, index_sequence<I...>) {
 return INVOKE(std::forward<F>(f), std::get<I>(std::forward<Tuple>(t))...);
}
```

Equivalent to

```
return apply_impl(std::forward<F>(f), std::forward<Tuple>(t),
 make_index_sequence<tuple_size_v<decay_t<Tuple>>>{});
```

### 3.3 Metaprogramming and type traits

[meta]

#### 3.3.1 Header <experimental/type\_traits> synopsis

[meta.type.synop]

```
#include <type_traits>

namespace std {
namespace experimental {
inline namespace fundamentals_v1 {

```

### 3.3.2 Other type transformations

[meta.trans.other]

- <sup>1</sup> This sub-clause contains templates that may be used to transform one type to another following some predefined rule.
- <sup>2</sup> Each of the templates in this subclause shall be a *TransformationTrait* (C++14 §20.10.1).
- <sup>3</sup> Within this section, define the *invocation parameters* of *INVOKE*(*f*, *t*<sub>1</sub>, *t*<sub>2</sub>, ..., *t*<sub>N</sub>) as follows, in which *T*<sub>1</sub> is the possibly cv-qualified type of *t*<sub>1</sub> and *U*<sub>1</sub> denotes *T*<sub>1</sub>& if *t*<sub>1</sub> is an lvalue or *T*<sub>1</sub>&& if *t*<sub>1</sub> is an rvalue:
  - When *f* is a pointer to a member function of a class *T* the *invocation parameters* are *U*<sub>1</sub> followed by the parameters of *f* matched by *t*<sub>2</sub>, ..., *t*<sub>N</sub>.
  - When *N* == 1 and *f* is a pointer to member data of a class *T* the *invocation parameter* is *U*<sub>1</sub>.
  - If *f* is a class object, the *invocation parameters* are the parameters matching *t*<sub>1</sub>, ..., *t*<sub>N</sub> of the best viable function (C++14 §13.3.3) for the arguments *t*<sub>1</sub>, ..., *t*<sub>N</sub> among the function call operators of *f*.
  - In all other cases, the *invocation parameters* are the parameters of *f* matching *t*<sub>1</sub>, ... *t*<sub>N</sub>.
- <sup>4</sup> In all of the above cases, if an argument *t*<sub>I</sub> matches the ellipsis in the function's *parameter-declaration-clause*, the corresponding *invocation parameter* is defined to be the result of applying the default argument promotions (C++14 §5.2.2) to *t*<sub>I</sub>.

[ Example: Assume *s* is defined as

```

struct S {
 int f(double const &) const;
 void operator()(int, int);
 void operator()(char const *, int i = 2, int j = 3);
 void operator()(...);
};

```

- The invocation parameters of *INVOKE*(&*S*::*f*, *S*(), 3.5) are (*S* &&, double const &).
- The invocation parameters of *INVOKE*(*S*(), 1, 2) are (int, int).

- The invocation parameters of `INVOKE(S(), "abc", 5)` are `(const char *, int)`. The defaulted parameter `j` does not correspond to an argument.
  - The invocation parameters of `INVOKE(S(), locale(), 5)` are `(locale, int)`. Arguments corresponding to ellipsis maintain their types.
- end example ]

Table 3 — Other type transformations

| Template                                                                            | Condition                                                                                                                          | Comments  |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|-----------|
| template <class Fn, class... ArgTypes> struct raw_invocation_type<Fn(ArgTypes...)>; | Fn and all types in the parameter pack ArgTypes shall be complete types, (possibly cv-qualified) void, or arrays of unknown bound. | see below |
| template <class Fn, class... ArgTypes> struct invocation_type<Fn(ArgTypes...)>;     | Fn and all types in the parameter pack ArgTypes shall be complete types, (possibly cv-qualified) void, or arrays of unknown bound. | see below |

- <sup>5</sup> Access checking is performed as if in a context unrelated to `Fn` and `ArgTypes`. Only the validity of the immediate context of the expression is considered. [ *Note*: The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the "immediate context" and can result in the program being ill-formed. — end note ]
- <sup>6</sup> The nested typedef `raw_invocation_type<Fn(ArgTypes...)>::type` shall be defined as follows. If the expression `INVOKE(declval<Fn>(), declval<ArgTypes>()...)` is ill-formed when treated as an unevaluated operand (C++14 §5), there shall be no member type. Otherwise:
- Let `R` denote `result_of_t<Fn(ArgTypes...)>`.
  - Let the types `Ti` be the invocation parameters of `INVOKE(declval<Fn>(), declval<ArgTypes>()...)`.
  - Then the member typedef `type` shall name the function type `R(T1, T2, ...)`.
- <sup>7</sup> The nested typedef `invocation_type<Fn(ArgTypes...)>::type` shall be defined as follows. If `raw_invocation_type<Fn(ArgTypes...)>::type` does not exist, there shall be no member typedef `type`. Otherwise:
- Let `A1, A2, ...` denote `ArgTypes...`
  - Let `R(T1, T2, ...)` denote `raw_invocation_type_t<Fn(ArgTypes...)>`
  - Then the member typedef `type` shall name the function type `R(U1, U2, ...)` where `Ui` is `decay_t<Ai>` if `declval<Ai>()` is an rvalue otherwise `Ti`.

### 3.4 Compile-time rational arithmetic

[ratio]

#### 3.4.1 Header <experimental/ratio> synopsis

[header.ratio.synop]

```
#include <ratio>

```

## 4.2 Class template function

[\[func.wrap.func\]](#)

- <sup>1</sup> The specification of all declarations within this sub-clause 4.2 and its sub-clauses are the same as the corresponding declarations, as specified in C++14 §20.9.11.2, unless explicitly specified otherwise. [ *Note*: `std::experimental::function` uses `std::bad_function_call`, there is no additional type `std::experimental::bad_function_call` — *end note* ].

```

namespace std {
 namespace experimental {
 inline namespace fundamentals_v1 {

 template<class> class function; // undefined

 template<class R, class... ArgTypes>
 class function<R(ArgTypes...)> {
 public:
 typedef R result_type;
 typedef T1 argument_type;
 typedef T1 first_argument_type;
 typedef T2 second_argument_type;

 typedef erased_type allocator_type;

 function() noexcept;
 function(nullptr_t) noexcept;
 function(const function&);

```

```

function(function&&);
template<class F> function(F);
template<class A> function(allocator_arg_t, const A&) noexcept;
template<class A> function(allocator_arg_t, const A&,
 nullptr_t) noexcept;
template<class A> function(allocator_arg_t, const A&,
 const function&);
template<class A> function(allocator_arg_t, const A&,
 function&&);
template<class F, class A> function(allocator_arg_t, const A&, F);

function& operator=(const function&);
function& operator=(function&&);
function& operator=(nullptr_t) noexcept;
template<class F> function& operator=(F&&);
template<class F> function& operator=(reference_wrapper<F>);

~function();

void swap(function&);
template<class F, class A> void assign(F&&, const A&);

explicit operator bool() const noexcept;

R operator() (ArgTypes...) const;

const type_info& target_type() const noexcept;
template<class T> T* target() noexcept;
template<class T> const T* target() const noexcept;

pmr::memory_resource* get_memory_resource();
};

template <class R, class... ArgTypes>
bool operator==(const function<R(ArgTypes...)>&, nullptr_t) noexcept;
template <class R, class... ArgTypes>
bool operator==(nullptr_t, const function<R(ArgTypes...)>&) noexcept;

template <class R, class... ArgTypes>
bool operator!=(const function<R(ArgTypes...)>&, nullptr_t) noexcept;
template <class R, class... ArgTypes>
bool operator!=(nullptr_t, const function<R(ArgTypes...)>&) noexcept;

template <class R, class... ArgTypes>
void swap(function<R(ArgTypes...)>&, function<R(ArgTypes...)>&);

} // namespace fundamentals_v1
} // namespace experimental

template <class R, class... ArgTypes, class Alloc>
struct uses_allocator<experimental::function<R(ArgTypes...)>, Alloc>
 : true_type { };

```

```
} // namespace std
```

#### 4.2.1 function construct/copy/destroy

[\[func.wrap.func.con\]](#)

- 1 When a `function` constructor that takes a first argument of type `allocator_arg_t` is invoked, the second argument is treated as a *type-erased allocator* (8.3). If the constructor moves or makes a copy of a function object (C++14 §20.9), including an instance of the `experimental::function` class template, then that move or copy is performed by *using-allocator construction* with allocator `get_memory_resource()`.
- 2 In the following descriptions, let `ALLOCATOR_OF(f)` be the allocator specified in the construction of `function f`, or `allocator<char>()` if no allocator was specified.
- 3 `function& operator=(const function& f);`
  - 4 **Effects:** `function(allocator_arg, ALLOCATOR_OF(*this), f).swap(*this);`
  - 5 **Returns:** `*this`
- 6 `function& operator=(function&& f);`
  - 7 **Effects:** `function(allocator_arg, ALLOCATOR_OF(*this), std::move(f)).swap(*this);`
  - 8 **Returns:** `*this`
- 9 `function& operator=(nullptr_t) noexcept;`
  - 10 **Effects:** If `*this != nullptr`, destroys the target of `this`.
  - 11 **Postconditions:** `!(*this)`. The memory resource returned by `get_memory_resource()` after the assignment is equivalent to the memory resource before the assignment. [ *Note:* the address returned by `get_memory_resource()` might change — *end note* ]
  - 12 **Returns:** `*this`
- 13 `template<class F> function& operator=(F&& f);`
  - 14 **Effects:** `function(allocator_arg, ALLOCATOR_OF(*this), std::forward<F>(f)).swap(*this);`
  - 15 **Returns:** `*this`
- 16 `template<class F> function& operator=(reference_wrapper<F> f);`
  - 17 **Effects:** `function(allocator_arg, ALLOCATOR_OF(*this), f).swap(*this);`
  - 18 **Returns:** `*this`

#### 4.2.2 function modifiers

[\[func.wrap.func.mod\]](#)

- 1 `void swap(function& other);`
  - 2 **Requires:** `this->get_memory_resource() == other->get_memory_resource()`.
  - 3 **Effects:** Interchanges the targets of `*this` and `other`.
  - 4 **Remarks:** The allocators of `*this` and `other` are not interchanged.

### 4.3 Searchers

[\[func.searchers\]](#)

- <sup>1</sup> This sub-clause provides function object types (C++14 §20.9) for operations that search for a sequence `[pat_first, pat_last)` in another sequence `[first, last)` that is provided to the object's function call operator. The first sequence (the pattern to be searched for) is provided to the object's constructor, and the second (the sequence to be searched) is provided to the function call operator.
- <sup>2</sup> Each specialization of a class template specified in this sub-clause 4.3 shall meet the `CopyConstructible` and `CopyAssignable` requirements. Template parameters named `ForwardIterator`, `ForwardIterator1`, `ForwardIterator2`, `RandomAccessIterator`, `RandomAccessIterator1`, `RandomAccessIterator2`, and `BinaryPredicate` of templates specified in this sub-clause 4.3 shall meet the same requirements and semantics as specified in C++14 §25.1. Template parameters named `Hash` shall meet the requirements as specified in C++14 §17.6.3.4.
- <sup>3</sup> The Boyer-Moore searcher implements the Boyer-Moore search algorithm. The Boyer-Moore-Horspool searcher implements the Boyer-Moore-Horspool search algorithm. In general, the Boyer-Moore searcher will use more memory and give better run-time performance than Boyer-Moore-Horspool.

#### 4.3.1 Class template `default_searcher`

[\[func.searchers.default\]](#)

```
template<class ForwardIterator1, class BinaryPredicate = equal_to>
class default_searcher {
public:
 default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
 BinaryPredicate pred = BinaryPredicate());

 template<class ForwardIterator2>
 ForwardIterator2
 operator()(ForwardIterator2 first, ForwardIterator2 last) const;

private:
 ForwardIterator1 pat_first_; // exposition only
 ForwardIterator1 pat_last_; // exposition only
 BinaryPredicate pred_; // exposition only
};
```

- <sup>1</sup> `default_searcher(ForwardIterator pat_first, ForwardIterator pat_last, BinaryPredicate pred = BinaryPredicate());`

<sup>2</sup> **Effects:** Constructs a `default_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, and `pred_` with `pred`.

<sup>3</sup> **Throws:** Any exception thrown by the copy constructor of `BinaryPredicate` or `ForwardIterator1`.

- <sup>4</sup> `template<class ForwardIterator2>`  
`ForwardIterator2 operator()(ForwardIterator2 first, ForwardIterator2 last) const;`

<sup>5</sup> **Effects:** Equivalent to `return std::search(first, last, pat_first_, pat_last_, pred_);`

## 4.3.1.1 default\_searcher creation functions

[\[func.searchers.default.creation\]](#)

- ```
1 template<class ForwardIterator, class BinaryPredicate = equal_to<>>
  default_searcher<ForwardIterator, BinaryPredicate>
  make_default_searcher(ForwardIterator pat_first, ForwardIterator pat_last,
    BinaryPredicate pred = BinaryPredicate());
```
- ² *Effects:* Equivalent to return `default_searcher<ForwardIterator, BinaryPredicate>(pat_first, pat_last, pred);`

4.3.2 Class template boyer_moore_searcher

[\[func.searchers.boyer_moore\]](#)

- ```
template<class RandomAccessIterator1,
 class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
 class BinaryPredicate = equal_to<>>
class boyer_moore_searcher {
public:
 boyer_moore_searcher(RandomAccessIterator1 pat_first, RandomAccessIterator1 pat_last,
 Hash hf = Hash(), BinaryPredicate pred = BinaryPredicate());

 template<class RandomAccessIterator2>
 RandomAccessIterator2
 operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

private:
 RandomAccessIterator1 pat_first_; // exposition only
 RandomAccessIterator1 pat_last_; // exposition only
 Hash hash_; // exposition only
 BinaryPredicate pred_; // exposition only
};
```
- <sup>1</sup> `boyer_moore_searcher(RandomAccessIterator1 pat_first, RandomAccessIterator1 pat_last, Hash hf = Hash(), BinaryPredicate pred = BinaryPredicate());`
- <sup>2</sup> *Requires:* The value type of `RandomAccessIterator1` shall meet the `DefaultConstructible`, `CopyConstructible`, and `CopyAssignable` requirements.
- <sup>3</sup> *Requires:* For any two values A and B of the type `iterator_traits<RandomAccessIterator1>::value_type`, if `pred(A,B)==true`, then `hf(A)==hf(B)` shall be true.
- <sup>4</sup> *Effects:* Constructs a `boyer_moore_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.
- <sup>5</sup> *Throws:* Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1`, or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

- 6 `template<class RandomAccessIterator2>`  
`RandomAccessIterator2 operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;`
- 7 **Requires:** `RandomAccessIterator1` and `RandomAccessIterator2` shall have the same value type.
- 8 **Effects:** Finds a subsequence of equal values in a sequence.
- 9 **Returns:** The first iterator `i` in the range `[first, last - (pat_last_ - pat_first_))` such that for every non-negative integer `n` less than `pat_last_ - pat_first_` the following condition holds:  
`pred(*(i + n), *(pat_first_ + n)) != false`. Returns first if `[pat_first_, pat_last_)` is empty, otherwise returns last if no such iterator is found.
- 10 **Complexity:** At most `(last - first) * (pat_last_ - pat_first_)` applications of the predicate.

#### 4.3.2.1 `boyer_moore_searcher` creation functions

[\[func.searchers.boyer\\_moore.creation\]](#)

- 1 `template<class RandomAccessIterator,`  
`class Hash = hash<typename iterator_traits<RandomAccessIterator>::value_type>,`  
`class BinaryPredicate = equal_to<>>`  
`boyer_moore_searcher<RandomAccessIterator, Hash, BinaryPredicate>`  
`make_boyer_moore_searcher(RandomAccessIterator pat_first, RandomAccessIterator pat_last,`  
`Hash hf = Hash(), BinaryPredicate pred = BinaryPredicate());`
- 2 **Effects:** Equivalent to `return boyer_moore_searcher<RandomAccessIterator, Hash, BinaryPredicate>(`  
`pat_first, pat_last, hf, pred);`

#### 4.3.3 Class template `boyer_moore_horspool_searcher`

[\[func.searchers.boyer\\_moore\\_horspool\]](#)

```
template<class RandomAccessIterator1,
 class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
 class BinaryPredicate = equal_to<>>
class boyer_moore_horspool_searcher {
public:
 boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first, RandomAccessIterator1 pat_last,
 Hash hf = Hash(), BinaryPredicate pred = BinaryPredicate());

 template<class RandomAccessIterator2>
 RandomAccessIterator2
 operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

private:
 RandomAccessIterator1 pat_first_; // exposition only
 RandomAccessIterator1 pat_last_; // exposition only
 Hash hash_; // exposition only
 BinaryPredicate pred_; // exposition only
};
```

- 1 `boyer_moore_horspool_searcher(`  
`RandomAccessIterator1 pat_first, RandomAccessIterator1 pat_last,`  
`Hash hf = Hash(), BinaryPredicate pred = BinaryPredicate());`
- 2 **Requires:** The value type of `RandomAccessIterator1` shall meet the `DefaultConstructible`, `CopyConstructible`, and `CopyAssignable` requirements.
- 3 **Requires:** For any two values A and B of the type `iterator_traits<RandomAccessIterator1>::value_type`, if `pred(A,B)==true`, then `hf(A)==hf(B)` shall be true.
- 4 **Effects:** Constructs a `boyer_moore_horspool_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.
- 5 **Throws:** Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1` or the copy constructor or operator() of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated..
- 6 `template<class RandomAccessIterator2>`  
`RandomAccessIterator2 operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;`
- 7 **Requires:** `RandomAccessIterator1` and `RandomAccessIterator2` shall have the same value type.
- 8 **Effects:** Finds a subsequence of equal values in a sequence.
- 9 **Returns:** The first iterator `i` in the range `[first, last - (pat_last_ - pat_first_))` such that for every non-negative integer `n` less than `pat_last_ - pat_first_` the following condition holds:  
`pred(*(i + n), *(pat_first_ + n)) != false`. Returns first if `[pat_first_, pat_last_)` is empty, otherwise returns `last` if no such iterator is found.
- 10 **Complexity:** At most `(last - first) * (pat_last_ - pat_first_)` applications of the predicate.

#### 4.3.3.1 boyer\_moore\_horspool\_searcher creation functions

[\[func.searchers.boyer\\_moore\\_horspool.creation\]](#)

- 1 `template<class RandomAccessIterator`  
`class Hash = hash<typename iterator_traits<RandomAccessIterator>::value_type>,`  
`class BinaryPredicate = equal_to<>>`  
`boyer_moore_searcher_horspool<RandomAccessIterator, Hash, BinaryPredicate>`  
`make_boyer_moore_horspool_searcher(`  
`RandomAccessIterator pat_first, RandomAccessIterator pat_last,`  
`Hash hf = Hash(), BinaryPredicate pred = BinaryPredicate());`
- 2 **Effects:** Equivalent to  
`return boyer_moore_horspool_searcher<RandomAccessIterator, Hash, BinaryPredicate>(`  
`pat_first, pat_last, hf, pred);`

## 5 Optional objects

[optional]

### 5.1 In general

[optional.general]

- <sup>1</sup> This subclause describes class template `optional` that represents *optional objects*. An *optional object for object types* is an object that contains the storage for another object and manages the lifetime of this contained object, if any. The contained object may be initialized after the optional object has been initialized, and may be destroyed before the optional object has been destroyed. The initialization state of the contained object is tracked by the optional object.

### 5.2 Header <experimental/optional> synopsis

[optional.synop]

```

namespace std {
 namespace experimental {
 inline namespace fundamentals_v1 {

 // 5.3, optional for object types
 template <class T> class optional;

 // 5.4, In-place construction
 struct in_place_t{};
 constexpr in_place_t in_place{};

 // 5.5, No-value state indicator
 struct nullopt_t{see below};
 constexpr nullopt_t nullopt(unspecified);

 // 5.6, Class bad_optional_access
 class bad_optional_access;

 // 5.7, Relational operators
 template <class T>
 constexpr bool operator==(const optional<T>&, const optional<T>&);
 template <class T>
 constexpr bool operator!=(const optional<T>&, const optional<T>&);
 template <class T>
 constexpr bool operator<(const optional<T>&, const optional<T>&);
 template <class T>
 constexpr bool operator>(const optional<T>&, const optional<T>&);
 template <class T>
 constexpr bool operator<=(const optional<T>&, const optional<T>&);
 template <class T>
 constexpr bool operator>=(const optional<T>&, const optional<T>&);

 // 5.8, Comparison with nullopt
 template <class T> constexpr bool operator==(const optional<T>&, nullopt_t) noexcept;
 template <class T> constexpr bool operator==(nullopt_t, const optional<T>&) noexcept;
 template <class T> constexpr bool operator!=(const optional<T>&, nullopt_t) noexcept;
 template <class T> constexpr bool operator!=(nullopt_t, const optional<T>&) noexcept;
 template <class T> constexpr bool operator<(const optional<T>&, nullopt_t) noexcept;
 }
 }
}

```

```

template <class T> constexpr bool operator<(nullopt_t, const optional<T>&) noexcept;
template <class T> constexpr bool operator<=(const optional<T>&, nullopt_t) noexcept;
template <class T> constexpr bool operator<=(nullopt_t, const optional<T>&) noexcept;
template <class T> constexpr bool operator>(const optional<T>&, nullopt_t) noexcept;
template <class T> constexpr bool operator>(nullopt_t, const optional<T>&) noexcept;
template <class T> constexpr bool operator>=(const optional<T>&, nullopt_t) noexcept;
template <class T> constexpr bool operator>=(nullopt_t, const optional<T>&) noexcept;

```

// 5.9, Comparison with T

```

template <class T> constexpr bool operator==(const optional<T>&, const T&);
template <class T> constexpr bool operator==(const T&, const optional<T>&);
template <class T> constexpr bool operator!=(const optional<T>&, const T&);
template <class T> constexpr bool operator!=(const T&, const optional<T>&);
template <class T> constexpr bool operator<(const optional<T>&, const T&);
template <class T> constexpr bool operator<(const T&, const optional<T>&);
template <class T> constexpr bool operator<=(const optional<T>&, const T&);
template <class T> constexpr bool operator<=(const T&, const optional<T>&);
template <class T> constexpr bool operator>(const optional<T>&, const T&);
template <class T> constexpr bool operator>(const T&, const optional<T>&);
template <class T> constexpr bool operator>=(const optional<T>&, const T&);
template <class T> constexpr bool operator>=(const T&, const optional<T>&);

```

// 5.10, Specialized algorithms

```

template <class T> void swap(optional<T>&, optional<T>&) noexcept (see below);
template <class T> constexpr optional<see below> make_optional(T&&);

```

} // namespace fundamentals\_v1

} // namespace experimental

// 5.11, Hash support

```

template <class T> struct hash;
template <class T> struct hash<experimental::optional<T>>;

```

} // namespace std

- <sup>1</sup> A program that necessitates the instantiation of template `optional` for a reference type, or for possibly cv-qualified types `in_place_t` or `nullopt_t` is ill-formed.

### 5.3 optional for object types

[optional.object]

```

template <class T>
class optional
{
public:
 typedef T value_type;

```

// 5.3.1, Constructors

```

constexpr optional() noexcept;
constexpr optional(nullopt_t) noexcept;
optional(const optional&);
optional(optional&&) noexcept (see below);
constexpr optional(const T&);

```

```

constexpr optional(T&&);
template <class... Args> constexpr explicit optional(in_place_t, Args&&...);
template <class U, class... Args>
 constexpr explicit optional(in_place_t, initializer_list<U>, Args&&...);

// 5.3.2, Destructor
~optional();

// 5.3.3, Assignment
optional& operator=(nullopt_t) noexcept;
optional& operator=(const optional&);
optional& operator=(optional&&) noexcept (see below);
template <class U> optional& operator=(U&&);
template <class... Args> void emplace(Args&&...);
template <class U, class... Args>
 void emplace(initializer_list<U>, Args&&...);

// 5.3.4, Swap
void swap(optional&) noexcept (see below);

// 5.3.5, Observers
constexpr T const* operator ->() const;
constexpr T* operator ->();
constexpr T const& operator *() const &;
constexpr T& operator *() &;
constexpr T&& operator *() &&;
constexpr const T&& operator *() const &&;
constexpr explicit operator bool() const noexcept;
constexpr T const& value() const &;
constexpr T& value() &;
constexpr T&& value() &&;
constexpr const T&& value() const &&;
template <class U> constexpr T value_or(U&&) const &;
template <class U> constexpr T value_or(U&&) &&;

private:
 T* val; // exposition only
};

```

- <sup>1</sup> Any instance of `optional<T>` at any given time either contains a value or does not contain a value. When an instance of `optional<T>` *contains a value*, it means that an object of type `T`, referred to as the optional object's *contained value*, is allocated within the storage of the optional object. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate its contained value. The contained value shall be allocated in a region of the `optional<T>` storage suitably aligned for the type `T`. When an object of type `optional<T>` is contextually converted to `bool`, the conversion returns `true` if the object contains a value; otherwise the conversion returns `false`.
- <sup>2</sup> Member `val` is provided for exposition only. When an `optional<T>` object contains a value, `val` points to the contained value.
- <sup>3</sup> `T` shall be an object type and shall satisfy the requirements of `Destructible` (Table 24).

## 5.3.1 Constructors

[optional.object.ctor]

```
1 constexpr optional() noexcept;
 constexpr optional(nullopt_t) noexcept;
```

<sup>2</sup> *Postconditions:* `*this` does not contain a value.

<sup>3</sup> *Remarks:* No contained value is initialized. For every object type `T` these constructors shall be `constexpr` constructors (C++14 §7.1.5).

```
4 optional(const optional<T>& rhs);
```

<sup>5</sup> *Requires:* `is_copy_constructible_v<T>` is true.

<sup>6</sup> *Effects:* If `rhs` contains a value, initializes the contained value as if direct-non-list-initializing an object of type `T` with the expression `*rhs`.

<sup>7</sup> *Postconditions:* `bool(rhs) == bool(*this)`.

<sup>8</sup> *Throws:* Any exception thrown by the selected constructor of `T`.

```
9 optional(optional<T>&& rhs) noexcept (see below);
```

<sup>10</sup> *Requires:* `is_move_constructible_v<T>` is true.

<sup>11</sup> *Effects:* If `rhs` contains a value, initializes the contained value as if direct-non-list-initializing an object of type `T` with the expression `std::move(*rhs)`. `bool(rhs)` is unchanged.

<sup>12</sup> *Postconditions:* `bool(rhs) == bool(*this)`.

<sup>13</sup> *Throws:* Any exception thrown by the selected constructor of `T`.

<sup>14</sup> *Remarks:* The expression inside `noexcept` is equivalent to:

```
is_nothrow_move_constructible_v<T>
```

```
15 constexpr optional(const T& v);
```

<sup>16</sup> *Requires:* `is_copy_constructible_v<T>` is true.

<sup>17</sup> *Effects:* Initializes the contained value as if direct-non-list-initializing an object of type `T` with the expression `v`.

<sup>18</sup> *Postconditions:* `*this` contains a value.

<sup>19</sup> *Throws:* Any exception thrown by the selected constructor of `T`.

<sup>20</sup> *Remarks:* If `T`'s selected constructor is a `constexpr` constructor, this constructor shall be a `constexpr` constructor.

21 `constexpr optional(T&& V);`

22 *Requires:* `is_move_constructible_v<T>` is true.

23 *Effects:* Initializes the contained value as if direct-non-list-initializing an object of type `T` with the expression `std::move(V)`.

24 *Postconditions:* `*this` contains a value.

25 *Throws:* Any exception thrown by the selected constructor of `T`.

26 *Remarks:* If `T`'s selected constructor is a `constexpr` constructor, this constructor shall be a `constexpr` constructor.

27 `template <class... Args> constexpr explicit optional(in_place_t, Args&&... args);`

28 *Requires:* `is_constructible_v<T, Args&&...>` is true.

29 *Effects:* Initializes the contained value as if direct-non-list-initializing an object of type `T` with the arguments `std::forward<Args>(args) ...`.

30 *Postconditions:* `*this` contains a value.

31 *Throws:* Any exception thrown by the selected constructor of `T`.

32 *Remarks:* If `T`'s constructor selected for the initialization is a `constexpr` constructor, this constructor shall be a `constexpr` constructor.

33 `template <class U, class... Args>`  
`constexpr explicit optional(in_place_t, initializer_list<U> il, Args&&... args);`

34 *Requires:* `is_constructible_v<T, initializer_list<U>&, Args&&...>` is true.

35 *Effects:* Initializes the contained value as if direct-non-list-initializing an object of type `T` with the arguments `il, std::forward<Args>(args) ...`.

36 *Postconditions:* `*this` contains a value.

37 *Throws:* Any exception thrown by the selected constructor of `T`.

38 *Remarks:* The function shall not participate in overload resolution unless `is_constructible_v<T, initializer_list<U>&, Args&&...>` is true. If `T`'s constructor selected for the initialization is a `constexpr` constructor, this constructor shall be a `constexpr` constructor.

### 5.3.2 Destructor

[optional.object.dtor]

1 `~optional();`

2 *Effects:* If `is_trivially_destructible_v<T>` != true and `*this` contains a value, calls `val->T::~~T()`.

3 *Remarks:* If `is_trivially_destructible_v<T>` == true then this destructor shall be a trivial destructor.

## 5.3.3 Assignment

[optional.object.assign]

1 `optional<T>& operator=(nullopt_t) noexcept;`

2 *Effects:* If `*this` contains a value, calls `val->T::~~T()` to destroy the contained value; otherwise no effect.

3 *Returns:* `*this`.

4 *Postconditions:* `*this` does not contain a value.

5 `optional<T>& operator=(const optional<T>& rhs);`

6 *Requires:* `is_copy_constructible_v<T>` is true and `is_copy_assignable_v<T>` is true.

7 *Effects:*

Table 4 — `optional::operator=(const optional&)` effects

|                                     | <b>*this contains a value</b>                                         | <b>*this does not contain a value</b>                                                                                      |
|-------------------------------------|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>rhs contains a value</b>         | assigns <code>*rhs</code> to the contained value                      | initializes the contained value as if direct-non-list-initializing an object of type <code>T</code> with <code>*rhs</code> |
| <b>rhs does not contain a value</b> | destroys the contained value by calling <code>val-&gt;T::~~T()</code> | no effect                                                                                                                  |

8 *Returns:* `*this`.

9 *Postconditions:* `bool(rhs) == bool(*this)`.

10 *Remarks:* If any exception is thrown, the result of the expression `bool(*this)` remains unchanged. If an exception is thrown during the call to `T`'s copy constructor, no effect. If an exception is thrown during the call to `T`'s copy assignment, the state of its contained value is as defined by the exception safety guarantee of `T`'s copy assignment.

11 `optional<T>& operator=(optional<T>&& rhs) noexcept (see below);`

12 *Requires:* `is_move_constructible_v<T>` is true and `is_move_assignable_v<T>` is true.

13 *Effects:* The result of the expression `bool(rhs)` remains unchanged.

Table 5 — `optional::operator=(optional&&)` effects

|                                     | <b>*this contains a value</b>                                         | <b>*this does not contain a value</b>                                                                                                 |
|-------------------------------------|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>rhs contains a value</b>         | assigns <code>std::move(*rhs)</code> to the contained value           | initializes the contained value as if direct-non-list-initializing an object of type <code>T</code> with <code>std::move(*rhs)</code> |
| <b>rhs does not contain a value</b> | destroys the contained value by calling <code>val-&gt;T::~~T()</code> | no effect                                                                                                                             |

14 *Returns:* `*this`.

15 *Postconditions:* `bool(rhs) == bool(*this)`.

16 *Remarks:* The expression inside `noexcept` is equivalent to:

`is_nothrow_move_assignable_v<T> && is_nothrow_move_constructible_v<T>`

If any exception is thrown, the result of the expression `bool(*this)` remains unchanged. If an exception is thrown during the call to `T`'s move constructor, the state of `*rhs.val` is determined by the exception safety guarantee of `T`'s move constructor. If an exception is thrown during the call to `T`'s move assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `T`'s move assignment.

17 `template <class U> optional<T>& operator=(U&& v);`

18 *Requires:* `is_constructible_v<T, U>` is true and `is_assignable_v<T&, U>` is true.

19 *Effects:* If `*this` contains a value, assigns `std::forward<U>(v)` to the contained value; otherwise initializes the contained value as if direct-non-list-initializing object of type `T` with `std::forward<U>(v)`.

20 *Returns:* `*this`.

21 *Postconditions:* `*this` contains a value.

22 *Remarks:* If any exception is thrown, the result of the expression `bool(*this)` remains unchanged. If an exception is thrown during the call to `T`'s constructor, the state of `v` is determined by the exception safety guarantee of `T`'s constructor. If an exception is thrown during the call to `T`'s assignment, the state of `*val` and `v` is determined by the exception safety guarantee of `T`'s assignment.

The function shall not participate in overload resolution unless `is_same_v<decay_t<U>, T>` is true.

23 *Notes:* The reason for providing such generic assignment and then constraining it so that effectively `T == U` is to guarantee that assignment of the form `o = {}` is unambiguous.

24 `template <class... Args> void emplace(Args&&... args);`

25 *Requires:* `is_constructible_v<T, Args&&...>` is true.

26 *Effects:* Calls `*this = nullopt`. Then initializes the contained value as if direct-non-list-initializing an object of type `T` with the arguments `std::forward<Args>(args)...`

27 *Postconditions:* `*this` contains a value.

28 *Throws:* Any exception thrown by the selected constructor of `T`.

29 *Remarks:* If an exception is thrown during the call to `T`'s constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

30 `template <class U, class... Args> void emplace(initializer_list<U> il, Args&&... args);`

31 *Effects:* Calls `*this = nullopt`. Then initializes the contained value as if direct-non-list-initializing an object of type `T` with the arguments `il, std::forward<Args>(args)...`

32 *Postconditions:* `*this` contains a value.

33 *Throws:* Any exception thrown by the selected constructor of `T`.

34 *Remarks:* If an exception is thrown during the call to `T`'s constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

The function shall not participate in overload resolution unless

`is_constructible_v<T, initializer_list<U>&, Args&&...>` is true.

## 5.3.4 Swap

[\[optional.object.swap\]](#)

1 `void swap(optional<T>& rhs) noexcept (see below);`

2 **Requires:** Lvalues of type `T` shall be swappable and `is_move_constructible_v<T>` is true.

3 **Effects:**

Table 6 — `optional::swap(optional&)` effects

|                                     | <b>*this contains a value</b>                                                                                                                                                                                                                                                                                                     | <b>*this does not contain a value</b>                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rhs contains a value</b>         | calls <code>swap(*(*this), *rhs)</code>                                                                                                                                                                                                                                                                                           | initializes the contained value of <code>*this</code> as if direct-non-list-initializing an object of type <code>T</code> with the expression <code>std::move(*rhs)</code> , followed by <code>rhs.val-&gt;T::~T()</code> ; postcondition is that <code>*this</code> contains a value and <code>rhs</code> does not contain a value |
| <b>rhs does not contain a value</b> | initializes the contained value of <code>rhs</code> as if direct-non-list-initializing an object of type <code>T</code> with the expression <code>std::move(*(*this))</code> , followed by <code>val-&gt;T::~T()</code> ; postcondition is that <code>*this</code> does not contain a value and <code>rhs</code> contains a value | no effect                                                                                                                                                                                                                                                                                                                           |

4 **Throws:** Any exceptions that the expressions in the Effects element throw.

5 **Remarks:** The expression inside `noexcept` is equivalent to:

```
is_nothrow_move_constructible_v<T> && noexcept(swap(declval<T&>(), declval<T&>()))
```

If any exception is thrown, the results of the expressions `bool(*this)` and `bool(rhs)` remain unchanged. If an exception is thrown during the call to function `swap` the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `swap` for lvalues of `T`. If an exception is thrown during the call to `T`'s move constructor, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `T`'s move constructor.

## 5.3.5 Observers

[\[optional.object.observe\]](#)

1 `constexpr T const* operator->() const;`  
`constexpr T* operator->();`

2 **Requires:** `*this` contains a value.

3 **Returns:** `val`.

4 **Throws:** Nothing.

5 **Remarks:** Unless `T` is a user-defined type with overloaded unary `operator&`, these functions shall be `constexpr` functions.

6 `constexpr T const& operator*() const &;`  
`constexpr T& operator*() &;`

7 **Requires:** `*this` contains a value.

8 **Returns:** `*val`.

9 **Throws:** Nothing.

10 **Remarks:** These functions shall be `constexpr` functions.

11 constexpr T&& operator\*() &&;  
 constexpr const T&& operator\*() const &&;

12 *Requires:* \*this contains a value

13 *Effects:* Equivalent to return std::move(\*val);

14 constexpr explicit operator bool() const noexcept;

15 *Returns:* true if and only if \*this contains a value.

16 *Remarks:* This function shall be a constexpr function.

17 constexpr T const& value() const &;  
 constexpr T& value() &;

18 *Effects:* Equivalent to return bool(\*this) ? \*val : throw bad\_optional\_access();

19 constexpr T&& value() &&;  
 constexpr const T&& value() const &&;

20 *Effects:* Equivalent to return bool(\*this) ? std::move(\*val) : throw bad\_optional\_access();

21 template <class U> constexpr T value\_or(U&& v) const &;

22 *Effects:* Equivalent to return bool(\*this) ? \*\*this : static\_cast<T>(std::forward<U>(v));

23 *Remarks:* If is\_copy\_constructible\_v<T> && is\_convertible\_v<U&&, T> is false, the program is ill-formed.

24 template <class U> T value\_or(U&& v) &&;

25 *Effects:* Equivalent to return bool(\*this) ? std::move(\*\*this) : static\_cast<T>(std::forward<U>(v));

26 *Remarks:* If is\_move\_constructible\_v<T> && is\_convertible\_v<U&&, T> is false, the program is ill-formed.

## 5.4 In-place construction

[optional.inplace]

1 struct in\_place\_t{};  
 constexpr in\_place\_t in\_place{};

2 The struct in\_place\_t is an empty structure type used as a unique type to disambiguate constructor and function overloading. Specifically, optional<T> has a constructor with in\_place\_t as the first parameter followed by a parameter pack; this indicates that it should be constructed in-place (as if by a call to a placement new expression) with the forwarded pack expansion as arguments for the initialization of T.

## 5.5 No-value state indicator

[optional.nullopt]

1 struct nullopt\_t{see below};  
 constexpr nullopt\_t nullopt(unspecified);

2 The struct nullopt\_t is an empty structure type used as a unique type to indicate the state of not containing a value for optional objects. In particular, optional<T> has a constructor with nullopt\_t as a single argument; this indicates that an optional object not containing a value shall be constructed.

3 Type nullopt\_t shall not have a default constructor. It shall be a literal type. Constant nullopt shall be initialized with an argument of literal type.

## 5.6 Class `bad_optional_access`

[optional.bad\_optional\_access]

```
class bad_optional_access : public logic_error {
public:
 bad_optional_access();
};
```

<sup>1</sup> The class `bad_optional_access` defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an optional object that does not contain a value.

<sup>2</sup> `bad_optional_access()`;

<sup>3</sup> *Effects:* Constructs an object of class `bad_optional_access`.

<sup>4</sup> *Postconditions:* `what()` returns an implementation-defined NTBS.

## 5.7 Relational operators

[optional.relops]

<sup>1</sup> `template <class T> constexpr bool operator==(const optional<T>& x, const optional<T>& y);`

<sup>2</sup> *Requires:* `T` shall meet the requirements of `EqualityComparable`.

<sup>3</sup> *Returns:* If `bool(x) != bool(y)`, `false`; otherwise if `bool(x) == false`, `true`; otherwise `*x == *y`.

<sup>4</sup> *Remarks:* Specializations of this function template, for which `*x == *y` is a core constant expression, shall be `constexpr` functions.

<sup>5</sup> `template <class T> constexpr bool operator!=(const optional<T>& x, const optional<T>& y);`

<sup>6</sup> *Returns:* `!(x == y)`.

<sup>7</sup> `template <class T> constexpr bool operator<(const optional<T>& x, const optional<T>& y);`

<sup>8</sup> *Requires:* `*x < *y` shall be well-formed and its result shall be convertible to `bool`.

<sup>9</sup> *Returns:* If `!y`, `false`; otherwise, if `!x`, `true`; otherwise `*x < *y`.

<sup>10</sup> *Remarks:* Specializations of this function template, for which `*x < *y` is a core constant expression, shall be `constexpr` functions.

<sup>11</sup> `template <class T> constexpr bool operator>(const optional<T>& x, const optional<T>& y);`

<sup>12</sup> *Returns:* `y < x`.

<sup>13</sup> `template <class T> constexpr bool operator<=(const optional<T>& x, const optional<T>& y);`

<sup>14</sup> *Returns:* `!(y < x)`.

<sup>15</sup> `template <class T> constexpr bool operator>=(const optional<T>& x, const optional<T>& y);`

<sup>16</sup> *Returns:* `!(x < y)`.

## 5.8 Comparison with `nullopt`

[optional.nullopts]

<sup>1</sup> `template <class T> constexpr bool operator==(const optional<T>& x, nullopt_t) noexcept;`  
`template <class T> constexpr bool operator==(nullopt_t, const optional<T>& x) noexcept;`

<sup>2</sup> *Returns:* `!x`.

```
3 template <class T> constexpr bool operator!=(const optional<T>& X, nullopt_t) noexcept;
 template <class T> constexpr bool operator!=(nullopt_t, const optional<T>& x) noexcept;
```

4 *Returns:* bool(x).

```
5 template <class T> constexpr bool operator<(const optional<T>& X, nullopt_t) noexcept;
```

6 *Returns:* false.

```
7 template <class T> constexpr bool operator<(nullopt_t, const optional<T>& X) noexcept;
```

8 *Returns:* bool(x).

```
9 template <class T> constexpr bool operator<=(const optional<T>& X, nullopt_t) noexcept;
```

10 *Returns:* !x.

```
11 template <class T> constexpr bool operator<=(nullopt_t, const optional<T>& X) noexcept;
```

12 *Returns:* true.

```
13 template <class T> constexpr bool operator>(const optional<T>& X, nullopt_t) noexcept;
```

14 *Returns:* bool(x).

```
15 template <class T> constexpr bool operator>(nullopt_t, const optional<T>& X) noexcept;
```

16 *Returns:* false.

```
17 template <class T> constexpr bool operator>=(const optional<T>& X, nullopt_t) noexcept;
```

18 *Returns:* true.

```
19 template <class T> constexpr bool operator>=(nullopt_t, const optional<T>& X) noexcept;
```

20 *Returns:* !x.

## 5.9 Comparison with T

[optional.comp\_with\_t]

```
1 template <class T> constexpr bool operator==(const optional<T>& X, const T& V);
```

2 *Returns:* bool(x) ? \*X == V : false.

```
3 template <class T> constexpr bool operator==(const T& V, const optional<T>& x);
```

4 *Returns:* bool(x) ? V == \*X : false.

```
5 template <class T> constexpr bool operator!=(const optional<T>& X, const T& V);
```

6 *Returns:* bool(x) ? !(\*X == V) : true.

```
7 template <class T> constexpr bool operator!=(const T& V, const optional<T>& x);
```

8 *Returns:* bool(x) ? !(V == \*X) : true.

```
9 template <class T> constexpr bool operator<(const optional<T>& X, const T& V);
```

10 *Returns:* bool(x) ? \*X < V : true.

```

11 template <class T> constexpr bool operator<(const T& v, const optional<T>& x);
12 Returns: bool(x) ? v < *x : false.

13 template <class T> constexpr bool operator<=(const optional<T>& x, const T& v);
14 Returns: !(x > v).

15 template <class T> constexpr bool operator<=(const T& v, const optional<T>& x);
16 Returns: !(v > x).

17 template <class T> constexpr bool operator>(const optional<T>& x, const T& v);
18 Returns: bool(x) ? v < *x : false.

19 template <class T> constexpr bool operator>(const T& v, const optional<T>& x);
20 Returns: bool(x) ? *x < v : true.

21 template <class T> constexpr bool operator>=(const optional<T>& x, const T& v);
22 Returns: !(x < v).

23 template <class T> constexpr bool operator>=(const T& v, const optional<T>& x);
24 Returns: !(v < x).

```

## 5.10 Specialized algorithms

[optional.specalg]

```

1 template <class T> void swap(optional<T>& x, optional<T>& y) noexcept(noexcept(x.swap(y)));
2 Effects: Calls x.swap(y).

3 template <class T> constexpr optional<decay_t<T>> make_optional(T&& v);
4 Returns: optional<decay_t<T>>(std::forward<T>(v)).

```

## 5.11 Hash support

[optional.hash]

```

1 template <class T> struct hash<experimental::optional<T>>;
2 Requires: The template specialization hash<T> shall meet the requirements of class template hash (C++14 §20.9.12). The template specialization hash<optional<T>> shall meet the requirements of class template hash. For an object o of type optional<T>, if bool(o) == true, hash<optional<T>>() (o) shall evaluate to the same value as hash<T>() (*o), otherwise it evaluates to an unspecified value.

```

## 6 Class any

[any]

- <sup>1</sup> This section describes components that C++ programs may use to perform operations on objects of a discriminated type.
- <sup>2</sup> [ *Note*: The discriminated type may contain values of different types but does not attempt conversion between them, i.e. 5 is held strictly as an `int` and is not implicitly convertible either to "5" or to 5.0. This indifference to interpretation but awareness of type effectively allows safe, generic containers of single values, with no scope for surprises from ambiguous conversions. — *end note* ]

### 6.1 Header <experimental/any> synopsis

[any.synop]

```

namespace std {
namespace experimental {
inline namespace fundamentals_v1 {

 class bad_any_cast : public bad_cast
 {
 public:
 virtual const char* what() const noexcept;
 };

 class any
 {
 public:
 // 6.3.1, any construct/destroy
 any() noexcept;

 any(const any& other);
 any(any&& other) noexcept;

 template <class ValueType>
 any(ValueType&& value);

 ~any();

 // 6.3.2, any assignments
 any& operator=(const any& rhs);
 any& operator=(any&& rhs) noexcept;

 template <class ValueType>
 any& operator=(ValueType&& rhs);

 // 6.3.3, any modifiers
 void clear() noexcept;
 void swap(any& rhs) noexcept;

 // 6.3.4, any observers
 bool empty() const noexcept;
 const type_info& type() const noexcept;
 };
}

```

```

// 6.4, Non-member functions
void swap(any& x, any& y) noexcept;

template<class ValueType>
 ValueType any_cast(const any& operand);
template<class ValueType>
 ValueType any_cast(any& operand);
template<class ValueType>
 ValueType any_cast(any&& operand);

template<class ValueType>
 const ValueType* any_cast(const any* operand) noexcept;
template<class ValueType>
 ValueType* any_cast(any* operand) noexcept;

} // namespace fundamentals_v1
} // namespace experimental
} // namespace std

```

## 6.2 Class `bad_any_cast`

[[any.bad\\_any\\_cast](#)]

- <sup>1</sup> Objects of type `bad_any_cast` are thrown by a failed `any_cast`.

## 6.3 Class `any`

[[any.class](#)]

- <sup>1</sup> An object of class `any` stores an instance of any type that satisfies the constructor requirements or is empty, and this is referred to as the *state* of the class `any` object. The stored instance is called the *contained object*. Two states are equivalent if they are either both empty or if both are not empty and if the contained objects are equivalent.
- <sup>2</sup> The non-member `any_cast` functions provide type-safe access to the contained object.
- <sup>3</sup> Implementations should avoid the use of dynamically allocated memory for a small contained object. [ *Example*: where the object constructed is holding only an int. — *end example* ] Such small-object optimization shall only be applied to types `T` for which `is_nothrow_move_constructible_v<T>` is true.

### 6.3.1 `any` construct/destruct

[[any.cons](#)]

- <sup>1</sup> `any()` `noexcept`;
- <sup>2</sup> *Postconditions*: `this->empty()`
- <sup>3</sup> `any(const any& other)`;
- <sup>4</sup> *Effects*: Constructs an object of type `any` with an equivalent state as `other`.
- <sup>5</sup> *Throws*: Any exceptions arising from calling the selected constructor of the contained object.
- <sup>6</sup> `any(any&& other)` `noexcept`;
- <sup>7</sup> *Effects*: Constructs an object of type `any` with a state equivalent to the original state of `other`.
- <sup>8</sup> *Postconditions*: `other` is left in a valid but otherwise unspecified state.

```

9 template<class ValueType>
 any(ValueType&& value);
10 Let T be equal to decay_t<ValueType>.

11 Requires: T shall satisfy the CopyConstructible requirements. If is_copy_constructible_v<T> is false, the
 program is ill-formed.

12 Effects: Constructs an object of type any that contains an object of type T direct-initialized with
 std::forward<ValueType>(value).

13 Remarks: This constructor shall not participate in overload resolution if decay_t<ValueType> is the same type as
 any.

14 Throws: Any exception thrown by the selected constructor of T .

15 ~any();
16 Effects: clear().

```

### 6.3.2 any assignments

[any.assign]

```

1 any& operator=(const any& rhs);
 2 Effects: any(rhs).swap(*this). No effects if an exception is thrown.
 3 Returns: *this
 4 Throws: Any exceptions arising from the copy constructor of the contained object.

5 any& operator=(any&& rhs) noexcept;
 6 Effects: any(std::move(rhs)).swap(*this).
 7 Returns: *this
 8 Postconditions: The state of *this is equivalent to the original state of rhs and rhs is left in a valid but otherwise
 unspecified state.

9 template<class ValueType>
 any& operator=(ValueType&& rhs);
10 Let T be equal to decay_t<ValueType>.

11 Requires: T shall satisfy the CopyConstructible requirements. If is_copy_constructible_v<T> is false, the
 program is ill-formed.

12 Effects: Constructs an object tmp of type any that contains an object of type T direct-initialized with
 std::forward<ValueType>(rhs), and tmp.swap(*this). No effects if an exception is thrown.

13 Returns: *this

14 Remarks: This operator shall not participate in overload resolution if decay_t<ValueType> is the same type as any.

15 Throws: Any exception thrown by the selected constructor of T .

```

**6.3.3 any modifiers****[any.modifiers]**

```
1 void clear() noexcept;
 2 Effects: If not empty, destroys the contained object.
 3 Postconditions: empty() == true.

4 void swap(any& rhs) noexcept;
 5 Effects: Exchange the states of *this and rhs.
```

**6.3.4 any observers****[any.observers]**

```
1 bool empty() const noexcept;
 2 Returns: true if *this has no contained object, otherwise false.

3 const type_info& type() const noexcept;
 4 Returns: If *this has a contained object of type T, typeid(T); otherwise typeid(void).
 5 [Note: Useful for querying against types known either at compile time or only at runtime. — end note]
```

**6.4 Non-member functions****[any.nonmembers]**

```
1 void swap(any& x, any& y) noexcept;
 2 Effects: x.swap(y).
```

```

3 template<class ValueType>
 ValueType any_cast(const any& operand);
template<class ValueType>
 ValueType any_cast(any& operand);
template<class ValueType>
 ValueType any_cast(any&& operand);

```

4 **Requires:** `is_reference_v<ValueType>` is true or `is_copy_constructible_v<ValueType>` is true. Otherwise the program is ill-formed.

5 **Returns:** For the first form, `*any_cast<add_const_t<remove_reference_t<ValueType>>>(&operand)`. For the second and third forms, `*any_cast<remove_reference_t<ValueType>>(&operand)`.

6 **Throws:** `bad_any_cast` if `operand.type() != typeid(remove_reference_t<ValueType>)`.

[ Example:

```

any x(5); // x holds int
assert(any_cast<int>(x) == 5); // cast to value
any_cast<int&>(x) = 10; // cast to reference
assert(any_cast<int>(x) == 10);

x = "Meow"; // x holds const char*
assert(strcmp(any_cast<const char*>(x), "Meow") == 0);
any_cast<const char*&>(x) = "Harry";
assert(strcmp(any_cast<const char*>(x), "Harry") == 0);

x = string("Meow"); // x holds string
string s, s2("Jane");
s = move(any_cast<string&>(x)); // move from any
assert(s == "Meow");
any_cast<string&>(x) = move(s2); // move to any
assert(any_cast<const string&>(x) == "Jane");

string cat("Meow");
const any y(cat); // const y holds string
assert(any_cast<const string&>(y) == cat);

any_cast<string&>(y); // error; cannot
// any_cast away const

```

— end example ]

```

7 template<class ValueType>
 const ValueType* any_cast(const any* operand) noexcept;
template<class ValueType>
 ValueType* any_cast(any* operand) noexcept;

```

8 **Returns:** If `operand != nullptr` && `operand->type() == typeid(ValueType)`, a pointer to the object contained by `operand`, otherwise `nullptr`.

[ Example:

```

bool is_string(const any& operand) {
 return any_cast<string>(&operand) != nullptr;
}

```

— end example ]

## 7 string\_view

[string.view]

- <sup>1</sup> The class template `basic_string_view` describes an object that can refer to a constant contiguous sequence of char-like (C++14 §21.1) objects with the first element of the sequence at position zero. In the rest of this section, the type of the char-like objects held in a `basic_string_view` object is designated by `charT`.
- <sup>2</sup> [ *Note:* The library provides implicit conversions from `const charT*` and `std::basic_string<charT, ...>` to `std::basic_string_view<charT, ...>` so that user code can accept just `std::basic_string_view<charT>` as a non-templated parameter wherever a sequence of characters is expected. User-defined types should define their own implicit conversions to `std::basic_string_view` in order to interoperate with these functions. — *end note* ]
- <sup>3</sup> The complexity of `basic_string_view` member functions is  $O(1)$  unless otherwise specified.

### 7.1 Header <experimental/string\_view> synopsis

[string.view.synop]

```
namespace std {
 namespace experimental {
 inline namespace fundamentals_v1 {

 // 7.2, Class template basic_string_view
 template<class charT, class traits = char_traits<charT>>
 class basic_string_view;

 // 7.9, basic_string_view non-member comparison functions
 template<class charT, class traits>
 constexpr bool operator==(basic_string_view<charT, traits> x,
 basic_string_view<charT, traits> y) noexcept;
 template<class charT, class traits>
 constexpr bool operator!=(basic_string_view<charT, traits> x,
 basic_string_view<charT, traits> y) noexcept;
 template<class charT, class traits>
 constexpr bool operator< (basic_string_view<charT, traits> x,
 basic_string_view<charT, traits> y) noexcept;
 template<class charT, class traits>
 constexpr bool operator> (basic_string_view<charT, traits> x,
 basic_string_view<charT, traits> y) noexcept;
 template<class charT, class traits>
 constexpr bool operator<= (basic_string_view<charT, traits> x,
 basic_string_view<charT, traits> y) noexcept;
 template<class charT, class traits>
 constexpr bool operator>= (basic_string_view<charT, traits> x,
 basic_string_view<charT, traits> y) noexcept;
 // see below, sufficient additional overloads of comparison functions

 // 7.10, Inserters and extractors
 template<class charT, class traits>
 basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os,
 basic_string_view<charT, traits> str);

 // basic_string_view typedef names
```

```

typedef basic_string_view<char> string_view;
typedef basic_string_view<char16_t> u16string_view;
typedef basic_string_view<char32_t> u32string_view;
typedef basic_string_view<wchar_t> wstring_view;

} // namespace fundamentals_v1
} // namespace experimental

// 7.11, Hash support
template <class T> struct hash;
template <> struct hash<experimental::string_view>;
template <> struct hash<experimental::u16string_view>;
template <> struct hash<experimental::u32string_view>;
template <> struct hash<experimental::wstring_view>;

} // namespace std

```

- <sup>1</sup> The function templates defined in C++14 §20.2.2 and C++14 §24.7 are available when `<experimental/string_view>` is included.

## 7.2 Class template `basic_string_view`

[\[string.view.template\]](#)

```

template<class charT, class traits = char_traits<charT>>
class basic_string_view {
public:
 // types
 typedef traits traits_type;
 typedef charT value_type;
 typedef charT* pointer;
 typedef const charT* const_pointer;
 typedef charT& reference;
 typedef const charT& const_reference;
 typedef implementation-defined const_iterator; // See 7.4
 typedef const_iterator iterator;1
 typedef reverse_iterator<const_iterator> const_reverse_iterator;
 typedef const_reverse_iterator reverse_iterator;
 typedef size_t size_type;
 typedef ptrdiff_t difference_type;
 static constexpr size_type npos = size_type(-1);

 // 7.3, basic_string_view constructors and assignment operators
 constexpr basic_string_view() noexcept;
 constexpr basic_string_view(const basic_string_view&) noexcept = default;
 basic_string_view& operator=(const basic_string_view&) noexcept = default;
 template<class Allocator>
 basic_string_view(const basic_string<charT, traits, Allocator>& str) noexcept;
 constexpr basic_string_view(const charT* str);
 constexpr basic_string_view(const charT* str, size_type len);

 // 7.4, basic_string_view iterator support
 constexpr const_iterator begin() const noexcept;

```

1. Because `basic_string_view` refers to a constant sequence, `iterator` and `const_iterator` are the same type.

```

constexpr const_iterator end() const noexcept;
constexpr const_iterator cbegin() const noexcept;
constexpr const_iterator cend() const noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

// 7.5, basic_string_view capacity
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
constexpr size_type max_size() const noexcept;
constexpr bool empty() const noexcept;

// 7.6, basic_string_view element access
constexpr const_reference operator[](size_type pos) const;
constexpr const_reference at(size_type pos) const;
constexpr const_reference front() const;
constexpr const_reference back() const;
constexpr const_pointer data() const noexcept;

// 7.7, basic_string_view modifiers
constexpr void remove_prefix(size_type n);
constexpr void remove_suffix(size_type n);
constexpr void swap(basic_string_view& s) noexcept;

// 7.8, basic_string_view string operations
template<class Allocator>
explicit operator basic_string<charT, traits, Allocator>() const;
template<class Allocator = allocator<charT> >
basic_string<charT, traits, Allocator> to_string(

```

```

private:
 const_pointer data_; // exposition only
 size_type size_; // exposition only
};

```

- <sup>1</sup> In every specialization `basic_string_view<charT, traits>`, the type `traits` shall satisfy the character traits requirements (C++14 §21.2), and the type `traits::char_type` shall name the same type as `charT`.

### 7.3 `basic_string_view` constructors and assignment operators

[\[string.view.cons\]](#)

- ```

1 constexpr basic_string_view() noexcept;
2 Effects: Constructs an empty basic_string_view.
3 Postconditions: size_ == 0 and data_ == nullptr.
4 template<class Allocator>
  basic_string_view(const basic_string<charT, traits, Allocator>& str) noexcept;
5 Effects: Constructs a basic_string_view, with the postconditions in Table 7.

```

Table 7 — `basic_string_view(const basic_string&)` effects

Element	Value
<code>data_</code>	<code>str.data()</code>
<code>size_</code>	<code>str.size()</code>

- ```

6 constexpr basic_string_view(const charT* str);
7 Requires: [str, str + traits::length(str)) is a valid range.
8 Effects: Constructs a basic_string_view, with the postconditions in Table 8.

```

Table 8 — `basic_string_view(const charT*)` effects

| Element            | Value                            |
|--------------------|----------------------------------|
| <code>data_</code> | <code>str</code>                 |
| <code>size_</code> | <code>traits::length(str)</code> |

- <sup>9</sup> *Complexity:*  $O(\text{traits::length}(\text{str}))$

10 constexpr basic\_string\_view(const charT\* str, size\_type len);

11 *Requires:* [str, str + len) is a valid range.

12 *Effects:* Constructs a basic\_string\_view, with the postconditions in Table 9.

Table 9 — basic\_string\_view(const charT\*, size\_type) effects

| Element | Value |
|---------|-------|
| data_   | str   |
| size_   | len   |

## 7.4 basic\_string\_view iterator support

[string.view.iterators]

1 typedef *implementation-defined* const\_iterator;

2 A constant random-access iterator type such that, for a const\_iterator it, if  $\&*(it+N)$  is valid, then it is equal to  $(\&*it)+N$ .

3 For a basic\_string\_view str, any operation that invalidates a pointer in the range [str.data(), str.data()+str.size()) invalidates pointers, iterators, and references returned from str's methods.

4 All requirements on container iterators (C++14 §23.2) apply to basic\_string\_view::const\_iterator as well.

5 constexpr const\_iterator begin() const noexcept;  
constexpr const\_iterator cbegin() const noexcept;

6 *Returns:* An iterator such that  $\&*begin() == data\_if !empty()$ , or else an unspecified value such that [begin(), end()) is a valid range.

7 constexpr const\_iterator end() const noexcept;  
constexpr const\_iterator cend() const noexcept;

8 *Returns:* begin() + size()

9 const\_reverse\_iterator rbegin() const noexcept;  
const\_reverse\_iterator crbegin() const noexcept;

10 *Returns:* const\_reverse\_iterator(end()).

11 const\_reverse\_iterator rend() const noexcept;  
const\_reverse\_iterator crend() const noexcept;

12 *Returns:* const\_reverse\_iterator(begin()).

## 7.5 basic\_string\_view capacity

[string.view.capacity]

1 constexpr size\_type size() const noexcept;

2 *Returns:* size\_

3 constexpr size\_type length() const noexcept;

4 *Returns:* size\_.

5 constexpr size\_type max\_size() const noexcept;

6 *Returns:* The largest possible number of char-like objects that can be referred to by a basic\_string\_view.

7 constexpr bool empty() const noexcept;

8 *Returns:* size\_ == 0.

## 7.6 basic\_string\_view element access

[\[string.view.access\]](#)

1 constexpr const\_reference operator[](size\_type pos) const;

2 *Requires:* pos < size().

3 *Returns:* data\_[pos]

4 *Throws:* Nothing.

5 [ *Note:* Unlike `basic_string::operator[]`, `basic_string_view::operator[](size())` has undefined behavior instead of returning `charT()`. — *end note* ]

6 constexpr const\_reference at(size\_type pos) const;

7 *Throws:* out\_of\_range if pos >= size().

8 *Returns:* data\_[pos].

9 constexpr const\_reference front() const;

10 *Requires:* !empty()

11 *Returns:* data\_[0].

12 *Throws:* Nothing.

13 constexpr const\_reference back() const;

14 *Requires:* !empty()

15 *Returns:* data\_[size() - 1].

16 *Throws:* Nothing.

17 constexpr const\_pointer data() const noexcept;

18 *Returns:* data\_

19 [ *Note:* Unlike `basic_string::data()` and string literals, `data()` may return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass `data()` to a routine that takes just a `const charT*` and expects a null-terminated string. — *end note* ]

## 7.7 basic\_string\_view modifiers

[\[string.view.modifiers\]](#)

1 constexpr void remove\_prefix(size\_type n);

2 *Requires:* n <= size()

3 *Effects:* Equivalent to `data_ += n; size_ -= n;`

4 constexpr void remove\_suffix(size\_type n);  
 5 *Requires:*  $n \leq \text{size}()$   
 6 *Effects:* Equivalent to `size_ -= n;`  
 7 constexpr void swap(basic\_string\_view& s) noexcept;  
 8 *Effects:* Exchanges the values of `*this` and `s`.

## 7.8 basic\_string\_view string operations

[string.view.ops]

1 template<class Allocator>  
 explicit<sup>2</sup> operator basic\_string<  
 charT, traits, Allocator>() const;  
 2 *Effects:* Equivalent to `return basic_string<charT, traits, Allocator>(begin(), end());`  
 3 *Complexity:*  $O(\text{size}())$   
 4 [ *Note:* Users who want to control the allocator instance should call `to_string(allocator)`. — *end note* ]  
 5 template<class Allocator = allocator<charT>>  
 basic\_string<charT, traits, Allocator> to\_string(  
 const Allocator& a = Allocator()) const;  
 6 *Returns:* `basic_string<charT, traits, Allocator>(begin(), end(), a)`.  
 7 *Complexity:*  $O(\text{size}())$   
 8 size\_type copy(charT\* s, size\_type n, size\_type pos = 0) const;  
 9 Let `rlen` be the smaller of `n` and `size() - pos`.  
 10 *Throws:* `out_of_range` if `pos > size()`.  
 11 *Requires:* `[s, s + rlen)` is a valid range.  
 12 *Effects:* Equivalent to `std::copy_n(begin() + pos, rlen, s)`.  
 13 *Returns:* `rlen`.  
 14 *Complexity:*  $O(rlen)$   
 15 constexpr basic\_string\_view substr(size\_type pos = 0, size\_type n = npos) const;  
 16 *Throws:* `out_of_range` if `pos > size()`.  
 17 *Effects:* Determines the effective length `rlen` of the string to reference as the smaller of `n` and `size() - pos`.  
 18 *Returns:* `basic_string_view(data()+pos, rlen)`.

2. This conversion is explicit to avoid accidental  $O(N)$  operations on type mismatches.

19 constexpr int compare(basic\_string\_view str) const noexcept;

20 *Effects:* Determines the effective length *rlen* of the strings to compare as the smaller of *size()* and *str.size()*. The function then compares the two strings by calling *traits::compare(data(), str.data(), rlen)*.

21 *Complexity:*  $O(rlen)$

22 *Returns:* The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 10.

Table 10 — *compare()* results

| Condition                          | Return Value |
|------------------------------------|--------------|
| <i>size()</i> < <i>str.size()</i>  | < 0          |
| <i>size()</i> == <i>str.size()</i> | 0            |
| <i>size()</i> > <i>str.size()</i>  | > 0          |

23 constexpr int compare(size\_type pos1, size\_type n1, basic\_string\_view str) const;

24 *Effects:* Equivalent to *return substr(pos1, n1).compare(str);*

25 constexpr int compare(size\_type pos1, size\_type n1, basic\_string\_view str,  
size\_type pos2, size\_type n2) const;

26 *Effects:* Equivalent to *return substr(pos1, n1).compare(str.substr(pos2, n2));*

27 constexpr int compare(const charT\* s) const;

28 *Effects:* Equivalent to *return compare(basic\_string\_view(s));*

29 constexpr int compare(size\_type pos1, size\_type n1, const charT\* s) const;

30 *Effects:* Equivalent to *return substr(pos1, n1).compare(basic\_string\_view(s));*

31 constexpr int compare(size\_type pos1, size\_type n1,  
const charT\* s, size\_type n2) const;

32 *Effects:* Equivalent to *return substr(pos1, n1).compare(basic\_string\_view(s, n2));*

### 7.8.1 Searching *basic\_string\_view*

[\[string.view.find\]](#)

1 This section specifies the *basic\_string\_view* member functions named *find*, *rfind*, *find\_first\_of*, *find\_last\_of*, *find\_first\_not\_of*, and *find\_last\_not\_of*.

2 Member functions in this section have complexity  $O(\text{size()} * \text{str.size}())$  at worst, although implementations are encouraged to do better.

3 Each member function of the form

constexpr *return-type* *fx1*(const charT\* s, size\_type pos);

is equivalent to *return fx1(basic\_string\_view(s), pos);*

4 Each member function of the form

constexpr *return-type* *fx1*(const charT\* s, size\_type pos, size\_type n);

is equivalent to *return fx1(basic\_string\_view(s, n), pos);*

5 Each member function of the form

constexpr *return-type* *fx2*(charT c, size\_type pos);

is equivalent to `return fx2(basic_string_view(&c, 1), pos);`

6 `constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;`

7 **Effects:** Determines the lowest position `xpos`, if possible, such that the following conditions obtain:

- `pos <= xpos`
- `xpos + str.size() <= size()`
- `traits::eq(at(xpos+I), str.at(I))` for all elements `I` of the string referenced by `str`.

8 **Returns:** `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

9 **Remarks:** Uses `traits::eq()`.

10 `constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;`

11 **Effects:** Determines the highest position `xpos`, if possible, such that the following conditions obtain:

- `xpos <= pos`
- `xpos + str.size() <= size()`
- `traits::eq(at(xpos+I), str.at(I))` for all elements `I` of the string referenced by `str`.

12 **Returns:** `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

13 **Remarks:** Uses `traits::eq()`.

14 `constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;`

15 **Effects:** Determines the lowest position `xpos`, if possible, such that the following conditions obtain:

- `pos <= xpos`
- `xpos < size()`
- `traits::eq(at(xpos), str.at(I))` for some element `I` of the string referenced by `str`.

16 **Returns:** `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

17 **Remarks:** Uses `traits::eq()`.

18 `constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;`

19 **Effects:** Determines the highest position `xpos`, if possible, such that the following conditions obtain:

- `xpos <= pos`
- `xpos < size()`
- `traits::eq(at(xpos), str.at(I))` for some element `I` of the string referenced by `str`.

20 **Returns:** `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

21 **Remarks:** Uses `traits::eq()`.

22 `constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;`

23 **Effects:** Determines the lowest position `xpos`, if possible, such that the following conditions obtain:

- `pos <= xpos`
- `xpos < size()`
- `traits::eq(at(xpos), str.at(I))` for no element `I` of the string referenced by `str`.

24 **Returns:** `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

25 **Remarks:** Uses `traits::eq()`.

26 constexpr size\_type find\_last\_not\_of(basic\_string\_view str, size\_type pos = npos) const noexcept;

27 **Effects:** Determines the highest position `xpos`, if possible, such that the following conditions obtain:

- `xpos <= pos`
- `xpos < size()`
- `traits::eq(at(xpos), str.at(I))` for no element `I` of the string referenced by `str`.

28 **Returns:** `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

29 **Remarks:** Uses `traits::eq()`.

## 7.9 basic\_string\_view non-member comparison functions

[string.view.comparison]

- <sup>1</sup> Let `s` be `basic_string_view<charT, traits>`, and `sv` be an instance of `s`. Implementations shall provide sufficient additional overloads marked `constexpr` and `noexcept` so that an object `t` with an implicit conversion to `s` can be compared according to Table 11.

Table 11 — Additional `basic_string_view` comparison overloads

| Expression              | Equivalent to              |
|-------------------------|----------------------------|
| <code>t == sv</code>    | <code>S(t) == sv</code>    |
| <code>sv == t</code>    | <code>sv == S(t)</code>    |
| <code>t != sv</code>    | <code>S(t) != sv</code>    |
| <code>sv != t</code>    | <code>sv != S(t)</code>    |
| <code>t &lt; sv</code>  | <code>S(t) &lt; sv</code>  |
| <code>sv &lt; t</code>  | <code>sv &lt; S(t)</code>  |
| <code>t &gt; sv</code>  | <code>S(t) &gt; sv</code>  |
| <code>sv &gt; t</code>  | <code>sv &gt; S(t)</code>  |
| <code>t &lt;= sv</code> | <code>S(t) &lt;= sv</code> |
| <code>sv &lt;= t</code> | <code>sv &lt;= S(t)</code> |
| <code>t &gt;= sv</code> | <code>S(t) &gt;= sv</code> |
| <code>sv &gt;= t</code> | <code>sv &gt;= S(t)</code> |

[ Example: A sample conforming implementation for `operator==` would be:

```
template<class T> using __identity = decay_t<T>;
template<class charT, class traits>
constexpr bool operator==(
 basic_string_view<charT, traits> lhs,
 basic_string_view<charT, traits> rhs) noexcept {
 return lhs.compare(rhs) == 0;
}
template<class charT, class traits>
constexpr bool operator==(
 basic_string_view<charT, traits> lhs,
 __identity<basic_string_view<charT, traits>> rhs) noexcept {
 return lhs.compare(rhs) == 0;
}
template<class charT, class traits>
constexpr bool operator==(
 __identity<basic_string_view<charT, traits>> lhs,
 basic_string_view<charT, traits> rhs) noexcept {
 return lhs.compare(rhs) == 0;
}
```

— end example ]

```

2 template<class charT, class traits>
 constexpr bool operator==(basic_string_view<charT, traits> lhs,
 basic_string_view<charT, traits> rhs) noexcept;

3 Returns: lhs.compare(rhs) == 0.

4 template<class charT, class traits>
 constexpr bool operator!=(basic_string_view<charT, traits> lhs,
 basic_string_view<charT, traits> rhs) noexcept;

5 Returns: lhs.compare(rhs) != 0.

6 template<class charT, class traits>
 constexpr bool operator<(basic_string_view<charT, traits> lhs,
 basic_string_view<charT, traits> rhs) noexcept;

7 Returns: lhs.compare(rhs) < 0.

8 template<class charT, class traits>
 constexpr bool operator>(basic_string_view<charT, traits> lhs,
 basic_string_view<charT, traits> rhs) noexcept;

9 Returns: lhs.compare(rhs) > 0.

10 template<class charT, class traits>
 constexpr bool operator<=(basic_string_view<charT, traits> lhs,
 basic_string_view<charT, traits> rhs) noexcept;

11 Returns: lhs.compare(rhs) <= 0.

12 template<class charT, class traits>
 constexpr bool operator>=(basic_string_view<charT, traits> lhs,
 basic_string_view<charT, traits> rhs) noexcept;

13 Returns: lhs.compare(rhs) >= 0.

```

## 7.10 Inserters and extractors

[\[string.view.io\]](#)

```

1 template<class charT, class traits>
 basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os,
 basic_string_view<charT, traits> str);

2 Effects: Equivalent to return os << str.to_string();

```

## 7.11 Hash support

[\[string.view.hash\]](#)

```

1 template <> struct hash<experimental::string_view>;
template <> struct hash<experimental::u16string_view>;
template <> struct hash<experimental::u32string_view>;
template <> struct hash<experimental::wstring_view>;

2 The template specializations shall meet the requirements of class template hash (C++14 §20.9.12).

```

} // namespace fundamentals_v1
} // namespace experimental

// C++14 §20.8.2.7
template<class T> struct hash<experimental::shared_ptr<T>>;

} // namespace std

```

<sup>1</sup> For the purposes of subclause 8.2, a pointer type  $Y^*$  is said to be *compatible with* a pointer type  $T^*$  when either  $Y^*$  is convertible to  $T^*$  or  $Y$  is  $U[N]$  and  $T$  is  $U$  cv  $[]$ .

## 8.2.1.1 shared\_ptr constructors

[\[memory.smartptr.shared.const\]](#)

```
1 template<class Y> explicit shared_ptr(Y* p);
```

<sup>2</sup> **Requires:** *Y* shall be a complete type. The expression `delete[] p`, when *T* is an array type, or `delete p`, when *T* is not an array type, shall be well-formed, shall have well defined behavior, and shall not throw exceptions. When *T* is `U[N]`, `Y(*) [N]` shall be convertible to *T\**; when *T* is `U[]`, `Y(*) []` shall be convertible to *T\**; otherwise, *Y\** shall be convertible to *T\**.

<sup>3</sup> **Effects:** When *T* is not an array type, constructs a `shared_ptr` object that owns the pointer *p*. Otherwise, constructs a `shared_ptr` that owns *p* and a deleter of an unspecified type that calls `delete[] p`.

<sup>4</sup> **Postconditions:** `use_count() == 1` && `get() == p`.

<sup>5</sup> **Throws:** `bad_alloc`, or an implementation-defined exception when a resource other than memory could not be obtained.

<sup>6</sup> **Exception safety:** If an exception is thrown, `delete p` is called when *T* is not an array type, `delete[] p` otherwise.

```
7 template<class Y, class D> shared_ptr(Y* p, D d);
template<class Y, class D, class A> shared_ptr(Y* p, D d, A a);
template <class D> shared_ptr(nullptr_t p, D d);
template <class D, class A> shared_ptr(nullptr_t p, D d, A a);
```

<sup>8</sup> **Requires:** *D* shall be CopyConstructible. The copy constructor and destructor of *D* shall not throw exceptions. The expression `d(p)` shall be well formed, shall have well defined behavior, and shall not throw exceptions. *A* shall be an allocator (C++14 §17.6.3.5). The copy constructor and destructor of *A* shall not throw exceptions. When *T* is `U[N]`, `Y(*) [N]` shall be convertible to *T\**; when *T* is `U[]`, `Y(*) []` shall be convertible to *T\**; otherwise, *Y\** shall be convertible to *T\**.

<sup>9</sup> **Effects:** Constructs a `shared_ptr` object that owns the object *p* and the deleter *d*. The second and fourth constructors shall use a copy of *a* to allocate memory for internal use.

<sup>10</sup> **Postconditions:** `use_count() == 1` && `get() == p`.

<sup>11</sup> **Throws:** `bad_alloc`, or an implementation-defined exception when a resource other than memory could not be obtained.

<sup>12</sup> **Exception safety:** If an exception is thrown, `d(p)` is called.

```
13 template<class Y> shared_ptr(const shared_ptr<Y>& r, element_type* p) noexcept;
```

<sup>14</sup> **Effects:** Constructs a `shared_ptr` instance that stores *p* and shares ownership with *r*.

<sup>15</sup> **Postconditions:** `get() == p` && `use_count() == r.use_count()`

<sup>16</sup> [ *Note:* To avoid the possibility of a dangling pointer, the user of this constructor must ensure that *p* remains valid at least until the ownership group of *r* is destroyed. — end note ]

<sup>17</sup> [ *Note:* This constructor allows creation of an empty `shared_ptr` instance with a non-null stored pointer. — end note ]

18 `shared_ptr(const shared_ptr& r) noexcept;`  
`template<class Y> shared_ptr(const shared_ptr<Y>& r) noexcept;`

19 **Requires:** The second constructor shall not participate in the overload resolution unless  $Y^*$  is *compatible with*  $T^*$ .

20 **Effects:** If  $r$  is *empty*, constructs an *empty* `shared_ptr` object; otherwise, constructs a `shared_ptr` object that *shares ownership* with  $r$ .

21 **Postconditions:** `get() == r.get() && use_count() == r.use_count()`.

22 `shared_ptr(shared_ptr&& r) noexcept;`  
`template<class Y> shared_ptr(shared_ptr<Y>&& r) noexcept;`

23 **Remarks:** The second constructor shall not participate in overload resolution unless  $Y^*$  is *compatible with*  $T^*$ .

24 **Effects:** Move-constructs a `shared_ptr` instance from  $r$ .

25 **Postconditions:** `*this` shall contain the old value of  $r$ .  $r$  shall be *empty*. `r.get() == 0`.

26 `template<class Y> explicit shared_ptr(const weak_ptr<Y>& r);`

27 **Requires:**  $Y^*$  shall be *compatible with*  $T^*$ .

28 **Effects:** Constructs a `shared_ptr` object that *shares ownership* with  $r$  and stores a copy of the pointer stored in  $r$ .

29 **Postconditions:** `use_count() == r.use_count()`.

30 **Throws:** `bad_weak_ptr` when `r.expired()`.

31 **Exception safety:** If an exception is thrown, the constructor has no effect.

32 `template <class Y, class D> shared_ptr(unique_ptr<Y, D>&& r);`

33 **Remarks:** This constructor shall not participate in overload resolution unless  $Y^*$  is *compatible with*  $T^*$ .

34 **Effects:** Equivalent to `shared_ptr(r.release(), r.get_deleter())` when  $D$  is not a reference type, otherwise `shared_ptr(r.release(), ref(r.get_deleter()))`.

35 **Exception safety:** If an exception is thrown, the constructor has no effect.

### 8.2.1.2 `shared_ptr` observers

[[memory.smartptr.shared.obs](#)]

1 `element_type* get() const noexcept;`

2 **Returns:** The stored pointer.

3 `T& operator*() const noexcept;`

4 **Requires:** `get() != 0`.

5 **Returns:** `*get()`.

6 **Remarks:** When  $T$  is an array type or cv-qualified `void`, it is unspecified whether this member function is declared. If it is declared, it is unspecified what its return type is, except that the declaration (although not necessarily the definition) of the function shall be well formed.

7 `T* operator->() const noexcept;`

8 *Requires:* `get() != 0`.

9 *Returns:* `get()`.

10 *Remarks:* When `T` is an array type, it is unspecified whether this member function is declared. If it is declared, it is unspecified what its return type is, except that the declaration (although not necessarily the definition) of the function shall be well formed.

11 `element_type& operator[](ptrdiff_t i) const noexcept;`

12 *Requires:* `get() != 0 && i >= 0`. If `T` is `U[N]`, `i < N`.

13 *Returns:* `get()[i]`.

14 *Remarks:* When `T` is not an array type, it is unspecified whether this member function is declared. If it is declared, it is unspecified what its return type is, except that the declaration (although not necessarily the definition) of the function shall be well formed.

### 8.2.1.3 `shared_ptr` casts

[\[memory.smartptr.shared.cast\]](#)

1 `template<class T, class U> shared_ptr<T> static_pointer_cast(const shared_ptr<U>& r) noexcept;`

2 *Requires:* The expression `static_cast<T*>((U*)0)` shall be well formed.

3 *Returns:* `shared_ptr<T>(r, static_cast<typename shared_ptr<T>::element_type*>(r.get()))`

4 [ *Note:* The seemingly equivalent expression `shared_ptr<T>(static_cast<T*>(r.get()))` will eventually result in undefined behavior, attempting to delete the same object twice. — *end note* ]

5 `template<class T, class U> shared_ptr<T> dynamic_pointer_cast(const shared_ptr<U>& r) noexcept;`

6 *Requires:* The expression `dynamic_cast<T*>((U*)0)` shall be well formed.

7 *Returns:*

- When `dynamic_cast<typename shared_ptr<T>::element_type*>(r.get())` returns a nonzero value `p`, `shared_ptr<T>(r, p)`;
- Otherwise, `shared_ptr<T>()`.

8 [ *Note:* The seemingly equivalent expression `shared_ptr<T>(dynamic_cast<T*>(r.get()))` will eventually result in undefined behavior, attempting to delete the same object twice. — *end note* ]

9 `template<class T, class U> shared_ptr<T> const_pointer_cast(const shared_ptr<U>& r) noexcept;`

10 *Requires:* The expression `const_cast<T*>((U*)0)` shall be well formed.

11 *Returns:* `shared_ptr<T>(r, const_cast<typename shared_ptr<T>::element_type*>(r.get()))`.

12 [ *Note:* The seemingly equivalent expression `shared_ptr<T>(const_cast<T*>(r.get()))` will eventually result in undefined behavior, attempting to delete the same object twice. — *end note* ]

13 `template<class T, class U> shared_ptr<T> reinterpret_pointer_cast(const shared_ptr<U>& r) noexcept;`

14 *Requires:* The expression `reinterpret_cast<T*>((U*)0)` shall be well formed.

15 *Returns:* `shared_ptr<T>(r, reinterpret_cast<typename shared_ptr<T>::element_type*>(r.get()))`.

## 8.2.2 Class template weak\_ptr

[\[memory.smartptr.weak\]](#)

```

namespace std {
namespace experimental {
inline namespace fundamentals_v1 {

 template<class T> class weak_ptr {
 public:
 typedef typename remove_extent_t<T> element_type;

 // 8.2.2.1, weak_ptr constructors
 constexpr weak_ptr() noexcept;
 template<class Y> weak_ptr(shared_ptr<Y> const& r) noexcept;
 weak_ptr(weak_ptr const& r) noexcept;
 template<class Y> weak_ptr(weak_ptr<Y> const& r) noexcept;
 weak_ptr(weak_ptr&& r) noexcept;
 template<class Y> weak_ptr(weak_ptr<Y>&& r) noexcept;

 // C++14 §20.8.2.3.2
 ~weak_ptr();

 // C++14 §20.8.2.3.3
 weak_ptr& operator=(weak_ptr const& r) noexcept;
 template<class Y> weak_ptr& operator=(weak_ptr<Y> const& r) noexcept;
 template<class Y> weak_ptr& operator=(shared_ptr<Y> const& r) noexcept;
 weak_ptr& operator=(weak_ptr&& r) noexcept;
 template<class Y> weak_ptr& operator=(weak_ptr<Y>&& r) noexcept;

 // C++14 §20.8.2.3.4
 void swap(weak_ptr& r) noexcept;
 void reset() noexcept;

 // C++14 §20.8.2.3.5
 long use_count() const noexcept;
 bool expired() const noexcept;
 shared_ptr<T> lock() const noexcept;
 template<class U> bool owner_before(shared_ptr<U> const& b) const;
 template<class U> bool owner_before(weak_ptr<U> const& b) const;
 };

 // C++14 §20.8.2.3.6
 template<class T> void swap(weak_ptr<T>& a, weak_ptr<T>& b) noexcept;

} // namespace fundamentals_v1
} // namespace experimental
} // namespace std

```

## 8.2.2.1 weak\_ptr constructors

[\[memory.smartptr.weak.const\]](#)

```

1 weak_ptr(const weak_ptr& r) noexcept;
 template<class Y> weak_ptr(const weak_ptr<Y>& r) noexcept;
 template<class Y> weak_ptr(const shared_ptr<Y>& r) noexcept;

```

<sup>2</sup> *Requires:* The second and third constructors shall not participate in the overload resolution unless  $Y^*$  is compatible with  $T^*$ .

<sup>3</sup> *Effects:* If  $r$  is *empty*, constructs an *empty* `weak_ptr` object; otherwise, constructs a `weak_ptr` object that *shares ownership* with  $r$  and stores a copy of the pointer stored in  $r$ .

<sup>4</sup> *Postconditions:* `use_count() == r.use_count()`.

## 8.3 Type-erased allocator

[\[memory.type.erased.allocator\]](#)

<sup>1</sup> A *type-erased allocator* is an allocator or memory resource, `alloc`, used to allocate internal data structures for an object  $x$  of type  $C$ , but where  $C$  is not dependent on the type of `alloc`. Once `alloc` has been supplied to  $x$  (typically as a constructor argument), `alloc` can be retrieved from  $x$  only as a pointer `rp` of static type

`std::experimental::pmr::memory_resource*` (8.5). The process by which `rp` is computed from `alloc` depends on the type of `alloc` as described in Table 12:

Table 12 — Computed `memory_resource` for type-erased allocator

| If the type of <code>alloc</code> is                                | then the value of <code>rp</code> is                                                                                                                                                              |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| non-existent — no <code>alloc</code> specified                      | The value of <code>experimental::pmr::get_default_resource()</code> at the time of construction.                                                                                                  |
| <code>nullptr_t</code>                                              | The value of <code>experimental::pmr::get_default_resource()</code> at the time of construction.                                                                                                  |
| a pointer type convertible to <code>pmr::memory_resource*</code>    | <code>static_cast&lt;experimental::pmr::memory_resource*&gt;(alloc)</code>                                                                                                                        |
| <code>pmr::polymorphic_allocator&lt;U&gt;</code>                    | <code>alloc.resource()</code>                                                                                                                                                                     |
| any other type meeting the Allocator requirements (C++14 §17.6.3.5) | a pointer to a value of type <code>experimental::pmr::resource_adaptor&lt;A&gt;</code> where $A$ is the type of <code>alloc</code> . <code>rp</code> remains valid only for the lifetime of $x$ . |
| None of the above                                                   | The program is ill-formed.                                                                                                                                                                        |

<sup>2</sup> Additionally, class  $C$  shall meet the following requirements:

- `C::allocator_type` shall be identical to `std::experimental::erased_type`.
- `X.get_memory_resource()` returns `rp`.

8.4 Header `<experimental/memory_resource>` synopsis[\[memory.resource.synop\]](#)

```

namespace std {
namespace experimental {
inline namespace fundamentals_v1 {
namespace pmr {

 class memory_resource;

 bool operator==(const memory_resource& a,
 const memory_resource& b) noexcept;
 bool operator!=(const memory_resource& a,
 const memory_resource& b) noexcept;

```

## 8.5 Class `memory_resource`

[\[memory.resource\]](#)

### 8.5.1 Class `memory_resource` overview

[\[memory.resource.overview\]](#)

- <sup>1</sup> The `memory_resource` class is an abstract interface to an unbounded set of classes encapsulating memory resources.

```

class memory_resource {
 // For exposition only
 static constexpr size_t max_align = alignof(max_align_t);

public:
 virtual ~memory_resource();

 void* allocate(size_t bytes, size_t alignment = max_align);
 void deallocate(void* p, size_t bytes,
 size_t alignment = max_align);

```

```

 bool is_equal(const memory_resource& other) const noexcept;

protected:
 virtual void* do_allocate(size_t bytes, size_t alignment) = 0;
 virtual void do_deallocate(void* p, size_t bytes,
 size_t alignment) = 0;

 virtual bool do_is_equal(const memory_resource& other) const noexcept = 0;
};

```

## 8.5.2 memory\_resource public member functions

[memory\_resource.public]

```

1 ~memory_resource();
 2 Effects: Destroys this memory_resource.

3 void* allocate(size_t bytes, size_t alignment = max_align);
 4 Effects: Equivalent to return do_allocate(bytes, alignment);

5 void deallocate(void* p, size_t bytes, size_t alignment = max_align);
 6 Effects: Equivalent to do_deallocate(p, bytes, alignment);

7 bool is_equal(const memory_resource& other) const noexcept;
 8 Effects: Equivalent to return do_is_equal(other);

```

## 8.5.3 memory\_resource protected virtual member functions

[memory\_resource.priv]

```

1 virtual void* do_allocate(size_t bytes, size_t alignment) = 0;
 2 Requires: Alignment shall be a power of two.

 3 Returns: A derived class shall implement this function to return a pointer to allocated storage (C++14 §3.7.4.2) with
 a size of at least bytes. The returned storage is aligned to the specified alignment, if such alignment is supported;
 otherwise it is aligned to max_align.

 4 Throws: A derived class implementation shall throw an appropriate exception if it is unable to allocate memory with
 the requested size and alignment.

5 virtual void do_deallocate(void* p, size_t bytes, size_t alignment) = 0;
 6 Requires: p shall have been returned from a prior call to allocate(bytes, alignment) on a memory resource equal
 to *this, and the storage at p shall not yet have been deallocated.

 7 Effects: A derived class shall implement this function to dispose of allocated storage.

 8 Throws: Nothing.

```

```
9 virtual bool do_is_equal(const memory_resource& other) const noexcept = 0;
```

- <sup>10</sup> *Returns:* A derived class shall implement this function to return `true` if memory allocated from this can be deallocated from other and vice-versa; otherwise it shall return `false`. [ *Note:* The most-derived type of other might not match the type of this. For a derived class, D, a typical implementation of this function will compute `dynamic_cast<const D*>(&other)` and go no further (i.e., return `false`) if it returns `nullptr`. — *end note* ]

#### 8.5.4 memory\_resource equality

[\[memory\\_resource.eq\]](#)

```
1 bool operator==(const memory_resource& a, const memory_resource& b) noexcept;
```

- <sup>2</sup> *Returns:* `&a == &b || a.is_equal(b)`.

```
3 bool operator!=(const memory_resource& a, const memory_resource& b) noexcept;
```

- <sup>4</sup> *Returns:* `!(a == b)`.

### 8.6 Class template polymorphic\_allocator

[\[memory.polymorphic\\_allocator.class\]](#)

#### 8.6.1 Class template polymorphic\_allocator overview

[\[memory.polymorphic\\_allocator.overview\]](#)

- <sup>1</sup> A specialization of class template `pmr::polymorphic_allocator` conforms to the `Allocator` requirements (C++14 §17.6.3.5). Constructed with different memory resources, different instances of the same specialization of `pmr::polymorphic_allocator` can exhibit entirely different allocation behavior. This runtime polymorphism allows objects that use `polymorphic_allocator` to behave as if they used different allocator types at run time even though they use the same static allocator type.

```
template <class Tp>
class polymorphic_allocator {
 memory_resource* m_resource; // For exposition only

public:
 typedef Tp value_type;

 polymorphic_allocator() noexcept;
 polymorphic_allocator(memory_resource* r);

 polymorphic_allocator(const polymorphic_allocator& other) = default;

 template <class U>
 polymorphic_allocator(const polymorphic_allocator<U>& other) noexcept;

 polymorphic_allocator&
 operator=(const polymorphic_allocator& rhs) = default;

 Tp* allocate(size_t n);
 void deallocate(Tp* p, size_t n);

 template <class T, class... Args>
 void construct(T* p, Args&&... args);

 // Specializations for pair using piecewise construction
 template <class T1, class T2, class... Args1, class... Args2>
 void construct(pair<T1,T2>* p, piecewise_construct_t,
```

```

 tuple<Args1...> x, tuple<Args2...> y);
template <class T1, class T2>
 void construct(pair<T1,T2>* p);
template <class T1, class T2, class U, class V>
 void construct(pair<T1,T2>* p, U&& x, V&& y);
template <class T1, class T2, class U, class V>
 void construct(pair<T1,T2>* p, const std::pair<U, V>& pr);
template <class T1, class T2, class U, class V>
 void construct(pair<T1,T2>* p, pair<U, V>&& pr);

template <class T>
 void destroy(T* p);

// Return a default-constructed allocator (no allocator propagation)
polymorphic_allocator select_on_container_copy_construction() const;

memory_resource* resource() const;
};

```

### 8.6.2 polymorphic\_allocator constructors

[\[memory.polymorphic.allocator.ctor\]](#)

```

1 polymorphic_allocator() noexcept;
 2 Effects: Sets m_resource to get_default_resource().

3 polymorphic_allocator(memory_resource* r);
 4 Requires: r is non-null.
 5 Effects: Sets m_resource to r.
 6 Throws: Nothing
 7 Notes: This constructor provides an implicit conversion from memory_resource*.

8 template <class U>
 polymorphic_allocator(const polymorphic_allocator<U>& other) noexcept;
 9 Effects: Sets m_resource to other.resource().

```

### 8.6.3 polymorphic\_allocator member functions

[\[memory.polymorphic.allocator.mem\]](#)

```

1 Tp* allocate(size_t n);
 2 Returns: Equivalent to return static_cast<Tp*>(m_resource->allocate(n * sizeof(Tp), alignof(Tp)));

3 void deallocate(Tp* p, size_t n);
 4 Requires: p was allocated from a memory resource, x, equal to *m_resource, using
 x.allocate(n * sizeof(Tp), alignof(Tp)).
 5 Effects: Equivalent to m_resource->deallocate(p, n * sizeof(Tp), alignof(Tp)).
 6 Throws: Nothing.

```

```
7 template <class T, class... Args>
 void construct(T* p, Args&&... args);
```

<sup>8</sup> **Requires:** *Uses-allocator construction* of `T` with allocator `this->resource()` (see 2.1) and constructor arguments `std::forward<Args>(args)...` is well-formed. [ *Note: uses-allocator construction is always well formed for types that do not use allocators. — end note* ]

<sup>9</sup> **Effects:** Construct a `T` object at `p` by *uses-allocator construction* with allocator `this->resource()` (2.1) and constructor arguments `std::forward<Args>(args)...`

<sup>10</sup> **Throws:** Nothing unless the constructor for `T` throws.

```
11 template <class T1, class T2, class... Args1, class... Args2>
 void construct(pair<T1,T2>* p, piecewise_construct_t,
 tuple<Args1...> x, tuple<Args2...> y);
```

<sup>12</sup> **Effects:** Let `xprime` be a tuple constructed from `x` according to the appropriate rule from the following list. [ *Note: The following description can be summarized as constructing a `std::pair<T1,T2>` object at `p` as if by separate *uses-allocator construction* with allocator `this->resource()` (2.1) of `p->first` using the elements of `x` and `p->second` using the elements of `y`. — end note* ]

- If `uses_allocator_v<T1,memory_resource*>` is false and `is_constructible_v<T,Args1...>` is true, then `xprime` is `x`.
- Otherwise, if `uses_allocator_v<T1,memory_resource*>` is true and `is_constructible_v<T1,allocator_arg_t,memory_resource*,Args1...>` is true, then `xprime` is `tuple_cat(make_tuple(allocator_arg, this->resource()), std::move(x))`.
- Otherwise, if `uses_allocator_v<T1,memory_resource*>` is true and `is_constructible_v<T1,Args1...,memory_resource*>` is true, then `xprime` is `tuple_cat(std::move(x), make_tuple(this->resource()))`.
- Otherwise the program is ill formed.

and let `yprime` be a tuple constructed from `y` according to the appropriate rule from the following list:

- If `uses_allocator_v<T2,memory_resource*>` is false and `is_constructible_v<T,Args2...>` is true, then `yprime` is `y`.
- Otherwise, if `uses_allocator_v<T2,memory_resource*>` is true and `is_constructible_v<T2,allocator_arg_t,memory_resource*,Args2...>` is true, then `yprime` is `tuple_cat(make_tuple(allocator_arg, this->resource()), std::move(y))`.
- Otherwise, if `uses_allocator_v<T2,memory_resource*>` is true and `is_constructible_v<T2,Args2...,memory_resource*>` is true, then `yprime` is `tuple_cat(std::move(y), make_tuple(this->resource()))`.
- Otherwise the program is ill formed.

then this function constructs a `std::pair<T1,T2>` object at `p` using constructor arguments `piecewise_construct`, `xprime`, `yprime`.

```
13 template <class T1, class T2>
 void construct(std::pair<T1,T2>* p);
```

<sup>14</sup> **Effects:** Equivalent to `this->construct(p, piecewise_construct, tuple<>(), tuple<>())`;

```
15 template <class T1, class T2, class U, class V>
 void construct(std::pair<T1,T2>* p, U&& x, V&& y);
```

<sup>16</sup> **Effects:** Equivalent to `this->construct(p, piecewise_construct, forward_as_tuple(std::forward<U>(x)), forward_as_tuple(std::forward<V>(y)))`;

```

17 template <class T1, class T2, class U, class V>
 void construct(std::pair<T1,T2>* p, const std::pair<U, V>& pr);

18 Effects: Equivalent to this->construct(p, piecewise_construct, forward_as_tuple(pr.first),
 forward_as_tuple(pr.second));

19 template <class T1, class T2, class U, class V>
 void construct(std::pair<T1,T2>* p, std::pair<U, V>&& pr);

20 Effects: Equivalent to this->construct(p, piecewise_construct,
 forward_as_tuple(std::forward<U>(pr.first)), forward_as_tuple(std::forward<V>(pr.second)));

21 template <class T>
 void destroy(T* p);

22 Effects: p->~T().

23 polymorphic_allocator select_on_container_copy_construction() const;

24 Returns: polymorphic_allocator().

25 memory_resource* resource() const;

26 Returns: m_resource.

```

#### 8.6.4 polymorphic\_allocator equality

[\[memory.polymorphic\\_allocator.eq\]](#)

```

1 template <class T1, class T2>
 bool operator==(const polymorphic_allocator<T1>& a,
 const polymorphic_allocator<T2>& b) noexcept;

2 Returns: *a.resource() == *b.resource().

3 template <class T1, class T2>
 bool operator!=(const polymorphic_allocator<T1>& a,
 const polymorphic_allocator<T2>& b) noexcept;

4 Returns: ! (a == b)

```

### 8.7 template alias resource\_adaptor

[\[memory.resource.adaptor\]](#)

#### 8.7.1 resource\_adaptor

[\[memory.resource.adaptor.overview\]](#)

<sup>1</sup> An instance of `resource_adaptor<Allocator>` is an adaptor that wraps a `memory_resource` interface around `Allocator`. In order that `resource_adaptor<X<T>>` and `resource_adaptor<X<U>>` are the same type for any allocator template `x` and types `T` and `U`, `resource_adaptor<Allocator>` is rendered as an alias to a class template such that `Allocator` is rebound to a `char` value type in every specialization of the class template. The requirements on this class template are defined below. The name `resource_adaptor_imp` is for exposition only and is not normative, but the definitions of the members of that class, whatever its name, are normative. In addition to the `Allocator` requirements (C++14 §17.6.3.5), the parameter to `resource_adaptor` shall meet the following additional requirements:

- `typename allocator_traits<Allocator>::pointer` shall be identical to `typename allocator_traits<Allocator>::value_type*`.
- `typename allocator_traits<Allocator>::const_pointer` shall be identical to `typename allocator_traits<Allocator>::value_type const*`.
- `typename allocator_traits<Allocator>::void_pointer` shall be identical to `void*`.
- `typename allocator_traits<Allocator>::const_void_pointer` shall be identical to `void const*`.
