Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 22, *Programming languages, their environments and system software interfaces*.

Programming languages — C++ Extensions for ranges

1 Scope

[intro.scope]

¹ This document describes extensions to the C++ Programming Language (2) that permit operations on ranges of data. These extensions include changes and additions to the existing library facilities as well as the extension of one core language facility. In particular, changes and extensions to the Standard Library include:

- (1.1) — The formulation of the foundational and iterator concept requirements using the syntax of the Concepts TS (2).
- (1.2) — Analogues of the Standard Library algorithms specified in terms of the new concepts.
- (1.3) — The loosening of the algorithm constraints to permit the use of *sentinels* to denote the end of a range and corresponding changes to algorithm return types where necessary.
- (1.4) — The addition of new concepts describing *range* and *view* abstractions; that is, objects with a begin iterator and an end sentinel.
- (1.5) — New algorithm overloads that take range objects.
- (1.6) — Support of *callable objects* (as opposed to *function objects*) passed as arguments to the algorithms.
- (1.7) — The addition of optional *projection* arguments to the algorithms to permit on-the-fly data transformations.
- (1.8) — Analogues of the iterator primitives and new primitives in support of the addition of sentinels to the library.
- (1.9) — Constrained analogues of the standard iterator adaptors and stream iterators that satisfy the new iterator concepts.
- (1.10) — New iterator adaptors (`counted_iterator` and `common_iterator`) and sentinels (`unreachable`).

² Changes to the core language include:

- (2.1) — the extension of the range-based `for` statement to support the new iterator range requirements (10.4).

³ This document does not specify constrained analogues of other parts of the Standard Library (e.g., the numeric algorithms), nor does it add range support to all the places that could benefit from it (e.g., the containers).

⁴ This document does not specify any new range views, actions, or facade or adaptor utilities; all are left as future work.

2 Normative references

[intro.refs]

¹ The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

- (1.1) — ISO/IEC 14882:2014, *Programming Languages - C++*
- (1.2) — ISO/IEC TS 19217:2015, *Programming Languages - C++ Extensions for Concepts*

ISO/IEC 14882:2014 is herein called the *C++ Standard* and ISO/IEC TS 19217:2015 is called the *Concepts TS*.

3 Terms and definitions

[intro.defs]

For the purposes of this document, the terms and definitions given in ISO/IEC 14882:2014, ISO/IEC TS 19217:2015, and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <http://www.iso.org/obp>

— IEC Electropedia: available at <http://www.electropedia.org/>

3.1

[defns.expr.equiv]

expression-equivalent

relationship that exists between two expressions E1 and E2 such that

- E1 and E2 have the same effects,
- `noexcept(E1) == noexcept(E2)`, and
- E1 is a constant subexpression — an expression whose evaluation as subexpression of a conditional-expression CE (ISO/IEC 14882:2014 §5.16) would not prevent CE from being a core constant expression (ISO/IEC 14882:2014 §5.19) — if and only if E2 is a constant subexpression

3.2

[defns.projection]

projection

⟨function object argument⟩ transformation which an algorithm applies before inspecting the values of elements

[Example:

```
std::pair<int, const char*> pairs[] = {{2, "foo"}, {1, "bar"}, {0, "baz"}};
ranges::sort(pairs, std::less<>(), [](auto const& p) { return p.first; });
```

sorts the pairs in increasing order of their **first** members:

```
{{0, "baz"}, {1, "bar"}, {2, "foo"}}
```

— end example]

4 General principles

[intro]

4.1 Implementation compliance

[intro.compliance]

- ¹ Conformance requirements for this specification are the same as those defined in ISO/IEC 14882:2014 §1.4. [Note: Conformance is defined in terms of the behavior of programs. — end note]

4.2 Namespaces, headers, and modifications to standard classes [intro.namespaces]

- ¹ Since the extensions described in this document are experimental and not part of the C++ standard library, they should not be declared directly within namespace `std`. Unless otherwise specified, all components described in this document either:
 - (1.1) — modify an existing interface in the C++ Standard Library in-place,
 - (1.2) — are declared in namespace `std::experimental::ranges::v1`.
- ² The International Standard, ISO/IEC 14882, together with ISO/IEC TS 19217:2015 (the Concepts TS), provide important context and specification for this document. In places, this document suggests changes to be made to components in namespace `std` in-place. In other places, entire chapters and sections are copied from ISO/IEC 14882 and modified so as to define similar but different components in namespace `std::experimental::ranges::v1`.
- ³ Instructions to modify or add paragraphs are written as explicit instructions. Modifications made to existing text from the International Standard use underlining to represent added text and ~~striketrough~~ to represent deleted text.
- ⁴ This document assumes that the contents of the `std::experimental::ranges::v1` namespace will become a new constrained version of the C++ Standard Library that will be delivered alongside the existing unconstrained version.
- ⁵ Unless otherwise specified, references to other entities described in this document are assumed to be qualified with `std::experimental::ranges::`, and references to entities described in the International Standard are assumed to be qualified with `std::`.
- ⁶ New header names are prefixed with `experimental/ranges/`. Where the final element of a new header name is the same as an existing standard header name (e.g., `<experimental/ranges/algorithm>`), the new header shall include the standard header as if by

```
#include <algorithm>
```

5 Statements

[stmt]

5.1 Iteration statements

[stmt.iter]

5.1.1 The range-based for statement

[stmt.ranged]

¹ [Note: This clause is presented as a set of differences to apply to ISO/IEC 14882:2014 §6.5.4 to allow differently typed begin and end iterators, as in C++17. — end note]

² For a range-based for statement of the form

```
for ( for-range-declaration : expression ) statement
let range-init be equivalent to the expression surrounded by parentheses
( expression )
and for a range-based for statement of the form
```

```
for ( for-range-declaration : braced-init-list ) statement
let range-init be equivalent to the braced-init-list. In each case, a range-based for statement is
equivalent to
```

```
{
    auto && __range = range-init;
    for ( auto __begin = begin-expr,
          __end = end-expr;
          __begin != __end;
          ++__begin ) {
        for-range-declaration = *__begin;
        statement
    }
}
```

The range-based for statement

```
for ( for-range-declaration : for-range-initializer ) statement
is equivalent to
```

```
{
    auto &&__range = for-range-initializer;
    auto __begin = begin-expr;
    auto __end = end-expr;
    for ( ; __begin != __end; ++__begin ) {
        for-range-declaration = *__begin;
        statement
    }
}
```

where

(2.1) if the *for-range-initializer* is an *expression*, it is regarded as if it were surrounded by parentheses (so that a comma operator cannot be reinterpreted as delimiting two *init-declarators*);

(2.2) — *__range*, *__begin*, and *__end* are variables defined for exposition only; and *__RangeT* is the type of the expression, and *begin-expr* and *end-expr* are determined as follows:

(2.3) — *begin-expr* and *end-expr* are determined as follows:

(2.3.1) — if *__RangeT* the *for-range-initializer* is an *expression* of array type *R*, *begin-expr* and *end-expr* are *__range* and *__range* + *__bound*, respectively, where *__bound* is the array bound. If *__RangeT* is an array of unknown *size* *bound* or an array of incomplete type, the program is ill-formed;

- (2.3.2) — if `__range` the *for-range-initializer* is an expression of class type `C`, the *unqualified-ids* `begin` and `end` are looked up in the scope of `class __range` as if by class member access lookup (3.4.5), and if either (or both) finds at least one declaration, *begin-expr* and *end-expr* are `__range.begin()` and `__range.end()`, respectively;
- (2.3.3) — otherwise, *begin-expr* and *end-expr* are `begin(__range)` and `end(__range)`, respectively, where `begin` and `end` are looked up in the associated namespaces (3.4.2). [*Note*: Ordinary unqualified lookup (3.4.1) is not performed. — *end note*]

[*Example*:

```
int array[5] = { 1, 2, 3, 4, 5 };
for (int& x : array)
    x *= 2;
```

— *end example*]

- 3 In the *decl-specifier-seq* of a *for-range-declaration*, each *decl-specifier* shall be either a *type-specifier* or *constexpr*. The *decl-specifier-seq* shall not define a class or enumeration.

6 Library introduction [library]

6.1 General [library.general]

- 1 This Clause describes the contents of the *Ranges library*, how a well-formed C++ program makes use of the library, and how a conforming implementation may provide the entities in the library.
- 2 Clause 6.3, Clauses 7 through 12, and Annex Annex A specify the contents of the library, as well as library requirements and constraints on both well-formed C++ programs and conforming implementations.
- 3 Detailed specifications for each of the components in the library are in Clauses 7–12, as shown in Table 1.

Table 1 — Library categories

Clause	Category
7	Concepts library
8	General utilities library
9	Iterators library
10	Ranges library
11	Algorithms library
12	Numerics library

- 4 The concepts library (Clause 7) describes library components that C++ programs may use to perform compile-time validation of template parameters and perform function dispatch based on properties of types.
- 5 The general utilities library (Clause 8) includes components used by other library elements and components used as infrastructure in C++ programs, such as function objects.
- 6 The iterators library (Clause 9) describes components that C++ programs may use to perform iterations over containers (Clause ISO/IEC 14882:2014 §23), streams (ISO/IEC 14882:2014 §27.7), stream buffers (ISO/IEC 14882:2014 §27.6), and ranges (10).
- 7 The ranges library (Clause 10) describes components for dealing with ranges of elements.
- 8 The algorithms library (Clause 11) describes components that C++ programs may use to perform algorithmic operations on containers (Clause ISO/IEC 14882:2014 §23) and other sequences.
- 9 The numerics library (Clause 12) provides concepts that are useful to constrain numeric algorithms.

6.2 Method of description (Informative) [description]

- 1 This subclause describes the conventions used to specify the Ranges library. 6.2.1 describes the structure of the normative Clauses 7 through 12 and Annex Annex A. 6.2.2 describes other editorial conventions.

6.2.1 Structure of each clause

[structure]

6.2.1.1 Elements

[structure.elements]

¹ Each library clause contains the following elements, as applicable:¹

- (1.1) — Summary
- (1.2) — Requirements
- (1.3) — Detailed specifications

6.2.1.2 Summary

[structure.summary]

¹ The Summary provides a synopsis of the category, and introduces the first-level subclauses. Each subclause also provides a summary, listing the headers specified in the subclause and the library entities provided in each header.

² Paragraphs labeled “Note(s):” or “Example(s):” are informative, other paragraphs are normative.

³ The contents of the summary and the detailed specifications include:

- (3.1) — macros
- (3.2) — values
- (3.3) — types
- (3.4) — classes and class templates
- (3.5) — functions and function templates
- (3.6) — objects
- (3.7) — concepts

6.2.1.3 Requirements

[structure.requirements]

¹ Requirements describe constraints that shall be met by a C++ program that extends the Ranges library. Such extensions are generally one of the following:

- (1.1) — Template arguments
- (1.2) — Derived classes
- (1.3) — Containers, iterators, and algorithms that meet an interface convention or satisfy a concept

² Interface convention requirements are stated as generally as possible. Instead of stating “class X has to define a member function `operator++()`,” the interface requires “for any object `x` of class X, `++x` is defined.” That is, whether the operator is a member is unspecified.

³ Requirements are stated in terms of concepts (Concepts TS [dcl.spec.concept]). Concepts are stated in terms of well-defined expressions that define valid terms of the types that satisfy the concept. For every set of well-defined expression requirements there is a named concept that specifies an initial set of the valid expressions and their semantics. Any generic algorithm (Clause 11) that uses the well-defined expression requirements is described in terms of the valid expressions for its formal type parameters.

⁴ Template argument requirements are sometimes referenced by name. See ISO/IEC 14882:2014 §17.5.2.1.

⁵ In some cases the semantic requirements are presented as C++ code. Such code is intended as a specification of equivalence of a construct to another construct, not necessarily as the way the construct must be implemented.²

⁶ Required operations of any concept defined in this document need not be total functions; that is, some arguments to a required operation may result in the required semantics failing to be satisfied. [*Example*: The required `<` operator of the `StrictTotallyOrdered` concept (7.4.4) does not meet the semantic requirements of that concept when operating on NaNs. — *end example*] This does not affect whether a type satisfies the concept.

⁷ A declaration may explicitly impose requirements through its associated constraints (Concepts TS [temp.constr.decl]). When the associated constraints refer to a concept (Concepts TS [dcl.spec.concept]), additional semantic requirements are imposed on the use of the declaration.

¹ To save space, items that do not apply to a Clause are omitted. For example, if a Clause does not specify any requirements, there will be no “Requirements” subclause.

² Although in some cases the code given is unambiguously the optimum implementation.

6.2.1.4 Detailed specifications**[structure.specifications]**

- ¹ The detailed specifications of each entity defined in Clauses 7–12 follow the conventions established by ISO/IEC 14882:2014 §17.5.1.4.

6.2.2 Other conventions**[conventions]**

- ¹ This subclause describes several editorial conventions used to describe the contents of the Ranges library. These conventions are for describing member functions (6.2.2.1), and private members (6.2.2.2).

6.2.2.1 Functions within classes**[functions.within.classes]**

- ¹ This document follows the same conventions as specified in ISO/IEC 14882:2014 §17.5.2.2.

6.2.2.2 Private members**[objects.within.classes]**

- ¹ This document follows the same conventions as specified in ISO/IEC 14882:2014 §17.5.2.3.

6.3 Library-wide requirements**[requirements]**

- ¹ This subclause specifies requirements that apply to the entire Ranges library. Clauses 7 through 12 and Annex Annex A specify the requirements of individual entities within the library.
- ² Requirements specified in terms of interactions between threads do not apply to programs having only a single thread of execution.
- ³ Within this subclause, 6.3.1 describes the library's contents and organization, 6.3.3 describes how well-formed C++ programs gain access to library entities, 6.3.4 describes constraints on well-formed C++ programs, and 6.3.5 describes constraints on conforming implementations.

6.3.1 Library contents and organization**[organization]**

- ¹ 6.3.1.1 describes the entities and macros defined in the Ranges library.

6.3.1.1 Library contents**[contents]**

- ¹ The Ranges library provides definitions for the entities and macros specified in the Ranges library headers (6.3.2).
- ² All library entities are defined within an inline namespace `v1` within the namespace `std::experimental::ranges` or namespaces nested within namespace `std::experimental::ranges::v1`. It is unspecified whether names declared in a specific namespace are declared directly in that namespace or in an inline namespace inside that namespace.

6.3.2 Headers**[headers]**

- ¹ Each element of the Ranges library is declared or defined (as appropriate) in a header.
- ² The Ranges library provides the Ranges library headers, shown in Table 2.

Table 2 — Ranges TS library headers

<code><experimental/ranges/algorithm></code>	<code><experimental/ranges/range></code>
<code><experimental/ranges/concepts></code>	<code><experimental/ranges/tuple></code>
<code><experimental/ranges/functional></code>	<code><experimental/ranges/type_traits></code>
<code><experimental/ranges/iterator></code>	<code><experimental/ranges/utility></code>
<code><experimental/ranges/random></code>	

6.3.3 Using the library**[using]****6.3.3.1 Overview****[using.overview]**

- ¹ This section describes how a C++ program gains access to the facilities of the Ranges library. 6.3.3.2 describes effects during translation phase 4, while 6.3.3.3 describes effects during phase 8 (ISO/IEC 14882:2014 §2.2).

6.3.3.2 Headers**[using.headers]**

The entities in the Ranges library are defined in headers, the use of which is governed by the same requirements as specified in ISO/IEC 14882:2014 §17.6.2.2.

6.3.3.3 Linkage [using.linkage]

- ¹ Entities in the C++ standard library have external linkage (ISO/IEC 14882:2014 §3.5). Unless otherwise specified, objects and functions have the default `extern "C++"` linkage (ISO/IEC 14882:2014 §7.5).

6.3.4 Constraints on programs [constraints]

6.3.4.1 Overview [constraints.overview]

- ¹ This section describes restrictions on C++ programs that use the facilities of the Ranges library. The following subclauses specify constraints on the program's use of Ranges library classes as base classes (6.3.4.2) and other constraints.

6.3.4.2 Derived classes [derived.classes]

- ¹ Virtual member function signatures defined for a base class in the Ranges library may be overridden in a derived class defined in the program (ISO/IEC 14882:2014 §10.3).

6.3.4.3 Other functions [res.on.functions]

- ¹ In certain cases (operations on types used to instantiate Ranges library template components), the Ranges library depends on components supplied by a C++ program. If these components do not meet their requirements, this document places no requirements on the implementation.
- ² In particular, the effects are undefined if an incomplete type (ISO/IEC 14882:2014 §3.9) is used as a template argument when instantiating a template component or evaluating a concept, unless specifically allowed for that component.

6.3.4.4 Function arguments [res.on.arguments]

- ¹ The constraints on arguments passed to C++ standard library function as specified in ISO/IEC 14882:2014 §17.6.4.9 also apply to arguments passed to functions in the Ranges library.

6.3.4.5 Library object access [res.on.objects]

- ¹ The constraints on object access by C++ standard library functions as specified in ISO/IEC 14882:2014 §17.6.4.10 also apply to object access by functions in the Ranges library.

6.3.4.6 Requires paragraph [res.on.required]

- ¹ Violation of the preconditions specified in a function's *Requires*: paragraph results in undefined behavior unless the function's *Throws*: paragraph specifies throwing an exception when the precondition is violated.

6.3.4.7 Semantic requirements [res.on.requirements]

- ¹ If the semantic requirements of a declaration's constraints (6.2.1.3) are not satisfied at the point of use, the program is ill-formed, no diagnostic required.

6.3.5 Conforming implementations [conforming]

- ¹ The constraints upon, and latitude of, implementations of the Ranges library follow the same constraints and latitudes for implementations of the C++ standard library as specified in ISO/IEC 14882:2014 §17.6.5.

6.3.5.1 Customization Point Objects [customization.point.object]

- ¹ A *customization point object* is a function object (8.3) with a literal class type that interacts with user-defined types while enforcing semantic requirements on that interaction.
- ² The type of a customization point object shall satisfy `Semiregular` (7.5.3).
- ³ All instances of a specific customization point object type shall be equal (7.1.1).
- ⁴ The type of a customization point object `T` shall satisfy `Invocable<const T, Args...>` (7.6.2) when the types of `Args...` meet the requirements specified in that customization point object's definition. Otherwise, `T` shall not have a function call operator that participates in overload resolution.
- ⁵ Each customization point object type constrains its return type to satisfy a particular concept.
- ⁶ The library defines several named customization point objects. In every translation unit where such a name is defined, it shall refer to the same instance of the customization point object.
- ⁷ [Note: Many of the customization point objects in the library evaluate function call expressions with an unqualified name which results in a call to a user-defined function found by argument dependent name

lookup (ISO/IEC 14882:2014 §3.4.2). To preclude such an expression resulting in a call to unconstrained functions with the same name in namespace `std`, customization point objects specify that lookup for these expressions is performed in a context that includes deleted overloads matching the signatures of overloads defined in namespace `std`. When the deleted overloads are viable, user-defined overloads must be more specialized (ISO/IEC 14882:2014 §14.5.6.2) or more constrained (Concepts TS [temp.constr.order]) to be used by a customization point object. — *end note*

7 Concepts library

[`concepts.lib`]

7.1 General

[`concepts.lib.general`]

- ¹ This Clause describes library components that C++ programs may use to perform compile-time validation of template parameters and perform function dispatch based on properties of types. The purpose of these concepts is to establish a foundation for equational reasoning in programs.
- ² The following subclauses describe core language concepts, comparison concepts, object concepts, and function concepts as summarized in Table 3.

Table 3 — Fundamental concepts library summary

	Subclause	Header(s)
7.3	Core language concepts	<experimental/ranges/concepts>
7.4	Comparison concepts	
7.5	Object concepts	
7.6	Callable concepts	

7.1.1 Equality Preservation

[`concepts.lib.general.equality`]

- ¹ An expression is *equality preserving* if, given equal inputs, the expression results in equal outputs. The inputs to an expression are the set of the expression's operands. The output of an expression is the expression's result and all operands modified by the expression.
- ² Not all input values must be valid for a given expression; e.g., for integers `a` and `b`, the expression `a / b` is not well-defined when `b` is 0. This does not preclude the expression `a / b` being equality preserving. The *domain* of an expression is the set of input values for which the expression is required to be well-defined.
- ³ Expressions required by this specification to be equality preserving are further required to be stable: two evaluations of such an expression with the same input objects must have equal outputs absent any explicit intervening modification of those input objects. [*Note*: This requirement allows generic code to reason about the current values of objects based on knowledge of the prior values as observed via equality preserving expressions. It effectively forbids spontaneous changes to an object, changes to an object from another thread of execution, changes to an object as side effects of non-modifying expressions, and changes to an object as side effects of modifying a distinct object if those changes could be observable to a library function via an equality preserving expression that is required to be valid for that object. — *end note*]
- ⁴ Expressions declared in a *requires-expression* in this document are required to be equality preserving, except for those annotated with the comment “not required to be equality preserving.” An expression so annotated may be equality preserving, but is not required to be so.
- ⁵ An expression that may alter the value of one or more of its inputs in a manner observable to equality preserving expressions is said to modify those inputs. This document uses a notational convention to specify which expressions declared in a *requires-expression* modify which inputs: except where otherwise specified, an expression operand that is a non-constant lvalue or rvalue may be modified. Operands that are constant lvalues or rvalues must not be modified.
- ⁶ Where a *requires-expression* declares an expression that is non-modifying for some constant lvalue operand, additional variations of that expression that accept a non-constant lvalue or (possibly constant) rvalue for the given operand are also required except where such an expression variation is explicitly required with differing semantics. These *implicit expression variations* must meet the semantic requirements of the declared expression. The extent to which an implementation validates the syntax of the variations is unspecified.

[*Example*:

```

template <class T>
concept bool C =
    requires(T a, T b, const T c, const T d) {
        c == d;           // #1
        a = std::move(b); // #2
        a = c;            // #3
    };

```

Expression #1 does not modify either of its operands, #2 modifies both of its operands, and #3 modifies only its first operand `a`.

Expression #1 implicitly requires additional expression variations that meet the requirements for `c == d` (including non-modification), as if the expressions

```

a == d;      a == b;      a == move(b);      a == d;
c == a;      c == move(a); c == move(d);
move(a) == d; move(a) == b; move(a) == move(b); move(a) == move(d);
move(c) == b; move(c) == move(b); move(c) == d; move(c) == move(d);

```

had been declared as well.

Expression #3 implicitly requires additional expression variations that meet the requirements for `a = c` (including non-modification of the second operand), as if the expressions `a = b` and `a = move(c)` had been declared. Expression #3 does not implicitly require an expression variation with a non-constant rvalue second operand, since expression #2 already specifies exactly such an expression explicitly. — *end example*]

[*Example:* The following type `T` meets the explicitly stated syntactic requirements of concept `C` above but does not meet the additional implicit requirements:

```

struct T {
    bool operator==(const T&) const { return true; }
    bool operator==(T&) = delete;
};

```

`T` fails to meet the implicit requirements of `C`, so `C<T>` is not satisfied. Since implementations are not required to validate the syntax of implicit requirements, it is unspecified whether or not an implementation diagnoses as ill-formed a program which requires `C<T>`. — *end example*]

7.2 Header `<experimental/ranges/concepts>` synopsis [`concepts.lib.synopsis`]

```

7.3 Core language concepts

[concepts.lib.corelang]

7.3.1 General

[concepts.lib.corelang.general]

- 1 This section contains the definition of concepts corresponding to language features. These concepts express relationships between types, type classifications, and fundamental type properties.

7.3.2 Concept Same

[concepts.lib.corelang.same]

```

template <class T, class U>
concept bool Same = is_same<T, U>::value; // see below

```

- 1 There need not be any subsumption relationship between Same<T, U> and is_same<T, U>::value.
- 2 *Remarks:* For the purposes of constraint checking, Same<T, U> implies Same<U, T>.

7.3.3 Concept DerivedFrom

[concepts.lib.corelang.derived]

```

template <class T, class U>
concept bool DerivedFrom =
    is_base_of<U, T>::value &&
    is_convertible<remove_cv_t<T>*, remove_cv_t<U>*>::value; // see below

```

- 1 There need not be any subsumption relationship between DerivedFrom<T, U> and either is_base_of<U, T>::value or is_convertible<remove_cv_t<T>*, remove_cv_t<U>*>::value.
- 2 [*Note:* DerivedFrom<T, U> is satisfied if and only if T is publicly and unambiguously derived from U, or T and U are the same class type ignoring cv-qualifiers. — end note]

7.3.4 Concept ConvertibleTo

[concepts.lib.corelang.convertibleto]

```
template <class T, class U>
concept bool ConvertibleTo =
    is_convertible<From, To>::value && // see below
    requires(From (&f)()) {
        static_cast<To>(f());
    };
```

1 Let **test** be the invented function:

```
To test(From (&f)()) {
    return f();
}
```

and let **f** be a function with no arguments and return type **From** such that **f()** is equality preserving. **ConvertibleTo<From, To>** is satisfied only if:

- (1.1) — **To** is not an object or reference-to-object type, or **static_cast<To>(f())** is equal to **test(f)**.
- (1.2) — **From** is not a reference-to-object type, or
- (1.2.1) — If **From** is an rvalue reference to a non const-qualified type, the resulting state of the object referenced by **f()** after either above expression is valid but unspecified (ISO/IEC 14882:2014 §17.6.5.15).
- (1.2.2) — Otherwise, the object referred to by **f()** is not modified by either above expression.

2 There need not be any subsumption relationship between **ConvertibleTo<From, To>** and **is_convertible<From, To>::value**.

7.3.5 Concept CommonReference

[concepts.lib.corelang.commonref]

1 For two types **T** and **U**, if **common_reference_t<T, U>** is well-formed and denotes a type **C** such that both **ConvertibleTo<T, C>** and **ConvertibleTo<U, C>** are satisfied, then **T** and **U** share a *common reference type*, **C**. [Note: **C** could be the same as **T**, or **U**, or it could be a different type. **C** may be a reference type. **C** need not be unique. — end note]

```
template <class T, class U>
concept bool CommonReference =
    Same<common_reference_t<T, U>, common_reference_t<U, T>> &&
    ConvertibleTo<T, common_reference_t<T, U>> &&
    ConvertibleTo<U, common_reference_t<T, U>>;
```

2 Let **C** be **common_reference_t<T, U>**. Let **t** be a function whose return type is **T**, and let **u** be a function whose return type is **U**. **CommonReference<T, U>** is satisfied only if:

- (2.1) — **C(t())** equals **C(t())** if and only if **t()** is an equality preserving expression (7.1.1).
- (2.2) — **C(u())** equals **C(u())** if and only if **u()** is an equality preserving expression.

3 [Note: Users can customize the behavior of **CommonReference** by specializing the **basic_common_reference** class template (8.4.3). — end note]

7.3.6 Concept Common

[concepts.lib.corelang.common]

1 If **T** and **U** can both be explicitly converted to some third type, **C**, then **T** and **U** share a *common type*, **C**. [Note: **C** could be the same as **T**, or **U**, or it could be a different type. **C** may not be unique. — end note]

```
template <class T, class U>
concept bool Common =
    Same<common_type_t<T, U>, common_type_t<U, T>> &&
    ConvertibleTo<T, common_type_t<T, U>> &&
    ConvertibleTo<U, common_type_t<T, U>> &&
    CommonReference<
        add_lvalue_reference_t<const T>,
        add_lvalue_reference_t<const U>> &&
    CommonReference<
        add_lvalue_reference_t<common_type_t<T, U>>,
```

```
common_reference_t<
    add_lvalue_reference_t<const T>,
    add_lvalue_reference_t<const U>>>;
```

2 Let `C` be `common_type_t<T, U>`. Let `t` be a function whose return type is `T`, and let `u` be a function whose return type is `U`. `Common<T, U>` is satisfied only if:

(2.1) — `C(t())` equals `C(t())` if and only if `t()` is an equality preserving expression (7.1.1).

(2.2) — `C(u())` equals `C(u())` if and only if `u()` is an equality preserving expression (7.1.1).

3 [Note: Users can customize the behavior of `Common` by specializing the `common_type` class template (8.4.2). — end note]

7.3.7 Concept Integral

[`concepts.lib.corelang.integral`]

```
template <class T>
concept bool Integral = is_integral<T>::value; // see below
```

1 There need not be any subsumption relationship between `Integral<T>` and `is_integral<T>::value`.

7.3.8 Concept SignedIntegral

[`concepts.lib.corelang.signedintegral`]

```
template <class T>
concept bool SignedIntegral = Integral<T> && is_signed<T>::value; // see below
```

1 There need not be any subsumption relationship between `SignedIntegral<T>` and `is_signed<T>::value`.

2 [Note: `SignedIntegral<T>` may be satisfied even for types that are not signed integral types (ISO/IEC 14882:2014 §3.9.1); for example, `char`. — end note]

7.3.9 Concept UnsignedIntegral

[`concepts.lib.corelang.unsignedintegral`]

```
template <class T>
concept bool UnsignedIntegral = Integral<T> && !SignedIntegral<T>;
```

1 [Note: `UnsignedIntegral<T>` may be satisfied even for types that are not unsigned integral types (ISO/IEC 14882:2014 §3.9.1); for example, `char`. — end note]

7.3.10 Concept Assignable

[`concepts.lib.corelang.assignable`]

```
template <class T, class U>
concept bool Assignable =
    is_lvalue_reference<T>::value && // see below
    CommonReference<
        const remove_reference_t<T>&,
        const remove_reference_t<U>&> &&
    requires(T t, U&& u) {
        { t = std::forward<U>(u) } -> Same<T>&&;
    };
```

1 Let `t` be an lvalue that refers to an object `o` such that `decltype((t))` is `T`, and `u` an expression such that `decltype((u))` is `U`. Let `u2` be a distinct object that is equal to `u`. `Assignable<T, U>` is satisfied only if

(1.1) — `addressof(t = u) == addressof(o)`.

(1.2) — After evaluating `t = u`:

(1.2.1) — `t` is equal to `u2`, unless `u` is a non-const xvalue that refers to `o`.

(1.2.2) — If `u` is a non-const xvalue, the resulting state of the object to which it refers is valid but unspecified (ISO/IEC 14882:2014 §17.6.5.15).

(1.2.3) — Otherwise, if `u` is a glvalue, the object to which it refers is not modified.

- 2 There need not be any subsumption relationship between `Assignable<T, U>` and `is_lvalue_reference<T>::value`.
- 3 [*Note:* Assignment need not be a total function (6.2.1.3); in particular, if assignment to an object `x` can result in a modification of some other object `y`, then `x = y` is likely not in the domain of `=`. — *end note*]

7.3.11 Concept Swappable

[`concepts.lib.corelang.swappable`]

```
template <class T>
concept bool Swappable =
    requires(T& a, T& b) {
        ranges::swap(a, b);
    };

template <class T, class U>
concept bool SwappableWith =
    CommonReference<
        const remove_reference_t<T>&,
        const remove_reference_t<U>&> &&
    requires(T&& t, U&& u) {
        ranges::swap(std::forward<T>(t), std::forward<T>(t));
        ranges::swap(std::forward<U>(u), std::forward<U>(u));
        ranges::swap(std::forward<T>(t), std::forward<U>(u));
        ranges::swap(std::forward<U>(u), std::forward<T>(t));
    };
};
```

- 1 This subclause provides definitions for swappable types and expressions. In these definitions, let `t` denote an expression of type `T`, and let `u` denote an expression of type `U`.
- 2 An object `t` is *swappable with* an object `u` if and only if `SwappableWith<T, U>` is satisfied. `SwappableWith<T, U>` is satisfied only if given distinct objects `t2` equal to `t` and `u2` equal to `u`, after evaluating either `ranges::swap(t, u)` or `ranges::swap(u, t)`, `t2` is equal to `u` and `u2` is equal to `t`.
- 3 An rvalue or lvalue `t` is *swappable* if and only if `t` is swappable with any rvalue or lvalue, respectively, of type `T`.
- [*Example:* User code can ensure that the evaluation of `swap` calls is performed in an appropriate context under the various conditions as follows:

```
#include <utility>

// Requires: std::forward<T>(t) shall be swappable with std::forward<U>(u).
template <class T, class U>
void value_swap(T&& t, U&& u) {
    using std::experimental::ranges::swap;
    swap(std::forward<T>(t), std::forward<U>(u));    // OK: uses "swappable with" conditions
                                                    // for rvalues and lvalues
}

// Requires: lvalues of T shall be swappable.
template <class T>
void lv_swap(T& t1, T& t2) {
    using std::experimental::ranges::swap;
    swap(t1, t2);    // OK: uses swappable conditions for
                    // lvalues of type T
}

namespace N {
    struct A { int m; };
    struct Proxy { A* a; };
    Proxy proxy(A& a) { return Proxy{ &a }; }

    void swap(A& x, Proxy p) {
        std::experimental::ranges::swap(x.m, p.a->m);    // OK: uses context equivalent to swappable
                                                         // conditions for fundamental types
    }
}
```

```

    void swap(Proxy p, A& x) { swap(x, p); } // satisfy symmetry constraint
}

int main() {
    int i = 1, j = 2;
    lv_swap(i, j);
    assert(i == 2 && j == 1);

    N::A a1 = { 5 }, a2 = { -5 };
    value_swap(a1, proxy(a2));
    assert(a1.m == -5 && a2.m == 5);
}

— end example]

```

7.3.12 Concept Destructible

[concepts.lib.corelang.destructible]

- ¹ The **Destructible** concept specifies properties of all types, instances of which can be destroyed at the end of their lifetime, or reference types.

```

template <class T>
concept bool Destructible = is_nothrow_destructible<T>::value; // see below

```

- ² There need not be any subsumption relationship between **Destructible**<T> and **is_nothrow_destructible**<T>::value.
- ³ [Note: Unlike the **Destructible** library concept in the C++ Standard (ISO/IEC 14882:2014 §17.6.3.1), this concept forbids destructors that are **noexcept(false)**, even if non-throwing. — end note]

7.3.13 Concept Constructible

[concepts.lib.corelang.constructible]

- ¹ The **Constructible** concept constrains the initialization of a variable of a type with a given set of argument types.

```

template <class T, class... Args>
concept bool Constructible =
    Destructible<T> && is_constructible<T, Args...>::value; // see below

```

- ² There need not be any subsumption relationship between **Constructible**<T, Args...> and **is_constructible**<T, Args...>::value.

7.3.14 Concept DefaultConstructible

[concepts.lib.corelang.defaultconstructible]

```

template <class T>
concept bool DefaultConstructible = Constructible<T>;

```

7.3.15 Concept MoveConstructible

[concepts.lib.corelang.moveconstructible]

```

template <class T>
concept bool MoveConstructible =
    Constructible<T, T> && ConvertibleTo<T, T>;

```

- ¹ If T is an object type, then let **rv** be an rvalue of type T and **u2** a distinct object of type T equal to **rv**. **MoveConstructible**<T> is satisfied only if
- (1.1) — After the definition **T u = rv**;, **u** is equal to **u2**.
- (1.2) — **T{rv}** is equal to **u2**.
- (1.3) — If T is not **const**, **rv**'s resulting state is valid but unspecified (ISO/IEC 14882:2014 §17.6.5.15); otherwise, it is unchanged.

7.3.16 Concept CopyConstructible

[concepts.lib.corelang.copyconstructible]

```
template <class T>
concept bool CopyConstructible =
    MoveConstructible<T> &&
    Constructible<T, T&> && ConvertibleTo<T&, T> &&
    Constructible<T, const T&> && ConvertibleTo<const T&, T> &&
    Constructible<T, const T> && ConvertibleTo<const T, T>;
```

¹ If *T* is an object type, then let *v* be an lvalue of type (possibly *const*) *T* or an rvalue of type *const T*. *CopyConstructible<T>* is satisfied only if

- (1.1) — After the definition *T u = v*;, *u* is equal to *v*.
- (1.2) — *T{v}* is equal to *v*.

7.4 Comparison concepts

[concepts.lib.compare]

7.4.1 General

[concepts.lib.compare.general]

¹ This section describes concepts that establish relationships and orderings on values of possibly differing object types.

7.4.2 Concept Boolean

[concepts.lib.compare.boolean]

¹ The *Boolean* concept specifies the requirements on a type that is usable in Boolean contexts.

```
template <class B>
concept bool Boolean =
    Movable<decay_t<B>> && // (see 7.5.1)
    requires(const remove_reference_t<B>& b1,
              const remove_reference_t<B>& b2, const bool a) {
        { b1 }      -> ConvertibleTo<bool>&&;
        { !b1 }     -> ConvertibleTo<bool>&&;
        { b1 && a }  -> Same<bool>&&;
        { b1 || a }  -> Same<bool>&&;
        { b1 && b2 } -> Same<bool>&&;
        { a && b2 }  -> Same<bool>&&;
        { b1 || b2 } -> Same<bool>&&;
        { a || b2 }  -> Same<bool>&&;
        { b1 == b2 } -> ConvertibleTo<bool>&&;
        { b1 == a }  -> ConvertibleTo<bool>&&;
        { a == b2 }  -> ConvertibleTo<bool>&&;
        { b1 != b2 } -> ConvertibleTo<bool>&&;
        { b1 != a }  -> ConvertibleTo<bool>&&;
        { a != b2 }  -> ConvertibleTo<bool>&&;
    };
```

² Given *const* lvalues *b1* and *b2* of type *remove_reference_t*, then *Boolean* is satisfied only if

- (2.1) — *bool(b1) == !bool(!b1)*.
- (2.2) — (*b1 && b2*), (*b1 && bool(b2)*), and (*bool(b1) && b2*) are all equal to (*bool(b1) && bool(b2)*), and have the same short-circuit evaluation.
- (2.3) — (*b1 || b2*), (*b1 || bool(b2)*), and (*bool(b1) || b2*) are all equal to (*bool(b1) || bool(b2)*), and have the same short-circuit evaluation.
- (2.4) — *bool(b1 == b2)*, *bool(b1 == bool(b2))*, and *bool(bool(b1) == b2)* are all equal to (*bool(b1) == bool(b2)*).
- (2.5) — *bool(b1 != b2)*, *bool(b1 != bool(b2))*, and *bool(bool(b1) != b2)* are all equal to (*bool(b1) != bool(b2)*).

³ [Example: The types *bool*, *std::true_type*, and *std::bitset<N>::reference* are *Boolean* types. Pointers, smart pointers, and types with explicit conversions to *bool* are not *Boolean* types. — end example]

7.4.3 Concept EqualityComparable

[concepts.lib.compare.equalitycomparable]

```
template <class T, class U>
concept bool WeaklyEqualityComparableWith =
    requires(const remove_reference_t<T>& t,
              const remove_reference_t<U>& u) {
        { t == u } -> Boolean&&;
        { t != u } -> Boolean&&;
        { u == t } -> Boolean&&;
        { u != t } -> Boolean&&;
    };
```

1 Let t and u be `const` lvalues of types `remove_reference_t<T>` and `remove_reference_t<U>` respectively. `WeaklyEqualityComparableWith<T, U>` is satisfied only if:

- (1.1) — $t == u$, $u == t$, $t != u$, and $u != t$ have the same domain.
- (1.2) — $\text{bool}(u == t) == \text{bool}(t == u)$.
- (1.3) — $\text{bool}(t != u) == !\text{bool}(t == u)$.
- (1.4) — $\text{bool}(u != t) == \text{bool}(t != u)$.

```
template <class T>
concept bool EqualityComparable = WeaklyEqualityComparableWith<T, T>;
```

2 Let a and b be objects of type T . `EqualityComparable<T>` is satisfied only if:

- (2.1) — $\text{bool}(a == b)$ if and only if a is equal to b .

3 [*Note*: The requirement that the expression $a == b$ is equality preserving implies that $==$ is reflexive, transitive, and symmetric. — *end note*]

```
template <class T, class U>
concept bool EqualityComparableWith =
    EqualityComparable<T> &&
    EqualityComparable<U> &&
    CommonReference<
        const remove_reference_t<T>&,
        const remove_reference_t<U>&> &&
    EqualityComparable<
        common_reference_t<
            const remove_reference_t<T>&,
            const remove_reference_t<U>&>> &&
    WeaklyEqualityComparableWith<T, U>;
```

4 Let t be a `const` lvalue of type `remove_reference_t<T>`, u be a `const` lvalue of type `remove_reference_t<U>`, and C be:

`common_reference_t<const remove_reference_t<T>&, const remove_reference_t<U>&>`

`EqualityComparableWith<T, U>` is satisfied only if:

- (4.1) — $\text{bool}(t == u) == \text{bool}(C(t) == C(u))$.

7.4.4 Concept StrictTotallyOrdered

[concepts.lib.compare.stricttotallyordered]

```
template <class T>
concept bool StrictTotallyOrdered =
    EqualityComparable<T> &&
    requires(const remove_reference_t<T>& a,
              const remove_reference_t<T>& b) {
        { a < b } -> Boolean&&;
        { a > b } -> Boolean&&;
        { a <= b } -> Boolean&&;
        { a >= b } -> Boolean&&;
    };
};
```

1 Let `a`, `b`, and `c` be `const` lvalues of type `remove_reference_t<T>`. `StrictTotallyOrdered<T>` is satisfied only if

- (1.1) — Exactly one of `bool(a < b)`, `bool(a > b)`, or `bool(a == b)` is true.
- (1.2) — If `bool(a < b)` and `bool(b < c)`, then `bool(a < c)`.
- (1.3) — `bool(a > b) == bool(b < a)`.
- (1.4) — `bool(a <= b) == !bool(b < a)`.
- (1.5) — `bool(a >= b) == !bool(a < b)`.

```
template <class T, class U>
concept bool StrictTotallyOrderedWith =
    StrictTotallyOrdered<T> &&
    StrictTotallyOrdered<U> &&
    CommonReference<
        const remove_reference_t<T>&,
        const remove_reference_t<U>&> &&
    StrictTotallyOrdered<
        common_reference_t<
            const remove_reference_t<T>&,
            const remove_reference_t<U>&>> &&
    EqualityComparableWith<T, U> &&
    requires(const remove_reference_t<T>& t,
        const remove_reference_t<U>& u) {
        { t < u } -> Boolean&&;
        { t > u } -> Boolean&&;
        { t <= u } -> Boolean&&;
        { t >= u } -> Boolean&&;
        { u < t } -> Boolean&&;
        { u > t } -> Boolean&&;
        { u <= t } -> Boolean&&;
        { u >= t } -> Boolean&&;
    };
```

2 Let `t` be a `const` lvalue of type `remove_reference_t<T>`, `u` be a `const` lvalue of type `remove_reference_t<U>`, and `C` be:

```
common_reference_t<const remove_reference_t<T>&, const remove_reference_t<U>&>
```

`StrictTotallyOrderedWith<T, U>` is satisfied only if

- (2.1) — `bool(t < u) == bool(C(t) < C(u))`.
- (2.2) — `bool(t > u) == bool(C(t) > C(u))`.
- (2.3) — `bool(t <= u) == bool(C(t) <= C(u))`.
- (2.4) — `bool(t >= u) == bool(C(t) >= C(u))`.
- (2.5) — `bool(u < t) == bool(C(u) < C(t))`.
- (2.6) — `bool(u > t) == bool(C(u) > C(t))`.
- (2.7) — `bool(u <= t) == bool(C(u) <= C(t))`.
- (2.8) — `bool(u >= t) == bool(C(u) >= C(t))`.

7.5 Object concepts

[`concepts.lib.object`]

1 This section describes concepts that specify the basis of the value-oriented programming style on which the library is based.

7.5.1 Concept Movable

[concepts.lib.object.movable]

```
template <class T>
concept bool Movable =
    is_object<T>::value &&
    MoveConstructible<T> &&
    Assignable<T&, T> &&
    Swappable<T>;
```

- ¹ There need not be any subsumption relationship between `Movable<T>` and `is_object<T>::value`.

7.5.2 Concept Copyable

[concepts.lib.object.copyable]

```
template <class T>
concept bool Copyable =
    CopyConstructible<T> &&
    Movable<T> &&
    Assignable<T&, const T&>;
```

7.5.3 Concept Semiregular

[concepts.lib.object.semiregular]

```
template <class T>
concept bool Semiregular =
    Copyable<T> &&
    DefaultConstructible<T>;
```

- ¹ [*Note:* The `Semiregular` concept is satisfied by types that behave similarly to built-in types like `int`, except that they may not be comparable with `==`. — *end note*]

7.5.4 Concept Regular

[concepts.lib.object.regular]

```
template <class T>
concept bool Regular =
    Semiregular<T> &&
    EqualityComparable<T>;
```

- ¹ [*Note:* The `Regular` concept is satisfied by types that behave similarly to built-in types like `int` and that are comparable with `==`. — *end note*]

7.6 Callable concepts

[concepts.lib.callable]

7.6.1 General

[concepts.lib.callable.general]

- ¹ The concepts in this section describe the requirements on function objects (8.3) and their arguments.

7.6.2 Concept Invocable

[concepts.lib.callable.invocable]

- ¹ The `Invocable` concept specifies a relationship between a callable type (ISO/IEC 14882:2014 §20.9.1) `F` and a set of argument types `Args...` which can be evaluated by the library function `invoke` (8.3.1).

```
template <class F, class... Args>
concept bool Invocable =
    requires(F&& f, Args&&... args) {
        invoke(std::forward<F>(f), std::forward<Args>(args)...); // not required to be equality preserving
    };
```

- ² [*Note:* Since the `invoke` function call expression is not required to be equality-preserving (7.1.1), a function that generates random numbers may satisfy `Invocable`. — *end note*]

7.6.3 Concept RegularInvocable

[concepts.lib.callable.regularinvocable]

```
template <class F, class... Args>
concept bool RegularInvocable =
    Invocable<F, Args...>;
```

- 1 The **invoke** function call expression shall be equality-preserving and shall not modify the function object or the arguments (7.1.1). [*Note*: This requirement supersedes the annotation in the definition of **Invocable**. — *end note*]
- 2 [*Note*: A random number generator does not satisfy **RegularInvocable**. — *end note*]
- 3 [*Note*: The distinction between **Invocable** and **RegularInvocable** is purely semantic. — *end note*]

7.6.4 Concept Predicate

[concepts.lib.callable.predicate]

```
template <class F, class... Args>
concept bool Predicate =
    RegularInvocable<F, Args...> &&
    Boolean<result_of_t<F&&(Args&&...)>>;
```

7.6.5 Concept Relation

[concepts.lib.callable.relation]

```
template <class R, class T, class U>
concept bool Relation =
    Predicate<R, T, T> &&
    Predicate<R, U, U> &&
    CommonReference<
        const remove_reference_t<T>&,
        const remove_reference_t<U>&> &&
    Predicate<R,
        common_reference_t<
            const remove_reference_t<T>&,
            const remove_reference_t<U>&>,
        common_reference_t<
            const remove_reference_t<T>&,
            const remove_reference_t<U>&>> &&
    Predicate<R, T, U> &&
    Predicate<R, U, T>;
```

- 1 Let r be an expression such that $\text{decltype}((r))$ is R , t be an expression such that $\text{decltype}((t))$ is T , u be an expression such that $\text{decltype}((u))$ is U , and C be $\text{common_reference_t}<\text{const remove_reference_t}<T>\&, \text{const remove_reference_t}<U>\&>$. $\text{Relation}<R, T, U>$ is satisfied only if
- (1.1) — $\text{bool}(r(t, u)) == \text{bool}(r(C(t), C(u)))$.
- (1.2) — $\text{bool}(r(u, t)) == \text{bool}(r(C(u), C(t)))$.

7.6.6 Concept StrictWeakOrder

[concepts.lib.callable.strictweakorder]

```
template <class R, class T, class U>
concept bool StrictWeakOrder = Relation<R, T, U>;
```

- 1 A **Relation** satisfies **StrictWeakOrder** only if it imposes a *strict weak ordering* on its arguments.
- 2 The term *strict* refers to the requirement of an irreflexive relation ($!\text{comp}(x, x)$ for all x), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define $\text{equiv}(a, b)$ as $!\text{comp}(a, b) \ \&\& \ !\text{comp}(b, a)$, then the requirements are that **comp** and **equiv** both be transitive relations:
- (2.1) — $\text{comp}(a, b) \ \&\& \ \text{comp}(b, c)$ implies $\text{comp}(a, c)$
- (2.2) — $\text{equiv}(a, b) \ \&\& \ \text{equiv}(b, c)$ implies $\text{equiv}(a, c)$ [*Note*: Under these conditions, it can be shown that
- (2.2.1) — **equiv** is an equivalence relation
- (2.2.2) — **comp** induces a well-defined relation on the equivalence classes determined by **equiv**
- (2.2.3) — The induced relation is a strict total ordering. — *end note*]

8 General utilities library

[utilities]

8.1 General

[utilities.general]

- ¹ This Clause describes utilities that are generally useful in C++ programs; some of these utilities are used by other elements of the Ranges library. These utilities are summarized in Table 4.

Table 4 — General utilities library summary

Subclause	Header(s)
8.2 Utility components	<experimental/ranges/utility>
8.3 Function objects	<experimental/ranges/functional>
8.4 Type traits	<type_traits>
8.5 Tagged tuple-like types	<experimental/ranges/utility> & <experimental/ranges/tuple>

8.2 Utility components

[utility]

- ¹ This subclause contains some basic function and class templates that are used throughout the rest of the library.

Header <experimental/ranges/utility> synopsis

- ² The header <experimental/ranges/utility> defines several types, function templates, and concepts that are described in this Clause. It also defines the templates `tagged` and `tagged_pair` and various function templates that operate on `tagged_pair` objects.

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {  
    // 8.2.1, swap:  
    namespace {  
        constexpr unspecified swap = unspecified ;  
    }  
  
    // 8.2.2, exchange:  
    template <MoveConstructible T, class U=T>  
        requires Assignable<T&, U>  
    constexpr T exchange(T& obj, U&& new_val) noexcept(see below);  
  
    // 8.5.2, struct with named accessors  
    template <class T>  
    concept bool TagSpecifier = see below;  
  
    template <class F>  
    concept bool TaggedType = see below;  
  
    template <class Base, TagSpecifier... Tags>  
        requires sizeof...(Tags) <= tuple_size<Base>::value  
    struct tagged;  
  
    // 8.5.4, tagged pairs  
    template <TaggedType T1, TaggedType T2> using tagged_pair = see below;  
  
    template <TagSpecifier Tag1, TagSpecifier Tag2, class T1, class T2>  
    constexpr see below make_tagged_pair(T1&& x, T2&& y);  
}}}  
  
namespace std {  
    // 8.5.3, tuple-like access to tagged  
    template <class Base, class... Tags>  
    struct tuple_size<experimental::ranges::tagged<Base, Tags...>>;
```

```

template <size_t N, class Base, class... Tags>
struct tuple_element<N, experimental::ranges::tagged<Base, Tags...>>;
}

```

8.2.1 swap

[utility.swap]

- ¹ The name **swap** denotes a customization point object (6.3.5.1). The effect of the expression **ranges::swap**(E1, E2) for some expressions E1 and E2 is equivalent to:

- (1.1) — (void)**swap**(E1, E2), if that expression is valid, with overload resolution performed in a context that includes the declarations

```

template <class T>
void swap(T&, T&) = delete;
template <class T, size_t N>
void swap(T(&)[N], T(&)[N]) = delete;

```

and does not include a declaration of **ranges::swap**. If the function selected by overload resolution does not exchange the values referenced by E1 and E2, the program is ill-formed with no diagnostic required.

- (1.2) — Otherwise, (void)**swap_ranges**(E1, E2) if E1 and E2 are lvalues of array types (ISO/IEC 14882:2014 §3.9.2) of equal extent and **ranges::swap**(*(E1), *(E2)) is a valid expression, except that **noexcept**(**ranges::swap**(E1, E2)) is equal to **noexcept**(**ranges::swap**(*(E1), *(E2))).
- (1.3) — Otherwise, if E1 and E2 are lvalues of the same type T which meets the syntactic requirements of **MoveConstructible**<T> and **Assignable**<T&, T>, exchanges the referenced values. **ranges::swap**(E1, E2) is a constant expression if the constructor selected by overload resolution for **T{std::move(E1)}** is a constexpr constructor and the expression **E1 = std::move(E2)** can appear in a constexpr function. **noexcept**(**ranges::swap**(E1, E2)) is equal to **is_nothrow_move_constructible**<T>::value && **is_nothrow_move_assignable**<T>::value. If either **MoveConstructible** or **Assignable** is not satisfied, the program is ill-formed with no diagnostic required.
- (1.4) — Otherwise, **ranges::swap**(E1, E2) is ill-formed.

- ² *Remark:* Whenever **ranges::swap**(E1, E2) is a valid expression, it exchanges the values referenced by E1 and E2 and has type void.

8.2.2 exchange

[utility.exchange]

```

template <MoveConstructible T, class U=T>
requires Assignable<T&, U>
constexpr T exchange(T& obj, U&& new_val) noexcept(see below);

```

- ¹ *Effects:* Equivalent to:

```

T old_val = std::move(obj);
obj = std::forward<U>(new_val);
return old_val;

```

Remarks: The expression in **noexcept** is equivalent to:

```

is_nothrow_move_constructible<T>::value &&
is_nothrow_assignable<T&, U>::value

```

8.3 Function objects

[function.objects]

- ¹ Header <experimental/ranges/functional> synopsis

```

namespace std { namespace experimental { namespace ranges { inline namespace v1 {
// 8.3.1, invoke:
template <class F, class... Args>
result_of_t<F&&(Args&&...)> invoke(F&& f, Args&&... args);

// 8.3.2, comparisons:
template <class T = void>
requires see below

```

```

struct equal_to;

template <class T = void>
    requires see below
struct not_equal_to;

template <class T = void>
    requires see below
struct greater;

template <class T = void>
    requires see below
struct less;

template <class T = void>
    requires see below
struct greater_equal;

template <class T = void>
    requires see below
struct less_equal;

template <> struct equal_to<void>;
template <> struct not_equal_to<void>;
template <> struct greater<void>;
template <> struct less<void>;
template <> struct greater_equal<void>;
template <> struct less_equal<void>;

// 8.3.3, identity:
struct identity;
}}}}

```

8.3.1 Function template invoke

[func.invoke]

```

template <class F, class... Args>
result_of_t<F&&(Args&&...)> invoke(F&& f, Args&&... args);

```

- ¹ *Effects:* Equivalent to:
 return *INVOKE*(std::forward<F>(f), std::forward<Args>(args)...); (ISO/IEC 14882:2014 § 20.9.2).

8.3.2 Comparisons

[comparisons]

- ¹ The library provides basic function object classes for all of the comparison operators in the language (ISO/IEC 14882:2014 §5.9, ISO/IEC 14882:2014 §5.10).
- ² In this section, *BUILTIN_PTR_CMP*(*T*, *op*, *U*) for types *T* and *U* and where *op* is an equality (ISO/IEC 14882:2014 §5.10) or relational operator (ISO/IEC 14882:2014 §5.9) is a boolean constant expression. *BUILTIN_PTR_CMP*(*T*, *op*, *U*) is true if and only if *op* in the expression *declval<T>()* *op* *declval<U>()* resolves to a built-in operator comparing pointers.
- ³ There is an implementation-defined strict total ordering over all pointer values of a given type. This total ordering is consistent with the partial order imposed by the builtin operators <, >, <=, and >=.

```

template <class T = void>
    requires EqualityComparable<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, ==, const T&)
struct equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

```

- ⁴ *operator()* has effects equivalent to: return *equal_to*<>(x, y);

```
template <class T = void>
    requires EqualityComparable<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, ==, const T&)
struct not_equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

5 operator() has effects equivalent to: return !equal_to<>(x, y);

```
template <class T = void>
    requires StrictTotallyOrdered<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, <, const T&)
struct greater {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

6 operator() has effects equivalent to: return less<>(y, x);

```
template <class T = void>
    requires StrictTotallyOrdered<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, <, const T&)
struct less {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

7 operator() has effects equivalent to: return less<>(x, y);

```
template <class T = void>
    requires StrictTotallyOrdered<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, <, const T&)
struct greater_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

8 operator() has effects equivalent to: return !less<>(x, y);

```
template <class T = void>
    requires StrictTotallyOrdered<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, <, const T&)
struct less_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

9 operator() has effects equivalent to: return !less<>(y, x);

```
template <> struct equal_to<void> {
    template <class T, class U>
        requires EqualityComparableWith<T, U> || BUILTIN_PTR_CMP(T, ==, U)
    constexpr bool operator()(T&& t, U&& u) const;

    typedef unspecified is_transparent;
};
```

10 *Requires:* If the expression `std::forward<T>(t) == std::forward<U>(u)` results in a call to a built-in operator `==` comparing pointers of type `P`, the conversion sequences from both `T` and `U` to `P` shall be equality-preserving (7.1.1).

11 *Effects:*

- (11.1) — If the expression `std::forward<T>(t) == std::forward<U>(u)` results in a call to a built-in operator `==` comparing pointers of type `P`: returns `false` if either (the converted value of) `t` precedes `u` or `u` precedes `t` in the implementation-defined strict total order over pointers of type `P` and otherwise `true`.
- (11.2) — Otherwise, equivalent to: return `std::forward<T>(t) == std::forward<U>(u)`;

```

template <> struct not_equal_to<void> {
    template <class T, class U>
        requires EqualityComparableWith<T, U> || BUILTIN_PTR_CMP(T, ==, U)
        constexpr bool operator()(T&& t, U&& u) const;

    typedef unspecified is_transparent;
};

```

12 `operator()` has effects equivalent to:

```

    return !equal_to<>{}(std::forward<T>(t), std::forward<U>(u));

```

```

template <> struct greater<void> {
    template <class T, class U>
        requires StrictTotallyOrderedWith<T, U> || BUILTIN_PTR_CMP(U, <, T)
        constexpr bool operator()(T&& t, U&& u) const;

    typedef unspecified is_transparent;
};

```

13 `operator()` has effects equivalent to:

```

    return less<>{}(std::forward<U>(u), std::forward<T>(t));

```

```

template <> struct less<void> {
    template <class T, class U>
        requires StrictTotallyOrderedWith<T, U> || BUILTIN_PTR_CMP(T, <, U)
        constexpr bool operator()(T&& t, U&& u) const;

    typedef unspecified is_transparent;
};

```

14 *Requires:* If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator < comparing pointers of type P, the conversion sequences from both T and U to P shall be equality-preserving (7.1.1). For any expressions ET and EU such that `decltype((ET))` is T and `decltype((EU))` is U, exactly one of `less<>{}(ET, EU)`, `less<>{}(EU, ET)` or `equal_to<>{}(ET, EU)` shall be true.

15 *Effects:*

(15.1) — If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator < comparing pointers of type P: returns **true** if (the converted value of) *t* precedes *u* in the implementation-defined strict total order over pointers of type P and otherwise **false**.

(15.2) — Otherwise, equivalent to: `return std::forward<T>(t) < std::forward<U>(u);`

```

template <> struct greater_equal<void> {
    template <class T, class U>
        requires StrictTotallyOrderedWith<T, U> || BUILTIN_PTR_CMP(T, <, U)
        constexpr bool operator()(T&& t, U&& u) const;

    typedef unspecified is_transparent;
};

```

16 `operator()` has effects equivalent to:

```

    return !less<>{}(std::forward<T>(t), std::forward<U>(u));

```

```

template <> struct less_equal<void> {
    template <class T, class U>
        requires StrictTotallyOrderedWith<T, U> || BUILTIN_PTR_CMP(U, <, T)
        constexpr bool operator()(T&& t, U&& u) const;

```

```
typedef unspecified is_transparent;
};
```

17 operator() has effects equivalent to:

```
return !less<>{}(std::forward<U>(u), std::forward<T>(t));
```

8.3.3 Class identity

[func.identity]

```
struct identity {
    template <class T>
    constexpr T&& operator()(T&& t) const noexcept;

    typedef unspecified is_transparent;
};
```

1 operator() returns std::forward<T>(t).

8.4 Metaprogramming and type traits

[meta]

8.4.1 Header <experimental/ranges/type_traits> synopsis

[meta.type.synop]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
    // 8.4.2, type properties:
    template <class T, class U> struct is_swappable_with;
    template <class T> struct is_swappable;

    template <class T, class U> struct is_nothrow_swappable_with;
    template <class T> struct is_nothrow_swappable;

    template <class T, class U> constexpr bool is_swappable_with_v
        = is_swappable_with<T, U>::value;
    template <class T> constexpr bool is_swappable_v
        = is_swappable<T>::value;

    template <class T, class U> constexpr bool is_nothrow_swappable_with_v
        = is_nothrow_swappable_with<T, U>::value;
    template <class T> constexpr bool is_nothrow_swappable_v
        = is_nothrow_swappable<T>::value;

    // 8.4.3, other transformations:
    template <class... T> struct common_type;
    template <class T, class U, template <class> class TQual, template <class> class UQual>
        struct basic_common_reference { };
    template <class... T> struct common_reference;

    template <class... T>
        using common_type_t = typename common_type<T...>::type;
    template <class... T>
        using common_reference_t = typename common_reference<T...>::type;
}}}}
```

8.4.2 Type properties

[meta.unary.prop]

- 1 These templates provide access to some of the more important properties of types.
- 2 It is unspecified whether the library defines any full or partial specializations of any of these templates.
- 3 For all of the class templates *X* declared in this subclause, instantiating that template with a template argument that is a class template specialization may result in the implicit instantiation of the template argument if and only if the semantics of *X* require that the argument must be a complete type.
- 4 For the purpose of defining the templates in this subclause, a function call expression `declval<T>()` for any type *T* is considered to be a trivial (ISO/IEC 14882:2014 §3.9, ISO/IEC 14882:2014 §12) function call that is not an odr-use (ISO/IEC 14882:2014 §3.2) of `declval` in the context of the corresponding definition notwithstanding the restrictions of (ISO/IEC 14882:2014 §20.2.5).

Table 5 — Additional type property predicates

Template	Condition	Precondition
<pre>template <class T, class U> struct is_swappable_with;</pre>	The expressions <code>ranges::swap(declval<T>(), declval<U>())</code> and <code>ranges::swap(declval<U>(), declval<T>())</code> are each well-formed when treated as an unevaluated operand (Clause ISO/IEC 14882:2014 §5). Access checking is performed as if in a context unrelated to T and U. Only the validity of the immediate context of the <code>swap</code> expressions is considered. [<i>Note</i>: The compilation of the expressions can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. — <i>end note</i>]	T and U shall be complete types, (possibly <i>cv</i>-qualified) <code>void</code>, or arrays of unknown bound.
<pre>template <class T> struct is_swappable;</pre>	For a referenceable type T, the same result as <code>is_swappable_with_v<T&, T&></code>, otherwise <code>false</code>.	T shall be a complete type, (possibly <i>cv</i>-qualified) <code>void</code>, or an array of unknown bound.
<pre>template <class T, class U> struct is_nothrow_swappable_with;</pre>	<code>is_swappable_with_v<T, U></code> is true and each <code>swap</code> expression of the definition of <code>is_swappable_with<T, U></code> is known not to throw any exceptions (ISO/IEC 14882:2014 §5.3.7).	T and U shall be complete types, (possibly <i>cv</i>-qualified) <code>void</code>, or arrays of unknown bound.
<pre>template <class T> struct is_nothrow_swappable;</pre>	For a referenceable type T, the same result as <code>is_nothrow_swappable_with_v<T&, T&></code>, otherwise <code>false</code>.	T shall be a complete type, (possibly <i>cv</i>-qualified) <code>void</code>, or an array of unknown bound.

8.4.3 Other transformations

[meta.trans.other]

Table 6 — Other transformations

Template	Comments
<pre>template <class... T> struct common_type;</pre>	The member typedef type shall be defined or omitted as specified below. If it is omitted, there shall be no member type . Each type in the parameter pack T shall be complete or (possibly <i>cv</i>) void . A program may specialize this trait if at least one template parameter in the specialization depends on a user-defined type and <code>sizeof...(T) == 2</code> . [<i>Note: Such specializations are needed when only explicit conversions are desired among the template arguments. — end note</i>]
<pre>template <class T, class U, template <class> class TQual, template <class> class UQual> struct basic_common_reference;</pre>	The primary template shall have no member typedef type . A program may specialize this trait if at least one template parameter in the specialization depends on a user-defined type. In such a specialization, a member typedef type may be defined or omitted. If it is omitted, there shall be no member type . [<i>Note: Such specializations may be used to influence the result of <code>common_reference</code>. — end note</i>]
<pre>template <class... T> struct common_reference;</pre>	The member typedef type shall be defined or omitted as specified below. If it is omitted, there shall be no member type . Each type in the parameter pack T shall be complete or (possibly <i>cv</i>) void .

¹ Let `CREF(A)` be `add_lvalue_reference_t<const remove_reference_t<A>>`. Let `UNCVREF(A)` be `remove_cv_t<remove_reference_t<A>>`. Let `XREF(A)` denote a unary template T such that `T<UNCVREF(A)>` denotes the same type as A. Let `COPYCV(FROM, TO)` be an alias for type TO with the addition of FROM's top-level *cv*-qualifiers. [*Example: `COPYCV(const int, volatile short)` is an alias for `const volatile short`. — end example*] Let `RREF_RES(Z)` be `remove_reference_t<Z>&&` if Z is a reference type or Z otherwise. Let `COND_RES(X, Y)` be `decltype(declval<bool>() ? declval<X(&())>() : declval<Y(&())>())`. Given types A and B, let X be `remove_reference_t<A>`, let Y be `remove_reference_t<B>`, and let `COMMON_REF(A, B)` be:

- (1.1) — If A and B are both lvalue reference types, `COMMON_REF(A, B)` is `COND_RES(COPYCV(X, Y) &, COPYCV(Y, X) &)`.
- (1.2) — Otherwise, let C be `RREF_RES(COMMON_REF(X&, Y&))`. If A and B are both rvalue reference types, and C is well-formed, and `is_convertible<A, C::value>` and `is_convertible<B, C::value>` are true, then `COMMON_REF(A, B)` is C.
- (1.3) — Otherwise, let D be `COMMON_REF(const X&, Y&)`. If A is an rvalue reference and B is an lvalue reference and D is well-formed and `is_convertible<A, D::value>` is true, then `COMMON_REF(A, B)` is D.
- (1.4) — Otherwise, if A is an lvalue reference and B is an rvalue reference, then `COMMON_REF(A, B)` is `COMMON_REF(B, A)`.
- (1.5) — Otherwise, `COMMON_REF(A, B)` is `decay_t<COND_RES(CREF(A), CREF(B))>`.

If any of the types computed above are ill-formed, then `COMMON_REF(A, B)` is ill-formed.

² Note A: For the `common_type` trait applied to a parameter pack T of types, the member **type** shall be either defined or not present as follows:

- (2.1) — If `sizeof...(T)` is zero, there shall be no member **type**.
- (2.2) — Otherwise, if `sizeof...(T)` is one, let T1 denote the sole type in the pack T. The member typedef **type** shall denote the same type as `decay_t<T1>`.
- (2.3) — Otherwise, if `sizeof...(T)` is two, let T1 and T2 denote the two types in the pack T, and let D1 and D2 be `decay_t<T1>` and `decay_t<T2>` respectively. Then
 - (2.3.1) — If D1 and T1 denote the same type and D2 and T2 denote the same type, then
 - (2.3.1.1) — If `std::common_type_t<T1, T2>` is well-formed, then the member typedef **type** denotes `std::common_type_t<T1, T2>`.
 - (2.3.1.2) — If `COMMON_REF(T1, T2)` is well-formed, then the member typedef **type** denotes that type.

- (2.3.1.3) — Otherwise, there shall be no member **type**.
- (2.3.2) — Otherwise, if `common_type_t<D1, D2>` is well-formed, then the member typedef **type** denotes that type.
- (2.3.3) — Otherwise, there shall be no member **type**.
- (2.4) — Otherwise, if `sizeof...(T)` is greater than two, let **T1**, **T2**, and **Rest**, respectively, denote the first, second, and (pack of) remaining types comprising **T**. Let **C** be the type `common_type_t<T1, T2>`. Then:
- (2.4.1) — If there is such a type **C**, the member typedef **type** shall denote the same type, if any, as `common_type_t<C, Rest...>`.
- (2.4.2) — Otherwise, there shall be no member **type**.
- 3 Note B: Notwithstanding the provisions of ISO/IEC 14882:2014 §20.10.2, and pursuant to ISO/IEC 14882:2014 §17.6.4.2.1, a program may specialize `common_type_t<T1, T2>` for types **T1** and **T2** such that `is_same<T1, decay_t<T1>>::value` and `is_same<T2, decay_t<T2>>::value` are each **true**. [*Note: Such specializations are needed when only explicit conversions are desired between the template arguments. — end note*] Such a specialization need not have a member named **type**, but if it does, that member shall be a *typedef-name* for an accessible and unambiguous *cv*-unqualified non-reference type **C** to which each of the types **T1** and **T2** is explicitly convertible. Moreover, `common_type_t<T1, T2>` shall denote the same type, if any, as does `common_type_t<T2, T1>`. No diagnostic is required for a violation of this Note's rules.
- 4 For the `common_reference` trait applied to a parameter pack **T** of types, the member **type** shall be either defined or not present as follows:
- (4.1) — If `sizeof...(T)` is zero, there shall be no member **type**.
- (4.2) — Otherwise, if `sizeof...(T)` is one, let **T1** denote the sole type in the pack **T**. The member typedef **type** shall denote the same type as **T1**.
- (4.3) — Otherwise, if `sizeof...(T)` is two, let **T1** and **T2** denote the two types in the pack **T**. Then
- (4.3.1) — If **T1** and **T2** are reference types and `COMMON_REF(T1, T2)` is well-formed and denotes a reference type then the member typedef **type** denotes that type.
- (4.3.2) — Otherwise, if `basic_common_reference<UNCVREF(T1), UNCVREF(T2), XREF(T1), XREF(T2)>::type` is well-formed, then the member typedef **type** denotes that type.
- (4.3.3) — Otherwise, if `COND_RES(T1, T2)` is well-formed, then the member typedef **type** denotes that type.
- (4.3.4) — Otherwise, if `common_type_t<T1, T2>` is well-formed, then the member typedef **type** denotes that type.
- (4.3.5) — Otherwise, there shall be no member **type**.
- (4.4) — Otherwise, if `sizeof...(T)` is greater than two, let **T1**, **T2**, and **Rest**, respectively, denote the first, second, and (pack of) remaining types comprising **T**. Let **C** be the type `common_reference_t<T1, T2>`. Then:
- (4.4.1) — If there is such a type **C**, the member typedef **type** shall denote the same type, if any, as `common_reference_t<C, Rest...>`.
- (4.4.2) — Otherwise, there shall be no member **type**.
- 5 Notwithstanding the provisions of ISO/IEC 14882:2014 §20.10.2, and pursuant to ISO/IEC 14882:2014 §17.6.4.2.1, a program may specialize `basic_common_reference<T, U, TQual, UQual>` for types **T** and **U** such that `is_same<T, decay_t<T>>::value` and `is_same<U, decay_t<U>>::value` are each **true**. [*Note: Such specializations are needed when only explicit conversions are desired between the template arguments. — end note*] Such a specialization need not have a member named **type**, but if it does, that member shall be a *typedef-name* for an accessible and unambiguous type **C** to which each of the types `TQual<T>` and `UQual<U>` is convertible. Moreover, `basic_common_reference<T, U, TQual, UQual>::type` shall denote the same type, if any, as does `basic_common_reference<U, T, UQual, TQual>::type`. A program may not specialize `basic_common_reference` on the third or fourth parameters, **TQual** or **UQual**. No diagnostic is required for a violation of these rules.

8.5 Tagged tuple-like types

[taggedtuple]

8.5.1 General

[taggedtuple.general]

- ¹ The library provides a template for augmenting a tuple-like type with named element accessor member functions. The library also provides several templates that provide access to `tagged` objects as if they were tuple objects (see ISO/IEC 14882:2014 §20.4.2.6).

8.5.2 Class template `tagged`

[taggedtuple.tagged]

- ¹ Class template `tagged` augments a tuple-like class type (e.g., `pair` (ISO/IEC 14882:2014 §20.3), `tuple` (ISO/IEC 14882:2014 §20.4)) by giving it named accessors. It is used to define the alias templates `tagged_pair` (8.5.4) and `tagged_tuple` (8.5.5).
- ² In the class synopsis below, let i be in the range $[0, \text{sizeof} \dots (\text{Tags}))$ and T_i be the i^{th} type in `Tags`, where indexing is zero-based.

// defined in header <experimental/ranges/utility>

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
    template <class T>
    concept bool TagSpecifier = implementation-defined;

    template <class F>
    concept bool TaggedType = implementation-defined;

    template <class Base, TagSpecifier... Tags>
    requires sizeof...(Tags) <= tuple_size<Base>::value
    struct tagged :
        Base, TAGGET(tagged<Base, Tags...>, Ti, i)... { // see below
        using Base::Base;
        tagged() = default;
        tagged(tagged&&) = default;
        tagged(const tagged&) = default;
        tagged &operator=(tagged&&) = default;
        tagged &operator=(const tagged&) = default;
        tagged(Base&&) noexcept(see below)
            requires MoveConstructible<Base>;
        tagged(const Base&) noexcept(see below)
            requires CopyConstructible<Base>;
        template <class Other>
            requires Constructible<Base, Other>
        constexpr tagged(tagged<Other, Tags...> &&that) noexcept(see below);
        template <class Other>
            requires Constructible<Base, const Other&>
        constexpr tagged(const tagged<Other, Tags...> &that);
        template <class Other>
            requires Assignable<Base&, Other>
        constexpr tagged& operator=(tagged<Other, Tags...>&& that) noexcept(see below);
        template <class Other>
            requires Assignable<Base&, const Other&>
        constexpr tagged& operator=(const tagged<Other, Tags...>& that);
        template <class U>
            requires Assignable<Base&, U> && !Same<decay_t<U>, tagged>
        constexpr tagged& operator=(U&& u) noexcept(see below);
        constexpr void swap(tagged& that) noexcept(see below)
            requires Swappable<Base>;
        friend constexpr void swap(tagged&, tagged&) noexcept(see below)
            requires Swappable<Base>;
    };
}}}
```

- ³ A *tagged getter* is an empty trivial class type that has a named member function that returns a reference to a member of a tuple-like object that is assumed to be derived from the getter class. The tuple-like type of a tagged getter is called its *DerivedCharacteristic*. The index of the tuple element returned from the

getter's member functions is called its *ElementIndex*. The name of the getter's member function is called its *ElementName*

- 4 A tagged getter class with DerivedCharacteristic *D*, ElementIndex *N*, and ElementName *name* shall provide the following interface:

```
struct __TAGGED_GETTER {
    constexpr decltype(auto) name() &      { return get<N>(static_cast<D&>(*this)); }
    constexpr decltype(auto) name() &&     { return get<N>(static_cast<D&&(*this)); }
    constexpr decltype(auto) name() const & { return get<N>(static_cast<const D&>(*this)); }
};
```

- 5 A *tag specifier* is a type that facilitates a mapping from a tuple-like type and an element index into a *tagged getter* that gives named access to the element at that index. `TagSpecifier<T>` is satisfied if and only if *T* is a tag specifier. The tag specifiers in the `Tags` parameter pack shall be unique. [Note: The mapping mechanism from tag specifier to tagged getter is unspecified. — end note]
- 6 Let *TAGGET*(*D*, *T*, *N*) name a tagged getter type that gives named access to the *N*-th element of the tuple-like type *D*.
- 7 It shall not be possible to delete an instance of class template `tagged` through a pointer to any base other than `Base`.
- 8 `TaggedType<F>` is satisfied if and only if *F* is a unary function type with return type *T* which satisfies `TagSpecifier<T>`. Let *TAGSPEC*(*F*) name the tag specifier of the `TaggedType` *F*, and let *TAGELEM*(*F*) name the argument type of the `TaggedType` *F*.

```
tagged(Base&& that) noexcept(see below)
    requires MoveConstructible<Base>;
```

- 9 *Effects:* Initializes `Base` with `std::move(that)`.

- 10 *Remarks:* The expression in the `noexcept` is equivalent to:

```
is_nothrow_move_constructible<Base>::value
```

```
tagged(const Base& that) noexcept(see below)
    requires CopyConstructible<Base>;
```

- 11 *Effects:* Initializes `Base` with `that`.

- 12 *Remarks:* The expression in the `noexcept` is equivalent to:

```
is_nothrow_copy_constructible<Base>::value
```

```
template <class Other>
    requires Constructible<Base, Other>
constexpr tagged(tagged<Other, Tags...> &&that) noexcept(see below);
```

- 13 *Effects:* Initializes `Base` with `static_cast<Other&&>(that)`.

- 14 *Remarks:* The expression in the `noexcept` is equivalent to:

```
is_nothrow_constructible<Base, Other>::value
```

```
template <class Other>
    requires Constructible<Base, const Other&>
constexpr tagged(const tagged<Other, Tags...>& that);
```

- 15 *Effects:* Initializes `Base` with `static_cast<const Other&>(that)`.

```
template <class Other>
    requires Assignable<Base&, Other>
constexpr tagged& operator=(tagged<Other, Tags...>&& that) noexcept(see below);
```

16 *Effects:* Assigns `static_cast<Other&&>(that)` to `static_cast<Base&>(*this)`.

17 *Returns:* `*this`.

18 *Remarks:* The expression in the `noexcept` is equivalent to:

```
is_nothrow_assignable<Base&, Other>::value
```

```
template <class Other>
requires Assignable<Base&, const Other&>
constexpr tagged& operator=(const tagged<Other, Tags...>& that);
```

19 *Effects:* Assigns `static_cast<const Other&>(that)` to `static_cast<Base&>(*this)`.

20 *Returns:* `*this`.

```
template <class U>
requires Assignable<Base&, U> && !Same<decay_t<U>, tagged>
constexpr tagged& operator=(U&& u) noexcept(see below);
```

21 *Effects:* Assigns `std::forward<U>(u)` to `static_cast<Base&>(*this)`.

22 *Returns:* `*this`.

23 *Remarks:* The expression in the `noexcept` is equivalent to:

```
is_nothrow_assignable<Base&, U>::value
```

```
constexpr void swap(tagged& rhs) noexcept(see below)
requires Swappable<Base>;
```

24 *Effects:* Calls `swap` on the result of applying `static_cast` to `*this` and `that`.

25 *Throws:* Nothing unless the call to `swap` on the Base sub-objects throws.

26 *Remarks:* The expression in the `noexcept` is equivalent to:

```
noexcept(swap(declval<Base&>(), declval<Base&>()))
```

```
friend constexpr void swap(tagged& lhs, tagged& rhs) noexcept(see below)
requires Swappable<Base>;
```

27 *Effects:* Equivalent to `lhs.swap(rhs)`.

28 *Remarks:* The expression in the `noexcept` is equivalent to:

```
noexcept(lhs.swap(rhs))
```

8.5.3 Tuple-like access to tagged

[tagged.astuple]

```
namespace std {
template <class Base, class... Tags>
struct tuple_size<experimental::ranges::tagged<Base, Tags...>>
: tuple_size<Base> { };

template <size_t N, class Base, class... Tags>
struct tuple_element<N, experimental::ranges::tagged<Base, Tags...>>
: tuple_element<N, Base> { };
}
```

8.5.4 Alias template `tagged_pair`

[tagged.pairs]

// defined in header <experimental/ranges/utility>

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {  
    // ...  
    template <TaggedType T1, TaggedType T2>  
    using tagged_pair = tagged<pair<TAGELEM(T1), TAGELEM(T2)>,  
                                TAGSPEC(T1), TAGSPEC(T2)>;  
}}}}
```

1 [Example:

```
// See 11.2:  
tagged_pair<tag::min(int), tag::max(int)> p{0, 1};  
assert(&p.min() == &p.first);  
assert(&p.max() == &p.second);
```

— end example]

8.5.4.1 Tagged pair creation functions

[tagged.pairs.creation]

// defined in header <experimental/ranges/utility>

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {  
    template <TagSpecifier Tag1, TagSpecifier Tag2, class T1, class T2>  
    constexpr see below make_tagged_pair(T1&& x, T2&& y);  
}}}}
```

1 Let P be the type of `make_pair(std::forward<T1>(x), std::forward<T2>(y))`. Then the return type is `tagged<P, Tag1, Tag2>`.

2 Returns: `{std::forward<T1>(x), std::forward<T2>(y)}`.

3 [Example: In place of:

```
    return tagged_pair<tag::min(int), tag::max(double)>(5, 3.1415926); // explicit types
```

a C++ program may contain:

```
    return make_tagged_pair<tag::min, tag::max>(5, 3.1415926); // types are deduced
```

— end example]

8.5.5 Alias template `tagged_tuple`

[tagged.tuple]

1 Header <experimental/ranges/tuple> synopsis

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {  
    template <TaggedType... Types>  
    using tagged_tuple = tagged<tuple<TAGELEM(Types)...>,  
                                TAGSPEC(Types)...>;  
  
    template <TagSpecifier... Tags, class... Types>  
    requires sizeof...(Tags) == sizeof...(Types)  
    constexpr see below make_tagged_tuple(Types&&... t);  
}}}}
```

2

```
template <TaggedType... Types>  
using tagged_tuple = tagged<tuple<TAGELEM(Types)...>,  
                            TAGSPEC(Types)...>;
```

3 [Example:

```
// See 11.2:  
tagged_tuple<tag::in(char*), tag::out(char*)> t{0, 0};  
assert(&t.in() == &get<0>(t));  
assert(&t.out() == &get<1>(t));
```

— end example]

8.5.5.1 Tagged tuple creation functions

[tagged.tuple.creation]

```
template <TagSpecifier... Tags, class... Types>
requires sizeof...(Tags) == sizeof...(Types)
constexpr see below make_tagged_tuple(Types&&... t);
```

¹ Let T be the type of `make_tuple(std::forward<Types>(t)...)...`. Then the return type is `tagged<T, Tags...>`.

² *Returns:* `tagged<T, Tags...>(std::forward<Types>(t)...)...`.

³ [*Example:*

```
int i; float j;
make_tagged_tuple<tag::in1, tag::in2, tag::out>(1, ref(i), cref(j))
```

creates a tagged tuple of type

```
tagged_tuple<tag::in1(int), tag::in2(int&), tag::out(const float&)>
```

— *end example*]

9 Iterators library

[iterators]

9.1 General

[iterators.general]

- ¹ This Clause describes components that C++ programs may use to perform iterations over containers (Clause ISO/IEC 14882:2014 §23), streams (ISO/IEC 14882:2014 §27.7), and stream buffers (ISO/IEC 14882:2014 §27.6).
- ² The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 7.

Table 7 — Iterators library summary

Subclause	Header(s)
9.3 Iterator requirements	
9.4 Indirect callable requirements	
9.5 Common algorithm requirements	
9.6 Iterator primitives	<experimental/ranges/iterator>
9.7 Predefined iterators	
9.8 Stream iterators	

9.2 Header <experimental/ranges/iterator> synopsis

[iterator.synopsis]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
  template <class T> concept bool dereferenceable // exposition only
    = requires(T& t) { {*t} -> auto&&; };

  // 9.3, iterator requirements:
  // 9.3.2, customization points:
  namespace {
    // 9.3.2.1, iter_move:
    constexpr unspecified iter_move = unspecified ;

    // 9.3.2.2, iter_swap:
    constexpr unspecified iter_swap = unspecified ;
  }

  // 9.3.3, associated types:
  // 9.3.3.1, difference_type:
  template <class> struct difference_type;
```

```

template <class T> using difference_type_t
    = typename difference_type<T>::type;

// 9.3.3.2, value_type:

}

```

9.3 Iterator requirements

[iterator.requirements]

9.3.1 General

[iterator.requirements.general]

- ¹ Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. All input iterators *i* support the expression **i*, resulting in a value of some object type *T*, called the *value type* of the iterator. All output iterators support the expression **i = o* where *o* is a value of some type that is in the set of types that are *writable* to the particular iterator type of *i*. For every iterator type *X* there is a corresponding signed integer type called the *difference type* of the iterator.
- ² Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines five categories of iterators, according to the operations defined on them: *input iterators*, *output iterators*, *forward iterators*, *bidirectional iterators* and *random access iterators*, as shown in Table 8.

Table 8 — Relations among iterator categories

Random Access	→	Bidirectional	→	Forward	→	Input
						Output

- ³ The five categories of iterators correspond to the iterator concepts `InputIterator`, `OutputIterator`, `ForwardIterator`, `BidirectionalIterator`, and `RandomAccessIterator`, respectively. The generic term *iterator* refers to any type that satisfies `Iterator`.
- ⁴ Forward iterators satisfy all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also satisfy all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also satisfy all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified.
- ⁵ Iterators that further satisfy the requirements of output iterators are called *mutable iterators*. Nonmutable iterators are referred to as *constant iterators*.
- ⁶ Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. These values are called *past-the-end* values. Values of an iterator *i* for which the expression **i* is defined are called *dereferenceable*. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. [Example: After the declaration of an uninitialized pointer *x* (as with `int* x;`), *x* must always be assumed to have a singular value of a pointer. — end example] Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and using a value-initialized iterator as the source of a copy or move operation. [Note: This guarantee is not offered for default initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. — end note] In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.
- ⁷ Most of the library's algorithmic templates that operate on data structures have interfaces that use ranges. A range is an iterator and a *sentinel* that designate the beginning and end of the computation, or an iterator and a count that designate the beginning and the number of elements to which the computation is to be applied.
- ⁸ An iterator and a sentinel denoting a range are comparable. The types of a sentinel and an iterator that denote a range must satisfy `Sentinel` (9.3.9). A range `[i,s)` is empty if `i == s`; otherwise, `[i,s)` refers to the elements in the data structure starting with the element pointed to by *i* and up to but not including the element pointed to by the first iterator *j* such that `j == s`.
- ⁹ A sentinel *s* is called *reachable* from an iterator *i* if and only if there is a finite sequence of applications of the expression `++i` that makes `i == s`. If *s* is reachable from *i*, `[i,s)` denotes a range.

- 10 A counted range `[i,n)` is empty if `n == 0`; otherwise, `[i,n)` refers to the `n` elements in the data structure starting with the element pointed to by `i` and up to but not including the element pointed to by the result of incrementing `i` `n` times.
- 11 A range `[i,s)` is valid if and only if `s` is reachable from `i`. A counted range `[i,n)` is valid if and only if `n == 0`; or `n` is positive, `i` is dereferenceable, and `[++i,--n)` is valid. The result of the application of functions in the library to invalid ranges is undefined.
- 12 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized).
- 13 Destruction of an iterator may invalidate pointers and references previously obtained from that iterator.
- 14 An *invalid* iterator is an iterator that may be singular.³

9.3.2 Customization points

[iterator.custpoints]

9.3.2.1 `iter_move`

[iterator.custpoints.iter_move]

- 1 The name `iter_move` denotes a *customization point object* (6.3.5.1). The expression `ranges::iter_move(E)` for some subexpression `E` is expression-equivalent to the following:
- (1.1) — `static_cast<decltype(iter_move(E))>(iter_move(E))`, if that expression is well-formed when evaluated in a context that does not include `ranges::iter_move` but does include the lookup set produced by argument-dependent lookup (ISO/IEC 14882:2014 §3.4.2).
- (1.2) — Otherwise, if the expression `*E` is well-formed:
- (1.2.1) — if `*E` is an lvalue, `std::move(*E)`;
- (1.2.2) — otherwise, `static_cast<decltype(*E)>(*E)`.
- (1.3) — Otherwise, `ranges::iter_move(E)` is ill-formed.
- 2 If `ranges::iter_move(E)` does not equal `*E`, the program is ill-formed with no diagnostic required.

9.3.2.2 `iter_swap`

[iterator.custpoints.iter_swap]

- 1 The name `iter_swap` denotes a *customization point object* (6.3.5.1). The expression `ranges::iter_swap(E1, E2)` for some subexpressions `E1` and `E2` is expression-equivalent to the following:
- (1.1) — `(void)iter_swap(E1, E2)`, if that expression is well-formed when evaluated in a context that does not include `ranges::iter_swap` but does include the lookup set produced by argument-dependent lookup (ISO/IEC 14882:2014 §3.4.2) and the following declaration:
- ```
void iter_swap(auto, auto) = delete;
```
- (1.2) — Otherwise, if the types of `E1` and `E2` both satisfy `Readable`, and if the reference type of `E1` is swappable with (7.3.11) the reference type of `E2`, then `ranges::swap(*E1, *E2)`
- (1.3) — Otherwise, if the types `T1` and `T2` of `E1` and `E2` satisfy `IndirectlyMovableStorable<T1, T2> && IndirectlyMovableStorable<T2, T1>`, `(void)(*E1 = iter_exchange_move(E2, E1))`, except that `E1` is evaluated only once.
- (1.4) — Otherwise, `ranges::iter_swap(E1, E2)` is ill-formed.
- 2 If `ranges::iter_swap(E1, E2)` does not swap the values denoted by the expressions `E1` and `E2`, the program is ill-formed with no diagnostic required.
- 3 `iter_exchange_move` is an exposition-only function specified as:

```
template <class X, class Y>
constexpr value_type_t<remove_reference_t<X>> iter_exchange_move(X&& x, Y&& y)
noexcept(see below);
```

- 4 *Effects:* Equivalent to:

```
value_type_t<remove_reference_t<X>> old_value(iter_move(x));
*x = iter_move(y);
return old_value;
```

3) This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.

- 5 *Remarks:* The expression in the `noexcept` is equivalent to:

```
NE(remove_reference_t<X>, remove_reference_t<Y>) &&
NE(remove_reference_t<Y>, remove_reference_t<X>)
```

Where `NE(T1, T2)` is the expression:

```
is_nothrow_constructible<value_type_t<T1>, rvalue_reference_t<T1>>::value &&
is_nothrow_assignable<value_type_t<T1>&, rvalue_reference_t<T1>>::value &&
is_nothrow_assignable<reference_t<T1>, rvalue_reference_t<T2>>::value &&
is_nothrow_assignable<reference_t<T1>, value_type_t<T2>>::value &&
is_nothrow_move_constructible<value_type_t<T1>>::value &&
noexcept(ranges::iter_move(declval<T1&>()))
```

### 9.3.3 Iterator associated types

[iterator.assoc.types]

- 1 To implement algorithms only in terms of iterators, it is often necessary to determine the value and difference types that correspond to a particular iterator type. Accordingly, it is required that if `WI` is the name of a type that satisfies the `WeaklyIncrementable` concept (9.3.6), `R` is the name of a type that satisfies the `Readable` concept (9.3.4), and `II` is the name of a type that satisfies the `InputIterator` concept (9.3.11) concept, the types

```
difference_type_t<WI>
value_type_t<R>
iterator_category_t<II>
```

be defined as the iterator's difference type, value type and iterator category, respectively.

#### 9.3.3.1 difference\_type

[iterator.assoc.types.difference\_type]

- 1 `difference_type_t<T>` is implemented as if:

```
template <class> struct difference_type { };

template <class T>
struct difference_type<T*>
: enable_if<is_object<T>::value, ptrdiff_t> { };

template <class I>
struct difference_type<const I> : difference_type<decay_t<I>> { };

template <class T>
requires requires { typename T::difference_type; }
struct difference_type<T> {
 using type = typename T::difference_type;
};

template <class T>
requires !requires { typename T::difference_type; } &&
requires(const T& a, const T& b) { { a - b } -> Integral; }
struct difference_type<T>
: make_signed< decltype(declval<T>() - declval<T>()) > {
};

template <class T> using difference_type_t
= typename difference_type<T>::type;
```

- 2 Users may specialize `difference_type` on user-defined types.

#### 9.3.3.2 value\_type

[iterator.assoc.types.value\_type]

- 1 A `Readable` type has an associated value type that can be accessed with the `value_type_t` alias template.

```
template <class> struct value_type { };

template <class T>
struct value_type<T*>
```

```

 : enable_if<is_object<T>::value, remove_cv_t<T>> { };

template <class I>
 requires is_array<I>::value
struct value_type<I> : value_type<decay_t<I>> { };

template <class I>
struct value_type<const I> : value_type<decay_t<I>> { };

template <class T>
 requires requires { typename T::value_type; }
struct value_type<T>
 : enable_if<is_object<typename T::value_type>::value, typename T::value_type> { };

template <class T>
 requires requires { typename T::element_type; }
struct value_type<T>
 : enable_if<
 is_object<typename T::element_type>::value,
 remove_cv_t<typename T::element_type>>
 { };

template <class T> using value_type_t
 = typename value_type<T>::type;

```

- 2 If a type `I` has an associated value type, then `value_type<I>::type` shall name the value type. Otherwise, there shall be no nested type `type`.
- 3 The `value_type` class template may be specialized on user-defined types.
- 4 When instantiated with a type `I` such that `I::value_type` is valid and denotes a type, `value_type<I>::type` names that type, unless it is not an object type (ISO/IEC 14882:2014 §3.9) in which case `value_type<I>` shall have no nested type `type`. [Note: Some legacy output iterators define a nested type named `value_type` that is an alias for `void`. These types are not `Readable` and have no associated value types. — end note]
- 5 When instantiated with a type `I` such that `I::element_type` is valid and denotes a type, `value_type<I>::type` names the type `remove_cv_t<I::element_type>`, unless it is not an object type (ISO/IEC 14882:2014 §3.9) in which case `value_type<I>` shall have no nested type `type`. [Note: Smart pointers like `shared_ptr<int>` are `Readable` and have an associated value type. But a smart pointer like `shared_ptr<void>` is not `Readable` and has no associated value type. — end note]

### 9.3.3.3 iterator\_category

[iterator.assoc.types.iterator\_category]

- 1 `iterator_category_t<T>` is implemented as if:

```

template <class> struct iterator_category { };

template <class T>
struct iterator_category<T*>
 : enable_if<is_object<T>::value, random_access_iterator_tag> { };

template <class T>
struct iterator_category<T const> : iterator_category<T> { };

template <class T>
 requires requires { typename T::iterator_category; }
struct iterator_category<T> {
 using type = see below;
};

template <class T> using iterator_category_t
 = typename iterator_category<T>::type;

```

- 2 Users may specialize `iterator_category` on user-defined types.
- 3 If `T::iterator_category` is valid and denotes a type, then the type `iterator_category<T>::type` is computed as follows:

- (3.1) — If `T::iterator_category` is the same as or derives from `std::random_access_iterator_tag`, `iterator_category<T>::type` is `ranges::random_access_iterator_tag`.
- (3.2) — Otherwise, if `T::iterator_category` is the same as or derives from `std::bidirectional_iterator_tag`, `iterator_category<T>::type` is `ranges::bidirectional_iterator_tag`.
- (3.3) — Otherwise, if `T::iterator_category` is the same as or derives from `std::forward_iterator_tag`, `iterator_category<T>::type` is `ranges::forward_iterator_tag`.
- (3.4) — Otherwise, if `T::iterator_category` is the same as or derives from `std::input_iterator_tag`, `iterator_category<T>::type` is `ranges::input_iterator_tag`.
- (3.5) — Otherwise, if `T::iterator_category` is the same as or derives from `std::output_iterator_tag`, `iterator_category<T>` has no nested type.
- (3.6) — Otherwise, `iterator_category<T>::type` is `T::iterator_category`

4 `rvalue_reference_t<T>` is implemented as if:

```
template <dereferenceable T>
 requires see below using rvalue_reference_t
 = decltype(ranges::iter_move(declval<T&>()));
```

5 The expression in the `requires` clause is equivalent to:

```
requires(T& t) { { ranges::iter_move(t) } -> auto&&; }
```

### 9.3.4 Concept Readable

[iterators.readable]

- 1 The **Readable** concept is satisfied by types that are readable by applying `operator*` including pointers, smart pointers, and iterators.

```
template <class In>
concept bool Readable =
 requires {
 typename value_type_t<In>;
 typename reference_t<In>;
 typename rvalue_reference_t<In>;
 } &&
 CommonReference<reference_t<In>&&, value_type_t<In>&> &&
 CommonReference<reference_t<In>&&, rvalue_reference_t<In>&&> &&
 CommonReference<rvalue_reference_t<In>&&, const value_type_t<In>&>;
```

### 9.3.5 Concept Writable

[iterators.writable]

- 1 The **Writable** concept specifies the requirements for writing a value into an iterator's referenced object.

```
template <class Out, class T>
concept bool Writable =
 requires(Out&& o, T&& t) {
 *o = std::forward<T>(t); // not required to be equality preserving
 *std::forward<Out>(o) = std::forward<T>(t); // not required to be equality preserving
 const_cast<const reference_t<Out>&&>(*o) =
 std::forward<T>(t); // not required to be equality preserving
 const_cast<const reference_t<Out>&&>(*std::forward<Out>(o)) =
 std::forward<T>(t); // not required to be equality preserving
 };
```

- 2 Let `E` be an expression such that `decltype((E))` is `T`, and let `o` be a dereferenceable object of type `Out`. `Writable<Out, T>` is satisfied only if
- (2.1) — If `Readable<Out> && Same<value_type_t<Out>, decay_t<T>>` is satisfied, then `*o` after any above assignment is equal to the value of `E` before the assignment.
- 3 After evaluating any above assignment expression, `o` is not required to be dereferenceable.
- 4 If `E` is an xvalue (ISO/IEC 14882:2014 §3.10), the resulting state of the object it denotes is valid but unspecified (ISO/IEC 14882:2014 §17.6.5.15).
- 5 [Note: The only valid use of an `operator*` is on the left side of the assignment statement. *Assignment through the same value of the writable type happens only once.* — end note]

### 9.3.6 Concept WeaklyIncrementable

[iterators.weaklyincrementable]

- <sup>1</sup> The **WeaklyIncrementable** concept specifies the requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be **EqualityComparable**.

```
template <class I>
concept bool WeaklyIncrementable =
 Semiregular<I> &&
 requires(I i) {
 typename difference_type_t<I>;
 requires SignedIntegral<difference_type_t<I>>;
 { ++i } -> Same<I>&; // not required to be equality preserving
 i++; // not required to be equality preserving
 };
```

- <sup>2</sup> Let *i* be an object of type *I*. When *i* is in the domain of both pre- and post-increment, *i* is said to be *incrementable*. **WeaklyIncrementable**<*I*> is satisfied only if
- (2.1) — The expressions *++i* and *i++* have the same domain.
  - (2.2) — If *i* is incrementable, then both *++i* and *i++* advance *i* to the next element.
  - (2.3) — If *i* is incrementable, then *&++i* is equal to *&i*.
- <sup>3</sup> [Note: For **WeaklyIncrementable** types, *a* equals *b* does not imply that *++a* equals *++b*. (Equality does not guarantee the substitution property or referential transparency.) Algorithms on weakly incrementable types should never attempt to pass through the same incrementable value twice. They should be single pass algorithms. These algorithms can be used with *istream*s as the source of the input data through the *istream\_iterator* class template. — end note]

### 9.3.7 Concept Incrementable

[iterators.incrementable]

- <sup>1</sup> The **Incrementable** concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be **EqualityComparable**. [Note: This requirement supersedes the annotations on the increment expressions in the definition of **WeaklyIncrementable**. — end note]

```
template <class I>
concept bool Incrementable =
 Regular<I> &&
 WeaklyIncrementable<I> &&
 requires(I i) {
 { i++ } -> Same<I>&&;
 };

```

- <sup>2</sup> Let *a* and *b* be incrementable objects of type *I*. **Incrementable**<*I*> is satisfied only if
- (2.1) — If *bool(a == b)* then *bool(a++ == b)*.
  - (2.2) — If *bool(a == b)* then *bool((a++, a) == ++b)*.
- <sup>3</sup> [Note: The requirement that *a* equals *b* implies *++a* equals *++b* (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that satisfy **Incrementable**. — end note]

### 9.3.8 Concept Iterator

[iterators.iterator]

- <sup>1</sup> The **Iterator** concept forms the basis of the iterator concept taxonomy; every iterator satisfies the **Iterator** requirements. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (9.3.9), to read (9.3.11) or write (9.3.12) values, or to provide a richer set of iterator movements (9.3.13, 9.3.14, 9.3.15).

```
template <class I>
concept bool Iterator =
 requires(I i) {
 { *i } -> auto&&; // Requires: i is dereferenceable
 } &&
 WeaklyIncrementable<I>;
```

- <sup>2</sup> [Note: The requirement that the result of dereferencing the iterator is deducible from `auto&&` means that it cannot be `void`. — end note]

### 9.3.9 Concept Sentinel

[iterators.sentinel]

- <sup>1</sup> The **Sentinel** concept specifies the relationship between an **Iterator** type and a **Semiregular** type whose values denote a range.

```
template <class S, class I>
concept bool Sentinel =
 Semiregular<S> &&
 Iterator<I> &&
 WeaklyEqualityComparableWith<S, I>;
```

- <sup>2</sup> Let `s` and `i` be values of type `S` and `I` such that `[i,s)` denotes a range. Types `S` and `I` satisfy **Sentinel**<`S`, `I`> only if:
- (2.1) — `i == s` is well-defined.
- (2.2) — If `bool(i != s)` then `i` is dereferenceable and `[++i,s)` denotes a range.
- <sup>3</sup> The domain of `==` can change over time. Given an iterator `i` and sentinel `s` such that `[i,s)` denotes a range and `i != s`, `[i,s)` is not required to continue to denote a range after incrementing any iterator equal to `i`. Consequently, `i == s` is no longer required to be well-defined.

### 9.3.10 Concept SizedSentinel

[iterators.sizedsentinel]

- <sup>1</sup> The **SizedSentinel** concept specifies requirements on an **Iterator** and a **Sentinel** that allow the use of the `-` operator to compute the distance between them in constant time.

```
template <class S, class I>
concept bool SizedSentinel =
 Sentinel<S, I> &&
 !disable_sized_sentinel<remove_cv_t<S>, remove_cv_t<I>>> &&
 requires(const I& i, const S& s) {
 { s - i } -> Same<difference_type_t<I>>>&&;
 { i - s } -> Same<difference_type_t<I>>>&&;
 };
```

- <sup>2</sup> Let `i` be an iterator of type `I`, and `s` a sentinel of type `S` such that `[i,s)` denotes a range. Let `N` be the smallest number of applications of `++i` necessary to make `bool(i == s)` be true. **SizedSentinel**<`S`, `I`> is satisfied only if:
- (2.1) — If `N` is representable by `difference_type_t<I>`, then `s - i` is well-defined and equals `N`.
- (2.2) — If `-N` is representable by `difference_type_t<I>`, then `i - s` is well-defined and equals `-N`.
- <sup>3</sup> [Note: `disable_sized_sentinel` provides a mechanism to enable use of sentinels and iterators with the library that meet the syntactic requirements but do not in fact satisfy **SizedSentinel**. A program that instantiates a library template that requires **SizedSentinel** with an iterator type `I` and sentinel type `S` that meet the syntactic requirements of **SizedSentinel**<`S`, `I`> but do not satisfy **SizedSentinel** is ill-formed with no diagnostic required unless `disable_sized_sentinel<S, I>` evaluates to `true` (6.2.1.3). — end note]
- <sup>4</sup> [Note: The **SizedSentinel** concept is satisfied by pairs of **RandomAccessIterators** (9.3.15) and by counted iterators and their sentinels (9.7.6.1). — end note]

### 9.3.11 Concept InputIterator

[iterators.input]

- <sup>1</sup> The **InputIterator** concept is a refinement of **Iterator** (9.3.8). It defines requirements for a type whose referenced values can be read (from the requirement for **Readable** (9.3.4)) and which can be both pre- and post-incremented. [Note: Unlike in ISO/IEC 14882, input iterators are not required to satisfy **EqualityComparable** (7.4.3). — end note]

```
template <class I>
concept bool InputIterator =
 Iterator<I> &&
```

```

Readable<I> &&
requires { typename iterator_category_t<I>; } &&
DerivedFrom<iterator_category_t<I>, input_iterator_tag>;

```

### 9.3.12 Concept OutputIterator

[iterators.output]

- <sup>1</sup> The **OutputIterator** concept is a refinement of **Iterator** (9.3.8). It defines requirements for a type that can be used to write values (from the requirement for **Writable** (9.3.5)) and which can be both pre- and post-incremented. However, output iterators are not required to satisfy **EqualityComparable**.

```

template <class I, class T>
concept bool OutputIterator =
 Iterator<I> &&
 Writable<I, T> &&
 requires(I i, T&& t) {
 *i++ = std::forward<T>(t); // not required to be equality preserving
 };

```

- <sup>2</sup> Let *E* be an expression such that `decltype((E))` is *T*, and let *i* be a dereferenceable object of type *I*. **OutputIterator**<*I*, *T*> is satisfied only if `*i++ = E`; has effects equivalent to:

```

*i = E;
++i;

```

- <sup>3</sup> [Note: Algorithms on output iterators should never attempt to pass through the same iterator twice. They should be *single pass* algorithms. Algorithms that take output iterators can be used with ostreams as the destination for placing data through the `ostream_iterator` class as well as with insert iterators and insert pointers. — end note]

### 9.3.13 Concept ForwardIterator

[iterators.forward]

- <sup>1</sup> The **ForwardIterator** concept refines **InputIterator** (9.3.11), adding equality comparison and the multi-pass guarantee, specified below.

```

template <class I>
concept bool ForwardIterator =
 InputIterator<I> &&
 DerivedFrom<iterator_category_t<I>, forward_iterator_tag> &&
 Incrementable<I> &&
 Sentinel<I, I>;

```

- <sup>2</sup> The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type. [Note: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]

- <sup>3</sup> Pointers and references obtained from a forward iterator into a range `[i,s)` shall remain valid while `[i,s)` continues to denote a range.

- <sup>4</sup> Two dereferenceable iterators *a* and *b* of type *X* offer the *multi-pass guarantee* if:

(4.1) — `a == b` implies `++a == ++b` and

(4.2) — The expression `([] (X x){++x;} (a), *a)` is equivalent to the expression `*a`.

- <sup>5</sup> [Note: The requirement that `a == b` implies `++a == ++b` (which is not true for weaker iterators) and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators. — end note]

### 9.3.14 Concept BidirectionalIterator

[iterators.bidirectional]

- <sup>1</sup> The **BidirectionalIterator** concept refines **ForwardIterator** (9.3.13), and adds the ability to move an iterator backward as well as forward.

```

template <class I>
concept bool BidirectionalIterator =
 ForwardIterator<I> &&
 DerivedFrom<iterator_category_t<I>, bidirectional_iterator_tag> &&

```

```

requires(I i) {
 { --i } -> Same<I>&;
 { i-- } -> Same<I>&&;
};

```

<sup>2</sup> A bidirectional iterator **r** is decrementable if and only if there exists some **s** such that **++s == r**. Decrementable iterators **r** shall be in the domain of the expressions **--r** and **r--**.

<sup>3</sup> Let **a** and **b** be decrementable objects of type **I**. **BidirectionalIterator<I>** is satisfied only if:

(3.1) — **&--a == &a**.

(3.2) — If **bool(a == b)**, then **bool(a-- == b)**.

(3.3) — If **bool(a == b)**, then after evaluating both **a--** and **--b**, **bool(a == b)** still holds.

(3.4) — If **a** is incrementable and **bool(a == b)**, then **bool(--(++a) == b)**.

(3.5) — If **bool(a == b)**, then **bool(++(--a) == b)**.

### 9.3.15 Concept **RandomAccessIterator**

[iterators.random.access]

<sup>1</sup> The **RandomAccessIterator** concept refines **BidirectionalIterator** (9.3.14) and adds support for constant-time advancement with **+=**, **+**, **-=**, and **-**, and the computation of distance in constant time with **-**. **Random access iterators** also support array notation via subscripting.

```

template <class I>
concept bool RandomAccessIterator =
 BidirectionalIterator<I> &&
 DerivedFrom<iterator_category_t<I>, random_access_iterator_tag> &&
 StrictTotallyOrdered<I> &&
 SizedSentinel<I, I> &&
 requires(I i, const I j, const difference_type_t<I> n) {
 { i += n } -> Same<I>&&;
 { j + n } -> Same<I>&&;
 { n + j } -> Same<I>&&;
 { i -= n } -> Same<I>&&;
 { j - n } -> Same<I>&&;
 j[n];
 requires Same<decltype(j[n]), reference_t<I>>;
 };

```

<sup>2</sup> Let **a** and **b** be valid iterators of type **I** such that **b** is reachable from **a**. Let **n** be the smallest value of type **difference\_type\_t<I>** such that after **n** applications of **++a**, then **bool(a == b)**. **RandomAccessIterator<I>** is satisfied only if:

(2.1) — **(a += n)** is equal to **b**.

(2.2) — **&(a += n)** is equal to **&a**.

(2.3) — **(a + n)** is equal to **(a += n)**.

(2.4) — For any two positive integers **x** and **y**, if **a + (x + y)** is valid, then **a + (x + y)** is equal to **(a + x) + y**.

(2.5) — **a + 0** is equal to **a**.

(2.6) — If **(a + (n - 1))** is valid, then **a + n** is equal to **++(a + (n - 1))**.

(2.7) — **(b += -n)** is equal to **a**.

(2.8) — **(b -= n)** is equal to **a**.

(2.9) — **&(b -= n)** is equal to **&b**.

(2.10) — **(b - n)** is equal to **(b -= n)**.

(2.11) — If **b** is dereferenceable, then **a[n]** is valid and is equal to **\*b**.

## 9.4 Indirect callable requirements

[indirectcallable]

### 9.4.1 General

[indirectcallable.general]

<sup>1</sup> There are several concepts that group requirements of algorithms that take callable objects (ISO/IEC 14882:2014 §20.9.2) as arguments.

## 9.4.2 Indirect callables

[indirectcallable.indirectinvocable]

- <sup>1</sup> The indirect callable concepts are used to constrain those algorithms that accept callable objects (ISO/IEC 14882:2014 §20.9.1) as arguments.

```
template <class F, class I>
concept bool IndirectUnaryInvocable =
 Readable<I> &&
 CopyConstructible<F> &&
 Invocable<F&, value_type_t<I>&> &&
 Invocable<F&, reference_t<I>>> &&
 Invocable<F&, iter_common_reference_t<I>>> &&
 CommonReference<
 result_of_t<F&(value_type_t<I>&>),
 result_of_t<F&(reference_t<I>&&>>>;

template <class F, class I>
concept bool IndirectRegularUnaryInvocable =
 Readable<I> &&
 CopyConstructible<F> &&
 RegularInvocable<F&, value_type_t<I>&> &&
 RegularInvocable<F&, reference_t<I>>> &&
 RegularInvocable<F&, iter_common_reference_t<I>>> &&
 CommonReference<
 result_of_t<F&(value_type_t<I>&>),
 result_of_t<F&(reference_t<I>&&>>>;

template <class F, class I>
concept bool IndirectUnaryPredicate =
 Readable<I> &&
 CopyConstructible<F> &&
 Predicate<F&, value_type_t<I>&> &&
 Predicate<F&, reference_t<I>>> &&
 Predicate<F&, iter_common_reference_t<I>>>;

template <class F, class I1, class I2 = I1>
concept bool IndirectRelation =
 Readable<I1> && Readable<I2> &&
 CopyConstructible<F> &&
 Relation<F&, value_type_t<I1>&, value_type_t<I2>&> &&
 Relation<F&, value_type_t<I1>&, reference_t<I2>>> &&
 Relation<F&, reference_t<I1>, value_type_t<I2>&> &&
 Relation<F&, reference_t<I1>, reference_t<I2>>> &&
 Relation<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>>;

template <class F, class I1, class I2 = I1>
concept bool IndirectStrictWeakOrder =
 Readable<I1> && Readable<I2> &&
 CopyConstructible<F> &&
 StrictWeakOrder<F&, value_type_t<I1>&, value_type_t<I2>&> &&
 StrictWeakOrder<F&, value_type_t<I1>&, reference_t<I2>>> &&
 StrictWeakOrder<F&, reference_t<I1>, value_type_t<I2>&> &&
 StrictWeakOrder<F&, reference_t<I1>, reference_t<I2>>> &&
 StrictWeakOrder<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>>;

template <class> struct indirect_result_of { };

template <class F, class... Is>
 requires Invocable<F, reference_t<Is>...>
struct indirect_result_of<F(Is...)> :
 result_of<F(reference_t<Is>&&...)> { };

```

**9.4.3 Class template projected****[projected]**

- <sup>1</sup> The **projected** class template is intended for use when specifying the constraints of algorithms that accept callable objects and projections (3.2). It bundles a **Readable** type **I** and a function **Proj** into a new **Readable** type whose reference type is the result of applying **Proj** to the **reference\_t** of **I**.

```
template <Readable I, IndirectRegularUnaryInvocable<I> Proj>
struct projected {
 using value_type = remove_cv_t<remove_reference_t<indirect_result_of_t<Proj&(I)>>>;
 indirect_result_of_t<Proj&(I)> operator*() const;
};

template <WeaklyIncrementable I, class Proj>
struct difference_type<projected<I, Proj>> {
 using type = difference_type_t<I>;
};
```

- <sup>2</sup> [Note: **projected** is only used to ease constraints specification. Its member function need not be defined. — end note]

**9.5 Common algorithm requirements****[commonalgoreq]****9.5.1 General****[commonalgoreq.general]**

- <sup>1</sup> There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are three relational concepts that specify how element values are transferred between **Readable** and **Writable** types: **IndirectlyMovable**, **IndirectlyCopyable**, and **IndirectlySwappable**. There are three relational concepts for rearrangements: **Permutable**, **Mergeable**, and **Sortable**. There is one relational concept for comparing values from different sequences: **IndirectlyComparable**.
- <sup>2</sup> [Note: The **equal\_to<>** and **less<>** (8.3.2) function types used in the concepts below impose additional constraints on their arguments beyond those that appear explicitly in the concepts' bodies. **equal\_to<>** requires its arguments satisfy **EqualityComparableWith** (7.4.3), and **less<>** requires its arguments satisfy **StrictTotallyOrderedWith** (7.4.4). — end note]

**9.5.2 Concept IndirectlyMovable****[commonalgoreq.indirectlymovable]**

- <sup>1</sup> The **IndirectlyMovable** concept specifies the relationship between a **Readable** type and a **Writable** type between which values may be moved.

```
template <class In, class Out>
concept bool IndirectlyMovable =
 Readable<In> &&
 Writable<Out, rvalue_reference_t<In>>;
```

- <sup>2</sup> The **IndirectlyMovableStorable** concept augments **IndirectlyMovable** with additional requirements enabling the transfer to be performed through an intermediate object of the **Readable** type's value type.

```
template <class In, class Out>
concept bool IndirectlyMovableStorable =
 IndirectlyMovable<In, Out> &&
 Writable<Out, value_type_t<In>> &&
 Movable<value_type_t<In>> &&
 Constructible<value_type_t<In>, rvalue_reference_t<In>> &&
 Assignable<value_type_t<In> &, rvalue_reference_t<In>>;
```

**9.5.3 Concept IndirectlyCopyable****[commonalgoreq.indirectlycopyable]**

- <sup>1</sup> The **IndirectlyCopyable** concept specifies the relationship between a **Readable** type and a **Writable** type between which values may be copied.

```
template <class In, class Out>
concept bool IndirectlyCopyable =
 Readable<In> &&
 Writable<Out, reference_t<In>>;
```

- <sup>2</sup> The `IndirectlyCopyableStorable` concept augments `IndirectlyCopyable` with additional requirements enabling the transfer to be performed through an intermediate object of the `Readable` type's value type. It also requires the capability to make copies of values.

```
template <class In, class Out>
concept bool IndirectlyCopyableStorable =
 IndirectlyCopyable<In, Out> &&
 Writable<Out, const value_type_t<In>&> &&
 Copyable<value_type_t<In>> &&
 Constructible<value_type_t<In>, reference_t<In>> &&
 Assignable<value_type_t<In>&, reference_t<In>>;
```

#### 9.5.4 Concept `IndirectlySwappable`

[commonalgoreq.indirectlyswappable]

- <sup>1</sup> The `IndirectlySwappable` concept specifies a swappable relationship between the values referenced by two `Readable` types.

```
template <class I1, class I2 = I1>
concept bool IndirectlySwappable =
 Readable<I1> && Readable<I2> &&
 requires(I1&& i1, I2&& i2) {
 ranges::iter_swap(std::forward<I1>(i1), std::forward<I2>(i2));
 ranges::iter_swap(std::forward<I2>(i2), std::forward<I1>(i1));
 ranges::iter_swap(std::forward<I1>(i1), std::forward<I1>(i1));
 ranges::iter_swap(std::forward<I2>(i2), std::forward<I2>(i2));
 };
};
```

- <sup>2</sup> Given an object `i1` of type `I1` and an object `i2` of type `I2`, `IndirectlySwappable<I1, I2>` is satisfied if after `ranges::iter_swap(i1, i2)`, the value of `*i1` is equal to the value of `*i2` before the call, and *vice versa*.

#### 9.5.5 Concept `IndirectlyComparable`

[commonalgoreq.indirectlycomparable]

- <sup>1</sup> The `IndirectlyComparable` concept specifies the common requirements of algorithms that compare values from two different sequences.

```
template <class I1, class I2, class R = equal_to<>, class P1 = identity,
 class P2 = identity>
concept bool IndirectlyComparable =
 IndirectRelation<R, projected<I1, P1>, projected<I2, P2>>;
```

#### 9.5.6 Concept `Permutable`

[commonalgoreq.permutable]

- <sup>1</sup> The `Permutable` concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

```
template <class I>
concept bool Permutable =
 ForwardIterator<I> &&
 IndirectlyMovableStorable<I, I> &&
 IndirectlySwappable<I, I>;
```

#### 9.5.7 Concept `Mergeable`

[commonalgoreq.mergeable]

- <sup>1</sup> The `Mergeable` concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

```
template <class I1, class I2, class Out,
 class R = less<>, class P1 = identity, class P2 = identity>
concept bool Mergeable =
 InputIterator<I1> &&
 InputIterator<I2> &&
 WeaklyIncrementable<Out> &&
 IndirectlyCopyable<I1, Out> &&
 IndirectlyCopyable<I2, Out> &&
 IndirectStrictWeakOrder<R, projected<I1, P1>, projected<I2, P2>>;
```

## 9.5.8 Concept Sortable

[commonalgoreq.sortable]

- <sup>1</sup> The Sortable concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., sort).

```
template <class I, class R = less<>, class P = identity>
concept bool Sortable =
 Permutable<I> &&
 IndirectStrictWeakOrder<R, projected<I, P>>;
```

## 9.6 Iterator primitives

[iterator.primitives]

- <sup>1</sup> To simplify the task of defining iterators, the library provides several classes and functions:

## 9.6.1 Iterator traits

[iterator.traits]

- <sup>1</sup> For the sake of backwards compatibility, this document specifies the existence of an `iterator_traits` alias that collects an iterator's associated types. It is defined as if:

```
template <InputIterator I> struct __pointer_type { // exposition only
 using type = add_pointer_t<reference_t<I>>;
};
template <InputIterator I>
 requires requires(I i) { { i.operator->() } -> auto&&; }
struct __pointer_type<I> { // exposition only
 using type = decltype(declval<I>().operator->());
};
template <class> struct __iterator_traits { }; // exposition only
template <Iterator I> struct __iterator_traits<I> {
 using difference_type = difference_type_t<I>;
 using value_type = void;
 using reference = void;
 using pointer = void;
 using iterator_category = output_iterator_tag;
};
template <InputIterator I> struct __iterator_traits<I> { // exposition only
 using difference_type = difference_type_t<I>;
 using value_type = value_type_t<I>;
 using reference = reference_t<I>;
 using pointer = typename __pointer_type<I>::type;
 using iterator_category = iterator_category_t<I>;
};
template <class I>
 using iterator_traits = __iterator_traits<I>;
```

- <sup>2</sup> [Note: `iterator_traits` is an alias template to prevent user code from specializing it. — end note]
- <sup>3</sup> [Example: To implement a generic `reverse` function, a C++ program can do the following:

```
template <BidirectionalIterator I>
void reverse(I first, I last) {
 difference_type_t<I> n = distance(first, last);
 --n;
 while(n > 0) {
 value_type_t<I> tmp = *first;
 *first++ = *--last;
 *last = tmp;
 n -= 2;
 }
}
```

— end example]

## 9.6.2 Standard iterator traits

[iterator.stdtraits]

- <sup>1</sup> To facilitate interoperability between new code using iterators conforming to this document and older code using iterators that conform to the iterator requirements specified in ISO/IEC 14882, three specializations of `std::iterator_traits` are provided to map the newer iterator categories and associated types to the older ones.

```
namespace std {
 template <experimental::ranges::Iterator Out>
 struct iterator_traits<Out> {
 using difference_type = experimental::ranges::difference_type_t<Out>;
 using value_type = see below;
 using reference = see below;
 using pointer = see below;
 using iterator_category = std::output_iterator_tag;
 };
}
```

- <sup>2</sup> The nested type `value_type` is computed as follows:

- (2.1) — If `Out::value_type` is valid and denotes a type, then `std::iterator_traits<Out>::value_type` is `Out::value_type`.
- (2.2) — Otherwise, `std::iterator_traits<Out>::value_type` is `void`.

- <sup>3</sup> The nested type `reference` is computed as follows:

- (3.1) — If `Out::reference` is valid and denotes a type, then `std::iterator_traits<Out>::reference` is `Out::reference`.
- (3.2) — Otherwise, `std::iterator_traits<Out>::reference` is `void`.

- <sup>4</sup> The nested type `pointer` is computed as follows:

- (4.1) — If `Out::pointer` is valid and denotes a type, then `std::iterator_traits<Out>::pointer` is `Out::pointer`.
- (4.2) — Otherwise, `std::iterator_traits<Out>::pointer` is `void`.

```
template <experimental::ranges::InputIterator In>
struct iterator_traits<In> { };

template <experimental::ranges::InputIterator In>
 requires experimental::ranges::Sentinel<In, In>
struct iterator_traits<In> {
 using difference_type = experimental::ranges::difference_type_t<In>;
 using value_type = experimental::ranges::value_type_t<In>;
 using reference = see below;
 using pointer = see below;
 using iterator_category = see below;
};
}
```

- <sup>5</sup> The nested type `reference` is computed as follows:

- (5.1) — If `In::reference` is valid and denotes a type, then `std::iterator_traits<In>::reference` is `In::reference`.
- (5.2) — Otherwise, `std::iterator_traits<In>::reference` is `experimental::ranges::reference_t<In>`.

- <sup>6</sup> The nested type `pointer` is computed as follows:

- (6.1) — If `In::pointer` is valid and denotes a type, then `std::iterator_traits<In>::pointer` is `In::pointer`.
- (6.2) — Otherwise, `std::iterator_traits<In>::pointer` is `experimental::ranges::iterator_traits<In>::pointer`.

- <sup>7</sup> Let type `C` be `experimental::ranges::iterator_category_t<In>`. The nested type `std::iterator_traits<In>::iterator_category` is computed as follows:

- (7.1) — If `C` is the same as or inherits from `std::input_iterator_tag` or `std::output_iterator_tag`, `std::iterator_traits<In>::iterator_category` is `C`.

- (7.2) — Otherwise, if `experimental::ranges::reference_t<In>` is not a reference type, `std::iterator_traits<In>::iterator_category` is `std::input_iterator_tag`.
- (7.3) — Otherwise, if `C` is the same as or inherits from `experimental::ranges::random_access_iterator_tag`, `std::iterator_traits<In>::iterator_category` is `std::random_access_iterator_tag`.
- (7.4) — Otherwise, if `C` is the same as or inherits from `experimental::ranges::bidirectional_iterator_tag`, `std::iterator_traits<In>::iterator_category` is `std::bidirectional_iterator_tag`.
- (7.5) — Otherwise, if `C` is the same as or inherits from `experimental::ranges::forward_iterator_tag`, `std::iterator_traits<In>::iterator_category` is `std::forward_iterator_tag`.
- (7.6) — Otherwise, `std::iterator_traits<In>::iterator_category` is `std::input_iterator_tag`.

<sup>8</sup> [Note: Some implementations may find it necessary to add additional constraints to these partial specializations to prevent them from being considered for types that conform to the iterator requirements specified in ISO/IEC 14882. — end note]

### 9.6.3 Standard iterator tags

[std.iterator.tags]

- <sup>1</sup> It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces *category tag* classes which can be used as compile time tags for algorithm selection. [Note: The preferred way to dispatch to more specialized algorithm implementations is with concept-based overloading. — end note] The category tags are: `input_iterator_tag`, `output_iterator_tag`, `forward_iterator_tag`, `bidirectional_iterator_tag` and `random_access_iterator_tag`. For every input iterator of type `I`, `iterator_category_t<I>` shall be defined to be the most specific category tag that describes the iterator's behavior.

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 struct output_iterator_tag { };
 struct input_iterator_tag { };
 struct forward_iterator_tag : input_iterator_tag { };
 struct bidirectional_iterator_tag : forward_iterator_tag { };
 struct random_access_iterator_tag : bidirectional_iterator_tag { };
}}}}
```

- <sup>2</sup> [Note: The `output_iterator_tag` is provided for the sake of backward compatibility. — end note]
- <sup>3</sup> [Example: For a program-defined iterator `BinaryTreeIterator`, it could be included into the `bidirectional_iterator` category by specializing the `difference_type`, `value_type`, and `iterator_category` templates:

```
template <class T> struct difference_type<BinaryTreeIterator<T>> {
 using type = ptrdiff_t;
};
template <class T> struct value_type<BinaryTreeIterator<T>> {
 using type = T;
};
template <class T> struct iterator_category<BinaryTreeIterator<T>> {
 using type = bidirectional_iterator_tag;
};
```

— end example]

### 9.6.4 Iterator operations

[iterator.operations]

- <sup>1</sup> Since only types that satisfy `RandomAccessIterator` provide the `+` operator, and types that satisfy `SizedSentinel` provide the `-` operator, the library provides customization point objects (6.3.5.1) `advance`, `distance`, `next`, and `prev`. These customization point objects use `+` and `-` for random access iterators and ranges that satisfy `SizedSentinel` (and are, therefore, constant time for them); for output, input, forward and bidirectional iterators they use `++` to provide linear time implementations.
- <sup>2</sup> The name `advance` denotes a customization point object (6.3.5.1). It has the following function call operators:

```
template <Iterator I>
constexpr void operator()(I& i, difference_type_t<I> n) const;
```

3 *Requires:*  $n$  shall be negative only for bidirectional iterators.

4 *Effects:* For random access iterators, equivalent to  $i += n$ . Otherwise, increments (or decrements for negative  $n$ ) iterator  $i$  by  $n$ .

```
template <Iterator I, Sentinel<I> S>
constexpr void operator()(I& i, S bound) const;
```

5 *Requires:* If `Assignable<I&, S>` is not satisfied, `[i, bound)` shall denote a range.

6 *Effects:*

(6.1) — If `Assignable<I&, S>` is satisfied, equivalent to `i = std::move(bound)`.

(6.2) — Otherwise, if `SizedSentinel<S, I>` is satisfied, equivalent to `advance(i, bound - i)`.

(6.3) — Otherwise, increments  $i$  until  $i == \text{bound}$ .

```
template <Iterator I, Sentinel<I> S>
constexpr difference_type_t<I> operator()(I& i, difference_type_t<I> n, S bound) const;
```

7 *Requires:* If  $n > 0$ , `[i, bound)` shall denote a range. If  $n == 0$ , `[i, bound)` or `[bound, i)` shall denote a range. If  $n < 0$ , `[bound, i)` shall denote a range and `(BidirectionalIterator<I> && Same<I, S>)` shall be satisfied.

8 *Effects:*

(8.1) — If `SizedSentinel<S, I>` is satisfied:

(8.1.1) — If  $|n| \geq |\text{bound} - i|$ , equivalent to `advance(i, bound)`.

(8.1.2) — Otherwise, equivalent to `advance(i, n)`.

(8.2) — Otherwise, increments (or decrements for negative  $n$ ) iterator  $i$  either  $n$  times or until  $i == \text{bound}$ , whichever comes first.

9 *Returns:*  $n - M$ , where  $M$  is the distance from the starting position of  $i$  to the ending position.

10 The name `distance` denotes a customization point object. It has the following function call operators:

```
template <Iterator I, Sentinel<I> S>
constexpr difference_type_t<I> operator()(I first, S last) const;
```

11 *Requires:* `[first, last)` shall denote a range, or `(Same<S, I> && SizedSentinel<S, I>)` shall be satisfied and `[last, first)` shall denote a range.

12 *Effects:* If `SizedSentinel<S, I>` is satisfied, returns `(last - first)`; otherwise, returns the number of increments needed to get from `first` to `last`.

```
template <Range R>
constexpr difference_type_t<iterator_t<R>> operator()(R&& r) const;
```

*Effects:* Equivalent to: `return distance(ranges::begin(r), ranges::end(r));` (10.4)

*Remarks:* Instantiations of this member function template may be ill-formed if the declarations in `<experimental/ranges/range>` are not in scope at the point of instantiation (ISO/IEC 14882:2014 §14.6.4.1).

```
template <SizedRange R>
constexpr difference_type_t<iterator_t<R>> operator()(R&& r) const;
```

13 *Effects:* Equivalent to: `return ranges::size(r);` (10.5.1)

14 *Remarks:* Instantiations of this member function template may be ill-formed if the declarations in `<experimental/ranges/range>` are not in scope at the point of instantiation (ISO/IEC 14882:2014 §14.6.4.1).

- 15 The name **next** denotes a customization point object. It has the following function call operators:

```
template <Iterator I>
constexpr I operator()(I x) const;
```

- 16 *Effects:* Equivalent to: `++x; return x;`

```
template <Iterator I>
constexpr I operator()(I x, difference_type_t<I> n) const;
```

- 17 *Effects:* Equivalent to: `advance(x, n); return x;`

```
template <Iterator I, Sentinel<I> S>
constexpr I operator()(I x, S bound) const;
```

- 18 *Effects:* Equivalent to: `advance(x, bound); return x;`

```
template <Iterator I, Sentinel<I> S>
constexpr I operator()(I x, difference_type_t<I> n, S bound) const;
```

- 19 *Effects:* Equivalent to: `advance(x, n, bound); return x;`

- 20 The name **prev** denotes a customization point object. It has the following function call operators:

```
template <BidirectionalIterator I>
constexpr I operator()(I x) const;
```

- 21 *Effects:* Equivalent to: `--x; return x;`

```
template <BidirectionalIterator I>
constexpr I operator()(I x, difference_type_t<I> n) const;
```

- 22 *Effects:* Equivalent to: `advance(x, -n); return x;`

```
template <BidirectionalIterator I>
constexpr I operator()(I x, difference_type_t<I> n, I bound) const;
```

- 23 *Effects:* Equivalent to: `advance(x, -n, bound); return x;`

## 9.7 Iterator adaptors

[iterators.predef]

### 9.7.1 Reverse iterators

[iterators.reverse]

- 1 Class template **reverse\_iterator** is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence. The fundamental relation between a reverse iterator and its corresponding underlying iterator *i* is established by the identity: `*make_reverse_iterator(i) == *prev(i)`

#### 9.7.1.1 Class template **reverse\_iterator**

[reverse.iterator]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <BidirectionalIterator I>
 class reverse_iterator {
 public:
 using iterator_type = I;
 using difference_type = difference_type_t<I>;
 using value_type = value_type_t<I>;
 using iterator_category = iterator_category_t<I>;
 using reference = reference_t<I>;
 using pointer = I;

 constexpr reverse_iterator();
```

```

explicit constexpr reverse_iterator(I x);
constexpr reverse_iterator(const reverse_iterator<ConvertibleTo<I>>& i);
constexpr reverse_iterator& operator=(const reverse_iterator<ConvertibleTo<I>>& i);

constexpr I base() const;
constexpr reference operator*() const;
constexpr pointer operator->() const;

constexpr reverse_iterator& operator++();
constexpr reverse_iterator operator++(int);
constexpr reverse_iterator& operator--();
constexpr reverse_iterator operator--(int);

constexpr reverse_iterator operator+ (difference_type n) const
 requires RandomAccessIterator<I>;
constexpr reverse_iterator& operator+=(difference_type n)
 requires RandomAccessIterator<I>;
constexpr reverse_iterator operator- (difference_type n) const
 requires RandomAccessIterator<I>;
constexpr reverse_iterator& operator-=(difference_type n)
 requires RandomAccessIterator<I>;
constexpr reference operator[] (difference_type n) const
 requires RandomAccessIterator<I>;

friend constexpr rvalue_reference_t<I> iter_move(const reverse_iterator& i)
 noexcept(see below);
template <IndirectlySwappable<I> I2>
 friend constexpr void iter_swap(const reverse_iterator& x, const reverse_iterator<I2>& y)
 noexcept(see below);

private:
 I current; // exposition only
};

template <class I1, class I2>
 requires EqualityComparableWith<I1, I2>
constexpr bool operator==(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
template <class I1, class I2>
 requires EqualityComparableWith<I1, I2>
constexpr bool operator!=(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator<(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator>(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator>=(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator<=(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);

```

```

template <class I1, class I2>
 requires SizedSentinel<I1, I2>
 constexpr difference_type_t<I2> operator-(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
template <RandomAccessIterator I>
 constexpr reverse_iterator<I> operator+(
 difference_type_t<I> n,
 const reverse_iterator<I>& x);

template <BidirectionalIterator I>
 constexpr reverse_iterator<I> make_reverse_iterator(I i);
}}}}

```

### 9.7.1.2 reverse\_iterator operations

[reverse.iter.ops]

#### 9.7.1.2.1 reverse\_iterator constructor

[reverse.iter.cons]

```
constexpr reverse_iterator();
```

- <sup>1</sup> *Effects:* Value-initializes `current`. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type `I`.

```
explicit constexpr reverse_iterator(I x);
```

- <sup>2</sup> *Effects:* Initializes `current` with `x`.

```
constexpr reverse_iterator(const reverse_iterator<ConvertibleTo<I>>& i);
```

- <sup>3</sup> *Effects:* Initializes `current` with `i.current`.

#### 9.7.1.2.2 reverse\_iterator::operator=

[reverse.iter.op=]

```
constexpr reverse_iterator&
operator=(const reverse_iterator<ConvertibleTo<I>>& i);
```

- <sup>1</sup> *Effects:* Assigns `i.current` to `current`.

- <sup>2</sup> *Returns:* `*this`.

#### 9.7.1.2.3 Conversion

[reverse.iter.conv]

```
constexpr I base() const;
```

- <sup>1</sup> *Returns:* `current`.

#### 9.7.1.2.4 operator\*

[reverse.iter.op.star]

```
constexpr reference operator*() const;
```

- <sup>1</sup> *Effects:* Equivalent to: `return *prev(current);`

#### 9.7.1.2.5 operator->

[reverse.iter.opref]

```
constexpr pointer operator->() const;
```

- <sup>1</sup> *Effects:* Equivalent to: `return prev(current);`

#### 9.7.1.2.6 operator++

[reverse.iter.op++]

```
constexpr reverse_iterator& operator++();
```

1 *Effects:* --current;

2 *Returns:* \*this.

```
constexpr reverse_iterator operator++(int);
```

3 *Effects:*

```
reverse_iterator tmp = *this;
--current;
return tmp;
```

#### 9.7.1.2.7 operator--

[reverse.iter.op--]

```
constexpr reverse_iterator& operator--();
```

1 *Effects:* ++current

2 *Returns:* \*this.

```
constexpr reverse_iterator operator--(int);
```

3 *Effects:*

```
reverse_iterator tmp = *this;
++current;
return tmp;
```

#### 9.7.1.2.8 operator+

[reverse.iter.op+]

```
constexpr reverse_iterator
operator+(difference_type n) const
requires RandomAccessIterator<I>;
```

1 *Returns:* reverse\_iterator(current+n).

#### 9.7.1.2.9 operator+=

[reverse.iter.op+=]

```
constexpr reverse_iterator&
operator+=(difference_type n)
requires RandomAccessIterator<I>;
```

1 *Effects:* current += n;

2 *Returns:* \*this.

#### 9.7.1.2.10 operator-

[reverse.iter.op-]

```
constexpr reverse_iterator
operator-(difference_type n) const
requires RandomAccessIterator<I>;
```

1 *Returns:* reverse\_iterator(current-n).

#### 9.7.1.2.11 operator-=

[reverse.iter.op-=]

```
constexpr reverse_iterator&
operator-=(difference_type n)
requires RandomAccessIterator<I>;
```

1 *Effects:* current -= n;

2 *Returns:* \*this.

**9.7.1.2.12 operator[]**

[reverse.iter.opindex]

```
constexpr reference operator[](
 difference_type n) const
 requires RandomAccessIterator<I>;
```

<sup>1</sup> *Returns:* current[-n-1].

**9.7.1.2.13 operator==**

[reverse.iter.op==]

```
template <class I1, class I2>
 requires EqualityComparableWith<I1, I2>
constexpr bool operator==(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
```

<sup>1</sup> *Effects:* Equivalent to: return x.current == y.current;

**9.7.1.2.14 operator!=**

[reverse.iter.op!=]

```
template <class I1, class I2>
 requires EqualityComparableWith<I1, I2>
constexpr bool operator!=(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
```

<sup>1</sup> *Effects:* Equivalent to: return x.current != y.current;

**9.7.1.2.15 operator<**

[reverse.iter.op&lt;]

```
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator<(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
```

<sup>1</sup> *Effects:* Equivalent to: return x.current > y.current;

**9.7.1.2.16 operator>**

[reverse.iter.op&gt;]

```
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator>(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
```

<sup>1</sup> *Effects:* Equivalent to: return x.current < y.current;

**9.7.1.2.17 operator>=**

[reverse.iter.op&gt;=]

```
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator>=(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
```

<sup>1</sup> *Effects:* Equivalent to: return x.current <= y.current;

**9.7.1.2.18 operator<=**

[reverse.iter.op&lt;=]

```
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator<=(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
```

<sup>1</sup> *Effects:* Equivalent to: return x.current >= y.current;

#### 9.7.1.2.19 operator-

[reverse.iter.opdiff]

```
template <class I1, class I2>
 requires SizedSentinel<I1, I2>
 constexpr difference_type_t<I2> operator-(
 const reverse_iterator<I1>& x,
 const reverse_iterator<I2>& y);
```

1 *Effects:* Equivalent to: return `y.current - x.current`;

#### 9.7.1.2.20 operator+

[reverse.iter.opsum]

```
template <RandomAccessIterator I>
 constexpr reverse_iterator<I> operator+(
 difference_type_t<I> n,
 const reverse_iterator<I>& x);
```

1 *Effects:* Equivalent to: return `reverse_iterator<I>(x.current - n)`;

#### 9.7.1.2.21 iter\_move

[reverse.iter.iter\_move]

```
friend constexpr rvalue_reference_t<I> iter_move(const reverse_iterator& i)
 noexcept(see below);
```

1 *Effects:* Equivalent to: return `ranges::iter_move(prev(i.current))`;

2 *Remarks:* The expression in `noexcept` is equivalent to:

```
noexcept(ranges::iter_move(declval<I&>())) && noexcept(--declval<I&>()) &&
 is_nothrow_copy_constructible<I>::value
```

#### 9.7.1.2.22 iter\_swap

[reverse.iter.iter\_swap]

```
template <IndirectlySwappable<I> I2>
 friend constexpr void iter_swap(const reverse_iterator& x, const reverse_iterator<I2>& y)
 noexcept(see below);
```

1 *Effects:* Equivalent to `ranges::iter_swap(prev(x.current), prev(y.current))`.

2 *Remarks:* The expression in `noexcept` is equivalent to:

```
noexcept(ranges::iter_swap(declval<I>(), declval<I>())) && noexcept(--declval<I&>())
```

#### 9.7.1.2.23 Non-member function make\_reverse\_iterator()

[reverse.iter.make]

```
template <BidirectionalIterator I>
 constexpr reverse_iterator<I> make_reverse_iterator(I i);
```

1 *Returns:* `reverse_iterator<I>(i)`.

### 9.7.2 Insert iterators

[iterators.insert]

1 To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called *insert iterators*, are provided in the library. With regular iterator classes,

```
while (first != last) *result++ = *first++;
```

causes a range `[first,last)` to be copied into a range starting with `result`. The same code with `result` being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the *insert mode* instead of the *regular overwrite mode*.

2 An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators satisfy `OutputIterator`. `operator*` returns the insert iterator itself. The assignment `operator=(const T& x)` is defined on insert iterators to allow writing into them, it inserts `x` right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. `back_insert_iterator` inserts elements at the end of a container, `front_insert_iterator`

inserts elements at the beginning of a container, and `insert_iterator` inserts elements where the iterator points to in a container. `back_inserter`, `front_inserter`, and `inserter` are three functions making the insert iterators out of a container.

### 9.7.2.1 Class template `back_insert_iterator`

[back.insert.iterator]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <class Container>
 class back_insert_iterator {
 public:
 using container_type = Container;
 using difference_type = ptrdiff_t;

 constexpr back_insert_iterator();
 explicit back_insert_iterator(Container& x);
 back_insert_iterator&
 operator=(const value_type_t<Container>& value);
 back_insert_iterator&
 operator=(value_type_t<Container>&& value);

 back_insert_iterator& operator*();
 back_insert_iterator& operator++();
 back_insert_iterator operator++(int);

 private:
 Container* container; // exposition only
 };

 template <class Container>
 back_insert_iterator<Container> back_inserter(Container& x);
}}}}
```

### 9.7.2.2 `back_insert_iterator` operations

[back.insert.iter.ops]

#### 9.7.2.2.1 `back_insert_iterator` constructor

[back.insert.iter.cons]

```
constexpr back_insert_iterator();
```

1 *Effects:* Value-initializes container.

```
explicit back_insert_iterator(Container& x);
```

2 *Effects:* Initializes container with `addressof(x)`.

#### 9.7.2.2.2 `back_insert_iterator::operator=`

[back.insert.iter.op=]

```
back_insert_iterator&
 operator=(const value_type_t<Container>& value);
```

1 *Effects:* Equivalent to `container->push_back(value)`.

2 *Returns:* `*this`.

```
back_insert_iterator&
 operator=(value_type_t<Container>&& value);
```

3 *Effects:* Equivalent to `container->push_back(std::move(value))`.

4 *Returns:* `*this`.

#### 9.7.2.2.3 `back_insert_iterator::operator*`

[back.insert.iter.op\*]

```
back_insert_iterator& operator*();
```

1 *Returns:* `*this`.

#### 9.7.2.2.4 back\_insert\_iterator::operator++

[back.insert.iter.op++]

```
back_insert_iterator& operator++();
back_insert_iterator operator++(int);
```

1 *Returns: \*this.*

#### 9.7.2.2.5 back\_inserter

[back.inserter]

```
template <class Container>
back_insert_iterator<Container> back_inserter(Container& x);
```

1 *Returns: back\_insert\_iterator<Container>(x).*

#### 9.7.2.3 Class template front\_insert\_iterator

[front.insert.iterator]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <class Container>
 class front_insert_iterator {
 public:
 using container_type = Container;
 using difference_type = ptrdiff_t;

 constexpr front_insert_iterator();
 explicit front_insert_iterator(Container& x);
 front_insert_iterator&
 operator=(const value_type_t<Container>& value);
 front_insert_iterator&
 operator=(value_type_t<Container>&& value);

 front_insert_iterator& operator*();
 front_insert_iterator& operator++();
 front_insert_iterator operator++(int);

 private:
 Container* container; // exposition only
 };

 template <class Container>
 front_insert_iterator<Container> front_inserter(Container& x);
}}}}
```

#### 9.7.2.4 front\_insert\_iterator operations

[front.insert.iter.ops]

##### 9.7.2.4.1 front\_insert\_iterator constructor

[front.insert.iter.cons]

```
constexpr front_insert_iterator();
```

1 *Effects: Value-initializes container.*

```
explicit front_insert_iterator(Container& x);
```

2 *Effects: Initializes container with addressof(x).*

##### 9.7.2.4.2 front\_insert\_iterator::operator=

[front.insert.iter.op=]

```
front_insert_iterator&
 operator=(const value_type_t<Container>& value);
```

1 *Effects: Equivalent to container->push\_front(value).*

2 *Returns: \*this.*

```
front_insert_iterator&
 operator=(value_type_t<Container>&& value);
```

3 *Effects:* Equivalent to `container->push_front(std::move(value))`.

4 *Returns:* `*this`.

#### 9.7.2.4.3 `front_insert_iterator::operator*`

[front.insert.iter.op\*]

```
front_insert_iterator& operator*();
```

1 *Returns:* `*this`.

#### 9.7.2.4.4 `front_insert_iterator::operator++`

[front.insert.iter.op++]

```
front_insert_iterator& operator++();
front_insert_iterator operator++(int);
```

1 *Returns:* `*this`.

#### 9.7.2.4.5 `front_inserter`

[front.inserter]

```
template <class Container>
front_insert_iterator<Container> front_inserter(Container& x);
```

1 *Returns:* `front_insert_iterator<Container>(x)`.

#### 9.7.2.5 Class template `insert_iterator`

[insert.iterator]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <class Container>
 class insert_iterator {
 public:
 using container_type = Container;
 using difference_type = ptrdiff_t;

 insert_iterator();
 insert_iterator(Container& x, iterator_t<Container> i);
 insert_iterator&
 operator=(const value_type_t<Container>& value);
 insert_iterator&
 operator=(value_type_t<Container>&& value);

 insert_iterator& operator*();
 insert_iterator& operator++();
 insert_iterator& operator++(int);

 private:
 Container* container; // exposition only
 iterator_t<Container> iter; // exposition only
 };

 template <class Container>
 insert_iterator<Container> inserter(Container& x, iterator_t<Container> i);
}}}}
```

#### 9.7.2.6 `insert_iterator` operations

[insert.iter.ops]

##### 9.7.2.6.1 `insert_iterator` constructor

[insert.iter.cons]

```
insert_iterator();
```

1 *Effects:* Value-initializes `container` and `iter`.

```
insert_iterator(Container& x, iterator_t<Container> i);
```

2 *Requires:* `i` is an iterator into `x`.

3 *Effects:* Initializes `container` with `addressof(x)` and `iter` with `i`.

#### 9.7.2.6.2 insert\_iterator::operator=

[insert.iter.op=]

```
insert_iterator&
operator=(const value_type_t<Container>& value);
```

1 *Effects:* Equivalent to:

```
iter = container->insert(iter, value);
++iter;
```

2 *Returns:* \*this.

```
insert_iterator&
operator=(value_type_t<Container>&& value);
```

3 *Effects:* Equivalent to:

```
iter = container->insert(iter, std::move(value));
++iter;
```

4 *Returns:* \*this.

#### 9.7.2.6.3 insert\_iterator::operator\*

[insert.iter.op\*]

```
insert_iterator& operator*();
```

1 *Returns:* \*this.

#### 9.7.2.6.4 insert\_iterator::operator++

[insert.iter.op++]

```
insert_iterator& operator++();
insert_iterator& operator++(int);
```

1 *Returns:* \*this.

#### 9.7.2.6.5 inserter

[inserter]

```
template <class Container>
insert_iterator<Container> inserter(Container& x, iterator_t<Container> i);
```

1 *Returns:* insert\_iterator<Container>(x, i).

### 9.7.3 Move iterators and sentinels

[iterators.move]

#### 9.7.3.1 Class template move\_iterator

[move.iterator]

1 Class template `move_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator's indirection operator to an rvalue of the value type. Some generic algorithms can be called with move iterators to replace copying with moving.

2 [Example:

```
list<string> s;
// populate the list s
vector<string> v1(s.begin(), s.end()); // copies strings into v1
vector<string> v2(make_move_iterator(s.begin()),
 make_move_iterator(s.end())); // moves strings into v2
```

— end example]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <InputIterator I>
 class move_iterator {
 public:
 using iterator_type = I;
 using difference_type = difference_type_t<I>;
 using value_type = value_type_t<I>;
```

```

using iterator_category = input_iterator_tag;
using reference = rvalue_reference_t<I>;

constexpr move_iterator();
explicit constexpr move_iterator(I i);
constexpr move_iterator(const move_iterator<ConvertibleTo<I>>& i);
constexpr move_iterator& operator=(const move_iterator<ConvertibleTo<I>>& i);

constexpr I base() const;
constexpr reference operator*() const;

constexpr move_iterator& operator++();
constexpr void operator++(int);
constexpr move_iterator operator++(int)
 requires ForwardIterator<I>;
constexpr move_iterator& operator--();
constexpr void operator--(int)
 requires BidirectionalIterator<I>;

constexpr move_iterator operator+(difference_type n) const
 requires RandomAccessIterator<I>;
constexpr move_iterator& operator+=(difference_type n)
 requires RandomAccessIterator<I>;
constexpr move_iterator operator-(difference_type n) const
 requires RandomAccessIterator<I>;
constexpr move_iterator& operator-=(difference_type n)
 requires RandomAccessIterator<I>;
constexpr reference operator[](difference_type n) const
 requires RandomAccessIterator<I>;

friend constexpr rvalue_reference_t<I> iter_move(const move_iterator& i)
 noexcept(see below);
template <IndirectlySwappable<I> I2>
 friend constexpr void iter_swap(const move_iterator& x, const move_iterator<I2>& y)
 noexcept(see below);

private:
 I current; // exposition only
};

template <class I1, class I2>
 requires EqualityComparableWith<I1, I2>
constexpr bool operator==(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
template <class I1, class I2>
 requires EqualityComparableWith<I1, I2>
constexpr bool operator!=(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator<(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator<=(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator>(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
template <class I1, class I2>
 requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator>=(

```

```

 const move_iterator<I1>& x, const move_iterator<I2>& y);

template <class I1, class I2>
 requires SizedSentinel<I1, I2>
 constexpr difference_type_t<I2> operator-(
 const move_iterator<I1>& x,
 const move_iterator<I2>& y);
template <RandomAccessIterator I>
 constexpr move_iterator<I> operator+(
 difference_type_t<I> n,
 const move_iterator<I>& x);
template <InputIterator I>
 constexpr move_iterator<I> make_move_iterator(I i);
}}}}

```

- <sup>3</sup> [Note: `move_iterator` does not provide an `operator->` because the class member access expression `i->m` may have different semantics than the expression `(*i).m` when the expression `*i` is an rvalue. — end note]

### 9.7.3.2 `move_iterator` operations

[move.iter.ops]

#### 9.7.3.2.1 `move_iterator` constructors

[move.iter.op.const]

```
constexpr move_iterator();
```

- <sup>1</sup> *Effects:* Constructs a `move_iterator`, value-initializing `current`. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type `I`.

```
explicit constexpr move_iterator(I i);
```

- <sup>2</sup> *Effects:* Constructs a `move_iterator`, initializing `current` with `i`.

```
constexpr move_iterator(const move_iterator<ConvertibleTo<I>>& i);
```

- <sup>3</sup> *Effects:* Constructs a `move_iterator`, initializing `current` with `i.current`.

#### 9.7.3.2.2 `move_iterator::operator=`

[move.iter.op.=]

```
constexpr move_iterator& operator=(const move_iterator<ConvertibleTo<I>>& i);
```

- <sup>1</sup> *Effects:* Assigns `i.current` to `current`.

#### 9.7.3.2.3 `move_iterator` conversion

[move.iter.op.conv]

```
constexpr I base() const;
```

- <sup>1</sup> *Returns:* `current`.

#### 9.7.3.2.4 `move_iterator::operator*`

[move.iter.op.star]

```
constexpr reference operator*() const;
```

- <sup>1</sup> *Effects:* Equivalent to: `return iter_move(current);`

#### 9.7.3.2.5 `move_iterator::operator++`

[move.iter.op.incr]

```
constexpr move_iterator& operator++();
```

- <sup>1</sup> *Effects:* Equivalent to `++current`.

- <sup>2</sup> *Returns:* `*this`.

```
constexpr void operator++(int);
```

3 *Effects:* Equivalent to ++current.

```
constexpr move_iterator operator++(int)
 requires ForwardIterator<I>;
```

4 *Effects:* Equivalent to:

```
 move_iterator tmp = *this;
 ++current;
 return tmp;
```

#### 9.7.3.2.6 move\_iterator::operator--

[move.iter.op.decr]

```
constexpr move_iterator& operator--()
 requires BidirectionalIterator<I>;
```

1 *Effects:* Equivalent to --current.

2 *Returns:* \*this.

```
constexpr move_iterator operator--(int)
 requires BidirectionalIterator<I>;
```

3 *Effects:* Equivalent to:

```
 move_iterator tmp = *this;
 --current;
 return tmp;
```

#### 9.7.3.2.7 move\_iterator::operator+

[move.iter.op.+]

```
constexpr move_iterator operator+(difference_type n) const
 requires RandomAccessIterator<I>;
```

1 *Effects:* Equivalent to: return move\_iterator(current + n);

#### 9.7.3.2.8 move\_iterator::operator+=

[move.iter.op.+=]

```
constexpr move_iterator& operator+=(difference_type n)
 requires RandomAccessIterator<I>;
```

1 *Effects:* Equivalent to current += n.

2 *Returns:* \*this.

#### 9.7.3.2.9 move\_iterator::operator-

[move.iter.op.-]

```
constexpr move_iterator operator-(difference_type n) const
 requires RandomAccessIterator<I>;
```

1 *Effects:* Equivalent to: return move\_iterator(current - n);

#### 9.7.3.2.10 move\_iterator::operator-=

[move.iter.op.-=]

```
constexpr move_iterator& operator-=(difference_type n)
 requires RandomAccessIterator<I>;
```

1 *Effects:* Equivalent to current -= n.

2 *Returns:* \*this.

#### 9.7.3.2.11 move\_iterator::operator[]

[move.iter.op.index]

```
constexpr reference operator[](difference_type n) const
 requires RandomAccessIterator<I>;
```

1 *Effects:* Equivalent to: return iter\_move(current + n);

#### 9.7.3.2.12 move\_iterator comparisons

[move.iter.op.comp]

```
template <class I1, class I2>
requires EqualityComparableWith<I1, I2>
constexpr bool operator==(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
```

1     *Effects:* Equivalent to: return x.current == y.current;

```
template <class I1, class I2>
requires EqualityComparableWith<I1, I2>
constexpr bool operator!=(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
```

2     *Effects:* Equivalent to: return !(x == y);

```
template <class I1, class I2>
requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator<(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
```

3     *Effects:* Equivalent to: return x.current < y.current;

```
template <class I1, class I2>
requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator<=(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
```

4     *Effects:* Equivalent to: return !(y < x);

```
template <class I1, class I2>
requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator>(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
```

5     *Effects:* Equivalent to: return y < x;

```
template <class I1, class I2>
requires StrictTotallyOrderedWith<I1, I2>
constexpr bool operator>=(
 const move_iterator<I1>& x, const move_iterator<I2>& y);
```

6     *Effects:* Equivalent to: return !(x < y);.

#### 9.7.3.2.13 move\_iterator non-member functions

[move.iter.nonmember]

```
template <class I1, class I2>
requires SizedSentinel<I1, I2>
constexpr difference_type_t<I2> operator-(
 const move_iterator<I1>& x,
 const move_iterator<I2>& y);
```

1     *Effects:* Equivalent to: return x.current - y.current;

```
template <RandomAccessIterator I>
constexpr move_iterator<I> operator+(
 difference_type_t<I> n,
 const move_iterator<I>& x);
```

2     *Effects:* Equivalent to: return x + n;

```
friend constexpr rvalue_reference_t<I> iter_move(const move_iterator& i)
 noexcept(see below);
```

3     *Effects:* Equivalent to: `return ranges::iter_move(i.current);`

4     *Remarks:* The expression in `noexcept` is equivalent to:

```
 noexcept(ranges::iter_move(i.current))
```

```
template <IndirectlySwappable<I> I2>
 friend constexpr void iter_swap(const move_iterator& x, const move_iterator<I2>& y)
 noexcept(see below);
```

5     *Effects:* Equivalent to: `ranges::iter_swap(x.current, y.current).`

6     *Remarks:* The expression in `noexcept` is equivalent to:

```
 noexcept(ranges::iter_swap(x.current, y.current))
```

```
template <InputIterator I>
 constexpr move_iterator<I> make_move_iterator(I i);
```

7     *Returns:* `move_iterator<I>(i).`

### 9.7.3.3 Class template `move_sentinel`

[`move_sentinel`]

1   Class template `move_sentinel` is a sentinel adaptor useful for denoting ranges together with `move_iterator`. When an input iterator type `I` and sentinel type `S` satisfy `Sentinel<S, I>`, `Sentinel<move_sentinel<S>, move_iterator<I>>` is satisfied as well.

2   [*Example:* A `move_if` algorithm is easily implemented with `copy_if` using `move_iterator` and `move_sentinel`:

```
template <InputIterator I, Sentinel<I> S, WeaklyIncrementable O,
 IndirectUnaryPredicate<I> Pred>
 requires IndirectlyMovable<I, O>
void move_if(I first, S last, O out, Pred pred)
{
 copy_if(move_iterator<I>{first}, move_sentinel<S>{last}, out, pred);
}
```

— *end example*]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <Semiregular S>
 class move_sentinel {
 public:
 constexpr move_sentinel();
 explicit move_sentinel(S s);
 move_sentinel(const move_sentinel<ConvertibleTo<S>>& s);
 move_sentinel& operator=(const move_sentinel<ConvertibleTo<S>>& s);

 S base() const;

 private:
 S last; // exposition only
 };

 template <class I, Sentinel<I> S>
 constexpr bool operator==(
 const move_iterator<I>& i, const move_sentinel<S>& s);
 template <class I, Sentinel<I> S>
 constexpr bool operator==(
 const move_sentinel<S>& s, const move_iterator<I>& i);
 template <class I, Sentinel<I> S>
```

```

constexpr bool operator!=(
 const move_iterator<I>& i, const move_sentinel<S>& s);
template <class I, Sentinel<I> S>
constexpr bool operator!=(
 const move_sentinel<S>& s, const move_iterator<I>& i);

template <class I, SizedSentinel<I> S>
constexpr difference_type_t<I> operator-(
 const move_sentinel<S>& s, const move_iterator<I>& i);
template <class I, SizedSentinel<I> S>
constexpr difference_type_t<I> operator-(
 const move_iterator<I>& i, const move_sentinel<S>& s);

template <Semiregular S>
constexpr move_sentinel<S> make_move_sentinel(S s);
}}}}

```

#### 9.7.3.4 move\_sentinel operations

[move.sent.ops]

##### 9.7.3.4.1 move\_sentinel constructors

[move.sent.op.const]

```
constexpr move_sentinel();
```

- <sup>1</sup> *Effects:* Constructs a `move_sentinel`, value-initializing `last`. If `is_trivially_default_constructible<S>::value` is true, then this constructor is a `constexpr` constructor.

```
explicit move_sentinel(S s);
```

- <sup>2</sup> *Effects:* Constructs a `move_sentinel`, initializing `last` with `s`.

```
move_sentinel(const move_sentinel<ConvertibleTo<S>>& s);
```

- <sup>3</sup> *Effects:* Constructs a `move_sentinel`, initializing `last` with `s.last`.

##### 9.7.3.4.2 move\_sentinel::operator=

[move.sent.op.=]

```
move_sentinel& operator=(const move_sentinel<ConvertibleTo<S>>& s);
```

- <sup>1</sup> *Effects:* Assigns `s.last` to `last`.

- <sup>2</sup> *Returns:* `*this`.

##### 9.7.3.4.3 move\_sentinel comparisons

[move.sent.op.comp]

```

template <class I, Sentinel<I> S>
constexpr bool operator==(
 const move_iterator<I>& i, const move_sentinel<S>& s);
template <class I, Sentinel<I> S>
constexpr bool operator==(
 const move_sentinel<S>& s, const move_iterator<I>& i);

```

- <sup>1</sup> *Effects:* Equivalent to: `return i.current == s.last;`

```

template <class I, Sentinel<I> S>
constexpr bool operator!=(
 const move_iterator<I>& i, const move_sentinel<S>& s);
template <class I, Sentinel<I> S>
constexpr bool operator!=(
 const move_sentinel<S>& s, const move_iterator<I>& i);

```

- <sup>2</sup> *Effects:* Equivalent to: `return !(i == s);`

9.7.3.4.4 `move_sentinel` non-member functions[`move.sent.nonmember`]

```
template <class I, SizedSentinel<I> S>
constexpr difference_type_t<I> operator-(
 const move_sentinel<S>& s, const move_iterator<I>& i);
```

1 *Effects:* Equivalent to: `return s.last - i.current;`

```
template <class I, SizedSentinel<I> S>
constexpr difference_type_t<I> operator-(
 const move_iterator<I>& i, const move_sentinel<S>& s);
```

2 *Effects:* Equivalent to: `return i.current - s.last;`

```
template <Semiregular S>
constexpr move_sentinel<S> make_move_sentinel(S s);
```

3 *Returns:* `move_sentinel<S>(s).`

## 9.7.4 Common iterators

[`iterators.common`]

1 Class template `common_iterator` is an iterator/sentinel adaptor that is capable of representing a non-bounded range of elements (where the types of the iterator and sentinel differ) as a bounded range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.

2 [*Note:* The `common_iterator` type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type. — *end note*]

3 [*Example:*

```
template <class ForwardIterator>
void fun(ForwardIterator begin, ForwardIterator end);

list<int> s;
// populate the list s
using CI =
 common_iterator<counted_iterator<list<int>::iterator>,
 default_sentinel>;
// call fun on a range of 10 ints
fun(CI(make_counted_iterator(s.begin(), 10)),
 CI(default_sentinel()));
```

— *end example*]

9.7.4.1 Class template `common_iterator`[`common.iterator`]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <Iterator I, Sentinel<I> S>
 requires !Same<I, S>
 class common_iterator {
 public:
 using difference_type = difference_type_t<I>;

 constexpr common_iterator();
 constexpr common_iterator(I i);
 constexpr common_iterator(S s);
 constexpr common_iterator(const common_iterator<ConvertibleTo<I>, ConvertibleTo<S>>& u);
 common_iterator& operator=(const common_iterator<ConvertibleTo<I>, ConvertibleTo<S>>& u);

 decltype(auto) operator*();
 decltype(auto) operator*() const
 requires dereferenceable <const I>;
 decltype(auto) operator->() const
 requires see below;
```

```

common_iterator& operator++();
decltype(auto) operator++(int);
common_iterator operator++(int)
 requires ForwardIterator<I>;

friend rvalue_reference_t<I> iter_move(const common_iterator& i)
 noexcept(see below)
 requires InputIterator<I>;
template <IndirectlySwappable<I> I2, class S2>
 friend void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
 noexcept(see below);

private:
 bool is_sentinel; // exposition only
 I iter; // exposition only
 S sentinel; // exposition only
};

template <Readable I, class S>
struct value_type<common_iterator<I, S>> {
 using type = value_type_t<I>;
};

template <InputIterator I, class S>
struct iterator_category<common_iterator<I, S>> {
 using type = input_iterator_tag;
};

template <ForwardIterator I, class S>
struct iterator_category<common_iterator<I, S>> {
 using type = forward_iterator_tag;
};

template <class I1, class I2, Sentinel<I2> S1, Sentinel<I1> S2>
bool operator==(
 const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
template <class I1, class I2, Sentinel<I2> S1, Sentinel<I1> S2>
 requires EqualityComparableWith<I1, I2>
bool operator==(
 const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
template <class I1, class I2, Sentinel<I2> S1, Sentinel<I1> S2>
bool operator!=(
 const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);

template <class I2, SizedSentinel<I2> I1, SizedSentinel<I2> S1, SizedSentinel<I1> S2>
difference_type_t<I2> operator-(
 const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
}}}}

```

#### 9.7.4.2 common\_iterator operations

[common.iter.ops]

##### 9.7.4.2.1 common\_iterator constructors

[common.iter.op.const]

```
constexpr common_iterator();
```

- <sup>1</sup> *Effects:* Constructs a `common_iterator`, value-initializing `is_sentinel`, `iter`, and `sentinel`. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type `I`.

```
constexpr common_iterator(I i);
```

- <sup>2</sup> *Effects:* Constructs a `common_iterator`, initializing `is_sentinel` with `false`, `iter` with `i`, and value-initializing `sentinel`.

```
constexpr common_iterator(S s);
```

- 3 *Effects:* Constructs a `common_iterator`, initializing `is_sentinel` with `true`, value-initializing `iter`, and initializing `sentinel` with `s`.

```
constexpr common_iterator(const common_iterator<ConvertibleTo<I>, ConvertibleTo<S>>& u);
```

- 4 *Effects:* Constructs a `common_iterator`, initializing `is_sentinel` with `u.is_sentinel`, `iter` with `u.iter`, and `sentinel` with `u.sentinel`.

#### 9.7.4.2.2 `common_iterator::operator=` [common.iter.op=]

```
common_iterator& operator=(const common_iterator<ConvertibleTo<I>, ConvertibleTo<S>>& u);
```

- 1 *Effects:* Assigns `u.is_sentinel` to `is_sentinel`, `u.iter` to `iter`, and `u.sentinel` to `sentinel`.

- 2 *Returns:* `*this`

#### 9.7.4.2.3 `common_iterator::operator*` [common.iter.op.star]

```
decltype(auto) operator*();
decltype(auto) operator*() const
 requires dereferenceable <const I>;
```

- 1 *Requires:* `!is_sentinel`

- 2 *Effects:* Equivalent to: `return *iter;`

#### 9.7.4.2.4 `common_iterator::operator->` [common.iter.op.ref]

```
decltype(auto) operator->() const
 requires see below;
```

- 1 *Requires:* `!is_sentinel`

- 2 *Effects:* Equivalent to:

- (2.1) — If `I` is a pointer type or if the expression `i.operator->()` is well-formed, `return iter;`
- (2.2) — Otherwise, if the expression `*iter` is a glvalue:

```
 auto&& tmp = *iter;
 return addressof(tmp);
```

- (2.3) — Otherwise, `return proxy(*iter);` where `proxy` is the exposition-only class:

```
class proxy { // exposition only
 value_type_t<I> keep_;
 proxy(reference_t<I>&& x)
 : keep_(std::move(x)) {}
public:
 const value_type_t<I>* operator->() const {
 return addressof(keep_);
 }
};
```

- 3 The expression in the *requires* clause is equivalent to:

```
Readable<const I> &&
(requires(const I& i) { i.operator->(); } ||
 is_reference<reference_t<I>>::value ||
 Constructible<value_type_t<I>, reference_t<I>>>
```

#### 9.7.4.2.5 common\_iterator::operator++

[common.iter.op.incr]

```
common_iterator& operator++();
```

- 1     *Requires:* !is\_sentinel  
2     *Effects:* Equivalent to ++iter.  
3     *Returns:* \*this.

```
decltype(auto) operator++(int);
```

- 4     *Requires:* !is\_sentinel.  
5     *Effects:* Equivalent to: return iter++;

```
common_iterator operator++(int)
 requires ForwardIterator<I>;
```

- 6     *Requires:* !is\_sentinel  
7     *Effects:* Equivalent to:  
            common\_iterator tmp = \*this;  
            ++iter;  
            return tmp;

#### 9.7.4.2.6 common\_iterator comparisons

[common.iter.op.comp]

```
template <class I1, class I2, Sentinel<I2> S1, Sentinel<I1> S2>
bool operator==(const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
```

- 1     *Effects:* Equivalent to:  
            return x.is\_sentinel ?  
                (y.is\_sentinel || y.iter == x.sentinel) :  
                (!y.is\_sentinel || x.iter == y.sentinel);

```
template <class I1, class I2, Sentinel<I2> S1, Sentinel<I1> S2>
 requires EqualityComparableWith<I1, I2>
bool operator==(const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
```

- 2     *Effects:* Equivalent to:  
            return x.is\_sentinel ?  
                (y.is\_sentinel || y.iter == x.sentinel) :  
                (y.is\_sentinel ?  
                    x.iter == y.sentinel :  
                    x.iter == y.iter);

```
template <class I1, class I2, Sentinel<I2> S1, Sentinel<I1> S2>
bool operator!=(const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
```

- 3     *Effects:* Equivalent to: return !(x == y);

```
template <class I2, SizedSentinel<I2> I1, SizedSentinel<I2> S1, SizedSentinel<I1> S2>
difference_type_t<I2> operator-(const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
```

4 *Effects:* Equivalent to:

```
return x.is_sentinel ?
 (y.is_sentinel ? 0 : x.sentinel - y.iter) :
 (y.is_sentinel ?
 x.iter - y.sentinel :
 x.iter - y.iter);
```

#### 9.7.4.2.7 iter\_move

[common.iter.op.iter\_move]

```
friend rvalue_reference_t<I> iter_move(const common_iterator& i)
 noexcept(see below)
 requires InputIterator<I>;
```

1 *Requires:* !i.is\_sentinel.

2 *Effects:* Equivalent to: return ranges::iter\_move(i.iter);

3 *Remarks:* The expression in noexcept is equivalent to:

```
noexcept(ranges::iter_move(i.iter))
```

#### 9.7.4.2.8 iter\_swap

[common.iter.op.iter\_swap]

```
template <IndirectlySwappable<I> I2>
 friend void iter_swap(const common_iterator& x, const common_iterator<I2>& y)
 noexcept(see below);
```

1 *Requires:* !x.is\_sentinel && !y.is\_sentinel.

2 *Effects:* Equivalent to ranges::iter\_swap(x.iter, y.iter).

3 *Remarks:* The expression in noexcept is equivalent to:

```
noexcept(ranges::iter_swap(x.iter, y.iter))
```

### 9.7.5 Default sentinels

[default.sentinel]

#### 9.7.5.1 Class default\_sentinel

[default.sent]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 class default_sentinel { };
}}}}
```

1 Class `default_sentinel` is an empty type used to denote the end of a range. It is intended to be used together with iterator types that know the bound of their range (e.g., `counted_iterator` (9.7.6.1)).

### 9.7.6 Counted iterators

[iterators.counted]

#### 9.7.6.1 Class template counted\_iterator

[counted.iterator]

1 Class template `counted_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of its distance from its starting position. It can be used together with class `default_sentinel` in calls to generic algorithms to operate on a range of  $N$  elements starting at a given position without needing to know the end position *a priori*.

2 [*Example:*

```
list<string> s;
// populate the list s with at least 10 strings
vector<string> v(make_counted_iterator(s.begin(), 10),
 default_sentinel()); // copies 10 strings into v
```

— end example]

3 Two values `i1` and `i2` of (possibly differing) types `counted_iterator<I1>` and `counted_iterator<I2>` refer to elements of the same sequence if and only if `next(i1.base(), i1.count())` and `next(i2.base(), i2.count())` refer to the same (possibly past-the-end) element.

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <Iterator I>
```

```

class counted_iterator {
public:
 using iterator_type = I;
 using difference_type = difference_type_t<I>;

 constexpr counted_iterator();
 constexpr counted_iterator(I x, difference_type_t<I> n);
 constexpr counted_iterator(const counted_iterator<ConvertibleTo<I>>& i);
 constexpr counted_iterator& operator=(const counted_iterator<ConvertibleTo<I>>& i);

 constexpr I base() const;
 constexpr difference_type_t<I> count() const;
 constexpr decltype(auto) operator*();
 constexpr decltype(auto) operator*() const
 requires dereferenceable <const I>;

 constexpr counted_iterator& operator++();
 decltype(auto) operator++(int);
 constexpr counted_iterator operator++(int)
 requires ForwardIterator<I>;
 constexpr counted_iterator& operator--()
 requires BidirectionalIterator<I>;
 constexpr counted_iterator operator--(int)
 requires BidirectionalIterator<I>;

 constexpr counted_iterator operator+ (difference_type n) const
 requires RandomAccessIterator<I>;
 constexpr counted_iterator& operator+=(difference_type n)
 requires RandomAccessIterator<I>;
 constexpr counted_iterator operator- (difference_type n) const
 requires RandomAccessIterator<I>;
 constexpr counted_iterator& operator-=(difference_type n)
 requires RandomAccessIterator<I>;
 constexpr decltype(auto) operator[](difference_type n) const
 requires RandomAccessIterator<I>;

 friend constexpr rvalue_reference_t<I> iter_move(const counted_iterator& i)
 noexcept(see below)
 requires InputIterator<I>;
 template <IndirectlySwappable<I> I2>
 friend constexpr void iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
 noexcept(see below);

private:
 I current; // exposition only
 difference_type_t<I> cnt; // exposition only
};

template <Readable I>
struct value_type<counted_iterator<I>> {
 using type = value_type_t<I>;
};

template <InputIterator I>
struct iterator_category<counted_iterator<I>> {
 using type = iterator_category_t<I>;
};

template <class I1, class I2>
 requires Common<I1, I2>
constexpr bool operator==(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
constexpr bool operator==(
 const counted_iterator<auto>& x, default_sentinel);

```

```

constexpr bool operator==(
 default_sentinel, const counted_iterator<auto>& x);

template <class I1, class I2>
 requires Common<I1, I2>
constexpr bool operator!=(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
constexpr bool operator!=(
 const counted_iterator<auto>& x, default_sentinel y);
constexpr bool operator!=(
 default_sentinel x, const counted_iterator<auto>& y);

template <class I1, class I2>
 requires Common<I1, I2>
constexpr bool operator<(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
template <class I1, class I2>
 requires Common<I1, I2>
constexpr bool operator<=(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
template <class I1, class I2>
 requires Common<I1, I2>
constexpr bool operator>(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
template <class I1, class I2>
 requires Common<I1, I2>
constexpr bool operator>=(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
template <class I1, class I2>
 requires Common<I1, I2>
constexpr difference_type_t<I2> operator-(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
template <class I>
 constexpr difference_type_t<I> operator-(
 const counted_iterator<I>& x, default_sentinel y);
template <class I>
 constexpr difference_type_t<I> operator-(
 default_sentinel x, const counted_iterator<I>& y);

template <RandomAccessIterator I>
 constexpr counted_iterator<I> operator+(
 difference_type_t<I> n, const counted_iterator<I>& x);

template <Iterator I>
 constexpr counted_iterator<I> make_counted_iterator(I i, difference_type_t<I> n);
}}}}

```

### 9.7.6.2 counted\_iterator operations

[counted.iter.ops]

#### 9.7.6.2.1 counted\_iterator constructors

[counted.iter.op.const]

```
constexpr counted_iterator();
```

- <sup>1</sup> *Effects:* Constructs a `counted_iterator`, value-initializing `current` and `cnt`. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type `I`.

```
constexpr counted_iterator(I i, difference_type_t<I> n);
```

- <sup>2</sup> *Requires:* `n >= 0`

- <sup>3</sup> *Effects:* Constructs a `counted_iterator`, initializing `current` with `i` and `cnt` with `n`.

```
constexpr counted_iterator(const counted_iterator<ConvertibleTo<I>>& i);
```

4       *Effects:* Constructs a `counted_iterator`, initializing `current` with `i.current` and `cnt` with `i.cnt`.

**9.7.6.2.2   counted\_iterator::operator=** [counted.iter.op=]

```
constexpr counted_iterator& operator=(const counted_iterator<ConvertibleTo<I>>& i);
```

1       *Effects:* Assigns `i.current` to `current` and `i.cnt` to `cnt`.

**9.7.6.2.3   counted\_iterator conversion** [counted.iter.op.conv]

```
constexpr I base() const;
```

1       *Returns:* `current`.

**9.7.6.2.4   counted\_iterator count** [counted.iter.op.cnt]

```
constexpr difference_type_t<I> count() const;
```

1       *Returns:* `cnt`.

**9.7.6.2.5   counted\_iterator::operator\*** [counted.iter.op.star]

```
constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
 requires dereferenceable <const I>;
```

1       *Effects:* Equivalent to: `return *current;`

**9.7.6.2.6   counted\_iterator::operator++** [counted.iter.op.incr]

```
constexpr counted_iterator& operator++();
```

1       *Requires:* `cnt > 0`

2       *Effects:* Equivalent to:

```
 ++current;
 --cnt;
```

3       *Returns:* `*this`.

```
decltype(auto) operator++(int);
```

4       *Requires:* `cnt > 0`.

5       *Effects:* Equivalent to:

```
 --cnt;
 try { return current++; }
 catch(...) { ++cnt; throw; }
```

```
constexpr counted_iterator operator++(int)
 requires ForwardIterator<I>;
```

6       *Requires:* `cnt > 0`

7       *Effects:* Equivalent to:

```
 counted_iterator tmp = *this;
 +++this;
 return tmp;
```

**9.7.6.2.7 counted\_iterator::operator--****[counted.iter.op.decr]**

```
constexpr counted_iterator& operator--();
requires BidirectionalIterator<I>
```

1 *Effects:* Equivalent to:

```
--current;
++cnt;
```

2 *Returns:* \*this.

```
constexpr counted_iterator operator--(int)
requires BidirectionalIterator<I>;
```

3 *Effects:* Equivalent to:

```
counted_iterator tmp = *this;
--*this;
return tmp;
```

**9.7.6.2.8 counted\_iterator::operator+****[counted.iter.op.+]**

```
constexpr counted_iterator operator+(difference_type n) const
requires RandomAccessIterator<I>;
```

1 *Requires:*  $n \leq \text{cnt}$

2 *Effects:* Equivalent to: `return counted_iterator(current + n, cnt - n);`

**9.7.6.2.9 counted\_iterator::operator+=****[counted.iter.op.+=]**

```
constexpr counted_iterator& operator+=(difference_type n)
requires RandomAccessIterator<I>;
```

1 *Requires:*  $n \leq \text{cnt}$

2 *Effects:*

```
current += n;
cnt -= n;
```

3 *Returns:* \*this.

**9.7.6.2.10 counted\_iterator::operator-****[counted.iter.op.-]**

```
constexpr counted_iterator operator-(difference_type n) const
requires RandomAccessIterator<I>;
```

1 *Requires:*  $-n \leq \text{cnt}$

2 *Effects:* Equivalent to: `return counted_iterator(current - n, cnt + n);`

**9.7.6.2.11 counted\_iterator::operator-=****[counted.iter.op.-=]**

```
constexpr counted_iterator& operator-=(difference_type n)
requires RandomAccessIterator<I>;
```

1 *Requires:*  $-n \leq \text{cnt}$

2 *Effects:*

```
current -= n;
cnt += n;
```

3 *Returns:* \*this.

#### 9.7.6.2.12 counted\_iterator::operator[]

[counted.iter.op.index]

```
constexpr decltype(auto) operator[](difference_type n) const
requires RandomAccessIterator<I>;
```

1 *Requires:* `n <= cnt`

2 *Effects:* Equivalent to: `return current[n];`

#### 9.7.6.2.13 counted\_iterator comparisons

[counted.iter.op.comp]

```
template <class I1, class I2>
requires Common<I1, I2>
constexpr bool operator==(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
```

1 *Requires:* `x` and `y` shall refer to elements of the same sequence (9.7.6).

2 *Effects:* Equivalent to: `return x.cnt == y.cnt;`

```
constexpr bool operator==(
 const counted_iterator<auto>& x, default_sentinel);
constexpr bool operator==(
 default_sentinel, const counted_iterator<auto>& x);
```

3 *Effects:* Equivalent to: `return x.cnt == 0;`

```
template <class I1, class I2>
requires Common<I1, I2>
constexpr bool operator!=(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
constexpr bool operator!=(
 const counted_iterator<auto>& x, default_sentinel);
constexpr bool operator!=(
 default_sentinel, const counted_iterator<auto>& x);
```

4 *Requires:* For the first overload, `x` and `y` shall refer to elements of the same sequence (9.7.6).

5 *Effects:* Equivalent to: `return !(x == y);`

```
template <class I1, class I2>
requires Common<I1, I2>
constexpr bool operator<(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
```

6 *Requires:* `x` and `y` shall refer to elements of the same sequence (9.7.6).

7 *Effects:* Equivalent to: `return y.cnt < x.cnt;`

8 [ *Note:* The argument order in the *Effects* element is reversed because `cnt` counts down, not up. — end note ]

```
template <class I1, class I2>
requires Common<I1, I2>
constexpr bool operator>=(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
```

9 *Requires:* `x` and `y` shall refer to elements of the same sequence (9.7.6).

10 *Effects:* Equivalent to: `return !(y < x);`

```
template <class I1, class I2>
requires Common<I1, I2>
constexpr bool operator>(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
```

11 *Requires:* x and y shall refer to elements of the same sequence (9.7.6).

12 *Effects:* Equivalent to: `return y < x;`

```
template <class I1, class I2>
 requires Common<I1, I2>
 constexpr bool operator==(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
```

13 *Requires:* x and y shall refer to elements of the same sequence (9.7.6).

14 *Effects:* Equivalent to: `return !(x < y);`

#### 9.7.6.2.14 counted\_iterator non-member functions

[counted.iter.nonmember]

```
template <class I1, class I2>
 requires Common<I1, I2>
 constexpr difference_type_t<I2> operator-(
 const counted_iterator<I1>& x, const counted_iterator<I2>& y);
```

1 *Requires:* x and y shall refer to elements of the same sequence (9.7.6).

2 *Effects:* Equivalent to: `return y.cnt - x.cnt;`

```
template <class I>
 constexpr difference_type_t<I> operator-(
 const counted_iterator<I>& x, default_sentinel y);
```

3 *Effects:* Equivalent to: `return -x.cnt;`

```
template <class I>
 constexpr difference_type_t<I> operator-(
 default_sentinel x, const counted_iterator<I>& y);
```

4 *Effects:* Equivalent to: `return y.cnt;`

```
template <RandomAccessIterator I>
 constexpr counted_iterator<I> operator+(
 difference_type_t<I> n, const counted_iterator<I>& x);
```

5 *Requires:* `n <= x.cnt`.

6 *Effects:* Equivalent to: `return x + n;`

```
friend constexpr rvalue_reference_t<I> iter_move(const counted_iterator& i)
 noexcept(see below)
 requires InputIterator<I>;
```

7 *Effects:* Equivalent to: `return ranges::iter_move(i.current);`

8 *Remarks:* The expression in `noexcept` is equivalent to:

```
noexcept(ranges::iter_move(i.current))
```

```
template <IndirectlySwappable<I> I2>
 friend constexpr void iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
 noexcept(see below);
```

9 *Effects:* Equivalent to `ranges::iter_swap(x.current, y.current)`.

10 *Remarks:* The expression in `noexcept` is equivalent to:

```
noexcept(ranges::iter_swap(x.current, y.current))
```

```
template <Iterator I>
constexpr counted_iterator<I> make_counted_iterator(I i, difference_type_t<I> n);
```

11 *Requires:*  $n \geq 0$ .

12 *Returns:* `counted_iterator<I>(i, n)`.

### 9.7.7 Dangling wrapper

[dangling.wrappers]

#### 9.7.7.1 Class template `dangling`

[dangling.wrap]

- 1 Class template `dangling` is a wrapper for an object that refers to another object whose lifetime may have ended. It is used by algorithms that accept rvalue ranges and return iterators.

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <CopyConstructible T>
 class dangling {
 public:
 constexpr dangling() requires DefaultConstructible<T>;
 constexpr dangling(T t);
 constexpr T get_unsafe() const;
 private:
 T value; // exposition only
 };

 template <Range R>
 using safe_iterator_t =
 conditional_t<is_lvalue_reference<R>::value,
 iterator_t<R>,
 dangling<iterator_t<R>>>;
 }}}}
```

#### 9.7.7.2 `dangling` operations

[dangling.wrap.ops]

##### 9.7.7.2.1 `dangling` constructors

[dangling.wrap.op.const]

```
constexpr dangling() requires DefaultConstructible<T>;
```

- 1 *Effects:* Constructs a `dangling`, value-initializing value.

```
constexpr dangling(T t);
```

- 2 *Effects:* Constructs a `dangling`, initializing value with `t`.

##### 9.7.7.2.2 `dangling::get_unsafe`

[dangling.wrap.op.get]

```
constexpr T get_unsafe() const;
```

- 1 *Returns:* `value`.

### 9.7.8 Unreachable sentinel

[unreachable.sentinel]

#### 9.7.8.1 Class `unreachable`

[unreachable.sentinel]

- 1 Class `unreachable` is a sentinel type that can be used with any `Iterator` to denote an infinite range. Comparing an iterator for equality with an object of type `unreachable` always returns `false`.

[*Example:*

```
char* p;
// set p to point to a character buffer containing newlines
char* nl = find(p, unreachable(), '\n');
```

Provided a newline character really exists in the buffer, the use of `unreachable` above potentially makes the call to `find` more efficient since the loop test against the sentinel does not require a conditional branch.

— *end example*]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
```

```

class unreachable { };

template <Iterator I>
constexpr bool operator==(const I&, unreachable) noexcept;
template <Iterator I>
constexpr bool operator==(unreachable, const I&) noexcept;
template <Iterator I>
constexpr bool operator!=(const I&, unreachable) noexcept;
template <Iterator I>
constexpr bool operator!=(unreachable, const I&) noexcept;
}}}}

```

### 9.7.8.2 unreachable operations

[unreachable.sentinel.ops]

#### 9.7.8.2.1 operator==

[unreachable.sentinel.op==]

```

template <Iterator I>
constexpr bool operator==(const I&, unreachable) noexcept;
template <Iterator I>
constexpr bool operator==(unreachable, const I&) noexcept;

```

<sup>1</sup> *Returns:* false.

#### 9.7.8.2.2 operator!=

[unreachable.sentinel.op!=]

```

template <Iterator I>
constexpr bool operator!=(const I& x, unreachable y) noexcept;
template <Iterator I>
constexpr bool operator!=(unreachable x, const I& y) noexcept;

```

<sup>1</sup> *Returns:* true.

## 9.8 Stream iterators

[iterators.stream]

- <sup>1</sup> To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

[*Example:*

```

partial_sum(istream_iterator<double, char>(cin),
 istream_iterator<double, char>(),
 ostream_iterator<double, char>(cout, "\n"));

```

reads a file containing floating point numbers from `cin`, and prints the partial sums onto `cout`. — *end example*]

### 9.8.1 Class template `istream_iterator`

[istream.iterator]

- <sup>1</sup> The class template `istream_iterator` is an input iterator (9.3.11) that reads (using `operator>>`) successive elements from the input stream for which it was constructed. After it is constructed, and every time `++` is used, the iterator reads and stores a value of `T`. If the iterator fails to read and store a value of `T` (`fail()` on the stream returns `true`), the iterator becomes equal to the *end-of-stream* iterator value. The constructor with no arguments `istream_iterator()` always constructs an end-of-stream input iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-stream iterator is not defined. For any other iterator value a `const T&` is returned. The result of `operator->` on an end-of-stream iterator is not defined. For any other iterator value a `const T*` is returned. The behavior of a program that applies `operator++()` to an end-of-stream iterator is undefined. It is impossible to store things into `istream` iterators.
- <sup>2</sup> Two end-of-stream iterators are always equal. An end-of-stream iterator is not equal to a non-end-of-stream iterator. Two non-end-of-stream iterators are equal when they are constructed from the same stream.

```

namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <class T, class charT = char, class traits = char_traits<charT>,
 class Distance = ptrdiff_t>
 class istream_iterator {
 public:

```

```

typedef input_iterator_tag iterator_category;
typedef Distance difference_type;
typedef T value_type;
typedef const T& reference;
typedef const T* pointer;
typedef charT char_type;
typedef traits traits_type;
typedef basic_istream<charT, traits> istream_type;
constexpr istream_iterator();
constexpr istream_iterator(default_sentinel);
istream_iterator(istream_type& s);
istream_iterator(const istream_iterator& x) = default;
~istream_iterator() = default;

const T& operator*() const;
const T* operator->() const;
istream_iterator& operator++();
istream_iterator operator++(int);
private:
 basic_istream<charT, traits>* in_stream; // exposition only
 T value; // exposition only
};

template <class T, class charT, class traits, class Distance>
 bool operator==(const istream_iterator<T, charT, traits, Distance>& x,
 const istream_iterator<T, charT, traits, Distance>& y);
template <class T, class charT, class traits, class Distance>
 bool operator==(default_sentinel x,
 const istream_iterator<T, charT, traits, Distance>& y);
template <class T, class charT, class traits, class Distance>
 bool operator==(const istream_iterator<T, charT, traits, Distance>& x,
 default_sentinel y);
template <class T, class charT, class traits, class Distance>
 bool operator!=(const istream_iterator<T, charT, traits, Distance>& x,
 const istream_iterator<T, charT, traits, Distance>& y);
template <class T, class charT, class traits, class Distance>
 bool operator!=(default_sentinel x,
 const istream_iterator<T, charT, traits, Distance>& y);
template <class T, class charT, class traits, class Distance>
 bool operator!=(const istream_iterator<T, charT, traits, Distance>& x,
 default_sentinel y);
}}}}

```

#### 9.8.1.1 istream\_iterator constructors and destructor

[istream.iterator.cons]

```

constexpr istream_iterator();
constexpr istream_iterator(default_sentinel);

```

- 1 *Effects:* Constructs the end-of-stream iterator. If T is a literal type, then these constructors shall be **constexpr** constructors.
- 2 *Postcondition:* in\_stream == nullptr.

```
istream_iterator(istream_type& s);
```

- 3 *Effects:* Initializes in\_stream with &s. value may be initialized during construction or the first time it is referenced.
- 4 *Postcondition:* in\_stream == &s.

```
istream_iterator(const istream_iterator& x) = default;
```

5 *Effects:* Constructs a copy of `x`. If `T` is a literal type, then this constructor shall be a trivial copy constructor.

6 *Postcondition:* `in_stream == x.in_stream`.

```
~istream_iterator() = default;
```

7 *Effects:* The iterator is destroyed. If `T` is a literal type, then this destructor shall be a trivial destructor.

### 9.8.1.2 istream\_iterator operations

[istream.iterator.ops]

```
const T& operator*() const;
```

1 *Returns:* value.

```
const T* operator->() const;
```

2 *Effects:* Equivalent to: `return addressof(operator*())`.

```
istream_iterator& operator++();
```

3 *Requires:* `in_stream != nullptr`.

4 *Effects:* `*in_stream >> value`.

5 *Returns:* `*this`.

```
istream_iterator operator++(int);
```

6 *Requires:* `in_stream != nullptr`.

7 *Effects:*

```
 istream_iterator tmp = *this;
 *in_stream >> value;
 return tmp;
```

```
template <class T, class charT, class traits, class Distance>
 bool operator==(const istream_iterator<T, charT, traits, Distance> &x,
 const istream_iterator<T, charT, traits, Distance> &y);
```

8 *Returns:* `x.in_stream == y.in_stream`.

```
template <class T, class charT, class traits, class Distance>
 bool operator==(default_sentinel x,
 const istream_iterator<T, charT, traits, Distance> &y);
```

9 *Returns:* `nullptr == y.in_stream`.

```
template <class T, class charT, class traits, class Distance>
 bool operator==(const istream_iterator<T, charT, traits, Distance> &x,
 default_sentinel y);
```

10 *Returns:* `x.in_stream == nullptr`.

```
template <class T, class charT, class traits, class Distance>
 bool operator!=(const istream_iterator<T, charT, traits, Distance> &x,
 const istream_iterator<T, charT, traits, Distance> &y);
template <class T, class charT, class traits, class Distance>
 bool operator!=(default_sentinel x,
 const istream_iterator<T, charT, traits, Distance> &y);
template <class T, class charT, class traits, class Distance>
 bool operator!=(const istream_iterator<T, charT, traits, Distance> &x,
 default_sentinel y);
```

11       Returns:  $!(x == y)$

### 9.8.2 Class template `ostream_iterator`

[`ostream.iterator`]

- <sup>1</sup> `ostream_iterator` writes (using `operator<<`) successive elements onto the output stream from which it was constructed. If it was constructed with `charT*` as a constructor argument, this string, called a *delimiter string*, is written to the stream after every `T` is written. It is not possible to get a value out of the output iterator. Its only use is as an output iterator in situations like

```
while (first != last)
 *result++ = *first++;
```

- <sup>2</sup> `ostream_iterator` is defined as:

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <class T, class charT = char, class traits = char_traits<charT>>
 class ostream_iterator {
 public:
 typedef ptrdiff_t difference_type;
 typedef charT char_type;
 typedef traits traits_type;
 typedef basic_ostream<charT, traits> ostream_type;
 constexpr ostream_iterator() noexcept;
 ostream_iterator(ostream_type& s) noexcept;
 ostream_iterator(ostream_type& s, const charT* delimiter) noexcept;
 ostream_iterator(const ostream_iterator& x) noexcept;
 ~ostream_iterator();
 ostream_iterator& operator=(const T& value);

 ostream_iterator& operator*();
 ostream_iterator& operator++();
 ostream_iterator& operator++(int);
 private:
 basic_ostream<charT, traits>* out_stream; // exposition only
 const charT* delim; // exposition only
 };
}}}
```

#### 9.8.2.1 `ostream_iterator` constructors and destructor

[`ostream.iterator.cons.des`]

```
constexpr ostream_iterator() noexcept;
```

- <sup>1</sup>       *Effects:* Initializes `out_stream` and `delim` with `nullptr`.

```
ostream_iterator(ostream_type& s) noexcept;
```

- <sup>2</sup>       *Effects:* Initializes `out_stream` with `&s` and `delim` with `nullptr`.

```
ostream_iterator(ostream_type& s, const charT* delimiter) noexcept;
```

- <sup>3</sup>       *Effects:* Initializes `out_stream` with `&s` and `delim` with `delimiter`.

```
ostream_iterator(const ostream_iterator& x) noexcept;
```

- <sup>4</sup>       *Effects:* Constructs a copy of `x`.

```
~ostream_iterator();
```

- <sup>5</sup>       *Effects:* The iterator is destroyed.

## 9.8.2.2 ostream\_iterator operations

[ostream.iterator.ops]

```
ostream_iterator& operator=(const T& value);
```

1 *Effects:* Equivalent to:

```
*out_stream << value;
if (delim != nullptr)
 *out_stream << delim;
return *this;
```

```
ostream_iterator& operator*();
```

2 *Returns:* \*this.

```
ostream_iterator& operator++();
ostream_iterator& operator++(int);
```

3 *Returns:* \*this.

## 9.8.3 Class template istreambuf\_iterator

[istreambuf.iterator]

- 1 The class template `istreambuf_iterator` defines an input iterator (9.3.11) that reads successive *characters* from the streambuf for which it was constructed. `operator*` provides access to the current input character, if any. Each time `operator++` is evaluated, the iterator advances to the next input character. If the end of stream is reached (`streambuf_type::sgetc()` returns `traits::eof()`), the iterator becomes equal to the *end-of-stream* iterator value. The default constructor `istreambuf_iterator()` and the constructor `istreambuf_iterator(nullptr)` both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of `istreambuf_iterator` shall have a trivial copy constructor, a `constexpr` default constructor, and a trivial destructor.
- 2 The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator value a `char_type` value is returned. It is impossible to assign a character via an input iterator.

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <class charT, class traits = char_traits<charT>>
 class istreambuf_iterator {
 public:
 typedef input_iterator_tag iterator_category;
 typedef charT value_type;
 typedef typename traits::off_type difference_type;
 typedef charT reference;
 typedef unspecified pointer;
 typedef charT char_type;
 typedef traits traits_type;
 typedef typename traits::int_type int_type;
 typedef basic_streambuf<charT, traits> streambuf_type;
 typedef basic_istream<charT, traits> istream_type;

 class proxy; // exposition only

 constexpr istreambuf_iterator() noexcept;
 constexpr istreambuf_iterator(default_sentinel) noexcept;
 istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
 ~istreambuf_iterator() = default;
 istreambuf_iterator(istream_type& s) noexcept;
 istreambuf_iterator(streambuf_type* s) noexcept;
 istreambuf_iterator(const proxy& p) noexcept;
 charT operator*() const;
 istreambuf_iterator& operator++();
 proxy operator++(int);
 bool equal(const istreambuf_iterator& b) const;
 private:
```

```

 ostreambuf_type* sbuf_; // exposition only
};

template <class charT, class traits>
 bool operator==(const istreambuf_iterator<charT, traits>& a,
 const istreambuf_iterator<charT, traits>& b);
template <class charT, class traits>
 bool operator==(default_sentinel a,
 const istreambuf_iterator<charT, traits>& b);
template <class charT, class traits>
 bool operator==(const istreambuf_iterator<charT, traits>& a,
 default_sentinel b);
template <class charT, class traits>
 bool operator!=(const istreambuf_iterator<charT, traits>& a,
 const istreambuf_iterator<charT, traits>& b);
template <class charT, class traits>
 bool operator!=(default_sentinel a,
 const istreambuf_iterator<charT, traits>& b);
template <class charT, class traits>
 bool operator!=(const istreambuf_iterator<charT, traits>& a,
 default_sentinel b);
}}}}

```

### 9.8.3.1 Class template `istreambuf_iterator::proxy` [istreambuf.iterator::proxy]

```

namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <class charT, class traits = char_traits<charT>>
 class istreambuf_iterator<charT, traits>::proxy { // exposition only
 charT keep_;
 basic_ostreambuf<charT, traits>* sbuf_;
 proxy(charT c, basic_ostreambuf<charT, traits>* sbuf)
 : keep_(c), sbuf_(sbuf) { }
 public:
 charT operator*() { return keep_; }
 };
}}}}

```

- <sup>1</sup> Class `istreambuf_iterator<charT, traits>::proxy` is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class `istreambuf_iterator<charT, traits>::proxy` provides a temporary placeholder as the return value of the post-increment operator (`operator++`). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

### 9.8.3.2 `istreambuf_iterator` constructors [istreambuf.iterator.cons]

```

constexpr istreambuf_iterator() noexcept;
constexpr istreambuf_iterator(default_sentinel) noexcept;

```

- <sup>1</sup> *Effects:* Constructs the end-of-stream iterator.

```

istreambuf_iterator(basic_istream<charT, traits>& s) noexcept;
istreambuf_iterator(basic_ostreambuf<charT, traits>* s) noexcept;

```

- <sup>2</sup> *Effects:* Constructs an `istreambuf_iterator` that uses the `basic_ostreambuf` object `*(s.rdbuf())`, or `*s`, respectively. Constructs an end-of-stream iterator if `s.rdbuf()` is null.

```

istreambuf_iterator(const proxy& p) noexcept;

```

- <sup>3</sup> *Effects:* Constructs a `istreambuf_iterator` that uses the `basic_ostreambuf` object pointed to by the proxy object's constructor argument `p`.

**9.8.3.3 istreambuf\_iterator::operator\*** [istreambuf\_iterator::op\*]

```
charT operator*() const
```

1 *Returns:* The character obtained via the `streambuf` member `sbuf_->sgetc()`.

**9.8.3.4 istreambuf\_iterator::operator++** [istreambuf\_iterator::op++]

```
istreambuf_iterator&
 istreambuf_iterator<charT, traits>::operator++();
```

1 *Effects:* Equivalent to `sbuf_->sumpc()`.

2 *Returns:* `*this`.

```
proxy istreambuf_iterator<charT, traits>::operator++(int);
```

3 *Effects:* Equivalent to: `return proxy(sbuf_->sumpc(), sbuf_);`

**9.8.3.5 istreambuf\_iterator::equal** [istreambuf\_iterator::equal]

```
bool equal(const istreambuf_iterator& b) const;
```

1 *Returns:* `true` if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what `streambuf` object they use.

**9.8.3.6 operator==** [istreambuf\_iterator::op==]

```
template <class charT, class traits>
 bool operator==(const istreambuf_iterator<charT, traits>& a,
 const istreambuf_iterator<charT, traits>& b);
```

1 *Effects:* Equivalent to: `return a.equal(b);`

```
template <class charT, class traits>
 bool operator==(default_sentinel a,
 const istreambuf_iterator<charT, traits>& b);
```

2 *Effects:* Equivalent to: `return istreambuf_iterator<charT, traits>{}.equal(b);`

```
template <class charT, class traits>
 bool operator==(const istreambuf_iterator<charT, traits>& a,
 default_sentinel b);
```

3 *Effects:* Equivalent to: `return a.equal(istreambuf_iterator<charT, traits>{});`

**9.8.3.7 operator!=** [istreambuf\_iterator::op!=]

```
template <class charT, class traits>
 bool operator!=(const istreambuf_iterator<charT, traits>& a,
 const istreambuf_iterator<charT, traits>& b);
template <class charT, class traits>
 bool operator!=(default_sentinel a,
 const istreambuf_iterator<charT, traits>& b);
template <class charT, class traits>
 bool operator!=(const istreambuf_iterator<charT, traits>& a,
 default_sentinel b);
```

1 *Effects:* Equivalent to: `return !(a == b);`

#### 9.8.4 Class template ostreambuf\_iterator

[ostreambuf.iterator]

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 template <class charT, class traits = char_traits<charT>>
 class ostreambuf_iterator {
 public:
 typedef ptrdiff_t difference_type;
 typedef charT char_type;
 typedef traits traits_type;
 typedef basic_streambuf<charT, traits> streambuf_type;
 typedef basic_ostream<charT, traits> ostream_type;

 constexpr ostreambuf_iterator() noexcept;
 ostreambuf_iterator(ostream_type& s) noexcept;
 ostreambuf_iterator(streambuf_type* s) noexcept;
 ostreambuf_iterator& operator=(charT c);

 ostreambuf_iterator& operator*();
 ostreambuf_iterator& operator++();
 ostreambuf_iterator& operator++(int);
 bool failed() const noexcept;

 private:
 streambuf_type* sbuf_; // exposition only
 };
}}}
```

- <sup>1</sup> The class template `ostreambuf_iterator` writes successive *characters* onto the output stream from which it was constructed. It is not possible to get a character value out of the output iterator.

##### 9.8.4.1 ostreambuf\_iterator constructors

[ostreambuf.iter.cons]

```
constexpr ostreambuf_iterator() noexcept;
```

- <sup>1</sup> *Effects:* Initializes `sbuf_` with `nullptr`.

```
ostreambuf_iterator(ostream_type& s) noexcept;
```

- <sup>2</sup> *Requires:* `s.rdbuf() != nullptr`.

- <sup>3</sup> *Effects:* Initializes `sbuf_` with `s.rdbuf()`.

```
ostreambuf_iterator(streambuf_type* s) noexcept;
```

- <sup>4</sup> *Requires:* `s != nullptr`.

- <sup>5</sup> *Effects:* Initializes `sbuf_` with `s`.

##### 9.8.4.2 ostreambuf\_iterator operations

[ostreambuf.iter.ops]

```
ostreambuf_iterator&
operator=(charT c);
```

- <sup>1</sup> *Requires:* `sbuf_ != nullptr`.

- <sup>2</sup> *Effects:* If `failed()` yields `false`, calls `sbuf_>sputc(c)`; otherwise has no effect.

- <sup>3</sup> *Returns:* `*this`.

```
ostreambuf_iterator& operator*();
```

- <sup>4</sup> *Returns:* `*this`.

```
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
```

5 *Returns:* `*this`.

```
bool failed() const noexcept;
```

6 *Requires:* `sbuf_ != nullptr`.

7 *Returns:* `true` if in any prior use of member `operator=`, the call to `sbuf_->sputc()` returned `traits::eof()`; or `false` otherwise.

## 10 Ranges library

[ranges]

### 10.1 General

[ranges.general]

- 1 This Clause describes components for dealing with ranges of elements.
- 2 The following subclauses describe range and view requirements, and components for range primitives as summarized in Table 9.

Table 9 — Ranges library summary

|      | Subclause        | Header(s)                                      |
|------|------------------|------------------------------------------------|
| 10.4 | Range access     | <code>&lt;experimental/ranges/range&gt;</code> |
| 10.5 | Range primitives |                                                |
| 10.6 | Requirements     |                                                |

### 10.2 decay\_copy

[ranges.decaycopy]

- 1 Several places in this Clause use the expression `DECAY_COPY(x)`, which is expression-equivalent to:

```
decay_t<decltype((x))>(x)
```

### 10.3 Header `<experimental/ranges/range>` synopsis

[range.synopsis]

```
#include <experimental/ranges/iterator>
```

```
namespace std { namespace experimental { namespace ranges { inline namespace v1 {
```

```
// 10.4, range access:
```

```
namespace {
 constexpr unspecified begin = unspecified ;
 constexpr unspecified end = unspecified ;
 constexpr unspecified cbegin = unspecified ;
 constexpr unspecified cend = unspecified ;
 constexpr unspecified rbegin = unspecified ;
 constexpr unspecified rend = unspecified ;
 constexpr unspecified crbegin = unspecified ;
 constexpr unspecified crend = unspecified ;
}
```

```
// 10.5, range primitives:
```

```
namespace {
 constexpr unspecified size = unspecified ;
 constexpr unspecified empty = unspecified ;
 constexpr unspecified data = unspecified ;
 constexpr unspecified cdata = unspecified ;
}
```

```
template <class T>
```

```
using iterator_t = decltype(ranges::begin(std::declval<T>()));
```

```

template <class T>
using sentinel_t = decltype(ranges::end(declval<T&>()));

template <class>
constexpr bool disable_sized_range = false;

template <class T>
struct enable_view { };

struct view_base { };

// 10.6, range requirements:

// 10.6.2, Range:
template <class T>
concept bool Range = see below;

// 10.6.3, SizedRange:
template <class T>
concept bool SizedRange = see below;

// 10.6.4, View:
template <class T>
concept bool View = see below;

// 10.6.5, BoundedRange:
template <class T>
concept bool BoundedRange = see below;

// 10.6.6, InputRange:
template <class T>
concept bool InputRange = see below;

// 10.6.7, OutputRange:
template <class R, class T>
concept bool OutputRange = see below;

// 10.6.8, ForwardRange:
template <class T>
concept bool ForwardRange = see below;

// 10.6.9, BidirectionalRange:
template <class T>
concept bool BidirectionalRange = see below;

// 10.6.10, RandomAccessRange:
template <class T>
concept bool RandomAccessRange = see below;
}}}
```

## 10.4 Range access

[range.access]

- <sup>1</sup> In addition to being available via inclusion of the `<experimental/ranges/range>` header, the customization point objects in 10.4 are available when `<experimental/ranges/iterator>` is included.

### 10.4.1 begin

[range.access.begin]

- <sup>1</sup> The name `begin` denotes a customization point object (6.3.5.1). The expression `ranges::begin(E)` for some subexpression `E` is expression-equivalent to:
- (1.1) — `ranges::begin(static_cast<const T&>(E))` if `E` is an rvalue of type `T`. This usage is deprecated. [Note: This deprecated usage exists so that `ranges::begin(E)` behaves similarly to `std::begin(E)` as defined in ISO/IEC 14882 when `E` is an rvalue. — end note]
  - (1.2) — Otherwise, `(E) + 0` if `E` has array type (ISO/IEC 14882:2014 §3.9.2).

- (1.3) — Otherwise, `DECAY_COPY((E).begin())` if it is a valid expression and its type `I` meets the syntactic requirements of `Iterator<I>`. If `Iterator` is not satisfied, the program is ill-formed with no diagnostic required.
  - (1.4) — Otherwise, `DECAY_COPY(begin(E))` if it is a valid expression and its type `I` meets the syntactic requirements of `Iterator<I>` with overload resolution performed in a context that includes the declaration `void begin(auto&) = delete;` and does not include a declaration of `ranges::begin`. If `Iterator` is not satisfied, the program is ill-formed with no diagnostic required.
  - (1.5) — Otherwise, `ranges::begin(E)` is ill-formed.
- <sup>2</sup> [Note: Whenever `ranges::begin(E)` is a valid expression, its type satisfies `Iterator`. — end note]

#### 10.4.2 end

[range.access.end]

- <sup>1</sup> The name `end` denotes a customization point object (6.3.5.1). The expression `ranges::end(E)` for some subexpression `E` is expression-equivalent to:
- (1.1) — `ranges::end(static_cast<const T&>(E))` if `E` is an rvalue of type `T`. This usage is deprecated. [Note: This deprecated usage exists so that `ranges::end(E)` behaves similarly to `std::end(E)` as defined in ISO/IEC 14882 when `E` is an rvalue. — end note]
  - (1.2) — Otherwise, `(E) + extent<T>::value` if `E` has array type (ISO/IEC 14882:2014 §3.9.2) `T`.
  - (1.3) — Otherwise, `DECAY_COPY((E).end())` if it is a valid expression and its type `S` meets the syntactic requirements of `Sentinel<S, decltype(ranges::begin(E))>`. If `Sentinel` is not satisfied, the program is ill-formed with no diagnostic required.
  - (1.4) — Otherwise, `DECAY_COPY(end(E))` if it is a valid expression and its type `S` meets the syntactic requirements of `Sentinel<S, decltype(ranges::begin(E))>` with overload resolution performed in a context that includes the declaration `void end(auto&) = delete;` and does not include a declaration of `ranges::end`. If `Sentinel` is not satisfied, the program is ill-formed with no diagnostic required.
  - (1.5) — Otherwise, `ranges::end(E)` is ill-formed.
- <sup>2</sup> [Note: Whenever `ranges::end(E)` is a valid expression, the types of `ranges::end(E)` and `ranges::begin(E)` satisfy `Sentinel`. — end note]

#### 10.4.3 cbegin

[range.access.cbegin]

- <sup>1</sup> The name `cbegin` denotes a customization point object (6.3.5.1). The expression `ranges::cbegin(E)` for some subexpression `E` of type `T` is expression-equivalent to `ranges::begin(static_cast<const T&>(E))`.
- <sup>2</sup> Use of `ranges::cbegin(E)` with rvalue `E` is deprecated. [Note: This deprecated usage exists so that `ranges::cbegin(E)` behaves similarly to `std::cbegin(E)` as defined in ISO/IEC 14882 when `E` is an rvalue. — end note]
- <sup>3</sup> [Note: Whenever `ranges::cbegin(E)` is a valid expression, its type satisfies `Iterator`. — end note]

#### 10.4.4 cend

[range.access.cend]

- <sup>1</sup> The name `cend` denotes a customization point object (6.3.5.1). The expression `ranges::cend(E)` for some subexpression `E` of type `T` is expression-equivalent to `ranges::end(static_cast<const T&>(E))`.
- <sup>2</sup> Use of `ranges::cend(E)` with rvalue `E` is deprecated. [Note: This deprecated usage exists so that `ranges::cend(E)` behaves similarly to `std::cend(E)` as defined in ISO/IEC 14882 when `E` is an rvalue. — end note]
- <sup>3</sup> [Note: Whenever `ranges::cend(E)` is a valid expression, the types of `ranges::cend(E)` and `ranges::cbegin(E)` satisfy `Sentinel`. — end note]

#### 10.4.5 rbegin

[range.access.rbegin]

- <sup>1</sup> The name `rbegin` denotes a customization point object (6.3.5.1). The expression `ranges::rbegin(E)` for some subexpression `E` is expression-equivalent to:
- (1.1) — `ranges::rbegin(static_cast<const T&>(E))` if `E` is an rvalue of type `T`. This usage is deprecated. [Note: This deprecated usage exists so that `ranges::rbegin(E)` behaves similarly to `std::rbegin(E)` as defined in ISO/IEC 14882 when `E` is an rvalue. — end note]

- (1.2) — Otherwise, `DECAY_COPY((E).rbegin())` if it is a valid expression and its type `I` meets the syntactic requirements of `Iterator<I>`. If `Iterator` is not satisfied, the program is ill-formed with no diagnostic required.
  - (1.3) — Otherwise, `make_reverse_iterator(ranges::end(E))` if both `ranges::begin(E)` and `ranges::end(E)` are valid expressions of the same type `I` which meets the syntactic requirements of `BidirectionalIterator<I>` (9.3.14).
  - (1.4) — Otherwise, `ranges::rbegin(E)` is ill-formed.
- 2 [Note: Whenever `ranges::rbegin(E)` is a valid expression, its type satisfies `Iterator`. — end note]

#### 10.4.6 `rend`

[range.access.rend]

- 1 The name `rend` denotes a customization point object (6.3.5.1). The expression `ranges::rend(E)` for some subexpression `E` is expression-equivalent to:
- (1.1) — `ranges::rend(static_cast<const T&>(E))` if `E` is an rvalue of type `T`. This usage is deprecated. [Note: This deprecated usage exists so that `ranges::rend(E)` behaves similarly to `std::rend(E)` as defined in ISO/IEC 14882 when `E` is an rvalue. — end note]
  - (1.2) — Otherwise, `DECAY_COPY((E).rend())` if it is a valid expression and its type `S` meets the syntactic requirements of `Sentinel<S, decltype(ranges::rbegin(E))>`. If `Sentinel` is not satisfied, the program is ill-formed with no diagnostic required.
  - (1.3) — Otherwise, `make_reverse_iterator(ranges::begin(E))` if both `ranges::begin(E)` and `ranges::end(E)` are valid expressions of the same type `I` which meets the syntactic requirements of `BidirectionalIterator<I>` (9.3.14).
  - (1.4) — Otherwise, `ranges::rend(E)` is ill-formed.
- 2 [Note: Whenever `ranges::rend(E)` is a valid expression, the types of `ranges::rend(E)` and `ranges::rbegin(E)` satisfy `Sentinel`. — end note]

#### 10.4.7 `crbegin`

[range.access.crbegin]

- 1 The name `crbegin` denotes a customization point object (6.3.5.1). The expression `ranges::crbegin(E)` for some subexpression `E` of type `T` is expression-equivalent to `ranges::rbegin(static_cast<const T&>(E))`.
- 2 Use of `ranges::crbegin(E)` with rvalue `E` is deprecated. [Note: This deprecated usage exists so that `ranges::crbegin(E)` behaves similarly to `std::crbegin(E)` as defined in ISO/IEC 14882 when `E` is an rvalue. — end note]
- 3 [Note: Whenever `ranges::crbegin(E)` is a valid expression, its type satisfies `Iterator`. — end note]

#### 10.4.8 `crend`

[range.access.crend]

- 1 The name `crend` denotes a customization point object (6.3.5.1). The expression `ranges::crend(E)` for some subexpression `E` of type `T` is expression-equivalent to `ranges::rend(static_cast<const T&>(E))`.
- 2 Use of `ranges::crend(E)` with rvalue `E` is deprecated. [Note: This deprecated usage exists so that `ranges::crend(E)` behaves similarly to `std::crend(E)` as defined in ISO/IEC 14882 when `E` is an rvalue. — end note]
- 3 [Note: Whenever `ranges::crend(E)` is a valid expression, the types of `ranges::crend(E)` and `ranges::crbegin(E)` satisfy `Sentinel`. — end note]

### 10.5 Range primitives

[range.primitives]

- 1 In addition to being available via inclusion of the `<experimental/ranges/range>` header, the customization point objects in 10.5 are available when `<experimental/ranges/iterator>` is included.

#### 10.5.1 `size`

[range.primitives.size]

- 1 The name `size` denotes a customization point object (6.3.5.1). The expression `ranges::size(E)` for some subexpression `E` with type `T` is expression-equivalent to:
- (1.1) — `DECAY_COPY(extent<T>::value)` if `T` is an array type (ISO/IEC 14882:2014 §3.9.2).
  - (1.2) — Otherwise, `DECAY_COPY(static_cast<const T&>(E).size())` if it is a valid expression and its type `I` satisfies `Integral<I>` and `disable_sized_range<T>` (10.6.3) is false.

- (1.3) — Otherwise, `DECAY_COPY(size(static_cast<const T&>(E)))` if it is a valid expression and its type `I` satisfies `Integral<I>` with overload resolution performed in a context that includes the declaration `void size(const auto&) = delete;` and does not include a declaration of `ranges::size`, and `disable_sized_range<T>` is false.
  - (1.4) — Otherwise, `DECAY_COPY(ranges::cend(E) - ranges::cbegin(E))`, except that `E` is only evaluated once, if it is a valid expression and the types `I` and `S` of `ranges::cbegin(E)` and `ranges::cend(E)` meet the syntactic requirements of `SizedSentinel<S, I>` (9.3.10) and `ForwardIterator<I>`. If `SizedSentinel` and `ForwardIterator` are not satisfied, the program is ill-formed with no diagnostic required.
  - (1.5) — Otherwise, `ranges::size(E)` is ill-formed.
- <sup>2</sup> [Note: Whenever `ranges::size(E)` is a valid expression, its type satisfies `Integral`. — end note]

### 10.5.2 empty

[range.primitives.empty]

- <sup>1</sup> The name `empty` denotes a customization point object (6.3.5.1). The expression `ranges::empty(E)` for some subexpression `E` is expression-equivalent to:
- (1.1) — `bool((E).empty())` if it is a valid expression.
  - (1.2) — Otherwise, `ranges::size(E) == 0` if it is a valid expression.
  - (1.3) — Otherwise, `bool(ranges::begin(E) == ranges::end(E))`, except that `E` is only evaluated once, if it is a valid expression and the type of `ranges::begin(E)` satisfies `ForwardIterator`.
  - (1.4) — Otherwise, `ranges::empty(E)` is ill-formed.
- <sup>2</sup> [Note: Whenever `ranges::empty(E)` is a valid expression, it has type `bool`. — end note]

### 10.5.3 data

[range.primitives.data]

- <sup>1</sup> The name `data` denotes a customization point object (6.3.5.1). The expression `ranges::data(E)` for some subexpression `E` is expression-equivalent to:
- (1.1) — `ranges::data(static_cast<const T&>(E))` if `E` is an rvalue of type `T`. This usage is deprecated. [Note: This deprecated usage exists so that `ranges::data(E)` behaves similarly to `std::data(E)` as defined in the C++ Working Paper when `E` is an rvalue. — end note]
  - (1.2) — Otherwise, `DECAY_COPY((E).data())` if it is a valid expression of pointer to object type.
  - (1.3) — Otherwise, `ranges::begin(E)` if it is a valid expression of pointer to object type.
  - (1.4) — Otherwise, `ranges::data(E)` is ill-formed.
- <sup>2</sup> [Note: Whenever `ranges::data(E)` is a valid expression, it has pointer to object type. — end note]

### 10.5.4 cdata

[range.primitives.cdata]

- <sup>1</sup> The name `cdata` denotes a customization point object (6.3.5.1). The expression `ranges::cdata(E)` for some subexpression `E` of type `T` is expression-equivalent to `ranges::data(static_cast<const T&>(E))`.
- <sup>2</sup> Use of `ranges::cdata(E)` with rvalue `E` is deprecated. [Note: This deprecated usage exists so that `ranges::cdata(E)` has behavior consistent with `ranges::data(E)` when `E` is an rvalue. — end note]
- <sup>3</sup> [Note: Whenever `ranges::cdata(E)` is a valid expression, it has pointer to object type. — end note]

## 10.6 Range requirements

[ranges.requirements]

### 10.6.1 General

[ranges.requirements.general]

- <sup>1</sup> Ranges are an abstraction of containers that allow a C++ program to operate on elements of data structures uniformly. In their simplest form, a range object is one on which one can call `begin` and `end` to get an iterator (9.3.8) and a sentinel (9.3.9). To be able to construct template algorithms and range adaptors that work correctly and efficiently on different types of sequences, the library formalizes not just the interfaces but also the semantics and complexity assumptions of ranges.
- <sup>2</sup> This document defines three fundamental categories of ranges based on the syntax and semantics supported by each: *range*, *sized range* and *view*, as shown in Table 10.
- <sup>3</sup> The `Range` concept requires only that `begin` and `end` return an iterator and a sentinel. The `SizedRange` concept refines `Range` with the requirement that the number of elements in the range can be determined

Table 10 — Relations among range categories

in constant time using the `size` function. The **View** concept specifies requirements on a **Range** type with constant-time copy and assign operations.

- 4 In addition to the three fundamental range categories, this document defines a number of convenience refinements of **Range** that group together requirements that appear often in the concepts and algorithms. *Bounded ranges* are ranges for which `begin` and `end` return objects of the same type. *Random access ranges* are ranges for which `begin` returns a type that satisfies **RandomAccessIterator** (9.3.15). The range categories *bidirectional ranges*, *forward ranges*, *input ranges*, and *output ranges* are defined similarly.

### 10.6.2 Ranges

[`ranges.range`]

- 1 The **Range** concept defines the requirements of a type that allows iteration over its elements by providing a `begin` iterator and an `end` sentinel. [Note: Most algorithms requiring this concept simply forward to an **Iterator**-based algorithm by calling `begin` and `end`. — end note]

```
template <class T>
concept bool Range =
 requires(T&& t) {
 ranges::begin(t); // not necessarily equality-preserving (see below)
 ranges::end(t);
 };

```

- 2 Given an lvalue `t` of type `remove_reference_t<T>`, `Range<T>` is satisfied only if
- (2.1) — [`begin(t), end(t)`] denotes a range.
- (2.2) — Both `begin(t)` and `end(t)` are amortized constant time and non-modifying. [Note: `begin(t)` and `end(t)` do not require implicit expression variations (7.1.1). — end note]
- (2.3) — If `iterator_t<T>` satisfies **ForwardIterator**, `begin(t)` is equality preserving.

- 3 [Note: Equality preservation of both `begin` and `end` enables passing a **Range** whose iterator type satisfies **ForwardIterator** to multiple algorithms and making multiple passes over the range by repeated calls to `begin` and `end`. Since `begin` is not required to be equality preserving when the return type does not satisfy **ForwardIterator**, repeated calls might not return equal values or might not be well-defined; `begin` should be called at most once for such a range. — end note]

### 10.6.3 Sized ranges

[`ranges.sized`]

- 1 The **SizedRange** concept specifies the requirements of a **Range** type that knows its size in constant time with the `size` function.

```
template <class T>
concept bool SizedRange =
 Range<T> &&
 !disable_sized_range<remove_cv_t<remove_reference_t<T>>> &&
 requires(T& t) {
 { ranges::size(t) } -> ConvertibleTo<difference_type_t<iterator_t<T>>>;
 };

```

- 2 Given an lvalue `t` of type `remove_reference_t<T>`, `SizedRange<T>` is satisfied only if:
- (2.1) — `ranges::size(t)` is  $\mathcal{O}(1)$ , does not modify `t`, and is equal to `ranges::distance(t)`.
- (2.2) — If `iterator_t<T>` satisfies **ForwardIterator**, `size(t)` is well-defined regardless of the evaluation of `begin(t)`. [Note: `size(t)` is otherwise not required be well-defined after evaluating `begin(t)`. For a **SizedRange** whose iterator type does not model **ForwardIterator**, for example, `size(t)` might only be well-defined if evaluated before the first call to `begin(t)`. — end note]

- 3 [ *Note*: The `disable_sized_range` predicate provides a mechanism to enable use of range types with the library that meet the syntactic requirements but do not in fact satisfy `SizedRange`. A program that instantiates a library template that requires a `Range` with such a range type `R` is ill-formed with no diagnostic required unless `disable_sized_range<remove_cv_t<remove_reference_t<R>>>` evaluates to `true` (6.2.1.3). — *end note*]

#### 10.6.4 Views

[`ranges.view`]

- 1 The `View` concept specifies the requirements of a `Range` type that has constant time copy, move and assignment operators; that is, the cost of these operations is not proportional to the number of elements in the `View`.
- 2 [ *Example*: Examples of `Views` are:
- (2.1) — A `Range` type that wraps a pair of iterators.
  - (2.2) — A `Range` type that holds its elements by `shared_ptr` and shares ownership with all its copies.
  - (2.3) — A `Range` type that generates its elements on demand.

A container (ISO/IEC 14882:2014 §23) is not a `View` since copying the container copies the elements, which cannot be done in constant time. — *end example*]

```
template <class T>
constexpr bool view_predicate // exposition only
 = see below;
```

```
template <class T>
concept bool View =
 Range<T> &&
 Semiregular<T> &&
 view_predicate <T>;
```

- 3 Since the difference between `Range` and `View` is largely semantic, the two are differentiated with the help of the `enable_view` trait. Users may specialize `enable_view` to derive from `true_type` or `false_type`.
- 4 For a type `T`, the value of `view_predicate <T>` shall be:
- (4.1) — If `enable_view<T>` has a member type `enable_view<T>::type::value`;
  - (4.2) — Otherwise, if `T` is derived from `view_base`, `true`;
  - (4.3) — Otherwise, if `T` is an instantiation of class template `initializer_list` (ISO/IEC 14882:2014 §18.9), `set` (ISO/IEC 14882:2014 §23.4.6), `multiset` (ISO/IEC 14882:2014 §23.4.7), `unordered_set` (ISO/IEC 14882:2014 §23.5.6), or `unordered_multiset` (ISO/IEC 14882:2014 §23.5.7), `false`;
  - (4.4) — Otherwise, if both `T` and `const T` satisfy `Range` and `reference_t <iterator_t<T>>` is not the same type as `reference_t <iterator_t<const T>>`, `false`; [ *Note*: Deep const-ness implies element ownership, whereas shallow const-ness implies reference semantics. — *end note*]
  - (4.5) — Otherwise, `true`.

#### 10.6.5 Bounded ranges

[`ranges.bounded`]

- 1 The `BoundedRange` concept specifies requirements of a `Range` type for which `begin` and `end` return objects of the same type. [ *Note*: The standard containers (ISO/IEC 14882:2014 §23) satisfy `BoundedRange`. — *end note*]

```
template <class T>
concept bool BoundedRange =
 Range<T> && Same<iterator_t<T>, sentinel_t<T>>;
```

#### 10.6.6 Input ranges

[`ranges.input`]

- 1 The `InputRange` concept specifies requirements of a `Range` type for which `begin` returns a type that satisfies `InputIterator` (9.3.11).

```
template <class T>
concept bool InputRange =
 Range<T> && InputIterator<iterator_t<T>>;
```

### 10.6.7 Output ranges

[ranges.output]

- <sup>1</sup> The `OutputRange` concept specifies requirements of a `Range` type for which `begin` returns a type that satisfies `OutputIterator` (9.3.12).

```
template <class R, class T>
concept bool OutputRange =
 Range<R> && OutputIterator<iterator_t<R>, T>;
```

### 10.6.8 Forward ranges

[ranges.forward]

- <sup>1</sup> The `ForwardRange` concept specifies requirements of an `InputRange` type for which `begin` returns a type that satisfies `ForwardIterator` (9.3.13).

```
template <class T>
concept bool ForwardRange =
 InputRange<T> && ForwardIterator<iterator_t<T>>;
```

### 10.6.9 Bidirectional ranges

[ranges.bidirectional]

- <sup>1</sup> The `BidirectionalRange` concept specifies requirements of a `ForwardRange` type for which `begin` returns a type that satisfies `BidirectionalIterator` (9.3.14).

```
template <class T>
concept bool BidirectionalRange =
 ForwardRange<T> && BidirectionalIterator<iterator_t<T>>;
```

### 10.6.10 Random access ranges

[ranges.random.access]

- <sup>1</sup> The `RandomAccessRange` concept specifies requirements of a `BidirectionalRange` type for which `begin` returns a type that satisfies `RandomAccessIterator` (9.3.15).

```
template <class T>
concept bool RandomAccessRange =
 BidirectionalRange<T> && RandomAccessIterator<iterator_t<T>>;
```

## 11 Algorithms library

[algorithms]

### 11.1 General

[algorithms.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause ISO/IEC 14882:2014 §23) and other sequences.
- <sup>2</sup> The following subclauses describe components for non-modifying sequence operations, modifying sequence operations, and sorting and related operations, as summarized in Table 11.

Table 11 — Algorithms library summary

| Subclause                              | Header(s)                       |
|----------------------------------------|---------------------------------|
| 11.3 Non-modifying sequence operations |                                 |
| 11.4 Mutating sequence operations      | <experimental/ranges/algorithm> |
| 11.5 Sorting and related operations    |                                 |

- <sup>3</sup> To ease transition, implementations shall provide the deprecated algorithm signatures specified in (Annex A.3).

#### Header <experimental/ranges/algorithm> synopsis

```
#include <initializer_list>

namespace std { namespace experimental { namespace ranges { inline namespace v1 {
 namespace tag {
 // 11.2, tag specifiers (See 8.5.2):
 struct in;
 struct in1;
```

```

 struct in2;
 struct out;
 struct out1;
 struct out2;
 struct fun;
 struct min;
 struct max;
 struct begin;
 struct end;
}

// 11.3, non-modifying sequence operations:
template <InputIterator I, Sentinel<I> S, class Proj = identity,

 bool
 prev_permutation(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});
}}}}

```

- 4 All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.
- 5 For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.
- 6 Both in-place and copying versions are provided for certain algorithms.<sup>4</sup> When such a version is provided for *algorithm* it is called *algorithm\_copy*. Algorithms that take predicates end with the suffix *\_if* (which follows the suffix *\_copy*).
- 7 [Note: Unless otherwise specified, algorithms that take function objects as arguments are permitted to copy those function objects freely. Programmers for whom object identity is important should consider using a wrapper class that points to a noncopied implementation object such as `reference_wrapper<T>` (ISO/IEC 14882:2014 §20.9.3), or some equivalent solution. — end note]
- 8 In the description of the algorithms operators + and − are used for some of the iterator categories for which they do not have to be defined. In these cases the semantics of `a+n` is the same as that of

```

X tmp = a;
advance(tmp, n);
return tmp;

```

and that of `b-a` is the same as of

```
return distance(a, b);
```

- 9 In the description of algorithm return values, sentinel values are sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator as follows:

```

I tmp = first;
while(tmp != last)
 ++tmp;
return tmp;

```

- 10 Overloads of algorithms that take `Range` arguments (10.6.2) behave as if they are implemented by calling `begin` and `end` on the `Range` and dispatching to the overload that takes separate iterator and sentinel arguments.
- 11 The number and order of template parameters for algorithm declarations is unspecified, except where explicitly stated otherwise.

## 11.2 Tag specifiers

[alg.tagspec]

```

namespace tag {
 struct in { /* implementation-defined */ };
 struct in1 { /* implementation-defined */ };
 struct in2 { /* implementation-defined */ };
 struct out { /* implementation-defined */ };
 struct out1 { /* implementation-defined */ };
 struct out2 { /* implementation-defined */ };
 struct fun { /* implementation-defined */ };
}

```

4) The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, `sort_copy` is not included because the cost of sorting is much more significant, and users might as well do `copy` followed by `sort`.

```

struct min { /* implementation-defined */ };
struct max { /* implementation-defined */ };
struct begin { /* implementation-defined */ };
struct end { /* implementation-defined */ };
}

```

- 1 In the following description, let  $X$  be the name of a type in the `tag` namespace above.
- 2 `tag::X` is a tag specifier (8.5.2) such that `TAGGET(D, tag::X, N)` names a tagged getter (8.5.2) with DerivedCharacteristic  $D$ , ElementIndex  $N$ , and ElementName  $X$ .
- 3 [Example: `tag::in` is a type such that `TAGGET(D, tag::in, N)` names a type with the following interface:

```

struct __input_getter {
 constexpr decltype(auto) in() & { return get<N>(static_cast<D&>(*this)); }
 constexpr decltype(auto) in() && { return get<N>(static_cast<D&&>(*this)); }
 constexpr decltype(auto) in() const & { return get<N>(static_cast<const D&>(*this)); }
};

```

— end example]

### 11.3 Non-modifying sequence operations

[alg.nonmodifying]

#### 11.3.1 All of

[alg.all\_of]

```

template <InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 bool all_of(I first, S last, Pred pred, Proj proj = Proj{});

template <InputRange Rng, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<Rng>, Proj>> Pred>
 bool all_of(Rng&& rng, Pred pred, Proj proj = Proj{});

```

- 1 *Returns:* true if `[first,last)` is empty or if `invoke(pred, invoke(proj, *i))` is true for every iterator  $i$  in the range `[first,last)`, and false otherwise.
- 2 *Complexity:* At most `last - first` applications of the predicate and `last - first` applications of the projection.

#### 11.3.2 Any of

[alg.any\_of]

```

template <InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 bool any_of(I first, S last, Pred pred, Proj proj = Proj{});

template <InputRange Rng, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<Rng>, Proj>> Pred>
 bool any_of(Rng&& rng, Pred pred, Proj proj = Proj{});

```

- 1 *Returns:* false if `[first,last)` is empty or if there is no iterator  $i$  in the range `[first,last)` such that `invoke(pred, invoke(proj, *i))` is true, and true otherwise.
- 2 *Complexity:* At most `last - first` applications of the predicate and `last - first` applications of the projection.

#### 11.3.3 None of

[alg.none\_of]

```

template <InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 bool none_of(I first, S last, Pred pred, Proj proj = Proj{});

template <InputRange Rng, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<Rng>, Proj>> Pred>
 bool none_of(Rng&& rng, Pred pred, Proj proj = Proj{});

```

- 1 *Returns:* true if `[first,last)` is empty or if `invoke(pred, invoke(proj, *i))` is false for every iterator `i` in the range `[first,last)`, and false otherwise.
- 2 *Complexity:* At most `last - first` applications of the predicate and `last - first` applications of the projection.

#### 11.3.4 For each

[alg.foreach]

```
template <InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryInvocable<projected<I, Proj>> Fun>
 tagged_pair<tag::in(I), tag::fun(Fun)>
 for_each(I first, S last, Fun f, Proj proj = Proj{});
```

```
template <InputRange Rng, class Proj = identity,
 IndirectUnaryInvocable<projected<iterator_t<Rng>, Proj>> Fun>
 tagged_pair<tag::in(safe_iterator_t<Rng>), tag::fun(Fun)>
 for_each(Rng&& rng, Fun f, Proj proj = Proj{});
```

- 1 *Effects:* Calls `invoke(f, invoke(proj, *i))` for every iterator `i` in the range `[first,last)`, starting from `first` and proceeding to `last - 1`. [Note: If the result of `invoke(proj, *i)` is a mutable reference, `f` may apply nonconstant functions. — end note]
- 2 *Returns:* `{last, std::move(f)}`.
- 3 *Complexity:* Applies `f` and `proj` exactly `last - first` times.
- 4 *Remarks:* If `f` returns a result, the result is ignored.
- 5 [Note: The requirements of this algorithm are more strict than those specified in ISO/IEC 14882:2014 §25.2.4. This algorithm requires `Fun` to satisfy `CopyConstructible`, whereas the algorithm in the C++ Standard requires only `MoveConstructible`. — end note]

#### 11.3.5 Find

[alg.find]

```
template <InputIterator I, Sentinel<I> S, class T, class Proj = identity>
 requires IndirectRelation<equal_to<>, projected<I, Proj>, const T*>
 I find(I first, S last, const T& value, Proj proj = Proj{});
```

```
template <InputRange Rng, class T, class Proj = identity>
 requires IndirectRelation<equal_to<>, projected<iterator_t<Rng>, Proj>, const T*>
 safe_iterator_t<Rng>
 find(Rng&& rng, const T& value, Proj proj = Proj{});
```

```
template <InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 I find_if(I first, S last, Pred pred, Proj proj = Proj{});
```

```
template <InputRange Rng, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<Rng>, Proj>> Pred>
 safe_iterator_t<Rng>
 find_if(Rng&& rng, Pred pred, Proj proj = Proj{});
```

```
template <InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 I find_if_not(I first, S last, Pred pred, Proj proj = Proj{});
```

```
template <InputRange Rng, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<Rng>, Proj>> Pred>
 safe_iterator_t<Rng>
 find_if_not(Rng&& rng, Pred pred, Proj proj = Proj{});
```

- 1 *Returns:* The first iterator `i` in the range `[first,last)` for which the following corresponding conditions hold: `invoke(proj, *i) == value`, `invoke(pred, invoke(proj, *i)) != false`, `invoke(pred, invoke(proj, *i)) == false`. Returns `last` if no such iterator is found.
- 2 *Complexity:* At most `last - first` applications of the corresponding predicate and projection.

## 11.3.6 Find end

[alg.find.end]

```

template <ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2,
 Sentinel<I2> S2, class Proj = identity,
 IndirectRelation<I2, projected<I1, Proj>> Pred = equal_to<>>
I1
 find_end(I1 first1, S1 last1, I2 first2, S2 last2,
 Pred pred = Pred{}, Proj proj = Proj{});

template <ForwardRange Rng1, ForwardRange Rng2,
 class Proj = identity,
 IndirectRelation<iterator_t<Rng2>,
 projected<iterator_t<Rng1>, Proj>> Pred = equal_to<>>
safe_iterator_t<Rng1>
 find_end(Rng1&& rng1, Rng2&& rng2, Pred pred = Pred{}, Proj proj = Proj{});

```

- 1 *Effects:* Finds a subsequence of equal values in a sequence.
- 2 *Returns:* The last iterator *i* in the range  $[first1, last1 - (last2 - first2))$  such that for every non-negative integer  $n < (last2 - first2)$ , the following condition holds: `invoke(pred, invoke(proj, *(i + n)), *(first2 + n)) != false`. Returns `last1` if  $[first2, last2)$  is empty or if no such iterator is found.
- 3 *Complexity:* At most  $(last2 - first2) * (last1 - first1 - (last2 - first2) + 1)$  applications of the corresponding predicate and projection.

## 11.3.7 Find first of

[alg.find.first.of]

```

template <InputIterator I1, Sentinel<I1> S1, ForwardIterator I2, Sentinel<I2> S2,
 class Proj1 = identity, class Proj2 = identity,
 IndirectRelation<projected<I1, Proj1>, projected<I2, Proj2>> Pred = equal_to<>>
I1
 find_first_of(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = Pred{},
 Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template <InputRange Rng1, ForwardRange Rng2, class Proj1 = identity,
 class Proj2 = identity,
 IndirectRelation<projected<iterator_t<Rng1>, Proj1>,
 projected<iterator_t<Rng2>, Proj2>> Pred = equal_to<>>
safe_iterator_t<Rng1>
 find_first_of(Rng1&& rng1, Rng2&& rng2, Pred pred = Pred{},
 Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

```

- 1 *Effects:* Finds an element that matches one of a set of values.
- 2 *Returns:* The first iterator *i* in the range  $[first1, last1)$  such that for some iterator *j* in the range  $[first2, last2)$  the following condition holds: `invoke(pred, invoke(proj1, *i), invoke(proj2, *j)) != false`. Returns `last1` if  $[first2, last2)$  is empty or if no such iterator is found.
- 3 *Complexity:* At most  $(last1 - first1) * (last2 - first2)$  applications of the corresponding predicate and the two projections.

## 11.3.8 Adjacent find

[alg.adjacent.find]

```

template <ForwardIterator I, Sentinel<I> S, class Proj = identity,
 IndirectRelation<projected<I, Proj>> Pred = equal_to<>>
I
 adjacent_find(I first, S last, Pred pred = Pred{},
 Proj proj = Proj{});

template <ForwardRange Rng, class Proj = identity,
 IndirectRelation<projected<iterator_t<Rng>, Proj>> Pred = equal_to<>>
safe_iterator_t<Rng>
 adjacent_find(Rng&& rng, Pred pred = Pred{}, Proj proj = Proj{});

```

- 1 *Returns:* The first iterator *i* such that both *i* and *i + 1* are in the range `[first,last)` for which the following corresponding condition holds: `invoke(pred, invoke(proj, *i), invoke(proj, *(i + 1))) != false`. Returns `last` if no such iterator is found.
- 2 *Complexity:* For a nonempty range, exactly `min((i - first) + 1, (last - first) - 1)` applications of the corresponding predicate, where *i* is `adjacent_find`'s return value, and no more than twice as many applications of the projection.

### 11.3.9 Count

[alg.count]

```
template <InputIterator I, Sentinel<I> S, class T, class Proj = identity>
requires IndirectRelation<equal_to<>, projected<I, Proj>, const T*>
difference_type_t<I>
count(I first, S last, const T& value, Proj proj = Proj{});
```

```
template <InputRange Rng, class T, class Proj = identity>
requires IndirectRelation<equal_to<>, projected<iterator_t<Rng>, Proj>, const T*>
difference_type_t<iterator_t<Rng>>
count(Rng&& rng, const T& value, Proj proj = Proj{});
```

```
template <InputIterator I, Sentinel<I> S, class Proj = identity,
IndirectUnaryPredicate<projected<I, Proj>> Pred>
difference_type_t<I>
count_if(I first, S last, Pred pred, Proj proj = Proj{});
```

```
template <InputRange Rng, class Proj = identity,
IndirectUnaryPredicate<projected<iterator_t<Rng>, Proj>> Pred>
difference_type_t<iterator_t<Rng>>
count_if(Rng&& rng, Pred pred, Proj proj = Proj{});
```

- 1 *Effects:* Returns the number of iterators *i* in the range `[first,last)` for which the following corresponding conditions hold: `invoke(proj, *i) == value`, `invoke(pred, invoke(proj, *i)) != false`.
- 2 *Complexity:* Exactly `last - first` applications of the corresponding predicate and projection.

### 11.3.10 Mismatch

[mismatch]

```
template <InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
class Proj1 = identity, class Proj2 = identity,
IndirectRelation<projected<I1, Proj1>, projected<I2, Proj2>> Pred = equal_to<>>
tagged_pair<tag::in1(I1), tag::in2(I2)>
mismatch(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = Pred{},
Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});
```

```
template <InputRange Rng1, InputRange Rng2,
class Proj1 = identity, class Proj2 = identity,
IndirectRelation<projected<iterator_t<Rng1>, Proj1>,
projected<iterator_t<Rng2>, Proj2>> Pred = equal_to<>>
tagged_pair<tag::in1(safe_iterator_t<Rng1>), tag::in2(safe_iterator_t<Rng2>>)
mismatch(Rng1&& rng1, Rng2&& rng2, Pred pred = Pred{},
Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});
```

- 1 *Returns:* A pair of iterators *i* and *j* such that `j == first2 + (i - first1)` and *i* is the first iterator in the range `[first1,last1)` for which the following corresponding conditions hold:
- (1.1) — *j* is in the range `[first2, last2)`.
- (1.2) — `*i != *(first2 + (i - first1))`
- (1.3) — `!invoke(pred, invoke(proj1, *i), invoke(proj2, *(first2 + (i - first1))))`
- Returns the pair `first1 + min(last1 - first1, last2 - first2)` and `first2 + min(last1 - first1, last2 - first2)` if such an iterator *i* is not found.
- 2 *Complexity:* At most `last1 - first1` applications of the corresponding predicate and both projections.

## 11.3.11 Equal

[alg.equal]

```

template <InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 class Pred = equal_to<>, class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
bool equal(I1 first1, S1 last1, I2 first2, S2 last2,
 Pred pred = Pred{},
 Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template <InputRange Rng1, InputRange Rng2, class Pred = equal_to<>,
 class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<iterator_t<Rng1>, iterator_t<Rng2>, Pred, Proj1, Proj2>
bool equal(Rng1&& rng1, Rng2&& rng2, Pred pred = Pred{},
 Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

```

1 *Returns:* If  $\text{last1} - \text{first1} \neq \text{last2} - \text{first2}$ , return false. Otherwise return true if for every iterator  $i$  in the range  $[\text{first1}, \text{last1})$  the following condition holds:  $\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, *i), \text{invoke}(\text{proj2}, *(first2 + (i - first1))))$ . Otherwise, returns false.

2 *Complexity:* No applications of the corresponding predicate and projections if:

- (2.1) — SizedSentinel<S1, I1> is satisfied, and
- (2.2) — SizedSentinel<S2, I2> is satisfied, and
- (2.3) —  $\text{last1} - \text{first1} \neq \text{last2} - \text{first2}$ .

Otherwise, at most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the corresponding predicate and projections.

## 11.3.12 Is permutation

[alg.is\_permutation]

```

template <ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2,
 Sentinel<I2> S2, class Pred = equal_to<>, class Proj1 = identity,
 class Proj2 = identity>
requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
bool is_permutation(I1 first1, S1 last1, I2 first2, S2 last2,
 Pred pred = Pred{},
 Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template <ForwardRange Rng1, ForwardRange Rng2, class Pred = equal_to<>,
 class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<iterator_t<Rng1>, iterator_t<Rng2>, Pred, Proj1, Proj2>
bool is_permutation(Rng1&& rng1, Rng2&& rng2, Pred pred = Pred{},
 Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

```

1 *Returns:* If  $\text{last1} - \text{first1} \neq \text{last2} - \text{first2}$ , return false. Otherwise return true if there exists a permutation of the elements in the range  $[\text{first2}, \text{first2} + (\text{last1} - \text{first1}))$ , beginning with I2 begin, such that  $\text{equal}(\text{first1}, \text{last1}, \text{begin}, \text{pred}, \text{proj1}, \text{proj2})$  returns true; otherwise, returns false.

2 *Complexity:* No applications of the corresponding predicate and projections if:

- (2.1) — SizedSentinel<S1, I1> is satisfied, and
- (2.2) — SizedSentinel<S2, I2> is satisfied, and
- (2.3) —  $\text{last1} - \text{first1} \neq \text{last2} - \text{first2}$ .

Otherwise, exactly  $\text{last1} - \text{first1}$  applications of the corresponding predicate and projections if  $\text{equal}(\text{first1}, \text{last1}, \text{first2}, \text{last2}, \text{pred}, \text{proj1}, \text{proj2})$  would return true; otherwise, at worst  $O(N^2)$ , where  $N$  has the value  $\text{last1} - \text{first1}$ .

## 11.3.13 Search

[alg.search]

```

template <ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2,
 Sentinel<I2> S2, class Pred = equal_to<>,
 class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>

```

```

I1
 search(I1 first1, S1 last1, I2 first2, S2 last2,
 Pred pred = Pred{},
 Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

```

```

template <ForwardRange Rng1, ForwardRange Rng2, class Pred = equal_to<>,
 class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<iterator_t<Rng1>, iterator_t<Rng2>, Pred, Proj1, Proj2>
safe_iterator_t<Rng1>
 search(Rng1&& rng1, Rng2&& rng2, Pred pred = Pred{},
 Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

```

1 *Effects:* Finds a subsequence of equal values in a sequence.

2 *Returns:* The first iterator *i* in the range `[first1, last1 - (last2 - first2))` such that for every non-negative integer *n* less than `last2 - first2` the following condition holds:

```

 invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n))) != false;

```

Returns `first1` if `[first2, last2)` is empty, otherwise returns `last1` if no such iterator is found.

3 *Complexity:* At most `(last1 - first1) * (last2 - first2)` applications of the corresponding predicate and projections.

```

template <ForwardIterator I, Sentinel<I> S, class T,
 class Pred = equal_to<>, class Proj = identity>
requires IndirectlyComparable<I, const T*, Pred, Proj>
I
 search_n(I first, S last, difference_type_t<I> count,
 const T& value, Pred pred = Pred{},
 Proj proj = Proj{});

template <ForwardRange Rng, class T, class Pred = equal_to<>,
 class Proj = identity>
requires IndirectlyComparable<iterator_t<Rng>, const T*, Pred, Proj>
safe_iterator_t<Rng>
 search_n(Rng&& rng, difference_type_t<iterator_t<Rng>> count,
 const T& value, Pred pred = Pred{}, Proj proj = Proj{});

```

4 *Effects:* Finds a subsequence of equal values in a sequence.

5 *Returns:* The first iterator *i* in the range `[first, last - count)` such that for every non-negative integer *n* less than `count` the following condition holds: `invoke(pred, invoke(proj, *(i + n)), value) != false`. Returns `last` if no such iterator is found.

6 *Complexity:* At most `last - first` applications of the corresponding predicate and projection.

## 11.4 Mutating sequence operations

[alg.modifying.operations]

### 11.4.1 Copy

[alg.copy]

```

template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O>
requires IndirectlyCopyable<I, O>
tagged_pair<tag::in(I), tag::out(O)>
 copy(I first, S last, O result);

template <InputRange Rng, WeaklyIncrementable O>
requires IndirectlyCopyable<iterator_t<Rng>, O>
tagged_pair<tag::in(safe_iterator_t<Rng>), tag::out(O)>
 copy(Rng&& rng, O result);

```

1 *Effects:* Copies elements in the range `[first, last)` into the range `[result, result + (last - first))` starting from `first` and proceeding to `last`. For each non-negative integer *n* < `(last - first)`, performs `*(result + n) = *(first + n)`.

2 *Returns:* `{last, result + (last - first)}`.

3 *Requires:* result shall not be in the range [first,last).

4 *Complexity:* Exactly last - first assignments.

```
template <InputIterator I, WeaklyIncrementable O>
requires IndirectlyCopyable<I, O>
tagged_pair<tag::in(I), tag::out(O)>
copy_n(I first, difference_type_t<I> n, O result);
```

5 *Effects:* For each non-negative integer  $i < n$ , performs  $*(result + i) = *(first + i)$ .

6 *Returns:* {first + n, result + n}.

7 *Complexity:* Exactly n assignments.

```
template <InputIterator I, Sentinel<I> S, WeaklyIncrementable O, class Proj = identity,
IndirectUnaryPredicate<projected<I, Proj>> Pred>
requires IndirectlyCopyable<I, O>
tagged_pair<tag::in(I), tag::out(O)>
copy_if(I first, S last, O result, Pred pred, Proj proj = Proj{});
```

```
template <InputRange Rng, WeaklyIncrementable O, class Proj = identity,
IndirectUnaryPredicate<projected<iterator_t<Rng>, Proj>> Pred>
requires IndirectlyCopyable<iterator_t<Rng>, O>
tagged_pair<tag::in(safe_iterator_t<Rng>), tag::out(O)>
copy_if(Rng&& rng, O result, Pred pred, Proj proj = Proj{});
```

8 Let  $N$  be the number of iterators  $i$  in the range [first,last) for which the condition `invoke(pred, invoke(proj, *i))` holds.

9 *Requires:* The ranges [first,last) and [result,result +  $N$ ) shall not overlap.

10 *Effects:* Copies all of the elements referred to by the iterator  $i$  in the range [first,last) for which `invoke(pred, invoke(proj, *i))` is true.

11 *Returns:* {last, result +  $N$ }.

12 *Complexity:* Exactly last - first applications of the corresponding predicate and projection.

13 *Remarks:* Stable (ISO/IEC 14882:2014 §17.6.5.7).

```
template <BidirectionalIterator I1, Sentinel<I1> S1, BidirectionalIterator I2>
requires IndirectlyCopyable<I1, I2>
tagged_pair<tag::in(I1), tag::out(I2)>
copy_backward(I1 first, S1 last, I2 result);
```

```
template <BidirectionalRange Rng, BidirectionalIterator I>
requires IndirectlyCopyable<iterator_t<Rng>, I>
tagged_pair<tag::in(safe_iterator_t<Rng>), tag::out(I)>
copy_backward(Rng&& rng, I result);
```

14 *Effects:* Copies elements in the range [first,last) into the range [result - (last-first),result) starting from last - 1 and proceeding to first.<sup>5</sup> For each positive integer  $n \leq (last - first)$ , performs  $*(result - n) = *(last - n)$ .

15 *Requires:* result shall not be in the range (first,last].

16 *Returns:* {last, result - (last - first)}.

17 *Complexity:* Exactly last - first assignments.

5) `copy_backward` should be used instead of `copy` when last is in the range [result - (last - first),result).

### 11.4.2 Move

[alg.move]

```
template <InputIterator I, Sentinel<I> S, WeaklyIncrementable O>
requires IndirectlyMovable<I, O>
tagged_pair<tag::in(I), tag::out(O)>
move(I first, S last, O result);
```

```
template <InputRange Rng, WeaklyIncrementable O>
requires IndirectlyMovable<iterator_t<Rng>, O>
tagged_pair<tag::in(safe_iterator_t<Rng>), tag::out(O)>
move(Rng&& rng, O result);
```

- 1 *Effects:* Moves elements in the range `[first,last)` into the range `[result,result + (last - first)`  
)`]` starting from `first` and proceeding to `last`. For each non-negative integer `n < (last-first)`, performs  
`*(result + n) = ranges::iter_move(first + n)`.
- 2 *Returns:* `{last, result + (last - first)}`.
- 3 *Requires:* `result` shall not be in the range `[first,last)`.
- 4 *Complexity:* Exactly `last - first` move assignments.

```
template <BidirectionalIterator I1, Sentinel<I1> S1, BidirectionalIterator I2>
requires IndirectlyMovable<I1, I2>
tagged_pair<tag::in(I1), tag::out(I2)>
move_backward(I1 first, S1 last, I2 result);
```

```
template <BidirectionalRange Rng, BidirectionalIterator I>
requires IndirectlyMovable<iterator_t<Rng>, I>
tagged_pair<tag::in(safe_iterator_t<Rng>), tag::out(I)>
move_backward(Rng&& rng, I result);
```

- 5 *Effects:* Moves elements in the range `[first,last)` into the range `[result - (last-first),result)`  
starting from `last - 1` and proceeding to `first`.<sup>6</sup> For each positive integer `n <= (last - first)`,  
performs `*(result - n) = ranges::iter_move(last - n)`.
- 6 *Requires:* `result` shall not be in the range `(first,last]`.
- 7 *Returns:* `{last, result - (last - first)}`.
- 8 *Complexity:* Exactly `last - first` assignments.

### 11.4.3 swap

[alg.swap]

```
template <ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2, Sentinel<I2> S2>
requires IndirectlySwappable<I1, I2>
tagged_pair<tag::in1(I1), tag::in2(I2)>
swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
```

```
template <ForwardRange Rng1, ForwardRange Rng2>
requires IndirectlySwappable<iterator_t<Rng1>, iterator_t<Rng2>>
tagged_pair<tag::in1(safe_iterator_t<Rng1>), tag::in2(safe_iterator_t<Rng2>)>
swap_ranges(Rng1&& rng1, Rng2&& rng2);
```

- 1 *Effects:* For each non-negative integer `n < min(last1 - first1, last2 - first2)` performs:  
`ranges::iter_swap(first1 + n, first2 + n)`.
- 2 *Requires:* The two ranges `[first1,last1)` and `[first2,last2)` shall not overlap. `*(first1 + n)`  
shall be swappable with `*(first2 + n)`.
- 3 *Returns:* `{first1 + n, first2 + n}`, where `n` is `min(last1 - first1, last2 - first2)`.
- 4 *Complexity:* Exactly `min(last1 - first1, last2 - first2)` swaps.

<sup>6</sup>) `move_backward` should be used instead of `move` when `last` is in the range `[result - (last - first),result)`.

## 11.4.4 Transform

[alg.transform]

```

template <InputIterator I, Sentinel<I> S, WeaklyIncrementable O,
 CopyConstructible F, class Proj = identity>
requires Writable<O, indirect_result_of_t<F&(projected<I, Proj>)>>
tagged_pair<tag::in(I), tag::out(O)>
transform(I first, S last, O result, F op, Proj proj = Proj{});

template <InputRange Rng, WeaklyIncrementable O, CopyConstructible F,
 class Proj = identity>
requires Writable<O, indirect_result_of_t<F&(
 projected<iterator_t<Rng>, Proj>)>>
tagged_pair<tag::in(safe_iterator_t<Rng>), tag::out(O)>
transform(Rng&& rng, O result, F op, Proj proj = Proj{});

template <InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 WeaklyIncrementable O, CopyConstructible F, class Proj1 = identity,
 class Proj2 = identity>
requires Writable<O, indirect_result_of_t<F&(projected<I1, Proj1>,
 projected<I2, Proj2>)>>
tagged_tuple<tag::in1(I1), tag::in2(I2), tag::out(O)>
transform(I1 first1, S1 last1, I2 first2, S2 last2, O result,
 F binary_op, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template <InputRange Rng1, InputRange Rng2, WeaklyIncrementable O,
 CopyConstructible F, class Proj1 = identity, class Proj2 = identity>
requires Writable<O, indirect_result_of_t<F&(
 projected<iterator_t<Rng1>, Proj1>, projected<iterator_t<Rng2>, Proj2>)>>
tagged_tuple<tag::in1(safe_iterator_t<Rng1>),
 tag::in2(safe_iterator_t<Rng2>),
 tag::out(O)>
transform(Rng1&& rng1, Rng2&& rng2, O result,
 F binary_op, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

```

- 1 Let  $N$  be  $(\text{last1} - \text{first1})$  for unary transforms, or  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  for binary transforms.
- 2 *Effects:* Assigns through every iterator  $i$  in the range  $[\text{result}, \text{result} + N)$  a new corresponding value equal to  $\text{invoke}(\text{op}, \text{invoke}(\text{proj}, *(\text{first1} + (i - \text{result}))))$  or  $\text{invoke}(\text{binary\_op}, \text{invoke}(\text{proj1}, *(\text{first1} + (i - \text{result}))), \text{invoke}(\text{proj2}, *(\text{first2} + (i - \text{result}))))$ .
- 3 *Requires:*  $\text{op}$  and  $\text{binary\_op}$  shall not invalidate iterators or subranges, or modify elements in the ranges  $[\text{first1}, \text{first1} + N]$ ,  $[\text{first2}, \text{first2} + N]$ , and  $[\text{result}, \text{result} + N]$ .<sup>7</sup>
- 4 *Returns:*  $\{\text{first1} + N, \text{result} + N\}$  or  $\text{make\_tagged\_tuple}<\text{tag::in1}, \text{tag::in2}, \text{tag::out}>(\text{first1} + N, \text{first2} + N, \text{result} + N)$ .
- 5 *Complexity:* Exactly  $N$  applications of  $\text{op}$  or  $\text{binary\_op}$  and the corresponding projection(s).
- 6 *Remarks:*  $\text{result}$  may be equal to  $\text{first1}$  in case of unary transform, or to  $\text{first1}$  or  $\text{first2}$  in case of binary transform.

## 11.4.5 Replace

[alg.replace]

```

template <InputIterator I, Sentinel<I> S, class T1, class T2, class Proj = identity>
requires Writable<I, const T2&> &&
IndirectRelation<equal_to<>, projected<I, Proj>, const T1*>
I
replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = Proj{});

template <InputRange Rng, class T1, class T2, class Proj = identity>
requires Writable<iterator_t<Rng>, const T2&> &&
IndirectRelation<equal_to<>, projected<iterator_t<Rng>, Proj>, const T1*>
safe_iterator_t<Rng>
replace(Rng&& rng, const T1& old_value, const T2& new_value, Proj proj = Proj{});

```

7) The use of fully closed ranges is intentional.
