Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information](#)

The committee responsible for this document is ISO/TC 60, *Gears*, Subcommittee SC 1, *Nomenclature and wormgearing*.

This second edition cancels and replaces the first edition (ISO/TR 10828:1997), which has been technically revised.

This edition includes the formulation for the geometrical dimensions of the worm and worm wheel, and that for the determination of gear mesh geometry (path of contact, zone and lines of contact) with the details to determine the non-dimensional parameters used to apply load capacity calculations (radius of curvature, sliding velocities).

Introduction

Thread forms of the worms of worm gear pairs are commonly related to the following machining processes:

- the type of machining process (turning, milling, grinding);
- the shapes of edges or surfaces of the cutting tools used;
- the tool position relative to an axial plane of the worm;
- where relevant, the diameters of disc type tools (grinding wheel diameter).

This Technical Report introduces all the aspects concerning the gear mesh geometry to define conjugate worm wheel, path of contact, lines of contact and other associated geometrical characteristics.

Worm gears — Worm profiles and gear mesh geometry

1 Scope

In this Technical Report, thread profiles of the five most common types of worms at the date of publication are described and formulae of their axial profiles are given.

The five worm types covered in this technical report are designated by the letters A, C, I, K and N.

The formulae to calculate the path of contact, the conjugate profile of the worm wheel, the lines of contact, the radius of curvature and the velocities at points of contact are provided. At the end the application of those formulae to calculate parameters used in load capacity calculations are provided.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 701, *International gear notations — Symbols for geometrical data*

ISO/TR 14521, *Worm gears — Load capacity of worm gears*

3 Symbols and abbreviated terms

For the purposes of this document, Tables 1 to 3 give the symbols the indices and the description.

Table 1 — Symbols for worm gears from Clause 4 of this document

Symbols	Description	Units	Figures	Formula number
A	distance from the worm axis to virtual point of the cutter (see ref.[1])	mm	Fig. A.4	
a	centre distance	mm	Fig. 3	41/42
a_0	refers to the worm/tool centre distance (length of the common perpendicular to the worm/tool axes)	mm	Fig. 18	54
a_1 to a_4	coefficient for A, I and N profile			
b_1	facewidth of worm	mm		24
b_{2H}	effective wheel facewidth	mm	Fig. 4	39
b_{2R}	wheel rim width	mm	Fig. 4	
c_1, c_2	tip clearance	mm		46/47

Symbols	Description	Units	Figures	Formula number
d_{a1}	worm tip diameter	mm		14
d_{a2}	worm wheel throat diameter	mm		35
d_{b1}	base diameter of involute helicoid (for I profile)	mm		22
d_{e2}	worm wheel outside diameter	mm		36
d_{f1}	worm root diameter	mm		15
d_{f2}	worm wheel root diameter	mm		34
d_{m1}	worm reference diameter	mm	Fig. 1/3	10
d_{m2}	worm wheel reference diameter	mm	Fig 2/3	25
d_{w1}	worm pitch diameter	mm		43
d_{w2}	worm wheel pitch diameter	mm	Fig 5	44
e_{mx1}	worm reference tooth space width in axial section	mm	Fig. 1	17
e_{n1}	worm normal tooth space width in normal section	mm		19
e_{m2}	worm wheel tooth space width in mid-plane section	mm		28
h_1	worm tooth depth	mm		11
h_2	worm wheel tooth depth	mm		32
h_{am1}	worm tooth reference addendum in axial section	mm	Fig. 3	12
h_{am2}	worm wheel tooth reference addendum in mid-plane section	mm	Fig. 3	30
h_{am1}^*	worm tooth reference addendum coefficient in axial section	-		
h_{am2}^*	worm wheel tooth reference addendum coefficient in mid-plane section	-		
h_{e2}	worm wheel tooth external addendum	mm		33
h_{fm1}	worm tooth reference dedendum in axial section	mm		13
h_{fm2}	worm wheel tooth reference dedendum in mid-plane section	mm		31
h_{fm1}^*	worm tooth reference dedendum coefficient in axial section	-		
h_{fm2}^*	worm wheel tooth reference dedendum coefficient in mid-plane section	-		
j_x	axial backlash	mm		
m_n	normal module	mm		9
m_{x1}	axial module	mm		2/G.1
p_{bn1}	normal pitch on base cylinder	mm		23
p_{n1}	normal pitch	mm		8
p_{t2}	transverse pitch	mm		26
p_{x1}	axial pitch	mm	Fig. 1	1
p_{z1}	lead (of worm)	mm		3
p_{zu1}	unit lead (lead of worm per radian)	mm/rad		4
q_1	diameter quotient	mm		5
r_{g2}	worm wheel throat form radius	mm		40

Symbols	Description	Units	Figures	Formula number
r_{b1}	base radius for involute profile	mm	Fig. A.4 and A.5	
r'_{b1}	base radius of a notional base circle	mm	Fig. A.4 and A.5	
r_t	radius at cusp	mm	Fig. 29	
s_{m2}	tooth thickness at the reference diameter of the worm wheel	mm	Fig. 2	27
s_K	rim thickness	mm	Fig. 12	
s_{mx1}	worm thread thickness in axial section	mm	Fig. 1	16
s_{mx1}^*	worm thread thickness in axial section coefficient	-		
s_{n1}	normal worm thread thickness in normal section	mm		18
u	gear ratio			45
x_2	worm wheel profile shift coefficient	-		29
z_1	number of threads in worm	-		
z_2	number of teeth in worm wheel	-		
α_{0n}	tool normal pressure angle	°		
α_{0t}	tool transverse pressure angle for A and I profiles	°	Fig. 7	
α_n	normal pressure angle	°		20
β_{m1}	reference helix angle of worm	°		7
γ_{m1}	reference lead angle of worm	°		6
γ_{b1}	base lead angle of worm thread (for I profile)	°	Fig. A.1	21
γ'_{b1}	base lead angle of the notional base helix	°	Fig. A.4 and A.5	
ρ_{Gm}	Radius of curvature of grinding wheel (C profile)			

In calculation, when a radius is derived, the symbol d for diameter shall be replaced by r for radius.

Table 2 — Subscripts for worm gears

Symbols	Description
0	cutting tool
1	worm
2	Wheel
G	grinding wheel

Table 3 — Coordinate of remarkable points

Symbols	Description
$x_G(y_G), y_G, \alpha_G(y_G)$	Coordinates of a point on the tool flank when the origin is at the point of intersection of the tool axis and the tool median plane, with the x-axis as the tool spindle axis and the

	abscissa on the trace of the median plane;
$x_x(y_r), y_x(y_r), \alpha_x(y_r)$	Coordinates of axial profile and axial pressure angle for A, I, N worm profiles
$x_x(y_G), y_x(y_G), \alpha_x(y_G)$	Coordinates of axial profile and axial pressure angle for K and C worm profiles
$x_D(y_p, D), y_D(y_p, D), \alpha_D(y_p, D)$	Coordinates of worm profile and pressure angle of worm profile in an offset plane
$x'_D(y_p, D), y_D(y_p, D), \alpha_D(y_p, D)$	Coordinates of worm profile and pressure angle of worm profile in an offset plane with origin on pitch axis
$x_{ID}(y_p, D), y_{ID}(y_p, D)$	Coordinates of path of contact in an offset plane with origin on pitch axis
$xR_D(y_p, D), yR_D(y_p, D)$	Coordinates of conjugate worm wheel profile of the worm in an offset plane with origin on worm wheel axis
$xT_D(r_{t2D}, D), yT_D(r_{t2D}, D)$	Coordinates of trochoid profile of the worm wheel profile in an offset plane with origin on worm wheel axis
$x_D(ycusp, D), y_D(ycusp, D)$	Coordinates of cusp point in an offset plane with origin on pitch axis
$C_{eq1D}(y_p, D)$	Curvature for the worm at a point in an offset plane
$C_{eq2D}(y_p, D)$	Curvature for the worm wheel at a point in an offset plane
$R_{eqD}(y_p, D)$	Equivalent radius of curvature in an offset plane
$r_{e2D}(D)$	outside radius of the worm wheel in the offset plane D
r_{t2D}	root radius of the worm wheel in the offset plane D
$\overline{M}_1(y_p, D)$	Coordinate of a point of contact for the worm (Eq 118)
$M_2(y_p, D)$	Coordinate of a point of contact for the worm wheel (Eq 119)
$\overline{TN1}_{cont}(y_p, D)$	Tangent unit vector to a line of contact (Eq 128)
$\overline{NormalNxy}(y_p, D)$	Normal unit vector to the lines of contact (Eq 114)
$\overline{NORMAL}(y_p, D)$	Normal unit vector to the lines of contact (Eq 116)
$Re_q(y_p, D)$	Radius of curvature along the line the contact (Eq 135)
$\vec{V}_1(y_p, D)$	Velocity of a point of the thread of the worm (Eq 138)
$\vec{V}_2(y_p, D)$	Velocity of a point of the tooth flank of the worm (Eq 140)
$V_{cDn}(y_p, D)$	Velocity at the contact point along the path of contact (Eq 150)
$V_{SUMn}(y_p, D)$	Sum of velocities at the point of contact (Eq 153) for method B in ISO/TR 14521

4 Formulae for calculation of dimensions

4.1 Parameters for a cylindrical worm

4.1.1 Axial pitch

$$p_{x1} = \pi \cdot m_{x1} \quad (1)$$

4.1.2 Axial module

$$m_{x1} = \frac{p_{x1}}{\pi} \quad (2)$$

4.1.3 Lead

$$p_{z1} = z_1 \cdot p_{x1} \quad (3)$$

4.1.4 Unit lead

$$p_{zu1} = \frac{p_{z1}}{2 \cdot \pi} \quad (4)$$

4.1.5 Diameter quotient

$$q_1 = \frac{d_{m1}}{m_{x1}} \quad (5)$$

4.1.6 Reference lead angle

$$\tan \gamma_{m1} = \frac{m_{x1} \cdot z_1}{d_{m1}} = \frac{z_1}{q_1} \quad (6)$$

4.1.7 Reference helix angle

$$\beta_{m1} = 90^\circ - \gamma_{m1} \quad (7)$$

4.1.8 Normal pitch on reference cylinder

$$p_{n1} = p_{x1} \cdot \cos \gamma_{m1} \quad (8)$$

4.1.9 Normal module

$$m_n = m_{x1} \cdot \cos \gamma_{m1} \quad (9)$$

4.1.10 Reference diameter

$$d_{m1} = q_1 \cdot m_{x1} \quad (10)$$

Figure 1 — Axial parameters for worm

4.1.11 Reference tooth depth

$$h_1 = h_{am1} + h_{fm1} = \frac{1}{2} \cdot (d_{a1} - d_{f1}) \quad (11)$$

4.1.12 Reference addendum

$$h_{am1} = h_{am1}^* \cdot m_{x1} = \frac{1}{2} \cdot (d_{a1} - d_{m1}) \quad (12)$$

where h_{am1}^* is the addendum coefficient; normally $h_{am1}^* = 1$

4.1.13 Reference dedendum

$$h_{fm1} = h_{fm1}^* \cdot m_{x1} = \frac{1}{2} \cdot (d_{m1} - d_{f1}) \quad (13)$$

where h_{fm1}^* = dedendum coefficient; generally $1,1 < h_{fm1}^* < 1,3$, the recommended value is 1,2

4.1.14 Tip diameter

$$d_{a1} = d_{m1} + 2 \cdot h_{am1} \quad (14)$$

4.1.15 Root diameter

$$d_{f1} = d_{m1} - 2 \cdot h_{fm1} \quad (15)$$

4.1.16 Thread thickness coefficient s_{mx1}^*

A recommended value is $s_{mx1}^* = 0,5$

In general practice, this coefficient is very often less than 0,5 when there is a wish to increase the worm wheel thread thickness to extend durability against wear of worm wheel.

See Figure 1.

4.1.17 Reference thread thickness in the axial section

$$s_{mx1} = s_{mx1}^* \cdot p_{x1} \quad (16)$$

4.1.18 Reference space width in the axial section

$$e_{mx1} = p_{x1} - s_{mx1} \quad (17)$$

4.1.19 Normal thread thickness

$$s_{n1} = s_{mx1} \cdot \cos \gamma_{m1} \quad (18)$$

4.1.20 Normal space width

$$e_{n1} = e_{mx1} \cdot \cos \gamma_{m1} \quad (19)$$

4.1.21 Profile flank form

It is specified by a letter:

A is the envelope of straight line in the axial section;

N is the envelope of straight line in the normal section of the space width;

I is the involute helicoid (the envelope of straight line in a plane tangent to the base cylinder);

K is a milled helicoid by double cone form;

C is a milled helicoid by circular convex form.

4.1.22 Normal pressure angle

For type-A

$$\tan \alpha_n = \tan \alpha_{0t} \cdot \cos \gamma_{m1} \quad (20)$$

For other type

$$\alpha_n = \alpha_{0n}$$

where α_{0n} is defined in 6.3, 6.4 and 6.5 for I and N and in 6.6 and 6.7 for K and C.

4.1.23 Base lead angle for I profile

$$\cos \gamma_{b1} = \cos \gamma_{m1} \cdot \cos \alpha_{0n} \quad (21)$$

4.1.24 Base diameter for I profile

$$d_{b1} = d_{m1} \cdot \frac{\tan \gamma_{m1}}{\tan \gamma_{b1}} = \frac{m_{x1} \cdot z_1}{\tan \gamma_{b1}} \quad (22)$$

NOTE For I profile if the root diameter is less than the base diameter attention should be taken in order that the diameter of start of active profile (SAP) is greater than d_{b1} .

4.1.25 Normal pitch on base cylinder

$$p_{bn1} = p_{x1} \cdot \cos \gamma_{b1} \quad (23)$$

4.1.26 Worm face width

$$b_1 \geq \sqrt{(d_{e2})^2 - (2 \cdot a - d_{a1})^2} \quad (24)$$

4.2 Parameters for a worm wheel

NOTE On Figure 2 the profile shift coefficient x_2 is negative.

Figure 2 — Parameters for worm wheel

4.2.1 Reference diameter

$$d_{m2} = d_{w2} + 2 \cdot x_2 \cdot m_{x1} \text{ or } d_{m2} = 2 \cdot a - d_{m1} \quad (25)$$

4.2.2 Transverse pitch

$$p_{t2} = p_{x1} \quad (26)$$

4.2.3 Transverse tooth thickness at reference diameter

This value can be calculated only for a worm wheel without profile shift as follows:

$$s_{m2} = e_{mx1} - j_x \quad (27)$$

where j_x = axial backlash.

See Figure 2.

4.2.4 Space width at reference diameter

This value can be calculated only for a worm wheel without profile shift as follows:

$$e_{m2} = p_{x1} - s_{m2} \quad (28)$$

4.2.5 Profile shift coefficient

$$x_2 = \frac{2 \cdot a - d_{m1} - m_{x1} \cdot z_2}{2 \cdot m_{x1}} \quad (29)$$

4.2.6 Addendum

$$h_{am2} = m_{x1} \cdot h_{am2}^* = \frac{1}{2} \cdot (d_{a2} - d_{m2}) \quad (30)$$

where h_{am2}^* is the addendum coefficient; $h_{am2}^* = 1$ (normally).

NOTE On both parts a) and b), the worm is the same. On part a) (left), the profile shift coefficient equal zero and on part b) (right) the profile shift coefficient is negative.

Key

1 symmetrical axis of the thread

Figure 3 — Pitch and reference diameters for worm gear set

4.2.7 Dedendum

$$h_{fm2} = m_{x1} \cdot h_{fm2}^* = \frac{1}{2} \cdot (d_{m2} - d_{f2}) \quad (31)$$

where h_{fm2}^* is the dedendum coefficient; generally $1,1 < h_{fm2}^* < 1,3$, the recommended value is 1,2.

4.2.8 Tooth depth

$$h_2 = h_{am2} + h_{fm2} \quad (32)$$

4.2.9 Outside addendum

$$h_{e2} = \frac{1}{2} \cdot (d_{e2} - d_{a2}) \quad (33)$$

Generally: $0,4 \leq \frac{h_{e2}}{m_{x1}} \leq 1,5$ Normally $h_{e2} / m_{x1} = 0,5$

4.2.10 Root diameter

$$d_{f2} = d_{m2} - 2h_{fm2} \quad (34)$$

4.2.11 Throat diameter

$$d_{a2} = d_{m2} + 2h_{am2} \quad (35)$$

4.2.12 Outside diameter

$$d_{e2} = d_{a2} + 2 \cdot h_{e2} \quad (36)$$

NOTE For min/max values see 4.2.9.

4.2.13 Minimum and maximum outside diameter

Generally

$$d_{e2min} = d_{a2} + 0,8 \cdot m_{x1} \quad (37)$$

$$d_{e2max} = d_{a2} + 3 \cdot m_{x1} \quad (38)$$

4.2.14 Worm wheel face width

$$b_{2H} \leq \sqrt{(2 \cdot a - d_{f2})^2 - (2 \cdot a - d_{e2})^2} \quad (39)$$

See Figure 4.

NOTE Case c) represents the geometrical conditions where b_{2H} reaches its maximum value.

Figure 4 — Worm wheel face width

4.2.15 Throat form radius

$$r_{g2} \geq a - \frac{d_{a2}}{2} \quad (40)$$

4.3 Meshing parameters

4.3.1 Centre distance

$$a = 0,5 \cdot (d_{m1} + d_{m2}) = 0,5 \cdot (d_{w1} + d_{w2}) \quad (41)$$

or

$$a = m_{x1} \cdot [0,5 \cdot (q_1 + z_2) + x_2] \quad (42)$$

See Figure 3.

4.3.2 Pitch diameter of worm wheel

$$d_{w2} = z_2 \cdot m_{x1} \quad (43)$$

4.3.3 Pitch diameter of worm

$$d_{w1} = 2 \cdot a - d_{w2} \quad (44)$$

4.3.4 Worm gear ratio

$$u = \frac{z_2}{z_1} \quad (45)$$

4.3.5 Contact ratio

The calculation of the contact ratio is defined in 10.6.

4.3.6 Tip clearance

$$c_1 = a - 0,5 \cdot (d_{a2} + d_{f1}) \quad (46)$$

$$c_2 = a - 0,5 \cdot (d_{a1} + d_{f2}) \quad (47)$$

5 Generalities on worm profiles

5.1 Definitions

Type A	straight sided axial profile;
Type C	concave axial profile formed by machining with a convex circular profile disc type cutter or grinding wheel;
Type I	involute helicoid, straight generatrix in base tangent planes;
Type N	straight profiles in normal plane of thread space helix;
Type K	milled helicoid generated by biconical grinding wheel or milling cutter, convex profiles in axial planes.

5.2 Conventions relative to the formulae of this document

5.2.1 The worm threads are right handed.

The formulae in this Technical Report define the coordinates of the left flank of the axial profile of worm, i.e. in the plane XOY of Figure 5.

To obtain the right flanks, it is necessary to draw a symmetric profile to the left flank relative to a perpendicular axis to the worm axis.

5.2.2 The worm and wheel pairs operate as speed reducing gears with directions of rotation as shown in Figure 5, thus the worm thread left flanks contact the wheel teeth. These are the flanks studied in this report.

5.2.3 The worm wheel is above the worm.

5.2.4 With the origin O, the reference axes X Y Z, are mutually perpendicular (see Figure 5):

- OX the worm axis coincides with the X axis;
- OY the common perpendicular to the worm and wheel axes coincides with the Y axis;

— OZ to complete the direct coordinate system.

A point is defined by its x, y, z coordinates. The following subscripts are used:

- x refers to the X-Y axial plane;
- D refers to an offset plane;
- n refers to the normal plane;
- t for any point refers to a transverse plane.

5.2.5 If the worm is driving, the worm gear set is a reducer. If the worm wheel is driving the worm gear set is an increaser.

Key

- | | | | |
|-----|---|-----|--|
| 1 | direction of rotation of the worm | (C) | pitch cylinder of the worm wheel – diameter d_{w2} |
| 2 | direction of rotation of the worm wheel | P | pitch plane of the worm – distance from the axis of the worm equal to $d_{w1}/2$ |
| (Δ) | pitch line | | |

NOTE For the clarity of drawing only one thread for worm is represented.

Figure 5 — Conventions used in formulae

6 Definition of profiles

6.1 Introduction

There are 2 types of worm profiles:

- profiles A, I, N are generated by a helical movement of a straight line in the space. The formulae of the axial profile are a direct function according to the radius of the worm. In that case gear mesh in an

offset plane uses two parameters: y_r which is the radius of the worm and D which is the distance of the offset plane

- profiles K and C are generated by a helical movement of a grinding wheel with a certain profile (see Figures 18) in the space. The generated flanks on the worm are the envelope of the grinding wheel. Each point of the worm profile is generated by a point of the grinding wheel. The formulae of the axial profile IS NOT a direct function according to the radius of the grinding wheel profile. In that case gear mesh in an offset plane uses two parameters: y_r which is the radius of the grinding wheel and D which is the distance of the offset plane. In those cases the calculations are more complex.

6.2 Type A

6.2.1 Geometrical definition

The thread flanks of type A are generated as envelopes of straight lines in axial planes which are inclined at a constant angle: $\frac{\pi}{2} - \alpha_{ot}$ to the axis (see Figure 6). This line as it is moved with simultaneous rotation about and translation along the axis X, defines the worm thread flank (Figure 6). The form of which is commonly described as an Archimedean helix.

Figure 6 — Profile A: Theoretical Generation

6.2.2 Machining methods

The straight generatrix is always crossing the worm axis; the flank of thread in an axial plane is always a straight line; so machining methods should ensure to generate this straight axial flank.

The threads may be cut on a lathe with a tool having straight edges, the cutting plane of which lies in an axial plane of the worm (Figure 7 a)).

Both flanks of a thread space may be machined simultaneously by using a tool of trapezoidal form.

Another method which is an inversion of the process of cutting a helical gear with a rack cutter, involves the use of an involute shaper to produce the desired rectilinear rack profile in an axial plane of the worm. The cutting face must lie in that axial plane (Figure 7 b)).

It is also necessary that the pitch circle of the shaper should roll without slip on the datum line of the rack profile. This coincides with a straight line generatrix of the worm pitch cylinder.

Figure 7 — Profile A - Machining Methods

Type A profile is a straight line in an axial plane.

The development of the formulae for the axial profile of type A worm is in Annex A, A.2.

6.3 Type I

6.3.1 Geometrical definition

A flank of a type I worm is an involute helicoidal surface. The form of which may be generated by a base tangent (Δ) to a helix (H), which moves along this - the base helix lying on the base cylinder of the worm, which is concentric with the worm axis (Figure 8).

A transverse profile (in a normal plane to the worm axis) of a flank is an involute to a circle.

**Key**

1 base cylinder of the worm

Figure 8 — Profile I - Theoretical generation

6.3.2 Machining methods

The straight generatrix is always tangential to the base helix in a plane which is tangential to the base cylinder, so the flank of the worm is a straight line in an offset plane which is tangential to the base cylinder. Machining methods should ensure this straight offset profile.

The involute helicoidal flanks of the threads can be generated by turning on a lathe using a knife tool with its straight edge aligned with the base tangent generatrix in a plane tangential to the base cylinder.

In order to machine both flanks of a thread simultaneously, it is necessary to set one left hand tool in one plane and one right hand tool in another plane as described after (Figure 9).

**Key**

- 1 base cylinder
- 2 cutting tool
- 3 generatrix

NOTE $\alpha_{0t} = \gamma_{b1}$

Figure 9 — Profile I - Machining method with a lathe

The worm flanks can be machined by milling or grinding using the plane side face of a disc type milling cutter or grinding wheel. The cutting face has to be aligned either

- with its axis parallel to the X-Z plane and the base tangent generatrix of the flank in the cutting face (Figure 10), or
- with the reference helix of the worm and in a plane perpendicular to the reference helix set to the normal pressure angle α_{0n} (Figure 11).

**Key**

- 1 base cylinder
- 2 grinding wheel (with flat active face)
- 3 action plane of the grinding wheel
- 4 generatrix
- P plane tangent to the base circle containing the generatrix

Figure 10 — Profile 1— Machining method by grinding (solution 1)

The latter method of alignment has the advantage that the cutting face extends to near the thread root whereas in order to do so by the previous method it will be necessary raise the cutter/grinding-wheel spindle so that the cutter/wheel periphery is tangential to the point of intersection of the base tangent generatrix with the root cylinder of the worm.

Both methods require that the mounting of the worm in the milling/grinding machine must be reversed between machining right and left flanks.

Figure 11 — Profile I - Machining method by grinding (solution 2)

Type I profile is slightly convex in an axial plane.

The development of the formulae for the axial profile of type I worm is in Annex A, A.3.

6.4 Type N

6.4.1 Geometrical definition

Each flank of a type N worm is formed by a straight line generatrix (Δ) which lies in a plane normal to the reference helix (H_1); crossing (M) which is a common point of intersection of a vector radius, the generatrix (Δ) and the reference helix H. The angle α between (Δ) and the radius vector at M point is constant.

The flank envelope is formed by the generatrix (Δ), due to the helicoidal movement of the vector radius carrying the point M which describes the reference helix (Figure 12).

Figure 12 — Profile N - Theoretical generation

6.4.2 Machining methods

The threads may be cut in a lathe with a tool having trapezoidal form having edges in the cutting plane which match the profile of the thread space in a plane normal to the reference helix of the thread space.

This is equivalent to placing the tool as for A type threads, then to rotate it around an axis matching its symmetrical axis up to an angle equal to the reference lead angle γ_{m1} (Figure 13).

Figure 13 — Profile N - Machining methods

Type N profiles are slightly concave in an axial plane.

The development of the formulae for the axial profile of type N worm is in Annex A, A.4.

6.5 General formulae for A, I and N profiles

6.5.1 General formula of axial profile for A, I, N profiles

The general formula of the axial profile of the worm for A, I, N profiles can be given by a single formula as follows, with x_x as the axial abscissa of the axial profile point function of the radius of the circle y_r at this point:

$$x_x(y_r) = a_1 \cdot \arctan\left(\frac{\sqrt{y_r^2 - a_2^2}}{a_2}\right) + a_3 \cdot \sqrt{y_r^2 - a_2^2} + a_4 \quad (48)$$

$$y_x(y_r) = y_r \quad (49)$$

The values for the coefficients are given in Table 4.

Table 4 — Coefficients a_1 to a_4 for A, I and N profiles

Coefficient	Profile		
	A Profile	I Profile	N Profile
a_1	$a_{1A} = 0$	$a_{1I} = -p_{zu1}$	$a_{1N} = p_{zu1}$
a_2	$a_{2A} = 0$	$a_{2I} = r_{bl}$	$a_{2N} = \frac{A \cdot \sin(\gamma_{m1}) \cdot \tan(\alpha_{0n})}{\sqrt{1 + (\sin(\gamma_{m1}) \cdot \tan(\alpha_{0n}))^2}}$ $A = r_{ml} - \frac{s_{mx1} \cdot \cos(\gamma_{m1})}{2 \cdot \tan(\alpha_{0n})}$
a_3	$a_{3A} = \frac{\tan(\alpha_{0n})}{\cos(\gamma_{m1})}$	$a_{3I} = \tan(\gamma_{b1})$	$a_{3N} = \frac{a_{2N}}{A \cdot \tan(\gamma_{m1})}$
a_4	0	0	0

In Formula (48), a_4 coefficient allows to translate the axial profile and to set up it at the correct position needed in the calculation.

To set up axial profile at the pitch point in the mid plane the a_4 coefficient has to be determined by the application of the general formula for the pitch radius r_{w1}

$$a_4 = -x_x(r_{w1}) = -a_1 \cdot \arctan\left(\frac{\sqrt{r_{w1}^2 - a_2^2}}{a_2}\right) - a_3 \cdot \sqrt{r_{w1}^2 - a_2^2} \quad (50)$$

In complement to the coordinate of the axial point it possible to define at this point the axial pressure angle at the y_r circle which is defined by the derivate of x_x function according to y_r :

$$dx_x(y_r) = \left(\frac{a_1 \cdot a_2}{y_r} + a_3 \cdot y_r \right) \frac{1}{\sqrt{y_r^2 - a_2^2}} \quad (51)$$

$$dy_x(y_r) = 1 \quad (52)$$

$$\tan \alpha_x(y_r) = \frac{dx_x(y_r)}{dy_x(y_r)} \quad (53)$$

6.6 Type K

6.6.1 Geometrical definition and method

Unlike those of types A, I and N, the thread flanks of type K worms do not have straight line generatrices. The thread spaces of type K worms are generated with a biconical grinding wheel or disc type milling cutter having straight cone generatrices (Figure 14).

The common perpendicular to the tool spindle and worm axes lies in the line (Δ) of intersection of the median plane (M) of the tool and a transverse plane of the worm (R). The angle between the two planes is equal to the worm reference lead angle of the worm γ_{m1} . The straight generatrix of each tool cone and the median plane of the tool forms an angle equal to the normal pressure angle α_{on} of the tool.

The worm is turned uniformly with simultaneous axial translation of threads so that a point on the common perpendicular, distant r_1 (r_1 : reference radius of worm) from the worm axis, describes the reference helix.

Figure 14 — Profile K - Machining method

The helicoidal flanks of the worm are generated by the conical sides of the tool and the profile form is influenced by the change of helix angle with change of thread height and points on the tool flanks which contact the worm threads lie on a curve and not on any one cone generatrix (Figure 15).

Key

1 grinding wheel

Figure 15 — Profile K - System of coordinates

Like type I profile, profile K is convex in axial planes.

The development of the formulae for the axial profile of grinding wheel for type K worm is in Annex B, B.1.

6.7 Type C

6.7.1 Geometrical definition

Unlike those of types A, I and N, the thread flanks of type C worms do not have straight line genatrices.

Like type K worms, the thread spaces of type C worms are generated with a grinding wheel or disc type milling cutter. In order to produce the concave thread profiles of type C worms, the tool has a cutting profile consisting of convex circular arcs. Figure 16 shows a tool and worm with the system of coordinates for the worm (x, y, z) and for the tool (x_G, y_G, z_G) .

The length of the line of centres a_0 (the common perpendicular to the worm and tool axes x_G and x) varies with the tool diameter. The angle between the projections of these axes (x, x_G) onto a plane perpendicular to the line of centres is usually equal to the reference lead angle of worm γ_{m1} . Figure 17 shows partially the tool. The 4 tool dimensions which determine the thread form of the worm are: the profile radius ρ_{Gm} , the mean radius R_{Gm} of the tool profile, the tool pressure angle α_{0n} and the tool thickness (equal to 2 times x_{Gm}).

The process of generating the worm C profiles is the same as for type K (see 6.6).

The thread flank profile form varies a little with a change of tool diameter.

However in contrast to type K thread profiles, type C thread profiles can be adjusted to compensate change of tool diameter by modifying the radius ρ_{Gm} and the angle α_{0n} of the tool.

Figure 16 — Profile C - System of coordinate

$\gamma_G = \gamma_{m1}$

Figure 17 a) — System of coordinate

Key

1 worm axis

Figure 17 b) — Axial section of the worm

Figure 17 — Profile C

Type C profile is concave in an axial plane.

The development of the formulae for the axial profile of grinding wheel for type C worm is in Annex B, B.2.

6.7.2 General formula for C and K profiles

For C and K profiles the parameter of the profile is the Y-circle radius y_G at a point on the profile of the grinding wheel which generates a point of the profile of the worm which has to be projected along its own helix in the axial plane of worm to obtain the axial profile point.

Key

1 worm axis

	K Profile	C Profile
Pressure angle at a point of axial profile of the grinding wheel	$\alpha_G(y_G) = \alpha_{0n}$	$\alpha_G(y_G) = \arcsin\left(\sin(\alpha_{0n}) - \frac{R_{Gm} - y_G}{\rho_{Gm}}\right)$
Abscissa at a point of axial profile of the grinding wheel	$x_G(y_G) = x_{Gm} - \tan(\alpha_{0n}) \cdot (y_G - R_{Ga})$	$x_G(y_G) = x_{Gm} + \rho_{Gm} \cdot (\cos(\alpha_G(y_G)) - \cos(\alpha_{0n}))$
Radius at a point of axial profile of the grinding wheel	y_G	y_G
		ρ_{Gm} : Radius of curvature of the grinding wheel

With:

Centre distance for grinding:

$$a_{0n} = R_{Ga} + \frac{d_{f1}}{2} \quad (54)$$

with R_{Ga} as the outside radius of the grinding wheel

Nominal radius of the grinding wheel:

$$R_{Gm} = a_{0n} - \frac{d_{m1}}{2} \quad (55)$$

$$x_{Gm} = \frac{(\pi \cdot m_{x1} - s_{mx1}) \cdot \cos(\gamma_{m1})}{2} \quad (56)$$

6.7.2.1 Formula for the point generated on the worm

The following formula shows the mesh condition of point G on the tool with a worm surface:

$$(c_1 \cdot \sin(\varepsilon_G(y_G)) + c_2(y_G)) + c_2(y_G) \cdot \cos(\varepsilon_G(y_G)) - c_3(y_G) = 0 \quad (57)$$

where $\varepsilon_G(y_G)$ is rotation angle of the tool:

$$c_1 = a_0 \cdot \cos(\gamma_{m1}) + p_{zu1} \cdot \sin(\gamma_{m1}) \quad (58)$$

$$c_2(y_G) = \sin(\gamma_{m1}) \cdot \left(x_G(y_G) - \frac{y_G}{\tan(\alpha_G(y_G))} \right) \quad (59)$$

$$c_3(y_G) = \left(-\frac{1}{\tan(\alpha_G(y_G))} \right) \cdot (a_0 \cdot \sin(\gamma_{m1}) - p_{zu1} \cdot \cos(\gamma_{m1})) \quad (60)$$

NOTE By default the inclination of the grinding wheel is equal to the lead angle.

From these formulae $\varepsilon_G(y_G)$ is calculated as follows:

$$\varepsilon_G(y_G) = \arcsin \left(\frac{c_3(y_G)}{\sqrt{c_1^2 + c_2(y_G)^2}} \right) - \arctan \left(\frac{c_2(y_G)}{c_1} \right) \quad (61)$$

Then the point on the worm surface generated by the point G is shown by the following formulae:

$$xc_{uw}(y_G) = x_G(y_G) \cdot \cos(\gamma_{m1}) - y_G \cdot \sin(\varepsilon_G(y_G)) \cdot \sin(\gamma_{m1}) \quad (62)$$

$$yc_{uw}(y_G) = a_0 - y_G \cdot \cos(\varepsilon_G(y_G)) \quad (63)$$

$$zc_{uw}(y_G) = -x_G(y_G) \cdot \sin(\gamma_{m1}) - y_G \cdot \cos(\gamma_{m1}) \cdot \sin(\varepsilon_G(y_G)) \quad (64)$$

6.7.2.2 Point of the worm surface in the axial plane

$$\phi_x(y_G) = \arctan\left(\frac{zc_{uw}(y_G)}{yc_{uw}(y_G)}\right) \quad (65)$$

$$x_x(y_G) = xc_{uw}(y_G) - p_{zu1} \cdot \phi_x(y_G) \quad (66)$$

$$y_x(y_G) = \frac{yc_{uw}(y_G)}{\cos(\phi_x(y_G))} \quad (67)$$

6.7.2.3 Pressure angle of the C/K profiles

6.7.2.3.1 First derivative of $c_2(y_G)$ et $c_3(y_G)$

$$dc_2(y_G) = \left(dx_G(y_G) + \frac{1}{dx_G(y_G)} - \frac{y_G}{dx_G(y_G)^2} \cdot d2x_G(y_G) \right) \cdot \sin(\gamma_{m1}) \quad (68)$$

$$dc_3(y_G) = \left(\frac{-a_0 \cdot \sin(\gamma_{m1}) + p_{zu1} \cdot \cos(\gamma_{m1})}{dx_G(y_G)^2} \cdot d2x_G(y_G) \right) \quad (69)$$

6.7.2.3.2 First derivative of $\varepsilon_G(y_G)$

$$d\varepsilon_G(y_G) = \frac{dc_3(y_G)}{(c_1^2 + c_2(y_G)^2 - c_3(y_G)^2)^{\frac{1}{2}}} - \frac{c_3(y_G) \cdot c_2(y_G) \cdot dc_2(y_G)}{(c_1^2 + c_2(y_G)^2) \cdot (c_1^2 + c_2(y_G)^2 - c_3(y_G)^2)^{\frac{1}{2}}} - \frac{dc_2(y_G) \cdot c_1}{c_1^2 + c_2(y_G)^2} \quad (70)$$

6.7.2.3.3 First derivative of point generated by the grinding wheel

$$dxc_{uw}(y_G) = dx_G(y_G) \cdot \cos(\gamma_{m1}) \cdot (\sin(\varepsilon_G(y_G)) + y_G \cdot \cos(\varepsilon_G(y_G)) \cdot d\varepsilon_G(y_G)) \cdot \sin(\gamma_{m1}) \quad (71)$$

$$dyc_{uw}(y_G) = -\cos(\varepsilon_G(y_G)) + y_G \cdot \sin(\varepsilon_G(y_G)) \cdot d\varepsilon_G(y_G) \quad (72)$$

$$dzc_{uw}(y_G) = -(dx_G(y_G) \cdot \sin(\gamma_{m1})) - [\sin(\varepsilon_G(y_G)) + y_G \cdot \cos(\varepsilon_G(y_G)) \cdot (d\varepsilon_G(y_G))] \cdot \cos(\gamma_{m1}) \quad (73)$$

6.7.2.3.4 First derivative of point generated by the grinding wheel projected in the axial plane of the worm

$$d\phi_x(y_G) = \frac{dzc_{uw}(y_G) \cdot yc_{uw}(y_G) - zc_{uw}(y_G) \cdot dyc_{uw}(y_G)}{yc_{uw}(y_G)^2 + zc_{uw}(y_G)^2} \quad (74)$$

$$dx_x(y_G) = dxc_{uw}(y_G) - p_{zu1} \cdot d\phi_x(y_G) \quad (75)$$

$$dy_x(y_G) = \frac{dyc_{uw}(y_G)}{\cos(\phi_x(y_G))} + \frac{yc_{uw}(y_G)}{\cos(\phi_x(y_G))^2} \cdot \sin(\phi_x(y_G)) \cdot d\phi_x(y_G) \quad (76)$$

6.7.2.3.5 Pressure angle of the C/K profiles in axial plane

$$\tan \alpha_x(y_G) = \frac{dx_x(y_G)}{dy_x(y_G)} \quad (77)$$

6.7.2.3.6 Derivative of pressure angle of the C/K profiles

$$d \tan \alpha_x(y_G) = \frac{d^2 x_x(y_G)}{d y_x(y_G)} - \frac{d x_x(y_G) \cdot d^2 x_x(y_G)}{d y_x(y_G)^2} \quad (78)$$

For the calculation of second derivative of x_x, y_x see Annex A for A, I, N profiles and Annex B for C and K profiles.

NOTE The previous formulae apply to any profile of disc type tool.

6.7.3 General formula of the axial profile

In the following of document the axial profile of the worm is considered with general formulae $x_x(y_p), y_x(y_p), \tan \alpha_x(y_p)$ as a function of a parameter y_p , with

- $y_p = y_r$, radius of the worm for A, I, N profiles, and
- and $y_p = y_G$ for radius of the worm for C and K profiles.

6.8 Algorithm to initialize the calculation

The first step is to initialize the calculation by the input of geometric parameters:

- of the worm: $z_1, \gamma_{m1}, m_{x1}, \alpha_n$, profile type, $d_{t1}, d_1, c_1^*, s_{mx1}^*$ and only for K profile R_{Ga} and C profile R_{Ga} , ρ_{Gm} ;
- of the worm wheel: $z_2, b_{2H}, x_2, c_1^*, c_2^*, d_{e2}$.

Note The worm gear mesh is split in an odd number of offset planes, N_{plane} , equally spaced by a value of $b_{2H}/(N_{plane} - 1)$. The Offset planes are noted D_i .

The algorithm has to be continued in 10.4.1.

7 Section planes

7.1 Introduction

The section planes are defined in Figure 19.

7.2 Axial plane

The axial plane is the plane containing the worm axis and the X and Y axes of the coordinate system (see plane X, Figure 19).

7.3 Offset plane

An offset plane is parallel to the X-Y plane at an offset D (Z axis) (see plane D, Figure 19).

A point in the offset plane is determined by the point of intersection with that plane of the helix through a reference point x, y, in X-Y plane.

7.4 Transverse plane

A transverse plane is a plane which is perpendicular to the axis of the worm (see plane R, Figure 19).

7.5 Normal plane

A normal plane is defined as a plane which is perpendicular to the reference helix crossing the symmetric axes of the complete axial profile (left and right flank) (see plane N, Figure 19).

Figure 19 — Section planes

7.6 Point of the worm surface in an offset plane: offset profile of worm

By definition the worm wheel is conjugate to the worm. The profile of the worm is defined in an axial plane, and it is projected in offset planes (Figure 20) in order to study the gear mesh of the worm gear set.

The distance between the axial plane of the worm and an offset plane is defined by distance D . D can be positive or negative along Z axis.

The coordinates of point (M_d) in an offset plane and on the helix curve, which pass the point (M_x) in the plane, are shown as follows:

**Key**

- 1 axial plane (O, X, Y)
- 2 offset plane

Figure 20 — Relationship between axial profile and the profile in an offset plane

For a given axial point of worm surface, the corresponding point x_D and y_D on the same helix in an offset plane D , is obtained with the angle δ_D in the transverse plane (Y,Z).

$$\delta_D(y_p, D) = \arcsin\left(\frac{D}{y_x(y_p)}\right) \quad (79)$$

$$x_D(y_p, D) = x_x(y_p) + p_{zu1} \cdot \delta_D(y_p, D) \quad (80)$$

$$y_D(y_p, D) = y_x(y_p) \cdot \cos(\delta_D(y_p, D)) \quad (81)$$

First derivatives of rack Profile formula:

With the derivatives according to y_p :

$$d\delta_D(y_p, D) = \frac{-D}{y_x(y_p)} \cdot \frac{dy_x(y_p)}{\sqrt{y_x(y_p)^2 - D^2}} \quad (82)$$

$$dx_D(y_p, D) = dx_x(y_p) + p_{zu1} \cdot d\delta_D(y_p, D) \quad (83)$$

$$dy_D(y_p, D) = dy_x(y_p) \cdot \cos(\delta_D(y_p, D)) - y_x(y_p) \cdot \sin(\delta_D(y_p, D)) \cdot d\delta_D(y_p, D) \quad (84)$$

And it results the pressure angle of the axial projected point is:

$$\tan \alpha_D(y_p, D) = \frac{dx_D(y_p, D)}{dy_D(y_p, D)} \quad (85)$$

8 Pitch surfaces

To study worm gear geometry the first step is to define the main parameters of the worm gear set (see Clause 4), and to select the type of the worm profile:

- For the worm:
 - number of threads on worm;
 - diameter quotient;
 - axial module;
 - normal pressure angle;
 - thread thickness;
 - rotational speed of the worm (rpm);
 - worm profile;
 - outside diameter of the grinding wheel for K and C profile;
 - radius of curvature of the grinding wheel for C profile.
- For the worm wheel:
 - number of teeth on worm wheel;
 - profile shift coefficient;
 - face width of worm wheel;
 - outside addendum coefficient;
 - bottom clearance coefficient;
- In complement addendum and dedendum coefficients can be defined if they are not equal to proposed values of Clause 4.

**Key**

- 1 worm wheel
- 2 pitch circle in the offset plane
- 3 pitch plane
- 4 worm

NOTE Definition of axes (by default a right hand driving worm is considered).

Figure 21 — Definition of pitch surfaces

The axis to study the gear mesh (Figure 21) are (0, X, Y, Z), with OX as the axis of the worm, OY along the centre line in the mid plane of the worm wheel. The Z axis is used to define the distance D of each offset plane according to the mid plane.

Right hand worm threads are considered, as the worm is driving and the worm wheel driven.

The pitch surface of the worm is a plane parallel to the axis of the worm and the axis of the wheel with a distance to the axis of the worm equal to the half of pitch diameter $d_{w1}/2$ (see 4.3.3).

The pitch cylinder of the worm wheel is defined with the pitch diameter d_{w2} (see 4.3.2).

The pitch cylinder of the wheel is rolling without sliding on the pitch plane of the worm.

The common tangent between the 2 pitch surfaces is called pitch axis; it is also the instantaneous axis of rotation.

9 Conjugate worm wheel profile

9.1 Introduction

For all the calculations in Clauses 9 to 15 the origin of the abscissa of the profile in an offset plane D has to be defined on the pitch line (see Clause 8) with the following transformation:

$$r_{wD} = \sqrt{D^2 + \left(\frac{d_{w1}}{2}\right)^2} \quad (86)$$

$$\delta_{DI}(D) = \delta_D(r_{wD}, D) = \arcsin\left(\frac{D}{y_x(r_{wD})}\right) \quad (87)$$

$$\Delta x_D(D) = x_x(r_{wD}) + p_{zu1} \cdot \delta_{DI}(D) \quad (88)$$

As the projection of the axial plane in an offset plane is done along the helix, consequently each offset profile, obtained with formulae 70 to 81, has to be translated by a value $\Delta x_D(D)$ in order that each offset profile crosses the pitch axis (see end of Clause 8). This is necessary for the following calculations to determine the values defined in Clauses 9 and 10.

This translation is given by:

$$x'_D(y_P, D) = x_D(y_P, D) - \Delta x_D(D) \quad (89)$$

9.2 Path of contact

The path of contact in an offset plane is the line along which the contact point between the flank of the worm and the conjugate flank of the worm wheel is moving during the gear mesh. The coordinate of the path of contact is defined in Figure 22 and the followings formulae:

**Key**

- (P1) profile of worm wheel
 (P2) profile of worm
 (L) path of contact
 (PL) pitch line of worm

Figure 22 — Path of contact in offset plane D

$$y_{ID}(y_p, D) = y_D(y_p, D) - \frac{d_{w1}}{2} \quad (90)$$

$$x_{ID}(y_p, D) = -\frac{y_{ID}(y_p, D)}{\tan \alpha_D(y_p, D)} \quad (91)$$

**Key**

- 1 point of contact n°1
 2 point of contact n°2
 (ED) external diameter
 (PL) pitch line

Figure 23 — Path of contact

When there is no singularity (see 9.6) in the gear mesh the active path of contact is limited:

- on one side by the outside diameter of the worm wheel to define the start of active profile (SAP), point A on Figure 23;
- on the other side by the active tip diameter of the worm (often equal to the outside diameter of the worm except if there is chamfering), point B on Figure 23.

For the calculation of point A and B see 10.3.

9.3 Worm wheel profile conjugate with worm profile

The worm wheel profile conjugate with the worm profile in an offset plane D is obtained in Figure 24 and the following formulae. Each point of the worm wheel profile is obtained from a point of the path of contact. The kinematic conditions of rolling without sliding of pitch surfaces allow projecting those points in circular coordinates of the wheel defined according to the centreline crossing the pitch point of the offset plane.

Circular coordinates:

$$r_{M2D}(y_p, D) = \sqrt{(r_{w2} - y_{ID}(y_p, D))^2 + x_{ID}(y_p, D)^2} \quad (92)$$

$$\varepsilon_D(y_p, D) = \frac{(x'_{ID}(y_p, D) - x'_{ID}(r_{wD}, D)) - x_{ID}(y_p, D)}{r_{w2}} \quad (93)$$

$$\theta_D(y_p, D) = \varepsilon_D(y_p, D) + \arctan\left(\frac{x_{ID}(y_p, D)}{r_{w2} - y_{ID}(y_p, D)}\right) \quad (94)$$

Cartesian coordinates with origin at the pitch point:

$$x_{RD}(y_p, D) = r_{M2D}(y_p, D) \cdot \sin(\theta_D(y_p, D)) \quad (95)$$

$$y_{RD}(y_p, D) = r_{w2} - r_{M2D}(y_p, D) \cdot \cos(\theta_D(y_p, D)) \quad (96)$$

The angular origin of the conjugate profile with worm is on axis O_{2l} crossing the pitch point (see Figure 24).

(PC) pitch circle of the worm wheel
(PL) pitch line of worm
(L) path of contact

The outside radius of the worm wheel in the OFF SET plane D is given by:

$$r_{e2D}(D) = \min \left[a - \sqrt{\left(\frac{d_{f1}}{2} + c_1 \right)^2 - D^2}, 0,5 \cdot d_{e2} \right] \quad (97)$$

In certain cases it is interesting to determine the point of the worm (for A, I, N profiles) or of the grinding wheel (for C and K profile) which has generated the point of the worm wheel in an offset plane r_{Wheel} . The algorithm is given in Annex C.

9.4 Trochoid (or fillet) at root of the worm wheel

The tip corner of the cutting tool, which generates the worm wheel, generates a fillet or trochoid at the root of the worm wheel tooth. The tip corner is defined in each offset plane by the coordinates (x_{a0D}, y_{a0D}) obtained by increasing the outside diameter of the worm by the value of the clearance at the root of the worm wheel teeth; this corresponds to the outside radius of the cutting tool r_{a0} . The principle for the profile of the worm in an offset plane D is obtained in Figure 25 and the following formulae. Here again the kinematic conditions of rolling without sliding of pitch surfaces allow for the projection of those points in circular coordinates of the wheel defined according to the centreline crossing the tip corner of the offset plane.

**Key**

- (PC) pitch circle of the worm wheel
- (PL) pitch line of worm
- (P₁), (P'₁) offset profile of equivalent cutting tool
- (TR) trochoid generated by tip corner of cutting tool

Figure 25 — Trochoid (or fillet) of the worm wheel teeth

Circular coordinates (r_{t2D} , θ_{t2D}): in the formulae the radius circle of the point of the fillet r_{t2D} is the parameter.

r_{t2D} has to be greater than the root radius of the worm wheel r_{r2D} given by:

$$r_{t2D} = a_w - \sqrt{r_{a0}^2 - D^2} \quad (98)$$

and:

$$\theta_{t2D} = \frac{x'_D(r_{a0}, D) - x'_D(r_{wD}, D)}{r_{w2}} - \arctan \left[\frac{\sqrt{r_{t2D}^2 - (r_{w2} - y_{1D}(r_{a0}, D))^2}}{r_{w2} - y_{1D}(r_{a0}, D)} \right] + \frac{\sqrt{r_{t2D}^2 - (r_{w2} - y_{1D}(r_{a0}, D))^2}}{r_{w2}} \quad (99)$$

Cartesian coordinates:

$$xT_D(r_{t2D}, D) = r_{t2D} \cdot \sin(\theta_{t2D}(r_{t2D}, D)) \quad (100)$$

$$yT_D(r_{t2D}, D) = r_{w2} - r_{t2D} \cdot \cos(\theta_{t2D}(r_{t2D}, D)) \quad (101)$$

The relations are obtained directly as a function of a radius of the circle crossing the point of the trochoid. In Formula (100 and 101) θ_{t2D} is determined with the same origin axis O_2I as the conjugate profile of the worm wheel (see 9.3).

This allows to calculate, for each offset plane, the form radius of the worm wheel r_{mD} which corresponds to the intersection of the trochoid and conjugate profile. This value is obtained when $\theta_{t2D} = \theta_D$ for $r_{t2D} = r_{m2D}$ (see Formulae (92), (94) and (99)).

9.5 Equivalent radius of curvature in an offset plane

To determine the equivalent radius of curvature the following process is used:

- 1) calculation of the radius of curvature of the worm at the point of contact. This calculation is made on the basis of analytical formula of the worm profile in each off set plane;
- 2) calculation of the radius of curvature of the conjugate profile of the worm wheel by using the EULER SAVARY method;
- 3) from those 2 values it is possible to calculate an equivalent radius of curvature.

9.5.1 Curvature for the worm at a point in an offset plane

It is given by the following formula resulting of general mathematical formulae for a curve in 2 dimensions:

$$C_{eq1D}(y_p, D) = \frac{\cos(\delta_D(y_p, D)) \cdot \frac{d \tan \alpha_D(y_G, D)}{d y_x(y_G)}}{\left[1 + \left(\frac{d x_D(y_p, D)}{d y_D(y_p, D)} \right)^2 \right]^{\frac{3}{2}}} = \frac{1}{\rho_1(y_p, D)} \quad (102)$$

9.5.2 Curvature for the worm wheel at a point in an offset plane

To determine the radius of curvature of the worm wheel, we are using EULER-SAVARY geometric construction (see Figure 26).

**Key**

- (P1) offset profile of worm
- (P2) worm wheel profile conjugate to the offset profile of worm
- (PC) pitch circle of the worm wheel
- (PL) pitch line of worm

Figure 26 — Radius of curvature in an offset plane

In an offset plane, at a point M of path of contact, the centre of curvature of the worm wheel profile resulting from the enveloping curve (envelope) of the worm profile, is the same as the centre of curvature O_2 of the trajectory of the centre of curvature O_1 of the worm profile.

$$C_{eq2D}(y_p, D) = \frac{1 - C_{eq1D}(y_p, D) \cdot \left(\frac{y_{1D}(y_p, D)}{\sin \alpha_D(y_p, D)} + r_{w2} \cdot \sin \alpha_D(y_p, D) \right)}{r_{w2} \cdot \sin \alpha_D(y_p, D) - \frac{y_{1D}(y_p, D)}{\sin \alpha_D(y_p, D)} \cdot \left(1 - \frac{y_{1D}(y_p, D) \cdot C_{eq1D}(y_p, D)}{\sin \alpha_D(y_p, D)} \right)} = \frac{1}{\rho_2(y_p, D)} \quad (103)$$

With:

$$\sin \alpha_D(y_p, D) = \sin(\arctan(\tan \alpha_D(y_p, D))) \quad (104)$$

9.5.3 Equivalent radius of curvature in an offset plane

It is given by:

$$R_{eqD}(y_p, D) = \frac{1}{C_{eq1D}(y_p, D) + C_{eq2D}(y_p, D)} \quad (105)$$

9.6 Singularities of worm gear mesh

9.6.1 Point of zero pressure angle

Key

(PL)	pitch line of worm
I	pitch point
(L)	path of contact
1	point of zero pressure angle
2	asymptote

Figure 27 — Point of zero pressure angle

It can be observed on Figure 27 that the presence of a point of an offset profile with zero pressure angle gives a very flat path of contact. It is said that there is an asymptotic direction above the point of zero pressure angle.

The calculation of the point of the worm in the offset plane with pressure angle equal to zero is only valid if $D > 0$.

It is based on the calculation of the point where $\tan \alpha_D(y_{nul}, D) = 0$ in each off set plane.

The algorithm is given in the table:

A, I, N Profiles	C and K profiles
<pre> y min ← max(D, a₂) y max ← r_{a1} ynul ← 0,5 · (y min+ y max) ZERO(D) := DO while tan α_D (ynul,D) > 0,0000001 y min ← ynul if tan α_D (ynul,D) < 0 y max ← ynul if tan α_D (ynul,D) > 0 ynul ← 0,5 · (y min+ y max) END DO return ynul </pre>	<pre> y min ← Rgrindw(R_{Gm}, m_{x1}, r_{a1}) y max ← Rgrindw(R_{Gm}, m_{x1}, D) ynul ← 0,5 · (y min+ y max) ZERO(D) := DO while tan α_D (ynul,D) > 0,0000001 y min ← ynul if tan α_D (ynul,D) > 0 y max ← ynul if tan α_D (ynul,D) < 0 ynul ← 0,5 · (y min+ y max) END DO return ynul </pre>

The coordinate of the point of zero pressure angle is obtained by calculation $x'_D(ynul, D)$ and $y_D(ynul, D)$ (Formulae (80) and (81)).

For the different offset planes (with $D > 0$) the points of zero pressure angle give the line of zero pressure angle.

For profile I the line of zero pressure angle is an horizontal line tangent to the cylinder base.

9.6.2 Loss of contact

The zero pressure angle gives a very flat path of contact which can give a limitation of the gear mesh (Figure 28).

This phenomenon can only appear for offset planes with $D > 0$ – This can be a limitation of the active face width of worm wheel.

Key

- 1 point of tangency: cusp
- 2 worm wheel profile
- (PL) pitch line of worm
- (L) path of contact
- I pitch point
- (P) offset profile of worm (rack profile)

Figure 29 — Cusp effect

This effect can appear when the path of contact is flat – C profile is more sensitive to this effect than other profile types. It produces a limitation of the contact ratio because the path of contact is limited to the points between A and T. The potential of contact between T and B is lost.

Calculation of the cusp point of the worm wheel in the offset plane is valid for all the face width of the worm wheel. It is based on the calculation of the minimum value of the radius of the conjugate worm wheel in each off set plane.

To obtain this minimum value we determined when the derivative of $R_{M2D}(y_p, D)$ according to y_p is equal to zero.

$$d R_{M2D}(y_p, D) = \frac{1}{R_{M2D}(y_p, D)} \cdot \left[- (a_w - y_D(y_p, D)) \cdot d y_D(y_p, D) \right] + \left(\frac{y_D(y_p, D) - r_{w1}}{\tan \alpha_D(y_p, D)} \right) \cdot \frac{1}{\tan \alpha_D(y_p, D)^2} \cdot \left[d y_D(y_p, D) \cdot \tan \alpha_D(y_p, D) - (y_D(y_p, D) - r_{w1}) \cdot (1 + \tan \alpha_D(y_p, D)) \right] \quad (106)$$

The algorithm is:

A, I, N Profiles	C and K profiles
<pre> y min ← r_{w1} y max ← 6r_{a1} ycusp ← 0,5 · (y min+ y max) ZERO(D) := DO while d R_{M2D}(ycusp, D) > 0,0000001 y min ← ycusp if d R_{M2D}(ycusp, D) < 0 y max ← ycusp if d R_{M2D}(ycusp, D) > 0 ycusp ← 0,5 · (y min+ y max) END DO return ycusp </pre>	<pre> y min ← Rgrindw(R_w, m_{x1}, r_{w1}) y max ← Rgrindw(R_w, m_{x1}, r_{a1} + 5R_w) ycusp ← 0,5 · (y min+ y max) ZERO(D) := DO while d R_{M2D}(ycusp, D) > 0,0000001 y min ← ycusp if d R_{M2D}(ycusp, D) > 0 y max ← ycusp if d R_{M2D}(ycusp, D) < 0 ycusp ← 0,5 · (y min+ y max) END DO return ycusp </pre>

The coordinate of the cusp is obtained by calculation $x_D(ycusp, D)$ and $y_D(ycusp, D)$ (Formulae (80) and (81)).

For the different offset planes the cusps give the line of cusp points (see Figure 30). This line has to be outside of the zone of contact otherwise it limits the maximum potential contact and reduces the load capacity.

At each point of cusp the equivalent radius of curvature is equal to zero the other reason to avoid this line in the zone of contact.

Key

- 1 line of cusp point
- 2 line of start of active profile points or start of zone of contact
- 3 line of zero pressure angle point

In **BLACK** it is the ROOT CYLINDER of the WORM.

In **BLUE** it is the OUTSIDE CYLINDER of the WORM.

In **GREEN** (continuous line) it is the limit given by the ROOT ACTIVE radius on the WORM. Normally the lines of contact are between that line and the outside circle of the worm in BLUE.

In **RED** (dashed line) it is the limit given by the CUSP. If this line is CROSSING the outside cylinder of the worm, there is a LIMITATION of gear mesh. For the point of contact closed to CUSP LINE the radius of curvature is closed to ZERO.

In **MAGENTA** (dashed dot line) it is the limit given by the ZERO PRESSURE ANGLE - When this line is near ROOT ACTIVE lines there is a LIMITATION of gear mesh.

Figure 30 — Cusp line, zero pressure angle line, active root line for worm

10 Geometry of contact

10.1 General

In fact the development of the formulae for the profile of the worm is function of 2 parameters y_p and D .

With the partial derivative according to these 2 parameters of the vector which define the coordinate vector of a point of the worm we are able to obtain 2 vectors of the tangential plane to the worm.

$$\overrightarrow{P(y_p, D)} = \begin{pmatrix} x_D(y_p, D) \\ y_D(y_p, D) \\ D \end{pmatrix} \quad (107)$$

10.2 Tangent plane at point of contact

With the derivation according to y_p :

$$\overrightarrow{T1(y_p, D)} = \begin{pmatrix} dx_D(y_p, D) \\ dy_D(y_p, D) \\ 0 \end{pmatrix} \quad (108)$$

And $TD1$ the normalised vector is:

$$\overrightarrow{TD1(y_p, D)} = \frac{\overrightarrow{T1(y_p, D)}}{|\overrightarrow{T1(y_p, D)}|} \quad (109)$$

With the derivation according to D :

$$dDx_D(y_p, D) = \frac{p_{zu1}}{\cos(\delta_D(y_p, D))} \cdot y_x(y_p) \quad (110)$$

$$dDy_D(y_p, D) = -\tan(\delta_D(y_p, D)) \quad (111)$$

$$\overrightarrow{T2(y_p, D)} = \begin{pmatrix} dDx_D(y_p, D) \\ dDy_D(y_p, D) \\ 1 \end{pmatrix} \quad (112)$$

And $TD2$, the normalised vector is:

$$\overrightarrow{TD2(y_p, D)} = \frac{\overrightarrow{T2(y_p, D)}}{|\overrightarrow{T2(y_p, D)}|} \quad (113)$$

10.3 Normal plane at point of contact

The unit normal vector to the point of contact: (orientation from the inside to the outside of the worm) is given by:

$$\overrightarrow{\text{NORMAL}(y_p, D)} = \frac{\overrightarrow{TD2(y_p, D)} \times \overrightarrow{TD1(y_p, D)}}{|\overrightarrow{TD2(y_p, D)} \times \overrightarrow{TD1(y_p, D)}|} \quad (114)$$

$$n_{Nxy}(y_p, D) = \sqrt{(\overrightarrow{\text{NORMAL}(y_p, D)})_1^2 + (\overrightarrow{\text{NORMAL}(y_p, D)})_2^2} \quad (115)$$

$$\overrightarrow{\text{Normal}N_{xy}(y_p, D)} = \begin{pmatrix} \frac{\text{NORMAL}(y_p, D)_1}{nN_{xy}(y_p, D)} \\ \frac{\text{NORMAL}(y_p, D)_2}{nN_{xy}(y_p, D)} \\ 0 \end{pmatrix} \quad (116)$$

NOTE $\overrightarrow{\text{Normal}N_{xy}(y_p, D)}$ is the common normal vector to conjugate profiles at the point of contact.

10.4 Zone of contact

The zone of contact is limited in each offset plane by the active radius at the root of the worm and the tip radius of the worm or the cusp radius when there is limited conjugate contact.

In the longitudinal direction (along the face width of the worm wheel) the limitation is the face width of the worm wheel, or the tip radius of the worm for important values of face width or the cusp curve when there is limited conjugate contact. See Figure 31.

The zone of contact is the surface defined by all the path of contact in the different offset planes. It is limited by the tip cylinder of the worm and the external surface of the worm wheel defined by the external cylinder and external throat surface.

In the case of chamfering, those limits are respectively the addendum active cylinder of the worm and the active tip line at the tip of the worm wheel teeth.

In case of cusp in the gear mesh the zone of contact is limited by the cusp.

In each offset plane it can be defined:

- The start of active profile for the worm by the intersection of the path of contact with the external diameter of the worm wheel in this plane (either defined by the external cylinder or the throat diameter of the worm wheel). The result is that the radius of SAP of the worm is defined by the closest point to the axis of the worm of all offset planes. See Figure 30.
- The start of active profile for the worm wheel (SAP worm wheel) by either the intersection of the path of contact with the external diameter of the worm in this plane or by the point of tangency CUSP if there is a cusp (see Figure 29). The result is that for the worm wheel there is a distinct SAP in each offset planes.

**Key**

- 1 worm
- 2 wheel
- 3 form circle
- 4 outside diameter
- 5 path contact
- 6 axis of worm
- 7 zone of contact
- 8 line of zero pressure angles

Figure 31 — Zone of contact

The lines of contact are moving on the surface limited by the zone of contact.

In each offset plane, the zone of contact (Figures 31, 34) is limited by the start of active profile (point A in Figure 23) and the end of active profile (point B in Figure 23) except if there is a cusp (point T of Figure 29). In the last case the zone of contact is truncated as in Figure 34.

This calculation has to be done for all offset planes. It is recommended to use between 30 and 80 offset planes uniformly distributed along the worm wheel face width.

Continuing from 6.8, the following algorithm can be executed **in each offset plane D_i** :

NOTE The zone of contact in an offset plane is delimited by the limit points as indicated in 10.4.

10.5 Lines of contact

A line of contact is composed of all the conjugate points between the flank of the worm and the conjugate flank of the worm wheel for a relative position of the worm gear set.

Several threads of the worm can be simultaneously in contact.

Key

- A, B, C₁ and C₂ instantaneous lines of contact
- 1 zone of contact
- 2 worm
- 3 wheel

Figure 32 — Zone of contact and Lines of contact for one relative position of worm and worm wheel (here 3 threads are in contact for this relative position)

Key

- A, B, C₁ and C₂ instantaneous lines of contact
- 1 zone of contact with path of contact in different offset planes
- 2 worm
- 3 worm wheel

Figure 33 — Path of contact, zone of contact and lines of contact for one relative position of worm and worm wheel

Key

2 offset planes

3 worm

4 worm wheel

5 path of contact

6 line of zero pressure angles

(PL) pitch line

Figure 34 — Path of contact, zone of contact and lines of contact for one relative position of worm and worm wheel

The formula of the lines of contact $F_{\text{cont}}(y_p, D) = 0$ is given by:

$$F_{\text{cont}}(y_p, D) = x'_D(y_p, D) \cdot \tan \alpha_D(y_p, D) + y_D(y_p, D) - r_{w1} \quad (117)$$

Coordinate of a point of contact: For this we consider only the point along the path of contact (in fact for a relative position between the worm and the worm wheel there are 1 or 3 points of contact).

For the worm (0M):

$$\overrightarrow{M_1(y_p, D)} = \begin{pmatrix} x_{1D}(y_p, D) \\ y_{1D}(y_p, D) \\ D \end{pmatrix} \quad (118)$$

For the worm wheel (O_2M):

$$\overrightarrow{M_2(y_p, D)} = \begin{pmatrix} x_{1D}(y_p, D) \\ -a_w + y_{1D}(y_p, D) \\ D \end{pmatrix} \quad (119)$$

The determination of lines of contact is made by the determination of points of contact.

First of all the relative position of the worm is set up by the parameter $\Delta x_D(D)$ of Formula (89). This value is setup in order to obtain the first line of contact tangent to the zone of contact (see Figure 35), this is the initial value $\Delta x_{Dinit}(D)$.

To determine the 1st line of contact, the calculation is made in all the offset planes used to determine the zone of contact. In each offset plane, the initial value of y_p to calculate $F_{cont}(y_p, D) = 0$ is initialized between the values obtained for the start of active profile (point A in Figure 23) and the end of active profile (point B in Figure 23) or the cusp (point T of Figure 29). So the point of contact is obtained easily.

To obtain the next line of contact, the value of $\Delta x_{Dinit}(D)$ is decreased by the axial pitch p_{x1} , and all the points of contact are determined in each offset plane. Continue with this operation until the position of the worm for which there is no more contact points, it means points of contact out of the zone of contact.

To study a second relative position of the worm and the worm wheel the initial value $\Delta x_{Dinit}(D)$ is decreased by a portion of the axial pitch p_{x1} , p_{x1}/n where n is an integer corresponding to the number of relative positions to study. (e.g. for 10 relative positions to study $n=10$) and the process is started again with this new initial value.

10.6 Contact ratio

In a worm gear the contact ratio is obtained by the ratio of the distance between the 2 positions of the worm defined when the first line of contact is tangent to the zone of contact and the last line of contact is tangent to the zone of contact see Figure 35, divided by the axial pitch.

Key

- A, B, C₁ and C₂ instantaneous line of contact
 1 last line in contact
 2 zone of contact
 3 first line in contact

Figure 35 — Contact ratio

10.7 Tangent vector to the line of contact

To determine the vector tangent to the line of contact, we have to consider the formula of the lines of contact $F_{\text{cont}}(y_p, D) = 0$.

The derivatives of $F_{\text{cont}}(y_p, D)$ have to be evaluated for the point the contact. It means that in the formulae $dyF_{\text{cont}}(y_p, D)$ and $dDF_{\text{cont}}(y_p, D)$, $x_D(y_p, D)$ has to be replaced by $x_{1D}(y_p, D)$ which satisfies the contact formula.

$$dyF_{\text{cont}}(y_p, D) = x_{1D}(y_p, D) \cdot d \tan \alpha_D(y_p, D) + dx_D(y_p, D) \cdot \tan \alpha_D(y_p, D) + dy_D(y_p, D) \quad (120)$$

$$dDF_{\text{cont}}(y_p, D) = x_{1D}(y_p, D) \cdot dD \tan \alpha_D(y_p, D) + dDx_D(y_p, D) \cdot \tan \alpha_D(y_p, D) + dDy_D(y_p, D) \quad (121)$$

With:

$$dD\delta_D(y_p, D) = \frac{1}{y_x(y_p) \cdot \cos(\delta_D(y_p, D))} \quad (122)$$

$$dD\delta_D(y_p, D) = -\sin(\delta_D(y_p, D)) \cdot \tan \alpha_x(y_p) \cdot dD\delta_D(y_p, D) - \frac{p_{zu1}}{y_x(y_p)^2} \quad (123)$$

This is obtained by considering the derivative of $F_{\text{cont}}(y_p, D)$ at the point of contact, and it gives the relation between D and y_p along the line the contact as the relation of partial derivatives.

$$dDym(y_p, D) = \frac{-dyFcont(y_p, D)}{dDFcont(y_p, D)} \quad (124)$$

To obtain the tangent vector to the lines of contact we have to take the total derivative according to y_p (or D)

$$\overrightarrow{Tcont}(y_p, D) = \begin{pmatrix} dx_D(y_p, D) + dDx_D(y_p, D) \cdot dDym(y_p, D) \\ dy_D(y_p, D) + dDy_D(y_p, D) \cdot dDym(y_p, D) \\ dDym(y_p, D) \end{pmatrix} \quad (125)$$

And the unit vector is:

$$\overrightarrow{TN}_{cont}(y_p, D) = \frac{\overrightarrow{Tcont}(y_p, D)}{|\overrightarrow{Tcont}(y_p, D)|} \quad (126)$$

Or:

$$\overrightarrow{Tcont1}(y_p, D) = \begin{pmatrix} dDx_D(y_p, D) + \frac{dx_D(y_p, D)}{dDym(y_p, D)} \\ dDy_D(y_p, D) + \frac{dy_D(y_p, D)}{dDym(y_p, D)} \\ 1 \end{pmatrix} \quad (127)$$

And the unit vector is:

$$\overrightarrow{TN1}_{cont}(y_p, D) = \frac{\overrightarrow{Tcont1}(y_p, D)}{|\overrightarrow{Tcont1}(y_p, D)|} \quad (128)$$

NOTE $\overrightarrow{T}_{cont}(y_p, D)$ and $\overrightarrow{Tcont1}(y_p, D)$ are identical.

10.8 Normal plane at point of contact

As the contact is linear along the lines of contact, according to EULER's theory on curvatures of surface, the direction tangent to line of contact is ONE of the principal directions of curvature.

The SECOND principal direction of curvature is normal to that ONE and can be obtain with the vector product between the tangent vector to the line of contact and the normal to the tangent plane of contact.

Those 3 vectors $[\overrightarrow{TN}_{cont}(y_p, D), \overrightarrow{NORMAL}(y_p, D), \overrightarrow{B}(y_p, D)]$ defines the trihedral of DARBOUX RIBAUCCOUR.

$$\overrightarrow{B}(y_p, D) = \overrightarrow{TN}_{cont}(y_p, D) \times \overrightarrow{NORMAL}(y_p, D) \quad (129)$$

10.9 Principal equivalent radius of curvature

For a point of contact, the equivalent of curvature reaches MIN and MAX values called PRINCIPAL RADIUS OF CURVATURE when we consider its projection in the MAIN PLANES.

In a point of contact, those MAIN PLANES are defined as follows:

- the MAX equivalent of curvature is always in the plane defined by the normal at the surface of the worm and the vector tangent to the instantaneous line of contact;
- the MIN equivalent of curvature is always in the plane defined by the normal at the surface of the worm and the vector normal to the instantaneous line of contact.

This equivalent radius of curvature in an offset plane (see 9.5) has to be projected in the 2 main planes of curvature, which are in this particular case

- a) the plane normal to the instantaneous line of contact between the flanks of worm and worm wheel, crossing the studied point of contact,
- b) the plane tangent to the instantaneous line of contact between the flanks of worm and worm wheel, crossing the studied point of contact, and
- c) in this last plane the curvature is zero because the contact is locally linear.

At each point of contact we can define in an offset plane 3 vectors as follows:

- a tangent vector to the worm and worm wheel profile

$$\overrightarrow{t_D}(y_p, D) = \begin{pmatrix} \sin \alpha_D(y_p, D) \\ \cos(\arctan(\tan \alpha_D(y_p, D))) \\ 0 \end{pmatrix} \quad (130)$$

- a normal vector to the worm and worm wheel profile

$$\overrightarrow{n_D}(y_p, D) = \begin{pmatrix} \cos(\arctan(\tan \alpha_D(y_p, D))) \\ -\sin \alpha_D(y_p, D) \\ 0 \end{pmatrix} \quad (131)$$

- a vector normal to the offset plane

$$\overrightarrow{b_D}(y_p, D) = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} \quad (132)$$

The radius of curvature is projected along the normal to the point of contact contained in the offset plane.

First of all we have to determine the radius of curvature projected along the normal to the common tangent plane of conjugate flanks at the contact point.

The angle of projection is obtained by the scalar product between the 2 normal vectors.

$$\text{Req1}(y_p, D) = \frac{\text{Req}_{xy}(y_p, D)}{\overrightarrow{\text{NORMAL}}(y_p, D) \cdot \overrightarrow{\text{Normal}}_{xy}(y_p, D)} \quad (133)$$

EULER's formula on the radius of curvature of a surface is applicable. It gives the curvature C , as a function of the 2 principal curvatures C' and C'' and the angle ζ to direction of the curvature C' and the curvature C . The relation which classifies C' and C'' is: $C'' < C'$.

$$\text{EULER's formula is: } C = C' \cdot \cos^2(\zeta) + C'' \cdot \sin^2(\zeta) \quad (134)$$

In our case, because the profiles are conjugate we have always $C''=0$ (The contact is linear and the radius of curvature along the line the contact is infinite or the curvature equal to zero).

$$\text{Re } q(y_p, D) = \text{Re } q_1(y_p, D) \cdot \left\| \overrightarrow{t_D(y_p, D)} \cdot \overrightarrow{B(y_p, D)} \right\|^2 \quad (135)$$

10.10 Calculation of path of contact and zone of contact

The following procedure has to be applied in each offset plane D

SAP points are the limit of the zone of contact.

For the worm it is possible to determine the minimum diameter for all SAP points (see 10.3).

10.11 Calculation of line of contact

For a given relative position of the worm and the worm wheel it is possible to determine the lines of contact between the flanks of threads and worm wheel teeth.

The relative positions are initialised by the parameter $\Delta x_{Dinit}(D)$ (see 10.4).

For the value $\Delta x_D(D)$ equal to $\Delta x_{Dinit}(D)$ in Formula (89) the contact is just beginning in ONE point of SAP points of worm (See Figure 35). Then the 1st line of contact is obtained for the next thread. This means that $\Delta x_{Dinit}(D)$ has to be increased by a value of axial pitch.

To determine the next line of contact $\Delta x_{Dinit}(D)$ has to be again increased by a value of axial pitch p_{x1} . This process is carried out until the highest point of contact on a line of contact has reached the border of the zone of contact.

Then it is possible to re-initialise $\Delta x_D(D)$ to $\Delta x_{Dinit}(D)$, increased by a $0,1 \cdot p_{x1}$ to set up a new relative initial position of the worm and the worm wheel and to restart the process.

In each point of contact the followings value have to be determined:

- tangent vector to the line of contact (see 10.6);
- principal equivalent of radius of curvature (see 10.7);
- Velocities at contact point (see Clause 11)

11 Velocities at contact point

11.1 Velocity of a point of worm

The angular velocity of the worm (rads) is given by:

$$\omega_{w1} = \pi \cdot \frac{n_1}{30} \quad (136)$$

The angular velocity vector of the worm (rads) is given by:

$$\vec{\omega}_1 = \begin{pmatrix} \omega_{w1} \\ 0 \\ 0 \end{pmatrix} \quad (137)$$

Velocity of a point of the thread of the worm (in m/s):

$$\vec{V}_1(y_p, D) = 10^{-3} \vec{\omega}_1 \times \vec{M}_1(y_p, D) \quad (138)$$

Velocity of a point of worm wheel.

The point of the worm wheel flank is given by:

$$\vec{M}_2(y_p, D) = \begin{pmatrix} x_{1D}(y_p, D) \\ -a_w + y_D(y_p, D) \\ D \end{pmatrix} \quad (139)$$

Velocity of a point of the tooth flank of the worm wheel (in m/s):

$$\vec{V}_2(y_p, D) = 10^{-3} \vec{\omega}_2 \times \vec{M}_2(y_p, D) \quad (140)$$

11.2 Relative velocity between 2 conjugate flanks

The relative velocity between the 2 flanks (in m/s) (this is the sliding velocity):

$$\vec{V}_s(y_p, D) = \vec{V}_1(y_p, D) - \vec{V}_2(y_p, D) \quad (141)$$

This relative sliding velocity can be projected in the common tangent plane to the point of contact in 2 directions:

- one normal to the line of contact;
- the second tangent to the line of contact.

$$\vec{V}_{1n}(y_p, D) = \vec{V}_1(y_p, D) \cdot \vec{B}(y_p, D) \quad (142)$$

$$\vec{V}_{2n}(y_p, D) = \vec{V}_2(y_p, D) \cdot \vec{B}(y_p, D) \quad (143)$$

It results the projection of these velocities on the common normal at the point of contact are equal.

$$\overline{V_{Sn}}(y_p, D) = \overline{V_{1n}}(y_p, D) - \overline{V_{2n}}(y_p, D) = \overline{V_S}(y_p, D) \cdot \overline{TN1_{cont}}(y_p, D) \quad (144)$$

11.3 Tangent to the path of contact

The direction of the velocity of points of contact is obtained with the determination of the tangent vector to the path of contact in an offset plane:

$$dy_{ID}(y_p, D) = dy_{ID}(y_p, D) \quad (145)$$

$$dx_{ID}(y_p, D) = \frac{-1}{\tan \alpha_D(y_p, D)^2} \cdot (dy_{ID}(y_p, D) \cdot \tan \alpha_D(y_p, D) - y_{ID}(y_p, D) \cdot d \tan \alpha_D(y_p, D)) \quad (146)$$

If $\varepsilon_D(y_p, D)$ is the angle between the direction of pitch line of worm and the tangent to the path of contact, then:

$$\tan \varepsilon_D(y_p, D) = \frac{dy_{ID}(y_p, D)}{dx_{ID}(y_p, D)} \quad (147)$$

$$dx_D dy_D(y_p, D) = \frac{1}{\tan \varepsilon_D(y_p, D)} \quad (148)$$

11.4 Velocity of the contact point along the path of contact

Velocity of the contact point along the path of contact in an offset plane:

$$\vec{V}_{cD}(y_p, D) = \frac{10^{-3} \cdot \omega_{w1} \cdot p_{z2}}{\tan \alpha_D(y_p, D) - dx_D dy_D(y_p, D)} \cdot \begin{pmatrix} dx_D dy_D(y_p, D) \\ 1 \\ 0 \end{pmatrix} \quad (149)$$

$$V_{cDn}(y_p, D) = \vec{V}_{cD}(y_p, D) \cdot \vec{B}(y_p, D) \quad (150)$$

11.5 Velocity at the point of contact

Velocity of the contact point on the worm:

$$\overrightarrow{V_{c1n}(y_p, D)} = \overrightarrow{V_{1n}(y_p, D)} - \overrightarrow{V_{cDn}(y_p, D)} \quad (151)$$

Velocity of the contact point on the worm wheel:

$$\overrightarrow{V_{c2n}(y_p, D)} = \overrightarrow{V_{2n}(y_p, D)} - \overrightarrow{V_{cDn}(y_p, D)} \quad (152)$$

$\overrightarrow{V_{Dn}(y_p, D)}$ is the projection along the normal to the line of contact in the common tangent plane at the contact point

$$V_{SUMn}(y_p, D) = \left| \overrightarrow{V_{c1n}(y_p, D)} + \overrightarrow{V_{c2n}(y_p, D)} \right| \quad (153)$$

Annex A (informative)

Settings and derivatives of formulae for A, I, N profiles

A.1 Introduction

This annex contains the detailed formula of profile in the axial plane of the worm in the X-Y plane according to the conventions of Figure 5.

A.2 Formulae of the profile in the X-Y plane for type A worms

See Figures 6 to 7 and A.1 for the setting of type A worms, where:

α_{0t} is the tool transverse pressure angle for A and I profiles;

α_{0n} is the tool normal pressure angle (see Formula (19));

γ_{m1} is the reference lead angle of worm.

Figure A.1 — Generation of Type A profile

For a point (x_x, y_x) at a distance y_x from the worm axis:

$$x_x = y_x \cdot \tan(\alpha_{0t}) = y_x \cdot \tan(\alpha_{0n}) / \cos(\gamma_{m1}) \quad (\text{A.1})$$

and

$$\alpha_x = \alpha_{0t} \quad (\text{A.2})$$

A.3 Formulae of the profile in the X-Y plane for type I worms

See Figures 9 to 11 for the setting of type I worms, where

- p_{z1} is the lead;
- r_{b1} is the base radius of involute profile; (see Formula (22));
- γ_{b1} is the base lead angle of worm thread; (see Formula (21)).

Figure A.2 — Generation of Type I profile

For a point (x_x, y_x) at a distance y_x from the worm axis:

$$x_x = -p_{zu1} \arctan \frac{\sqrt{y_x^2 - r_{b1}^2}}{r_{b1}} + \sqrt{y_x^2 - r_{b1}^2} \cdot \tan(\gamma_{b1}) \quad (\text{A.3})$$

$$\tan(\alpha_x) = \frac{\sqrt{y_x^2 - r_{b1}^2}}{r_{b1}} \cdot \frac{p_{zu1}}{y_x} \quad (\text{A.4})$$

A.4 Formulae of the profiles in the X-Y plane for type N worms

See Figures 12 and 13 for the setting of type N worms, where

- p_{x1} is the axial pitch;
- p_{z1} is the lead (of worm);
- r'_{b1} is the base radius of a notional base circle;
- γ'_{b1} is the base lead angle of the notional base helix;
- A is the distance from the worm axis to virtual point of the cutter (OO_1 on Figure A.4) (see ref.[1]);
- γ_{m1} is the reference lead angle of worm;
- α_{0n} is the normal pressure angle;
- d_{m1} is the worm reference diameter.

Key

- 1 axis of worm
- 2 axis of symmetry of the tooth space
- 3 reference helix
- 4 generatrix

Figure A.3 — Generation of Type N profile

Figure A.4 — Profile N: Convention for formulae

For a point (x_x, y_x) at radial distance y_x from the worm axis:

$$x_x = p_{zu1} \left\{ \arctan \left(\frac{\sqrt{y_x^2 - r'_{b1}^2}}{r'_{b1}} \right) - \theta \right\} + \sqrt{y_x^2 - r'_{b1}^2} \cdot \tan(\gamma'_{b1}) \quad (A.5)$$

1 generatrix

Figure A.5 — Profile N: Generatrix with pseudo base radius

With:

$$\theta = \arctan \left(\frac{\sqrt{A - r_{b1}'^2}}{r_{b1}'} \right) \quad (\text{A.6})$$

$$\tan(\alpha_x) = \frac{p_{z1} \cdot r'_{b1} + 2 \cdot \pi \cdot y_x \cdot \tan(\gamma'_{b1})}{2 \cdot \pi \cdot y_x \sqrt{y_x^2 - r_{x1}^2}} \quad (\text{A.7})$$

68

$$\tan(\gamma'_b) = \frac{r'_{b1}}{A \cdot \tan(\gamma_{m1})} \quad (\text{A.8})$$

$$r'_{b1} = \frac{A \cdot \sin(\gamma_{m1}) \cdot \tan(\alpha_{0n})}{\sqrt{1 - (\sin(\gamma_{m1}) \cdot \tan(\alpha_{0n}))^2}} \quad (\text{A.9})$$

$$A = \frac{1}{2} \cdot \left(d_1 - p_{z1} \cdot \frac{\cos(\gamma_{m1})}{2 \cdot \tan(\alpha_{0n})} \right) \quad (\text{A.10})$$

A.5 Second derivative of axial profile formula

$$d^2x_x(y_p) = \left[-a_1 \cdot a_2 \cdot \left[2 - \left(\frac{a_2}{y_p} \right)^2 \right] - a_3 \cdot a_2^2 \right] \cdot \frac{1}{(y_p^2 - a_2^2)^{\frac{3}{2}}} \quad (\text{A.11})$$

$$d^2y_x(y_p) = 0 \quad (\text{A.12})$$

Annex B (informative)

Settings and derivatives of formulae for K and C profiles

B.1 Formulae for K profile

Where

C	is the cutter spindle/worm centre distance;
γ_{m1}	is the reference lead angle of worm;
p_{z1}	is the lead;
$(y_G, x_G(y_G))$	are the coordinates of a point on the tool flank when the origin is at the point of intersection of the tool axis and the tool median plane, with the x-axis as the tool spindle axis and the abscissa on the trace of the median plane;
d_{m1}	worm reference diameter;
p_{x1}	axial pitch;
α_{0n}	normal pressure angle of the tool.

Formulae of the profile of a bi-conical grinding wheel (Figure 16)

Like type I profile, profile K is convex in axial planes.

Figure B.1 — Profile K - Grinding wheel profile

One of the advantages of this type is that the two flanks of a thread space can be machined simultaneously.

A disadvantage is that the form of the thread flanks varies with tool diameter, so the reproducibility is approximated.

NOTE 1 The smaller the diameter of the tool, the more nearly the normal profiles of the thread spaces approach those of type N worms and the larger the tool diameter the more nearly the forms of the thread flanks approach those of type I worms.

NOTE 2 It is possible to machine type K worms with conical milling cutter. The flank surfaces have facets resulting of the cutting discontinuity caused by cutting tooth pitch.

$$x_w(y_G) = x_{ms} - \tan(\alpha_{0n}) \cdot (y_G - R_{Ga}) \quad (B.1)$$

$$\alpha_G(y_G) = \alpha_{0n} \quad (B.2)$$

With:

y_G is the radius of grinding wheel which generates the point on the worm.

R_p is the radius of the circle of intersection of both conical surfaces of the grinding wheel flanks.

$$a_0 = R_{Ga} + \frac{d_{f1}}{2} \quad (B.3)$$

$$R_w = a_0 - \frac{d_{m1}}{2} \quad (B.4)$$

$$x_{ms} = \frac{(\pi \cdot m_{x1} - s_{x1}) \cdot \cos(\gamma_{m1})}{2} \quad (B.5)$$

B.2 Alternatives formulae for C profiles

Formulae enabling determination of the axial sections of worms

With the basic data of the tool indicated in Figure 17, the parameters y_G , x_G and α_G may be derived for any point G of the tool profile.

On the basis of these three parameters and with the formulae provided below, the coordinates x , r , of an axial profile and the angle α of the tangent may be determined for any point P of the profile of a worm.

Symbols:

a_0	is the worm/tool centre distance (length of the common perpendicular to the worm/tool axes);
p_{z1}	is the lead (of worm);
γ_{m1}	is the lead angle of worm;
$y_{Gm} = R_{Gm}$,	see Figure B.2;
x_{Gm} , $\alpha_{Gm} = \alpha_{0n}$	

Formula of the profile of the grinding wheel

$$\alpha_G(y_G) = \arcsin\left(\sin(\alpha_{0n}) - \frac{R_{Gm} - y_G}{\rho_{Gm}}\right) \quad (B.6)$$

$$x_G(y_G) = x_{Gm} + \rho_{Gm} \cdot (\cos(\alpha_G(y_G)) - \cos(\alpha_{0n})) \quad (B.7)$$

Key

1 axis of the grinding wheel

Figure B.2 — Profile C - Axial section of the tool

$$y_G(y_G) = y_G \quad (\text{B.8})$$

With:

$$x_{Gm} = \frac{(\pi \cdot m_{x1} - s_{mx1}) \cdot \cos(\gamma_{m1})}{2} \quad (\text{B.9})$$

$$a_0 = R_{Ga} + \frac{d_{f1}}{2} \quad (\text{B.10})$$

$$R_{Gm} = a_0 - \frac{d_{m1}}{2} \quad (\text{B.11})$$

B.3 Derivatives for K profile

B.3.1 First derivative of K profile formula

$$d\alpha_G(y_G) = 0 \quad (\text{B.12})$$

$$dx_G(y_G) = -\tan(\alpha_{0n}) \quad (\text{B.13})$$

B.3.2 Second derivative of K profile formula

$$d^2\alpha_G(y_G) = 0 \quad (B.14)$$

$$d^2x_G(y_G) = 0 \quad (B.15)$$

B.3.3 Third derivative of K profile formula

$$d^3\alpha_G(y_G) = 0 \quad (B.16)$$

$$d^3x_G(y_G) = 0 \quad (B.17)$$

B.4 Derivatives for C profile**B.4.1 First derivative of C profile formula**

$$d\alpha_G(y_G) = \frac{1}{\rho_{Gm} \cdot \left[1 - \left(\sin(\alpha_{0n}) - \frac{R_{Gm} - y_G}{\rho_{Gm}} \right)^2 \right]^{\frac{1}{2}}} \quad (B.18)$$

$$dx_G(y_G) = -\rho_{Gm} \cdot \sin(\alpha_G(y_G)) \cdot d\alpha_G(y_G) \quad (B.19)$$

B.4.2 Second derivative of C profile formula

$$d^2\alpha_G(y_G) = \frac{1}{\rho_{Gm}^2 \cdot \left[1 - \left(\sin(\alpha_{0n}) - \frac{R_{Gm} - y_G}{\rho_{Gm}} \right)^2 \right]^{\frac{3}{2}}} \cdot \left(\sin(\alpha_{0n}) - \frac{R_{Gm} - y_G}{\rho_{Gm}} \right) \quad (B.20)$$

$$d^2x_G(y_G) = \rho_{Gm} \cdot \cos(\alpha_G(y_G)) \cdot d\alpha_G(y_G)^2 - \rho_{Gm} \cdot \sin(\alpha_G(y_G)) \cdot d^2\alpha_G(y_G) \quad (B.21)$$

B.4.3 Third derivative of C profile formula

$$d^3\alpha_G(y_G) = \frac{3}{\rho_{Gm}^3 \cdot \left[1 - \left(\sin(\alpha_{0n}) - \frac{R_{Gm} - y_G}{\rho_{Gm}} \right)^2 \right]^{\frac{5}{2}}} \cdot \left(\sin(\alpha_{0n}) - \frac{R_{Gm} - y_G}{\rho_{Gm}} \right)^2 + \frac{1}{\rho_{Gm}^3 \cdot \left[1 - \left(\sin(\alpha_{0n}) - \frac{R_{Gm} - y_G}{\rho_{Gm}} \right)^2 \right]^{\frac{3}{2}}} \quad (B.22)$$

$$\begin{aligned} d3x_G(y_G) = & \rho_{Gm} \cdot \sin(\alpha_G(y_G)) \cdot d\alpha_G(y_G)^3 \\ & - 3\rho_{Gm} \cdot \cos(\alpha_G(y_G)) \cdot d\alpha_G(y_G) \cdot d2\alpha_G(y_G) \\ & - \rho_{Gm} \cdot \sin(\alpha_G(y_G)) \cdot d3\alpha_G(y_G) \end{aligned} \quad (B.23)$$

B.5 Second derivative for K/C profile for $c2(y_G)$ et $c3(y_G)$

$$d2c2(y_G) = \left(d2x_G(y_G) - \frac{2 \cdot d2x_G(y_G)}{dx_G(y_G)^2} + \frac{2 \cdot y_G}{dx_G(y_G)^3} \cdot d2x_G(y_G)^2 - \frac{y_G}{dx_G(y_G)^2} \cdot d3x_G(y_G) \right) \cdot \sin(\gamma_{m1}) \quad (B.24)$$

$$\begin{aligned} d2c3(y_G) = & 2 \left(\frac{a_0 \cdot \sin(\gamma_{m1}) - p_{zu1} \cdot \cos(\gamma_{m1})}{dx_G(y_G)^3} \cdot d2x_G(y_G)^2 \right) \\ & - \frac{a_0 \cdot \sin(\gamma_{m1}) - p_{zu1} \cdot \cos(\gamma_{m1})}{dx_G(y_G)^2} \cdot d3x_G(y_G) \end{aligned} \quad (B.25)$$

B.6 Second derivative for K/C profile for $\varepsilon_G(y_G)$

B.6.1 First derivation of the 1st term of $d\varepsilon_G(y_G)$

(See 6.7.2.1 and 6.7.2.3.2 for $\varepsilon_w(y_G)$ and $d\varepsilon_w(y_G)$)

$$dA\varepsilon_G(y_G) = \frac{d2c3(y_G)}{(c_1^2 + c_2(y_G)^2 - c_3(y_G)^2)^{\frac{1}{2}}} - \frac{d c_3(y_G) \cdot (c_2(y_G) \cdot d c_2(y_G) - c_3(y_G) \cdot d c_3(y_G))}{(c_1^2 + c_2(y_G)^2 - c_3(y_G)^2)^{\frac{3}{2}}} \quad (B.26)$$

B.6.2 First derivation of the numerator of the 2nd term of $d\varepsilon_G(y_G)$

$$BN\varepsilon_G(y_G) = -c_3(y_G) \cdot c_2(y_G) \cdot d c_2(y_G) \quad (B.27)$$

and

$$dBN\varepsilon_G(y_G) = -d c_3(y_G) \cdot c_2(y_G) \cdot d c_2(y_G) - c_3(y_G) \cdot d c_2(y_G)^2 - c_3(y_G) \cdot c_2(y_G) \cdot d2c2(y_G) \quad (B.28)$$

B.6.3 First derivation of the 3rd term of $d\varepsilon_G(y_G)$

$$dC\varepsilon_G(y_G) = \left(-d2c2(y_G) + \frac{2 d c_2(y_G)^2 \cdot c_2(y_G)}{c_1^2 + c_2(y_G)^2} \right) \cdot \frac{c_1}{c_1^2 + c_2(y_G)^2} \quad (B.29)$$

B.6.4 First derivation of the denominator of the 2nd term of $d\varepsilon_G(y_G)$

$$BD\varepsilon_G(y_G) = (c_1^2 + c_2(y_G)^2) \cdot (c_1^2 + c_2(y_G)^2 - c_3(y_G)^2)^{\frac{1}{2}} \quad (B.30)$$

$$\begin{aligned} dBD\varepsilon_G(y_G) = & 2c_2(y_G) \cdot d c_2(y_G) \cdot (c_1^2 + c_2(y_G)^2 - c_3(y_G)^2)^{\frac{1}{2}} + \\ & (c_1^2 + c_2(y_G)^2) \cdot (c_1^2 + c_2(y_G)^2 - c_3(y_G)^2)^{-\frac{1}{2}} \cdot (c_2(y_G) \cdot d c_2(y_G) - c_3(y_G) \cdot d c_3(y_G)) \end{aligned} \quad (B.31)$$

$$d BD\varepsilon_G(y_G) = \frac{d BN\varepsilon_G(y_G) \cdot BD\varepsilon_G(y_G) - d BD\varepsilon_G(y_G) \cdot BN\varepsilon_G(y_G)}{BD\varepsilon_G(y_G)^2} \quad (B.32)$$

B.6.5 Second derivative for K/C profile for $\varepsilon_G(y_G)$

$$d^2\varepsilon_G(y_G) = d A\varepsilon_G(y_G) + d BD\varepsilon_G(y_G) + d C\varepsilon_G(y_G) \quad (B.33)$$

B.7 Second derivative of point generated by the grinding wheel

$$d^2x_{c_{uw}}(y_G) = d^2x_{c_G}(y_G) \cdot \cos(\gamma_{m1}) - (2 \cos(\varepsilon_w(y_G)) \cdot d\varepsilon_w(y_G) - y_G \cdot \sin(\varepsilon_w(y_G)) \cdot d\varepsilon_w(y_G)^2 + y_G \cdot \cos(\varepsilon_w(y_G)) \cdot d^2\varepsilon_w(y_G)) \cdot \sin(\gamma_{m1}) \quad (B.34)$$

$$d^2y_{c_{uw}}(y_G) = 2 \sin(\varepsilon_w(y_G)) \cdot d\varepsilon_w(y_G) + y_G \cdot \cos(\varepsilon_w(y_G)) \cdot d\varepsilon_w(y_G)^2 + y_G \cdot \sin(\varepsilon_w(y_G)) \cdot d^2\varepsilon_w(y_G) \quad (B.35)$$

$$d^2z_{c_{uw}}(y_G) = -d^2x_G(y_G) \cdot \sin(\gamma_{m1}) - (2 \cos(\varepsilon_w(y_G)) \cdot d\varepsilon_w(y_G) - y_G \cdot \sin(\varepsilon_w(y_G)) \cdot d\varepsilon_w(y_G)^2 + y_G \cdot \cos(\varepsilon_w(y_G)) \cdot d^2\varepsilon_w(y_G)) \cdot \cos(\gamma_{m1}) \quad (B.36)$$

B.8 Second derivative of point generated by the grinding wheel projected in the axial plane of worm

$$d^2\phi_x(y_G) = \frac{d^2z_{c_{uw}}(y_G) \cdot y_{c_{uw}}(y_G) - z_{c_{uw}}(y_G) \cdot d^2y_{c_{uw}}(y_G)}{y_{c_{uw}}(y_G)^2 + z_{c_{uw}}(y_G)^2} - \frac{2(dz_{c_{uw}}(y_G) \cdot y_{c_{uw}}(y_G) - z_{c_{uw}}(y_G) \cdot dy_{c_{uw}}(y_G)) \cdot y_{c_{uw}}(y_G) \cdot dy_{c_{uw}}(y_G) + z_{c_{uw}}(y_G) \cdot dy_{c_{uw}}(y_G) \cdot dz_{c_{uw}}(y_G)}{(y_{c_{uw}}(y_G)^2 + z_{c_{uw}}(y_G)^2)^2} \quad (B.37)$$

$$d^2x_x(y_G) = d^2x_{c_{uw}}(y_G) - p_{zu1} : d^2\phi_x(y_G) \quad (B.38)$$

$$d^2y_x(y_G) = \frac{d^2y_{c_{uw}}(y_G)}{\cos(\phi_x(y_G))} + \frac{2d^2y_{c_{uw}}(y_G)}{\cos(\phi_x(y_G))^2} \cdot \sin(\phi_x(y_G)) \cdot d\phi_x(y_G) + \left(\frac{2 \cdot \sin(\phi_x(y_G))^2}{\cos(\phi_x(y_G))^3} + \frac{1}{\cos(\phi_x(y_G))} \right) \cdot y_{c_{uw}}(y_G) \cdot d\phi_x(y_G)^2 + \frac{y_{c_{uw}}(y_G)}{\cos(\phi_x(y_G))^2} \cdot \sin(\phi_x(y_G)) \cdot d^2\phi_x(y_G) \quad (B.39)$$

$$d \tan \alpha_c(y_G) = \frac{d^2x_x(y_G)}{dy_x(y_G)} - \frac{dx_x(y_G) \cdot d^2y_x(y_G)}{dy_x(y_G)^2} \quad (B.40)$$
