1. SCOPE:

1.1 Form:

This specification covers a high strength, corrosion and heat resistant cobalt-chromium-nickel alloy in the form of bars.

1.2 Application:

These bars have been used typically for applications requiring a combination of high strength up to 1100 °F (593 °C), good tension-tension fatigue strength, toughness, and ductility, but usage is not limited to such applications. This alloy exhibits exceptionally good resistance to corrosion, crevice-corrosion, stress-corrosion cracking, and elevated temperature relaxation.

3.5.2.3.1 A standard, cylindrical, combination smooth-and-notched specimen
(R) conforming to ASTM E 292, maintained at 1200 °F $\pm$ 3 (649 °C $\pm$ 2) while
a load sufficient to produce an initial axial stress of 140 ksi
(965 MPa) or higher is applied continuously, shall not rupture in less

specimen shall not rupture in less than 23 hours and elongation after
rupture, measured at room temperature, shall be not less than 5% in 4D.

3.5.2.3.3 The tests of 3.5.2.3.1 and 3.5.2.3.2 may be conducted using incremental
(R) loading. In such case, the load required to produce an initial axial
stress of 140 ksi (965 MPa) or higher shall be used to rupture or for
23 hours, whichever occurs first. After the 23 hours and at intervals
of 8 to 16 hours, preferably 8 to 10 hours, thereafter, the stress
shall be increased in increments of 5.0 ksi (34.5 MPa). Time to
rupture and elongation requirements shall be as specified in 3.5.2.3.1.
