Superseding AS7459

**Bolts and Screws, Steel UNS K14675
Tensile Strength 195 ksi
Fatigue and Stress-Rupture Rated
Procurement Specification**

FSC 5306

RATIONALE

This document has been reaffirmed to comply with the SAE 5-year Review policy.

1. SCOPE:

1.1 Type:

This procurement specification covers bolts and screws made from a low alloy, heat resistant steel of the type identified under the Unified Numbering System as UNS K14675, having UNJ profile threads. The following specification designations and their properties are covered:

AS7459 195 ksi minimum ultimate tensile strength at room temperature
145 ksi minimum ultimate tensile strength at 900 °F
105 ksi stress rupture strength at 900 °F for 100 hours
100 ksi tension to 10 ksi tension fatigue at room temperature
Protective treatment to be specified on part drawing

AS7459-1 AS7459 part plated per AMS 2416, nickel-cadmium diffused plating

AS7459-2 195 ksi minimum ultimate tensile strength at room temperature
117 ksi minimum ultimate shear strength at room temperature
Protective treatment to be specified on part drawing

AS7459-3 AS7459-2 part plated per AMS 2416, nickel-cadmium diffused plating

1.2 Application:

Primarily for aerospace propulsion system applications where high strength at temperatures up to approximately 900 °F is required and the part is protected against corrosion.

SAE Technical Standards Board Rules provide that: "This report is published by SAE to advance the state of technical and engineering sciences. The use of this report is entirely voluntary, and its applicability and suitability for any particular use, including any patent infringement arising therefrom, is the sole responsibility of the user."

SAE reviews each technical report at least every five years at which time it may be reaffirmed, revised, or cancelled. SAE invites your written comments and suggestions.

1.3 Safety - Hazardous Materials:

While the materials, methods, applications, and processes described or referenced in this specification may involve the use of hazardous materials, this specification does not address the hazards which may be involved in such use. It is the sole responsibility of the user to ensure familiarity with the safe and proper use of any hazardous materials and to take necessary precautionary measures to ensure the health and safety of all personnel involved.

ASME B46.1 Surface Texture (Surface Roughness, Waviness, and Lay)

2.2 Definitions:

BURR: A rough edge or ridge left on the metal due to a cutting, grinding, piercing or blanking operation.

COLD ROLLING: Forming material below the recrystallation temperature.

CRACK: Rupture in the material which may extend in any direction and which may be intercrystalline or transcrystalline in character.

DEFECT: Any nonconformance of the unit of product with specified requirements.

DEFECTIVE: A unit of product which contains one or more defects.

DISCONTINUITY: An interruption in the normal physical structure or configuration of a part; such as a lap, seam, inclusion, crack, machining tear, or stringer.

INCLUSION: Non-metallic particles originating from the material making process. They may exist as discrete particles or strings of particles extending longitudinally.

LAP: Surface imperfection caused by folding over metal fins or sharp corners and then rolling or forging them into the surface. The allowable lap depth shall not exceed the limit specified herein. The minimum condition that shall be rated as a lap is a fold having its length equal to or greater than three times its width with a depth of 0.0005 inch when viewed at 200X magnification.

MACHINING TEAR: A pattern of short, jagged individual cracks, generally at right angles to the direction of machining, frequently the result of improperly set cutting tools, or dull cutting tools.

PRODUCTION INSPECTION LOT: Shall be all finished parts of the same part number, made from a single heat of alloy, heat treated at the same time to the same specified condition, produced as one continuous run, and submitted for vendor's inspection at the same time.

2.2 (Continued):

SEAM: Longitudinal surface imperfection in the form of an unwelded, open fold in the material.

STRINGER: A solid non-metallic impurity in the metal bar, often the result of inclusions that have been extended during the rolling process.

TIGHT BURR: A burr closely compacted and binding in the periphery of a part without any loose ends and is within the dimensional limits of the part.

2.3 Unit Symbols:

- ° - degree, angle
- °F - degree Fahrenheit
- HRC - hardness Rockwell C scale
- % - percent (1% = 1/100)
- lbf - pounds force
- ksi - kips (1000 pounds) per square inch

3. TECHNICAL REQUIREMENTS:

3.1 Material:

Shall be AMS 6304 steel.

3.2 Design:

Finished (completely manufactured) parts shall conform to the following requirements:

- 3.2.1 Dimensions: The dimensions of finished parts, after all processing, including plating or coating, shall conform to the requirements as specified on the part drawing. Dimensions shall apply after plating but before coating with dry film lubricants.
- 3.2.2 Surface Texture: Surface texture of finished parts, prior to plating or coating, shall conform to the requirements as specified on the part drawing, determined in accordance with ASME B46.1.
- 3.2.3 Threads: Screw thread UNJ profile and dimensions shall be in accordance with MIL-S-8879, unless otherwise specified on the part drawing.
- 3.2.3.1 Incomplete Lead and Runout Threads: Incomplete threads are permissible at the entering end and the juncture of the unthreaded portion of the shank or adjacent to the head as specified in AS3062.
- 3.2.3.2 Chamfer: The entering end of the thread shall be chamfered as specified on the part drawing.
- 3.2.4 Geometric Tolerances: Part features shall be within the geometric tolerances specified on the part drawing and, where applicable, controlled in accordance with AS3063.

SAE AS7459 Revision A

3.3 Fabrication:

- 3.3.1 Blanks: Heads shall be formed by hot forging or cold forging; machined heads are not permitted, except lightening holes may be produced by any suitable method. Wrenching recesses may be forged or machined. Flash or chip clearance in machined recesses shall not cause recess dimensions to exceed the specified limits.
- 3.3.2 Heat Treatment: Headed blanks, before finishing the shank and the bearing surface of the head, cold working the head-to-shank fillet radius, and rolling the threads, shall be heat treated as follows:
- 3.3.2.1 Heating Equipment: Furnaces may be of any type ensuring uniform temperature throughout the parts being heated and shall be equipped with, and operated by, automatic temperature controllers and data recorders conforming to AMS 2750. The heating medium or atmosphere shall cause neither surface hardening nor decarburization other than that permitted by 3.7.2.2 and 3.7.2.3.
- 3.3.2.2 Hardening: Headed blanks shall be uniformly heated to $1750^{\circ}\text{F} \pm 25^{\circ}\text{F}$, held at heat for 60 to 90 minutes and quenched in oil or water.
- 3.3.2.3 Tempering: Hardened blanks shall be tempered by heating uniformly to a temperature not lower than 1000°F , holding at heat for not less than 6 hours, and cooling in air.
- 3.3.3 Oxide and Decarburization Removal: Surface oxide and oxide penetration, and decarburization except as permitted in 3.7.2.3, resulting from prior heat treatment, shall be removed from the full body diameter and bearing surface of the head of the heat treated blanks prior to cold working the under head fillet radius and rolling the threads. The removal process shall produce no intergranular attack or corrosion of the blanks. The metal removed from the bearing surface of the head and the full body diameter of the shank shall be as little as practicable to obtain a clean, smooth surface.
- 3.3.4 Cold Rolling of Fillet Radius: After removal of oxide and decarburization as in 3.3.3, the head-to-shank fillet radius of parts having the radius complete throughout the circumference of the part shall be cold rolled sufficiently to remove all visual evidence of grinding or tool marks. Distortion due to cold rolling shall conform to Figure 2, unless otherwise specified on the part drawing. It shall not raise metal more than 0.002 inch above the contour at "A" or depress metal more than 0.002 inch below the contour at "B" as shown in Figure 2; distorted areas shall not extend beyond "C" as shown in Figure 2. In configurations having an undercut connected with the fillet radius, the cold working will be required only for 90° of fillet arc, starting at the point of tangency of the fillet radius and the bearing surface of the head. For shouldered bolts, having an unthreaded shank diameter larger than the thread major diameter and having an undercut connected with a fillet between the threaded shank and the shoulder of the unthreaded shank, the cold working will be required only for 90° of fillet arc, starting at the point of tangency of the fillet radius and the shouldered surface of the unthreaded shank.

SAE AS7459 Revision A

3.3.5 Thread Rolling: Threads shall be formed on the heat treated and finished blanks by a single cold rolling process after removal of oxide and decarburization as in 3.3.3.

3.4 Product Marking:

Each part shall be identification marked as specified by the part drawing. The markings may be formed by forging or stamping, raised or depressed not more than 0.010 inch maximum, with rounded root form on depressed characters.

3.5 Plating:

Where AS7459 and AS7459-2 is specified, any protective treatment shall be as specified on the part drawing. Where AS7459-1 is specified, parts in accordance with AS7459 shall be nickel-cadmium diffused plated in accordance with AMS 2416. Where AS7459-3 is specified, parts in accordance with AS7459-2 shall be nickel-cadmium diffused plated in accordance with AMS 2416. Plating thickness determined in accordance with plating specification.

3.6 Mechanical Properties:

Where AS7459 and AS7459-1 are specified, parts shall conform to the requirements of 3.6.1, 3.6.2, 3.6.4, and 3.6.5, and 3.6.6. Where AS7459-2 and AS7459-3 are specified, parts shall conform to the requirements of 3.6.1, 3.6.3, and 3.6.4. Threaded members of gripping fixtures for tensile, fatigue, and stress-rupture tests shall be of sufficient size and strength to develop the full strength of the part without stripping the thread.

AS7459 and AS7459-1 finished parts shall be tested in accordance with the following applicable test methods:

- | | |
|--|-----------------|
| a. Hardness | MIL-STD-1312-6 |
| b. Ultimate Tensile Strength at Room Temperature | MIL-STD-1312-8 |
| c. Stress-Rupture Strength at 900 °F | MIL-STD-1312-10 |
| d. Fatigue Strength at Room Temperature | MIL-STD-1312-11 |
| e. Ultimate Tensile Strength at 900 °F | MIL-STD-1312-18 |

AS7459-2 and AS7459-3 finished parts shall be tested in accordance with the following applicable test methods:

- | | |
|---|-----------------|
| a. Hardness | MIL-STD-1312-6 |
| b. Ultimate Tensile Strength at Room Temperature | MIL-STD-1312-8 |
| c. Ultimate Double Shear Strength at Room Temperature | MIL-STD-1312-13 |

SAE AS7459 Revision A

3.6.1 Ultimate Tensile Strength at Room Temperature:

3.6.1.1 Finished Parts: Tension bolts, such as hexagon, double hexagon, and spline drive head, shall have an ultimate tensile load not lower than that specified in Table 2A and shall be tested to failure in order to observe fracture location, first measuring and recording the maximum tensile load achieved. Screws, such as 100° flush head, pan head, and fillister head, shall have an ultimate tensile load not lower than that specified in Table 2B; screws need not be tested to failure, however the maximum tensile load achieved shall be measured and recorded. If the size or shape of the part is such that failure would occur outside the threaded section but the part can be tested satisfactorily, such as parts having a shank diameter equal to or less than the thread root diameter or having an undercut, parts shall have an ultimate tensile strength not lower than 195 ksi; for such parts, the diameter of the area on which stress is based shall be the actual measured minimum diameter of the part. Tension fasteners with either standard hexagon, double hexagon or spline drive heads having a minimum metal condition in the head equal to the design parameters specified in AS1132 shall not fracture in the head-to-shank fillet radius except when this radius is connected with an undercut or with a shank diameter less than the minimum pitch diameter of the thread.

3.6.1.2 Machined Test Specimens: If the size or shape of the part is such that a tensile test cannot be made on the part, tensile tests shall be conducted in accordance with ASTM E 8 on specimens prepared as in 4.5.7. Such specimens shall meet the following requirements:

- | | |
|---------------------------------------|---------|
| a. Ultimate Tensile Strength, minimum | 195 ksi |
| b. Elongation in 4D, minimum | 10% |
| c. Reduction of Area, minimum | 30% |

3.6.1.2.1 When permitted by purchaser, hardness tests on the end of parts may be substituted for tensile tests of machined specimens.

3.6.2 Ultimate Tensile Strength at 900 °F:

3.6.2.1 Finished Parts: Tension bolts heated to 900 °F ± 3 °F, held at heat for 30 minutes before testing, and tested at 900 °F ± 3 °F, shall have an ultimate tensile load not lower than the value specified in Table 2A and shall be tested to failure in order to observe fracture location, first measuring and recording the maximum tensile load achieved. If the size or shape of the part is such that failure would occur outside the threaded section but the part can be tested satisfactorily, such as parts having a shank diameter equal to or less than the thread root diameter or having an undercut, parts shall have an ultimate tensile strength not lower than 145 ksi; for such parts, the diameter of the area on which stress is based shall be the actual measured minimum diameter of the part. Tension fasteners with either standard hexagon, double hexagon or spline drive heads having a minimum metal condition in the head equal to the design parameters specified in AS1132 shall not fracture in the head-to-shank fillet radius except when this radius is connected with an undercut or with a shank diameter less than the minimum pitch diameter of the thread. Screws, such as 100° flush head, pan head, and fillister head, are not required to be tested for tensile strength at 900 °F.

SAE AS7459 Revision A

3.6.2.2 Machined Test Specimens: If the size or shape of the part is such that a tensile test cannot be made on the part, tensile tests shall be conducted in accordance with ASTM E 21 on specimens prepared as in 4.5.7. Such specimens shall meet the following requirements when heated to 900 °F $\pm$ 3 °F, held at heat for not less than 30 minutes before testing, and tested at 900 °F $\pm$ 3 °F:

- | | |
|---------------------------------------|---------|
| a. Ultimate Tensile Strength, minimum | 145 ksi |
| b. Elongation in 4D, minimum | 10% |
| c. Reduction of Area, minimum | 30% |

3.6.3 Ultimate Shear Strength: Finished bolts having a close toleranced full shank as in AS1132 shall have an ultimate double shear load not lower than that specified in Table 2A. The double shear test may be discontinued without a complete shear failure after the minimum ultimate shear load has been reached, first measuring and recording the maximum double shear load achieved. Shear bolts having special shank diameters shall have the minimum ultimate double shear load based on 117 ksi minimum shear strength. Shear tests are not required for screws, such as 100° flush head, having a grip less than 2.5 times the nominal diameter or protruding head screws, such as pan head and fillister head, having a grip less than 2 times the nominal diameter. Shear test is not required for the following conditions:

- Bolts and screws threaded to head.
- Protruding head bolts and screws having coarse toleranced full shank.
- Protruding head bolts and screws having PD or relieved shank.

3.6.4 Hardness: Shall be uniform and within the range 42 to 46 HRC (see 8.1), but hardness of the threaded section and of the head-to-shank fillet area may be higher as a result of the cold working operations. Parts shall not be rejected on the basis of hardness if the tensile strength properties in 3.6.1, fatigue strength in 3.6.5, and stress-rupture strength in 3.6.6 are met.

3.6.5 Fatigue Strength: Finished tension bolts tested in tension-tension fatigue at room temperature with maximum load as specified in Table 2A and minimum load equal to 10% of maximum load shall have average life of not less than 65,000 cycles with no part having life less than 45,000 cycles. Tests need not be run beyond 130,000 cycles. Life of parts which do not fail in less than 130,000 cycles shall be taken as 130,000 cycles for purposes of computing average life. If the shank diameter of the part is less than the minimum pitch diameter of the thread, parts shall withstand fatigue testing as above using loads sufficient to produce a maximum stress of 100 ksi and a minimum stress of 10 ksi. The above requirements apply only to tension bolts, such as hexagon, double hexagon, and spline drive heads per design parameters specified in AS1132, 0.138 inch and larger in nominal thread size, and having a head-to-shank fillet radius equal to or larger than that specified in AS1132, and not having an undercut; for all parts to which the above requirements do not apply, fatigue test requirements shall be as specified on the part drawing.

3.6.6 Stress-Rupture Strength at 900 °F:

- 3.6.6.1 Finished Parts: Finished tension bolts, maintained at 900 °F $\pm$ 3 °F while the tension load specified in Table 2A is applied continuously, shall not rupture in less than 100 hours. If the shank diameter of the bolt is less than the maximum minor (root) diameter of the thread but the part can be tested satisfactorily, bolts shall conform to the requirements of 3.6.6.1.1. Screws, such as 100° flush head, pan head, and fillister head, are not required to be tested for stress-rupture strength at 900 °F.
- 3.6.6.1.1 Bolts having a shank diameter less than the maximum minor (root) diameter of the thread shall be tested as in 3.6.6.1 except that the load shall be as specified in 3.6.6.2. The diameter of the area on which stress is based shall be the actual measured minimum diameter of the part.
- 3.6.6.2 Machined Test Specimens: If the size or shape of the bolt is such that a stress-rupture test cannot be made on the part, a test specimen prepared as in 4.5.7, maintained at 900 °F $\pm$ 3 °F while a load sufficient to produce an initial axial stress of 105 ksi is applied continuously, shall not rupture in less than 100 hours. Tests shall be conducted in accordance with ASTM E 139.

3.7 Quality:

Parts shall be uniform in quality and condition, clean, sound, smooth, and free from burrs (tight burrs may be acceptable if part performance is not affected) and foreign materials, and from imperfections detrimental to the usage of the part.

- 3.7.1 Macroscopic Examination, Headed Blank: A specimen cut from a headed blank shall be etched in a suitable etchant and examined at a magnification of 20X to determine conformance to the requirements of 3.7.1.1 and 3.7.1.2. The head and shank section shall extend not less than D/2 from the bearing surface of the head where "D" is the nominal diameter of the shank after heading.
- 3.7.1.1 Flow Lines: After heading and prior to heat treatment, examination of an etched section taken longitudinally through the blank shall show flow lines in the shank, head-to-shank fillet, and bearing surface which follow the contour of the blank as shown in Figure 1. Flow lines in headed blanks having special heads, such as Dee- or Tee-shaped heads or thinner than AS1132 standard heads, shall be as agreed upon by purchaser and vendor.
- 3.7.1.2 Internal Defects: Examination of longitudinal sections of the head and shank shall reveal no cracks, laps, or porosity.
- 3.7.2 Microscopic Examination: Specimens cut from parts shall be polished, etched in 2% Nital, and examined at 100X magnification to determine conformance to the requirements of 3.7.2.1, 3.7.2.2, 3.7.2.3, 3.7.2.4, 3.7.2.5, and 3.7.2.6.
- 3.7.2.1 Flow Lines: Examination of a longitudinal section through the threaded portion of the shank shall show evidence that the threads were rolled (see Figure 3).

SAE AS7459 Revision A

- 3.7.2.2 Internal Defects: Examination of longitudinal sections of the head and shank shall reveal no cracks, laps, or porosity. Thread imperfections shall conform to the requirements of 3.7.2.6.
- 3.7.2.3 Microstructure: Parts shall have microstructure of tempered martensite.
- 3.7.2.4 Surface Hardening: Parts shall have no change in hardness from core to surface except as produced during cold rolling of the head-to-shank fillet radius and during rolling of threads. There shall be no evidence of carburization or nitriding. In case of dispute over results of the microscopic examination, microhardness testing shall be used as a referee method; a Vickers hardness reading of an unrolled surface which exceeds the reading in the core by more than 30 points shall be evidence of nonconformance to this requirement.
- 3.7.2.5 Decarburization:
- 3.7.2.5.1 The bearing surface of the head, the head-to-shank fillet radius, the shank, and the threads shall be free from decarburization.
- 3.7.2.5.2 Depth of decarburization on those surfaces of the head which are the original surfaces of the bar shall be not greater than that permitted by the applicable material specification for the size of stock used to make the part.
- 3.7.2.5.3 Depth of decarburization on the OD of the head of cylindrical head parts is not restricted.
- 3.7.2.5.4 Depth of decarburization at any point on the surface not covered by 3.7.2.5.1, 3.7.2.5.2, or 3.7.2.5.3 shall not exceed 0.002 inch.
- 3.7.2.6 Threads:
- 3.7.2.6.1 Root defects such as laps, seams, notches, slivers, folds, roughness, and oxide scale are not permissible (see Figure 4).
- 3.7.2.6.2 Multiple laps on the flanks of threads are not permissible regardless of location.
- 3.7.2.6.3 Single Lap on Thread Profile: Shall conform to the following:
- Thread Flank Above the Pitch Diameter: A single lap is permissible along the flank of the thread above the pitch diameter on either the pressure or nonpressure flank (one lap at any cross-section through the thread) provided it extends toward the crest and generally parallel to the flank (see Figure 5). The lap depth shall not exceed the limit specified in Table 1 for the applicable thread pitch. A lap extending toward the root is not permissible (see Figure 6).
 - Thread Flank Below the Pitch Diameter: A lap along the thread flank below the pitch diameter, regardless of direction it extends, is not permissible (see Figure 7).

3.7.2.6.3 (Continued):

- c. Crest craters, crest laps, or a crest lap in combination with a crest crater are permissible provided that the imperfections do not extend deeper than the limit specified in Table 1 as measured from the thread crest when the thread major diameter is at minimum size (see Figure 8). The major diameter of the thread shall be measured prior to sectioning. As the major diameter of the thread approaches maximum size, values for depth of crest crater and crest lap imperfections listed in Table 1 may be increased by one-half of the difference between the minimum major diameter and actual major diameter as measured on the part.

3.7.3 Magnetic Particle Inspection: Prior to any required plating or coating, parts shall be subject to magnetic particle inspection in accordance with ASTM E 1444; any method may be used but resolution of disputed rejections shall be based upon the wet, continuous, fluorescent suspension method.

3.7.3.1 The following conditions shall be cause for rejection of parts inspected.

3.7.3.1.1 Discontinuities transverse to grain flow (i.e., at an angle of more than 10° to the axis of the shank), such as grinding checks and cracks.

3.7.3.1.2 Longitudinal indications (i.e., at an angle of 10° or less to the axis of the shank) due to imperfections other than seams, forming laps, and nonmetallic inclusions.

3.7.3.2 The following conditions shall be considered acceptable on parts inspected:

3.7.3.2.1 Parts having longitudinal indications (i.e., at an angle of 10° or less to the axis of the shank) of seams and forming laps parallel to the grain flow that are within the limits specified in 3.7.3.2.2 through 3.7.3.2.5 provided the separation between indications is not less than 0.062 inch in all directions.

3.7.3.2.2 Sides of Head: There shall be not more than six indications or subsurface indications per head. The length of each indication may be the full height of the surface but no indication shall break over either edge to a depth greater than 0.031 inch or the equivalent of 2H/3 thread depth (see Table 1), whichever is less.

3.7.3.2.3 Shank or Stem: There shall be not more than 10 subsurface and hairline surface indications. The length of any indication may be the full length of the surface but the total length of all indications shall not exceed twice the length of the surface. No indication shall break into a fillet or over an edge.

3.7.3.2.4 Threads: There shall be no indications, except as permitted in 3.7.2.6.

3.7.3.2.5 Top of Head and End of Stem: The number of indications is not restricted but the depth of any individual indication shall not exceed 0.010 inch as shown by sectioning representative samples. No indication, except those of 3.7.3.2.2, shall break over an edge.

4. QUALITY ASSURANCE PROVISIONS:

4.1 Responsibility for Inspection:

The vendor of parts shall supply all samples and shall be responsible for performing all required tests. Purchaser reserves the right to perform such confirmatory testing as deemed necessary to ensure that the parts conform to the requirements of this specification.

4.2 Responsibility for Compliance:

The manufacturer's system for parts production shall be based on preventing product defects, rather than detecting the defects at final inspection and then requiring corrective action to be invoked. An effective manufacturing in-process control system shall be established, subject to the approval of the purchaser, and used during production of parts.

4.3 Production Acceptance Tests:

The purpose of production acceptance tests is to check, as simply as possible, using a method which is inexpensive and representative of the part usage, with the uncertainty inherent in random sampling, that the parts comprising a production inspection lot satisfy the requirements of this specification.

4.4 Classification of Tests:

- a. Acceptance tests which are to be performed on each production inspection lot. A summary of acceptance tests is specified in Table 3.
- b. Periodic tests which are to be performed periodically on production lots at the discretion of the vendor or purchaser. Ultimate tensile strength test at 900 °F in 3.6.2, fatigue strength test in 3.6.5, and stress-rupture test in 3.6.6 are classified as periodic test and shall be performed at a frequency selected by the vendor unless frequency of testing is specified by purchaser.

4.5 Acceptance Test Sampling:

- 4.5.1 Material: Sampling for material composition on each heat shall be in accordance with AMS 6304.
- 4.5.2 Non-Destructive Tests - Visual and Dimensional: A random sample of parts shall be taken from each production inspection lot; the size of the sample to be as specified in Table 4. The classification of dimensional characteristics shall be as specified in Table 5. All dimensional characteristics are considered defective when out of tolerance.
- 4.5.3 Magnetic Particle Inspection: A random sample shall be selected from each production inspection lot; the size of the sample shall be as specified in Table 4 and classified as in Table 5. The sample units may be selected from those that have been subjected to and passed the visual and dimensional inspection, with additional units selected at random from the production inspection lot as necessary.

SAE AS7459 Revision A

- 4.5.4 Macroscopic Examination: A random sample of one part shall be selected from each production inspection lot.
- 4.5.5 Destructive Tests: A random sample shall be selected from each production inspection lot; the size of the sample shall be as specified in Table 6. The sample units may be selected from those that have been subjected to and passed the non-destructive tests and the magnetic particle inspection, with additional units selected at random from the production inspection lot as necessary.
- 4.5.6 Acceptance Quality: Of random samples tested, acceptance quality shall be based on zero defectives.
- 4.5.7 Test Specimens: Specimens for tensile testing of machined test specimens shall be of standard proportions in accordance with ASTM E 8. Specimens shall be machined from finished parts or coupons of the same lot of alloy and be processed together with the parts they represent. Specimens shall be machined from the center of parts.
- 4.6 Periodic Test Sampling:
- As agreed upon by purchaser and vendor.
- 4.7 Reports:
- The vendor of parts shall furnish with each shipment a report stating that the chemical composition of the parts conforms to the applicable material specification, showing the results of tests to determine conformance to the room temperature ultimate tensile property, ultimate shear property where applicable, hardness, and stating that the parts conform to the other technical requirements. This report shall include the purchase order number, AS7459, lot number, contractor or other direct supplier of material, part number, nominal size, and quantity.
- 4.8 Rejected Lots:
- If a production inspection lot is rejected, the vendor of parts shall perform corrective action to screen out or rework the defective parts, resubmit for acceptance tests inspection as in Table 3, or scrap the entire lot. Resubmitted lots shall be clearly identified as re-inspected lots.
5. PREPARATION FOR DELIVERY:
- 5.1 Packaging and Identification:
- 5.1.1 Packaging shall be in accordance with ASTM D 3951.
- 5.1.2 Parts having different part numbers shall be packed in separate containers.

SAE AS7459 Revision A

5.1.3 Each container of parts shall be marked to show not less than the following information:

BOLTS (SCREWS), STEEL, LOW ALLOY, CLASSIFICATION 195 ksi/900 °F
AS7459 (or AS7459-1, -2, -3, as applicable)
PART NUMBER
LOT NUMBER
PURCHASE ORDER NUMBER
QUANTITY
MANUFACTURER'S IDENTIFICATION

5.1.4 Threaded fasteners shall be suitably protected from abrasion and chafing during handling, transportation, and storage.

6. ACKNOWLEDGMENT:

A vendor shall mention this specification number in all quotations and when acknowledging purchase orders.

7. REJECTIONS:

Parts not conforming to this specification, or to modifications authorized by purchaser, will be subject to rejection.

8. NOTES:

8.1 Hardness Conversion Tables:

Hardness conversion tables for metals are presented in ASTM E 140.

8.2 Key Words:

Bolts, screws, procurement specification

8.3 The change bar () located in the left margin is for the convenience of the user in locating areas where technical revisions, not editorial changes, have been made to the previous issue of this document. An (R) symbol to the left of the document title indicates a complete revision of the document.

PREPARED BY SAE COMMITTEE E-25,
GENERAL STANDARDS FOR AEROSPACE PROPULSION SYSTEMS

FIGURE 1 - Satisfactory Grain Flow, Headed Blank, Before Heat Treatment

Showing a smooth, well formed grain flow following the contour of the head-to-shank fillet radius.

Nominal Bolt Diameter inch	C, maximum inch
Up to 0.3125, excl	0.062
0.3125 and 0.375	0.094
0.4375 to 0.625, incl	0.125
0.750 to 1.000, incl	0.156
Over 1.000	0.188

FIGURE 2 - Permissible Distortion From Fillet Working

FIGURE 3 - Flow Lines, Rolled Thread

FIGURE 4 - Root Defects, Rolled Thread

FIGURE 5 - Laps Above Pitch Diameter Extending Towards Crest, Rolled Thread

FIGURE 6 - Laps Above PD Extending Toward Root, Rolled Thread

FIGURE 7 - Laps Below PD Extending In Any Direction, Rolled Thread

Note A: Maximum depth of imperfection equals 20% of $2H/3$ depth at MMC plus $1/2$ the difference of the actual thread depth and minimum major diameter.

FIGURE 8 - Crest Craters & Crest Laps, Rolled Thread

SAE AS7459 Revision A

TABLE 1 - UNJ Ext Thread Depth at 2H/3 and Allowable Thread Lap Depth

Thread Pitches Per Inch n	UNJ Ext Thread Depth at 2H/3 inch	Allowable Thread Lap Depth inch
40	0.0144	0.0029
36	0.0160	0.0032
32	0.0180	0.0036
28	0.0206	0.0041
24	0.0241	0.0048
20	0.0289	0.0058
18	0.0321	0.0064
16	0.0361	0.0072
14	0.0412	0.0082
13	0.0444	0.0089
12	0.0481	0.0096
11	0.0525	0.0105
10	0.0577	0.0115
9	0.0642	0.0128
8	0.0722	0.0144

Note 1: Allowable lap depth is based upon 20% of UNJ external thread depth at 2H/3 in accordance with MIL-S-8879, and is calculated as follows:

$$2H/3 \text{ ext thd depth} = (2/3) (\cos 30^\circ)/n = 0.57735/n$$

$$\text{Lap Depth} = 0.2(2H/3) = 0.2(2/3)(\cos 30^\circ)/n = 0.11547/n$$

SAE AS7459 Revision A

TABLE 2A - Test Loads for Bolts

Thread Size	Ultimate Tensile Strength Test Load, lbf min Room Temp.	Ultimate Tensile Strength Test Load, lbf min At 900 °F	Fatigue Test Load lbf max Room Temp.	Stress-Rupture Test Load lbf At 900 °F	Ultimate Double Shear Test Load lbf min
0.112 -40	1180	875	--	570	2300
0.112 -48	1290	958	--	638	2300
0.138 -32	1770	1320	816	857	3500
0.138 -40	1980	1470	935	982	3500
0.164 -32	2730	2030	1290	1350	4940
0.164 -36	2870	2140	1370	1440	4940
0.190 -32	3900	2900	1860	1950	6640
0.250 -28	7090	5270	3420	3590	11500
0.3125-24	11300	8420	5490	5760	17900
0.375 -24	17100	12700	8390	8810	25800
0.4375-20	23100	17200	11300	11900	35200
0.500 -20	31200	23200	15400	16100	45900
0.5625-18	39600	29400	19500	20500	58200
0.625 -18	49900	37100	24700	25900	71800
0.750 -16	72700	54100	36100	37900	103400
0.875 -14	99300	73900	49300	51800	140700
1.000 -12	129000	96100	64200	67400	183800

NOTE 1: Requirements above apply to parts with UNJC, or UNJF threads, as applicable for thread sizes shown, to Class 3A tolerances. The diameter of the area on which stress for room temperature and 900 °F ultimate tensile strength test load requirements is based is the UNJ basic minor diameter at 0.5625H thread depth, where H is the height of sharp V-thread, and its area is calculated from Equation 1:

$$A_1 = 0.7854(d - 1.125H)^2 = 0.7854[d - (0.9743/n)]^2 \quad (\text{Eq.1})$$

where:

A_1 = area for ultimate tensile stress
 d = maximum major diameter of external thread
 H = height of sharp V-thread = $(\cos 30^\circ)/n$
 n = number of thread pitches per inch
