SAE Technical Standards Board Rules provide that: "This report is published by SAE to advance the state of technical and engineering sciences. The use of this report is entirely voluntary, and its applicability and suitability for any particular use, including any patent infringement arising therefrom, is the sole responsibility of the user."

SAE reviews each technical report at least every five years at which time it may be reaffirmed, revised, or cancelled. SAE invites your written comments and suggestions.

SAE WEB ADDRESS:

1. Scope

This SAE Standard defines methods and apparatus to evaluate electronic devices for immunity to potential interference from conducted transients along battery feed or switched ignition inputs. Test apparatus specifications outlined in this procedure were developed for component installed in vehicles with 12 V systems (passenger cars and light trucks, 12 V heavy-duty trucks, and vehicles with 24 V systems). Presently, it is not intended for use on other input/output (I/O) lines of the device under test (DUT).

1.1 Measurement Philosophy

Installed electrical equipment is powered from sources which contain, in addition to the desired electrical voltage, transients with peak values many times this value, caused by the release of stored energy during the operation of a relay and/or other loads connected to the source while starting and/or turning off the vehicle. These tests are designed to determine the capability of equipment to withstand such transients. The tests are performed in the laboratory (bench tests). Bench test methods give results, which allow comparison between laboratories.

These tests may not cover all types of transients, which can occur in a vehicle. The test pulses described in Section 8 are, however, characteristic of typical pulses. To ensure proper operation of a vehicle in the electromagnetic environment, vehicle testing should be performed in addition to bench testing.

1.2 Rationale

The March 2000 version of this standard has been revised to incorporate the latest changes in the International Standards ISO 7637 Part 2. Pulse 4 and pulse 5 have been deleted from this document (moved to ISO 16750-2). Appendix C (Generator Energy Capability) and Appendix D (Origin of Transients) have also been added.

2. References

General information regarding this document, including definitions, references, and general safety considerations is found in SAE J1113-1.

2.1 Applicable Publications

The following publications form a part of the specification to the extent specified herein. Unless otherwise indicated, the latest revision of SAE publications shall apply.

2.1.1 SAE PUBLICATION

Available from SAE, 400 Commonwealth Drive, Warrendale, PA 15096-0001, Tel: 877-606-7323 (inside USA and Canada) or 724-776-4970 (outside USA), www.sae.org.

2.1.2 ISO PUBLICATION

Available from ANSI, 25 West 43rd Street, New York, NY 10036-8002, Tel: 212-642-4900, www.ansi.org.

ISO 7637-2.3 (Release date 2002)—Road vehicles—Electrical disturbance by conduction and coupling—
Part 2.3: Electrical transient conduction along supply lines only

3. Test Equipment

3.1 Test Facility

Care shall be taken to ensure that the electromagnetic environment (radiated background noise) is not so high as to interfere with the measurement instrumentation setup.

3.2 Test Instrumentation

The following list defines the equipment needed to perform the test.

3.2.1 OSCILLOSCOPE

The use of a digitizing oscilloscope is preferred. If a digitizing oscilloscope is not available, a storage oscilloscope may be used. The oscilloscope used shall meet the following requirements:

a. Digitizing Oscilloscope

Sampling Rate.....	2 gigasamples/s (min)
Memory Size	1000 samples (min)
Bandwidth	DC to 400 MHz (min)
Input Sensitivity.....	5 mV/div (min)
High Impedance (input impedance >1 MΩ) oscilloscope shall be used	

b. Storage Oscilloscope

Bandwidth (Single Shot).....	DC to 400 MHz (min)
Input Sensitivity.....	5 mV/div (min)
Writing Speed.....	100 cm/μs (min)
High Impedance (input impedance >1 MΩ) oscilloscope shall be used	

3.2.2 VOLTAGE PROBE

Attenuation.....	100:1
Min. Breakdown Voltage	1.5 kV
Input Impedance	1 M
Probe Cable Length	3 m (max)
Probe Ground Length	130 mm (max)
Probe Capacitance C.....	< 10pf

3.2.3 DC POWER SUPPLY

(See J1113-1.)

If a standard power supply (with sufficient current capacity) is used to simulate the battery, it is important that the low internal impedance of the battery is also simulated.

When a battery is used, a charging source may be needed to achieve the specified reference levels.

3.2.4 VEHICLE SIMULATOR

A vehicle simulator unit shall be provided. This device must be capable of providing the inputs and loads necessary to exercise the DUT such that it operates as if it were installed in the vehicle.

3.2.5 DUT MONITORING INSTRUMENTATION

Instrumentation and/or visual observation shall be used to monitor the parameters of the DUT as stated in the Test Plan.

3.2.6 TEST PULSE GENERATOR

The test pulse generator shall be capable of producing the open circuit test pulses described in Section 8 at the maximum value of $|V_s|$. V_s shall be adjustable up to its limits.

The peak voltage V_s shall be adjusted to the test levels specified in Appendix B with tolerances of +10% and -0%. The timing (t) tolerances and internal resistance (R_i) tolerance shall be $\pm 20\%$ unless otherwise specified.

A verification procedure for the generator performance and tolerances is described in Appendix A.

Recommended values for the evaluation of immunity of devices can be chosen from Appendix B.

3.3 Test Voltages

The test voltages shall be as shown in Table 1 unless other values are agreed upon by the users of this document, in which case such values shall be documented in the test report.

TABLE 1—TEST VOLTAGES

Test Voltage	12 V System V	24 V System V
V_A	13.5 ± 0.5	27 ± 1
V_B	12 ± 0.2	24 ± 0.4

3.4 Test Set-Up Documentation

When testing is performed, all related details of the test shall be documented per Section 7. This includes details on test set-up, wiring harnesses, equipment used, and the DUT.

4. Test Plan

Prior to testing, a Test Plan shall be developed by those responsible for the specific DUT. In general, the Test Plan is based on the Product Specification and is agreed upon by the customer and supplier. The Test Plan should include all the details of the tests to be performed, such as: the DUT functions to be monitored; their function performance status classifications and Test Severity Levels as defined in Section 6 and Appendix B; the definitions of DUT performance deviations; and the order, level, repetition rate, and number of applications of the waveforms. Unless otherwise specified by the Test Plan, all tests shall be conducted at room temperature ($23^{\circ}\text{C} \pm 5^{\circ}\text{C}$).

NOTE—**Special consideration for time between test pulses and number of test pulses:** Period t_1 , the time between test pulses given with each test pulse definition, is a default value, which applies to DUTs without timing or dynamic processes. Consideration should be given in the Test Plan for each DUT function whose susceptibility may vary according to its internal timing or processing functions. Selection of time between pulses and number of pulses should maximize the probability that a test pulse will be applied during times of highest DUT susceptibility. In no case should the time between test pulses be less than the response time of the transient generator.

5. Test Procedure

5.1 The test setup is given in Figures 1A and 1B.

For test pulses 3a and 3b, the leads between the terminals of the test pulse generator and the device under test shall be laid out in a straight parallel line, shall have a height of $(50\text{ mm} + 10/-0\text{ mm})$ and shall have a length of $0.5\text{ m} \pm 0.1\text{ m}$.

The test pulse generator (see 3.2.6) shall be capable of producing the open circuit waveforms shown in Figures 2 through 9 with the parameters given in Tables 3 to 10.

The test pulse generator is verified according to Appendix A and then set up to provide the specific pulse polarity, amplitude, duration, and resistance with the DUT and optional resistance R_v and suppression diode bridge disconnected (see Figure 1A). (The appropriate voltage values are selected from Appendix B).

FIGURE 1B—TRANSIENT IMMUNITY TEST SET-UP—PULSE INJECTION

* Note: The test pulse generator can be located either on or off the ground plane.

** Note: Can be connected to the test apparatus during test to obtain additional information for engineering analysis (optional).

5.2 Connect the DUT to the generator (see Figure 1B) and disconnect the oscilloscope.

5.3 Apply the transient to the DUT.

5.4 Monitor the DUT's performance during/after transient injection for any deviations.

5.5 Perform the appropriate functional tests, per the test plan, to determine deviations and record the results as outlined in Section 7.

NOTE 1—In determining the susceptibility level, care must be exercised to eliminate the effects of cumulative deterioration such as dielectric “punch through” in semi-conductor devices.

NOTE 2—When testing to a specified level, unnoticed deviations may occur which may be detected only by performing functional tests and comparing the results of tested components against those of untested components.

6. Test Severity Levels and Evaluation of Results

- 6.1** A full description and discussion of the Function Performance Status Classification including Test Severity Levels are given in SAE J1113-1. It should be reviewed prior to using the Test Severity Levels presented in Appendix B.
- 6.2** A careful examination of the DUT shall be made during and after the completion of a test to determine proper operation. Any irregularities shall be recorded in the Test Report and shall be evaluated based on the Test Plan, the specifications covering the product being tested, or by agreement between the purchaser and supplier.

7. Test Documentation

The following information shall be recorded, unless otherwise prescribed in the Test Plan covering the product being tested:

- 7.1** Part number and/or description of the DUT.
- 7.2** Copy of the original Test Plan.
- 7.3** Description of the test setup and equipment used.
- 7.4** Description of the harness used between the injection apparatus and the DUT.
- 7.5** Test Pulse being applied (by number).
- 7.6** Order of injection for each of the waveform amplitudes.
- 7.7** Number (repetitions) of the pulse applied.
- 7.8** Pulse period (interval between pulses).
- 7.9** Any deviation from the waveforms prescribed for testing.
- 7.10** Point of application of pulse (pin number, letter, or name).
- 7.11** Exact characteristics of any disturbance during injection of the pulse.

8. Test Pulses

**APPENDIX A
(NORMATIVE)
TEST PULSE GENERATOR VERIFICATION PROCEDURE**

A.1 Scope

The purpose of this appendix is to provide a method for the verification of the output characteristics of test pulse generators.

A.2 General

See 3.2 for measurement instrumentation requirements

The verification measurements described in Section A.3 shall be conducted under two different load conditions to determine the behavior of the test generator.

- a. Under no load conditions
- b. Under matched load conditions

The V_A and V_B for this verification procedure are 0 V.

Care shall be taken for the selection of the resistors. They shall have sufficient power dissipation for both pulse and DC supply rating. Additionally they shall be non-inductive. The tolerance of the matching resistor shall be $\pm 1\%$.

A.3 Pulse verification**A.3.1 Test Pulse 1****A.3.1.1 (12 V SYSTEM)****TABLE A1—PULSE 1—12 V VERIFICATION VALUES**

	V_s	t_r	t_d

**APPENDIX C
(INFORMATIVE)
DETERMINATION OF PULSE GENERATOR'S ENERGY CAPABILITY**

C.1 Determination and Verification of Pulse Generator Minimum Energy Capability

C.2 Calculation Method for Determination of Minimum Energy Capability Specification

This method is to calculate the energy of the pulse as delivered by the generator to the matching resistor (resistive load R_L) utilizing the measured pulse parameters T_d and V_s .

The transient generator used for this document shall generate double exponential transients, which are a result of capacitive discharges into a pulse shaping network. This type of generator is used for the pulses 1(12 V), 1(24 V), 2a, 3a/3b and pulse 5.

Pulse 2b and pulse 4 have to be realized by programmable dc power sources.

Key

- 1 Power supply
- 2 Capacitor C_s
- 3 Pulse shaping network with internal resistance R_i
- 4 Pulse output
- 5 Matching load resistor R_L

FIGURE C1—EXAMPLE OF A SIMPLIFIED CIRCUIT DIAGRAM
OF A TRANSIENT GENERATOR

FIGURE C2—DOUBLE EXPONENTIAL PULSE SHAPE GENERATED BY A TRANSIENT GENERATOR

The influence of the rise time is not taken into account ($t_r \ll t_d$), which is allowed for all pulses specified in this document.

C.2.1 Voltage Function

$$V(t) = \frac{V_0 \times R_L}{R_i + R_L} \times e^{-\left(\frac{2.3 \times t}{T_d}\right)} \quad (\text{Eq. C1})$$

where:

V_0 is the open circuit output voltage
 R_i is the source resistor of the generator
 R_L is the load resistor for the generator
 t_d is the pulse width 10% to 10% of V_s
 $V(t)$ is a function of the voltage wave shape

C.2.2 Current Function

$$I(t) = \frac{1}{R_L} \times \frac{V_0 \times R_L}{R_i + R_L} \times e^{-\left(\frac{2.3 \times t}{T_d}\right)} = \frac{V_0}{R_i + R_L} \times e^{-\left(\frac{2.3 \times t}{T_d}\right)} \quad (\text{Eq. C2})$$

where:

V_0 is the open circuit output voltage
 R_i is the source resistor of the generator
 R_L is the load resistor for the generator
 t_d is the pulse width 10% to 10% of V_s
 $I(t)$ is a function of the current wave shape
