Ø HARDENABILITY BANDS FOR CARBON AND ALLOY H STEELS

1. INTRODUCTION:

The SAE Iron and Steel Technical Committee - Division 14 in cooperation with the Technical Committee on Alloy Steel Bars of the American Iron and Steel Institute devised hardenability bands for the constructional alloy steels. The initial SAE Standard for H Steels was published in 1948 and numerous revisions and additions have been issued in the intervening years. The SAE Iron and Steel Technical Committee established Division 8 in 1960 to devise hardenability bands for carbon steels. The result of Division 8 efforts is the SAE Recommended Practice J776.

Since that time, Division 14 has been dissolved and Division 1 was formed and was given responsibility for Carbon and Alloy Steel Bars. Division 8 is now responsible for Hardenability for Carbon and Alloy Steels. This trend was followed by the American Iron and Steel Institute which now has a technical committee for bars which covers both carbon and alloy steels.

SAE Recommended Practice J776 and the SAE Standard J407 were retired and the carbon and alloy H-Band Steels are combined in this new standard.

2. GRADES OF STEEL:

H steels and their corresponding minimum and maximum hardenability limits are shown for all of the carbon and alloy steels for which there are sufficient hardenability data and for grades that can use the standard end quench test. As hardenability data are accumulated for other grades, this standard will be revised to include such grades.

SAE Technical Board Rules provide that: "This report is published by SAE to advance the state of technical and engineering sciences. The use of this report is entirely voluntary, and its applicability and suitability for any particular use, including any patent infringement arising therefrom, is the sole responsibility of the user."

SAE reviews each technical report at least every five years at which time it may be reaffirmed, revised, or cancelled. SAE invites your written comments and suggestions.

3. CHEMICAL COMPOSITION LIMITS:

To permit steel producers the necessary latitude to meet a common standard of hardenability limits, the chemical composition limits of these steels have been broadened somewhat from those limits applicable to the same grades when specified by chemical composition only (J403 and J404). These broader limits permit adjustments in manufacturing ranges of chemistry to correct for individual plant melting characteristics which might otherwise influence the levels and widths of the bands. The modifications have not been great enough to influence the general characteristics of the original compositions of the series under consideration.

The chemical composition limits for electric furnace, open hearth, and BOF steels are outlined in Tables 1 and 2 and are subject to the permissible variations for product analysis outlined in Tables 1 and 3 of SAE J409.

4. IDENTIFICATION:

As a means of identifying steels specified to hardenability band limits, the suffix letter H has been added to the conventional series number. In the Unified Numbering System, the H appears as a prefix. It is important that steel consumers use this letter in specification requirements, as there is no other means of determining when hardenability band limits apply. When the letter is used, all conditions pertaining to chemical composition limits, restrictions, testing technique, and so forth, as outlined herein apply.

5. GRAIN SIZE:

The limits set forth for bands are intended to apply to steels exhibiting austenitic grain size 5 or finer (see SAE J418). In cases where coarse grain steel is desired, the hardenability limits shall be a matter of agreement between producer and consumer.

6. USE OF HARDENABILITY LIMITS:

Band limits are shown graphically and are so depicted for convenience in estimating the hardness value obtainable at various locations on the end quench test bar and for quick comparisons of the various H grades.

The values of Diameter of Rounds, with Same As-Quenched Hardness shown above each H-band, are approximate and were selected from the ranges appearing in Fig. 7 of SAE J406.

It should be noted that hardenability limits are presented graphically in both U.S. customary units and also in metric (SI) units. The metric hardenability bands were prepared by careful conversion from existing bands in U.S. customary units.

In either case, for specification purposes, the tabulated values of Rockwell hardness (HRC) are used. Values below 20 HRC are not specified because such values are not as accurate.

6. (Continued):

Two points from the tabulated values are commonly designated according to one of methods A, B, C, D, or E, which are defined in the following paragraphs. Those various methods are illustrated graphically in Figs. 1 and 2. Note that nearest whole integers of distance and hardness are to be used, not fractions.

- 6.1 The minimum and maximum hardness values at any desired distance. This method is illustrated in Figs. 1 and 2 as points A-A.
- 6.2 The minimum and maximum distance at which any desired hardness value occurs. This method is illustrated in Figs. 1 and 2 as points B-B. If the desired hardness does not fall on an exact sixteenth (or mm) position, the minimum distance selected should be the nearest sixteenth (or mm) position toward the quenched end and the maximum should be the nearest sixteenth (or mm) position away from the quenched end.
- 6.3 Two maximum hardness values at two desired distances, illustrated in Figs. 1 and 2 as points C-C.
- 6.4 Two minimum hardness values at two desired distances, illustrated in Figs. 1 and 2 as points D-D.
- 6.5 Any minimum hardness plus any maximum hardness, illustrated in Figs. 1 and 2 as points E-E.

When hardenability is specified according to one of the aforementioned methods A to E, the balance of the hardenability band is not applicable.

In cases when it is considered desirable, the maximum and minimum limits at a distance of 1/16 in (or 1.5 mm) from the quenched end can be specified in addition to the other two points as previously described in paragraphs A to E, inclusive.

When the full H-band is specified, the hardenability can be reported by listing hardness values from the quenched end to the test specimen for each 1/16-16/16 in and 1/4 in increments from there to 32/16 in. In the case of the metric end quench test, hardness values would be reported for 1.5, 3, 5, 7, 9, 11, 13, 15, 20, 25, 30, 35, 40, 45 and 50 mm from the quenched end. Except at the 1/16 in or 1.5 mm position, it is customary to accept a tolerance of two points HRC for a 3/16 in or 5 mm portion of the curve. This tolerance is necessary because curves of individual heats may vary somewhat in shape from the standard band limits and thus deviate slightly at one or more positions in the full length of the curves.

For shallow hardening carbon H steels, distances from the quenched end may be reported by listing hardness values for each 1/16 in or 1.5 mm or 1/32 in or 0.75 mm (rather than full sixteenths or 1.5 mm only as with alloy steels).

The technique of testing for acceptance should be in accordance with SAE J406.

7. GENERAL:

The hardenability limits in this standard are those for regular quality steels produced in accordance with the Steel Products Manuals published by AISI (American Iron and Steel Institute). Some of the steels in this standard can be specified to more restricted hardenability ranges; consult SAE J1868.

TABLE 1 - Carbon and Carbon Boron H Steels Composition

UNS No.	SAE or AISI Steel No.	Ladle Chemical Composition, Weight %				S, max ^b
		C	Mn	Si	P, max ^b

^aThe ranges and limits on this table apply only to material not exceeding 200 in² (0.13 m²) in cross sectional area, 18 in (460 mm) in width, or 10 000 lb (4.5 tonne) per piece in weight. Ranges and limits are subject to the permissible variations for product analysis shown in Table 4 of SAE J409.

^bSmall quantities of certain elements may be found in alloy steel which are not specified or required. These elements are to be considered as incidental and acceptable to the following maximum amounts: copper to 0.35%, nickel to 0.25%, chromium to 0.20%, and molybdenum to 0.06%.

^cFor open hearth and basic oxygen steels maximum sulfur content is to be 0.040% and maximum phosphorus content is to be 0.035%. Maximum phosphorus and sulfur in basic electric furnace steels are to be 0.025% each.

^dSulfur content range is 0.035/0.050%.

^fElectric furnace steel.

^aThe ranges and limits on this table apply only to material not exceeding 200 in² (0.13 m²) in cross sectional area, 18 in (460 mm) in width, or 10 000 lb (4.5 tonne) per piece in weight. Ranges and limits are subject to the permissible variations for product analysis shown in Table 4 of SAE J409.

^bSmall quantities of certain elements may be found in alloy steel which are not specified or required. These elements are to be considered as incidental and acceptable to the following maximum amounts: copper to 0.35%, nickel to 0.25%, chromium to 0.20%, and molybdenum to 0.06%.

^cFor open hearth and basic oxygen steels maximum sulfur content is to be 0.040% and maximum phosphorus content is to be 0.035%. Maximum phosphorus and sulfur in basic electric furnace steels are to be 0.025% each.

^eThese steels contain 0.0005-0.003% boron.

^fElectric furnace steel.

Method	Example
A Minimum and maximum hardness values at a designated distance	A-A 43 to 54 HRC at J 3/16
B A hardness value at minimum and maximum distances	B-B 39 HRC at J 4/16 min 39 HRC at J 9/16 max
C Two maximum hardness values at two designated distances	C-C 50 HRC at J 5/16 max 34 HRC at J 12/16 max
D Two minimum hardness values at two distances	D-D 35 HRC at J 5/16 min 21 HRC at J 16/16 min
E Any minimum hardness plus any maximum hardness	E-E 32 HRC at J 6/16 min 37 HRC at J 10/16 max
