

	SURFACE VEHICLE RECOMMENDED PRACTICE	SAE J1772™ FEB2012
		Issued 1996-10 Revised 2012-02
		Superseding J1772™ NOV2001
(R) SAE Electric Vehicle and Plug in Hybrid Electric Vehicle Conductive Charge Coupler		

RATIONALE

This recommended practice redefines AC Level 1 and AC Level 2 charge levels and specifies a conductive charge coupler and electrical interfaces for AC Level 1 and AC Level 2 charging. The coupler and interfaces for DC charging are currently being developed and will be added to this document upon completion. Adoption of multiple standard charge couplers based on charge level will enable selection of an appropriate charge coupler based on vehicle requirements thus allowing for better vehicle packaging, reduced cost, and ease of customer use. This revision includes technical and editorial clarifications based on feedback from vehicle and equipment manufactures on the January 2010 revision.

FOREWORD

Energy stored in a battery provides power for an Electric Vehicle (EV) or Plug In Hybrid Electric Vehicles (PHEV). Conductive charging is a method for connecting the electric power supply network to the EV/PHEV for the purpose of transferring energy to charge the battery and operate other vehicle electrical systems, establishing a reliable equipment grounding path, and exchanging control information between the EV/PHEV and the supply equipment. This document describes the electrical and physical interfaces between the EV/PHEV and supply equipment to facilitate conductive charging. Functional and performance requirements for the EV/PHEV and supply equipment are also specified. This document contains 51 pages, including this page, and should not be used as a design tool if any of the pages are missing.

NOTE: This SAE Recommended Practice is intended as a guide toward standard practice and is subject to change in order to harmonize with international standards and to keep pace with experience and technical advances.

SAE Technical Standards Board Rules provide that: "This report is published by SAE to advance the state of technical and engineering sciences. The use of this report is entirely voluntary, and its applicability and suitability for any particular use, including any patent infringement arising therefrom, is the sole responsibility of the user."

SAE reviews each technical report at least every five years at which time it may be revised, reaffirmed, stabilized, or cancelled. SAE invites your written comments and suggestions.

1. SCOPE

This SAE Recommended Practice covers the general physical, electrical, functional and performance requirements to facilitate conductive charging of EV/PHEV vehicles in North America. This document defines a common EV/PHEV and supply equipment vehicle conductive charging method including operational requirements and the functional and dimensional requirements for the vehicle inlet and mating connector.

3. DEFINITIONS

3.1 AC LEVEL 1 CHARGING

A method that allows an EV/PHEV to be connected to the most common grounded electrical receptacles (NEMA 5-15R and NEMA 5-20R). The vehicle shall be fitted with an on-board charger capable of accepting energy from the existing single phase alternating current (AC) supply network. The maximum power supplied for AC Level 1 charging shall conform to the values in Table 1. A cord and plug EVSE with a NEMA 5-15P plug may be used with a NEMA 5-20R receptacle. A cord and plug EVSE with a NEMA 5-20P plug is not compatible with a NEMA 5-15R receptacle.

3.2 AC LEVEL 2 CHARGING

A method that uses dedicated AC EV/PHEV supply equipment in either private or public locations. The vehicle shall be fitted with an on-board charger capable of accepting energy from single phase alternating current (AC) electric vehicle supply equipment. The maximum power supplied for AC Level 2 charging shall conform to the values in Table 1.

3.3 CHARGER

An electrical device that converts alternating current energy to regulated direct current for replenishing the energy of a rechargeable energy storage device (i.e., battery) and may also provide energy for operating other vehicle electrical systems.

3.4 CHASSIS GROUND

The conductor used to connect the non-current carrying metal parts of the vehicle high voltage system to the equipment ground.

3.5 CONDUCTIVE

Having the ability to transmit electricity through a physical path (conductor).

3.6 CONNECTOR (CHARGE)

A conductive device that by insertion into a vehicle inlet establishes an electrical connection to the electric vehicle for the purpose of transferring energy and exchanging information. This is part of the coupler.

3.7 CONTACT (CHARGE)

A conductive element in a connector that mates with a corresponding element in the vehicle inlet to provide an electrical path.

3.8 CONTROL PILOT

An electrical signal that is sourced by the Electric Vehicle Supply Equipment (EVSE). Control Pilot is the primary control conductor and is connected to the equipment ground through control circuitry on the vehicle and performs the following functions:

- a. Verifies that the vehicle is present and connected
- b. Permits energization/de-energization of the supply
- c. Transmits supply equipment current rating to the vehicle
- d. Monitors the presence of the equipment ground
- e. Establishes vehicle ventilation requirements

3.9 COUPLER (CHARGE)

A mating vehicle inlet and connector set.

3.10 DC CHARGING

A method that uses dedicated direct current (DC) EV/PHEV supply equipment to provide energy from an appropriate off-board charger to the EV/PHEV in either private or public locations.

3.11 ELECTRIC VEHICLE (EV)

An automotive type vehicle, intended for highway use, primarily powered by an electric motor that draws from a rechargeable energy storage device. For the purpose of this document the definition in the United States Code of Federal Regulations – Title 40, Part 600, Subchapter Q is used. Specifically, an automobile means:

- a. Any four wheeled vehicle propelled by a combustion engine using on-board fuel or by an electric motor drawing current from a rechargeable storage battery or other portable energy devices (rechargeable using energy from a source off the vehicle such as residential electric service).
- b. Which is manufactured primarily for use on public streets, roads, and highways.
- c. Which is rated not more than 3855.6 kg (8500 lb), which has a curb weight of not more than 2721.6 kg (6000 lb), and which has a basic frontal area of not more than 4.18 m² (45 ft²).

3.12 ELECTRIC VEHICLE SUPPLY EQUIPMENT (EVSE)

The conductors, including the ungrounded, grounded, and equipment grounding conductors, the electric vehicle connectors, attachment plugs, and all other fittings, devices, power outlets, or apparatuses installed specifically for the purpose of delivering energy from the premises wiring to the electric vehicle. Charging cords with NEMA 5-15P and NEMA 5-20P attachment plugs are considered EVSEs.

3.13 EQUIPMENT GROUND (GROUNDING CONDUCTOR)

A conductor used to connect the non-current carrying metal parts of the EV/PHEV supply equipment to the system grounding conductor, the grounding electrode conductor, or both, at the service equipment.

3.14 EV/PHEV CHARGING SYSTEM

The equipment required to condition and transfer energy from the constant frequency, constant voltage supply network to the direct current, variable voltage EV/PHEV traction battery bus for the purpose of charging the battery and/or operating vehicle electrical systems while connected.

3.15 INSULATOR

The portion of a charging system that provides for the separation, support, sealing, and protection from live parts.

3.16 OFF-BOARD CHARGER

A charger located off of the vehicle.

3.17 ON-BOARD CHARGER

A charger located on the vehicle.

3.18 PLUG IN HYBRID ELECTRIC VEHICLE (PHEV)

A hybrid vehicle with the ability to store and use off-board electrical energy in a rechargeable energy storage device.

3.19 VEHICLE INLET (CHARGE)

The device on the electric vehicle into which the connector is inserted for the purpose of transferring energy and exchanging information. This is part of the coupler.

4. GENERAL CONDUCTIVE CHARGING SYSTEM DESCRIPTION

In the most fundamental sense, there are 3 functions, 2 electrical and 1 mechanical, that must be performed to allow charging of the EV/PHEV battery from the electric supply network. The electric supply network transmits alternating current electrical energy at various nominal voltages (rms) and a frequency of 60 Hz. The EV/PHEV battery is a DC device that operates at a varying voltage depending on the nominal battery voltage, state-of-charge, and charge/discharge rate. The first electrical function converts the AC to DC and is commonly referred to as rectification. The second electrical function is the control or regulation of the supply voltage to a level that permits a managed charge rate based on the battery charge acceptance characteristics – i.e., voltage, capacity, electrochemistry, and other parameters. The combination of these two functions are the embodiment of a charger. The mechanical function is the physical coupling or connecting of the EV/PHEV to the EVSE and is performed by the user. The conductive charging system consists of a charger and a coupler. The conductive system architecture is suitable for use with electrical ratings as specified in Table 1 and as shown in Figure 1.

It is recommended that residential EVSEs input current rating be limited to 32 amp (40 amp branch breaker) unless the EVSE is part of a home energy management system. Residential EVSEs with input current ratings of greater than 32 amp without home energy management may require substantial infrastructure investment by the resident owner, utility, or both.

TABLE 1 - CHARGE METHOD ELECTRICAL RATINGS (NORTH AMERICA)

Charge Method	Nominal Supply Voltage (V)	Max Current (Amps-continuous)	Branch Circuit Breaker rating (Amps)
AC Level 1	120 V AC, 1-phase	12 A	15 A (min)
	120 V AC, 1-phase	16 A	20 A
AC Level 2	208 to 240 V AC, 1-phase	≤ 80 A	Per NEC 625
DC Charging	Under Development: See Appendix D		

FIGURE 1 - CONDUCTIVE EV/PHEV CHARGING SYSTEM ARCHITECTURE

4.1 AC Level 1 and AC Level 2 Interface Functions

The conductive coupler consists of a connector/vehicle inlet set with electromechanical contacts imbedded in an insulator and contained within a housing for each of the mating parts. The contacts provide a physical connection at the vehicle interface for the power conductors, equipment grounding conductor, and control pilot conductor between the EV/PHEV and EVSE. In addition a proximity sense conductor is provided between the EV/PHEV and charge connector. The interface consists of 5 contacts that perform the interface functions as shown in Figure 2 and specified in Table 2.

FIGURE 2 - AC LEVEL 1 AND AC LEVEL 2 CONDUCTIVE COUPLER CONTACT INTERFACE FUNCTIONS

TABLE 2 - AC LEVEL 1 AND AC LEVEL 2 CONDUCTIVE COUPLER CONTACT FUNCTIONS

Contact #	Connector Function	Vehicle Inlet Function	Description
1	AC Power (L1)	Charger 1	Power for AC Level 1 and 2
2	AC Power (L2,N)	Charger 2	Power for AC Level 1 and 2
3	Equipment ground	Chassis ground	Connect EVSE equipment grounding conductor to EV/PHEV chassis ground during charging
4	Control pilot	Control pilot	Primary control conductor (operation described in Section 5)
5	Proximity Detection	Proximity Detection	Allows vehicle to detect presence of charge connector

A method of EV/PHEV charging that extends AC power from the most common grounded electrical receptacle to an on-board charger using an appropriate cord set, as shown in Figure 3 at the electrical ratings specified in Table 1. AC level 1 allows connection to existing electrical receptacles in compliance with the National Electrical Code - Article 625.

FIGURE 3 - AC LEVEL 1 SYSTEM CONFIGURATION
Figure Illustrates Vehicle Charging

4.3 AC Level 2 Charging

The primary method of EV/PHEV charging that extends AC power from the electric supply to an on-board charger from a dedicated EVSE as shown in Figure 4. The electrical ratings are similar to large household appliances and specified in Table 1. AC Level 2 may be utilized at home, workplace, and public charging facilities.

FIGURE 4 – AC LEVEL 2 SYSTEM CONFIGURATION
Figure Illustrates Vehicle Charging

4.4 DC Charging

Under development. See Appendix D for additional DC charging information.

5. CONTROL AND DATA

The control pilot circuit is the primary control means to ensure proper operation when connecting an EV/PHEV to the EVSE. This section describes the functions and sequencing of events for this circuit based on the recommended typical implementation or equivalent circuit parameters.

5.1 Typical Control Pilot Circuit

A typical control pilot circuit is shown in Figure 5.

FIGURE 5 - TYPICAL CONTROL PILOT CIRCUIT

5.2 Equivalent Control Pilot Circuit

The equivalent control pilot circuit and vehicle states are shown in Figure 6 and defined in Table 3, 3A, Table 4, and Table 5.

FIGURE 6 - CONTROL PILOT EQUIVALENT CIRCUIT

TABLE 3 - DEFINITION OF VEHICLE / EVSE STATES

State Designation	Voltage (vdc Nominal) ⁽⁵⁾	Description of Vehicle / EVSE State
State A	12.0 ⁽¹⁾	Vehicle not connected
State B1	9.0 ⁽¹⁾	Vehicle connected / not ready to accept energy EVSE not ready to supply energy,
State B2	9.0 ⁽²⁾⁽³⁾	Vehicle connected / not ready to accept energy EVSE capable to supply energy
State C	6.0 ⁽²⁾	Vehicle connected / ready to accept energy / indoor charging area ventilation not required EVSE capable to supply energy
State D	3.0 ⁽²⁾	Vehicle connected / ready to accept energy / indoor charging area ventilation required EVSE capable to supply energy
State E ⁽⁴⁾	0	EVSE disconnected from vehicle No AC power to EVSE, or control pilot short to utility ground
State F	-12.0 ⁽¹⁾⁽⁶⁾	Other EVSE problem.

1. Static voltage.
2. Positive portion of 1 KHz square wave, measured after transition has fully settled.
3. The transition from State B1 to State B2 begins as a static DC voltage which transitions to PWM upon the EVSE detection of vehicle connected / not ready to accept energy and EVSE capable to provide energy.
4. EVSE is not required to actively generate State E.
5. Voltage measured by EVSE as shown in Figure 5.
6. Optional state. The EVSE may enter State F upon detecting a self diagnosed fault that prevents the EVSE from delivering power. This option would require user intervention to reset the EVSE to restore normal operation.

TABLE 3A – CONTROL PILOT STATE VOLTAGE RANGE REFERENCE FROM MATED CHARGE COUPLER INTERFACE

State	Min Voltage	Nominal Voltage	Max Voltage
State A	11.40	12.00	12.60
State B1	8.36	9.00	9.56
State B2	8.36	9.00	9.56
State C	5.48	6.00	6.49
State D	2.62	3.00	3.25

Table Calculation Parameters

1. The maximum, nominal, and minimum positive regulator voltages from Table 4 (State A)
2. The maximum, nominal, and minimum resistance values allowed for each state from Table 5
3. The maximum and minimum diode voltage extremes allowed in Table 5
4. For nominal voltages, the midpoint of the diode voltage extremes in Table 5 (0.70V) was used

TABLE 4 - EVSE CONTROL PILOT CIRCUIT PARAMETERS (SEE FIGURE 6)

Parameter ⁽¹⁾	Symbol	Units	Nominal Value	Max Value	Min Value
Generator					
voltage high, open circuit	Voch	V	12.00	12.60	11.40
voltage low, open circuit	Vocl	V	-12.00	-12.60	-11.40
Frequency	Fo	Hertz	1000	1020	980
pulse width ⁽²⁾	Pwo	Microsec	Per Figure 7	Nom, + 5 μ s	Nom, - 5 μ s
rise time ⁽³⁾	Trg	Microsec	n.a.	2	n.a.
fall time ⁽³⁾	Tfg	Microsec	n.a.	2	n.a.
settling time ⁽⁴⁾	Tsg	Microsec	n.a.	3	n.a.
Output Components					
equivalent source resistance	R1	Ohms	1000	1030 ⁽⁵⁾	970 ⁽⁵⁾
total equivalent EVSE capacitance, w/o cable	C1	Picofarads	n.a.	n.a.	300 ⁽⁶⁾
total equivalent EVSE capacitance, including cable	C1 + Cc	Picofarads	n.a.	3100	n.a.

1. Tolerances to be maintained over the environmental conditions and useful life as specified by the manufacturer.
2. Measured at 50% points of complete negative-to-positive or positive-to-negative transitions.
3. 10% to 90% of complete negative-to-positive transition or 90% to 10% of complete positive-to-negative transition measured between the pulse generator output and R1. Note that the term Generator is referring to the EVSE circuitry prior to and driving the 1K Ω source resistor with a $\pm$ 12V square wave. This circuitry should have rise/fall times faster than 2 μ sec. Rise/fall times slower than this will begin to add noticeably to the output rise/fall times dictated by the 1K Ω resistor and all capacitance on the Pilot line.
4. To 95% of steady-state value, measured from start of transition.
5. Maximum and minimum resistor values are $\pm$ 3% about nominal.
6. Guarantees rise time slow enough to remove transmission line effects from cable.

Table 5 - EV/PHEV Control Pilot Circuit Parameters (see Figure 6)

Parameter ⁽¹⁾	Symbol	Units	Nominal value	Max value	Min value
Equivalent load resistance – State B1&B2	R2B	Ohms	2740	2822 ⁽²⁾	2658 ⁽²⁾
Equivalent load resistance – State C ⁽³⁾	R2C	Ohms	882	908 ⁽²⁾	856 ⁽²⁾
Equivalent load resistance – State D ⁽⁴⁾	R2D	Ohms	246	253 ⁽²⁾	239 ⁽²⁾
Total equivalent capacitance	C2	picofarads	n.a.	2400	n.a.
Equivalent diode voltage drop ⁽⁵⁾	Vd	V	0.70	0.85	0.55

1. Tolerances to be maintained over the environmental conditions and useful life as specified by the manufacturer.

2. Maximum and minimum resistor values are $\pm 3\%$ about nominal.

3. Vehicles not requiring ventilation for indoor charging areas.

4. Vehicles requiring ventilation for indoor charging areas.

5. Silicon small signal diode, -40°C to 85°C , forward current 2.75 to 10.0 ma.

5.3 Control Pilot Functions

The control pilot performs the following functions.

5.3.1 Verification of Vehicle Connection

The EVSE is able to determine that the connector is inserted into the vehicle inlet and properly connected to the EV/PHEV by sensing resistance R3 as shown in Figures 3, 4, and 5. The diode, D1, is present to help an EVSE determine that an EV/PHEV is connected rather than other potential low impedance loads. If the EVSE does not detect diode D1 (missing or shorted), it may indicate a fault by entering State F. The EV/PHEV may optionally monitor the control pilot on the anode side of diode D1 as shown in Figure 5.

5.3.2 EVSE Not Ready To Supply Energy

The EVSE is able to indicate to the EV/PHEV that it is not ready to supply energy by not turning on the oscillator and maintaining State B1. State B1 may be used by the EVSE to maintain the current charge session during load management, fee transaction, or other events.

The EVSE may turn off the oscillator at any time while in State C or D during the current charge session. When the EVSE turns off the oscillator, the EVSE shall terminate AC energy transfer. The EV/PHEV then opens S2 resulting in State B1.

5.3.3 EVSE Ready to Supply Energy

The EVSE is able to indicate to the EV/PHEV that it is ready to supply energy by turning on the oscillator and providing the square wave signal specified in Figure 7. The EVSE shall not close contactors unless the oscillator is on and valid per Figure 7. In each of the states specified in Table 3 & 3A, the EVSE may supply the pilot as a DC signal or as an oscillating signal. However, normally the oscillator is only turned on in State B2, State C, or State D. Oscillation in other states should only be transitory as specified in Table 8.

5.3.4 EV/PHEV Ready to Accept Energy

The EV/PHEV indicates that it is ready to accept energy from the EVSE by closing switch S2, as shown in Figures 3, 4, and 5, when the current profile on the control pilot oscillator is sensed. The EV/PHEV may de-energize the EVSE at any time by opening switch S2.

5.3.5 Determination of Indoor Ventilation

The EVSE is able to determine if the EV/PHEV requires indoor charging ventilation by sensing the voltage as specified in Table 3 & 3A. If required, the EVSE will provide a signal to turn on the indoor charging area ventilation system according to National Electrical Code – Article 625.

5.3.6 EVSE Current Capacity

The EVSE communicates the maximum available continuous current capacity to the EV/PHEV by modulating the pilot duty cycle as described in Table 6A, Table 6B and shown in Figure 7.

The overall (EVSE and EV/PHEV) control pilot tolerance is not to exceed $\pm 2\%$. This tolerance is distributed up to $\pm 0.5\%$ for the EVSE and up to 1.5% for the EV/PHEV. In the case of overlapping ranges, the valid state takes precedence over the error state.

Based on an overall tolerance of 2% duty cycle (see Table 6B):

- 5.3.6.1 If the EV/PHEV reads a duty cycle of 3-7%, the EV/PHEV shall interpret this as a valid digital communications command. See 5.5.
- 5.3.6.2 If the EV/PHEV reads a duty cycle between 8% and less than 10%, the EV/PHEV should interpret this as a valid 10% duty cycle.
- 5.3.6.3 If the EV reads a duty cycle less than or equal to 85.0% the EV/PHEV should base the current on the Amps = (% duty cycle) * 0.6 formula.
- 5.3.6.4 If the EV reads a duty cycle greater than 85.0%, the EV/PHEV should base the current on the Amps = (% duty cycle - 64) * 2.5 formula.
- 5.3.6.5 If the EV reads a duty cycle of 97%, it is recommended the EV/PHEV consider this as a valid 96% duty cycle.

TABLE 6A - EVSE NOMINAL CONTROL PILOT DUTY CYCLE

EVSE Nominal Duty Cycle	EVSE Commanded Max Current
Duty Cycle < 5%	Error state, no charging allowed
Duty Cycle = 5%	Indicates that digital communication is needed.
5% < Duty Cycle < 10%	Error state, no charging allowed
10% ≤ Duty Cycle ≤ 85%	Available current = (duty cycle %) x 0.6
85% < Duty Cycle ≤ 96%	Available current = (duty cycle % - 64) x 2.5
Duty Cycle > 96%	Error state, no charging allowed

TABLE 6B - VEHICLE CONTROL PILOT DUTY CYCLE INTERPRETATION
BASED ON $\pm 2\%$ OVERALL TOLERANCE

Vehicle Duty Cycle Interpretation	Max Current to be drawn by Vehicle
Duty Cycle < 3%	Error state, no charging allowed
3% ≤ Duty Cycle ≤ 7%	Indicates that digital communication is needed
7% < Duty Cycle < 8%	Error state, no charging allowed
8% ≤ Duty Cycle < 10%	6A
10% ≤ Duty Cycle ≤ 85%	Available current = (duty cycle %) x 0.6
85% < Duty Cycle ≤ 96%	Available current = (duty cycle % - 64) x 2.5
96% < Duty Cycle ≤ 97%	80A
Duty Cycle > 97%	Error state, no charging allowed

FIGURE 7 - SUPPLY CURRENT RATING VS. PILOT CIRCUIT DUTY CYCLE

As an example, a 20% duty cycle would be $20 \times 0.6 = 12$ A. In this case, the vehicle must adjust its current draw to a maximum of 12 A.

A duty cycle of 5% indicates that digital communication is needed, see 5.5.

The EVSE may accept an external signal to vary the duty cycle for supply or premises power limitations. The EV/PHEV vehicle shall use the duty cycle to control the on-board charger AC current drawn from the line.

5.3.7 Verification of Equipment Grounding Continuity

The equipment grounding conductor provides a return path for the control pilot current to insure that the EVSE equipment ground is safely connected to the EV/PHEV vehicle chassis ground during charging. Loss of this signal shall result in the automatic de-energization at the EVSE.

5.4 Proximity Detection

Upon insertion of the connector into the vehicle inlet, the coupler shall provide a means to detect the presence of the connector in the vehicle inlet as described in Table 7 and shown in Figure 8. Detection of the connector will occur at a point where damage to coupler, EV/PHEV, or EVSE could occur if the EV/PHEV were to be intentionally moved. Proximity detection may also provide a signal to activate the EV/PHEV charge controller and engage the EV/PHEV drive interlock system. EV/PHEV Proximity detection may also be used to provide a signal in the vehicle charge control strategy to help reduce electrical arcing of the coupler during disconnect. Resistors R5-R7 allow for diagnostics of the circuit. S3 is mechanically linked to the connector latch release actuator. S3 is normally closed at all times except when the connector latch release actuator is actuated to decouple the connector from the vehicle inlet. Opening of S3 should trigger the vehicle charge control to provide a controlled shutoff of charge power prior to disconnection. Refer to Table 8.

FIGURE 8 - TYPICAL PROXIMITY DETECTION CIRCUIT

TABLE 7 - PROXIMITY DETECTION CIRCUIT PARAMETERS (SEE FIGURE 8)

Parameter ⁽¹⁾	Symbol	Units	Nominal value	Max value	Min value
Equivalent load resistance	R4	Ohms	330	363 ⁽²⁾	297 ⁽²⁾
Equivalent load resistance	R5	Ohms	2700	2970 ⁽²⁾	2430 ⁽²⁾
Equivalent load resistance	R6	Ohms	150	165 ⁽²⁾	135 ⁽²⁾
Equivalent load resistance	R7	Ohms	330	363 ⁽²⁾	297 ⁽²⁾

1. Tolerances to be maintained over the environmental conditions and useful life as specified by the manufacturer.

2. Maximum and minimum resistor values are $\pm 10\%$ about nominal.

5.5 Digital Data Transfer

A duty cycle of 5% indicates that digital communication is required and must be established between the EVSE and vehicle before charging. This is required for DC charging. Digital communication is optional at any valid control pilot duty cycle for AC Level 1 & 2 charging. When optionally used with AC Level 1 & 2 charging, more functions may be accommodated than by Control Pilot duty cycle functionality alone.

When optionally used with AC Level 1 & 2 charging, the EV/PHEV may receive charge current limits via the Control Pilot and digital communications. If these charge current limits do not correlate, the EV/PHEV shall charge at the lower of the two indicated current limits.

Digital data transfer is currently under development.

TABLE 8 - EVSE AND EV/PHEV RESPONSE TIME SPECIFICATIONS

Transition	Initial Condition ⁽¹⁾⁽²⁾⁽³⁾	New Condition	EVSE Response Time	EV/PHEV Response Time	Specification or Condition
1	State = x OSC = off	State = x OSC = on	no max		delay until pilot oscillator will be turned on by EVSE
2	State = x OSC = x	State = A OSC = x	100 ms max		delay from disconnect until the contactor opens and terminates AC energy transfer
3	State = x OSC = x	State = E or State = F OSC = x		5 s max	delay until EV/PHEV opens battery isolation contactor
4	State = x OSC = on	State = A OSC = off	2 s max		delay until oscillator turned off after EV/PHEV is disconnected
5	State = B2 OSC = on	State = C or State = D OSC = on	3 s max		delay until contactor closes and initiates AC energy transfer in response to S2 closed
6	State = C or State = D OSC = on	State = B2 OSC = on	3 s max		delay until contactor opens and terminates AC energy transfer in response to S2 opened
7	State = x OSC = x	State = A or State = E or State = F OSC = x		3 s max	in response to an invalid pilot the EV/PHEV enters a safe mode and if necessary opens S2 which commands the EVSE to terminate AC energy transfer
8	State = x OSC = x	State = E or State = F OSC = x	3 s max		delay from EVSE setting invalid pilot until termination of AC energy transfer
9	State = B2 or State = C or State = D OSC = on	invalid pilot frequency		3 s max	in response to an invalid pilot frequency the EV/PHEV enters a safe mode and if necessary opens S2 which commands the EVSE to terminate AC energy transfer
10	State = x OSC = x	external signal to EVSE	10 s max		delay from external load management signal until EVSE modifies pilot signal state, duty cycle or other required response
11	State = C or State = D OSC = on	change in pilot duty cycle		5 s max	EV/PHEV modifies max current draw for on-board battery charger in response to pilot signal duty cycle modification
12	State = C OSC = on	State = D OSC = x	3 s max		EVSE response to change of ventilation request
13	State = C or State = D S3 closed	State = C or State = D S3 open		100 ms max	EV/PHEV terminates charge due to Proximity circuit opening
14	State = B1 OSC = off	State = B2 OSC = on	no max		EVSE transitions from not ready to supply energy to ready to supply energy
1. Current State from Table 3 & 3A defining pilot voltage and vehicle state. 2. OSC = off for pilot oscillator turned off, OSC - on for pilot oscillator turned on. 3. x for state or oscillator indicates any condition or unknown condition.					

NOTES (Note number corresponds to states listed above):

1. The pilot signal oscillation indicates that the EVSE is ready to supply energy. Regardless of the state transition, there

is no guarantee that the EVSE will be ready to supply AC energy within a minimum time period.

2. The transition from any State to State A indicates the vehicle connector has been removed. For safety reasons, it is important to de-energize the connector.
3. The transition from any State to State E or State F is an indication that the connector has been removed or that the EVSE is not available. For safety reasons, it is important that the vehicle goes into a safe state.
4. After a transition from any State to State A, the EVSE should turn off the oscillator (S1). For the purpose of filtering and reasonable control response time, the EVSE will not turn off the oscillator immediately. The connector may be immediately reinserted into the vehicle, and the EV/PHEV could see State C or State D with the oscillator turned on and no AC energy transfer for the listed maximum time before the oscillator is turned off.
5. After the vehicle closes S2 in order to request AC energy transfer, the vehicle can expect the contactor to close within a specified time period.
6. After the vehicle opens S2, in order to stop requesting AC energy transfer, it can expect the contactor to open within a specified time period.
7. The vehicle must respond to the pilot signal voltages. In this case, the EVSE may be experiencing a power outage, ground fault, or other condition that requires termination of the AC energy transfer mode. The vehicle should respond by entering a safe mode and if necessary open switch S2 which commands the EVSE to terminate AC energy transfer.
8. If the EVSE transitions to State E or F the EVSE must open the contactor in less than 3 s.
9. The vehicle must respond to a pilot signal frequency that is significantly out of tolerance. The frequency of the EVSE oscillator is used to verify connection to a compatible EVSE and proper operation of the EVSE. If the frequency is incorrect, the vehicle should respond by entering a safe mode and if necessary open switch S2 which commands the EVSE to terminate AC energy transfer. The recommended tolerance is $\pm 2\%$, 1020 Hz to 980 Hz.
10. It is common for EVSE equipment to support an input signal for the purpose of external load control (utility service interrupt signal, etc.). This input is used for various purposes including off peak charging support, utility load shedding, and building load management controllers. A maximum response time must be specified to guarantee universal compatibility with the external controlling equipment.
11. The EVSE may modify the pilot signal duty cycle at any time, commanding the EV/PHEV to increase or decrease the maximum AC current draw. The vehicle must adhere to the maximum response time in order guarantee universal compatibility with the external controlling equipment. (See Table 8, Transition 10)
12. The EVSE should respond to ventilation state changes of the control pilot.
13. Switch S3 opens when the connector latch lever is actuated. This opens the Proximity Circuit. The EV/PHEV should terminate charge prior to connector disconnect to prevent connector contact arc damage. Charge resumption after S3 closing is OEM specific.
14. State B1 is used by the EVSE to indicate that the EVSE is not ready to supply energy. State B1 may be used by the EVSE to maintain the current charge session during load management, fee transaction, or other events. This state may last for an extended period of time. The EV/PHEV may enter a sleep mode during this state and wake upon detection of the EVSE turning on the oscillator and entering State B2.

5.6 Typical Start Up Sequence

The charge process shall commence sequentially according to the following steps as the connector is inserted into the vehicle inlet:

- a. The control pilot activates the EV/PHEV charge controller, the proximity detection activates the drive interlock.
- b. Verification of EV/PHEV connection is detected by EVSE, by detecting a change from State A to State B1. During this state change the oscillator is off. See switch S1.
- c. EVSE indicates that it is ready to supply energy by turning on the oscillator and supplying square wave pilot signal to the EV/PHEV, State B2. See switch S1.
- d. EV/PHEV indicates that it is ready to accept energy from the EVSE by closing switch S2 and providing vehicle ventilation information to the EVSE, State C or State D.
- e. The EVSE determines that the equipment grounding conductor to the EV/PHEV chassis ground is in place by detecting the high side of Pilot being in State B1, B2, C, or D, while the low side being at -12V.
- f. The EVSE determines that the EV/PHEV pilot control circuitry is correctly configured by verifying the presence of the diode. The low side of the pilot pulse must be within the range specified in Table 4.
- g. The EVSE determines if indoor area ventilation is required or not. If indoor charging area ventilation is not required then proceed to the next step. If indoor charging area ventilation is required then 3 conditions can exist with corresponding EVSE responses. They are:
 - a. Condition 1 – If the EVSE is listed for indoor charging of all vehicles, turn on the indoor area ventilation system and proceed to the next step.
 - b. Condition 2 – If the EVSE is listed for outdoor charging of all vehicles, proceed to the next step
 - c. Condition 3 – If the EVSE is listed for vehicles not requiring indoor charging area ventilation, terminate the process and do not allow energization
- h. The EV/PHEV vehicle determines the nature of and available current from the EVSE according to 1 of the following 3 conditions by measuring the duty cycle of the signal and proceeding as follows (see 5.3.5.1 – 5.3.5.5 and Table 6B):
 - a. If the pilot duty cycle is between 10% and 96%, calculate available line current from the duty cycle and proceed to the next step.
 - b. If the pilot duty cycle is between 3% and 7%, calculate available line current from the digital data link and proceed to the next step. See 5.5.
 - c. If the digital data link cannot be established as described in 5.6.h.b, the process must be terminated and the fault condition displayed by the EVSE
- i. The EVSE may now energize the system by closing the main power contactor and charging may commence at power levels up to rated maximum continuous current of the EVSE for continuous rated conditions, or up to the rating of the protective circuit breaker for non-continuous conditions, or up to the maximum rated current of the EVSE for DC charging as provided by the digital data link. A continuous load is defined as operating at a given level for more than 3 hours.
- j. The pilot signal shall be monitored, and charge current adjusted accordingly, continuously during the charge process. If pilot signal is lost or the pulse width goes outside of the allowable range, the EVSE must terminate the charge process by opening the main contactor and turning off the pilot oscillator. The EVSE should also display the fault condition.

- k. To terminate the charge process, turn the EVSE on/off switch to the off position and/or remove the connector from the vehicle inlet. See 5.4.

6. GENERAL EV/PHEV REQUIREMENTS

6.1 EV/PHEV Cable Ampacity Coordination

Vehicle cabling used for the AC Mains and Safety Ground should be coordinated with the supply input from the EVSE (known from the Control Pilot duty cycle). The following are examples of possible methods coordination may be achieved:

1. Sizing the cables for maximum EVSE supply input.
2. Provide circuit protection, such as fuses, for the cables.
3. Prohibit charge from an EVSE with supply input that exceeds the vehicle cable rating.

NOTE: A plug-in vehicle should be able to connect and charge from any EVSE. The maximum rating for 240V AC energy transfer is Level 2 which is 80A using a 100A premise circuit breaker. The design of the vehicle wiring from the charge connector to the charger needs to comprehend the full range of EVSE output.

6.2 Environmental

The on-board EV/PHEV charging system electronic components shall meet the requirements specified in SAE J1211 Handbook for Robustness Validation of Automotive Electrical/Electronic Modules.

7. GENERAL EVSE REQUIREMENTS

Refer to Appendix C for an EVSE compatibility test procedure. This procedure is intended to help insure interoperability between EVSEs and EV/PHEV.

The following electromagnetic compatibility (EMC) paragraphs (7.1 thru 7.9) apply to the off-vehicle EVSE. SAE test methods for on-vehicle EV/PHEV charging equipment are under consideration.

7.1 EVSE Electromagnetic Emissions

The FCC Code of Federal Regulations – Title 47, Part 15 includes requirements for unintentional radiators and power line communication systems. The cordset and other EVSE external to the vehicle, if employing an internal frequency source exceeding 9 kHz, shall comply with FCC CFR47, Title 47, Parts 15A, 15B as a separate device.

NOTES:

1. Charging or support equipment used exclusively in vehicles may be formally exempted from FCC specific technical standards per paragraph 15.103, but FCC strongly recommends compliance to the FCC limits. The applicability of the FCC paragraph 15.103 exemption to specific devices is outside the scope of this document. The FCC Office of Engineering and Technology Laboratory Division Knowledge Database website provides up-to-date published interpretations of FCC rules.
2. An on-board Power Line Communication system may require separate FCC Part 15 compliance testing in a representative configuration, if the vehicle is so equipped. See FCC rules for composite systems incorporating carrier current communication systems.
3. Additionally, some markets may regulate EMC via the relevant sections of IEC 61851-21, “Electric Vehicle Charging Systems”. Specific market requirements are outside the scope of this document

7.1.1 EVSE Conducted Emissions

The EVSE shall meet FCC Part 15 conducted limits for unintentional radiators.

7.1.2 EVSE Radiated Emissions

The EVSE shall meet FCC Part 15 radiated limits for unintentional radiators. See 7.1, Note 1.

7.2 EVSE Electromagnetic Immunity

The EVSE shall be tested in accordance with and shall meet requirements for electromagnetic field immunity as specified in UL 2231-2. In addition to the performance requirements specified in UL 2231-2, the functions defined in Section 5 shall perform as designed during and after testing at the specified levels. Additional requirements may optionally be specified. See SAE J1812 for methods of specification of test levels and function performance status.

NOTES:

1. The UL 2231-2 standard specifies radiated immunity testing from 150 kHz to 1000 MHz, using IEC 1000-4-3. To avoid technical issues with the application of the IEC standard below its specified lower frequency limit of 80 MHz, it is recommended that immunity testing below 80 MHz be performed in accordance with IEC 61000-4-6, using a 20 volt rms emf test severity level. From 80 to 1000 MHz, IEC 61000-4-3 is recommended with a 20 V/m carrier test severity level.
2. For developmental testing, use of the frequency step sizes specified in ISO 11452-1 will facilitate an efficient evaluation of product immunity.

The test setup for radiated immunity is shown in Figure 9. Additional details are as follows:

- a. The test bench shall be covered with a ground plane, located 800 mm above the test site ground plane or absorber lined shield enclosure (ALSE) floor.
- b. The back edge of the test bench ground plane shall be connected to the test site ground plane or ALSE floor or wall, using a series of straps. See SAE J1113-21 for bench grounding requirements.
- c. The AC Receptacle or Level 2 EVSE (if applicable) shall be mounted on a dielectric support, 200 mm above the front edge of the bench ground plane.
- d. Level 1 EVSE (if applicable) shall be positioned at a minimum height of 700 mm above the test site or ALSE ground plane and connected to the AC Receptacle with a cord having a maximum length of 305 mm.
- e. The AC receptacle (or Level 1 EVSE) mains conductors shall be connected to a pair of 50 uH line impedance stabilization networks (LISNs), using conductors having a maximum length of 200 mm. The 50 Ohm LISN ports shall be terminated with 50 Ohm loads. The ground conductors from the AC receptacle and the incoming mains line shall connect to the test bench at a point near the LISN terminals on the EVSE side of the LISNs. See CISPR 16.1.2 for LISN specifications.
- f. The cordset length shall be in accordance with NEC 625. Excluding the vertical section exposed to the test field, the remainder of the cordset shall lay on the floor in a non-inductive pattern (i.e., "zig-zag", not coiled).
- g. A grounded plate shall be provided on the floor, for mounting of the vehicle charge coupler and vehicle electrical / electronic equipment necessary for operation of the EVSE. Representative RF loading of conductive coupler circuits shall be included.
- h. The standard tolerance for radiated immunity test setup dimensions shall be 5%, unless otherwise specified.

FIGURE 9 - RADIATED IMMUNITY TEST SETUP

7.3 EVSE Electrostatic Discharge

The EVSE shall be tested in accordance with and shall meet the requirements for electrostatic discharge specified in UL 2231-2.

7.4 EVSE Harmonic Distortion Immunity

The EVSE shall be tested in accordance with and shall meet the requirements for harmonic distortion immunity specified in UL 2231-2.

7.5 EVSE Electrical Fast Transient Immunity

The EVSE shall be tested in accordance with and shall meet the requirements for electrical fast transient immunity specified in UL 2231-2.

7.6 EVSE Voltage Dips, Short Interruptions and Voltage Variations Immunity

The EVSE shall be tested in accordance with and shall meet the requirements for voltage dips, short interruptions and voltage variations immunity specified in UL 2231-2.

7.7 EVSE Magnetic Field Immunity

The EVSE shall be tested in accordance with and shall meet the requirements for magnetic field immunity specified in UL 2231-2.

7.8 EVSE Capacitor Switching Transient Test

The EVSE shall be tested in accordance with and shall meet the capacitor switching transient test requirements specified in UL 2231-2.

7.9 EVSE Voltage Surge Test

The EVSE shall be tested in accordance with and shall meet the requirements for voltage surge specified in UL 2231-2.

7.10 Installation Requirements

The EVSE shall meet the requirements specified in the National Electrical Code – Article 625 and Canadian Electrical Code – Part 1, Section 86.

7.11 General Product Standards

The EVSE shall meet and be listed to the general product requirements specified in UL 2594 Outline of Investigation - Electric Vehicle Supply Equipment.

7.12 Personnel Protection System

The EVSE shall incorporate a listed system of personnel protection as specified in UL 2231 Personnel Protection Systems for EV Charging Circuits.

7.13 AC Present Indicator

The EVSE shall incorporate a feature that indicates that the EVSE is receiving AC input power. The specific requirements for this indicator (such as color, lamp type, intensity, field of view, etc) can be defined by the EVSE manufacturer. The indicator should be labeled as to its function and when illuminated the indicator would signal presence of AC electrical energy from the premise wiring. See Section 9 for additional information.

7.14 Conductor Cord Requirements

The conductor cord shall meet the requirements specified in the National Electrical Code – Articles 625 and Article 400 – Table 400-4, and UL 2594 Outline of Investigation - Electric Vehicle Supply Equipment.

7.15 Coupler Requirements

The EV/PHEV coupler shall meet the requirements specified in the National Electrical Code – Articles 625, UL 2251 Plugs, Receptacles, and Couplers for Electric Vehicles, and Section 8 of this document.

8. COUPLER REQUIREMENTS

8.1 Vehicle Inlet/ Connector Compatibility

The vehicle inlet designs shall be of a common physical configuration that is capable of accepting common connector physical configurations for AC Level 1 and AC Level 2. Additionally, the physical requirements shall ensure compatibility of connectors and vehicle inlets manufactured by the same manufacturer at different points in time as well as different manufacturers of the mating connectors and vehicle inlets.

8.2 Ergonomic Requirements

The coupler shall comply with the following ergonomic requirements.

8.2.1 Ease of Use

During connection and disconnection, the human efforts required shall be ≤ 60 N at beginning of life. This amount of force is typically within the physical capabilities of the general adult population and persons with limited or restricted capabilities.

8.2.2 Indexing

During connection and disconnection, the insertion/removal of the connector and inlet shall be intuitively obvious and free of multiple orientations for AC Level 1 and AC Level 2 charging configurations.

8.2.3 Alignment

The vehicle inlet shall provide a lead-in feature for automatic alignment during insertion and removal of the connector.

8.2.4 Tactile Feel

The coupler shall incorporate a means to provide tactile and/or audible feedback to the user when fully engaged.

8.2.5 Latching

The coupler shall have a latching mechanism to prevent inadvertent or accidental decoupling. The latching mechanism should provide a means in the connector to open the proximity detection conductor (see 5.4) when disengaging from the vehicle inlet.

8.3 Safety Requirements

The coupler shall comply with the following safety requirements.

8.3.1 Isolation

The vehicle inlet power contacts shall be electrically isolated from battery voltages when the connector is removed from the vehicle inlet.

8.3.2 Exposure of Contacts

The vehicle inlet and connector shall be designed to prevent direct contact with live parts according to UL 2251 Plugs, Receptacles, and Couplers for Electric Vehicles.

8.3.3 Sharp Edges

The vehicle inlet and connector shall be free of sharp edges and potentially injurious protrusions per UL 1439 Determination of Sharpness of Edges on Equipment.

8.3.4 Surface Temperature

The maximum external surface temperature of the coupler shall be as specified in UL 2251 Plugs, Receptacles, and Couplers for Electric Vehicles.

8.3.5 Hazardous Conditions

The coupler should be designed to avoid or mitigate potentially hazardous conditions – fire, electric shock, or personnel injury.

8.3.6 Unauthorized Access

For unattended public access charging, the coupler may provide a means to engage an optional coupler locking mechanism to reduce the likelihood of tampering or unauthorized removal.

Dimensional requirements to implement an optional coupler locking mechanism may be found in Appendix E, sheets 1-3.

8.4 Performance Requirements

The coupler shall comply with the following performance requirements

8.4.1 Design Life

The coupler shall be designed to a minimum of 10 000 cycles of mechanical operation. The coupler performance shall not be reduced by the environment conditions specified in 8.5 of this document.

8.4.2 Impact Resistance

The connector shall continue to function as intended after being dropped from a height of 1 m onto a concrete surface per UL 2251 Plugs, Receptacles, and Couplers for Electric Vehicles.

8.4.3 Vehicle Drive-Over

The connector shall continue to function as intended or fail in a safe manner after being driven over by a vehicle as specified in UL 2251 Plugs, Receptacles, and Couplers for Electric Vehicles.

8.5 Environmental Requirements

The coupler shall comply with the following environmental requirements:

8.5.1 General Environmental Considerations

The vehicle inlet should meet the performance requirements specified in 8.4 under weather and environmental conditions specified by the individual automobile manufacturers.

8.5.2 Temperature Range

The coupler shall be designed to withstand continuous ambient temperatures in the range of -30°C to $+50^{\circ}\text{C}$ during operation when supplied with the EVSE or installed in the EV/PHEV and continuous ambient temperatures in the range of -40°C and $+80^{\circ}\text{C}$ during shipping or storage when the components parts are assembled, supplied with the EVSE, or installed in the EV/PHEV.

8.5.3 Temperature Rise

The electrical contacts shall be designed for a maximum temperature rise of 50°C above ambient at rated load. The wiring insulation shall be rated for 105°C . For couplers rated less than 200 A, the load is to be applied continuously. For connectors rated 200 A or greater, the load is to be applied for 20 min followed by a no-load period of 10 min and repeated until peak temperatures stabilize. Refer to UL 2251 Plugs, Receptacles, and Couplers for Electric Vehicles.

8.5.4 Insulation Resistance

The insulation resistance of the coupler EV/PHEV shall be as specified in UL 2251 Plugs, Receptacles, and Couplers for Electric Vehicles.

8.5.5 Fluid Resistance

The coupler shall be unaffected by automotive lubricants, solvents, and fuels as specified in SAE USCAR 2.

8.5.6 Mechanical Requirements

The vehicle inlet shall be able to withstand the minimum automotive vibration conditions when tested to the following procedures and pass/fail criteria:

- a. Vibration Test Procedure - A vehicle inlet as mounted on a test fixture shall be securely bolted to the table of the vibration test machine and subjected to vibration according to the following test parameters:

1. Frequency - Varied from 10 to 55 Hz and return to 10 Hz at a linear sweep period of 2 min/complete sweep cycle.
2. Excursion - $1.0 + 0.1/-0.0$ mm peak to peak over the specified frequency range.
3. Direction of Vibration - Vertical axis of the vehicle inlet as it is mounted on the vehicle.
4. Test Duration - $60 + 1/-0$ min.
5. Pass/Fail Criteria—After completion of the test, there shall be no observed rotation, displacement, cracking or rupture of parts of the device that could result in failure to operate as intended or cause to fail any of the other test requirements specified in this document. Cracking or rupture of the parts of the device that affect mounting shall constitute a failure.

8.5.7 Sealing Requirements

The vehicle inlet shall be sealed in a manner that the following requirements are met:

- a. When de-coupled, the vehicle inlet shall have an effective sealing system for outdoor use to provide a degree of protection against corrosion, windblown dust and rain, splashing water, hose-directed water, and external ice formation per UL 50, type 3S: Standard for Enclosures for Electrical Equipment as specified in UL 2251 Plugs, Receptacles, and Couplers for Electric Vehicles.
- b. When coupled, the vehicle inlet shall have an effective sealing system for outdoor use to provide a degree of protection against corrosion, windblown dust and rain, splashing water, hose-directed water, and external ice formation per UL 50, type 3S: Standard for Enclosures for Electrical Equipment as specified in UL 2251 Plugs, Receptacles, and Couplers for Electric Vehicles.
- c. The vehicle inlet shall provide for the egress of fluids.

8.6 General Coupler Physical Description

The vehicle inlet designs shall be of a common physical configuration that is capable of accepting common connector physical configurations for AC Level 1 and AC Level 2. Additionally, the physical requirements shall ensure compatibility of connectors and vehicle inlets manufactured by the same manufacturer at different points in time as well as different manufacturers of the mating connectors and vehicle inlets.

8.6.1 Vehicle Inlet General requirements

A standard configuration shall be capable of AC Level 1 and AC Level 2 charging. The contact requirements shall be as specified in Table 9.

TABLE 9 - VEHICLE INLET CONTACT REQUIREMENTS

Contact #	Function	Standard ⁽¹⁾ – AC Level 1 and 2
1	Charger 1	X
2	Charger 2	X
3	Chassis ground	X
4	Control pilot	X
5	Proximity	X

1. Note: X = required, O = optional.

8.6.2 Connector General Requirements

The connector shall be fitted with a cord corresponding to its intended usage and shall meet the requirements specified in the National Electrical Code – Articles 625 and Article 400 – Table 400-4 for the power conductors, and UL 2251 - Plugs, Receptacles, and Couplers for Electric Vehicles, Table 15.1 for ground conductors and Table 10 for contacts.

TABLE 10 - CONNECTOR CONTACT REQUIREMENTS

Contact #	Function	Standard ⁽¹⁾ – AC Level 1 and 2	DC Charging Under Development
1	Power	X	
2	Power	X	
3	Equipment ground	X	
4	Control pilot	X	
5	Proximity	X	

1. Note: X = required, O = optional.

8.7 Dimensional Requirements

The coupler shall be designed to comply with the key dimensional requirements as specified in this section.

8.7.1 Interface Contacts Sizing

The general contact sizes at the coupler interface shall comply with the dimensions as specified in Table 11.

TABLE 11 - CONTACT SIZE AND CURRENT RATING

Contact #	Function	Size (mm)	Current rating (Amps)	Voltage rating
1	Power	3.6 diameter	up to 80 A	300 min, up to 600 vac/vdc
2	Power	3.6 diameter	up to 80 A	300 min, up to 600 vac/vdc
3	Equipment/chassis ground	2.8 diameter	Fault rated	
4	Control pilot	1.5 diameter	2 A	30 vdc
5	Proximity	1.5 diameter	2 A	30 vdc

8.7.2 Vehicle Inlet Physical Dimensions

The vehicle inlet shall comply with the key physical dimensions as shown in Appendix D, sheet D-1.

8.7.3 Connector Physical Dimensions

The connector shall comply with the key physical dimensions as shown in Appendix D, sheet D-2.

8.7.4 Vehicle Inlet Access Zone

The vehicle inlet shall be installed in the vehicle to allow connector access when the cover door is opened as shown in Appendix D, sheets D-3 through D-5.

Dimensional requirements to implement an optional coupler locking mechanism may be found in Appendix E, sheets E-1 through E-3.

8.7.5 Contact Sequencing

During connection, the connector and vehicle inlet shall comply with the following contact sequencing; equipment/chassis ground contact is first make/last break and the control pilot contact is last make/first break.

9. CHARGE STATUS INDICATOR

The PHEV shall provide charge status information visible to the operator while inserting the coupler into the vehicle inlet. The specific requirements (such as color, lamp type, styling, intensity, field of view, etc) for the Charge Status Indicator can be defined by the vehicle manufacturer.

This indicator, as well as the AC Present Indicator on the EVSE (7.4) should be considered part of a diagnostic strategy that helps determine possible causes of no-charge events. This diagnostic strategy is optional for battery electric vehicles.

10. CONNECTOR / VEHICLE INLET OPTIONAL MARKING

A connector and/or vehicle inlet manufactured to this Recommend Practice may optionally visibly display the following identification on its outer surface in Arial font: "SAE J1772™". Any party providing such identification warrants that the connector and/ or vehicle inlet complies with all mandatory requirements of this Recommend Practice and agrees to indemnify and hold SAE harmless from any and all liability arising out of any failure to comply and any resulting injury or damage arising from such failure.

11. NOTES

11.1 Marginal Indicia

A change bar (I) located in the left margin is for the convenience of the user in locating areas where technical revisions, not editorial changes, have been made to the previous issue of this document. An (R) symbol to the left of the document title indicates a complete revision of the document, including technical revisions. Change bars and (R) are not used in original publications, nor in documents that contain editorial changes only.

APPENDIX C – EVSE TEST PROCEDURE

C.1 INTRODUCTION

As part of the SAE J1772 Task Force, this document addresses the need for a protocol to evaluate the compatibility of AC Level 1 and AC Level 2 EVSE equipment. Here compatibility is closely defined as the EVSE being able to operate with any vehicle vendor's product that is also SAE J1772 compliant. Specifically, the EVSE must provide and respond to appropriate SAE J1772 signaling within the specified tolerance ranges for the various signal parameters. This document seeks to define a set of tests that will ensure an EVSE provides such compatibility. This document does not provide a comprehensive set of tests to verify compliance with applicable UL or other standards.

The compatibility tests described here focus on the measurement of functional signal parameters such as voltage, frequency and the like, with an emphasis on those items that are required for basic EVSE operation and are likely to vary from vehicle to vehicle. The tests do not address compliance or compatibility from the vehicle perspective and does not address what has been termed "in-band" communication using the Pilot pin.

C.2 DEFINITION OF A SAE J1772 COMPLIANT EVSE

A SAE J1772 Compliant EVSE is defined as an EVSE that meets all requirements of SAE J1772 and adequately performs as per the tests described in this appendix.

C.3 FUNCTIONAL TEST PROTOCOL

Four key areas are covered by functional tests:

- EVSE/PEV pilot circuit
- EVSE response to state changes (pilot circuit load impedance)
- Maximum and minimum timing requirements for the EVSE
- The proximity detection pin

All tests assume that an EVSE is connected to an energized AC power source, except the cable capacitance verification test. Since the tests, as described, do not involve full power loading of the EVSE, the sizing of the AC source is not specified.

It is expected that EVSE will be exposed to typical outdoor temperature extremes. The tests described are to be conducted at a minimum of three temperatures: -30 °C, +25 °C, +50 °C (SAE J1772 Section 8.5.2), with results recorded at each temperature point. The ambient temperature should be maintained within +/- 2 °C of the specified temperature during a test.

C.4 EVSE/PEV PILOT CIRCUIT COMPATIBILITY

Pin 4 of the SAE J1772 compliant connector is defined as the Pilot pin with pin 3 as the ground reference. The Pilot pin provides for handshaking between the EVSE and the PEV. A pulse width modulation signal (PWM) is used to communicate the state of the EVSE to the PEV and load impedance values are used for the PEV to communicate its readiness to charge. Refer to SAE J1772 Figures 3 and 4 for definitions of component designators.

C.4.1 Pilot Pin (Pin 4) Idle State Voltage and Output Impedance

- C.4.1.1 Measurement of Pin 4 high state voltage. With no vehicle connected to the EVSE, verify the voltage at pin 4 of the SAE J1772 connector. The idle state voltage at pin 4 (referenced to pin 3) should be between 11.4 and 12.6Vdc. For EVSE that disable the PWM when not connected, the measurement should be made with a high impedance (> 1 megaohm) DC voltage meter, since this voltage is presented via the nominal 1000 ohm source impedance. If the EVSE does not provide a DC voltage in State A, refer to C.4.2.2 for an alternate method of measuring the Pin 4 high state voltage.

- C.4.1.2 Measurement of Pin 4 low state voltage. With no vehicle connected to the EVSE, if possible, place the EVSE into a “not-available” state (State F in SAE J1772). The pin 4 voltage (referenced to Pin 3) should be between -11.4 and -12.6V dc as measured with a high impedance (> 1 megaohm) DC voltage meter. If the EVSE cannot be forced into State F, refer to C.4.2.2 for an alternate method of measuring the Pin 4 low state voltage.
- C.4.1.3 Measurement of R1. Apply a 50k to 100k ohm load test resistor RL from pin 4 to pin 3 and monitor the additional voltage drop measured between pins 4 and 3.

$$R1 = \left(\frac{V4_3_OPEN - V4_3_LOADED}{V4_3_LOADED} \right) * RL \text{ (ohms)}$$

Where:

- V4_3_OPEN is the measured open circuit voltage between pins 4 and 3
- V4_3_LOADED is the voltage measured between pins 4 and 3 with the 50k to 100k ohm load in place
- RL is the measured value of the 50k to 100k load test resistor (Note: the value of RL must be known to better than +/- 0.1%)
- R1 is the equivalent source resistance for the EVSE pin 4 driver

The calculated equivalent source resistance, R1, should be between 970 and 1030 ohms.

C.4.2 PWM Parameters

The following measurements should be made through a SAE J1772 compliant connector/cable properly wired to the EVSE. Load the Pilot Pin (pin 4) with a silicon diode, capacitor C2 and resistor R2 as shown in Figure C.4.2 Pilot Pin Loading below. The silicon diode D1 should provide a voltage/current characteristic compliant with Table 5 of SAE J1772. The Capacitor C2 should be 2400pF +0%/-10%. The resistor R2 should be 2.74kohm (+/- 1%). This is to signal the EVSE that a vehicle is connected but is not ready to accept energy (State B). Note that pin 3 is to be used as the return for the load.

FIGURE C.4.2: PILOT PIN LOADING DIAGRAM

- C.4.2.1 PWM Parameter Measurement. With the Load Circuit attached to the SAE J1772 plug, the EVSE should begin to produce a PWM output signal. The output duty cycle should be based on the ampacity of the EVSE and should be as determined by Figure 7 of the SAE J1772 standard. Examine the PWM signal for the following parameters:
- C.4.2.1.1 Frequency: Fo must be between 980 to 1020Hz; can be measured at points 1 or 2

NOTE: Only one of the two following tests need be conducted:

- C.4.2.1.2 Duty Cycle: Based on ampacity per Figure 7 of SAE J1772; value to be within +/- 0.5 percent of expected value; can be measured at points 1 or 2; Duty cycle is calculated as

$$\text{Duty Cycle} = \frac{P_{wo}}{\left(\frac{1}{F_o}\right)} (\%)$$

- C.4.2.1.3 Pulse width: Per Table 4 of SAE J1772, P_{wo} must be within +/-5us of the nominal value; can be measured at points 1 or 2; the nominal value is calculated as

$$P_{wo} = \frac{1}{F_o} * \text{Duty}_{\text{Figure 7}} (\text{SECONDS})$$

Note that P_{wo} is measured at the 50% points of the complete negative-to-positive or positive-to-negative transitions.

- C.4.2.1.4 Pulse rise time: less than or equal to 2us; must be measured at point 1

Measured as 10% to 90% of the negative-to-positive or 90% to 10% of the positive-to-negative transition

- C.4.2.1.5 Pulse fall time: less than or equal to 2us; must be measured at point 1

Measured as 10% to 90% of the negative-to-positive or 90% to 10% of the positive-to-negative transition

- C.4.2.1.6 Settling time: less than or equal to 3us; must be measured at point 1

Measured from start of transition to 95% of steady state value

- C.4.2.2 Alternate Pilot pin high and low state voltage measurement. This is an optional method for measuring the pin 4 high and low state voltages and is included for EVSE that do not provide a constant high state voltage when idle and/or cannot be forced into State F as required in C.4.1.1.2. This test requires that the EVSE PWM generator be active. The EVSE is loaded as C.4.2.1, which should make the PWM active with the EVSE in State B. With the PWM active, if Measurement Point 1 is accessible, then the voltage values can be directly measured and should be in the range noted below. Otherwise, the high and low state voltages will be measured between pins 4 and 3 using a high impedance oscilloscope probe (>1 megaohm). At Measurement Point 2, the positive swing voltage will be affected by the loading of the test circuit due to the diode being in forward conduction mode.

FIGURE C.4.2.2: ANTICIPATED WAVEFORM AT MEASUREMENT POINT 2

At Measurement Point 2, for the positive swing of the PWM, VS must be calculated from V4_3 as:

$$VS = VD + (V4_3 - VD) \left(\frac{R1 + R2}{R2} \right)$$

Where:

- VD is the diode forward voltage
- V4_3 is the voltage measured between pins 4 and 3
- R1 is the VS source resistance (as measured in C.4.1.1.3)
- R2 is the load resistor measured value (nominally 2.74K for State B)
- VS is the positive swing voltage of the PWM source

The high state voltage (as directly measured or calculated) should be between +11.4 and +12.6 V and the low state voltage should be between -12.6 and -11.4 V.

C.4.3 External Ampacity Control

This test only applies to EVSE equipped with external or manual ampacity control capability.

For a unit with a continuously variable external or manual ampacity-control, repeat C.4.2 for 20%, 40%, 60%, 80% and 100% ampacity values.

For a unit that provides for external or manual control of discrete ampacity steps, repeat C.4.2 for each available ampacity. Tests should be repeated for a sampling of 5 ampacity values if more than 5 discrete steps are available.

C.4.4 Pilot Circuit Capacitance

With EVSE de-energized (all AC power removed from EVSE input), use a capacitance meter to measure the Pilot line to ground capacitance. With no cable present the value should be no less than 300pF. With a SAE J1772 cable present, the value should be no larger than 3100pF and can be measured between pins 4 and 3.

C.5 EVSE RESPONSE TO STATE CHANGES (PILOT CIRCUIT LOAD IMPEDANCE)

PEV loading of the pilot pin is used to notify the EVSE of the PEV status. Since the vehicle test load response is dependent on the value of R1 and the high state voltage of the PWM signal generated by the EVSE, the test measurements are based on the pin 4 voltage as opposed to the load resistance. The voltage range specified for each state was calculated based on maximum and minimum voltage expected for all possible values of R1, R2, R3 determined.

FIGURE C.5.1: PILOT PIN LOADING DIAGRAM

C.5.1 EVSE State Detection

The following measurements should be made through a SAE J1772 compliant connector/cable properly wired to the EVSE. Load the Pilot Pin (Pin 4) with a silicon diode, capacitor C2 and resistor R2 as shown in the Figure C.5.1 Pilot Pin Loading above. The silicon diode D1 should provide a voltage/current characteristic compliant with Table 5 of SAE J1772. The Capacitor C2 should be 2400pF +0%/-10%). The value of R2 should be adjusted as per the test description.

- C.5.1.1 State B functionality. Verify EVSE enters State B (vehicle connected/not ready to accept energy) for any value of R2 that produces a voltage from 8.370 V to 9.594 V at pin 4.
- C.5.1.2 State C functionality. Verify EVSE enters State C (vehicle connected/ready to accept energy/indoor charging area ventilation not required) for any value of R2 that produces a voltage from 5.474 V to 6.531 V at pin 4.
- C.5.1.3 State D functionality. Verify EVSE enters State D (vehicle connected/ready to accept energy/indoor charging area ventilation required) for any value of R2 that produces a voltage from 2.642 V to 3.173 V at pin 4. For EVSE that are not equipped for ventilation, verify that the EVSE indicates an error condition and does not close the main contactor.

C.6 EVSE TIME RESPONSE

SAE J1772 specifies maximum and/or minimum timing values for changes between EVSE states. The following tests verify that the EVSE complies with these timing requirements.

C.6.1 State Transition Timing

- C.6.1.1 When transitioning from any of States B, C, or D to State A, verify that the contactor opens in less than 100ms.
- C.6.1.2 When transitioning from any of States B, C, or D to State A, verify that the PWM oscillator goes off within 2s of the state change.
- C.6.1.3 When transitioning from State C or D to State B, verify that AC contactor opens within 3s of state change.
- C.6.1.4 When transitioning from State B to State C or D, verify that the AC contactor closes within 3s of state change.
- C.6.1.5 When transitioning from State C to State D, verify that ventilation is enabled (if the EVSE is so equipped) or that the AC contactor opens within 3s (if EVSE is not ventilation equipped).
- C.6.1.6 Ampacity Control Response Time NOTE: This test is only performed for an EVSE with external or manual ampacity control. The EVSE should be in an active charge state (C or D). Using the external or manual ampacity control, set the programmed output current to a new value sufficiently different to allow for detection of the duty cycle change. Verify that the PWM signal on Pin 4 changes duty cycle within 10s.

C.7 EVSE/PEV PROXIMITY DETECTION FUNCTION

Pin 5 of the SAE J1772 compliant connector is defined as the Proximity Detect pin. This pin is used by the PEV to sense the presence of the SAE J1772 connector. For C.7.1, the following circuit is used to load the Proximity Pin.

FIGURE C.7.1: PROXIMITY PIN CIRCUIT (A) AND TEST LOAD CIRCUIT (B)

C.7.1 Proximity Pin Output Impedance

C.7.1.1 Output impedance with S3 open. Apply the Load Circuit in Figure C.7.1.B to the proximity pin as shown above. The 5V source should be referenced to Pin 3. With switch S3 open (activated), verify the pin 5 output impedance as:

$$\text{Output Impedance} = \left(\frac{V5_3}{VSS - V5_3} \right) * R4 \text{ (ohms)}$$

Where:

- VSS is the measured value of the 5V source
- V5_3 is the voltage measured between at pins 5 and 3 with the 5V source coupled through 330 ohms
- R4 is the measured value of the 330 ohm coupling resistor

The calculated output impedance should be between 432 and 528 ohms. Note that the values of R4, VSS and V5_3 must be known to better than +/-0.1%.

C.7.1.2 Output impedance with S3 closed. Repeat C.7.1.1, but with switch S3 closed (not activated), verify output impedance.

The calculated output impedance should be between 135 and 165 ohms. Note that the values of R4, VSS and V5_3 must be known to better than +/-0.1%.
