

Lubricants, Industrial Oils, and Related Products Type D Compressor Oils—Specification

Foreword—The Society of Automotive Engineers (SAE) Industrial Lubricants Committee has developed a number of industrial, non-production lubricant performance specifications.

The purpose of these voluntary SAE specifications is to:

- a. Define minimum performance requirements for industrial lubricants.
- b. Provide lubricant suppliers with performance targets for a minimum number of key industrial lubricants.
- c. Improve the availability of these lubricants to member companies.
- d. Provide a plant oriented, user friendly, classification system using common test standards and properties.

ISO Standard 6743 - Lubricants, industrial oils and related products (class L) - Classification is the foundation for these documents.

- a. Performance characteristics and test procedures are specified.
- b. For information, equivalent ISO, DIN, CEN, BSI, ASTM, AFNOR, CETOP, and IP test methods are referenced.¹

-
1. International Standards Organization (ISO)
Deutsches Institut für Normung e. V. (DIN)
European Committee for Standardization (CEN)
American Society for Testing and Materials (ASTM)
Association of Francaise de Normalisation (AFNOR)
The Institute of Petroleum (IP) NOTE: Now combined with BSI
British Standards Institution (BSI), BS 2000: XXX where XXX is the corresponding IP number
European Committee on Hydraulic Oil and Pneumatics (CETOP)

SAE Technical Standards Board Rules provide that: "This report is published by SAE to advance the state of technical and engineering sciences. The use of this report is entirely voluntary, and its applicability and suitability for any particular use, including any patent infringement arising therefrom, is the sole responsibility of the user."

SAE reviews each technical report at least every five years at which time it may be reaffirmed, revised, or cancelled. SAE invites your written comments and suggestions.

Industrial lubricant classifications targeted:

- a. Lubricants, Industrial Oils and Related Products - Classification (SAE MS1000)
- b. Hydraulic fluids (SAE MS1004)
- c. Fire resistant hydraulic fluids (SAE MS1005)
- d. Lubricating oils (various applications, SAE MS1001, 1002, 1006,1007, 1009, 1010)
- e. Lubricating greases (SAE MS1011)
- f. Metal Removal Fluids (SAE MS1008)
- g. Metal Forming Fluids

See SAE MS1000 - Index of lubricants and symbols.

NOTE— Environmental, Technical Reports, and/or health and safety regulations may present additional specifications to the supplier.

1. Scope—See Table 1.

TABLE 1—SCOPE AND FIELD OF APPLICATIONS

Code Letter	General Application	Particular Application	More Specific Application	Product Type	Symbol	Typical Application	Remarks
D	Air compressors	Positive displacement air compressors with oil lubricated compression chambers	Reciprocating crosshead and trunk pistons or Rotary drip feed (vane)		DAA	Light duty	See Table 2
					DAB	Medium duty	
			Rotary oil-flooded (vane and screw compressors)		DAC	Heavy duty	See Table 3
					DAG	Light duty	
					DAH	Medium duty	
		Positive displacement air compressors with oil-free compression chambers	Liquid ring compressors and water-flooded vane and screw compressors		—	—	Lubricants suitable for gears, bearings, and transmissions
		Dynamic compressors	Reciprocating oil-free compressors		—	—	Lubricants suitable for bearings, and gears
		Dynamic compressors	Rotary oil-free compressors		—	—	Lubricants suitable for bearings, and gears
		Dynamic compressors	Radial and axial turbocompressors		—	—	Lubricants suitable for bearings, and gears

1.1 Information Concerning Duties of Compressors

1.1.1 INTRODUCTION—The following guidelines are given to help interested parties in differentiating between

light duty
medium duty
heavy duty

(see also ISO 5388)

1.1.2 RECIPROCATING OIL-LUBRICATED AND ROTARY DRIP-FEED AIR COMPRESSORS—Whether the duty of reciprocating and rotary drip feed compressors is to be classified as light, medium, or heavy depends on many parameters, for example

- a. The compressor design, i.e. type of cooling, number of stages, valve velocities, oil retention time, etc.;
- b. Ambient conditions, i.e. intake air temperature, coolant temperature, presence of catalytic dust or gases, etc.;
- c. Operating conditions, i.e. continuous or intermittent service, layout of the pressure system, maintenance, oil change intervals, etc.

The ultimate criterion is satisfactory, reliable air compressor operation with the prevention of excessive oil retention or the formation of coke deposits in the hot discharge air system.

1.1.3 ROTARY OIL-FLOODED AIR COMPRESSORS—Whether the duty of rotary oil-flooded air compressors is to be classified as light, medium, or heavy depends on many parameters, for example

- a. The compressor design, i.e., air discharge pressure and pressure ratio, number of stages, oil recirculation rate, oil separating system, etc.;
- b. Ambient conditions, i.e., intake air temperature and humidity, presence of contaminants (dust or gases), etc.;
- c. Operating conditions, i.e., continuous or intermittent service, maintenance, oil change intervals, discharge temperature, etc.

NOTE— Conditions such as air humidity or low circulating air volume may recommend an oil for heavier duty.

TABLE 2—RECIPROCATING OIL-LUBRICATED AIR COMPRESSORS

Duty	Symbol	Operating Conditions	
Light	DAA	Intermittent operation	Sufficient time to allow cooling between periods of operation -compressor stop and start -variable discharge capacity
		Continuous operation	a) discharge pressure < 1000 kPa (10 bar) discharge temperature < 160 °C stage pressure ratio < 3: 1 or b) discharge pressure > 1000 kPa (10 bar) discharge temperature < 140 °C stage pressure ratio < 3: 1
Medium	DAB	Intermittent operation	Sufficient time to allow cooling between periods of operation
		Continuous operation	a) discharge pressure < 1000 kPa (10 bar) discharge temperature > 160 °C or b) discharge pressure > 1000 kPa (10 bar) discharge temperature > 140 °C but < 160 °C or c) stage pressure ratio > 3: 1
Heavy	DAC	Intermittent or continuous operation	As for "medium" when conditions a), b), or c) above are fulfilled and where severe coke formation in a discharge might be anticipated as a result of previous experience with a medium duty oil.

TABLE 3—ROTARY OIL-FLOODED AIR COMPRESSORS

Duty	Symbol	Operating Conditions	
Light	DAG	Air and air/oil discharge temperature < 90 °C Discharge pressure < 800 kPa (< 8 bar)	
Medium	DAH	Air and air/oil discharge temperature < 100 °C Discharge pressure 800 to 1500 kPa (8 to 15 bar)	
		Or Air and air/oil discharge temperature between 100 and 110 °C Discharge pressure < 800 kPa (< 8 bar)	
Heavy	DAJ	Air and air/oil discharge temperature > 110 °C Discharge pressure < 800 kPa (< 8 bar)	
		Or Air and air/oil discharge temperature > 110 °C Discharge pressure 800 to 1500 kPa (8 to 15 bar)	
		Or Discharge pressure > 1500 kPa (> 15 bar)	

1.2 Concept—The lubricants defined by this specification are high quality oils formulated with additives to provide good oxidation resistance, corrosion protection, demulsibility, and foam stability. They are types DAA, DAB, DAC, DAG, DAH, and DAJ intended for use in air compressor applications.

- a. This specification does not address ester or glycol-type fluids.
- b. Properties of lubricants used for vacuum pumps (ISO 6743-3A) or gas and refrigeration compressors (ISO 6743-3B) are not addressed in this document.

- 30 minutes at 54 °C, or 60 minutes at 82 °C for ISO VG ≤ 100.
- SRE-NBR 1 sealant must be used as specified in DIN 53 538, specified reference sealant is available from Bundesantalt fur, Berlin Materialforschung und-prufung (BAM)
Unter den Eichen 87, D-12205 Berlin, Germany Telephone ++49 30 8104-0.
- To be met at point of delivery by supplier; and point of use by customer.

PREPARED BY THE SAE INDUSTRIAL LUBRICANTS COMMITTEE

Rationale—Not applicable

Relationship of SAE Standard to ISO Standard—Not applicable

Application—The Society of Automotive Engineers (SAE) Industrial Lubricants Committee has developed a number of industrial, non-production lubricant performance specifications.

The purpose of these voluntary SAE documents is to:

- a. Define minimum performance requirements for industrial lubricants, where tests are available.
- b. Provide lubricant suppliers with performance targets for key industrial lubricants.
- c. Promote the availability of these lubricants to member companies and others that may wish to use these specifications.
- d. Provide a user-friendly classification system using common test standards and properties.

ISO Standard 6743 - Lubricants, industrial oils and related products (class L) - Classification is the foundation for these documents.

- a. Performance properties, requirements, and test procedures are specified.
- b. For information, equivalent ISO, DIN, CEN, BSI, ASTM, AFNOR, CETOP and IP test methods are referenced.
